

Supporting Statement Part

Collections of Information Employing Statistical Methods

1. The universe for this project is the 50 states' and the District of Columbia's Medicaid and SCHIP programs.

The potential respondent universe is 17 unique programs (17 Medicaid and 17 SCHIP). We estimate that approximately 504 active cases will be randomly selected for review by each of the 17 states in each program to achieve a state specific, program specific eligibility payment error rate. These results will be used to calculate a national eligibility component error rate. We estimate states will randomly select 204 denied and terminated cases for the negative case reviews.

The anticipated response rate is 100 percent due to the statutory requirements at section 1902(a) (6) of the Act and section 2107(b) (1) of the Act that require states to provide information necessary for the Secretary to monitor program performance.

2. In the first year of each state's eligibility measurement, we determined a case sample size of 504 active and 204 negative (per state using an assumed error rate of 5 percent). In subsequent years, the actual sample size for each state will be estimated to achieve a 95 percent confidence level (using the mid-point of the confidence interval) within three percent precision.

In order to meet the requirements of IPIA, all selected states must participate.

3. We will depend on states to provide reliable data. The states are reporting findings monthly and on an annual basis for the year selected for review (once every three years).

4. Not applicable.

5. The Lewin Group was consulted on the statistical methodology of this project.
