Reported Voting and Registration by Sex, Race and Hispanic Origin, for States: November 2010

October 2011

Information on reported voting and registration by various demographic and socioeconomic characteristics is collected for the nation in November of Congressional and Presidential election years in the Current Population Survey (CPS). The CPS is a monthly survey of about 50,000 households conducted by the Bureau of the Census for the Bureau of Labor Statistics. The CPS is the primary source of information on the labor force characteristics of the U.S. population. The voting supplement does not provide estimates of partisanship, such as what candidate a voter supported or what political party a voter aligned themselves with.

Frequently Asked Questions	

households. Between 1790 to 1870, the duty of collecting census data fell upon the U.S. Marshals. A March 3, 1879 act replaced the U.S. Marshals with specially hired and trained census-takers to conduct the 1880 and subsequent censuses.

During the early censuses, U.S. Marshalls received little training or instruction on how to collect census data. In fact, it was not until 1830 that marshals even received printed schedules on which to record households' responses. The marshals often received limited instruction from the census acts passed prior to each census.

Beginning with the 1880 census, specially hired and trained census-takers replaced the U.S. marshals. Door-to-door census by temporary census-takers was the primary method of conducting the census until the U.S. Census Bureau began mailing questionnaires to households in 1950.

As more and more households received and returned their questionnaires by mail, the role of census-taker changed. Today, the majority of households are counted by mailed questionnaires. Census-takers visit places frequented by transient households (shelters and soup kitchens, campsites, etc.) and households that do not return their mailed questionnaires (during the "Nonresponse Follow-Up" phase of the census). As a result, the "Instructions to Enumerators" provided here include the congressional acts U.S. marshalls reviewed during the early census, specially-published instructions for door-to-door census, and lastly, guides used for the limited number of personal interviews conducted during nonresponse follow-up operations

Index of Questions

1950 Population

The 1950 census population questionnaire asked fewer questions than its predecessor, the full population was asked only 20 questions. As in 1940, a 5 percent sample was asked an additional slate of questions. Enumerators asked the following questions, listed by column:

1. Name of street, avenue or road where the household is located
2. Home or apartment number
3. Serial number of dwelling unit
4. Is this house on a farm (or ranch)?
5. If no, is this house on a place of three or more acres?
6. Corresponding agriculture questionnaire number
7. Name
8. Relationship to head
9. Race
10. Sex
11. How old was this person on his last birthday?
12. Is this person now married, widowed, divorced, separated, or never married?
Enumerators were to enter "Mar" for married, "Wid" for widowed, "D" for divorced, "Sep" for separated, or "Nev" for never married
13. What State or country was the person born in?
14. If foreign born, is the person naturalized?

[See More](#)

1950 Housing

The 1950 census housing questionnaire was slightly shorter than its counterpart from 1940 but retained the layout developed during that census. Additionally, the questionnaires for occupied and vacant housing were combined into one form. Enumerators collected the following information, listed by column and category number:

For all dwelling units:

1. Serial number of the dwelling unit
2. Block number
3. Type of living quarters
 - 1.) House, apartment, or flat
 - 2.) Trailer
 - 3.) Tent, boat, railroad car
 - X.) Non-dwelling unit quarters within a large rooming house, institution, hotel, tourist court, etc.
4. Type of Structure
 - 1.) Detached
 - 2.) Semi-detached
 - 3.) Attached

New Residential Construction

This page provides national and regional data on the number of new housing units authorized by building permits; authorized, but not started; started; under construction; and completed. The data are for new, privately-owned housing units, excluding "HUD-code" manufactured (mobile) homes. The data are from the Building Permit Survey, and from the Survey of Construction (SOC), which is partially funded by the Department of Housing and Urban Development (HUD). Local building permit data may be found on the Building Permits Survey webpage. [See More](#)

Bachelor's Degree Attainment Tops 30 Percent for the First Time

February 23, 2012

In March 2011, for the first time ever, more than 30 percent of U.S. adults 25 and older had at least a bachelor's degree, the U.S. Census Bureau reported today. As recently as 1998, fewer than one-quarter of people this age had this level of education. [See More](#)

Census Bureau Reports Hispanic Voter Turnout Reaches Record High for Congressional Election

September 28, 2011

Email Tweet Share +

Hispanics made up 7 percent of voters in the 2010 congressional election, the highest percentage for a nonpresidential election since the U.S. Census Bureau began collecting this information in 1974. Hispanics comprised 6 percent of voters in 2006.

Blacks also increased their share of the electorate, going from 11 percent in 2006 to 12 percent in 2010 (a figure not statistically different from the record high in 1998).

These numbers come from [Voting and Registration in the Election of November 2010](#), a set of tables that compares voting and registration patterns by demographic, social and geographic characteristics. They also include state figures on voting and registration.

"These statistics show that the nation's electorate is becoming increasingly diverse," said Tiffany Julian, of the Census Bureau's Education and Social Stratification Branch. "The electorate looks much different than when we first started collecting these data 37 years ago."

The Asian share of the electorate in 2010 was not statistically different than the share in 2006 (2.5 percent and 2.2 percent, respectively). Non-Hispanic white voters decreased from 80.4 percent of the electorate in 2006 to 77.5 percent in 2010, a decline of 2.9 percentage points.

Other highlights from the tables:

- Maine and Washington experienced voter turnout greater than 55 percent. Fewer than 40 percent of citizens in Texas reported voting.
- The most common reason people did not vote was they were too busy (27 percent). Another 16 percent felt that their vote would not make a difference.
- Homeowners were more likely to register and vote than renters; 74 percent of homeowners were registered to vote and 68 percent actually voted; 61 percent of renters were registered and 52 percent voted.
- People with at least some college education made up 68 percent of voters. Individuals without a high school diploma comprised 6 percent of voters.
- Veterans were more likely to vote (57 percent) than nonveterans (44 percent).
- People living in families who earned \$100,000 or more were more than twice as likely to vote

Visit ask.census.gov for further information

The U.S. Census Bureau today released a 2010 Census brief, *The American Indian and Alaska Native Population: 2010*, PDF that shows almost half (44 percent) of this population, or 2.3 million people, reported being American Indian and Alaska Native in combination with one or more other races. This multiracial group grew by 39 percent from 2000 to 2010.

Overall, 5.2 million people, or 1.7 percent of all people in the United States, identified as American Indian and Alaska Native, either alone or in combination with one or more races. This population grew by 27 percent from 2000 to 2010. Those who reported being American Indian and Alaska Native alone totaled 2.9 million, an increase of 18 percent from 2000 to 2010. The multiple race American Indian and Alaska Native population, as well as both the alone and alone-or-in-combination populations, all grew at a faster rate than the total U.S. population, which increased by 9.7 percent from 2000 to 2010.

Those who reported being American Indian and Alaska Native alone or in combination with one or more other races increased by 39 percent from 2000 to 2010.

More Than Three-Fourths Live Outside Tribal Areas

A majority of the American Indian and Alaska Native alone-or-in-combination population (78 percent) lived outside of American Indian and Alaska Native areas. At the same time, most counties with relatively higher proportions of American Indians and Alaska Natives tended to be in close proximity to reservations, trust lands or Oklahoma tribal statistical areas. This was especially evident in counties throughout the West and in Oklahoma.

Majority Live in 10 States

The 10 states with the largest American Indian and Alaska Native alone-or-in-combination population in 2010 were California, Oklahoma, Arizona, Texas, New York, New Mexico, Washington, North Carolina, Florida and Michigan. Among these states, Texas, North Carolina and Florida experienced substantial rates of growth in this population at 46 percent, 40 percent and 38 percent, respectively. The American Indian and Alaska Native alone population experienced growth of at least 20 percent in Texas, North Carolina, Florida and New York.

The multiple-race American Indian and Alaska Native population increased by more than 50 percent in 18 states. North Carolina, Delaware and South Dakota experienced the most rapid growth in this population at more than 70 percent. In all but three states, the multiple-race proportion of the American Indian and Alaska Native alone-or-in-combination population increased from 2000 to 2010.

Tribal Groupings

The largest number of people who identified with any ^{Census} American Indian tribal grouping, either alone or in combination, identified as Cherokee (819,000). The Navajo tribal grouping had the largest number of individuals who identified with one-tribal-grouping and no other race (287,000).

Among the largest American Indian tribal groupings, Blackfeet had the highest proportion who reported more than one tribal grouping or race. Seventy-four percent of Blackfeet individuals reported an additional race and/or tribal grouping.

The largest Alaska Native tribal grouping, either alone or in combination, was Yup'ik (34,000), followed by Inupiat (33,000). Yup'ik also had the greatest number of people who identified with one tribal grouping and no other race (29,000).

Among all Alaska Native tribal groupings, Tlingit-Haida had the highest proportion who reported more than one tribal grouping or race. Forty-two percent of Tlingit-Haida individuals reported an additional race and/or tribal grouping.

Race Definitions

People who reported only one race on their 2010 Census questionnaire are referred to as the race "alone" population. For example, respondents who marked only the "American Indian or Alaska Native" category would be included in the American Indian and Alaska Native alone population. This population can be viewed as the minimum number of people reporting American Indian and Alaska Native.

Individuals who chose more than one of the six race category options on the 2010 Census form are referred to as the race "in combination" population, or as the group who reported more than one race. One way to define the American Indian and Alaska Native population is to combine those respondents who reported American Indian and Alaska Native alone with those who reported American Indian and Alaska Native in combination with one or more other races. Another way to think of the American Indian and Alaska Native alone-or-in-combination population is the total number of people who reported American Indian or Alaska Native, whether or not they reported any other races.

Valentine's Day 2012: Feb. 14 January 4, 2012

Expressing one's love to another is a celebrated custom on Valentine's Day; whereby sweethearts and family members present gifts to one another, such as cards, symbols, or flowers. Opinions differ as to who was the original Valentine, but the most popular theory is that he was a clergyman who was executed for secretly marrying couples in ancient Rome. In A.D. 496, Pope Gelasius I declared Feb. 14...[Read More](#)

The relationship between educational attainment and economic outcomes is shaped by a variety of educational experiences, including field of training, length of time spent in school, and level of attainment. This report explores the relationship between educational attainment, field of training, and eventual occupation and earnings.

School Enrollment in the United States: 2008 (P20-564)

June 2011

[View as PDF](#)

This report discusses school enrollment levels and trends in the population aged 3 and older based on data collected in 2008 by the U.S. Census Bureau in the American Community Survey (ACS) and the Current Population Survey (CPS). This is the second report in a series of reports using both ACS and CPS data to discuss school enrollment.

Public Education Finances: 2009

May 2011

[View as PDF](#)

The U.S. Census Bureau conducts a Census of Government Finances and an Annual Survey of Government Finances as authorized by law under Title 13, U.S. Code, Sections 161 and 182. The Census of Government Finances has been conducted every 5 years since 1957, while the Annual Survey of Government Finances has been conducted annually since 1977 in years when the Census of Government Finances is not conducted. The 2009 Annual Survey of Government Finances, similar to previous annual surveys and censuses of governments, covers the entire range of government finance activities—revenue, expenditure, debt, and assets (cash and security holdings).

2011 Annual Building Permits

January 2012

[View as PDF](#)

During 2011, local building permit offices in the 20,000-place universe authorized the construction of 624,061 new privately-owned housing units with a total valuation of \$105.3 billion. This was 2.2 percent above the preliminary annual estimate of 610,707 housing units and is a 3.2 percent increase from the 2010 total.

QuickFacts

FAQs	New Data	Student State Facts
------	----------	---------------------

What is QuickFacts?

QuickFacts tables are summary profiles showing frequently requested data items from various Census Bureau programs. Profiles are available for the nation, states, counties, and places.

How do I select an area in QuickFacts?

You may select an area in any of three ways:

You may pull down state, county, or city lists, then select "Go".

You may select the link labeled "View map", then select the state or county you desire on the map.

You may select the link labeled "Place search". There, when you enter the name of a city, town or other place, you will get a link for itself (for cities of 5,000 or more), its county, and its state. If more than one area qualifies, there will be multiple entries from which to choose. If no entry matches the spelling you entered, a list of areas with similar names will be given.

Where can I get data for other levels of geography, like my city, metropolitan area, or ZIP code?

At this time, QuickFacts tables are only available for the nation, states, counties, and large cities. In the future, we may offer QuickFacts for metropolitan areas. While not consolidated into QuickFacts profiles, there are a number of sources on the web for data about: metropolitan areas
ZIP codes

Where can I get data more detailed than QuickFacts shows?

Select the link labeled "Browse data sets for ..." in the upper right of the page.

Why were the included data items selected?

These items answer questions people frequently ask and also demonstrate the wide variety of data available. State and US profiles were limited to only those items that could also be shown for counties; additional data sets may be shown via the "Browse more data sets for ..." Some of the data items available for counties are not available for cities. link.

Why are not all cities listed on the pull-down menu?

QuickFacts includes incorporated places with 5,000 or more inhabitants. Some of the data sets on which QuickFacts depends do not include census designated places and may have population or other minimums. Since 2010 Census data are available for all places regardless of size, the cities menu includes an option for "other places not listed", which takes you to a search page for 2010 Census profiles.

Why do I come up with more than 100 percent when I add the race groups (White, Black, Asian, and American Indian) and Hispanic origin together.
Hispanic origin is not a race, and persons of hispanic origin may be of any race. For more information, click on the icon next to any of the race or hispanic items.

Can I download the data in QuickFacts?

Yes. You may either download the data one area at a time (using links at the bottom of each page), or download the entire data set in ASCII files.

Working Paper No. 24

Medical Out-of-Pocket Spending Among the Uninsured: Differential Spending & the Supplemental Poverty Measure

September 9, 2011

Kyle J. Caswell and Kathleen S. Short
 Social, Economic, and Housing Statistics Division - U.S. Census Bureau

[Email](#)
[Tweet](#)
[Share](#)
[View as PDF](#)

INTRODUCTION

Introduction
 The uninsured, on average, utilize less medical services than their insured counterparts (e.g., Meer and Rosen, 2004).¹ Decreased utilization can take the form of preventative services (Hadley, 2003), or more general unmet health care needs (e.g., Carlson et al., 2006; Ayanian et al., 2000). And while uninsured individuals clearly spend less on premium Medical Out-of-Pocket (MOOP) expenses than the insured, they may also spend less than their insured counterparts on non-premium MOOP expenditures—especially if seriously ill where utilization increases to the rates of the insured (e.g., Johnson and Rystal, 2000).

Highlights

- Overview of the DA Methodology
- Sensitivity Analysis of the DA Estimates
- Obtaining the DA Estimates by Race (Black and Non-Black)
- Outreach to External Experts

These facts have implications for poverty measurement as recommended by the National Academy of Sciences Panel on Poverty and Family Assistance for the Supplemental Poverty Measure (SPM) (discussed in section II). Concerning MOOP spending, the panel recommended subtracting observed spending from income to determine poverty status in the SPM. However, because the uninsured have lower medical services utilization, and MOOP spending, their spending will reflect unmet needs relative to the insured's spending—resulting in downward pressure on the poverty rate in the SPM for the uninsured relative to the insured, *ceteris paribus*. Recognizing this aspect of the SPM, the Interagency Technical Working Group (ITWG) on Developing a Supplemental Poverty Measure recently suggested investigating the pros and cons of implementing an "adjustment" for the uninsured that accounts for such differential spending and its effect on poverty measurement (U.S. Census Bureau, 2010).

This research is a direct response to the ITWG and offers two distinct advances in how MOOP spending is incorporated into measuring poverty. First, it extends the method developed in Caswell and O'Hara (2010), which estimates counterfactual distributions of non-premium and premium MOOP spending for the uninsured, intended to reflect the correlation of spending of their insured counterparts. Specifically, this research is distinct in that it takes into account the type of insurance coverage—private coverage versus Medicaid/CHIP—of the donor (i.e., control) for predictive mean matching models of non-premium MOOP spending. Second, this work considers an additional counterfactual environment that incorporates key features of the Patient Protection and Affordable Care Act (PPACA), scheduled to be implemented in 2014, in assigning counterfactual premium values to hypothetical health insurance units (H IU) of the uninsured. These two counterfactual environments are therefore intended to represent levels of MOOP spending corresponding to satisfied medical care need of the uninsured, in terms of poverty measurement.

QuickFacts

In fewer than 10 years, older people will outnumber children for the first time in history.

Rural-to-urban migration tends to lower the percentage of younger adults in rural areas and correspondingly raise the percentage of older residents.

The percentage of older people living alone in developing countries is usually much lower than that in developed countries; levels in the latter may exceed 40 percent.

Should I Respond to a Survey?

Why did I get an American Community Survey?

Your address was selected as a part of a sample and represents thousands of other households like yours. We randomly select about 3 million addresses each year to participate in the survey.

Do I have to answer these questions?

Yes. You are legally obligated to answer all the questions, as accurately as you can.

The relevant laws are Title 18 U.S.C Section 3571 and Section 3559, which amends Title 13 U.S.C. Section 221.

Your answers are important. As part of a sample, you represent many other people. Find out how each question helps your community, your state, and the federal government in questions in the form and why we ask.

How do I benefit?

The information that the Census Bureau collects helps to determine how more than \$400 billion dollars of federal funding each year are spent on infrastructure and services. Your answers help state and local leaders make decisions about programs and investments such as new highways, schools, hospitals, job training, community centers, and emergency services.

Is the American Community Survey legitimate?

Yes. The American Community Survey is legitimate. It is a survey conducted by the U.S. Census Bureau.

Unlike the every-10-year census, our survey continues all year, every year. We randomly sample addresses in every state, the District of Columbia, and Puerto Rico.

Answers are collected to form up-to-date statistics used by many federal, state, tribal, and local leaders. Some American Community Survey questions have been asked by the census since it first began in 1790.

If you have additional concerns about whether the American Community Survey is legitimate, call 1-800-354-7271 for additional confirmation.

What protects my privacy in the Census Bureau?

All Census Bureau employees take an oath of nondisclosure and are sworn for life to protect all information that could identify individuals. Disclosing ANY information that could identify you or your family means 5 years in prison, or \$250,000 in fines, or both.

What is the legal authority behind the American Community Survey?

Your obligation to answer - and our commitment to confidentiality - are both in Title 13 of the U.S. Code.

Centers of Population

Each decade, after it tabulates the decennial census, the Census Bureau calculates the center of population. The National Mean Center of Population based on the 2010 Census is near Plato, Mo., an incorporated village in Texas County.

Population Estimates

The Census Bureau's Population Estimates Program (PEP) produces estimates of the population for the United States, its states, counties, cities, and towns, as well as for the Commonwealth of Puerto Rico and its municipalities.

A brief explanation of the calculation performed by each of the spreadsheets is presented here, grouped by main demographic topics.

Age Structure

There are 11 spreadsheets for the analysis of the age structure of the population. They are, in alphabetical order:

ADJAGE Adjusts any population total by sex to a given age structure.

AGENT Interpolates between two population age structures. The user can specify if the interpolation is to be linear or exponential.

AGESEX Analyzes the age reporting in a population age and sex distribution. Calculates age and sex ratio indices and the United Nations age/sex accuracy index.

AGESMTH Smooths a population age distribution using several methods.

BASEPOP and **BPSTRNG** Prepare the age and sex distribution of a population for making a projection. The difference between the two spreadsheets is the smoothing process.

GRPOP-YB Makes a graph using population age structures for two or three dates, by year of birth of each cohort.

MOVEPOP Moves the population age distribution pertaining to a specific date to another date.

ORAG Distributes open-ended age groups (younger than 80+) into 5-year age groups up to 80 years and over.

PYRAMID Makes an age pyramid by sex, with absolute numbers and percentages of the population data.

SIMAGE Calculates the Whipple, Myers, and Bacht indices of age heaping based on enumerated population by single years of age.

Mortality

There are 15 spreadsheets for analyzing the mortality of a population. Some spreadsheets were prepared for populations with acceptable data, while others assume that only limited data are available. Although the set of mortality spreadsheets is the largest, we did not include those techniques developed and published by the United Nations in the MORTPAK package. The analysis of mortality may require the use of both the U.S. Census Bureau spreadsheets (PASEX) and the MORTPAK package. The PASEX spreadsheets related to mortality are:

ADJMX Adjusts a pattern of mortality rates by age for both sexes combined or for each sex (age-specific, death rates or central death rates from an empirical or existing life table) for obtaining a user-specified number of deaths in a population.

BTHSRV Estimates infant mortality rates based on information on the number of children born during a year prior to the census and the number still alive at the census date.

EOLGST Fits a logistic function to values of life expectancies at birth for each sex simultaneously, given two or more observed values of life expectancies and the two asymptotes of the logistic.

GRBAL Uses the technique developed by Brass for estimating the completeness of reporting of deaths over 5 years of age in relation to a population (Brass, 1975).

INTPLTM and **INTPLTF** Interpolate male and female life tables, respectively, between the values of two given sets of "pivot" life tables.

LOGITQX and **LOGITLX** These two spreadsheets are used for smoothing functions of a life table, using logits of the $q(x)$ and $l(x)$ functions of a life table.

LTMOQYAD Constructs a life table from age-specific death rates or from the probabilities of dying between two specific ages.

LTMTH Selects a Coale-Demeny model life table, region North, that will reproduce a given crude death rate pertaining to a given population age structure.

LTPODTH Constructs and smooths a life table for both sexes or one sex at a time, using population and death data.

LTSTH Is the same as LTMTH, but using region South of the Coale-Demeny model life tables.

LTWST Is the same as LTMTH, but using region West of the Coale-Demeny model life tables.

PREBEN Estimates the level of mortality for ages 5 years and above during an intercensal period (Preston-Bennett, 1983).

PRECOA Uses the technique developed by Preston and Coale for evaluating an available age distribution of deaths in relation to the population.

Fertility

There are 13 spreadsheets for analyzing the fertility of a population. Most spreadsheets are for populations whose registration of births is not complete.

ADJASFR Adjusts a given pattern of age-specific fertility rates to reproduce a desired total number of births.

ARFE-2 and **ARFE-3** Use a technique developed by Ariaga for estimating fertility rates based on information on the average number of children ever born and a pattern of fertility.

ASFRPATT Provides age-specific fertility rates pertaining to a given total fertility rate.

CBR-GFR Calculates the crude birth rate and the general fertility rate based on a desired total fertility rate.

CBR-TFR Estimates the crude birth rate and the total fertility rate, based on the general fertility rate.

PFRATIO Uses the P/F ratio technique, originally developed by Brass, for adjusting reported age-specific fertility rates to the "actual" level of fertility.

RELEFERT Uses Rele's technique for estimating the gross reproduction rate of a population for one or two 5-year periods prior to the census date.

REL-GMPZ Uses the technique developed by Brass and associates for the evaluation and adjustment of fertility estimates obtained from retrospective reports of birth histories or features of birth histories.

REVCBR Calculates crude birth rates during two or three 5-year periods prior to the census date, based on the age structure of the population.

TFR-GFR Estimates the total fertility rate and the general fertility rate based on a crude birth rate.

TFRLOGST Fits a logistic function to two or more values of total fertility rates, and interpolates and extrapolates. It requires asymptotic values.

TFRSINE Fits a sine function to two values of total fertility rates, and interpolates and

Download

Instructions for Downloading PASEX (Excel version)

Note: The latest version of the PASEX spreadsheets was created to correct a problem that prevented the spreadsheets from being saved. This appears to have been a result of recent Microsoft Windows updates.

1. Transfer the PASEX.EXE file to your PC

Download PASEX.EXE. This will copy the PASEX.EXE to your hard drive. Your software should prompt you for a filename and location. For best results, copy to the directory where you want to store the spreadsheet files (e.g. C:\PASEX) or a temporary directory (e.g. C:\TEMP).

2. Run PASEX.EXE on your PC to unzip the files.

After you have successfully retrieved PASEX.EXE, make sure it is on your local hard drive in the desired directory. The file PASEX.EXE is a self-extracting archive (ZIP), which contains the Excel version of the PAS spreadsheets. The unzipped Excel files will take up about 3 megabytes. If you have placed PASEX.EXE in a subdirectory called C:\PASEX, you can run the program in one of two ways:

In Windows:

1. Click on Start then Run, and enter the name of the directory and the program name, e.g. C:\PASEX\PASEX.EXE or you can use the Browse button to find the file.
2. Click the OK button.

Using DOS (Command Prompt):

1. Switch to that directory and run the program to extract the files:
C:

CD C:\PASEX

PASEX

The subdirectory should then contain the 45 * xls files.

Population Analysis System (PASEX)

Developed by the international programs staff of the U.S. Census Bureau, this program is used by researchers in statistical offices, universities, and private organizations around the world for data collection, data processing, and population analysis work. The program is available free of charge.

Overview	Documentation	Download
----------	---------------	----------

The U.S. Census Bureau developed the Population Analysis System (PASEX) to enhance the process of analyzing available population data. PASEX is a set of spreadsheets containing frequently used procedures and methods in basic demographic analysis. PASEX spreadsheets include demographic methods for the following main topics: age structure, mortality, fertility, migration, distribution of population, urbanization, and population projections.

PASEX consists of spreadsheets formatted for use in Excel, so users will need to have access to Excel to use PASEX. The spreadsheets and the special program RUP (a population projection program for rural and urban projections) are distributed together with the manuals describing the basic demographic methods and procedures they perform. The United Nations' MORTPAK is a set of programs for mortality analysis that can be used with PASEX and RUP for analyzing population data. The user should obtain this package through the United Nations. These demographic analysis tools allow users to produce national and subnational population estimates and projections along with estimates and rates of fertility, mortality, and migration.

INTRODUCTION

In the United States, a collection of methods have historically been used to develop estimates of the population for comparison with decennial census counts. These estimates are developed from various types of demographic data in order to build a historical accounting of population change. The term Demographic Analysis (DA) has been used to refer to this approach for assessing the quality of the census. For the 2010 Census, the U.S. Census Bureau is again using the DA estimates along with results from operational indicators and a post-enumeration survey to assess the quality of the decennial census.¹

In past decades, the Census Bureau has produced the DA estimates at the national level for single- year birth cohorts by sex and two broad race categories, Black and non-Black. Reflecting the contributions of many demographers, two distinct methodologies have evolved over time for separately estimating the population under 65 years of age and the population 65 years and over. Administrative records on births, deaths, and estimates of international migration are used to estimate the population under 65. Estimates of the population 65 and over are developed from data on Medicare enrollment and estimates of the number of those not enrolled. The DA estimates have been limited to the national level and the Black and non-Black race categories because of the limitations of the available historical data.^{2, 3}

This paper describes the development of the 2010 DA population estimates. In order to show the sensitivity of the DA estimates to the use of different but plausible input values, alternative estimates for each component of the DA methodology were developed. Specific combinations of alternative inputs were then used to produce five series of DA estimates by single year of age, sex, and the DA race categories for use in the demographic analysis of the 2010 Census counts.⁴ The specific combinations of alternative estimates were selected to communicate the uncertainty around the DA estimates and include a low series, three middle series, and a high series. All series were considered to be plausible. These estimates were produced without knowledge of the 2010 Census results and will provide an essentially independent basis for assessing the accuracy of the 2010 Census counts.⁵ Overview of the DA Methodology DA represents a macro-level approach for analyzing census counts that relies on comparisons with Separate methods are used in DA to obtain estimates for two segments of the total population: the population under age 65, and the population aged 65 and over.

(1) Ages Under 65.

The DA estimates for the population aged 0 to 64 (P0-64) are derived by the basic demographic accounting equation applied to each birth cohort:

$$P0-64 = B - D + I - E \quad (1)$$
