SECTION XIII - DIAGNOSTIC TESTING		
NOTE: The diagnosis of arthritis must be confirmed by imaging studies. Once arthritis has been documented, no further imaging studies are indicated, even if arthritis has worsened.		
Imaging studies are not required to make the diagnosis of IVDS; Electromyography (EMG) studies are rarely required to diagnose radiculopathy in the appropriate clinical setting.		
For purposes of this examination, the diagnosis of IVDS and/or radiculopathy can be made by a history of characteristic radiating pain and/or sensory changes in the arms, and objective clinical findings, which may include the asymmetrical loss or decrease of reflexes, decreased strength and/or abnormal sensation.
