

Survey of State Criminal History Information Systems 2010-2012

B. Statistical Methods

1. Respondent Universe

The survey will be provided to the central criminal history record repositories in 56 jurisdictions including the 50 States, the District of Columbia, American Samoa, Guam, the N. Mariana Islands, Puerto Rico and the U.S. Virgin Islands. These entities represent the entire population of central criminal history repositories. Thus, the survey does not involve any sampling, methods for stratification, imputations or similar statistical methods. The most recent survey (yearend 2008) achieved a 95% response rate with some follow up effort (all 50 states responded, but no responses were received from American Samoa, N. Mariana Islands, and the Virgin Islands). A similar response rate is anticipated for the yearend 2010 collection.

2. Procedures for Collecting the Information

Respondents will have access to online, password-protected reporting forms (screen shots from the 2008 web-based survey is included as Attachment 4). For the 2008 collection, 39 (73.5%) of the 53 respondents submitted their information via the web-based form (13 submitted via fax and 1 via the U.S. mail). A similar distribution is anticipated for the 2010 and 2012 collection. The web-based forms will automatically populate databases which will be accessible by respondents online, thereby reducing data entry error. The functionality will include a built-in utility for respondents to complete and submit individual sections of the survey, examine/update previously submitted portions of it, and will allow other maintenance and reporting capabilities. It is possible that some respondents will prefer to complete a paper version of the survey. This capability is also being provided. The draft introductory letter to respondents (Attachment 3) provides details on the modes of submitting the survey.

For most of the numerical data collected, the data collection agent will primarily calculate totals, percentages, and perhaps cumulative percentages. In some cases, frequencies will be compiled and some distributional statistics will be calculated including means, medians, modes, and ranges.

3. Methods to Maximize Response Rates

Response rates will be maximized through email reminders after the initial contact. Where necessary, respondents will be contacted via telephone. This follow-up will be performed primarily by the data collection agent. The survey is the only existing source for complete and comprehensive data on the status of state-maintained criminal history records. As such, users at both the state and Federal levels have come to depend on its production on a regular basis to assess the effectiveness of programs designed to improve criminal record quality and to identify priorities for federal funding. It is the most cited publication produced by SEARCH and the survey is very popular among respondent agencies. As a result of the follow-up efforts, and due to the survey's popularity and importance, non-response has not been

a significant issue. In a few exceptional cases, follow-up may be conducted by BJS if the data collection agent has not been successful in achieving a response.

Respondents will be asked to verify submitted responses, and will also be given the opportunity to review individual and compiled responses prior to publication.

4. Tests of Procedures

There are no tests of procedure associated with this data collection.

5. Contact information

BJS contact for statistical aspects of the design – Devon Adams (202-514-9157; devon.adams@usdoj.gov)

Data Collection Agent contact - Dennis DeBacco, SEARCH, 7311 Greenhaven Drive, Suite 145, Sacramento, CA, 95831, (916) 392-2550, ext 325; dennis.debacco@searchorg.
