

I couldn't see it, I couldn't feel it, but it was there. My doctor told me it put me at risk for a heart attack.

It was high blood pressure. High blood pressure can increase your risk of having a stroke or a heart attack. Fortunately, high blood pressure can be treated.

Introducing Zintria. Prescription Zintria helps lower your blood pressure, which can reduce your risk of having a stroke or heart attack.

But unlike other treatments, you take it Only once a month. Fewer pills. I like that. Zintria is not for everyone

If you have a very slow heart rate or some types of abnormal heart rhythm, you should not take Zintria.

Don't stop taking Zintria suddenly. That may lead to chest pain or a heart attack.

When you first start taking Zintria, avoid activities where you need to be alert because the most common side effects are tiredness and dizziness.

Also, because Zintria lowers the pressure in your eyes, you may have blurry vision. In rare cases this may lead to a temporary loss of side vision, which could affect your ability to drive.

You are encouraged to report negative side effects of prescription drugs to the FDA. Visit www.fda.gov/medwatch or call 1-800-FDA-1088.

You should have regular eye exams to check for this problem. Zintria worked for me. Ask your doctor if Zintria is right for you.
