

Attachment 26

Reading Recognition

Name of test: Reading Recognition

Estimated time burden: 5 minutes (English version); 10 minutes (Spanish version)

Estimated number of items: 50 items (English); 70-125 depending on age and prescreening performance (Spanish)

NOTE: While parallel development procedures were employed to develop the English and Spanish versions, they are independent measures (i.e., item content—the particular words—differs). In final form, both the English and Spanish versions will function identically as Computer Adaptive Testing (CAT)-administered measures. While development of the English version has been completed for norming, the Spanish version is at the validation stage and a CAT has not yet been constructed. Any differences between the two versions will be summarized in the Spanish version section. Word lists (i.e., the item banks) for both versions also appear below.

Materials:

Laptop & mouse
Monitor

Description:

The participant is asked to read and pronounce letters and words as accurately as possible. For the youngest children, the initial items require them to identify the letters in an array with 3 symbols or to identify a specific letter in an array of 4 letters. Each administration is individualized using a computerized adaptive format and requires approximately 5 minutes.

Overview:

Each participant will see a series of letters and words presented one at a time on the computer screen. Items are presented in order of difficulty – the computer adjusts the difficulty level of items depending on the participant's performance. The number of items presented will depend on age, but will be approximately 50 for most participants. The computer will administer each item one by one, in an untimed fashion, until the test is completed.

Public reporting burden for this collection of information is estimated to average 2 1/2 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to: NIH, Project Clearance Branch, 6705 Rockledge Drive, MSC 7974, Bethesda, MD 20892-7974, ATTN: PRA (0925-xxxx*) EXP: (xx/xxxx). Do not return the completed form to this address.

Scoring:

The test is scored automatically by the computer, but the examiner must record whether each *response* is correct. As the participant pronounces a letter or word, the examiner checks the pronunciation key on the screen and clicks the **Yes** button if the pronunciation is correct or the **No** button if the response is incorrect.

Note: It is essential that the examiner thoroughly review and master the item pronunciation guide *before* administering this test and adhere to it for all item scoring. The examiner should not rely on his/her own understanding of word pronunciations based on previous experience.

Administration Instructions

Before beginning, the examiner should indicate the education level of the participant on the opening screen.

Say: **“Now I’m going to show you some letters and some words. I want you to read each letter or word out loud. Read each one loud enough so that I can hear you. Some will be easy and some will be hard. Don’t worry if you don’t know the word or its meaning – just read it out loud the best you can. Let’s begin.”**

When the first item appears, say: **“Tell me, what is this letter/word?”** (Say whichever is appropriate. This prompt can be repeated as many times as is needed.)

For children ages 3-4, the first item(s) will require the participant to point to a letter rather than name it. Follow the on-screen instructions. Note: One or more of these items may be administered to older participants, depending on their performance on the test and what the computer selects to display for a given participant.

If the participant says: “I don’t know this one” or “I can’t read it,” say: **“It is OK if you don’t know the word or what it means – just try to read it as best you can.”** This prompt can be used to reassure participants if they refuse to read the letters/words. If, after prompting, a participant refuses to offer a response, mark the item incorrect (**No**) and the computer will move on to the next item.

Once the examiner scores an item (selects **Yes** or **No**), the computer will proceed to the next item. If the examiner needs to go back and change a score for a response, he/she needs to select the **GO BACK** button, return to the previous screen, and then change the response score. Note: changing the score of a response may affect the item the participant will see when the screen refreshes.

Sample Participant Screen (English version; not to scale)

Spanish version

Estimate of time burden and number of items listed above.

Materials:

Same as above

Description:

Same as above except that the Spanish version is not administered as a computerized adaptive test.

General Task Overview:

Same as above except that participants will receive 70-125 words depending on age and performance on a set of screening items. (The screener consists of 9 items, and routes participants to 1 of 4 forms of fixed length within form but varying in length across forms.)

Scoring:

Same as above

Administration Instructions:

Before beginning, the examiner should indicate the age of the participant; education level is not needed for the Spanish version in its current form. Also, changing the score of a response will not affect the next item the participant will see, as within form the Spanish forms are linear/fixed.

English items:
