Practice Transformation for Physicians and Health Care Teams

This Practice Transformation site, formerly called Better Diabetes Care, is designed to help physicians, health care professionals and health care administrators across the country who want to change the system of health care delivery around diabetes. NDEP believes that practice change is essential to provide the type of evidence-based care recommended by the Patient-Centered Medical Home (PCMH) model to effectively manage diabetes, prevent its serious complications, and delay or prevent type 2 diabetes. The PCMH incorporates dimensions of patient-centered care presented by the Institute of Medicine and the Chronic Care Model. This site is organized according to those dimensions.

Engage Leadership and Assess Your Practice

Provide Evidence-Based Care

Use Information Systems

Improve Practice Quality

Use Clinical Decision Support

Practice Team-Based Care

Enhance Patient-Centered Interactions

Improve Patient Care Coordination

Practice change is made up of a relatively small number of specific interventions that are interrelated. These changes are reflected by the principles of the PCMH that are becoming the centerpiece of efforts to reform U. S. health care and improve the value of primary care. Accountable Care Organizations (ACOs) are playing a large role in reforms and the PCMH principles are being incorporated into ACOs.

▶ Improve Practice Quality

▶ Clinical Decision Support

▶ Team-Based Care

▶ Patient-Centered Interactions

▶ Patient Care Coordination

This section helps users to review the tasks that effective leaders can undertake to ensure the successful transformation of a practice into a patient-centered medical home (PCMH). The process of self-assessment to assess needs and develop priorities stimulates communication, helps to organize and monitor improvements, and identifies needed resources. Eight change concepts are presented that practices need to embrace to effectively transform into a PCMH. Access to resources and program assessment tools is provided. A table presents optimal patient clinical outcomes aligned to best practices by provider and appropriate reimbursement for care.

Experienced clinicians use a wide range of judgments, decisions, actions, and recommendations in the practice of medicine that include knowledge, past experience, empathy, compassion, respect for the patient's wishes, an appreciation of common care practice patterns within the community, and an understanding of human biology.

The practice of evidence-based decision-making involves integrating these elements with the best available clinical evidence from a systematic review of research. However, a literature search only informs the clinician of the available evidence and says nothing about helping the clinician make the best decision in light of the patient's preferences and values.

This section provides an overview of ways an evidence base can guide clinical decision-making. It includes principles and limitations of evidence-based decision-making, differences in numeric presentation of results, ways to integrate an evidence base into daily practice. Resources include current diabetes-specific practice guidelines and recommendations.

Use Information Systems

Information technology is one of the most rapidly changing areas of health care and is substantially altering the ability of health care providers to support the delivery of better diabetes care. Allowing enhanced capabilities for self-management, monitoring, improved access, and better communication between patients and providers, as well as improving access to educational opportunities, makes the introduction of new technology an important driving force behind improving health. This section focuses on fundamental technological advances with known effectiveness in clinical systems for improving the process of care delivery and providing better clinical outcomes.

Improve Practice Quality

This section addresses how to go about transforming a practice into a patient-centered medical home (PCMH). It provides practical information about the use in clinical settings of rapid cycle improvements that involve small-scale local tests of change in physician offices or health care organizations. This section also will help users identify evaluation needs related to improving the delivery of diabetes services and how to implement evaluation measurements. A number of resources address how a practice could incorporate diabetes recognition programs, other professional services, and physician accreditation.

Use Clinical Decision Support

A review article suggests that clinical decision support systems provide clinicians with patient-specific assessments or recommendations to aid clinical decision making. [1] Examples include manual or computer based systems that attach care reminders to the charts of patients needing specific preventive care services and computerized physician order entry systems that provide patient-specific recommendations as part of the order entry process. Such systems have been shown to improve prescribing practices, reduce serious medication errors, enhance the delivery of preventive care services, and improve adherence to recommended care standards.

On a practical level, the findings imply that clinicians and other healthcare stakeholders should implement clinical decision support systems that (a) provide decision support automatically as part of clinician workflow, (b) deliver decision support at the time and location of decision making, (c) provide actionable recommendations, and (d) use a computer to generate the decision support. [1].

This section on Clinical Decision Support provides a wide selection of resources and tools that support diabetes prevention and management. Selected resources could be integrated into computer based systems. Resources and tools for each section are organized under key categories identified by the [Chronic Care Model](#) [2]: Clinical Information Systems, Community Resources, Decision Support, Practice Redesign, and Self-management Support.

Practice Team-Based Care

Patient-centered care is an approach to “providing care that is respectful of and responsive to individual patient preferences, needs, and values and ensuring that patient values guide all clinical decisions.”^[1] In this context, the management of diabetes and comorbidities can be pursued within a multifactor risk reduction framework and can incorporate optimal strategies for the best benefits and outcomes for each person with diabetes.

The patient-centered medical home model encourages a proactive approach to health promotion, disease prevention, and chronic disease management through the development of individualized care plans and effective healthcare team member communication and coordination of care. ^[2]

This section discusses the benefits of team care and useful resources for effective team building.

 - Cultural Competency
- ▶ Patient Care Coordination

When informed patients take an active role in managing their diabetes, and care providers are prepared, proactive, and supported with time and resources, their interaction is likely to be productive. [1] This patient-centered interaction can lead to better diabetes care, more efficient and effective practices, healthier patients, and more satisfied patients, families, and providers. The goal is "to customize care to the specific needs and circumstances of each individual, that is, to modify the care to respond to the person, not the person to the care." [2] Because patients are highly variable in their preferences, they and their families need to be involved with the physician and the health care team in diabetes management decision-making. It is the patients who in reality make the important choices that affect their health and well being, and indeed it is the patients who are in control and experience the consequences of their choices. Providers can guide patients to make better choices.

This section presents seven dimensions of patient-centered care as they relate to people with diabetes, numerous resources to help transform a practice into a PCMH, effective ways to provide patient education and support, and suggestions to address health literacy and build cultural competency.

- ▼ Patient Care Coordination
 - Referrals & Transitions
 - Improve Communications
 - Community Partnerships

Care coordination involves patient referral for specialized services by a medical/surgical or specialist consultant or community agency or transition between providers or institutions such as hospital to primary care, or pediatric to adult care. Quality chronic care integrates clinic and community-based services in order to address the comprehensive medical and health needs of people who are served. "Such a system provides the comprehensive model on which the quality of both health promotion and chronic illness care depend." [1]

This section addresses ways to improve coordination of care and to enhance community partnerships. Numerous resources are included.
