Crop Production 2010 Summary

January 2011

ISSN: 1057-7823

Update Alert – January 14, 2011

Barley and Dry Bean narratives on pages 85 and 92, respectively, have been updated to accurately reflect the data in the tables.

Corn for grain production is estimated at 12.4 billion bushels, down 1 percent from the November 1 forecast and 5 percent below the record high production of 13.1 billion bushels set in 2009. United States grain yield for 2010 is estimated at 152.8 bushels per acre. This is down 1.5 bushels from the November forecast and 11.9 bushels below the record high yield of 164.7 bushels per acre set in 2009. Area harvested for grain is estimated at 81.4 million acres, up slightly from the November forecast and up 2 percent from 2009.

Sorghum grain production in 2010 is estimated at 345 million bushels, up 2 percent from the November 1 forecast but 10 percent below 2009. Planted area is estimated at 5.40 million acres, down 19 percent from last year. Area harvested for grain, at 4.81 million acres, is down 13 percent from 2009. Average grain yield, at 71.8 bushels per acre, is down 0.7 bushel from the previous forecast but up 2.4 bushels from last year.

Rice production in 2010 is estimated at a record high 243 million cwt, up 1 percent from the previous forecast and up 11 percent from 2009. Planted area is estimated at 3.64 million acres, up 16 percent from 2009. Area harvested, at 3.62 million acres, is down slightly from the previous forecast but up 17 percent from the previous crop year. The average yield for all United States rice is estimated at 6,725 pounds per acre, up 56 pounds from the previous forecast but down 360 pounds from the 2009 yield.

Soybean production in 2010 totaled 3.33 billion bushels, down 1 percent from the November 1 forecast and down 1 percent from 2009. United States production is the second largest on record. The average yield per acre is estimated at 43.5 bushels, 0.4 bushel below the November 1 forecast and 0.5 bushel below last year's record high yield. Harvested area is up slightly from 2009 to a record high 76.6 million acres.

All cotton production is estimated at 18.3 million 480-pound bales, up slightly from last month and up 50 percent from 2009. The United States yield is estimated at 821 pounds per acre, up 7 pounds from the December 1 forecast and up 44 pounds from last year. Harvested area, at 10.7 million acres, is down 1 percent from December but up 42 percent from last year.

This report was approved on January 12, 2011.

Principal Crops Area Planted and Harvested – States and United States: 2008-2010

[Crops included are corn, sorghum, oats, barley, rye, winter wheat, Durum wheat, other spring wheat, rice, soybeans, peanuts, sunflower, cotton, dry edible beans, potatoes, canola, proso millet, and sugarbeets. Harvested acreage is used for all hay, tobacco, and sugarcane in computing total area planted. Includes double cropped acres and unharvested small grains planted as cover crops]

Corn for Grain Objective Yield Data

The National Agricultural Statistics Service conducted objective yield surveys in 10 corn producing States during 2010. Randomly selected plots in corn for grain fields were visited monthly from August through harvest to obtain specific counts and measurements. Data in this table are rounded actual field counts from this survey.

Forage Production

Forage production is the sum of all dry hay production and haylage/greenchop production after converting the haylage/greenchop production to a dry equivalent basis (13 percent moisture) by multiplying the green weight (weight at harvest) by 0.4943. The conversion factor (0.4943) is based on the assumption that one ton of dry hay is 0.87 ton of dry matter, one ton of haylage is 0.45 ton dry matter and one ton of greenchop is 0.25 ton dry matter. The total haylage/greenchop production is assumed to be comprised of 90 percent haylage and 10 percent greenchop. Therefore, the conversion factor used to adjust haylage/greenchop production to a dry equivalent basis = $((0.45*0.9)+(0.25*0.1))/0.87 = 0.4943$. The factors assumed here may vary by State and can be adjusted. Adjustments would result in a slightly different conversion factor.

All Forage Area Harvested, Yield, and Production – States and 18 State Total: 2008-2010

[All forage production is the sum of the following dry equivalents: alfalfa hay harvested as dry hay, all other hay harvested as dry hay, alfalfa haylage and greenchop, all other haylage and greenchop; after converting alfalfa and all other haylage and greenchop to a dry equivalent basis]

Soybean Objective Yield Data

The National Agricultural Statistics Service conducted an objective yield survey in 11 soybean producing States during 2010. Randomly selected plots in soybean fields were visited monthly from August through harvest to obtain specific counts and measurements. Data in this table are actual field counts from this survey.

2010 Annual Weather Summary

Highlights: A rapid transition from El Niño to La Niña and a persistent blocking high-pressure system over the northern Atlantic Ocean were the driving forces behind a number of extreme weather and climate events in 2010. In particular, the North Atlantic block was largely responsible for sustained cold outbreaks in Florida in both January and December 2010. Meanwhile, El Niño played a role in a stormy winter and spring in various parts of the country. Nevertheless, fields dried quickly enough in the Midwest to promote a rapid spring planting pace.

During the spring and summer growing seasons, above-normal temperatures dominated the Nation's major crop production areas, including the central and southern Plains and the Midwest. As a result, most crops developed and matured rapidly, although heat and expanding drought in the eastern Corn Belt and parts of the South reduced yield prospects. In contrast, unfavorably wet weather conditions affected parts of the western Corn Belt, where June flooding washed out some low-lying fields.

Following a warm growing season, Midwestern harvest activities proceeded at a rapid pace. Farther north and west, however, persistently cool, damp weather led to delayed small grain development and harvesting across the northern High Plains and the Northwest. California also experienced developmental and harvest delays for crops such as rice and cotton.

During autumn, signs of a developing La Niña included drought development across the Deep South and drought relief in the eastern Corn Belt. In addition, unfavorable dryness on the central and southern Plains led to a poorly established hard red winter wheat crop. Another late-year sign of La Niña's emerging presence was cold, stormy conditions from the Pacific Northwest to the upper Midwest.

Winter 2009-2010: With weather patterns governed by El Niño and a persistent high-pressure system over eastern Canada and the northern Atlantic Ocean, cold, stormy conditions dominated the United States. El Niño supplied the energy for an active storm track across the central and southern United States, while the high-pressure system acted as an atmospheric block that repeatedly forced cold air southeastward across the Plains, Midwest, and Southeast.

According to the National Climatic Data Center (NCDC), the Nation experienced its seventeenth coldest, fifteenth wettest winter on record. The United States winter average temperature of 31.1 degrees Fahrenheit was 1.8 degrees Fahrenheit below the 1901-2000 mean, resulting in the coldest December-February period since 1984-85. It was among the ten coldest winters in nine Southern States from Oklahoma and Texas eastward to South Carolina, Georgia, and Florida. Meanwhile, Maine posted its third-warmest winter since 1895-96. Winter precipitation averaged 7.35 inches (114 percent of the long-term mean) across the contiguous United States. It was among the ten driest winters on record in Wyoming and Idaho, while top-ten wetness affected South Dakota, Alabama, and seven Atlantic Coast States from Florida to New Jersey. Individual monthly highlights included a pair of December blizzards across parts of the Plains and upper Midwest, a severe, early-January freeze in Florida, and record-setting February snowfall in the Mid-Atlantic States and adjoining areas. The winter of 2009-10 will also be remembered for snow accumulations across the Deep South. In California, key watershed areas received near-normal winter snowfall, following a 3-year drought.

Spring: Cool weather in the West and record-setting warmth from Michigan to Maine highlighted the spring season. A wet spring eased the effects of a dry winter in the Northwest, while a gradual drying trend affected much of the Nation's southern tier. Drought persisted through the end of May in parts of the Great Lakes region and developed in parts of the Gulf Coast States.

According to NCDC, the Nation experienced its twentieth warmest, sixtieth driest spring on record. The United States spring average temperature of 53.2 degrees Fahrenheit was 1.4 degrees Fahrenheit above the 1901-2000 mean. It was the warmest spring on record in Michigan, New Jersey, New York and all six New England States, and among the ten warmest in ten other Midwestern and Northeastern States. In contrast, California experienced its fourteenth coolest spring. Spring precipitation averaged 7.58 inches (98 percent of the long-term mean) across the contiguous United States. State rankings ranged from the fifth driest spring in Louisiana to the second wettest spring in Rhode Island. Individual monthly highlights included March flooding in the Northeast, rapid Midwestern planting progress in April, and Southern rainfall extremes during May. For the latter highlight, May opened with historic rains in parts of Kentucky and Tennessee, while drought developed and expanded during the month from eastern Texas into the lower Mississippi Valley.

Summer: Consistent warmth across the majority of the Nation fueled rapid crop development. In fact, record-setting summer warmth affected numerous locations from the Southeast into New England. A major exception to the warm pattern was the Northwest (as far east as Montana), where persistently cool conditions delayed both winter and spring wheat maturation and harvesting. Meanwhile, pockets of drought developed or expanded during the summer months from the Mid-South into the East. Drought development was also noted in the lower Midwest as far north as the Ohio Valley. In contrast, wet conditions plagued portions of the western Corn Belt.

According to NCDC, the Nation experienced its fifth hottest, ninth wettest summer on record. The United States summer average temperature of 74.0 degrees Fahrenheit was 1.9 degrees Fahrenheit above the 1901-2000 mean. Only the summers of 1934, 1936, 2002, and 2006 were hotter. It was the hottest summer on record in ten Eastern States from Alabama to Rhode Island. In contrast, it was the twentieth coolest summer in Oregon. Meanwhile, June-August precipitation averaged 9.34 inches, 113 percent of the mean. It was the Nation's wettest summer since 2004. State rankings ranged from the twelfth driest June-August period in New Jersey to the wettest summer on record in Wisconsin. Individual monthly highlights included June flooding in parts of the Midwest, along with early-summer heat and dryness from the Delta into the Mid-Atlantic States. Hurricane Alex, which made landfall in northeastern Mexico, contributed to late-June and early-July downpours and flooding in southern Texas. During July, widespread rain maintained generally favorable conditions for Midwestern summer crops, except in areas of excessive wetness. By the end of July, heat began to creep northward into the southern Corn Belt. During August, a broad area of unfavorable dryness stretched from the south-central United States into the Ohio Valley and the lower Great Lakes region. The late-summer dryness, along with a continuation of hot weather, trimmed yield prospects for some rain-fed summer crops.

Autumn: The United States escaped a busy Atlantic tropical season with no hurricane landfalls and minimal overall impacts. Midwestern harvest activities proceeded at a near-record to record-setting pace, with corn and soybean fieldwork nearly complete by the end of October. Meanwhile, portions of the central and southern Plains did not receive enough moisture to allow for proper establishment of winter wheat. Dry conditions also plagued parts of the eastern Corn Belt, although November precipitation provided drought relief. By the end of autumn, signs of the evolving La Niña included Northwestern wetness and dry conditions in the southern Atlantic region and much of the south-central and southwestern United States.

According to NCDC, the Nation experienced its fourteenth warmest, fifty-third driest autumn on record. The United States autumn average temperature of 55.7 degrees Fahrenheit was 1.5 degrees Fahrenheit above the 1901-2000 mean. State rankings ranged from the fifty-third coolest autumn in Washington to the fifth-warmest autumn in Rhode Island. Meanwhile, autumn precipitation averaged 6.70 inches (virtually equal to the long-term mean) across the contiguous United States. It was the second driest September-November period in Florida, but among the ten wettest autumns on record in Maine, Minnesota, North Dakota, and Nevada.

2010 Annual Crop Summary

April: Unseasonably warm temperatures blanketed much of the country east of the Rocky Mountains during the month, allowing spring fieldwork in numerous States to advance at a pace well ahead of normal. Rainfall was plentiful in the western half of the United States, helping to alleviate prolonged drought conditions in areas and boosting small grain growth. In Texas, wet fields and cool temperatures delayed the start of sorghum planting to one week behind normal, while sunny skies allowed for rapid mid-month planting in the Delta. Elsewhere, with warm, mostly dry weather conditions prevailing throughout much of the major corn-producing regions, planting progress exploded during the latter half of April as producers rushed to get as much seed in the ground as possible ahead of approaching late-month thunderstorms. By April 25, half of the 2010 corn crop had been planted, the earliest date on record that progress had reached the midpoint.

May: While cooler than normal temperatures dominated much of the western United States, slowing the emergence of recently planted row crops and hindering head development in small grains, above average temperatures afforded producers throughout the eastern half of the country ample time for completing fieldwork. Early-May thunderstorms delivered a deluge of rainfall to portions of Kentucky and Tennessee causing severe flooding, limiting fieldwork, and damaging some crops in low-lying areas near creeks and rivers. Similarly, spring storm systems inundated California's

rice-producing region with above average rainfall, leaving producers seeding fields as conditions allowed. By May 2, ninety-six percent of the Nation's sugarbeet crop was planted, well ahead of both last year and the 5-year average, with producers in Idaho replanting some fields due to poor emergence, frost damage, and seedling disease. Mid-month cold spells damaged some soybean fields in the northernmost areas of Indiana, causing producers to replant a portion of the crop. Barley seeding remained active throughout the month despite fluctuating weather conditions; however, unusually cool late-month temperatures in Idaho and Montana slowed crop emergence.

June: Warmer than normal temperatures prevailed across much of the country during the month, promoting rapid summer crop development in some areas, while negatively impacting crop conditions in others. Conversely, cool temperatures in the Pacific Northwest, northern Rocky Mountains, and portions of the northern Great Plains hampered small grain maturation. As the month began, cotton producers across the country had planted 91 percent of their intended acreage, with planting complete in Arizona, Arkansas, California, Louisiana, and Missouri. Corn condition ratings declined during June, as mid-month storms delivered above average rainfall and hail that caused flooding and damaged corn plants in some fields in Illinois, Indiana, Iowa, Minnesota, and Nebraska, the five largest corn-producing States. Warm, mostly dry weather was the norm for much of the major winter wheat-producing regions during mid-June, boosting heading progress and providing ideal harvest conditions. Peanut producers had planted 96 percent of the 2010 crop by June 13, ahead of both last year and the average pace. Hot late-month temperatures in the Delta caused a decline in rice condition ratings, but promoted rapid phenological development.

July: Above average precipitation fell on much of the Great Plains and Midwest during the month, helping to improve dry soil moisture conditions in some areas while adding to already soggy fields in others. Conversely, many areas east of the Mississippi River and west of the Rocky Mountains were abnormally dry. Hot temperatures lingered month-long east of the Mississippi River, hampering the phenological development of summer row crops in some Southeastern States. Warm temperatures on the Plains as the month began helped to jumpstart the heading of Kansas' sorghum crop, the earliest start of heading since 2006. Following a rapid planting pace during the spring and nearly ideal growing conditions throughout much of the major corn-producing areas in May and June, the Nation's crop continued to develop at a faster than normal pace during July. Oat harvest was underway in some States by July 11 and neared the halfway point toward month's end. Head development of the Nation's rice crop gained momentum as the month progressed, with heading in Arkansas, the largest rice-producing State, over three weeks ahead of normal by month's end. Warm temperatures coupled with adequate soil moisture levels across the major soybean-producing regions provided ideal growing conditions and promoted rapid crop development throughout July.

August: While near-normal temperatures prevailed from the Rocky Mountains westward, unseasonably warm temperatures reigned from the Great Plains to the Atlantic Coast during August, promoting the rapid phenological development of many row crops as well as small grain harvest. Rainfall in excess of 12 inches left many low-lying corn fields in Iowa, the largest corn-producing State, completely saturated, stunting growth and yellowing portions of the crop. Despite mostly ideal weather that provided ample time for fieldwork during the first half of the month, barley harvest remained behind normal in Idaho, Montana, North Dakota, and Washington, four of the six largest producing States, due to early-season developmental delays. In Kansas, triple-digit temperatures combined with persistently dry weather mid-month depleted soil moisture levels and stressed portions of the sorghum crop. Similarly, above average temperatures and a lack of available soil moisture stressed cotton fields in areas of Texas, leading to a decline in crop condition ratings. Hot, humid conditions blanketed much of the major soybean-producing regions during mid-August, maintaining a rapid pod setting pace, while timely late-month rainfall aided pod filling in portions of the Corn Belt. By August 29, sorghum harvest was underway and well ahead of normal in the Delta but 19 percentage points behind last year in Texas.

September: Tropical Storms Hermine and Nicole bookended the month, delivering substantial amounts of precipitation to much of the south-central and eastern portions of the country. Most notably, coastal locations in both North Carolina and Texas received rainfall totaling 13 inches or more, slowing fieldwork and causing localized flooding in low-lying areas. Elsewhere, unusually dry conditions allowed for the quick harvest of row crops and small grains. By September 5, corn harvesting was underway in 11 of the 18 major corn-producing States, while soybean harvesting had begun in all major estimating States except North Carolina and Wisconsin by September 19. Nationally, sorghum harvesting inched forward during the first half of the month but gained speed as fields in portions of Texas began to dry out. Winter wheat producers were busy seeding their 2011 crop by mid-September. Toward month's end, peanut producers in the Southern Low Plains of Texas were rushing to dig their fields before feral hogs ruined the crop.

October: Above average temperatures and relatively dry conditions across much of the United States promoted the quickest harvest pace in over 19 years for the 2010 corn and soybean crops. Elsewhere, timely late-month storm systems dumped much-needed precipitation on areas of the Great Plains, aiding the establishment of recently seeded small grains. Winter wheat seeding gained momentum as October progressed and warm, mostly sunny weather provided nearly ideal fieldwork conditions; however, crop establishment in portions of the central and southern Great Plains was negatively impacted by generally dry conditions. Despite improved weather conditions in California mid-month that allowed rice producers to harvest their crop at a quicker pace, overall progress remained substantially behind both last year and the 5-year average. While double-digit harvest progress was evident throughout much of the major peanut-producing regions during the latter half of the month, some fields in portions in the Southeast needed additional moisture before producers could continue digging their crop. Warm, sunny weather across the major cotton-producing regions allowed for the quickest harvest of the Nation's crop since 2001. By October 31, cotton producers had harvested 61 percent of the 2010 crop, 34 percentage points ahead of last year and 17 percentage points ahead of the 5-year average.

November: Near-normal temperatures and mostly dry conditions blanketed much of the country during the month, affording producers ample time to finish harvesting their summer row crops and seeding their over-wintered small grains. As the month began, sugarbeet producers in the Red River Valley had finished harvesting this year's crop, while growers in Idaho and Michigan were busy digging the last of their fields. By November 7, corn producers had harvested 96 percent of the Nation's crop, 61 percentage points, or 43 days, ahead of last year and 23 percentage points ahead of the 5-year average. With the exception of Alabama, where progress typically trails the other peanut-producing States, harvest was complete or nearly complete by November 21. By November 28, cotton producers had harvested 91 percent of the 2010 crop, 11 percentage points ahead of last year and 10 percentage points ahead of the 5-year average.

Crop Comments

Corn: United States corn for grain production is estimated at 12.4 billion bushels, down 1 percent from the November 1 forecast and 5 percent below the record high production of 13.1 billion bushels set in 2009. United States grain yield for 2010 is estimated at 152.8 bushels per acre. This is down 1.5 bushels from the November forecast and 11.9 bushels below the record high yield of 164.7 bushels per acre set in 2009.

Regionally, estimated yields are down across much of the Corn Belt, Central Great Plains, Ohio Valley, and Mid-Atlantic States compared to 2009. Less than ideal soil conditions and above normal temperatures during the latter part of summer limited yield potential in these areas. Estimated yields are up from last year in the Southern Great Plains, Mississippi Delta, and Southeast. Improved weather and favorable harvesting conditions were the main reasons for the increase in yield. Yields were also up in the Great Lakes and Upper Mississippi Valley, with record high yields estimated in Michigan, Minnesota, North Dakota, and Wisconsin.

Corn planted area, at 88.2 million acres, is up 2 percent from 2009. This represents the second largest acreage since 1946, only behind 2007 with 93.5 million acres. Area harvested for grain is estimated at 81.4 million acres, up slightly from the November forecast and up 2 percent from 2009.

The 2010 corn objective yield data indicate the second highest number of ears per acre for the combined 10 objective yield States (Illinois, Indiana, Iowa, Kansas, Minnesota, Missouri, Nebraska, Ohio, South Dakota, and Wisconsin), only behind the record year of 2009. Record high ear counts were recorded in Iowa, Ohio, and Wisconsin.

Corn silage production is estimated at 107 million tons in 2010, down 1 percent from 2009. The United States silage yield is estimated at a record high 19.3 tons per acre, tying the previous record set in 2009. Acreage harvested for silage is estimated at 5.57 million acres, down 1 percent from a year ago.

Planting got off to a rapid start in 2010 due to favorable conditions across much of the major corn-producing region during the middle of April. By April 25, half of the Nation's corn acreage had been planted, the earliest date on record that planting had progressed to the midpoint. At 50 percent complete, planting progress was 30 percentage points ahead of the 2009 pace and 28 percentage points ahead of the 5-year average pace. Planting progress was over 40 percentage points ahead of the 5-year average at this point in time in Illinois, Indiana, Iowa, and Minnesota, four of the five largest

corn-producing States. The end of April brought widespread frost to parts of the Midwest, but damage was minimal due to the fact that only a small amount of the crop had emerged.

Favorable planting conditions carried over into the first part of May, with 81 percent of the intended corn acreage planted as of May 9. This represented the third quickest planting pace on record, behind only 2004 and 2000, respectively. However, below average temperatures and wet weather dominated much of the Midwest and portions of the Plains during the middle part of May, hampering the planting of the remaining acreage and threatening emerged plants. Producers continued to battle wet field conditions during the latter part of May but were able to plant an additional 10 percent during the final two weeks of the month bringing the overall total to 97 percent. This was slightly ahead of the 5-year average pace of 96 percent.

Above average temperatures and adequate soil moisture levels in late June and early July pushed silking progress ahead of the normal pace in many parts of the country. By July 4, nineteen percent of the Nation's corn crop was at or beyond the silking stage, 11 percentage points ahead of the previous year's pace and 7 percentage points ahead of the five year average.

As of August 1, seventy-one percent of the corn acreage was rated in good to excellent condition in the 18 major producing States, up 3 percentage points from the previous year. Regionally, conditions were better than last year in the central and southern Great Plains, upper Great Lakes, and upper Mississippi Valley. Moderate temperatures and adequate soil moisture provided favorable growing conditions in these areas. Crop conditions were worse than a year ago in the Corn Belt States of Iowa and South Dakota mainly due to excessive soil moisture. Conditions were also worse in the Tennessee Valley and Mid-Atlantic regions due to above normal temperatures and dry conditions.

Condition ratings declined during August throughout much of the central and western Corn Belt, as well as the Tennessee Valley, mainly due to above normal temperatures and less than ideal soil conditions. The above normal temperatures during the first part of August promoted rapid phenological development. By September 5, virtually all of the Nation's corn acreage was at or beyond the dough stage, with 86 percent dented or beyond, 15 percentage points ahead of the 5-year average. Harvest was underway in 11 of the 18 major estimating States at this time.

Harvesting activities were in full swing during the month of October. Virtually the entire crop had reached the mature stage of development by October 10, twenty-six percentage points ahead of 2009 and 9 percentage points ahead of the 5-year average. As of October 31, ninety-one percent of the corn acreage was harvested, 67 percentage points ahead of last year, and 30 percentage points ahead of the 5-year average. Harvest was ahead of the normal pace in all 18 major producing States, with Illinois, Indiana, and Kansas all having less than 5 percent of the crop remaining in the field. Harvest was complete in Kentucky, North Carolina, and Tennessee by month's end.

Sorghum: Grain production in 2010 is estimated at 345 million bushels, up 2 percent from the November 1 forecast but 10 percent below 2009. Planted area is estimated at 5.40 million acres, down 19 percent from last year, and the lowest planted area on record. Area harvested for grain, at 4.81 million acres, is down 13 percent from 2009, and the lowest harvested area since 1939. Average grain yield, at 71.8 bushels per acre, is down 0.7 bushel from the previous forecast but up 2.4 bushels from last year. Record low planted acreages were established in Mississippi, Missouri, and Texas, while record high grain yields were set in Arizona, New Mexico, and Texas.

Silage production is estimated at 3.42 million tons, down 7 percent from 2009. Area cut for silage is estimated at 273,000 acres, up 7 percent from the previous year. Silage yields averaged 12.5 tons per acre, down 2.0 tons per acre from 2009.

While Texas continued to harvest most of the United States' silage production, Kansas led the Nation in area planted for all purposes, as well as area harvested for grain and grain production. Planted acreage decreased in nine of the 14 estimating States, with reductions of 13 and 30 percent, in Kansas and Texas, the two largest sorghum-producing States, respectively.

Planting was underway in all major estimating States except Nebraska and South Dakota by the end of April. Wet fields in portions of Kansas and Texas slowed fieldwork during May, leaving progress slightly behind normal. Crop maturation

continued at a near-normal pace throughout the summer, with harvest underway in limited areas by early July. By November 21, producers had harvested 95 percent of the 2010 sorghum crop, 22 percentage points ahead of last year and 8 percentage points ahead of the 5-year average.

Oats: The 2010 production is estimated at 81.2 million bushels, down 13 percent from last year and is a record low production. Yield is estimated at 64.3 bushels per acre, down 3.2 bushels from the previous year. Area planted to oats is estimated at a record low 3.14 million acres, down 8 percent from 2009. The largest decline occurred in North Dakota, where planted area decreased 70,000 acres from last year and is a record low for that State. In total, record lows for planted acres were set in 12 States. Harvested area is estimated at a record low 1.26 million acres, 8 percent below last year. The largest decline occurred in North Dakota, where area harvested for grain decreased 60,000 acres from last year and is also a record low for that State. Record lows for harvested area occurred in 10 States.

In California, Missouri, New York, North Carolina, and Wisconsin, excessively wet weather hindered the crop, with the average yield in these States declining 10 bushels from last year. In Idaho, favorable growing conditions led to a 6 bushel increase in yield from last year and is a record high yield for the State. Yield increases of 5 bushels per acre occurred in Michigan, Montana, and Texas.

During early spring, planting of the oat crop was ahead of the normal pace. By April 25, growers had planted 75 percent of the acreage, 15 points ahead of normal. During April, emergence also was ahead of the normal pace. By April 25, emergence was 49 percent complete, 13 points ahead of the 5-year average. As of May 30, planting was complete, with the crop 93 percent emerged, 1 point behind the normal pace. Through June, crop development was ahead of normal in most major oat-producing States. As of June 27, seventy-four percent of the oat acreage was headed, 3 points ahead of the 5-year average. However, North Dakota, the third largest oat-producing State, lagged 15 percentage points behind the 5-year average.

By August 1, forty-seven percent of the oat acreage was harvested, 3 points ahead of the normal pace. Also at this time, harvest in Texas was nearly complete at 97 percent with Ohio following closely behind at 96 percent. In North Dakota, harvest had just begun at 4 percent, and was 13 points behind normal. By August 29, harvest was 96 percent complete in the nine major producing States, 2 points ahead of the 5-year average.

Barley: Production is estimated at 180 million bushels, down 21 percent from 2009. Average yield per acre, at 73.1 bushels, is up 0.1 bushel from last year and is the highest yield on record since estimates began in 1866. Producers seeded 2.87 million acres in 2010, down 19 percent from last year. This is the lowest planted acreage on record. Harvested area, at 2.47 million acres, is down 21 percent from 2009, and the lowest level since 1882. Compared with last year, barley seedings decreased in Idaho, Montana, and North Dakota, the three largest barley-producing States. Producers in North Dakota seeded 720,000 acres and harvested 670,000 acres, down 40 and 41 percent, respectively, from the previous year. Seeded area in North Dakota establishes a record low for the State, while harvested area is the lowest since 1936. In addition, Michigan, Minnesota, and South Dakota producers set new record lows for seeded acreage. A record low for harvested area was set in South Dakota and tied in Michigan. Conversely, record high yields were set in Arizona, Montana, and Utah.

Barley seeding was well underway across much of the major producing regions by April 18, when 18 percent of the Nation's crop was in the ground. Above average temperatures and mostly dry weather during February and March promoted an early start to seeding in Washington, while cool, wet conditions and late-spring snow hampered fieldwork in Idaho. By May 30, ninety-six percent of the 2010 crop had been seeded, with overall progress at or ahead of normal in all five of the major estimating States except Montana. By June 13, emergence was complete or nearly complete in the five major estimating States. Although mostly warm temperatures in early July promoted rapid head development across much of the major barley-producing areas, overall progress in Idaho, Montana, and North Dakota remained behind normal following slow crop development earlier in the growing season. Harvest was underway in most States by the end of July, and had advanced to 91 percent complete by September 26, behind both last year and the 5-year average. As harvest surpassed the halfway point during the week ending August 22, eighty-four percent of the barley crop was reported in good to excellent condition, compared with 80 percent from the same time last year.

All wheat: Production totaled 2.21 billion bushels in 2010, down less than 1 percent from 2009. Grain area is 47.6 million

acres, down 5 percent from last year. The United States yield is a record high 46.4 bushels per acre, 1.9 bushels higher than 2009 and 1.5 bushels higher than the previous record set in 2008. The levels of production and changes from last year by type are winter wheat, 1.49 billion bushels, down 3 percent; other spring wheat, 616 million bushels, up 5 percent; Durum wheat, 107 million bushels, down 2 percent.

Winter wheat: The 2010 winter wheat production totaled 1.49 billion bushels, 3 percent below last year. The United States yield is 46.8 bushels per acre, up 2.6 bushels from the previous year and the fourth highest on record. Area harvested for grain is estimated at 31.7 million acres, down 8 percent from the previous year.

Planted acres were down from 2009 in many of the major Hard Red Winter growing States. While harvested acres were down from last year in most of the major growing States, ideal weather conditions in Oklahoma and Texas resulted in an increase of 1.70 million harvested acres from 2009 in those two States. Record high yields occurred in Colorado, Montana, Nevada, and North Dakota. Overall, Hard Red Winter production totaled 1.02 billion bushels, up 11 percent from 2009.

Planted and harvested acres decreased from a year ago across all of the Soft Red Winter growing area due to the late row crop harvest and wet weather during seeding. Illinois, Indiana, Missouri, and Ohio set record lows for planted acres. Production was down from last year in all of the Soft Red Winter growing States. Production was down 50 percent or more from 2009 in Arkansas, Georgia, Illinois, Indiana, Missouri, and North Carolina. Overall, Soft Red Winter production totaled 238 million bushels, down 41 percent from last year.

White winter production totaled 229 million bushels, up 14 percent from last year. Planted and harvested acreage in the Pacific Northwest States (Idaho, Oregon, and Washington) was above last year's levels. Yields were also up from last year in all three States.

Other spring wheat: Production for 2010 is estimated at 616 million bushels, up 5 percent from 2009 and the third highest total on record. Harvested area is 13.4 million acres, up 3 percent from last year. The United States yield is a record high 46.1 bushels per acre, 1.0 bushel higher than last year which was the previous record. Yields are above last year's level in all States except North Dakota and South Dakota. Average yield in North Dakota, the largest spring wheat-producing State, was 44.0 bushels per acre, 2.0 bushels lower than 2009 but still the second highest on record. Record high yields were set in Colorado, Montana, and Oregon.

Planting got off to a good start in many of the major spring wheat-producing States. Progress of the crop was ahead of last year, but lagged behind the 5-year average due to cooler temperatures. The growing season was marked by below normal temperatures and adequate moisture. Crop maturation continued behind normal throughout the growing season. As a result, harvest progress lagged behind the normal in most States in the growing area. Minnesota and South Dakota were the only States where harvest progressed ahead of the 5-year average.

Durum wheat: Production for 2010 is estimated at 107 million bushels, down 2 percent from 2009. Grain area harvested is 2.53 million acres, up 4 percent from the previous year. The United States yield is 42.4 bushels per acre, 2.5 bushels lower than the record yield set last year but still the second highest yield on record. Record yields occurred in Arizona, California, Montana, and South Dakota. North Dakota's yield of 37.5 bushels per acre is 1.5 bushels lower than last year but still the third highest yield on record. Harvest progress in Montana and North Dakota was behind normal.

Rice: Production in 2010 is estimated at a record high 243 million cwt, up 1 percent from the previous forecast and up 11 percent from 2009. Planted area is estimated at 3.64 million acres, up 16 percent from 2009. Area harvested, at 3.62 million acres, is down slightly from the previous forecast but up 17 percent from the previous crop year. The average yield for all United States rice is estimated at 6,725 pounds per acre, up 56 pounds from the previous forecast but 360 pounds below the 2009 yield.

Planted area is up from 2009 in all rice-producing States except California. Growers in Arkansas, the largest rice-producing State, planted a record 1.79 million acres in 2010, up 21 percent from the previous year. Area planted in Missouri, at 253,000 acres is also a record high. In California, the second largest rice-producing State, planted area is down 1 percent from last year and totaled 558,000 acres.

Planting got off to a rapid start this season in many of the southern States due to favorable weather conditions. However, in California, wet field conditions and spring rainstorms delayed planting. Warm temperatures throughout the growing season across much of the southern rice-producing areas pushed crop development and harvest ahead of normal, but the high temperatures resulted in lower than expected yields in many States. Harvest trailed well behind normal in California, where cool temperatures and wet conditions throughout much of the season limited crop growth and delayed field work. Favorable weather conditions in September allowed harvest to begin but wet field conditions at the end of the harvest season affected the harvest progress and yields of late maturing varieties.

Long grain rice yielded 6,486 pounds per acre across the Nation with production at 183 million cwt. Medium grain rice yielded 7,660 pounds per acre in 2010 with production at 57.1 million cwt. Short grain rice yielded 6,195 pounds per acre with production at 2.66 million cwt.

Rye: Production for 2010 is estimated at 7.43 million bushels, up 6 percent from last year. Harvested area totaled 265,000 acres, up 13,000 acres from 2009. The United States yield, at 28.0 bushels per acre, is up slightly from last year. Improved growing conditions in Oklahoma resulted in increased harvested acres and yield over 2009.

Proso millet: Production of proso millet in 2010 totaled 11.5 million bushels, up 30 percent from 2009. Planted area, at 390,000 acres, is up 11 percent, while harvested area, at 363,000 acres, is up 37 percent from last year. The average yield for 2010 is estimated at 31.8 bushels per acre, down 1.7 bushels from last year.

All hay: Production of dry hay for 2010 is estimated at 146 million tons, down 4 percent from the October 1 forecast and down 1 percent from the 2009 total. Area harvested is at 59.9 million acres, up slightly from both the October 1 forecast and from last year. The average yield, at 2.43 tons per acre, is down 0.12 ton from October and down 0.04 ton from the previous year.

Alfalfa and alfalfa mixtures: Production in 2010 is estimated at 67.9 million tons, down 5 percent from the October 1 forecast and down 4 percent from 2009. Harvested area, at 20.0 million acres, is 4 percent below the October 1 forecast and 6 percent below the previous year. The average yield is 3.40 tons per acre, 0.04 ton below the October 1 forecast but 0.05 ton above 2009.

Compared with December 1, 2009, alfalfa hay harvested area decreased in the majority of the country. States with a 200,000 acre or more decrease in harvested area from last year are Kansas, Minnesota, North Dakota, South Dakota, and Wisconsin. Compared with 2009, South Dakota showed the largest decrease in harvested acres, down 350,000 acres. States with the largest increases in harvested acres include Montana, up 250,000 acres, and New York, up 70,000 acres. Yields are up in the Northern Great Plains, Southern Great Plains, and the Great Lakes States. Yields are down in the majority of the Atlantic Coast States, Southern Cornbelt, and parts of the Southwest. Minnesota recorded the largest alfalfa hay yield increase of 0.60 tons per acre while Maryland had the largest yield decrease of 1.50 tons.

All other hay: Production in 2010 totaled 77.7 million tons, down 4 percent from the October 1 forecast but up 1 percent from 2009. Area for harvest, at 39.9 million acres, is up 3 percent from October and up 4 percent from last year. The average yield is estimated at 1.95 tons per acre, down 0.13 ton from October and down 0.04 ton from last year.

States with a 100,000 acre or more increase from last year include Kansas, Montana, South Dakota, Texas, and Virginia. The largest increase occurred in Texas, up 600,000 acres from last year followed by Kansas with a 200,000 acre increase. States with the largest acreage decreases from last year were lead by North Dakota down 190,000 acres, and Georgia, New York and Pennsylvania, all down 50,000 acres. Due to dry summer conditions, all States in the Southeast experienced lower yields from the previous year except Georgia, which increased 0.20 ton per acre. Yield decreases from last year also occurred in the Central Great Plains, Tennessee Valley and the majority of the Ohio Valley and Atlantic Coast States. Virginia had the largest yield decrease from last year at 0.60 ton per acre while Wisconsin recorded the largest yield increase at 0.60 ton per acre. Montana, Nebraska, and North Dakota had record high yields at 1.80, 1.50, and 1.75 tons, respectively.

Forage: Eighteen States participate in the forage estimation program, which measures annual production of forage crops,

with an emphasis on total alfalfa production. Haylage and greenchop production is converted to 13 percent moisture and combined with dry hay production to derive the total forage production. The total 2010 all haylage and greenchop production for the 18 States in the forage program is 33.8 million tons, of which 23.1 million tons are from alfalfa and alfalfa mixtures. The total all haylage production is up 7 percent from last year. Wisconsin, the leading haylage and greenchop producing State, harvested 1.40 million acres of all haylage and greenchop in 2010, of which 1.30 million were alfalfa and alfalfa mixtures, both down 100,000 acres from last year. The 18 State total forage area harvested is 35.7 million acres, including 14.5 million acres from alfalfa and alfalfa mixtures. The total forage harvested area is 71,000 acres lower than 2009 but the total forage production is up slightly from last year. The United States yield is estimated at 2.81 tons per acre, up 0.02 ton from the previous year.

New seedings of alfalfa and alfalfa mixtures: Growers seeded 2.55 million acres of alfalfa and alfalfa mixtures during 2010, down 5 percent from the 2009 seeded area of 2.67 million acres. The largest decrease occurred in Oklahoma, down 30,000 acres from 2009 while the largest increase was in Montana with an additional 25,000 acres. The new seedings of alfalfa and alfalfa mixtures will normally be harvested for the first time in the year following planting.

Peanuts: Production is estimated at 4.16 billion pounds, up 5 percent from the previous forecast and up 13 percent from 2009. Planted area is estimated at 1.29 million acres, up 15 percent from 2009. Area harvested is estimated at 1.26 million acres, up 16 percent from the previous crop year. Average yield is estimated at 3,311 pounds per acre, up 169 pounds from the previous forecast but down 110 pounds from 2009.

Production in the Southeast States (Alabama, Florida, Georgia, Mississippi, and South Carolina) is estimated at 3.20 billion pounds, up 4 percent from the previous forecast and up 13 percent from 2009. Planted area is estimated at 986,000 acres, up 16 percent from 2009. Harvested area is estimated at 957,000 acres, up 16 percent from the previous crop year. Average yield in the region is estimated at 3,340 pounds per acre, up 140 pounds from the previous forecast but 88 pounds lower than the 2009 average yield. Yields are up from the previous crop year in Florida, Mississippi, and South Carolina but yield is down from last year in Alabama. In Georgia, the leading peanut-producing State, the yield of 3,560 pounds per acre ties the record high yield achieved in 2009. The excellent yields in Georgia can be attributed to intensive irrigation and new drought resistant varieties.

Virginia-North Carolina production is estimated at 273 million pounds, up 5 percent from the previous forecast but down 5 percent from 2009. Planted area is estimated at 105,000 acres, up 33 percent from the previous crop year. Area for harvest, which is estimated at 104,000 acres, is up 33 percent from 2009. The average yield is estimated at 2,627 pounds per acre, up 163 pounds from the previous forecast but down 1,073 pounds from 2009. Hot, dry weather conditions during the growing season stressed the crop in the region and resulted in poor yields.

Southwest peanut production (New Mexico, Oklahoma, and Texas) is estimated at 686 million pounds, up 12 percent from the previous forecast and up 20 percent from 2009. Planted area is estimated at 197,000 acres, up 6 percent from the previous crop year. Area for harvest is estimated at 194,000 acres, up 11 percent from 2009. The average yield for the region is estimated at 3,536 pounds per acre, up 310 pounds from the previous forecast and up 271 pounds from the previous crop year. Yield is down from last season in Oklahoma, up from last year in Texas, and unchanged from last year in New Mexico.

Canola: Production in 2010 is estimated at a record high 2.45 billion pounds, up 66 percent from 2009 but down 3 percent from the October 1 forecast. The yield, at 1,713 pounds per acre, is down 98 pounds from last year's record high yield and down 73 pounds from October. Planted area is estimated at 1.45 million acres, 75 percent above last year's acreage. Harvested area, at 1.43 million acres, is up 76 percent from 2009. Production in North Dakota, the leading canola-producing State, is estimated at a record high 2.18 billion pounds, up 64 percent from last year. Although the yield in North Dakota is down 120 pounds from last year, planted area is up 75 percent.

Sunflower: The 2010 sunflower production totaled 2.74 billion pounds, down 10 percent from 2009. The United States average yield per acre decreased 94 pounds from last year's record high to 1,460 pounds. Planted area, at 1.95 million acres, is 4 percent below last year. Area harvested decreased 4 percent from last year to 1.87 million acres.

Production in North Dakota, the leading sunflower-producing State, is estimated at 1.25 billion pounds, down 5 percent

from 2009. The yield in North Dakota, at 1,456 pounds per acre, is down 62 pounds from 2009. Compared with last year, planted area in North Dakota was unchanged and harvested area decreased by less than 1 percent. Yields, compared with last year, are down in five of the nine major sunflower-producing States, but are up in Minnesota, Nebraska, Oklahoma, and Texas. The average yield in Nebraska is the second highest on record.

United States production of oil-type sunflower varieties, at 2.07 billion pounds, decreased 20 percent from 2009. Harvested acres are down 14 percent from the previous year and are the lowest since 1990. Although the yield decreased by 105 pounds, to 1,458 pounds per acre, the United States average yield for oil-type varieties is still the sixth highest on record.

Production of non-oil sunflower varieties, at 661 million pounds, increased 46 percent from last year. Area harvested, at 451,300 acres, is up 50 percent from 2009. The average yield decreased by 41 pounds from last year's record high to 1,465 pounds per acre.

As harvest of sunflowers began in early October, progress was slightly ahead of normal in Colorado but lagged behind normal in Kansas, North Dakota, and South Dakota. As of October 3, harvest progress was 3 percentage points behind normal in Kansas, North Dakota, and South Dakota. Through October, harvest in all four States progressed ahead of last year and ahead of the 5-year average in all four States with the exception of North Dakota. By October 31, harvest was 57 percent complete in the four major States, compared with the 5-year average of 52 percent. Harvest progress continued to progress ahead of normal through November and reached 96 percent harvested in the four major States by November 21, six points ahead of normal for that date.

Soybeans: Production in 2010 totaled 3.33 billion bushels, down 1 percent from the November 1 forecast and down 1 percent from 2009. United States production is the second largest on record. The average yield per acre is estimated at 43.5 bushels, 0.4 bushel below the November forecast and 0.5 bushel below last year's record high yield. Planted area for the Nation, at 77.4 million acres, is down fractionally from last year's record high. Soybean growers harvested a record 76.6 million acres, up slightly from last year but down less than 1 percent from November.

Yields are down or unchanged from last year in all States except Illinois, Louisiana, Mississippi, Texas, and the northern tier States. Hot, dry weather during the blooming stage and throughout pod development negatively impacted soybean yields in many areas. Compared with last year, the largest yield decrease occurred in New Jersey, down 18 bushels, and decreases of 10 bushels or more occurred in Alabama, Delaware, Georgia, Kansas, Kentucky, Tennessee, Virginia, and West Virginia. Meanwhile, the biggest increase from last year occurred in Wisconsin, where yields are up 10.5 bushels from 2009. Yield increases of 5 bushels or more from last year also occurred in Illinois, Minnesota, New York, and Texas. New record high yields were set in Illinois, New York, and Wisconsin.

The 2010 soybean objective yield survey data indicate that final average pod counts were higher than last year in seven of the eleven objective yield States. Compared with last year, pod counts were up more than 15 percent in Indiana and Ohio and more than 20 percent in Illinois and Minnesota. The only States that showed a decrease in pod counts from last year were Arkansas, Kansas, Missouri, and South Dakota.

Soybean planting got off to a good start this season as conditions were much improved compared with last year. The month of May began with planting in all States at or ahead of last year's pace and, with the exception of Louisiana, at or ahead of their 5-year average. During mid-May, several soybean-growing areas received cool, wet weather, but significant progress was made in many areas during the last week of May. As of May 30, planting progress had reached 74 percent complete, only one point behind normal, but 11 percentage points ahead of last year. During June, there were several heavy storms that moved through soybean-growing areas, slowing planting progress. Rainfall was particularly heavy at times in parts of the Central and Southern Great Plains, and the western Corn Belt. By June 27, ninety-seven percent of the soybean crop was planted, 2 points ahead of last year but equal to the 5-year average.

Emergence of the soybean crop began ahead of both normal and last year's pace, and remained very close to normal and a few points ahead of last year's pace throughout June. Soybeans reached 97 percent emerged by July 4, equal to the 5-year average but 2 points ahead of last year. Blooming progress for soybeans during July followed a very similar pattern to emergence progress, remaining several points ahead of last year but in line with the normal pace. As of August 1,

eighty-six percent of the Nation's crop was blooming, 3 points ahead of normal and 12 points ahead of last year. Fifty-three percent of the acreage was setting pods by August 1, five points ahead of normal and 20 points ahead of last year.

Soybean development continued to stay ahead of normal during the month of August. By August 29, ninety-six percent of the soybean crop was at or beyond the pod-setting stage, four points ahead of last year and 1 point ahead of normal. Of the States where progress was lagging behind normal, the only State that was more than a point behind the 5-year average at the end of August was Kansas, which lagged behind the normal pace by 5 percentage points.

During September, crop conditions declined or remained unchanged in all of the major-producing States except Illinois, Louisiana, Missouri, and Nebraska. The largest decline occurred in North Carolina, down 30 percentage points from last month, as hot, dry weather during most of September was followed by excessive rain at the end of the month. As of October 3, eighty-eight percent of acreage was dropping leaves or beyond, 11 points ahead of last year's pace and 3 points ahead of the 5-year average. Progress was ahead of normal in all major-producing States except Iowa, Kansas, Missouri, and North Dakota. The percent of acreage dropping leaves was more than 10 points ahead of normal in Kentucky and Michigan.

Soybean harvest in the eighteen major States was 37 percent complete at the beginning of October, 23 points ahead of last year's pace and 9 points ahead of normal. Mostly dry weather across most of the soybean-producing areas during the first two weeks of October further accelerated harvest progress. By October 17, eighty-three percent of soybeans were harvested, 54 percentage points higher than last year and 21 points ahead of the 5-year average. Although a few showers occurred in parts of the Midwest during the latter part of October which briefly slowed harvest, progress reached 96 percent complete by October 31, seventeen percentage points ahead of normal. This is the earliest date that 96 percent of the crop was harvested since 1975 when published data became available.

Flaxseed: Production of flaxseed in 2010 totaled 9.06 million bushels, up 22 percent from last year and 58 percent above 2008. Harvested area totaled 418,000 acres in 2010, up 33 percent from last year. The average yield for 2010, at 21.7 bushels per acre, represents the second highest yield on record, only behind the 2009 record yield of 23.6 bushels per acre. Production increased from the previous year in all estimating states except for Minnesota.

In North Dakota, the leading flaxseed-producing State, production totaled 8.54 million bushels in 2010, up 21 percent from 2009. Growers harvested 388,000 acres of flaxseed, up 32 percent from last year. The average yield in North Dakota is estimated at 22.0 bushels per acre, two bushels below the State record yield of 24.0 bushels per acre set in 2009.

Safflower: Production of safflower in 2010, at 221 million pounds, is down 9 percent from 2009. Growers planted 175,000 acres in 2010, unchanged from last year, while harvested area, at 167,700 acres, is up 1 percent from the previous year. The yield, at 1,320 pounds per acre, decreased 142 pounds from 2009. California producers led the Nation, producing 125 million pounds of safflower, down 12 percent from 2009.

Other Oilseeds: Mustard seed production for 2010 decreased 15 percent from last year to 41.9 million pounds. Planted area, at 50,500 acres, is down 2 percent and harvested area, at 48,100 acres, is down 3 percent from 2009. The average yield is 870 pounds per acre, 121 pounds below last year's record high yield.

Rapeseed production increased 172 percent from last year to 4.16 million pounds, the largest production since 2004. Growers planted 2,300 acres of rapeseed in 2010, an increase of 1,300 acres from last year. Harvested area, at 2,200 acres, is also up 1,300 acres from last year. The average yield is 1,891 pounds per acre, up 191 pounds from last year, and is the highest yield since records began in 1991.

Cotton: Upland cotton production is estimated at 17.8 million 480-pound bales, up slightly from the December 1 forecast and up 51 percent from last year. The United States yield for Upland cotton is estimated at 814 pounds per acre, up 7 pounds from last month and up 48 pounds from 2009. Harvested area, at 10.5 million acres, is down 1 percent from last month but up 42 percent from last year. Upland planted area, estimated at 10.8 million acres, is up 20 percent from last year.

Upland growers in the Southeastern region (Alabama, Florida, Georgia, North Carolina, South Carolina, and Virginia) finished planting by mid-June. Hot, dry weather during much of the summer allowed the crop to develop ahead of normal. By the end of August, limited harvest was underway in Alabama and Georgia. By late-September, defoliation and harvest were underway throughout the region. Harvest neared completion by the end of November. Objective yield data in Georgia show bolls per acre to be the lowest in the last 7 years and boll weight to be at its lowest level since 1998. North Carolina boll weights are at their lowest level since 2005.

In the Delta region (Arkansas, Louisiana, Mississippi, Missouri, and Tennessee) producers finished planting by the first of June. The crop developed quickly due to hot, dry conditions for much of the summer. Defoliation and harvest had begun by late-August in the region. Harvest was completed by mid-November. In Louisiana, objective yield data show boll weight to be the lightest in over 10 years. Objective yield data in Arkansas show the bolls per acre to be the largest on record in Arkansas and the largest in the last 5 years in Mississippi.

Texas producers finished planting Upland cotton by the middle of June. In the Panhandle, warm temperatures and timely rains allowed the crop to develop well ahead of normal. Defoliation and limited harvest was underway by the middle of September. In South Texas, harvest was complete by mid-September. Harvest progressed rapidly in the Panhandle of Texas through the first half of October. However, harvest came to a halt after strong thunderstorms moved through some parts of the growing area. Reports from growers indicated some damage to the crop due to heavy rain, hail, and high winds. Objective yield data in Texas show boll weight to be the lowest since 2005.

In Kansas and Oklahoma, the Upland crop developed ahead of normal during the growing season. In Oklahoma, harvest got underway in late September, while Kansas producers began harvesting in October.

Upland producers in California and Arizona completed planting by mid-June. The Upland crop developed behind normal throughout the summer. In Arizona, harvest began during the first week of September. In California, harvest got underway in October.

American Pima producers planted 204,200 acres, up 44 percent from last year. Harvested area, at 201,700 acres, is up 46 percent from last year. Production is estimated at 497,500 bales (480-pound), down slightly from the August 1 forecast but up 24 percent from last year. The United States yield is estimated at 1,184 pounds per acre, up 30 pounds from the August 1 forecast but down 205 pounds from last year.

All cotton ginnings totaled 16,447,200 running bales prior to January 1, compared with 10,812,000 running bales prior to the same date last year.

Cottonseed: Production for 2010, based on a 3-year average lint-seed ratio, is expected to total 6.19 million tons, up 49 percent from last year.

Tobacco: United States all tobacco production for 2010 totaled 720 million pounds, slightly above the October forecast but down 12 percent from 2009. Growers harvested 337,450 acres, down slightly from the previous forecast and 5 percent below a year ago. Yield per acre averaged 2,133 pounds per acre, up 23 pounds from the previous forecast but 190 pounds lower than 2009.

Flue-cured tobacco production totaled 453 million pounds, 1 percent above the previous forecast but 14 percent lower than last year. Harvested acres totaled 210,900 acres in 2010, slightly below the October 1 forecast and 6 percent below a year ago. In Virginia, acreage for 2010 remained unchanged, while acreage decreased in all other flue-cured States. Yields averaged 2,148 pounds per acre, 25 pounds above the last forecast but down 200 pounds from 2009. Yield per acre decreased from a year ago in North Carolina, but it increased in all other flue-cured States. Heavy rainfall in early October reduced North Carolina yields, while other States reported ideal conditions for tobacco growth.

Burley production totaled 188 million pounds, up 1 percent from the October forecast but 13 percent below last year. Growers harvested 97,600 acres, slightly below the previous forecast and 4 percent below 2009. Yields averaged 1,922 pounds per acre, 25 pounds above October but 187 pounds below a year ago.

Sugarbeets: Production for 2010 is estimated at 31.9 million tons, up fractionally from the November 1 forecast and 7 percent above last year. Growers in the 10 major sugarbeet-producing States planted 1.17 million acres, a decrease of 1 percent from 2009, while the area harvested totaled 1.16 million acres, up 1 percent from last year. Estimated yield, at 27.6 tons per acre, is 0.1 ton below the November forecast but 1.7 tons above last year and establishes a record high.

Record high yields were also set in Colorado, Minnesota, North Dakota, and Wyoming. Production increased from last year in three of the four largest sugarbeet-producing States.

An abnormally mild winter in Michigan led to an early return to fieldwork, and by mid-April, sugarbeet producers in the State were nearly finished planting their 2010 crop. Similarly, warm, mostly dry conditions in Minnesota and North Dakota provided ample time for planting. By May 2, ninety-six percent of the Nation's crop had been planted, well ahead of both last year and the 5-year average. Harvest was underway in Michigan and the Red River Valley by mid-September. Ideal fieldwork conditions promoted an active harvest pace throughout much of the fall, and by November 7, producers had dug 97 percent of this year's crop, 6 percentage points ahead of last year and 3 percentage points ahead of the 5-year average.

Sugarcane: Production of sugarcane for sugar and seed in 2010 is estimated at 29.5 million tons, of which 27.9 million tons was utilized for sugar and 1.69 million tons for seed. Total production for sugar and seed is up less than 1 percent from the December 1 forecast but down 3 percent from 2009. Sugarcane producers harvested 881,200 acres for sugar and seed in 2010, up 1 percent from both the December forecast and last year. Yield for sugar and seed is estimated at 33.5 tons per acre, unchanged from the December forecast but down 1.3 tons from 2009.

In Louisiana, expectations for a bumper crop were diminished when unusually dry weather conditions ruled the summer months, resulting in decreased yields and overall production. Elsewhere, unseasonably cold temperatures in Florida in late December damaged much of the State's remaining crop, prompting a rapid harvest pace in hopes of preventing as much loss as possible.

Dry beans: United States dry edible bean production is estimated at 31.8 million cwt for 2010, up 25 percent from 2009. Planted area is estimated at 1.91 million acres, up 24 percent from last year. Harvested area is estimated at 1.84 million acres, 26 percent above the previous year. The average United States yield is estimated at 1,726 pounds per acre, a decrease of 11 pounds from 2009.

Production is expected to be higher in 14 of the 18 States in the dry bean program in 2010. The top five producing States all showed increased production from last season. Production in North Dakota, the largest producing State, was up 35 percent from a year ago, while Michigan increased 21 percent from 2009. Minnesota and Nebraska's production increased 22 percent and 30 percent, respectively. Idaho's production is up 29 percent from last season.

In North Dakota, harvest began the final week of August, about three weeks ahead of last season and was essentially complete by mid-October, a month ahead of last year. In Michigan, harvest began on a limited basis the week of August 23. By September 7, dry beans were turning quickly and continued to be harvested. Harvest wrapped up the week ending October 17.

Excessive moisture slowed maturation and harvest in Minnesota. Several growers reported leaving unharvested beans in the fields. In Idaho, cool, wet weather this spring delayed planting and negatively impacted crop development.

Lentils: Production of lentils is estimated at 8.66 million cwt, up 48 percent from last year. Area for harvest is estimated at 634,000 acres, up 56 percent from the previous year. Average yield is expected to be 1,365 pounds per acre, down 75 pounds per acre from 2009. If realized, these would be the largest planted, harvested, and production levels since records began in 1986.

North Dakota's production, at 3.93 million cwt, is up 54 percent from 2009. Harvested area, at 255,000 acres, is up 56 percent from last year, while average yield, at 1,540 pounds per acre, decreased by 20 pounds. Planting started in late April, about the same as last year and was essentially completed by the end of May. Soil moisture supplies were rated

mostly adequate throughout the growing season with more favorable temperatures reported than in 2009. Harvest started in early August and was finished by the end of September, about a week behind the previous year.

Montana's production is estimated at 3.36 million cwt, up 110 percent from last year. Harvested area increased 113 percent from 2009, while average yield decreased by 20 pounds per acre to 1,360. Lentils were 94 percent planted by May 31 and 99 percent emerged by June 20. Crop condition by late June was rated mostly in the good to excellent range. Lentil harvest was nearly completed by October 3.

Washington's production, at 858,000 cwt, is down 18 percent from 2009. Harvested area increased 4 percent from a year ago, but average yield decreased by 300 pounds per acre to 1,100. Growers reported that the extremely wet spring and early warm summer conditions negatively impacted yields this year. Quality has been reported as good but seed size is smaller than normal.

Production in Idaho, at 513,000 cwt, is down 21 percent from last year. Harvested area is up 4 percent from last season but the average yield decreased 300 pounds per acre to 950. The cold, wet spring increased disease and weed pressure in much of the growing region.

Wrinkled seed peas: Production is estimated at 580,000 cwt in 2010, down 34 percent from 2009. Idaho production, at 190,000 cwt, is up 6 percent from 2009. Production in Washington, at 390,000 cwt, decreased 44 percent from last year.

Dry edible peas: Production of dry edible peas is estimated at 14.2 million cwt, down 17 percent from the 2009 estimate. Area for harvest, at 711,400 acres, is 15 percent below a year ago. Average yield is estimated at 1,999 pounds per acre, down 46 pounds from last season.

North Dakota's dry edible pea production is estimated at 8.12 million cwt, down 30 percent from last season. Harvested acres, at 400,000, decreased 17 percent and average yield is down 370 pounds per acre from last season. Planting began about a week behind normal and finished about a week ahead of the 2005-2009 average. Soil moisture supplies were rated mostly adequate and the 2010 crop condition was rated mostly good throughout the entire growing season. Harvest started the final week of July, a week ahead of last year, and was essentially finished by the end of August, two weeks ahead of the previous season.

Production in Montana, at 4.14 million cwt, is up 38 percent from the 2009 estimate. Harvested area decreased by 8 percent to 207,000 acres but average yield increased by 670 pounds per acre to 2,000. The crop was 93 percent planted by May 31 and 96 percent emerged by June 13, about the same as last year. Crop condition, by late June, was rated as mostly good to excellent. Producers began harvest at the end of July and it was 99 percent completed by September 12.

Production in Idaho is expected to be 480,000 cwt, down 38 percent from 2009. Harvested area, at 30,000 acres, decreased 27 percent, while average yield, at 1,600 pounds per acre, decreased 300 pounds from last year. Washington's production estimate, at 1.29 million cwt, is 24 percent below last year. Area for harvest, at 68,000 acres, decreased 20 percent from last season, while yield, at 1,900 pounds per acre, decreased 100 pounds. Wet spring and early warm summer conditions reduced this season's yields.

Austrian winter peas: Production of Austrian winter peas is estimated at 237,000 cwt, up 30 percent from 2009. Area harvested is estimated at 17,900 acres, up 31 percent from last year. Average yield is expected to be 1,666 pounds per acre, up 338 pounds per acre from last season.

The Idaho Austrian winter pea production estimate, at 99,000 cwt, is up 3 percent from last year. A cold, wet spring, disease, and weed problems lowered yield in most of the growing area.

Montana's production estimate of 110,000 cwt is up 96 percent from last year. Harvested area is up 17 percent from a year ago at 7,000 acres. In July, high temperatures and below normal precipitation were common. By mid-August, the prevailing hot, dry conditions aided harvest. Oregon's production estimate, at 28,000 cwt, is down 7 percent from last year. Harvested area increased 200 acres to 1,900.

Winter potatoes: California winter potato estimates are combined with spring potatoes beginning in 2010.

Spring potatoes: Production for 2010 is estimated at 24.8 million cwt, down 5 percent from the May 1 forecast but 16 percent above 2009. Harvested area totaled 85,900 acres, down 4 percent from the previous forecast but up 17 percent from a year ago. The average yield of 289 cwt per acre is down 2 cwt from the May 1 forecast but unchanged from 2009.

Florida production is estimated at 7.95 million cwt, up 5 percent from the May 1 forecast and 3 percent above the 2009 production. In California, production decreased 11 percent from the previous forecast but increased significantly from last year due to winter and summer acreage included in the spring total. Production in Texas increased 1 percent from 2009. Wet, spring conditions and a hot summer hindered plant growth in North Carolina, permitting growers to produce 13 percent fewer spring potatoes than in the previous year. Arizona production decreased 8 percent from last year.

Summer potatoes: Growers produced 11.5 million cwt of summer potatoes in 2010, down 2 percent from the September forecast and down 19 percent from 2009. Harvested area, at 37,100 acres, is down 11 percent from last year. The average yield of 311 cwt per acre is 32 cwt below 2009. Production declined from the previous year in eight of the nine producing States. Beginning in 2010, summer potatoes in California were combined with spring potatoes.

In Texas, production decreased 29 percent, largely due to a decline in harvested acres. Illinois potato fields received excessive rainfall during the spring, reducing yields by 35 cwt per acre from the previous year. In Virginia, producers lost acres due to hot, dry conditions. Colorado summer potato production decreased 2 percent from the previous year, but quality was reported to be in good condition. In Kansas, production decreased 15 percent.

Fall potatoes: Production of fall potatoes for 2010 is estimated at 361 million cwt, virtually unchanged from the December 1 forecast but down 8 percent from last year. Area harvested, at 881,300 acres, is down slightly from the December 1 forecast and 4 percent lower than last year. The average yield is estimated at 409 cwt per acre, unchanged from the December 1 forecast but 20 cwt below last year's record high yield.

Idaho's yield is forecast at 389 cwt per acre, 26 cwt below last year due to cool and wet, spring conditions. Production in Idaho is down 14 percent from last year largely due to an 8 percent decrease in harvested acres, the lowest acreage on record since 1980. Yield, at 550 cwt in the 10 Southwest counties is a record high. In Colorado, quality was reported to be in good condition. In California, yields were affected by a cool, wet spring and fall rains.

In North Dakota, crop condition was rated mostly good to excellent in June and August, and mostly fair to good throughout July. Harvest began in late August, ahead of both last year and the five year average. Wisconsin growers reported wet soil conditions in the southern and northern tiers of the State. In Michigan, crop conditions were nearly ideal with very few abandoned acres.

In Maine, the potato crop emerged 1-2 weeks early, with a mix of rain and sun promoting rapid growth. Quality was reported in good condition across the State. In Massachusetts, early plantings got the crop off to a good start. Above average yields were received in some areas.

All potatoes: Total 2010 United States potato production is estimated at 397 million cwt, 8 percent below the 2009 crop. Harvested area, at 1.00 million acres, is down 4 percent from last year. The average yield, at 395 cwt per acre, is down 19 cwt from last year's record high yield. Fall production is down 8 percent from the previous year and summer is down 19 percent. Spring production increased 16 percent from 2009 largely due to the inclusion of California's winter and summer potatoes in the spring total beginning in 2010.

Sweet potatoes: Production of sweet potatoes in 2010 is estimated at 23.8 million cwt, up 22 percent from last year. Growers harvested 117,000 acres, up 21 percent from last year. Yield per acre, at 204 cwt, is up 3 cwt from last year and is a new record high.

In North Carolina, a record high was set for production, up 6 percent from 2009. Although yield was down 20 cwt from last year, acres harvested increased 17 percent. In Mississippi, growing conditions were reported excellent, and timely, localized rains provided adequate moisture for a good crop. Despite cool weather that delayed planting, growers had an

excellent crop with record acreage, yields, and production. Increases in sweet potato plantings have been driven by growing demand due to its healthy properties and processing usage.

Peppermint oil: Production in 2010 is estimated at 6.36 million pounds, down less than 1 percent from last year. Harvested area is estimated at 71,300 acres, up 2 percent from 2009. Washington's harvested area, at 16,000 acres, is down 500 acres from a year ago, while Oregon showed a 500 acre increase from 2009. Acreage in Indiana, Michigan, Oregon and Wisconsin increased from 2009, while California, Idaho, and Washington showed a decrease from a year ago. Production increased in Indiana, Michigan, Oregon, and Wisconsin, while California, Idaho, and Washington reported lower production than in 2009.

Spearmint oil: Production is estimated at 2.32 million pounds for 2010, down 14 percent from last year. Harvested area is estimated at 18,600 acres, down 9 percent from 2009. Average yield is estimated at 125 pounds of oil per acre, down 7 pounds from last year. Growers in Indiana and Wisconsin showed increases in harvested acreage from a year ago, while Idaho, Oregon, and Washington producers showed acreage decreases. Michigan's harvested acres remained the same. Production increased in Indiana and Michigan, while Idaho, Oregon, Washington, and Wisconsin showed a decrease.

Hops: Production for Idaho, Oregon, and Washington in 2010 totaled 65.5 million pounds, down 31 percent from the 2009 crop of 94.7 million pounds. Production dropped 37 percent in Idaho and declined 30 percent from last year in both Washington and Oregon. Acreage decreased in all three States; 42 percent in Idaho, 24 percent in Oregon, and 18 percent in Washington. Yields increased from a year ago in Idaho to 2,129 pounds per acre but decreased to 1,791 and 2,147 pounds per acre in Oregon and Washington, respectively.

Washington growers accounted for 80 percent of the United States hop production for 2010. Zeus and Columbus/Tomahawk were the leading varieties in Washington, accounting for 38 percent of the State's hop production. In Oregon, Nugget and Willamette were the major varieties, accounting for 62 percent of the State's hop production.

Maple syrup: The preliminary 2010 United States maple syrup production estimate totaled 1.96 million gallons, down 19 percent from last year. The preliminary number of taps is estimated at 9.27 million, 3 percent above the 2009 total of 8.98 million. Yield per tap is estimated to be 0.211 gallons, down 21 percent from the previous season. Vermont led all States in production with 890,000 gallons, a decrease of 3 percent from 2009. Production in Maine was the second highest on record, at 310,000 gallons, down from the 2009 record high of 395,000 gallons.

Temperatures were reported to be too warm for optimal sap flow in all States. On average, the season lasted 23 days compared with 28 days last year. In most States, the season started sooner than last year. The earliest sap flow reported was January 14 in Vermont. The latest sap flow reported was May 1 in Maine. On average, approximately 46 gallons of sap were required to produce one gallon of syrup. This compares with 43 gallons in 2009. The majority of the syrup produced in each State this year was medium to dark in color with the exception of Maine.

Coffee: Hawaii coffee production is estimated at 7.90 million pounds (parchment basis) for the 2010-2011 season, down 9 percent from the previous season. On the Big Island, dry weather, a late harvesting season, and insect damage negatively impacted coffee yields. Puerto Rico coffee production for the 2010-2011 season is estimated at 9.00 million pounds (parchment basis), unchanged from last season's revised production.

Taro: Hawaii taro production for the 2010 crop year is estimated at 3.90 million pounds, down 3 percent from the previous year. Area in crop, at 475 acres, is up 30 acres from 2009. Weather varied throughout the year with drought in some areas and excess precipitation in others. Grower reports indicate that apple snails, feral pigs, leaf blight, and pocket rot negatively affected production.

Statistical Methodology

Survey procedures: The estimates in this report are based primarily on surveys conducted the first two weeks of December. The December Agricultural Survey (DAS) is a probability survey that includes a sample of approximately 84,000 farm operators selected from a list of producers that ensures all operations in the United States have a chance to be selected. These operators were contacted by mail, internet, telephone, or personal interview to obtain information on crop acreage, yield and production for the 2010 crop year.

Estimating procedures: National and State level objective yield and farm operator reported data (DAS) were reviewed for reasonableness and consistency with historical estimates. The survey data were also reviewed considering weather patterns and crop progress compared with previous years. Each Field Office submits an estimate and written analysis for their State to the Agricultural Statistics Board (ASB). The ASB uses the survey data, administrative data, and the State analysis to prepare the estimates published in this report.

Revision policy: Estimates contained in this report may be revised the following year, if new information is available that would justify a change. Estimates will also be reviewed after data for the 5-year Census of Agriculture are available. No revisions will be made after that date.

Reliability: The surveys used to make the acreage, yield, and production estimates contained in this report are subject to sampling and non-sampling type errors that are common to all surveys. Reliability of the objective yield and farmer survey must be treated separately because the survey designs for the two surveys are different. The objective yield indications (corn, cotton, and soybeans) are subject to sampling variability because all acres of a given commodity are not included in the sample.

The farm operator survey indications are also subject to sampling variability because not all operations with commodities of interest are included in the sample. This variability, as measured by the relative standard error at the National level, is approximately 1.2 for corn, 1.9 for Upland cotton and 1.1 for soybeans. This means that chances are approximately 95 out of 100 that survey estimates for production will be within plus or minus 2.2 percent for corn, 3.8 percent, for Upland cotton, and 2.2 percent for soybeans.

Survey indications are also subject to non-sampling errors such as omission, duplication, imputation for missing data, and mistakes in reporting, recording, and processing the data. These errors cannot be measured directly, but they are minimized through rigid quality controls in the data collection process and a careful review of all reported data for consistency and reasonableness.

Information Contacts

Listed below are the commodity statisticians in the Crops Branch of the National Agricultural Statistics Service to contact for additional information. E-mail inquiries may be sent to nass@nass.usda.gov

Lance Honig, Chief, Crops Branch (202) 720-2127

Jacqueline Moore, Head, Field Crops Section (202) 720-2127

Suzanne Avilla – Peanuts, Rice (202) 720-7688

Bryan Durham – Hay, Oats (202) 690-3234

Steve Maliszewski – Cotton, Cotton Ginnings, Sorghum (202) 720-5944

Anthony Prillaman – Corn, Proso Millet, Flaxseed (202) 720-9526

Nick Schauer – Wheat, Rye (202) 720-8068

Julie Schmidt – Crop Weather, Barley, Sugar Crops (202) 720-7621

Travis Thorson – Soybeans, Sunflower, Other Oilseeds (202) 720-7369

Jorge Garcia-Pratts, Head, Fruits, Vegetables and Special Crops Section (202) 720-2127

Debbie Flippin – Fresh and Processing Vegetables, Onions, Strawberries (202) 720-2157

Fred Granja – Apples, Apricots, Cherries, Plums, Prunes, Tobacco (202) 720-4288

Dawn Keen – Floriculture, Maple Syrup, Nursery, Tree Nuts (202) 720-4215

Jorge Garcia-Pratts – Citrus, Coffee, Grapes, Tropical Fruits (202) 720-5412

Tierra Mobley – Berries, Cranberries, Potatoes, Sweet Potatoes (202) 720-4285

Dan Norris – Austrian Winter Peas, Dry Edible Peas, Lentils, Mints,

Mushrooms, Peaches, Pears, Wrinkled Seed Peas, Dry Beans (202) 720-3250

Kim Ritchie – Hops (360) 709-2400

Access to NASS Reports

For your convenience, you may access NASS reports and products the following ways:

- All reports are available electronically, at no cost, on the NASS web site: <http://www.nass.usda.gov>
- Both national and state specific reports are available via a free e-mail subscription. To set-up this free subscription, visit <http://www.nass.usda.gov> and in the “Receive NASS Updates” box under “Receive reports by Email,” click on “National” or “State” to select the reports you would like to receive.
- Printed reports may be purchased from the National Technical Information Service (NTIS) by calling toll-free (800) 999-6779, or (703) 605-6220 if calling from outside the United States or Canada. Accepted methods of payment are Visa, MasterCard, check, or money order.

For more information on NASS surveys and reports, call the NASS Agricultural Statistics Hotline at (800) 727-9540, 7:30 a.m. to 4:00 p.m. ET, or e-mail: nass@nass.usda.gov.

The United States Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, political beliefs, genetic information, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD).

To file a complaint of discrimination, write to USDA, Assistant Secretary for Civil Rights, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue, S.W., Stop 9410, Washington, DC 20250-9410, or call toll-free at (866) 632-9992 (English) or (800) 877-8339 (TDD) or (866) 377-8642 (English Federal-relay) or (800) 845-6136 (Spanish Federal-relay). USDA is an equal opportunity provider and employer.

Today's Strategies & Tomorrow's Opportunities

February 24-25, 2011

Crystal Gateway Marriott Hotel
Arlington, Virginia

www.usda.gov/oce/forum

Early Bird Registration \$350 until January 21, 2011
* \$375 after January 21

Topical Sessions Will Address:

*Risk Management
*Renewable Energy
*Rural Communities
*Land Tenure Issues
*Sustainability

*Foreign Trade & Domestic Markets
*Conservation & the Environment
*Nutrition & USDA Dietary Guidelines
*Broadband
