Patrick Hooker Commissioner

October 2007

Dear Friends:

New York's equine industry has changed dramatically over the last five years, and therefore, I am pleased to present to you the results of the 2005 New York Equine Survey.

Since the last survey in 2001, the quality and impact of our equine industry in New York State has improved tremendously. Horse inventory has increased, along with their value in almost every category, representing over \$1.8 billion in value.

The equine industry continues to contribute greatly to the quality of life here in New York State. There are currently 197,000 horses, mules, donkeys, and burros raised at 33,000 different locations and with associated assets totaling \$10.4 billion. There are more than 987,000 acres of land devoted to equine purposes in New York State and the industry provides more than 12,000 jobs annually.

This survey is one of a series of studies by the New York State Department of Agriculture and Markets to take a comprehensive look at special sectors of New York agriculture, such as the equine industry, muckland crops, direct marketing, and turf grass. I hope you find the information presented to you in this survey of valuable use, and I thank you for your continued interest in New York agriculture.

Sincerely,

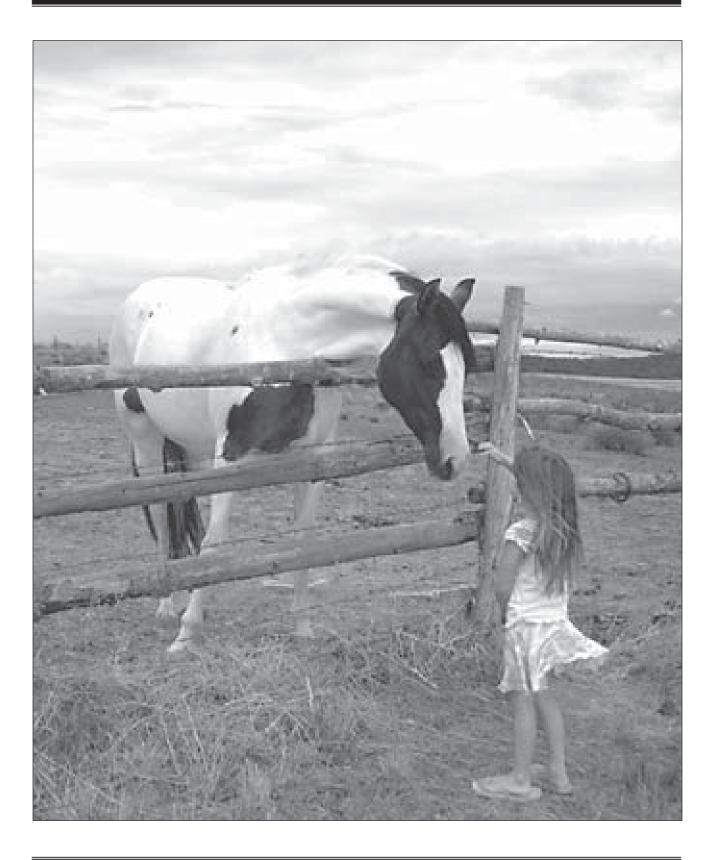

atrick Hooten

Patrick Hooker Commissioner

Eliot Spitzer Governor

# EQUINE SURVEY HIGHLIGHTS

#### EQUINE POPULATION

The 2005 Equine Survey indicated there were an estimated 197,000 equine of all types in New York on December 31, 2005, up 17 percent from the 168,000 on hand September 1, 2000. Race horse breeds totaled 50,200 head, up 20 percent from 2000, while other light horses increased to 113,400, a 13 percent increase. All light horse breeds combined totaled 163,600, up 15 percent.

Draft horse breeds increased from 11,500 head in 2000 to 12,100 in 2005, an increase of five percent, while donkeys and mules rose 40 percent to a total of 3,500 head. Ponies posted a 3 percent decrease to 12,000 head, continuing the trend begun in 1988. A new category of Miniature Horses was added to the 2005 Equine Survey for the first time for a total of 6,600 head.

#### VALUE OF EQUINE

All equine as of December 31, 2005, were valued at \$1.83 billion, up eight percent from 2000. Average value per head was computed from the survey data for each breed and aggregated to the total for all equine. Average value for race horse breeds decreased 17 percent to \$22,710 per head. Other categories of equine, except for donkeys,

donkeys, mules, all increased in average value. Other light horses increased 6 percent to \$5,270 per head. Draft horse breed average value increased 24 percent, from \$2,500 to \$3,100. Value of ponies increased 62 percent to \$3,890 per head, while donkeys and mules decreased 9 percent to \$800 per head. Miniature horse value was \$1,400 per head.

#### EQUINE RELATED ASSETS

Survey tabulations indicated total equine-related assets of \$10.4 billion on December 31, 2005, an increase of 69 percent since the 2000 survey. The value of land, fences, and buildings accounted for \$7.08 billion, or 68 percent of the total assets. This value included \$296 million for the 2,900 indoor arenas in New York. Equine on hand, at \$1.83 billion, accounted for 18 percent of the assets. Vehicles, equipment, tack, and equine feed and supplies on hand, at \$1.45 billion, accounted for the remaining 14 percent.

#### EQUINE EXPENDITURES

New York equine owners and operators spent a total of \$2.06 billion during 2005 for operating and capital expenses, an increase of nearly three times above the 2000 total of \$704 million. About \$1.10 billion, or 53 percent, of the total was for operating expenses. The leading operating expenses and amounts spent were: feed, \$119 million; hired labor, \$169 million; and boarding \$156 million. Operating expenses averaged \$5,594 per equine. Additional expense categories are shown in Table 18.

Expenditures for capital items increased greatly from the 2000 survey. Capital expenditures totaled \$958 million, up from \$181 million in 2000. Purchases of equipment totaled \$214 million. Purchases of equine amounted to \$254 million, and the purchase or improvement of equine-related real estate totaled \$490 million.

#### EQUINE LABOR

The survey indicated a total of 12,500 hired workers were employed by New York equine operations during 2005. Of these, 5,700 were full-time workers and 6,800 were part-time workers. In addition, 3,700 private contractors were employed by equine operations, and 11,100 volunteers contributed 1.83 million hours. Operators and unpaid family members worked an additional 43.2 million hours throughout 2005. Additional labor categories are shown in Table 20.

#### EQUINE REVENUES

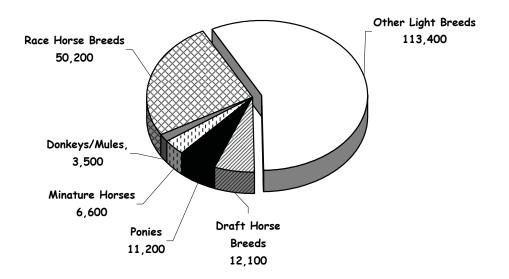

This new category was added for the 2005 Equine Survey. Respondents were surveyed for the revenues generated by their equine operation. Revenues totaled \$445 million, with equine services revenue totaling \$158 million, or 36 percent of the total. The next highest category of revenues was for equine sales, at \$118 million, or 27 percent of the total. Training revenues, breeding services and fees, and revenue from winnings made up the rest of the revenue.

## EQUINE BY DISTRICT

The concentration of New York State equine made some changes since the 2000 survey. Of the 197,000 total equine in New York on December 31, 2005, 22 percent, or 42,500 head, were in the Southeast District ( $2^{nd}$  place in 2000). The Western District had 19 percent of total equine with 37,900 head ( $1^{st}$  place in 2000). The Central District came in third with 32,300 head ( $4^{th}$  in 2000), or 16 percent, and the Eastern District fell to fourth with 29,100 head ( $3^{d}$  in 2000) or 15 percent.

For all light horses combined (race horse breeds plus all other

*light horse breeds*), the Southeast District was first with 36,600 head, or 22 percent of the 163,600 head. Next was the Western District with 31,100 head *(19 percent)*, then the Central District with 26,100 head *(16 percent)*. The Eastern District ranked fourth with 24,600 head *(15 percent)*.

Ponies totaled 11,200 head, with 2,700 (24 percent) in the Southeast District. The Western District accounted for 2,300 head (21 percent), just ahead of the Central District with 1,900 head (17 percent). Of the 12,100 draft horses indicated by the survey, 2,600 head, or 21 percent, were in the Western District. The Central District was second with 2,500 head, followed by the Southwest District with 1,700 head.

Miniature horses were surveyed for the first time in 2005 with a result of 6,600 head. The largest inventory was in the Western District with 1,500 head *(23 percent)*, with the Central and Southeast Districts both coming in with 1,200 head, or 18 percent, each.

#### EQUINE BY BREED

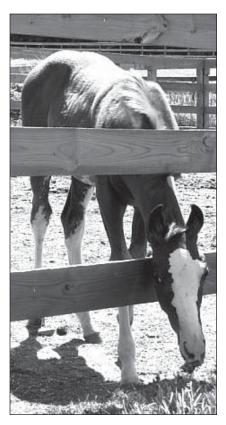

Quarter Horses jumped in inventory from 29,600 head in 2000 to 38,100 head in 2005, a 29 percent increase, continuing the trend since 1988. Second was Thoroughbreds with 33,300 head, 9 percent over 2000. Standardbred inventory gained 47 percent to 16,900 head, reversing the decline in numbers since 1978. Other major breeds of light horses were Warmbloods (25 percent increase), Pinto/Paints (up21percent), Appaloosas (5 percent down), and Morgans (9 *percent decrease).* Belgians, despite a 2 percent decrease in inventory, still comprised 50 percent of draft horse inventory. Percheron numbers increased six percent to 3,400, and Clydesdale numbers climbed 29 percent to 900. Welsh and Shetland ponies were the most common pony breeds, accounting for 29 percent and 21 percent, respectively, of all ponies.

#### AVERAGE VALUES BY BREED

Thoroughbreds continued to have the highest average value, at \$27,600 per head, even though they registered an 18 percent decrease since 2000. Average value of Standardbreds increased 25 percent to \$13,100 per head. With the increase in average value and larger inventory, Standardbred total value gained 84 percent to \$222 million. Race horse breeds accounted for 62 percent of the total value of equine in New York State.

The average value of Warmbloods increased 10 percent to \$22,000 per head. With increased average value and inventory, total value jumped 38 percent to \$185 million. Welsh ponies also increased in average value, from \$3,500 per head in 2000 to \$6,800 per head in 2005, a jump of 94 percent. Welsh ponies accounted for 50 percent of the total pony value.

The average values of individual breeds and miscellaneous breed categories reflect the average prices one would have had to pay to purchase the same type of animals on December 31, 2005. Reported values ranged from high-priced breeding, racing, and show stock to low-valued grade animals and older equine. High sentimental values placed on "family member" equine were excluded from average value calculations. Values by breed are shown in Table 4.

## EQUINE BY PRIMARY USE

The 2005 Equine Survey added two primary use categories per requests from the equine industry, as shown in Table 8. The added categories were for Lesson horses and those horses used in Specialty uses *(equine used primarily for commercial uses, such as therapeutic riding, day camps, riding stables, carriage rides, etc.).* Respondents were requested to record each equine in only one primary use category – the category for which the animal provided the use most important to the respondent.

#### PLEASURE USE

Forty-four percent of the equine in New York in 2005 were kept primarily for pleasure use, up from 39 percent in 2000. The greatest number of equine for pleasure use was in the Southeast District (16,000 head), while the highest percentage of equine for pleasure use was in Northern District (61 percent).

#### BREEDING USE

A total of 26,900 equine were used primarily for breeding in 2005, 14

percent of all equine. This compares to 30,100 head and 18 percent in 2000. In 2005, brood mares totaled 22,400, and stallions for breeding 4,500. Forty one percent of the equine breeding stock consisted of race horse breeds. up from 31 percent in 2000. Included in the breeding stock total were 29 percent of the miniature horses, 22 percent of the race horse breeds, 14 percent of the state's draft horses, 10 percent of other light horse breeds, and seven percent of the ponies. The greatest number of equine for breeding was in the Southeast District (6,000 head), while the highest percentage of equine for breeding was in the Southern District (17 percent).

#### RACING USE

A total of 14,500 equine in New York on December 31, 2005, were used primarily for racing. Thoroughbreds accounted for 63 percent and Standardbreds 37 percent. (Only Standardbreds and Thoroughbreds were included in the "Racing" category. All other breeds used for racing were included in the "Competition or Sport" category for this survey). The largest number of equine for racing (3,800 head) was in the Western District, while the highest percentage of equine for racing (18 percent) was in the Long Island/NYC District.

#### COMPETITION OR SPORT USE

Nearly 14 percent of equine in 2005 were used for showing, polo, eventing, etc., down from 17 percent in 2000. The total of 27,000 head included 18 percent of the non-racing light horse breeds, 16 percent of the ponies, seven percent of the race and draft horse breeds, and nine percent of the miniature horses. The Western District had the greatest number of equine for competition use at 7,100 and also the highest percentage of equine for competition at 19 percent.

#### LESSON USE

The 2005 Equine Survey included a new category of Lesson Horses. Six percent of horses in New York State were primarily used for lessons. The greatest number of lesson horses was 3,000 in the Southeast District. The highest concentration of lesson horses was in the Southeast and Long Island/NYC Districts, with seven percent and 11 percent of total horse population, respectively.

#### SPECIALTY & OTHER USE

Fifteen percent of New York's equine population in 2005 were kept for specialty and other uses, such as police work, carriage rides, day camps, or work, or were retired, as shown in Table 8. In Table 8, foals are included under "All Other" uses.

### Table 9. EQUINE BY PRIMARY USE AND BREED, NEW YORK, 2005 (Continued)

1/ Included in totals only.

## EQUINE OPERATIONS

New York had 33,000 places with equine in 2005, compared with 30,000 places in 2000. A place is defined as anyone operating land on which equine are kept. Owners of equine boarding their animals on land they did not operate were excluded.

Operators of places with equine were asked which type of activity best described their operation. Almost 60 percent (19,100 places) of the operators described their eauine as non-commercial/nonoperation farm. Second most common (6,000 *places*) were farms on which the major activity was deriving income from crops and/or livestock. Commercial boarding and training operations were third, with 4,700 places. Commercial breeding operations were next, with 2,300 places. New York registered a large increase in the number of non-commercial/nonfarm places between 2000 and 2005, while the number of crop/livestock

farms decreased. The number of crop/livestock farms decreased 25 percent from 2000, while the number of non-commercial/non-farm places increased 31 percent from 2000.

Most of the operations (80 percent) in the state consider themselves involved with recreational or pleasure riding or driving. (Operators were permitted to list more than one discipline that they were involved with). The second largest group was involved with shows or competitive events, even though this group showed a decrease from 2000. Most of the operations that were involved with shows or competitive events listed more than one discipline. Many were also involved with recreation and pleasure riding or driving.

More than half *(57 percent, or 18,900)* of the equine operations have been in operation 11 or more years. This number compares to 19,700, or 66

percent, of operations in 2000. The number of newer operations, those with equine five years or less, totaled 7,500 in 2005, compared with 4,900 in 2000. In most of the regions of the state, the number of operations of five years or less ranges from 19 to 26 percent of the total, with the exception of the Northern District and Long Island/ New York City District, which have 29 percent and 31 percent, respectively.

Property use prior to involvement with equine, for properties having equine less than 10 years, was more or less evenly divided among the four use categories. Former non-agricultural operations accounted for 25 percent. Twenty-four percent of operations had been livestock farms, excluding equine, while former horse farms and former crops farms accounted for 14 percent and 20 percent respectively. Previous property use for the remaining 17 percent was unknown or unreported.

### EQUINE RELATED EXPENDITURES AND REVENUES

#### EXPENDITURES

Equine related expenditures totaled \$2.06 billion in 2005, almost tripling from the \$704 million spent in 2000. equine related expenses Total were broken down into two main categories: operating expenses and capital expenses. The major increase in the expenditures came from the capital expenses. Capital expenses comprised 47 percent of the total expenditures, and increased from \$181 million in 2000 to \$958 million in 2005. Operating expenses accounted for the other 43 percent of expenditures, and increased from \$523 million in 2000 to \$1.10 billion in 2005.

Unlike 2000, labor expenses were the largest category in expenditures, with \$168 million spent on cash and non-cash labor expenditures, an average of \$857 per equine. Labor expense almost doubled from 2000's expenditure of \$88.3 million. Cash labor expenditures included cash wages as well as the employer's cost of Social Security tax, workmen's compensation, insurance, pension and unemployment compensation. Non-cash items included such things as housing, meals, clothing, horse board, lessons and other benefits.

Second was boarding fees with expenditures of \$156 million. In 2000, expenditures for boarding were combined with training fees and totaled \$54.8 million. For 2005, adding training fees into the boarding fees generates a total of \$213 million.

Third was feed expenses with \$119 million spent on grain, hay, and mixed or formula feeds, an increase of 18 percent over 2000. Feed expenditures included \$47.4 million for grain, \$55.7 million for hay, and \$15.6 million for mixed or formula feeds. Average per equine was \$602.

Other leading expenditures were property taxes (\$82.6 million), veterinary and health expenses (\$74.0 million), and maintenance and repair expenses (\$69.9 million). New categories added for this year's survey were values for home-grown bedding, grain, and hay. Homegrown bedding value was \$2.3 million, while value of home-grown grain was \$1.5 million. Home-grown hay was valued at \$24.7 million.

Capital expenditures of \$958 million accounted for 47 percent of all expenses The largest portion of capital expenditures was expenditures for purchase of land and capital improvements at \$490 million. In 2000, land and capital improvement purchases totaled \$63.0 million. Included in this figure are new real estate purchases and improvements to land and buildings for which the cost can be depreciated. Purchases of equine came in second with \$254 million spent, compared to \$49.5 million in 2000. Equipment purchases totaled \$214 million, compared to \$68.3 million in 2000. Included as equine related equipment purchases during the year were trucks, tractors, manure spreaders, horse vans, trailers, portable stalls, starting gates, hot walkers, treadmills, sulkies, carts, buggies, motor homes, campers and autos.

#### REVENUES

This was the first year revenues generated from an equine operation were enumerated. Total revenues generated were \$445 million. A large portion *(\$158 million, or 35 percent)* of this total came from revenues generated by providing equine services, such as boarding, sales preparation, trail riding or recreational services, equine judging, and guest farm services.

Second highest value *(\$118 mil-lion)* was revenues generated from equine sales, including equipment, feed and manure sales.

Revenues generated from training, including riding lessons, training and conditioning, and therapeutic riding, came in third with total revenues of \$75.3 million.

The remainder came from winnings (\$60.8 million) and breeding services (\$32.8 million).

#### Table 19. EQUINE RELATED REVENUES, NEW YORK, 2005

## EQUINE RELATED LABOR

There were 12,500 equine related positions for which employees were hired during 2005 in New York, 10 percent higher than the 11,200 positions in 2000. Of this, 54 percent, or 6,800, were considered part-time. A part-time or seasonal employee is defined as a person working less than 150 days a year.

Full-time employees totaled 5,700, 54 percent higher than 2000's total of 3,700. Of these, 28 percent, or 1,600, were employed as managers or assistant managers. Grooms or exercise riders totaled 1,400, or 25 percent of full-time employees. There were 900 trainers or assistant trainers, and 200 riding or driving instructors.

Of the total number, most employees fell into the "other" category. For the most part, these were general farm workers, persons hired for cleaning of stalls, tending equine, or general crop workers. The majority of these employees were part-time. Employees that performed multiple duties were counted only in the category for which the most important service to the operator was provided.

Cash labor expenditures of \$157 million included cash wages as well as the employer's share of Social Security taxes, worker's compensation, insurance, pension and unemployment compensation. The estimated value of non-cash items provided to workers during 2005 totaled \$12.2 million. These non-cash items included such things as housing, meals, clothing, horse board, lessons, and other benefits. A total of 2,500 workers, or 20 percent, were provided with housing.

A couple of new categories were added to the 2005 survey. For the first new category, respondents were asked about private contractors working on the respondent's equine operation. A total of 3,700 private contractors worked on equine operations in New York in 2005, most of them as "other" type of workers. Horse trainers/assistant trainers and grooms/exercise riders had 700 contractors each. There were 500 riding/driving instructors. A private contractor is defined as a person whose contract terms are defined by the individual providing service, and the individual is not on the company payroll.

The second new category asked for information about volunteers working on the equine operation. According to the survey, there were 11,100 volunteers providing their services to equine operations during 2005. Of these, 6,900 volunteers, or 62 percent, were working as "other" type of workers. Grooms/exercise riders made up another 3,600, or 32 percent. The remainder was managers/assistant managers, horse trainers/assistant trainers, and riding/driving instructors. Volunteers are described as any worker not paid in cash or non-cash items.

## Table 20. EQUINE RELATED LABOR, NEW YORK, 2005

## OPERATOR INFORMATION

In 2005, respondents were asked for general information about the operator.

The average number of years New York operators have owned equine is 21. This number takes into account those operators who have owned equine all their life, those that had equine in other states, and those who are new to the equine industry.

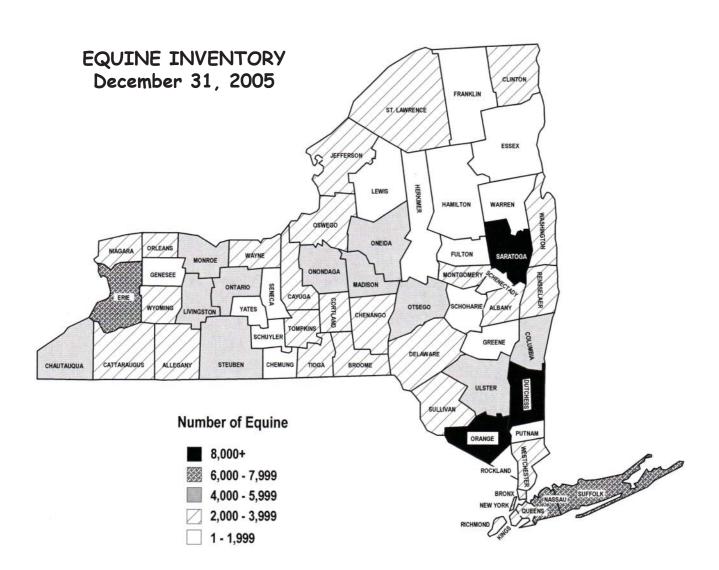

In	New	York	S	tate,	oper	ators	have
had	equ	uine	at	their	pre	esent	loca-
tion	for	an	ave	erage	of	16	years.

Of the 33,000 equine operations in New York State, most equine operators *(11,300, or 34 percent)* have a gross household income of between \$50,000 and \$99,999. Second are those that made between \$25,000 and \$49,999 with 8,000 operations, and close behind are those operations that make between \$100,000 and \$249,999 per year (7,600 operations).

Approximately 25 percent of the gross household income for all equine operations in New York is equine-related. This number ranges from zero percent for those who have equine only for pleasure to 100 percent for those operations whose income comes solely from equine.

	Number of Operations	Average

#### THE EQUINE INDUSTRY'S CONTRIBUTION TO THE NEW YORK STATE ECONOMY

Economic Analysis Performed by Nelson Bills and David Kay, Cornell University

Economic issues are a focal point of the 2005 survey and are reported on in this section. The contribution of the equine sector to the New York State economy was analyzed using the economic impact software program IMPLAN® (Impact Analysis for Planning). The IMPLAN<sup>®</sup> software allows economic analysts to estimate structural relationships between economic sectors in a regional economy. The model is derived from national level data maintained by the US Department of Commerce. This federal agency has been estimating input-output relationships for the US for more than a half-century. In the 1970s, with funding from the US Forest Service, IMPLAN<sup>®</sup> was developed to allow applications at state and substate levels *(Lindall and Olson, 2007)*. Applications using this model for statelevel analysis are now commonplace in the academic community and in the general business community as well. A detailed description of our modeling procedures are appended to this report.

The model addresses backward linkages between any single economic sector and other sectors of the wider New York economy. The analysis proceeds through the calculation of economic multipliers. The economic multiplier is an important tool in economic impact analysis. Formal practical study and our own experience indicate that industries are interdependent and that expansions or contractions in one industry are likely to have some far-reaching implications. A substantial share of total gross output in the New York State economy is comprised of cash business expenses. These are transactions between businesses to acquire the inputs needed to deliver additional product or service to a final user.

The object of multiplier analysis is to trace the inter-relationships between sectors and construct quantitative measures of the impact associated with increasing or decreasing a line of economic activity. The idea traces to economic base theory, which classifies goods and services sold outside the region's boundaries as "exports", and hence, basic. Conversely, goods and services produced by the nonbasic sector are consumed within the region's boundaries. Expansion of the basic sector of the economy necessarily entails added production in these support industries, particularly in terms of intermediate inputs, all of which adds to the overall development of a regional economy. The economic multiplier summarizes the cumulative (direct, indirect, and *induced*) effect of an initial change in final demand plus the resulting series of successive rounds of spending within the local economy. It is the ratio between the total change in spending and the initial change in final demand (or the income or *employment implied by it)*. Multipliers are constructed based on a "snapshot" of a regional economy. That is, the economic multiplier is governed by the pattern of economic transactions between firms and the final users of their products for a single year. Lots of transactions between in-state business firms make for relatively large economic multipliers; relatively fewer transactions mean smaller multipliers.

The point of departure for multiplier analysis is an assessment of the geographic distribution of business expenditures. For this study, survey respondents were asked to supply information on major categories of cash business expense. Then, each respondent was asked to allocate those expenditures to input suppliers instate and out-of-state. This distinction between instate and out-of-state expenditures is absolutely critical when making economic multiplier calculations. Out-of-state expenditures represent leakage from the state economy that cannot be recovered and circulated among business entities instate. Economic sectors with large amounts of leakage contribute relatively little to total state income and employment compared to industries that spend a substantial share of their business expense either locally or instate. Traditionally, farming enterprises have received high marks on instate expenses. That is, multipliers have been relatively large because farm businesses have tended to purchase relatively large shares of business inputs locally or at least within New York State. These arrangements of course, shift from year to year and from one economic sector to the next.

Responses gathered from equine operators suggest that their cash business expenses are primarily instate as shown in Figure 2. Not unexpectedly, nearly 100 percent of all property tax payments are made within state. Equine operators do own some real estate for business purposes in border states and about 3 percent of all property tax payments go out of state. Looking across other expense categories, instate expenses are also relatively high-usually 85 percent or more.

Information on the instate cash expenditures paves the way for estimates of the total output generated by the New York State equine industry. That estimate is reported in Table 1, and shows that total gross output directly attributable to equine in 2005 amounted to \$856 million. Accounting for indirect industry transactions stemming from this gross output generated an additional \$236 million for the New York State economy. The IMPLAN<sup>®</sup> model also allows an estimate of the induced changes in State output that stem from additional household expenditures attributable to the New York State equine industry. Taking these induced expenditures into account adds another \$285 million to total State output. Total importance for the New York State economy, then, measured in 2005 dollars, is on the order of \$1.38 billion.

(in 2005 dollar values)								
Item	Unit	Total Effect	Direct Effect	Indirect Effect	Induced Effect			
Industry output	Dollars (\$1,000)	1,376,666	855,067	236,173	285,426			
Value added	Dollars (\$1,000)	717,252	413,819	127,220	176,213			
Employment	Number	15,233	11,616	1,400	2,216			

# Table 23. ESTIMATED ECONOMIC IMPACT OF THE NEW YORK STATE EQUINE INDUSTRY, 2005

Another useful measure of these indirect and induced impacts is value-added. Value added indices avoid the double counting that comes from pegging estimates to changes in total gross output. The latter includes estimates of all intermediate transactions between economic sectors in New York State

Economic multiplier

0

Figure 3. economic multipliers for the

economy. Eliminating those and focusing on final payments, whether to households who provide labor services, imports of goods and services from out-of-state sources, or payments to owners of capital resources, add precision to an evaluation of any economic sector's contribution. Value

added measurements correspond to the equine industry's contribution to gross state product. In 2005, according to the modeling results reported in Table 1, total value-added attributable to the New York State equine industry, after taking into account the direct, indirect, and induced effects of equine goods and services, amounted to more than \$717 million.

Another critical aspect of industry structure goes to questions about labor use. For this reason, it is helpful to arrange input-output modeling results using employment rather than total gross output for value added as a unit of measure. Results for the New York State equine sector are reported, once again, in Table 1. Using labor to output ratios reported in the IMPLAN® model, we estimate that over 11,600 jobs are generated on equine farms in New York State.

This result is 7 percent lower than the 12,500 employee estimate generated by the 2005 survey, probably for several reasons. Employment estimates can vary by source because of differences in definition. Definitions are a challenge throughout farming and agriculture because of the seasonality of employment, dependence on family labor, and the use of part-time employees. In the equine sector, the employment picture is clouded further by the use of volunteers on many equine farms. But, in addition, the survey respondents were not asked to identify the location or residence of their employees. A fraction of all employees, however, likely reside in border states and commute to jobs on New York State equine farms. After taking indirect and induced changes in employment into account, our IMPLAN® model results suggest that the equine sector accounts for about 15,200 jobs statewide.

Rearranging these results yields economic multipliers using, in turn, gross output, value-added, and total employment as a unit of measure as in Figure 3. Each gives its own impression of the generative effects associated with the sector. The valueadded multipliers are the most robust by a small margin, with each additional dollar of value-added estimated to generate \$1.31 after taking indirect effects into account. Building in induced effects on value added brings the multiplier estimate to \$1.73. Output multipliers occupy a middle ground with employment measures suggesting relatively weak indirect and induced effects for the industry. This suggests that a relatively large proportion of equine business expenses go to instate input providers that feature either relatively low wages or relatively output/employment high ratios.

# EQUINE SURVEY PROCEDURES

## PURPOSE

The chief purpose of the 2005 Equine Survey was to update the data collected in the 2000 survey. The equine industry has changed substantially since the last survey in 2000, according to industry leaders. The survey documented changes in the industry since that time and provided updated information to help measure the contribution of horses, ponies, mules and donkeys to the New York economy. Some additional items were added to further evaluate the impact the equine industry has on the state.

# DESIGN

The survey was designed in a manner to ensure reliable coverage of all places with equine. A comprehensive list of all horse operations was compiled from many sources, including veterinarians and equine organizations. A list of 26,800 names was developed and used for the survey.

To compensate for any incompleteness in the list, a land area sample consisting of 289 segments of land was selected. Each segment was from about onetenth to one square mile *(64-640 acres)* in size and was canvassed for equine. Names of all persons with equine inside the segment were matched against the list of 26,800 names. The equine in segments for those persons not found on the list were expanded to give a measure of incompleteness of the list. This is known as multiple-frame sampling.

# METHODOLOGY

In the first phase of the survey, questionnaires were mailed in December 2005 to all persons on the list of operators. This questionnaire asked primarily the number of horses by breed and the total value for each breed on their operation on December 31, 2005. This system provided two purposes. First, we were able to obtain the number and value of horses by breed for these operations. Second, we were able to stratify the list by size in order to sub-sample these operations for the important second phase of the survey.

All known operations were sent a questionnaire. Key persons familiar with the equine industry also distributed questionnaires to pick up data for operations not already added to the list. In order to improve response on this phase of the survey, as many as possible of the non-respondents to the mailed survey were contacted by telephone. With the mail response and the telephone follow-up, we were able to get completed reports from approximately 60 percent of the list.

In the second phase, a stratified systematic sample of 2,500 names was selected from the operations who responded to the survey's first phase. Respondents were assigned to one of six inventory size groups or strata: 1-4, 5-9, 10-19, 20-49, 50 or more equine, or no equine on operation but equine expenses existed (owners that board out their horses). Sampling rates varied from 4 percent for the operations that had no equine but did have expenses to 100 percent for those operations with 50 or more equine. Race tracks were not sampled for the economic phase of the survey.

The comprehensive questionnaire used in the second phase of the survey, which included economic questions, was mailed to the entire sub-sample in July of 2006. Operations that did not respond by mail were contacted by telephone and/or personal visits during August, September, and October of 2006. We received responses from almost 60 percent of this group. Screening of the land area segments was conducted by trained enumerators during May and June of 2006. Each operation with land in the segments was asked for the number of equine on the land within the segment on December 31, 2005, and the type of operation.

# SUMMARIZATION

All questionnaires were manually reviewed before being computer edited and summarized. The data from the 289 area segments were expanded and added to the list of expansions after eliminating any operations that were already on the list.

This procedure resulted in a multipleframe indicator, which was the basis for estimating the total number of equine in New York. Summary results from the first phase of the survey were used to set county level estimates and the estimates for breed numbers. The results of the survey's second phase provided the basis for setting estimates of equine usage, assets, expenditures and hired labor.

# <u>RESULTS</u>

Estimates from a sample survey will vary depending upon the units selected in the sample. The variations in the expansions are measured by the relative error of the estimate which is the estimate divided by the statistical sampling error. The relative error gives an indication of the confidence that can be assigned to the survey expansions.

Statistically, this survey was designed to estimate the equine population at the State level. The relative error for the total number of equine was 2.9 percent, compared to 7.8 percent in the 2000 survey and 6.9 percent in the 1988 survey.

#### Dear Reporter:

Economic significance of the equine industry has changed in recent years. The last comprehensive study of New York equine was conducted in 2000. This survey will provide new facts about New York's equine industry.

Please make corrections in name, address and zip code, if necessary.

Whether you have one animal or a stable full, your contribution is essential. Results of this survey will be provided to anyone interested in New York's equine industry. Leaders and educators are depending on this survey to measure the contribution of equine to the New York economy and to the nation.

Your response is entirely voluntary, however your cooperation is extremely important. Your data represent your own and similar operations throughout the state. The information you provide is kept **STRICTLY CONFIDENTIAL** and used only for compiling state and county estimates. Federal law prohibits disclosing individual data and allows for severe fines and imprisonment for violations.

#### **INSTRUCTIONS FOR COMPLETING SECTION II - EQUINE INVENTORY**

Please record by breed the total number of equine located on the total acres operated, regardless of equine ownership, as of December 31, 2005. Then, break down the total breed number by recording the number in each category. If a horse is used for more than one purpose, such as a stallion used for pleasure riding, please list that horse <u>only once</u> in the category for which the horse provides the most important service to you.

#### PLEASE READ THE DEFINITIONS BELOW BEFORE RECORDING INVENTORY NUMBERS

- A. Broodmare a female that is kept primarily for breeding, now or in the future.
- B. Stallion a male that is kept primarily for breeding, now or in the future.
- C. Foals of 2005 born during calendar year 2005.
- D. Lessons any horse used primarily for instruction or training.
- E. Racing any horse kept primarily for the intention of racing whether or not a parimutuel event. Report foals in the foal category.
- F. Competition/Sport equine used primarily for showing, polo, eventing, etc.
- **G. Pleasure** equine used primarily for recreational use, such as hunting, pleasure riding, pleasure driving, 4-H and other youth programs.
- H. Specialty equine used primarily for commercial use, such as therapeutic riding, day camp, riding stables, carriage rides, or similar commercial uses
- I. Other equine used for farm work, police patrols, teaching, any retired horses, etc.

#### SECTION II - EQUINE INVENTORY ON THE LAND YOU OPERATE - DECEMBER 31, 2005

		Of the total reported, how many were primarily used for:								
			Breeding				Activity			
Breeds	Total Number	Brood Mares	Stallions	Foals of 2005	Lessons	Racing	Competition or Sport	Pleasure	Specialty: Therapeutic or Day camp	Other: Farm Work, Retired etc.
