Corrections Statistical Analysis Tool (CSAT) - Parole

This dynamic analysis tool allows you to examine data collected by the Annual Parole Survey on persons sentenced as adults. It includes parolees who were conditionally released to parole supervision by parole board decision, by mandatory conditional release, through other types of post-custody conditional supervision, or as the result of a sentence to a term of supervised release.

You can create ***Custom Tables*** of the number, characteristics and supervision rates of adults on parole at yearend. This tool also allows you to create custom tables of parole entries and exits. You can find more detail under ***Definitions***.

The ***FAQs*** provide answers to the most commonly asked questions. This ***User's Guide*** provides everything you need to get started.

Please direct any questions or comments about this tool to ***askbjs@usdoj.gov***.
