ABSTRACT:

The goal of National Cancer Institute’s (NCI) Behavioral Research Program (BRP) is to increase the breadth, depth, and quality of behavioral research in cancer prevention and control. BRP conducts varying programs of formative research to develop and validate cancer-related behavioral theories. This formative survey research refines and validates questionnaires necessary to test a theory regarding the nature of risk perceptions. Three questionnaires are designed to assess three aspects of risk perception (deliberative, affective and intuitive risk perception) across three health conditions (cancer, diabetes and heart disease). Participants will complete either a survey about cancer risk perceptions, diabetes risk perceptions, or a survey about heart disease risk perceptions. An internet sample ($N = 1500$), will be drawn from Amazon mTurk (<https://requester.mturk.com/>). mTurk is an internet service that allows researchers to gather survey data (mTurk also supports other purposes related to “crowd-sourcing”).
