<p>phase of the Project, the SDT believes that it is preferable to continue to use the specific value of 75 MVA within item Exclusion E3.a. No change made.</p> <p>Non-retail generation is meant to be the generation on the system (supply) side of the retail meter.</p> <p>The SDT believes that the existing phrase in Exclusion E3.a “and its underlying Elements” has sufficient clarity and meets the intent of the exclusion with brevity. No change made.</p> <p>The SDT acknowledges the work of Project 2010-07 “GO-TO” task force in identification of various NERC Standard requirements that would promote reliability of the generator-to-transmission interface. This Project 2010-17 SDT believes that the body of work in Project 2010-07 is most pertinent to generator lead-line facilities, rather than the looped and parallel-operated facilities contemplated in Exclusion E3, and therefore, the SDT finds it necessary to continue to require all of the characteristics of Exclusion E3 to be met in order to qualify for exclusion from the BES. No change made.</p> <p>The SDT considered the addition of the phrase “under normal operating conditions”, as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.</p> <p>The SDT has retained the statutory language “facilities used in the local distribution of electric energy” in the core definition section.</p>		
<p>Massachusetts Department of Public Utilities</p>	<p>Yes</p>	<p>The MA DPU generally supports this exclusion but believes it is too narrow. As noted in the response to question 7, Exclusion E3 should likely allow a higher level of aggregate generation MVA on a Local Network.</p> <p>In addition, local networks should not necessarily be ineligible for Exclusion E3 simply because an amount of power may transfer out of the network at times. NERC’s draft technical network exclusions document should be amended such that local networks would be permitted to qualify for network exclusions under E3 if power flowing out of the network is minimal and would not likely adversely impact the BES.</p>
<p><b>Response:</b> The SDT has determined that it must retain the 75 MVA threshold on generation allowed within a qualifying LN in order to remain consistent with the existing ERO Statement of Compliance Registry Criteria. There has not been sufficient technical justification to this point that would support a change from this threshold; however, such threshold will be considered in Phase 2 of</p>		

Organization	Yes or No	Question 9 Comment
<p>this Project 2010-17. No change made.</p> <p>The SDT feels strongly that in order for a network to qualify for exclusion under the Exclusion E3 section of the definition, there must be strict bounds and limits placed on the characteristics of the candidate facilities. Allowances for minor “out-flow” from the local network, or “minimal” flow, as suggested in this comment, will lead to an inconsistent application of the definition and therefore, a lack of bright-line quality in the definition. Situations such as what is proposed in this comment can be referred to the Exception Process for possible exclusion from the BES. No change made.</p>		
<p>The Dow Chemical Company</p>	<p>Yes</p>	<p>Dow is uncertain whether end user-owned, behind-the-meter delivery facilities of the sort it has described above would fall within the scope of the core BES definition proposed by NERC. To date, none of the Regional Entities has suggested that Dow should register as a Transmission Owner or Transmission Operator with respect to any of these Dow-owned delivery facilities. If a literal application of the proposed BES Definition would, because of their voltage level or for any other reason, include such facilities, then Dow has an interest in assuring that the E3 exclusion for "local network" facilities is structured to embrace them. To that end, Dow would propose, first, the elimination of the 300 Kv cap for these facilities. Dow has systems that operate above 300 Kv due solely to the capacity of the lines to supply power over the distance required at our large manufacturing sites.</p> <p>Second, for the same reasons discussed above (in response to question #7), the phrase “do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating)” in “a)” should be changed to “the net capacity provided to the transmission grid does not exceed 75 MVA.”</p> <p>Third, the introductory phrase in “b)” -- “Power flows only into the LN” -- is inconsistent with the recognition in “a)” (as amended pursuant to Dow’s above suggestion) that power may flow out of an LN and into the transmission grid if there is generation connected to the LN and the 75 MVA limit is observed. Dow recommends either deleting the introductory clause or correcting it to read “Power is not transferred through the LN.”</p>
<p><b>Response:</b> The SDT does not agree with the removal of the 300 kV cap that limits the qualification of a group of facilities for local network exclusion. The SDT feels that an upper bound is essential to prevent inappropriate exclusions of facilities that may be important to the reliable operation of the interconnected transmission system. The Exception Process is available for specific</p>		

Organization	Yes or No	Question 9 Comment
<p>circumstances where a 300kV cap is problematic.</p> <p>The SDT evaluated your comment in regard to Question 7 (Radial) as well as to the local network exclusion, and has concluded that both exclusions must necessarily be based on the gross aggregate nameplate of the generation connected within the candidate systems. The approach that is suggested in your comment could result in significant amounts of generation existing within the excluded area.</p> <p>It remains the intent of the SDT to uphold a 75 MVA limit on the connected (non-retail) generation within a qualifying LN and, at the same time, reinforcing that power flow is always from the BES toward the LN at all points of connection. We believe these characteristics are essential in order to ensure that qualifying LN facilities are not being relied upon for reliable operation of the interconnected transmission system.</p>		
Springfield Utility Board	Yes	<p>SUB strongly supports the exclusion of Local Networks from the BES. SUB particularly agrees with the addition of, “LN’s emanate from multiple points of connection at 100 kV or higher to improve the level of service to customer Load and not to accommodate bulk power transfer across the interconnected system.” language to the draft E3 Exclusion, as well as the LN characterization being more clearly defined. SUB is concerned that the E3 Exclusion does not specify that these power flows would be “under normal operating conditions” and specify if all power flow is considered.</p> <p>SUB recommends that unscheduled power flow should not be considered, but that it is applicable only to scheduled power flow.</p> <p>While SUB supports the exclusion of LNs from the BES, we believe there is additional work that needs to be done regarding the Local Network Exclusion Technical Justification. Without specific parameters, determining inclusions and exclusions will be left to the discretion of too many. This will create ambiguity and inconsistency of application.</p>
<p><b>Response:</b> The SDT considered the addition of the phrase “under normal operating conditions”, as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.</p> <p>The suggestion that only the “scheduled” portion of flow be considered under Exclusion E3.b would ignore the physical impact that the</p>		

Organization	Yes or No	Question 9 Comment
<p>candidate network has on the surrounding interconnected transmission system; therefore, the SDT must retain the provisions of Exclusion E3.b. However, the SDT has made a clarifying change to the exclusion language to address various comments that were received.</p> <p><b>E3.b:</b> <del>Power flows only into the LN; and if</del> the LN does not transfer energy originating outside the LN for delivery through the LN; The SDT does not intend to perform additional work on the technical justification document at this time. It was not intended to have any specific thresholds or parameters from which exclusions would be granted; it merely illustrates the negligible effects that a sample local network has upon the flows in the surrounding transmission network. No change made.</p>		
<p>Michigan Public Power Agency Clallam County PUD No.1 Snohomish County PUD Kootenai Electric Cooperative</p>	<p>Yes</p>	<p>MPPA and its members strongly supports the categorical exclusion of Local Networks (“LNs”) from the BES. We believe the exclusion is necessary to ensure that the BES definition complies with the statutory requirement, discussed in our response to Question 1, to exclude all facilities used in the local distribution of electric power. LNs are, of course, probably the most common form of local distribution facility. Further, the conversion of radial systems to local distribution networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. If the BES definition were to provide an exclusion for radials without providing a similar exclusion for LNs, however, it would discourage networking local distribution systems because of the significantly increased regulatory burdens faced by the local distribution utility if it elected to network its radial facilities. By placing radial systems and LNs on the same regulatory footing, the proposed definition will ensure that decisions about whether to network radial systems are made on the basis of costs and benefits to the retail customers served by those radials, and not on the basis of disparate regulatory treatment. Consumers will ultimately benefit from the path chosen by the SDT. MPPA and its members also support specific refinements made to the LN exclusion by the SDT in the current draft of the BES definition. In particular, MPPA supports the clarification of the purposes of a LN. The current draft states that LNs connect at multiple points to “improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system.” Snohomish supports this change in language because it reflects the fundamental purposes of a LN and emphasizes one of the key distinctions between LNs and bulk transmission facilities, namely, that LNs are designed primarily to serve local retail load while bulk transmission facilities are designed primarily to move bulk power from a bulk source (generally either</p>

Organization	Yes or No	Question 9 Comment
		<p>the point of interconnection of a wholesale generator or a the point of interconnection with another bulk transmission system) to one or more wholesale purchasers.</p> <p>MPPA believes further improvement of the language could be achieved with additional modifications and clarifications. With respect to the core language of Exclusion 3, we believe the language making a “group of contiguous transmission Elements operated at or above 100 kV” the starting point for identifying a LN would be improved by deleting the term “transmission” from this phrase. This is so because LNs are not used for transmission and the use of the term “transmission Elements” is therefore both confusing and unnecessary. There would be no room for argument about what the SDT intended by including the word “transmission” if the word is deleted and the Exclusion applies to any “group of Elements operated at 100 kV or above” that meets the remaining requirement of the Exclusion. Further, any definitional value that is added by using the term “transmission Elements” is accomplished by using that term in the core definition, and there is no reason to carry the term through in the Exclusions.</p> <p>MPPA also believes that subparagraphs (a) and (b) are redundant in the sense that whatever protection is offered by the generation limit in subparagraph (a) is duplicated by the limit in subparagraph (b) requiring no flow out of the LN. We believe the SDT can eliminate subparagraph (a) of Exclusion 3 and simply rely on subparagraph (b) because if power only flows into the LN even if it interconnects more than 75 MVA of generation, the interconnected generation interconnected will have no significant interaction with the interconnected bulk transmission system. It will only interact with the LN. And, with the advent of distributed generation, it is easy to foresee a situation in which a large number of very small distributed generators are interconnected into a LDN, so that the aggregate capacity of these generators exceeds 75 MVA. However, because the generators are small and dispersed and, under the criterion in subparagraph (b), would be wholly absorbed within the LN rather than transmitting power onto the interconnected grid, those generators would not have a material impact on the grid. We also suggest that subparagraph (b) of Exclusion 3 could be more clearly drafted. Subparagraph (b), as part of the requirement that power flow into a LN rather than out of it, includes this description: “The LN does not transfer energy originating outside the LN for delivery through the LN.” We understand this language is intended to distinguish a LN from a link in the transmission system - power on a transmission link passes through the transmission link to a load located elsewhere, while power in a LN enters the LN and is consumed by retail load within the LN.</p>

Organization	Yes or No	Question 9 Comment
		<p>While we agree with the concept proposed by the SDT, we believe the language would be clearer if it read: “The LN does not transfer energy originating outside the LN for delivery through the LN to loads located outside the LN.” We believe the italicized language is necessary to distinguish between a transmission system, where power that originates outside a system is delivered through the system and passes through the system to a sink located somewhere outside the system, from a LN, in which power originating outside the LN passes through the LN and is delivered to retail load within the LN. To put it another way, the italicized language helps distinguish a transmission system from an LN, in which the LN “transfers energy originating outside the LN for delivery through the LN to loads located within the LN.”</p> <p>We also believe the language of subparagraph (a) of Exclusion 3 could be improved. Subparagraph (d) would make LNs part of the BES if they interconnect “non-retail generation greater than 75 MVA (gross nameplate rating).” For the reasons stated in our responses to Questions 3, 5 and 7, we urge the SDT to replace the reference to a hard 75 MVA threshold with the defined term “Qualifying Aggregate Generation Resources” or some equivalent.</p> <p>We are also uncertain what is meant by the use of the term “non-retail generation” in subparagraph (a). From context, we believe the SDT considers “non-retail generation” to mean generation that is used by retail customers located within a LN rather than being exported and sold on wholesale markets outside the LN. We therefore suggest that the SDT replace the phrase “non-retail generation” with the phrase “generation sold in wholesale markets and transmitted outside the LN.”</p> <p>Similarly, we are unsure what is meant by the phrase “the LN and its underlying Elements.” We believe the phrase “and its underlying Elements” could simply be deleted from the definition without loss of meaning. In the alternative, the SDT might consider using the phrase “the LN, including all Elements located on the distribution side of any Automatic Fault Interrupting Devices (or other points of demarcation) separating the LN from the bulk interstate transmission system.” We believe this phrase more accurately reflects the SDT’s intent, which appears to be that generation exceeding 75 MVA in aggregate capacity interconnected anywhere within the LN disqualifies that LN from being excluded from the BES under Exclusion 3. Finally, MPPA believes that both subparagraphs (a) and (b) of Exclusion 3 could be safely eliminated as long as subparagraph (c) is retained. Subparagraph (c) makes a LN part of the BES if it is classified as a Flow Gate or Transfer Path. Flow Gates and Transfer</p>

Organization	Yes or No	Question 9 Comment
		<p>Paths are, by definition, the key facilities that allow reliable transmission of bulk electric power on the interconnected grid. If a LN has not been identified as either a Flow Gate or a Transfer Path, it is unlikely the LN is necessary for the reliable transmission of electricity on the interconnected bulk system.</p> <p>Apart from these specific improvements that we believe could be achieved by modifying the language of Exclusion 3, we believe the SDT may need to re-examine certain assumptions that appear to underlie the current draft. Specifically, subparagraph (a) suggests that if BES generation is embedded within a LN, the LN itself must also be BES. But two NERC bodies have already addressed similar questions and concluded there is no technical basis for such concerns. NERC’s Standards Drafting Team for Project 2010-07 and its predecessor, the “GO-TO Task Force” were formed to address how the dedicated interconnection facilities linking a BES generator to high-voltage transmission facilities should be treated under the NERC standards. The GO-TO Team concluded that by complying with a handful of reliability standards, primarily related to vegetation management, reliable operation of the bulk interconnected system could be protected without unduly burdening the owners of such interconnection systems. Therefore, there is no reason, according to the GO-TO Team, that dedicated high-voltage interconnection facilities must be treated as “Transmission” and classified as part of the BES in order to make reliability standards effective. See Final Report from the NERC Ad Hoc Group for Generator Requirements at the Transmission Interface (Nov. 16, 2009) (paper written by the GO-TO Task Force). Similarly, the Project 2010-07 Team observed that interconnection facilities “are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system.” White Paper Proposal for Information Comment, NERC Project 2010-07: Generator Requirements at the Transmission Interface, at 3 (March 2011). Requiring Generation Owners and Operators to comply with the same standards as BES Transmission Owners and Operators “would do little, if anything, to improve the reliability of the Bulk Electric System,” especially “when compared to the operation of the equipment that actually produces electricity - the generation equipment itself.” Id. We believe that interconnection of BES generators within a LN is analogous and that, based on the findings of the Project 2010-07 and GO-TO Teams, automatically classifying a LN as “BES” simply because a large generator is embedded in the LN will result in substantial overregulation and</p>

Organization	Yes or No	Question 9 Comment
		<p>unnecessary expense with little gain for bulk system reliability. If anything, generation interconnected through a LN is less likely to produce material impacts on the interconnected bulk transmission system than the equivalent generator interconnected through a single dedicated line because an LN is interconnected to the bulk system at several points, so that if one interconnection goes down, power can still flow from the BES generator to the bulk system on other interconnection points. Where a dedicated interconnection facility is involved, by contrast, if the interconnection line fails, the generator is unavailable to the interconnected bulk system.</p> <p>Similarly, we suggest that the SDT re-examine the assumptions underlying subparagraph (b), which seems to suggest that a local distribution system cannot be classified as a Local Network if power flows out of that system at any time, even if the amount is de minimis, the outward flow is only for a few hours a year, or the outward flow occurs only in an extreme contingency. Accordingly, we suggest that the initial clause of subparagraph (b) be revised to read: “Except in unusual circumstances, power flows only into the LN.”</p>
<p><b>Response:</b> The SDT considered the disposition of the word “transmission” in Exclusion E3, and determined that retention of this word – in lower-case – is necessary to modify the word “Element”. This is meant to eliminate the generation that would otherwise be included in the term “Element”.</p> <p>The SDT continues to believe that it is necessary to establish a limit on the allowable quantity of generation that may be significant to the reliable operation of the surrounding interconnected transmission system. Please note that the issues surrounding the appropriate generation threshold, among other topics, will be taken up in Phase 2 of this BES definition effort. No change made.</p> <p>The intent of the SDT in structuring the language of Exclusion E3.b was to ensure two things: first that power flow is always in the direction from the BES toward the LN, and second that the LN is not used for “wheel-through” transactions. The suggestion in your comment places an unnecessary qualifier on the “wheel-through” whereby it would only apply if the transaction were serving “loads”. The SDT believes this qualifier would inadvertently allow a wholesale transaction to be scheduled through the subject facilities, and this is contrary to the intent of Exclusion E3.b. Given the high degree of certainty and assurances regarding the high priority of the Phase 2 efforts on Project 2010-17, for the purpose of completing the posting of the definition in the first phase of the Project, the SDT believes that it is preferable to continue to use the specific value of 75 MVA within ExclusionE3.a. No change made.</p> <p>Non-retail generation is meant to be the generation on the system (supply) side of the retail meter.</p> <p>The SDT believes that the existing phrase in ExclusionE3.a “and its underlying Elements” has sufficient clarity and meets the intent of</p>		

Organization	Yes or No	Question 9 Comment
<p>the exclusion with brevity. No change made.</p> <p>The SDT acknowledges the work of the Project 2010-07 “GO-TO” task force in identification of various NERC Reliability Standard requirements that would promote reliability of the generator-to-transmission interface. The Project 2010-17 SDT believes that the body of work in Project 2010-07 is most pertinent to generator lead-line facilities, rather than the looped and parallel-operated facilities contemplated in the Exclusion E3, and therefore, the SDT finds it necessary to continue to require all of the characteristics of Exclusion E3 to be met in order to qualify for exclusion from the BES. No change made.</p> <p>The SDT considered the addition of the phrase “under normal operating conditions”, as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.</p>		
NESCOE	Yes	<p>NESCOE generally supports this exclusion but believes it is too narrow. As noted in the response to question 7, Exclusion E3 should allow a higher level of aggregate generation MVA on a Local Network (at least 300 MVA). In addition, NESCOE believes that local networks should not necessarily be ineligible for Exclusion E3 simply because an amount of power may transfer out of the network at times. NERC’s draft technical network exclusions document should be amended such that local networks would be permitted to qualify for network exclusions under E3 if power flowing out of the network is minimal and would not likely adversely impact the BES. For example, transfers of less than or equal to 100 MVA should not have any adverse impact on the BES. The draft technical network exclusions document should be amended to state that transfers of 100 MVA MVA into the BES from the local distribution network are acceptable. The 100 MVA limit suggested here represents 25% of the rated value of a typical 345/115 substation (typically on the order of 400 MVA). Rarely does more than a fraction of the rated MVA flow from the low voltage side to the high voltage side. An allowance of 100 MVA represents a flow level will have no significant impact to the interconnected bulk power network.</p>
<p><b>Response:</b> The SDT feels strongly that in order for a network to qualify for exclusion under the Exclusion E3 section of the definition, there must be strict bounds and limits placed on the characteristics of the candidate facilities. Allowances for minor “out-flow” from the local network, or “minimal” flow, as suggested in this comment, will lead to an inconsistent application of the definition and therefore, a lack of bright-line quality in the definition. Situations such as what is proposed in this comment can be referred to the</p>		

Organization	Yes or No	Question 9 Comment
Exception Process for possible exclusion from the BES. No change made.		
AECl and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative	Yes	<p>We would agree in principle with the LN exclusion if the wording of the exclusion includes the following phrase (in italics) added at the end of E3 b): Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN “under normal operating conditions”.</p> <p>Also, the correct BES threshold level should be 200 kV rather than 100 kV.</p> <p>Finally, the nomenclature of Flowgate (FG) components appears to be confused. AECl believes E3 c) should be changed to read “contingent Facility” rather than “monitored Facility”. Although unspecified within the NERC Glossary, we believe FG monitored Facilities are typically the impacted facilities in danger of overload, while the contingent facilities are those which, if lost, would cause the monitored Facility to become overloaded. As currently written, a formerly qualified LN could later become disqualified due to an external entity’s ill-designing a parallel EHV line, thereby causing one or more potential (N-1) overloaded Facility within that LN. Further, operational FG loading conditions are often relieved by opening-up LN elements near the monitored Facility, with little impact upon BES reliability, yet with lesser reliability to the underlying LN loads. This implies that the monitored elements of Flowgates are typically non-essential to the BES reliability. AECl can support “contingent” FG Facilities disqualifying a LN claim, but it cannot support “monitored” Facilities as disqualifying factors for rejecting a LN claim.</p>
<p><b>Response:</b> The SDT considered the addition of the phrase “under normal operating conditions”, as a qualifier to Exclusion E3.b, and determined that such a qualifier is not consistent with the intent to develop a set of bright line characteristics in the BES definition. For those circumstances where a network is unable to utilize the LN exclusion solely due to an abnormal situation that causes power to flow out of the network, that network would be a suitable candidate to apply for exclusion under the Exception Process. No change made.</p> <p>The SDT appreciates the suggestion of an alternate BES threshold level of 200 kV rather than 100 kV; however, in the absence of a strong technical justification, the SDT must retain the 100 kV threshold in the core definition. No change is being made at this time</p>		

Organization	Yes or No	Question 9 Comment
<p>but all threshold values will be examined in Phase 2.</p> <p>The SDT continues to believe that “monitored” is the most appropriate modifier of “Flowgate” in the text of Exclusion E3.c. Exclusion E3.c is intended to identify the elements that are part of these Flowgates, not necessarily those whose contingency can affect the Flowgate. The elements comprising Flowgates (and major transfer paths in the West) must continue to be prohibited from exclusion via Exclusion E3.c, since these facilities are more likely to be used in the transfer of bulk power than not; therefore, they are more characteristic of serving an interconnected transmission function than distribution. No change made.</p>		
Southern Company Generation	Yes	<p>What does the term "non-retail generation" mean?</p> <p>Can the term "non-retail generation" in E3a be changed to simply "generation."</p>
<p><b>Response:</b> Non-retail generation is meant to be the generation on the system (supply) side of the retail meter.</p> <p>The SDT has intentionally utilized the term “non-retail generation” in Exclusion E3.a in order to specifically isolate that generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier “non-retail” would cause candidate local networks with retail generation to be unfairly biased against obtaining this exclusion. No change made.</p>		
Electricity Consumers Resource Council (ELCON)	Yes	<p>This Exclusion and Exclusion E1 aid in the delineation of local distribution versus transmission. We suggest three clarifying revisions. First, the phrase “but less than 300 kV” should be deleted. Many large industrial facilities have on-site distribution systems that operate above 300 kV due solely to the capacity of the lines to supply power over the distance required at the manufacturing sites.</p> <p>Second, for the same reasons discussed above (in response to question #7), the phrase “do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating)” in “a)” should be changed to “the net capacity provided to the transmission grid does not exceed 75 MVA.”</p> <p>Third, the introductory phrase in “b)” -- “Power flows only into the LN” -- is inconsistent with the recognition in “a)” that power may flow out of an LN and into the transmission grid if there is generation connected to the LN and the 75 MVA limit is observed. We recommend either deleting the introductory clause or correcting it to read “Power is not transferred through the LN.”</p>
<p><b>Response:</b> The SDT does not agree with the removal of the 300 kV cap that limits the qualification of a group of facilities for local</p>		

Organization	Yes or No	Question 9 Comment
		<p>network exclusion. The SDT feels that an upper bound is essential to prevent inappropriate exclusions of facilities that may be important to the reliable operation of the interconnected transmission system. The Exception Process is available for specific circumstances where a 300 kV cap is problematic. No change made.</p> <p>The SDT evaluated your comment in regard to Question 7 as well as to the local network exclusion, and has concluded that both exclusions must necessarily be based on the gross aggregate nameplate of the generation connected within the candidate systems. The approach that is suggested in your comment could result in significant amounts of generation existing within the excluded area. No change made.</p> <p>It remains the intent of the SDT to uphold a 75 MVA limit on the connected (non-retail) generation within a qualifying LN and, at the same time, reinforcing that power flow is always from the BES toward the LN at all points of connection. The SDT believes these characteristics are essential in order to ensure that qualifying LN facilities are not being relied upon for reliable operation of the interconnected transmission system. However, the SDT has clarified Exclusion E3.b in response to industry comments:</p> <p><b>E3.b:</b> Power flows only into the LN: <del>and</del> <del>the</del> LN does not transfer energy originating outside the LN for delivery through the LN;</p>
<p>Transmission Access Policy Study Group</p>	<p>Yes</p>	<p>TAPS supports the exclusion of Local Networks from the BES. Such systems are generally not “necessary for operating an interconnected electric transmission network,” the standard in Orders 743 and 743-A. We have several suggestions to clarify the proposed language for this Exclusion. TAPS’ comments in response to Question 7 above regarding “points of connection at 100kV or higher” and “non-retail generation” are applicable to Exclusion E3 as well.</p> <p>The term “bulk power,” which occurs twice in Exclusion E3, is vague and could be read incorrectly as a reference to the statutorily-defined “bulk-power system,” which is not, we think, the SDT’s intent. The word “bulk” should be deleted, so that the Exclusion simply refers to transferring “power” across the interconnected system. TAPS raised this concern in response to the last posting of the BES Definition. In response, the SDT removed some instances of “bulk power” but left the remaining two, stating that “the SDT believes it provides conceptual value to the exclusion principle.” The SDT does not state what conceptual value the term is intended to provide; on the assumption that it relates to a distinction between transferring power from local generation to serve local load, and transferring power over longer distances, TAPS suggests, as an alternative to simply deleting the word “bulk,” that the Exclusion be revised to refer to “transfers of power from non-LN generation to non-LN load.” Exclusion E3(c) states: “Power flows only into the LN: The LN does not transfer energy</p>

Organization	Yes or No	Question 9 Comment
		<p>originating outside the LN for delivery through the LN.” This statement is unclear because the two parts mean different things. TAPS proposes rewriting this sentence to state: “Power flows only into the LN, that is, at each individual connection at 100 kV or higher, the pre-contingency flow of power is from outside the LN into the LN for all hours of the previous 2 years” to help clarify the intent. Two years is suggested because it is the time period set out in the draft exception application form for which an applicant should state whether power flows through an Element to the BES.</p>
<p><b>Response:</b> See response to Q7.</p> <p>The SDT prefers to continue the use of the word “bulk” in the core paragraph of Exclusion E3. The SDT believes this clarifies an important conceptual idea to the industry, and the term “bulk” is not intended to be definitional in this context. This paragraph merely provides an introduction to the concept of the local network, and retaining the term “bulk” conveys the concept effectively. The lettered sub-items under the core paragraph are the prescriptive and precise characteristics that the industry will use to determine qualification for exclusion under Exclusion E3. No change made.</p> <p>The SDT prefers not to add demonstration criteria, such as the suggestion to provide a minimum of 2 years worth of data, within the text of the BES definition. The SDT believes the language, particularly the word “always” adds sufficient clarity. No change made.</p>		
<p>Florida Municipal Power Agency</p>	<p>Yes</p>	<p>: FMPA supports the exclusion of Local Networks from the BES. Such systems are generally not “necessary for operating an interconnected electric transmission network,” the standard in Orders 743 and 743-A. However, we have several suggestions to clarify the proposed language for this Exclusion. Exclusion E3(c) states: “Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN.” This statement is unclear because the two parts mean different things. FMPA proposes rewriting this sentence to state: “Power flows only into the LN, that is, at each individual connection at 100 kV or higher, the pre-contingency flow of power is from outside the LN into the LN for all hours of the previous 2 years” to help clarify the intent. Two years is suggested because it is the time period set out in the draft exception application form for which an applicant should state whether power flows through an Element to the BES.</p> <p>FMPA’ comments in response to Question 7 above regarding “points of connection at 100kV or higher” and “non-retail generation” are applicable to Exclusion E3 as well.</p> <p>The term “bulk power,” which occurs twice in Exclusion E3, is vague and could be read incorrectly as a</p>

Organization	Yes or No	Question 9 Comment
		<p>reference to the statutorily-defined “bulk-power system,” which is not, we think, the SDT’s intent. The word “bulk” should be deleted, so that the Exclusion simply refers to transferring “power” across the interconnected system. FMPA raised this concern in response to the last posting of the BES Definition. In response, the SDT removed some instances of “bulk power” but left the remaining two, stating that “the SDT believes it provides conceptual value to the exclusion principle.” The SDT does not state what conceptual value the term is intended to provide; on the assumption that it relates to a distinction between transferring power from local generation to serve local load, and transferring power over longer distances, FMPA suggests, as an alternative to simply deleting the word “bulk,” that the Exclusion be revised to refer to “transfers of power from non-LN generation to non-LN load.”</p>
<p><b>Response:</b> Exclusion E3.b was intended to be a combination of two similar properties when it was drafted for the second posting of the BES definition. The SDT has received a number of comments indicating that these are two separate and distinct concepts, and has revised Exclusion E3.b to provide more clarity.</p> <p><b>E3.b:</b> Power flows only into the LN; <del>and</del> <del>the</del> LN does not transfer energy originating outside the LN for delivery through the LN;</p> <p>The SDT prefers not to add demonstration criteria, such as the suggestion to provide a minimum of 2 years worth of data, within the text of the BES definition. The SDT believes the language, particularly the word “always” adds sufficient clarity. No change made.</p> <p>See response to Q7.</p> <p>The SDT prefers to continue the use of the word “bulk” in the core paragraph of Exclusion E3. The SDT believes this clarifies an important conceptual idea to the industry, and the term “bulk” is not intended to be definitional in this context. This paragraph merely provides an introduction to the concept of the local network, and retaining the term “bulk” conveys the concept effectively. The lettered sub-items under the core paragraph are the prescriptive and precise characteristics that the industry will use to determine qualification for exclusion under Exclusion E3. No change made.</p>		
SERC Planning Standards Subcommittee	Yes	The term "non-retail generation" in E3a should be changed to simply "generation."
<p><b>Response:</b> The SDT has intentionally utilized the term “non-retail generation” in Exclusion E3.a in order to specifically isolate that</p>		

Organization	Yes or No	Question 9 Comment
<p>generation which is not situated behind the retail meter. It is important to retain this concept, since removal of the clarifier “non-retail” would cause candidate local networks with retail generation from obtaining this exclusion. No change made.</p>		
<p>Balancing Authority Northern California</p>	<p>Yes</p>	<p>It is preferred to hold reference to gross nameplate rating/threshold values until generation technical justification is completed as part of Phase 2; these studies should apply to any real or reactive power threshold reference.</p> <p>For Exclusion E3-b using the phrase “[p]ower flows only into the LN” is too restrictive. An allowable MW threshold of LN power producing resources should be deferred to the Phase 2 BES technical analysis. Where no generation is present in the LN, it is recommended that an allowance for residual flow through the LN.</p>
<p><b>Response:</b> The SDT agrees that the threshold(s) for generation throughout the BES definition should be addressed in Phase 2 of this effort; however, to satisfy the Commission’s directives in Order 743 and 743-A in a timely fashion, it is necessary to use a generation threshold that is consistent with the in-force Statement of Compliance Registry Criteria. No change made.</p> <p>The SDT feels strongly that in order for a local network to qualify for exclusion under the Exclusion E3 section of the definition, there must be strict bounds and limits placed on the characteristics of the candidate facilities. Allowances for minor “out-flow” from the local network, or “minimal” flow, as suggested in this comment, will lead to an inconsistent application of the definition and therefore, a lack of bright-line quality in the definition. Situations such as what is proposed in this comment can be referred to the Exception Process for possible exclusion from the BES. No change made.</p>

10. The SDT has added specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E4 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

**Summary Consideration:** Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices. The comments received identified overwhelming support of Exclusion E4 as written.

Some commenters questioned the use of the word ‘retail’ in Exclusion E4. The SDT determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the Load side of a customer meter) and would otherwise be included via the core definition and/or Inclusion I5.

Other commenters proposed adding the same threshold qualification language contained in other exclusions. Using a threshold for inclusion of non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

No changes were made to the definition as a result of these comments.

Organization	Yes or No	Question 10 Comment
Westar Energy	No	This particular Exclusion doesn't address the qualifier as to the impact to the BES. We believe the qualification language in E2, in regards to behind the meter generation, should also be included in Exclusion E4 for clarification purposes.

Organization	Yes or No	Question 10 Comment
Southwest Power Pool Standards Review Team	No	This particular Exclusion doesn't address the qualifier as to the impact to the BES. We request that it emulate the language provided for E2 (behind the meter gen) and classified for this specific exclusion.
<p><b>Response:</b> Using a threshold for inclusion of non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. ISO New England Inc	No	<p>The term "retail customer" is unclear and will lead to confusion.</p> <p>This exclusion should be removed as there are many instances where a generator may be using the reactive power device to meet other interconnection requirements and the reactive device should be held to the same BES requirements as the generator.</p>
<p><b>Response:</b> The SDT team considered the disposition of the word "retail" in the context of E4, and determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter). No change made.</p> <p>Exclusion E4 is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter) and would otherwise be included via the core definition and/or Inclusion I5. No change made.</p>		
Central Maine Power Company	No	Consider using other wording to replace "retail"

Organization	Yes or No	Question 10 Comment
<p><b>Response:</b> The SDT team considered the disposition of the word “retail” in the context of E4, and determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter). No change made.</p>		
<p>Metropolitan Water District of Southern California</p>	<p>No</p>	<p>Exclusion 4 appears to limit the devices just to retail customers. However, any end-user load, including wholesale or retail, should be included. NERC's Glossary of Terms uses the phrase "end-use customer", not retail customers to describe loads. MWDC recommends that Exclusion 4 be changed as follows: E4 - Reactive Power devices owned and operated by an end-use customer solely for its own use.</p>
<p><b>Response:</b> The SDT team considered the disposition of the word “retail” in the context of E4, and determined that retention of this word is important and correct. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter). No change made.</p>		
<p>The Dow Chemical Company</p>	<p>No</p>	<p>The term “solely” should be replaced by the term “primarily”. All devices to control Reactive power behind-the-meter arguably provide some benefit to the transmission grid.</p>
<p><b>Response:</b> The SDT does not believe these changes provide additional clarity. No change made.</p>		
<p>LCRA Transmission Services Corporation</p>	<p>No</p>	<p>This exclusion conflicts with inclusion item I5. Which one takes priority?</p>
<p><b>Response:</b> The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.</p> <p>Initially, the BES ‘core’ definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the ‘core’ definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the ‘core’ definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:</p> <p>“Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit</p>		

Organization	Yes or No	Question 10 Comment
<p>breaker, bus section, or transmission line. An element may be comprised of one or more components. “</p> <p>Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.</p> <p>Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.</p> <p>Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.</p> <p>Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.</p> <p>Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2.</p> <p>Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.</p> <p>In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.</p>		
Ameren	No	a)Reactive Power devices connected 100 kV and above applied for the purpose of voltage support to local load and/or local area network should also be excluded.
<p><b>Response:</b> Reactive Power devices connected at 100kV and above are included in the core definition. Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner.</p>		

Organization	Yes or No	Question 10 Comment
		<p>The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.</p> <p>Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.		
AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative	Yes	Ownership is irrelevant, so “owned and operated by the retail customer solely for its own use”, should be replaced by “owned and operated solely in conjunction with specific industrial customer loads.”
<b>Response:</b> The SDT does not believe this change provides additional clarity. No change made.		
NESCOE	Yes	While we are generally supportive of this exclusion, the term “retail” needs to be clarified (i.e., are retail customers of all sizes intended to be excluded?).
Massachusetts Department of Public Utilities	Yes	While we are generally supportive of this exclusion, the term “retail” needs to be clarified (i.e., are retail customers of all sizes intended to be excluded?).
<b>Response:</b> The SDT reviewed your comment and believes that ‘retail’ is the correct terminology. This is meant to eliminate non-generator Reactive Power devices that (are owned and operated on the load side of a customer meter. No change made. Using a threshold for non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort.		
Long Island Power Authority	Yes	Exclusion should identify a maximum value.
<b>Response:</b> Using a threshold for non-generator Reactive Power resource devices in the BES will be considered in Phase 2 of this effort. No change made.		

Organization	Yes or No	Question 10 Comment
ExxonMobil Research and Engineering	Yes	The BES SDT should work on clarifying the differences between Inclusion I5 and Exclusion E4. The phrase “solely for its own use” in Exclusion E4 is vague and open to interpretation. It is unclear whether equipment, such as power factor correction facilities, surge capacitors located in motor terminal boxes and excitation capacitors installed for use by a motor located on the low side of a 138 kV primary transformer would be excluded from the BES.
<p><b>Response:</b> It is the intent of the SDT that distribution devices are not included in the BES.</p> <p>The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.</p> <p>Initially, the BES ‘core’ definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. **11. Are there any other concerns with this definition that haven't been covered in previous questions and comments remembering that the exception criteria are posted separately for comment?**

**Summary Consideration:** Comments received for Question 11 were mostly re-statements of comments expressed in the previous questions. No changes were made to the core definition or Inclusions or Exclusions based solely on question 11 comments. However, changes were made to the Implementation Plan to clarify the compliance obligation date of the revised definition as shown below.

Some commenters have expressed frustration over the lack of high level guidance for the exception process. The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.

There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel's findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren't shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn't been handled before by

either party and there is a great deal of professional experience involved on both the submitter's and the Regional Entity's side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.

Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.

Some commenters have asked whether a single 'yes' or 'no' response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of Procedure that states "No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or disapproved."

The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals.

Finally, the SDT would point to the draft SAR for Phase 2 of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase 1 of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.

Some comments were received about the lack of a cost benefit analysis with regard to revision to the definition. The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.

Several comments were received questioning how to apply the definition with the inclusions and exclusions. The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.

Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer's side) and supersedes inclusion I2.

Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.

In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.

Finally, there were comments on the lack of a technical basis for the threshold values employed in the definition. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.

Implementation Plan - Compliance obligations for all newly identified Elements included by the definition shall begin 24 months after the applicable effective date of the definition.

Organization	Yes or No	Question 11 Comment
SERC OC Standards Review Group	Yes	<p>The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. The SERC OC standards Review Group is concerned how this revised definition will impact entity registration, i.e., how will the revised definition be integrated into the Compliance Registry Criteria. The implementation plan should include how the integration is going to occur.</p> <p>The Rules of Procedure exception process should be further defined or referenced in this definition.”The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review Group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”</p>
Southern Company	Yes	<p>The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. Southern Companies are concerned how this revised definition will impact entity registration, i.e., how will the revised definition be integrated into the Compliance Registry Criteria. The implementation plan should include how the integration is going to occur.</p> <p>The Rules of Procedure exception process should be further defined or referenced in this definition.</p>
<p><b>Response:</b> The revised definition of Bulk Electric System will be applied in the same manner as it is today. This is based on language contained in FERC Order No. 693, which states: “...the Commission will rely on the NERC definition of bulk electric system and NERC’s registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime”. As the SDT progresses through Phase 2 of the project, it is envisioned that the technical aspects contained in the definition and in the ERO Statement of Compliance Registry will be merged and ultimately incorporated into the definition of the Bulk Electric System. At that time the ERO Statement of Compliance Registry Criteria will be revised to point to the BES definition for the technical aspects in regards to BES Elements. No change made.</p> <p>The Rules of Procedure exception process is referenced in the current draft version of the BES definition in a note which states: “Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process”. No change made.</p>		

Organization	Yes or No	Question 11 Comment
<p>Northeast Power Coordinating Council</p>	<p>Yes</p>	<p>Technical bases have not been provided for the proposed definition of the BES. Additionally, the cost impacts have not been assessed and weighed against the potential benefits of this proposal.</p> <p>There is confusion arising from the construction and interactions of the Inclusion, and Exclusion sections.</p> <p>System diagrams, put in a separate guidance document, would help in understanding.</p> <p>The situation of using Exceptions to understand Exclusions must be avoided. Suggest consider incorporating Inclusions directly, and leave the Exclusions as is format wise.</p> <p>The Implementation period discusses a 24 month timeframe ( the Order suggests 18) from when the standard becomes effective to begin Compliance obligations. If construction is required to become compliant or meet performance requirements with standards, or CIP Version 5 standards increase the amount of BES assets this will be insufficient when considering budgeting, designing, siting requirements, and permitting.</p> <p>Concern exists over the paradigm that the definition should “mirror” the NERC Compliance Registry Criteria regarding who is registered. Some RSC members believe the definition should drive any changes to the registry criteria and not the criteria perpetuating the thresholds in the definition. However, there is a need to confirm that Phase 2 of this project will address this.</p> <p>The Inclusions and Exclusions listed need clarifications and perhaps diagrams and accompanying guidelines to clarify and explain the intent.</p>
<p><b>Response:</b> The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These</p>		

Organization	Yes or No	Question 11 Comment
		<p>and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.</p> <p>The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The technical aspects of the definition have remained identical to the current definition and identical to the application of the ERO Statement of Compliance Registry Criteria and therefore do not require a technical justification to support maintaining the status-quo.</p> <p>The SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.</p> <p>The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.</p> <p>Initially, the BES ‘core’ definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the ‘core’ definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the ‘core’ definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:</p> <p>“Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit</p>

Organization	Yes or No	Question 11 Comment
		<p>breaker, bus section, or transmission line. An element may be comprised of one or more components. “</p> <p>Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.</p> <p>Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.</p> <p>Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.</p> <p>Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.</p> <p>Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2.</p> <p>Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.</p> <p>In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.</p> <p>The development of a guidance document which contains generic diagrams is a portion of the overall project that the SDT feels is necessary to ensure the consistent application of the BES definition going forward. Therefore the SDT has determined that such a document will be developed during Phase 2 of the project.</p> <p>The SDT agrees that a potential reformatting of the definition (core, Inclusions and Exclusions) would improve the understanding of the application of the definition. However, these types of changes would require a significant amount of revisions to the current draft and could be seen as substantive in nature and prevent the SDT from moving forward with a recirculation ballot. This scenario would require a successive ballot which would place the project schedule in jeopardy of achieving a successful filing by January 25, 2012. The</p>

Organization	Yes or No	Question 11 Comment
<p>SDT will be exploring the reformatting of the definition (core, Inclusions and Exclusions) during Phase 2 of the project.</p> <p>In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.</p> <p>Phase 1 of the project, as explained above, is addressing Commission directives established in Order No. 743 within a relatively short time period. The SDT has decided to maintain the status quo with respect to applicability and the technical aspects contained in the ERO Statement of Compliance Registry Criteria as the prudent path to take to ensure a successful conclusion to Phase 1 of the project. The status quo was established in FERC Order No. 693, which states: “...the Commission will rely on the NERC definition of bulk electric system and NERC’s registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime”. As the SDT progresses through Phase 2 of the project, it is envisioned that the technical aspects contained in the definition and in the ERO Statement of Compliance Registry will be merged and ultimately incorporated into the definition of the Bulk Electric System. At which time the ERO Statement of Compliance Registry Criteria will be revised to point to the BES definition for the technical aspects in regards to BES Elements.</p>		
Westar Energy	Yes	We believe a reference should be made to the ROP changes which also provide a mechanism whereby Elements may be excluded or included in the BES. Without that reference, the proposed definition is not all inclusive of all means for exclusions or inclusions. We would suggest the definition be expanded to say “Unless modified by the lists shown below or as provided by Appendix 5C of the NERC Rules of Procedure, all Transmission...” This comment was submitted in response to the original posting and the response received was that it was inadvertently left out and that it would be placed back in, but we don’t see the reference in this draft of the definition.
Southwest Power Pool Standards Review Team	Yes	A reference needs to be made to the ROP changes which also provide a mechanism whereby Elements may be excluded/included in the BES. Without that reference the proposed definition does not completely include all means for exceptions/inclusions.

Organization	Yes or No	Question 11 Comment

We submitted this in the original posting and the response received was that it was inadvertently left out and that it would be placed back in. We don’t see the reference in this draft of the definition.</p>
<p><b>Response:</b> The Rules of Procedure exception process is referenced in the current draft version of the BES definition in a note which states: “Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process”. No change made.</p>		
WECC Staff	Yes	<p>Following are additional comments not covered in previous questions:</p> <ul style="list-style-type: none"> <li>o Under the section “Effective Dates”: There may be confusion with the statement “Compliance Obligations for Elements included by definition shall begin 24 months after the applicable effective data of the definition.” The phrase “included by definition” can be interpreted broadly.</li> <li>o WECC notes that a generation threshold of 75MVA is specified in Exclusions E1, E2, and E3. WECC believes that generation thresholds for Exclusions should be addressed in Phase 2 when generation thresholds for Inclusions are being considered.</li> </ul>
<p><b>Response:</b> The complete statement from the Implementation Plan states: “Compliance obligations for all newly identified Elements included by the definition shall begin 24 months after the applicable effective date of the definition.” The SDT’s intent with this language is to identify newly identified BES Elements based on the revised definition. In other words, Elements that were not considered to be BES Elements based on the exiting definition of BES in the NERC Glossary of Terms, but are now included as a result of revising the exiting definition. The Implementation Plan has been clarified as shown:</p> <p><b>Implementation Plan</b> - Compliance obligations for <u>all newly identified</u> Elements included by the definition shall begin 24 months after the applicable effective date of the definition.</p> <p>The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a</p>		

Organization	Yes or No	Question 11 Comment
<p>change from the current values that exist through the application of the definition today. Phase 1 of the project is addressing Commission directives established in Order No. 743 within a relatively short time period. Therefore the decision to maintain the status quo as far as application of the definition and the technical aspects contained in the ERO Statement of Compliance Registry Criteria is the prudent path to take to ensure a successful conclusion to Phase 1 of the project. The status quo was established in FERC Order No. 693, which states: "...the Commission will rely on the NERC definition of bulk electric system and NERC's registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime". These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p>		
ExxonMobil Research and Engineering	Yes	It would be worthwhile to explain the relationship (timeline) between the BES Definition implementation plan and the compliance implementation plan proposed in the BES RoP team's new Appendix 5C for the NERC Rules of Procedure.
Texas RE NERC Standards Subcommittee	Yes	It might be worthwhile to explain the relationship (timeline) between the BES Definition implementation plan and the compliance implementation plan proposed in the BES RoP team's new Appendix 5C for the NERC Rules of Procedure.
<p><b>Response:</b> For a newly identified Element(s) under the revised BES definition, the time period to be in full compliance with all applicable Reliability Standards is 24 months from the effective date of the definition. If the entity wishes to file for an exception of a newly identified Element(s) under the revised BES definition through the Rules of Procedure Exception Process, the entity will have 12 months from the effective date of the revised BES definition in which to file such a request. If the exception request is rejected or disapproved and the classification of the Element(s) remains as a BES Element, the Regional Entity and the owner of such a BES Element(s) shall agree to an Implementation Plan for full compliance obligations, which will establish an implementation date no earlier than the date established by the definition Implementation Plan (24 months from the effective date of the definition).</p>		
Dominion	Yes	As a general policy, Dominion believes that attempting to precisely refine the definition of the BES may not be the best way to insure BES reliability. Instead,

Organization	Yes or No	Question 11 Comment
		<p>industry effort should be focused on developing specific reliability standard requirements targeted toward solving problems that need to be addressed. Stated differently, every Element that could have an impact on the BES does not need to be included in the definition of the BES. NERC’s Functional Model addresses the broad range of functions performed by the electric utility industry. When reliability concerns are identified and can best be addressed via a standard, modifying the requirements in that standard as applicable to that functional model should occur rather than attempting to modify the BES definition. Effort spent on developing specific reliability standard requirements mentioned above is superior to the industry engaging in definitional debates that do not address to the underlying reliability drivers. It is not essential that each reliability standard explicitly apply to each registered entity. The existing reliability requirements, as applied to the various functional entities require communication of information necessary to insure there are no reliability gaps, either directly or indirectly among the various entities. The existing standards typically have a hierarchy wherein:</p> <ul style="list-style-type: none"> <li>o Planners (PA, TP) receive information predominately from the owners (GO, DP, TO) and those that represent end-use customers (LSE and PSE);</li> <li>o Reliability entities (BA, RC and TOP) receive information predominately from operating entities (GOP, TOP) and those that represent end-use customers (LSE and PSE);</li> <li>o Planners provide reliability assessments to Reliability entities (BA, RC and TOP) and receive feedback on these reliability assessments (including validity of assumptions and result); and</li> <li>o Reliability entities (BA, RC and TOP) give instructions (including when necessary directives) to operating entities (GOP, TOP) and those that represent end-use customers (LSE and PSE). This is how the industry has historically operated, how it operates today and why the standards in place today are structured as they are. Reliability is best served when the standards themselves contain the appropriate requirements and are applied to either an Element or Facility or to the appropriate functional entity (DP, GO, GOP, LSE, TO, TOP, etc.). Definitional boundaries can create the potential for false positives in reliability and, in fact, may be detrimental to reliability in the longer term if they impose additional compliance burdens without closing a reliability gap.</li> </ul>

Organization	Yes or No	Question 11 Comment
<p><b>Response:</b> The SDT acknowledges and appreciates the comments and recommendations associated with concepts for alternatives to the revision of the exiting definition of BES. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, and is bound to answering those directives in a manner that achieves industry consensus while remaining responsive to the language contained in the Orders. <b>No change made.</b></p>		
<p>Pepco Holdings Inc and Affiliates</p>	<p>Yes</p>	<p>1) From the proposed BES definition and Exclusion E1 it is very clear that a 138-12kV distribution transformer serving radial load would not be considered part of the BES. However, suppose this transformer was connected to a position in a ring-bus or a breaker-and-a-half arrangement. Would the physical bus between the transformer high side terminals and the two breakers in the ring-bus, or breaker-and-a-half-bus, be considered part of the BES? They would be contiguous transmission elements (bus) operating at 138kV and supplying a radial distribution transformer. Also, tripping of this “radial” bus section would not interrupt any BES facilities, due to the station bus arrangement. As such, by definition and Exclusion E1 this 138kV bus section (element) would not be part of the BES, and no special exclusion filing would be required. Is this correct? However, take the same 138-12kV transformer but this time connected in a typical line-bus arrangement. The transformer by definition is not a BES element. As was the case above, the bus section between the transformer and the two breakers in the line-bus would be contiguous elements (bus) operating at 138kV and supplying a radial distribution transformer. Again, by definition and Exclusion E1 this bus section (element) would not be part of the BES. However, in this case tripping of the “radial” bus section would result in an interruption to the through path of the station, and could therefore interrupt the through flow on BES facilities. Does this make either the transformer, or its associated bus section, or both part of the BES? Based on the above examples, if the type of bus connection could influence whether an element is included in the BES or not, then additional language needs to be added to the definition (either as an Inclusion or Exclusion) to make this point clear. The BES definition needs to be specific enough to eliminate any confusion as to what is included, and what is not included, and thereby greatly minimize, if not eliminate, the need to request interpretations. A sample FAQ document, with examples, would be</p>

Organization	Yes or No	Question 11 Comment
		<p>extremely helpful, but should not be a substitute for a BES description which leaves little room for interpretation.</p> <p>2) As seen from the above attempt to describe issues that need clarification, without a diagram to show specific situations, it is difficult to fully explain the concerns on ensuring that the BES definition stands on its own. Since the commenting process does not accommodate diagrams, PHI is sending separately a white paper with diagrams in an attempt to clarify the definition and make it as unambiguous as possible, leaving little room for interpretation. This paper may be helpful in developing a FAQ document.</p> <p>3) The definition should state that it applies to a system “normal” configuration. It does not include maintenance or N-1 or any abnormal configurations.</p> <p>4) There was no place on the comment forms to comment on the proposed Implementation Plan for the BES definition. So comments are included here. The proposed plan states “compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition.” This is fine for most applications; however, there is an effect with PRC-005 compliance. PRC-005 (Protection System Maintenance Standard) requires that evidence for the last two maintenance intervals, in order to demonstrate that you are following the prescribed intervals in your maintenance plan. If additional facilities are brought into scope by the new BES definition, and the protection systems associated with these facilities were not previously maintained on the same interval as other BES facilities, then it may not be possible within the allotted 24 months to demonstrate the facilities were maintained within the prescribed intervals for BES facilities. An implementation plan at least as long as one full maintenance cycle would be required to assure compliance. This issue needs to be addressed or coordinated with PRC-005.</p>
<p><b>Response:</b> 1) Exclusion E1 identifies a Radial system as “a group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher” (with additional criteria identified in parts E1a, b and c). The SDT interprets the language ‘single point of connection’ as a tapped point where the radial system originates. Therefore in a ring-bus, a breaker-and-a-half or a</p>		

Organization	Yes or No	Question 11 Comment
<p>typical line bus arrangement, the bus between the breakers and the breakers themselves are considered to be BES Elements. Under these circumstances the bus position is the 'single point of connection', not a contiguous group of Elements as suggested in the comment.</p> <p>2) The development of a guidance document which contains generic diagrams is a portion of the overall project that the SDT feels is necessary to ensure the consistent application of the BES definition going forward. Therefore the SDT has determined that such a document will developed during Phase 2 of the project.</p> <p>3) The SDT does not believe that system state affects the definition and therefore there is no need to declare that the definition only applies to normal state. No change made.</p> <p>4) The BES definition Implementation Plan addresses the implementation of the revised definition. The SDT is not in a position to comment on compliance obligations associated with the Reliability Standards. However, in circumstances where data may not be available due to the revised definition requirements, the SDT expects an entity to work with its Regional Entity to come up with a plan to satisfy the obligation.</p>		
<p>Southern Company Generation</p>	<p>Yes</p>	<p>1) On page 1, the year of the anticipated date for the BOT adoption is correctly 2012.</p> <p>2) We believe that the last two sentences of the first paragraph of the Background Information section of the 2nd draft of the definition document is incorrect. The statements read: " It should be noted that the revised definition does not address functional entity registration or standards requirements applicability. Those are separate issues." The definition of the BES that is approved will govern the scope of the equipment that is relevant to many of the reliability standards. This issue cannot be separated from the applicability of the requirements of the reliability standards. What is the purpose of creating a continent wide definition of the BES if is is not to provide instruction the enetties subject to the requirements of the standards? Refer to these sample standard requirements to see that this definition already plays a major part in the applicability of the requirements: EOP-005-2 R1, R4; EOP-006-2 R1; EOP-008-1 R1; FAC-008-1 R1.2; and PRC-005-1a for example - there are many others.</p>
<p><b>Response:</b> 1) The SDT has made the revision to the BOT adoption date to correctly identify the year as 2012.</p>		

Organization	Yes or No	Question 11 Comment
<p>2) The SDT acknowledges that the linkage between the BES definition and the Reliability Standards may have been understated in the <i>Background Information</i> contained in the comment form. However, the goal of the SDT in addressing the Commission directives is to develop modifications to the definition in response to the directives without significantly expanding or contracting the scope of the BES and not drive registration changes in the industry. The SDT believes that they have met these goals, as evidenced by a detailed review of the NERC Reliability Standards. The SDT determined that potentially the scope of applicability of certain requirements may change due to the establishment of a bright-line definition. However, this potential change did not dictate a need for modification of the language contained in the requirements.</p>		
<p>AECI and member GandTs, Central Electric Power Cooperative, KAMO Power, MandA Electric Power Cooperative, Northeast Missouri Electric Power Cooperative, NW Electric Power Cooperative Sho-Me Power Electric Power Cooperative</p>	<p>Yes</p>	<p>: AECI supports the bright-line concept, but believes the SDT should adopt a core voltage threshold of “200 kV or higher”, and MVA capacity of “150 MVA or greater”. A proper threshold is critical, because an inappropriately low threshold will divert significant industry attention and resource away from what truly benefits the BES reliability. (The number of facilities tend to rise more geometrically than linearly as the voltage threshold drops.)We believe that an evaluation of the transmission-line Surge Impedance Loading (SIL), at various kV levels, could provide technical insight as to why many industry planning engineers believe sub-230kV Facilities, in general do not belong within the BES. AECI suggests that the SDT consider a more consistent bright-line facility threshold of 150 MVA capability for all equipment. This would include transmission lines as well, where an Surge Impedance Loading analysis demonstrates that lines below 230 kV, can support 150 MVA flow up to 280 miles (applying 1.1 p.u. line-loadability of SIL, IEEE Transactions on Power Apparatus and Systems, Vol.PAS-98, No.2 March/April 1979, p 609, Figure 7),without additional reactive compensation. In comparison, single-conductor 138 kV lines, in same table, can support 150 MVA transfers no more than 50 miles, while 345 kV lines are capable of supporting 150 MVA transfers well over 600 miles.</p>
<p><b>Response:</b> The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These</p>		

Organization	Yes or No	Question 11 Comment
<p>and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p>		
<p>MRO NERC Standards Review Forum (NSRF)</p>	<p>Yes</p>	<p>NSRF recommends that the following statement be added after I5. If an element is not included based upon the core definition or I1 - I5, the elements is not consider to be a part of the BES.</p>
<p><b>Response:</b> The SDT is attempting through the BES definition to identify facilities that should be classified as BES Elements. Adding a statement that emphasizes the opposite of what the definition is intending to accomplish would be redundant and would negate the efforts of the SDT to improve clarity and remove the ambiguity that currently exists the definition today. No change made.</p>		
<p>IRC Standards Review Committee</p>	<p>Yes</p>	<p>(1) We support a phased approach proposed in the draft supplemental SAR. Development of the revised BES definition is an important and complex undertaking. The product of this work is fundamental to establishing the applicability of NERC Reliability Standards. The issues identified for attention in Phase 2 of this project warrant careful investigation and as such allowing additional time to properly research and provide for stakeholders to vett them is justified. Specific to the assessment of raising the generator rating threshold from 20 MVA to 75 MVA per unit, we would point out that this needs to be looked at from a different perspective. Industry debates so far have been on the apparent lack of reliability contribution and economic benefits for keeping the threshold at 20 MVA. The former point implies that any negative reliability impact that could be contributed by a generator higher than 20 MVA but lower than 75 MVA could be negligible. Some examples of the standards that the 20-75 MVA units may need to comply with to ensure reliability are:</p> <ul style="list-style-type: none"> <li>o Voltage and frequency ride through capability</li> <li>o Voltage control (AVR, etc.)</li> <li>o Underfrequency trip setting</li> <li>o Protection relay setting coordination</li> <li>o Data submission for modeling;</li> </ul> <p>verification of capability and model A Venn diagram developed by an industry group shows that generators at 20 to 74.99 MVA account for about 13.8% of the total</p>

Organization	Yes or No	Question 11 Comment
		<p>installed capacity in the US. Out of this, 3.0% are currently deemed non-BES whereas the other 10.8% are BES. We do not know how the BES reliability may be affected if these 10.8% generators are no longer deemed BES facilities (after an increase of threshold to 75 MVA) and subject to compliance with NERC standards, including those mentioned above. An assessment from both a positive contribution and a negative impact viewpoints are thus required to aid the determination of the merit of raising the rating threshold.</p> <p>(2) The draft Implementation Plan for the BES definition states “Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition.” We are concerned that the stated implementation period may be insufficient time to complete transition plans for newly identified BES Elements and Facilities, where those plans require procurement, installation and commissioning of additional equipment. We believe a period of 24 months may be more appropriate.</p>
<p><b>Response:</b> 1) The SDT agrees with the commenter that the best opportunity to address the industry concerns associated with the technical aspects of the definition is through Phase 2 of the project. The SDT also agrees with the commenter in that any assessment utilized to determine the correct threshold for generating resources should be accomplished without any preconceived threshold value as a target for justification. The full scope of the assessments will be determined through a joint effort between the SDT and the appropriate NERC Technical Committee.</p> <p>2) In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.</p>		
Tennessee Valley Authority	Yes	The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. TVA is concerned with this revised definition’s impact on entity registrations, i.e., how will the revised definition be integrated into the

Organization	Yes or No	Question 11 Comment
		<p>Compliance Registry Criteria.</p> <p>The implementation plan should include how the integration is going to occur. The 24 month period for new facilities that are to become BES elements as a result of this definition is very important to successful implementation of the definition. An period shorter that 24 months would be very problematic for the industry.</p>
<p><b>Response:</b> Phase 1 of the project, as explained above, is addressing Commission directives established in Order No. 743 within a relatively short time period. The SDT has decided to maintain the status quo with respect to applicability and the technical aspects contained in the ERO Statement of Compliance Registry Criteria as the prudent path to take to ensure a successful conclusion to Phase 1 of the project. The status quo was established in FERC Order No. 693, which states: “...the Commission will rely on the NERC definition of bulk electric system and NERC’s registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime”. As the SDT progresses through Phase 2 of the project, it is envisioned that the technical aspects contained in the definition and in the ERO Statement of Compliance Registry will be merged and ultimately incorporated into the definition of the Bulk Electric System. At which time the ERO Statement of Compliance Registry Criteria will be revised to point to the BES definition for the technical aspects in regards to BES Elements.</p> <p>The SDT agrees with the commenter in regards to the implementation time period of 24 months. In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.</p>		
Hydro One Networks Inc.	Yes	<ul style="list-style-type: none"> <li>o The definition of the Bulk Electric System (BES) is a foundational construct for the North American Electric Reliability Corporation (NERC). FERC Orders 743 and 743-A do not mandate a 100 kV approach. Instead, it states that a 100 kV bright line threshold is one approach to defining the BES. It further states that only “some” 115/138 kV facilities are necessary for the reliable operation of the bulk system. We believe that if one subset issue (such as 20 MVA vs. 75 MVA) of the entire definition, requires more</li> </ul>

Organization	Yes or No	Question 11 Comment
		<p>time and resources to arrive at the correct answer, the much larger and more fundamental issue of how to define BES should not have been dismissed without the appropriate analysis before another definition is proposed to be adopted by the ERO.</p> <ul style="list-style-type: none"> <li>o The proposed definition, in combination with other new and/or modified Reliability Standards such as newly modified and approved TPL Standards will require significant system upgrades with high dollar investments. We are deeply concerned that a) no such assessment has been undertaken by the SDT and/or the ERO and b) the proposed definition of the BES is not based on a technical analysis that will enhance the reliability of the interconnected transmission network.</li> <li>o The NERC as the ERO should at least undertake a cost and incremental reliability benefit analysis for its proposed definition of BES. Furthermore, cost impacts and reliability benefit assessments of the BES definition coupled with other new and modified reliability standards (such as the TPL Standards) must also be undertaken and weighed against the potential benefits, if any, of this or any proposal. Not providing such an assessment but using the 100 kV level as a starting point for the BES definition, gives no assurances of benefits for any stakeholder including respective governmental and regulatory authorities and rate payers in Canada or the USA.</li> <li>o The proposed definition would significantly increase the population of BES elements. Many of the standards requirements for these new elements will introduce administrative burden and operating expenses. This would impose significant costs, costs that ratepayers will have to bear, with little or no gain in reliability benefits for the interconnected transmission system. We suggest that the resulting BES definition must identify incremental reliability benefits by the ERO for the interconnected transmission network based on sound technical analysis to justify the change to those who will pay for any required system upgrades - the ratepayer.</li> <li>o The draft Implementation Plan for the BES definition states “Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition.” We are concerned that the stated implementation period will give insufficient time to complete transition plans for newly identified BES</li> </ul>

Organization	Yes or No	Question 11 Comment
		<p>Elements and Facilities, where those plans require approval, procurement, installation and commissioning of additional equipment. We believe a period of 60 months at a minimum is more appropriate.</p> <p>Finally, we believe that the SDT proposed approach for exception criteria is reasonable recognizing that one method/criteria can not be applicable to everyone and every situation within the ERO footprint. However, we believe that there is a huge gap and lack of any transparency on how the exception application will be evaluated and processed. We strongly suggest that the SDT develop a reference or a guidance document as part of the RoP that should provide guidance to Registered Entities, Regional Entities and the ERO on how an exception application should be processed. Else, (a) it will pose a challenge for each of the entities including ERO, and (b) may introduce Regional discretion and be perceived as having no transparency for the registered entities.</p>
<p><b>Response:</b> The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System including the 100 kV bright-line level. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.</p> <p>Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.</p> <p>The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to</p>		

Organization	Yes or No	Question 11 Comment
		<p>improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The technical aspects of the definition have remained identical to the current definition and identical to the application of the ERO Statement of Compliance Registry Criteria and therefore do not require a technical justification to support maintaining the status-quo.</p> <p>In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.</p> <p>The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.</p> <p>There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn’t been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one</p>

Organization	Yes or No	Question 11 Comment
		<p>has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel’s findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren’t shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn’t been handled before by either party and there is a great deal of professional experience involved on both the submitter’s and the Regional Entity’s side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.</p> <p>Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.</p> <p>Some commenters have asked whether a single ‘yes’ or ‘no’ response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of Procedure that states “No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or</p>

Organization	Yes or No	Question 11 Comment
		<p>disapproved.”</p> <p>The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals.</p> <p>Finally, the SDT would point to the draft SAR for Phase 2 of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase 1 of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.</p>
Western Area Power Administration	Yes	<p>Yes, the definition should also provide clarification on mobile equipment installed to support maintenance or equipment failures. Adding mobile equipment is a common practice for our industry and should be addressed in the definition to bring a general awareness and common understanding of the practice regarding the NERC standards. Recommendation: Add the following Exclusion to BES definition for mobile equipment. Exclude all mobile equipment on stand-by that has not been placed into service as well as all components of mobile equipment that does not meet the inclusion criteria for the primary function of the device being installed (e.g. ,battery bank on mobile transformer installed on radial feed would also be excluded)</p>
		<p><b>Response:</b> The SDT acknowledges the commenter’s concern and has determined that the need for an exclusion identifying mobile equipment is not appropriate. The SDT believes that the BES definition is identifying Elements that support the reliable operation of the interconnected transmission grid. This premise implies that the Element is electrically connected to the system and is performing a reliability related service. The SDT believes that the time the mobile equipment is placed in service is when the equipment would be classified as a BES Element and subject to compliance obligations. No change made.</p>
NESCOE	Yes	<p>NESCOE offers the following additional comments: 1) Phased Approach. While well-intentioned, separating the BES definition project into two separate phases is</p>

Organization	Yes or No	Question 11 Comment
		<p>problematic from both a procedural and substantive perspective. While we recognize that the filing due date is rapidly approaching, the BES definition cannot be considered in a vacuum, divorced from the concerns raised by a number of parties in response to past postings of the BES definition. The issues NERC has identified for consideration during the proposed “Phase 2” are inseparable from the development of the BES definition and should be squarely addressed before a definition is adopted. In particular, the development of criteria for determining what facilities are “necessary for the reliable operation” of the interconnected system cannot be put off for a second phase. Contrary to FERC’s direction, NERC’s proposal will force ratepayers to incur costs related to compliance with mandates that may or may not be revised through the second phase of the project. The importance of considering and resolving such concerns before adopting a definition is heightened by the proposed two-year implementation requirement. This short implementation period almost guarantees that entities will commit resources shortly after adoption of the definition to ensure compliance within the mandated period. In other words, ratepayers will bear costs related to compliance irrespective of any change resulting from the Phase 2 process or the exception process. Expediency, while understandable given the filing deadline, must be balanced against the risk that a multi-phased approach could lead to significant consumer costs without attendant meaningful reliability benefits.</p> <p>2) Cost-Benefit Analysis. A cost impact analysis should be performed as part of developing any reliability standard. However, the development of the BES definition has failed to consider the cost impacts of the definition (and its inclusions and exclusions) and weigh these impacts against identified benefits that the definition would achieve. NESCOE stated in its May 21, 2011 comments on the last posting of the BES definition that “any new costs a revised definition imposes - which fall ultimately on consumers - should provide meaningful reliability benefits.” A cost-benefit analysis should be integral to the development of a BES definition and, indeed, any reliability standard. This analysis should include a probabilistic risk assessment examining the likelihood of an event and the costs and risks resulting from such event, which should be weighed against the costs of complying with the proposed reliability</p>

Organization	Yes or No	Question 11 Comment
		<p>measures.</p> <p>3) Technical Justification. In addition to performing a cost-benefit analysis, a technical basis must be provided to justify a proposed reliability standard. However, as we state above, the proposed BES definition does not provide a technical justification for the 100 kV threshold. Nor does it provide a technical justification for the threshold for generation resources or other elements of the definition. As stated above, while well-intentioned and understandable, deferring this technical justification to a later and separate phase of the project is a flawed and potentially costly approach. Providing a technical justification for a reliability standard is a core function of standards development and should be addressed at the forefront of the process rather than relegated to a separate phase largely undertaken after a standard is filed.</p>
<p><b>Response:</b> 1) The SDT acknowledges the commenter’s concerns; however the SDT (and the ERO) has an obligation to respond to the Commission directives established in Order No. 743 within the time frame allotted by the Order. The narrow scope of the directives and the limited timeframe for project completion has prevented the SDT from fully vetting the concerns of the industry as expressed through the development process. To best address the Commission directives and stakeholder concerns, the SDT has opted to separate the project into phases. The revised project plan has been fully endorsed by the NERC Members Representative Committee and the Board of Trustees. Additionally the NERC Standards Committee has committed to the continued development of a revised definition by retaining the project as a high priority project and by dedicating the resources necessary to fully vet the issues raised by stakeholders.</p> <p>2) The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition</p>		

Organization	Yes or No	Question 11 Comment
<p>any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.</p> <p>3) The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The technical aspects of the definition have remained identical to the current definition and identical to the application of the ERO Statement of Compliance Registry Criteria and therefore do not require a technical justification to support maintaining the status-quo.</p>		
ReliabilityFirst	Yes	<p>This definition needs to be clear and easy enough for anyone to pickup, read, understand, apply and arrive at the same conclusion on whether the facility or element is included or excluded. This definition leaves room for continued debate and interpretation. To help make this definition clearer, ReliabilityFirst Staff has provided a redline version of the core definition under a separate cover (file titled “Bulk Electric System definition by RFC Staff 10-4-2011”).</p>
<p><b>Response:</b> The SDT believes that the revised definition of the BES has provided the necessary clarity to allow for consistent application on a continent-wide basis. The issues identified in the commenter’s redline (provided following the responses to question 11) have been fully vetted by the SDT and addressed in the responses to the comments for the applicable question related to the specific issue.</p>		
Ontario Power Generation Inc.	Yes	<p>Further to comments submitted in Question #1, OPG disagrees in general with proceeding to implement a 100 kV brightline definition in the absence of a properly quantified cost/benefit analysis. Entities are being asked to incur a high cost for no demonstrated benefit in wide-area reliability.</p>
<p><b>Response:</b> The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has</p>		

Organization	Yes or No	Question 11 Comment
<p>pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.</p>		
<p>Central Hudson Gas and Electric Corporation</p>	<p>Yes</p>	<p>Due to the movement to a phased BES definition development process and assuming the definition is approved as proposed, there is an urgent need for NERC to provide clear guidance to Registered Entities regarding how to proceed with facilities and address changes to the NERC Compliance Registry registration obligations brought in/on by the application of the new definition. The problem stems from a likely scenario whereby the affected Registered Entities may be faced with an Implementation Plan and an Exception Request Procedure which must be completed prior to the completion of the Phase 2 definition development process. If that is the case, many Registered Entities will be confronted with either (1) spending large amounts of human and financial resources, not yet acquired, to address facilities/procedures necessary to address possible new compliance obligations only to find their efforts rendered unnecessary by the results produced in Phase 2 or, (2) waiting until the results of Phase 2 are provided and risking being found non-compliant and subject to substantial penalties in the future. Neither option can be viewed as a desirable, or for that matter, an acceptable position to be placed in.</p>
<p><b>Response:</b> The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. <p>pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Therefore, the SDT believes that best opportunity to address cost and resources issues will be through the development of Regional transition plans once the definition has been approved by the Commission. The SDT recommends that the commenter pursue achieving full compliance with the revised definition in the appropriate time period (see Implementation Plan) while utilizing the Rules of Procedure exception process to specific exceptions from the BES definition.</p>		
Springfield Utility Board	Yes	<p>When submitting BES Definition comments, SUB would suggest a “not-applicable”, “no-impact” or “abstain” option in addition to “yes” or “no”. In some cases, the draft language has no impact on an entity’s system, yet that entity’s selection of “yes” or “no” may imply agreement or disagreement rather than expressing lack of applicability. This could skew the perception of agreement or disagreement, and create a potential issue for those who are directly impacted by the changes.</p>
<p><b>Response:</b> The SDT understands the commenter’s concern; however the formatting of the comment form (including the electronic version) is governed by the ERO and beyond the control of the SDT. Your comment will be forwarded to the NERC Standards staff for consideration.</p>		
Mission Valley Power	Yes	<p>Mission Valley Power - In order to help meet the fast approaching target date, Mission Valley Power will be voting affirmative in this ballot, with the hope these comments will be addressed in Phase 2. If the ballot should fail, please address these comments in this phase. Thanks to the team for their good work.</p>
<p><b>Response:</b> The SDT acknowledges and appreciates the continued support of the project. The SDT will consider all recommendations for modifications to the technical aspects of the definition for project inclusion at the appropriate time during Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing</p>		

Organization	Yes or No	Question 11 Comment
values.		
Consolidated Edison Co. of NY, Inc.	Yes	<p>Con Edison shares the concerns raised by the State of New York Department of Public Service (NYPSC) in its September 12, 2011 letter to NERC Chairman Anderson. The NYPSC expressed concern that the proposed BES Definition “would impose significant costs, costs that New York ratepayers will be expected to bear, with little or no increase in reliability benefits.” The BES definition is being revised without an assessment of costs or benefits. The SDT is encouraged to work with NERC Staff to perform such an assessment prior to providing the revised BES definition to the NERC Board. Regional Entities share this concern with cost effectiveness. In NPCC, the Board of Directors directed NPCC Staff to develop a methodology to assess the cost and benefit of Standards. This NPCC Cost Effectiveness Analysis Procedure (CEAP) establishes a process to address those concerns. The CEAP introduces two assessments of the estimated industry-wide costs of requirements into that Standard’s development process. The procedure adds supporting information and background for the NPCC stakeholders, ballot body and the NPCC Board of Directors. Moreover, during a 2010 FERC technical conference the Commission recognized that “reliability does not come without cost.” As a result, significant interest was expressed in development of a process to identify the costs for draft reliability Standards and the ability of the proposed standards to achieve the reliability objective(s) sought in a cost effective manner. We understand that it is a NERC priority to define adequate level of reliability and use it as the basis for determining the cost effectiveness of a proposed rule. While this has not yet been finalized, NERC could use this proposed standard as a test case for determining the relationship between costs and benefits.</p>
<p><b>Response:</b> The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. Northern Wasco County PUD	Yes	<p>In order to help meet the fast approaching target date, Northern Wasco County PUD will be voting affirmative in this ballot, with the hope these comments will be addressed in Phase 2. If the ballot should fail, please address these comments in this phase. Thanks to the team for their good work.</p>
Tillamook PUD	Yes	<p>If Tillamook PUD had signed up to ballot in time, we would be voting yes with the hope that these comments would be addressed in Phase 2. If the ballot fails, please address these comments in this phase.</p>
<p><b>Response:</b> The SDT acknowledges and appreciates the continued support of the project. The SDT will consider all recommendations for modifications to the technical aspects of the definition for project inclusion at the appropriate time during Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.</p>		
American Electric Power	Yes	<p>There needs to be some clarification regarding the default status of an asset, as well as the order and priority of the inclusion and exclusion classifications within the definition. First, prior to any evaluation by virtue of the definition, is an asset by default excluded from the BES, or rather, it is included? In addition, once the definition is used to evaluate an asset which has both inclusion attributes and exclusion attributes, which of the two classifications has greater weight? For example, if an asset is first included by the BES definition inclusion criteria can it then be excluded by BES</p>

Organization	Yes or No	Question 11 Comment
		<p>definition exclusion criteria? Or instead, if an asset is first excluded by BES definition exclusion criteria can it then be included by the BES definition inclusion criteria? AEP's recommendation is that an asset, by default, not be considered part of the BES. Next, the asset would be evaluated by the inclusion criteria as specified within the definition. Next, any asset explicitly included by the inclusion criteria is then evaluated using the exclusion criteria. Once the entity has made their determination based on the definition, exception requests could then be made to include or exclude assets as appropriate. We believe our interpretation is what is implied by the draft definition, however, this needs to be explicitly communicated within the definition itself.</p>
<p><b>Response:</b> The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.</p> <p>Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:</p> <p>"Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. "</p> <p>Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.</p> <p>Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the 'core' definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.</p> <p>Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.</p> <p>Exclusion E1 provides for the exclusion of 'transmission Elements' from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be</p>		

Organization	Yes or No	Question 11 Comment
<p>applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.</p> <p>Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2.</p> <p>Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.</p> <p>In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.</p>		
<p>City of St. George</p>	<p>Yes</p>	<p>The small utility exclusion issues discussed in the first draft of the documents are not included (draft 1 proposed E4) nor addressed in the draft 2 documentation. Under the present definition many small utilities with local generation to serve its own local load will be required to register for additional functions, or at a minimum go through a long, expensive, time consuming process to get an individual exclusion from the BES. The topics that have been postponed to Phase 2 of the project are critical to and will have a direct impact to many utilities. Phase 2 needs to have specific shorter than normal timelines established, similar to what Phase 1 has had. The present definition and standards in general makes little or no consideration for the actual impact of an entity or facility on the bulk system. As such small utilities with a few miles of 115 kV or 138 kV lines and some generation are required to meet the same requirements as large utilities with 100’s or 1,000’s of miles of 345 kV or 500 kV lines and that operate very large generation plants of several hundred MVA of capacity. All utilities support reliability improvement, but the requirements and associated costs need to match their actual impact to the overall system.</p>
<p><b>Response:</b> The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., potential small utility exclusion) of the BES definition. However, it is important to emphasize the fact that the SDT is developing a definition to identify the Elements that support the reliable operation of the interconnected transmission network regardless of ownership or operational responsibility. Small utility issues are very similar to the issues raised through the GOTO project and are best addressed through the applicability of the individual reliability standards, not through the definition of the BES.</p>		

Organization	Yes or No	Question 11 Comment
No change made.		
ISO New England Inc	Yes	<p>There are a number of possible scenarios where an element falls under both an inclusion and exclusion. The definition is unclear as to whether or not this would have the element be BES or not. During the webinar an example was given about a static shunt device meeting the requirements of I5, but is part of a radial network. The response during the webinar was that this would be excluded. If this is correct, it means that an exclusion takes precedence over an inclusion. Is this always the case? This needs to be clarified and stated somewhere in this document.</p> <p>To be consistent with regard to the terms “Operated at 100 kV” and “Connected at 100 kV “, we suggest that reference to generators should state, “Connected at a transmission element operated at 100 kV”. This will avoid confusion in cases where a generator is connected to a transmission element rated at 100 kV but operated at a lower voltage.</p>
<p><b>Response:</b> The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.</p> <p>Initially, the BES ‘core’ definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the ‘core’ definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the ‘core’ definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:</p> <p>“Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. “</p> <p>Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.</p> <p>Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.</p>		

Organization	Yes or No	Question 11 Comment
<p>Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.</p> <p>Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.</p> <p>Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2.</p> <p>Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.</p> <p>In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.</p> <p>The BES definition refers to operating voltage (as emphasized in FERC Order No. 743-A) and the SDT does not feel that the language “connected at a voltage of 100kV or above” creates any confusion on the intent of the Inclusion. No change made.</p>		
NBPT	Yes	<ul style="list-style-type: none"> <li>o When an exclusion and inclusion principles overlap which takes precedence? For example I5 may be excluded if in a LN (E3)</li> <li>o The Local Network Exclusion criterion does not appear to consider voltage support and the effects of shifting of load or impacts due to a loss of load. The 75 MW generation threshold has no technical basis. The LN exclusion should allow for studies demonstrating no through flow benefit regardless if there is.</li> <li>o 75 MW Generation has no technical justification.</li> <li>o Black Start resources should not be included in all GO/GOP standards except for those standards specific to black start units.</li> </ul>
<p><b>Response:</b> The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will</p>

This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.</p> <p>Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2.</p> <p>Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.</p> <p>In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.</p> <p>The local network exclusion has established a bright-line with specific characteristics that must be met to be eligible for exclusion.</p>

Organization	Yes or No	Question 11 Comment
		<p>Exclusion E3b states: “Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN”. This characteristic applies under all operating conditions including any variations in network load. It is not clear to the SDT what the commenter is referring to in regards to voltage support. Exclusion E3 addresses transmission Elements and does not exclude Real Power or Reactive Power resources from the BES.</p> <p>The concept of the 75 MVA threshold is based on the generation inclusion criteria for plant/facility arrangements by carrying through the concept of the reliability impact that the aggregated loss of 75 MVA or greater would have on the overall reliability of the interconnected transmission grid. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 and 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.</p> <p>The SDT has determined that Blackstart Resources serve a reliability benefit to the interconnected transmission grid and therefore have been included in the scope of the BES. This is consistent with current practice and specifically with the registration requirements that identify the owner, operators, and users of Blackstart Resources be registered as Generator Owner/Generator Operator. Specific concerns with the applicability of individual standards should be addressed through the Standard Development Process for the individual Reliability Standards in question.</p>
Texas Reliability Entity	Yes	<p>(1) It is unclear exactly what is intended by “non-retail generation” in Exclusion E1(c). We suggest that the term be explained or defined in the BES definition or in a collateral document. This term does not have a commonly understood unambiguous meaning in our Region.</p> <p>(2) Phase 2 has to be completed or explicitly defined/scoped to fully capture all of the components necessary for reliable operation of the BES.</p>

Organization	Yes or No	Question 11 Comment
<p><b>Response:</b> (1) Non-retail generation is the generation on the system (supply) side of the retail meter.</p> <p>(2) The supplemental SAR for Phase 2 of the project will be posted for industry comment at which time the SDT will be accepting recommendations for specific issues to be addressed by the SDT during phase 2 of the project.</p>		
<p>New York State Dept of Public Service</p>	<p>Yes</p>	<ul style="list-style-type: none"> <li>o Per NERC’s obligations under the Energy Power Act of 2005 to provide FERC technical advice, no technical justification has been provided for basing the BES definition on the 100 kV and MVA thresholds.</li> <li>o No cost analysis on either the reliability benefits of the overall definition or on the implementation plan has been performed to determine whether the likely high cost of the definition to ratepayers is justified.</li> <li>o The definition of the BES should be the driver for the application of all other NERC reliability standards and criteria. The definition uses the Statement of Compliance Registry Criteria as a driver of the definition when the reverse should be taking place; contents of the Statement should be driven by the BES definition.</li> </ul>
<p><b>Response:</b> The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the definition has not been altered in regards to the bright-line or the generation thresholds and therefore does not require the development of technical justification to maintain the status quo.</p> <p>SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission</p>		

Organization	Yes or No	Question 11 Comment
<p>grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.</p> <p>The SDT has revised the language in Inclusion I2 to eliminate the circular reference to the ERO Statement of Compliance Registry Criteria. Inclusion I2 has been revised to read:</p> <p><b>I2 -</b> Generating resource(s) (with gross individual <u>nameplate rating greater than 20 MVA</u> or gross <u>plant/facility</u> aggregate nameplate rating <u>greater than 75 MVA per the ERO Statement of Compliance Registry Criteria</u>) including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.</p>		
Hydro-Quebec TransEnergie	Yes	<p>In the Implementation plan, it is given only 24 months for compliance after applicable regulatory approval. Considering the possibility that a proposed transition plan may involve commissioning of long term projects, a provision for such situation should be made with longer delay.</p>
<p><b>Response:</b> The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. With that being said, the SDT believes that an implementation time period of 24 months is sufficient time to address the development of regional transition plans, address any necessary registration changes, file for exceptions through the Rules of Procedure exception process and address any required training. The SDT also acknowledges that the potential exists for extenuating circumstances that will need to be addressed through the regional transition plans.</p>		
Independent Electricity System Operator	Yes	<p>We wish to also express our support for phased approach proposed in the draft supplemental SAR. Development of the revised BES definition is an important and</p>

Organization	Yes or No	Question 11 Comment
		<p>complex undertaking. The product of this work is fundamental to establishing the applicability of NERC Reliability Standards. The issues identified for attention in Phase 2 of this project warrant careful investigation and as such allowing additional time to properly research and stakeholder them is justified. The draft Implementation Plan for the BES definition states “Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition.” We are concerned that the stated implementation period may be insufficient time to (1) prepare and file exception requests and have these assessed; and (2) in cases where these exception requests are not approved, to develop and complete transition plans for newly identified BES Elements and Facilities, particularly where those plans require major investments for the procurement, installation and commissioning of additional equipment. We therefore propose the following alternative wording for the Implementation Plan: “Compliance obligations for elements included by the definition shall be evaluated and an implementation schedule established within 24 months.”</p> <p>Throughout the document various phrases are used to describe generating units/resource, viz. “generation resources”, “generating resources”, “generating unit” and “power producing resources”. Please review these to identify and address any possible inconsistencies.</p>
<p><b>Response:</b> The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. With that being said, the SDT believes that an implementation time period of 24 months is sufficient time to address the development of regional transition plans,</p>		

Organization	Yes or No	Question 11 Comment
<p>address any necessary registration changes, file for exceptions through the Rules of Procedure exception process and address any required training. The SDT also acknowledges that the potential exists for extenuating circumstances that will need to be addressed through the regional transition plans.</p> <p>The SDT has reviewed the applicable documents for inconsistencies related to the terms generating units/resource, viz. “generation resources”, “generating resources”, “generating unit” and “power producing resources”. The SDT has made the appropriate modifications to address any issues resulting from the inconsistencies.</p>		
Central Lincoln	Yes	<p>We note that the SAR for Phase 2, like that for Phase 1, does not include all entity types. We see no reason to maintain dual definitions for the different entity types, and the resulting confusion.</p> <p>In order to help meet the fast approaching January target date, Central Lincoln will be voting affirmative in this ballot, with the hope these comments will be addressed in Phase 2. If the ballot should fail, please address these comments in this phase. Thanks to the team for their good work.</p>
<p><b>Response:</b> The draft SAR developed for Phase 2 of Project 2010-17 Definition of the Bulk Electric System, similar to the SAR for Phase 1 has purposefully omitted the Interchange Authority and the Purchase Selling Entity functional entities because these entities do not own or operate BES Elements. This conclusion does not necessitate the need for dual definitions; the definition of the BES does not impact the functional responsibilities of these entities.</p> <p>The SDT acknowledges and appreciates the continued support of the project. The SDT will consider all recommendations for modifications to the technical aspects of the definition for project inclusion at the appropriate time during Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values.</p>		
Utility Services, Inc.	Yes	<p>Utility Services would like to raise the question of whether SCRC III.3.d (the so-called "Generator Materiality" clause) is incorporated within the BES Inclusion Designations. One theory suggests that given that I2 is designed to deal with III.3.a and III.3.b and I3 reflects the need to incorporate black start generation; then generators under the materiality clause are not identified with the inclusion criteria. However, the second theory suggests that resources identified through I2 reflect the entire III.c.1-4 language</p>

Organization	Yes or No	Question 11 Comment
		of the SCRC, then the generators in the material clause are captured under I2. But if this is the case, then I3 is redundant to I2 and does not need to separately addressed.
<p><b>Response:</b> The SDT has revised the language in Inclusion I2 to clearly identify the applicability of generating resources. The revised language is as follows:</p> <p><b>I2 -</b> Generating resource(s) <del>(with gross individual <u>nameplate rating greater than 20 MVA</u> or gross <u>plant/facility</u> aggregate nameplate rating <u>greater than 75 MVA per the ERO Statement of Compliance Registry Criteria</u>)</del> including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.</p>		
FirstEnergy Corp.	Yes	FE supports the SDT's phased project approach which was well articulated in the NERC BES Definition Fact Sheet
LCRA Transmission Services Corporation	Yes	LCRA TSC supports the direction the standards drafting team taking with this project on the BES Definition and encourages further clarification as noted in these comments for proper application.
<p><b>Response:</b> The SDT acknowledges and appreciates the continued support of the project.</p>		
National Grid	Yes	The proposed implementation period in the draft definition is too short. The new BES definition will likely result in increased operational costs during the implementation period that will ultimately be borne by customers. Implicit in the Commission's directive to change the BES definition is the Commission's determination that the benefits of this change, including consistency among the regions, outweigh the ratepayer impacts. However, National Grid remains concerned that the ratepayer impacts have not been fully taken into account. The implementation period is a tool that can allow NERC to meet the Commission's directive while softening any resulting ratepayer impacts. Implementation can and should be staged in order to mitigate and even out rate increases. National Grid suggests that the implementation period be flexible to allow entities who anticipate that large and/or expensive upgrades to the BES will be necessary to meet compliance can submit an alternate implementation plan to spread compliance and the associated rate changes over a longer period; we

Organization	Yes or No	Question 11 Comment
		<p>would suggest a minimum of 7 years. This time period was also recognized as a reasonable implementation time period in the recent TPL-001-2 for those portions of the standard that would also result in plans that would require siting, permitting and construction activities. This BES definition is likely to have similar impacts for some entities and allowing for an implementation timeline with the definition change enables achievement of the goals while recognizing the realities of constructing facilities in today's environment.</p>
<p><b>Response:</b> The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT's efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission's concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 and 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. With that being said, the SDT believes that an implementation time period of 24 months is sufficient time to address the development of regional transition plans, address any necessary registration changes, file for exceptions through the Rules of Procedure exception process and address any required training. The SDT also acknowledges that the potential exists for extenuating circumstances that will need to be addressed through the regional transition plans.</p> <p>In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.</p>		
Rochester Gas and Electric	Yes	If the definition and inclusions and exclusions are not sufficiently specific and clear,

Organization	Yes or No	Question 11 Comment
and New York State Electric and Gas		<p>stakeholders will flood NERC and RROs with interpretation requests and/or apply the definition and its inclusions or exclusions incorrectly. Explanatory figures with one-line diagrams should be developed and shared to illustrate the system configurations included and excluded in this BES Definition. This would be very helpful for definition clarity. This should be done as part of an “Application Guide” for the BES Definition - this has precedence in CIP-002 version 5. Attached is a sample set of one-line diagrams with interpretations based upon the inclusions and exclusions developed by Northeast Power Coordinating Council members for discussion purposes as an example, but note that there is not a uniform agreement on these diagrams based on the BES Definition as written, due to lack of clarity.</p>
<p><b>Response:</b> The development of a guidance document which contains generic diagrams is a portion of the overall project that the SDT feels is necessary to ensure the consistent application of the BES definition going forward. Therefore the SDT has determined that such a document will be developed during Phase 2 of the project. The SDT thanks Rochester for the appended drawings but wishes to point out that the SDT does not agree with some of the depictions shown on the drawings thus pointing out the need for an eventual guidance document.</p>		
Central Maine Power Company	Yes	<p>If the definition and inclusions and exclusions are not sufficiently specific and clear, stakeholders will flood NERC and RROs with interpretation requests and/or apply the definition and its inclusions or exclusions incorrectly. Explanatory figures with one-line diagrams should be developed and shared to illustrate the system configurations included and excluded in a BES Definition. This would be very helpful for definition clarity. This should be done as part of an “Application Guide” for the BES Definition - there is precedence for an “Application Guide” with graphical support in CIP-002 version 5. A sample set of one-line diagrams with interpretations based upon the inclusions and exclusions developed by Northeast Power Coordinating Council members for discussion purposes is available as an example, but note that there is not a uniform agreement on these diagrams based on the BES Definition as written, due to lack of clarity.</p>

Organization	Yes or No	Question 11 Comment
Nebraska Public Power District	Yes	<p>Regarding the Local Network: Can there be some additional technical documents or examples provided for the most common configurations? The LN document is a good document to provide guidance, however the supply of common configuration examples would be very helpful in determining LN applicability. Examples where technical document with examples would be helpful: 1. If a breaker and a half source substation provides two parallel 115 kV lines feeding a load only substation from separate breaker and a half legs at the source substation, would the two parallel lines feeding the load be a LN distribution network feed since they are from the same source substation? 2. if there is a radial feed from a ring bus or a breaker and a half configuration to a radial load on a single line can the portion of the ring bus or breaker and a half bus between the line breakers and the breakers themselves at the source substation be excluded from the BES? 3. Can some legs of a 115kV breaker and a half substation be designated BES and the other legs be non BES depending on how the BES lines and loads tie in to the breaker and half legs? 4. In determining if elements are BES is there any consideration to fault locations and if these faults would interrupt BES flow on ring bus or breaker and a half configurations to help determine what is BES? If so, how many contingencies would be considered to interrupt BES flow?</p>
<p><b>Response:</b> The development of a guidance document which contains generic diagrams is a portion of the overall project that the SDT feels is necessary to ensure the consistent application of the BES definition going forward. Therefore the SDT has determined that such a document will be developed during Phase 2 of the project.</p>		
Ameren	Yes	<p>a) We believe this revised definition is an improvement over the previous posting, a step in the right direction.</p> <p>b) The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. Our concern is how this revised definition will impact entity registration, i.e., how will the revised definition be integrated into the Compliance Registry Criteria. The implementation plan should include how the integration is going to occur. The Rules of Procedure exception process should be further defined or referenced in this definition.</p>

Organization	Yes or No	Question 11 Comment
		<p>c) See Question 1 response: The general concept is sound, but the Inclusion and Exclusion sections create so many circular references it is virtually impossible to take a definitive stance on whether an asset is included or excluded to the BES definition. Please revise the inclusion and exclusion criteria to give pinpointed statements that are final and do not reference other criteria, that then again reference other criteria</p>
<p><b>Response:</b> a) The SDT acknowledges and appreciates the continued support of the project.</p> <p>b) The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The BES definition will be utilized in conjunction with the ERO Statement of Compliance Registry Criteria to determine how entities will be registered. As the SDT progresses through phase 2 of the project, consideration will be given to establish a definition that will eventually be the definitive document to determine registration requirements.</p> <p>The Rules of Procedure exception process is referenced in the current draft version of the BES definition in a note which states: “Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process”.</p> <p>c) The SDT has made several revisions that address the clarity issues raised by commenter’s. For a detailed response concerning the specific clarifications made by the SDT, see the individual responses for the appropriate question. The application of the bright-line definition of the BES is explained in the detail in the Summary Consideration at the beginning of this question.</p>		
MEAG Power	Yes	<p>The definition of the BES is referenced in several existing standards and the Statement of Compliance Registry Criteria. We are concerned how this revised definition will impact entity registration, i.e., how will the revised definition be integrated into the Compliance Registry Criteria.</p> <p>The implementation plan should include how the integration is going to occur.</p>

Organization	Yes or No	Question 11 Comment
<p><b>Response:</b> The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 and 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. The BES definition will be utilized in conjunction with the ERO Statement of Compliance Registry Criteria to determine how entities will be registered. As the SDT progresses through phase 2 of the project, consideration will be given to establish a definition that will eventually be the definitive document to determine registration requirements.</p> <p>The current Implementation Plan is determining the effective dates of the revised definition and the extended time period for meeting compliance obligations. The revised definition and the current ERO Statement of Compliance Registry Criteria will continue to be utilized in the same manner as today for registration determinations. In proposing a 24 month period in the Implementation Plan before the definition is applied in assessing compliance obligations, the SDT considered several activities that may require additional time to complete for an entity to become fully compliant. One of these activities is the development of transition plans in cases where significant issues may have been identified as potentially preventing an entity from meeting the compliance obligations within the 24 month period. These transition plans are to be developed by the Regional Entity and the Registered Entity in a cooperative manner to best address the identified concerns and establish an agreed to mitigation plan which results in full compliance by the Registered Entity.</p>		
Redding Electric Utility	Yes	
City of Redding	Yes	Redding is concerned that phase 2 will not produce significant rules or criteria that further define the BES; the desire to dedicate adequate resources is currently high since FERC has a looming deadline upon NERC, however without deadlines Redding believes that NERC will find it difficult to find the expertise or desire to finish the Project.
<p><b>Response:</b> The NERC Standards Committee (SC) has approved Phase 2 of Project 2010-17 Definition of the Bulk Electric System as a ‘high priority’ project. Additionally, the SC has retained the existing SDT and committed to providing the necessary resources through the NERC Technical Committees in providing analysis of technical issues to be addressed in Phase 2 of the project. Furthermore, the</p>		

Organization	Yes or No	Question 11 Comment
<p>SDT will be developing a project schedule for Phase 2, subject to approval by the SC, which will identify the appropriate deadlines throughout the project.</p>		
<p>Indeck Energy Services</p>	<p>Yes</p>	<p>As acknowledged in the response to Question 12 comments on the previous BES definition, the BES definition is expansive compared to the definition of the BPS in the FPA Section 215. The inclusion of the limited Exclusions is an attempt to remedy the situation. However, the Exclusions need to include a fifth one that if, based on studies or other assessments, it can be shown that any transmission or generator element otherwise identified as part of the BES is not important to the reliability of the BPS, then that element should be excluded from the mandatory standards program. There has never been a study to show that elements, such as a 20 MW wind farm, 60 MW merchant generator (which operates infrequently in the depressed market) in a large BA (eg NYISO) or a radial transmission line connecting a small generator are important to the reliability of the BPS. They are covered by the mandatory standards program through the registration criteria. The BES Definition is the opportunity to permit an entity to demonstrate that an element is unimportant to reliability of the BPS. The SDT has identified a small subset of elements that it is willing to exclude. By their very nature, these exclusions dim the bright line that is the stated goal of this project. However, the SDT's foresight seems limited in its selections. Analytical studies are used to evaluate contingencies that could lead to the Big Three (cascading outages, instability or voltage collapse). Such a study showing that a transmission or generation element is bounded by the N-1 or N-2 contingency would exclude it from the BES definition. For example, in a BA with a NERC definition Reportable Disturbance of approximately 400 MW (eg NYISO), a 20 MW wind farm, 60 MW merchant generator or numerous other smaller facilities would be bounded by larger contingencies. It would take more than six 60 MW merchant generators with close location and common mode failure to even be a Reportable Disturbance, much less become the N-1 contingency for the Big Three. Exclusion E5 should be "E5 - Any facility that can be demonstrated to the Regional Entity by analytical study or other assessment to be unimportant to the reliability of the BPS (with periodic reports by</p>

Organization	Yes or No	Question 11 Comment
		the Regional Entity to NERC of any such assessments).”
<p><b>Response:</b> The concerns of the commenter are addressed by the implementation of the Rules of Procedure exception process, which establishes the exclusion methods described by the commenter. The commenter’s suggested language leaves Regional discretion in the process, which is a cited concern requiring elimination by the Commission, in the Orders No. 743 and 743-A. The SDT has provided a reference to the Rules of Procedure exception process in the definition with the following language: “Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.”</p>		
<p>Kootenai Electric Cooperative Michigan Public Power Agency Clallam County PUD No.1 Blachly-Lane Electric Cooperative (BLEC) Coos-Curry Electric Cooperative (CCEC) Central Electric Cooperative (CEC) Clearwater Power Company (CPC) Snohomish County PUD Consumer's Power Inc. Douglas Electric Cooperative (DEC) Fall River Rural Electric Cooperative (FALL) Lane Electric Cooperative</p>	<p>No</p>	<p>KEC extends its thanks to the SDT and to the many industry entities that have actively participating in the Standards Development Process. KEC strongly supports the current draft and believes, with certain refinements discussed in our comments, that the definition will serve the industry and reliability regulators well for many years to come. In addition, as noted earlier, KEC is encouraged that the 20/75 MVA generation thresholds referred to in the NERC Statement of Compliance Registry Criteria, which have been relied upon by the SDT largely as a matter of necessity, will be reviewed and a technical assessment will be performed to identify the appropriate generation unit and plant size threshold to ensure a reliable North America. Finally, we understand that the Rules of Procedure Team will continue to move forward with developing an Exceptions Process that will complement the BES Definition and ensure that, to the extent the BES Definition is over-inclusive, facilities that should not be classified as BES will be excluded from the BES. Because the Exceptions Process is integral to a workable BES Definition, we support the current process for moving forward with the Exceptions Process and the BES Definition on parallel paths. We note that KEC specifically supports the changes made by the SDT in the “Effective Date” provision of the BES Definition, which shortens the effective date of the new definition to the beginning of the first calendar quarter after regulatory approval (as opposed to the first calendar quarter twenty-four months after regulatory approval), with a 24-month transition period. KEC supports this conclusion because it will allow entities seeking deregistration under the terms of the new BES definition to obtain the benefits of the new definition without an unreasonable wait, while allowing any entities that may be newly-classified as BES owners or operators sufficient time to</p>

## RFC Suggested changes to definition:

**Bulk Electric System (BES):** Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. ~~This does not include facilities used in the local distribution of electric energy.~~ The BES includes:

**Inclusions:**

- I1 - Transformers with primary and secondary terminals operated at 100 kV or higher, ~~unless excluded under Exclusion E1 or E3 for local distribution or retail customers.~~
- I2 - Generating resources as described in the ERO Statement of Compliance Registry Criteria including the generator terminals through the high-side of the step-up transformer(s), connected at a voltage of 100 kV or above.
- I3 - Blackstart Resources and associated designated blackstart Cranking Paths operated at 100 kV or higher, identified in the Transmission Operator's restoration plan, regardless of voltage level.
- ~~I4 - Dispersed power producing resources as described in the ERO Statement of Compliance Registry Criteria utilizing a system designed primarily for aggregating capacity, connected at common point at a voltage of 100 kV or above.~~
- **I45** - Static or dynamic devices dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in **Inclusion I1**.

This definition does not include facilities used in the local distribution of electric energy or retail customers, which are:-

**Exclusions:**

- E1 - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher from a single Transmission source originating with a single automatic interruption device and:
  - a) Only serves Load. Or,
  - b) Only includes generation resources not identified in **Inclusion I3**, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,
  - c) Where the radial system serves Load and includes generation resources, not identified in **Inclusion I3**, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

Note - A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

- **E2** - A generating unit or multiple generating units that serve all or part of retail customer Load with electric energy on the customer's side of the retail meter if:
  - (i) the net capacity provided to the BES does not exceed 75 MVA, and
  - (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.
- **E3** - Local Network (LN): A group of contiguous transmission Elements operated at or above 100 kV but less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:
  - a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in ~~Inclusion~~-I3 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);
  - b) Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN; and;
  - c) Not part of a Flowgate or transfer path: The LN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
- **E4** – Reactive Power devices owned and operated by the retail customer solely for its own use.

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

**Pacificorp additional comments:**

5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I4 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Yes:

No:

Comments: Setting a dispersed power producing resource limit to 75 MVA at a common point discriminates against single generator owners who own generators between 20 MVA and 75 MVA (inclusion I1), typically connected at a common point and requires such owners to be subject to additional standards that dispersed power producing owners are not required.

However, even with this concern, PacifiCorp supports the entire BES definition in its current form based on the timeframe under which the SDT is operating and with an emphasis based on a phase II SAR to address PacifiCorp's objections regarding generation levels.

Under the attached scenario, please identify which elements would be considered BES:

**Rochester Diagrams:** These diagrams were supplied by Rochester as examples and do not reflect the SDT's opinion of what is and isn't a BES Element.

Figure 1 (Inclusion I1):

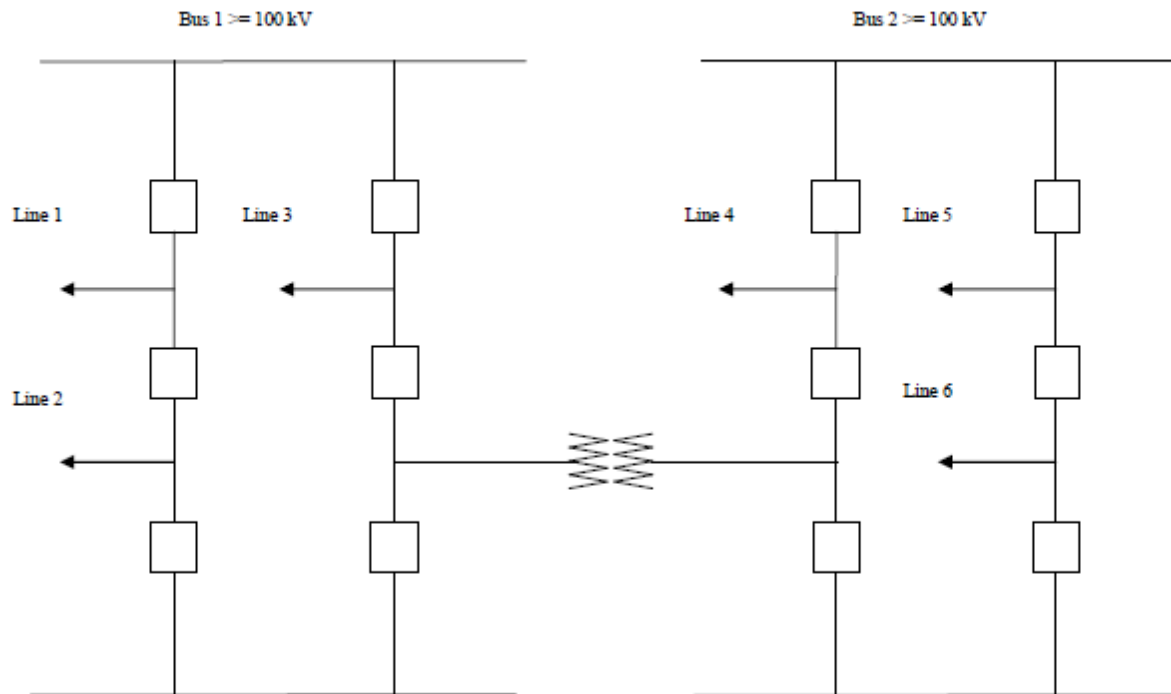

Figure 2 (Inclusion I1): **Non-BES in Red (Exclusions E1a, E1b, E1c)**

Figure 3 (Inclusion I2): **Non-BES in Red**

## Consideration of Comments on Initial Ballot — Definition of BES (Project 2010-17)

Date of Initial Ballot: September 30, 2011 - October 10, 2011

**Summary Consideration:** Many commenters followed instructions and cast their ballot while simply pointing to their detailed comments in the posted comment report. The SDT thanks those commenters as this greatly reduces the administrative workload on the SDT. Those who decided to place comments in the ballot report for the most part echoed comments that had already been seen by the SDT in the posted comment report which was administered first by the SDT. As a result, there were no changes to the definition due to comments received in the ballot report. However, for ease of reference, the changes to the definition made as a result of those comments are repeated here.

The SDT made the following changes to the definition due to industry comments received:

- Clarified the wording in Inclusion I1 to indicate that at least one secondary terminal must be at 100 kV or higher to accommodate multiple terminal transformers.
- Removed the reference to the ERO Statement of Compliance Registry Criteria in Inclusion I2 so that there is no chance of the registry values being changed and affecting the definition prior to resolution of threshold values in Phase II of this project.
- Clarified that generators were not part of Inclusion I5 to avoid improperly pulling in small generators.
- Clarified the language of Exclusion E2 by re-ordering the text as suggested.
- Clarified the language of Exclusion E3.b as suggested.

The SDT feels that it is important to remind the industry that Phase II of this project will begin immediately after the conclusion of Phase I as SDT resources clear up. The same SDT will follow through with Phase II.

The SDT is recommending that this project be moved forward to the recirculation ballot stage.

There were two comments that were repeated multiple times throughout the various documents. The first topic was about how to sort through the definition inclusions and exclusions, i.e., which takes precedence. The SDT offers this guidance on that issue:

The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.

Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the 'core' definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:

“Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. “

Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.

Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.

Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.

Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.

Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2.

Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.

In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.

The second item is about providing specific guidance on how the information on the exception request form will be used in making decisions on inclusions/exclusions in the exception process. While not technically part of this document which is about the definition, since the question did come up in these comments, the SDT provides the following information:

The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.

There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel's findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren't shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn't been handled before by either party and there is a great deal of professional experience involved on both the submitter's and the Regional Entity's side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.

Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.

Some commenters have asked whether a single 'yes' or 'no' response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of

Procedure that states “No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or disapproved.”

The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals.

Finally, the SDT would point to the draft SAR for Phase II of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase I of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.

If you feel that the drafting team overlooked your comments, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 404-446-2560 or at [herb.schrayshuen@nerc.net](mailto:herb.schrayshuen@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

<p><b>Response:</b> The SDT thanks you for following the instructions on submitting comments. This greatly decreases the amount of administrative work for the SDT and will help accelerate the process.</p>				
Mike Ramirez	Sacramento Municipal Utility District	4	Negative	SMUD believes that the SDT has made substantial progress towards a clear and workable definition of the BES. Although SMUD in balloting "Negative" we strongly support the approach to defining the Bulk Electric System as proposed here. SMUD recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct a technical analysis within the time available. Accordingly, SMUD agrees with the approach taken by the SDT, which is to propose a Phase II of the standards development process that would address the generator threshold level and other issues. However, it is our opinion that the second draft would benefit from further clarification or modification in a number of respects, as are detailed in our comments. That said, SMUD is prepared to support the BES definition as proposed by the SDT going forward. SMUD has taken the opportunity to provide this industry feedback, as it is our understanding that we will be afforded another ballot opportunity. If this were to be our sole occasion to ballot, we would vote "Affirmative" at this time. We are

Voter	Entity	Segment	Vote	Comment
				encouraged by the work that has been completed and we commend the SDT for their commitment and extensive work thus far. Detailed Comments submitted separately.
James Leigh-Kendall	Sacramento Municipal Utility District	3	Negative	SMUD believes that the SDT has made substantial progress towards a clear and workable definition of the BES. Although SMUD in balloting "Negative" we strongly support the approach to defining the Bulk Electric System as proposed here. SMUD recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct a technical analysis within the time available. Accordingly, SMUD agrees with the approach taken by the SDT, which is to propose a Phase II of the standards development process that would address the generator threshold level and other issues. However, it is our opinion that the second draft would benefit from further clarification or modification in a number of respects, as are detailed in our comments. That said, SMUD is prepared to support the BES definition as proposed by the SDT going forward. SMUD has taken the opportunity to provide this industry feedback, as it is our understanding that we will be afforded another ballot opportunity. If this were to be our sole occasion to ballot, we would vote "Affirmative" at this time. We are encouraged by the work that has been completed and we commend the SDT for their commitment and extensive work thus far. Detailed Comments submitted separately.
Terry L Baker	Platte River Power Authority	3	Negative	Platte River believes that the SDT has made substantial progress towards a clear and workable definition of the BES. Although Platte River ballots "Negative" we strongly support the approach to defining the Bulk Electric System as proposed here. Platte River recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct a technical analysis within the time available. Accordingly, Platte River agrees with the approach taken by the SDT, which is to propose a Phase II of the standards development process that would address the generator threshold level and other issues. <p><b>Response:</b> Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. The first step in Phase II will be the posting of the Phase II draft SAR for comment. At that time, you will have the opportunity to submit comments for the inclusion of items and issues to be considered by the SDT in Phase II.</p>				
Philip Riley	Public Service Commission of South Carolina	9	Negative	The Public Service Commission of South Carolina does not believe adequate technical evaluations have been done for basing the BES definition on the 100 kV and 20 MVA thresholds as proposed. In addition, the Public Service Commission of South Carolina does not believe adequate cost benefit studies have been done to justify the proposal for the 100

Voter	Entity	Segment	Vote	Comment
				kV and 20 MVA thresholds. Lack of cost benefit analyses has been a recurring comment of the Public Service Commission of South Carolina on proposed NERC standards.
<p><b>Response:</b> Both the 20 MVA and 100 kV thresholds are items for consideration in Phase II. At that time, technical evaluations and studies will be performed to provide the details the SDT needs to have to adequately address the issues.</p>				
<p>The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 &amp; 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 &amp; 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.</p>				
Dale Bodden	CenterPoint Energy Houston Electric	1	Negative	Inclusion I5 provides for the inclusion of static devices dedicated to supplying or absorbing Reactive Power based upon their connection to the transmission system. The wording concerning their connection to the transmission system appears reasonable; however, CenterPoint Energy believes the size of a static reactive device should be taken into consideration. Static reactive devices are more widely distributed across a transmission system than generation resources. We recommend that only static reactive devices that are greater than 150 MVAR be included. CenterPoint Energy could support Draft 2 if a reasonable size threshold is established for static reactive devices.

Voter	Entity	Segment	Vote	Comment
<p><b>Response:</b> The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p>				
Robert Ganley	Long Island Power Authority	1	Negative	<p>LIPA has voted NO to the proposed definition of Bulk Electric System as posted and offers the following comments with our vote: 1. The SDT needs to provide clarifying language for the following terms so that facilities can be adequately addressed in determining whether they are BES elements or not:</p> <ul style="list-style-type: none"> <li>a. "local distribution" as used in the BES core definition</li> <li>b. "common point" as used in Inclusion I4</li> <li>c. "single point of interconnection" as used in Exclusion E1</li> <li>d. "underlying Elements" as used in Exclusion E3a</li> </ul> <p>2. The core definition and exclusion E3b and E3c adequately define a Local Network. It seems like the intent to exclude non bulk distribution systems would still be included because of E3a. ( limits on connected generation ) We believe E3a should be eliminated in defining a Local Network.</p>
<p><b>Response:</b> a) The SDT believes that the wording in the core definition plus Exclusions E1 and E3 provide the basis for defining local distribution. In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.</p> <p>b) While the SDT has determined no additional clarification of the term "common point" is needed in the BES definition, the following guidance is provided. The SDT believes the common point of connection, which is the point from where generation is</p>				

Voter	Entity	Segment	Vote	Comment
<p>aggregated to determine if the 75 MVA threshold is met, to be the point where the individual transmission Element(s) of a collector system ultimately meet the 100 kV transmission system.</p> <p>c) The “single point of connection of 100 kV or higher” is where the radial system will begin if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation.</p> <p>d) The SDT believes that the existing phrase in ExclusionE3.a “and its underlying Elements” has sufficient clarity and meets the intent of the exclusion with brevity. No change made.</p> <p>e) The SDT continues to believe that it is necessary to establish a limit on the allowable quantity of generation that may be significant to the reliable operation of the surrounding interconnected transmission system. Please note that the issues surrounding the appropriate generation threshold, among other topics, will be taken up in Phase 2 of this BES definition effort. No change made.</p>				
Martyn Turner	Lower Colorado River Authority	1	Negative	<p>1. The SDT has made clarifying changes to the core definition in response to industry comments. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments:</p> <p>2. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I1 (transformers)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: LCRA TSC supports the inclusion of transformers (with both the primary and secondary windings operated at 100-kV or higher) in the BES definition; however, additional clarification is suggested. The term transformers needs to be further defined with respect to function (auto transformers, phase angle regulators, generator step-up transformers, etc.). Similarly, a separate definition for “Transformer” could be developed and included</p>

Voter	Entity	Segment	Vote	Comment
				<p>in the NERC Glossary of Terms.</p> <p>3. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I2 (generation) including the reference to the ERO Statement of Compliance Registry Criteria? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments:</p> <p>4. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I3 (blackstart)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments:</p> <p>5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I4 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: LCRA TSC suggests consistency between this inclusion criteria and the criteria used in I2 for "generation".</p> <p>6. The SDT has added specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I5 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: This inclusion conflicts with exclusion E4. Which one takes priority?</p> <p>7. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E1 (radial system)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: The current wording is unclear with respect to the treatment of normally open switching devices. LCRA TSC suggests the following language to replace the existing language on the note to E1: "Two radial systems connected by a normally open, manually operated switching</p>

Voter	Entity	Segment	Vote	Comment
				<p>device, as depicted on prints or one-line diagrams for example, may be considered as radial systems under this exclusion." The current wording is unclear with respect to "non-retail generation". The sudden loss of large, radial-supplied load may result in reliability deficiencies. LCRA TSC suggests stating a load level or a load capacity in the exclusion.</p> <p>8. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E2 (behind-the-meter generation)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments:</p> <p>9. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E3 (local network)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments:</p> <p>10. The SDT has added specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E4 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: This exclusion conflicts with inclusion item 15. Which one takes priority?</p> <p>11. Are there any other concerns with this definition that haven't been covered in previous questions and comments remembering that the exception criteria are posted separately for comment? Yes: X No: Comments: LCRA TSC supports the direction the standards drafting team taking with this project on the BES Definition and encourages further clarification as noted in these comments for proper application.</p>
<p><b>Response:</b> The SDT refers LCRA to the individual comment responses in the definition comment form as the comments expressed here are exactly identical to the comments submitted by LCRA on that form.</p>				
Danny Dees	MEAG Power	1	Negative	MEAG believes that a Yes vote for the draft BES Definition will result in minimal or no changes. We have identified a few changes that if made will secure a Yes vote on the next ballot.

Voter	Entity	Segment	Vote	Comment
				<p>The most important change is needed in I5 reactive resources noted below. I5 reactive resources - We feel that this inclusion should be limited to dynamic devices with an aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) connected through a common point.</p> <p>E1 - Non-retail generation needs to be defined to clarify why it is used in this exclusion.</p> <p>E2 (ii) The reference to generation on the customer's side of the retail meter needs to be clarified to provide a better understanding as to what is intended with this phrase.</p> <p>E3 b - We would agree with the exclusion if the wording of the exclusion includes the following phrase (in italics) added at the end of E3 b): Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN "under normal operating conditions".</p>
<p><b>Response:</b> The SDT refers MEAG to the individual comment responses in the definition comment form as the comments expressed here are exactly identical to the comments submitted by MEAG on that form.</p>				
Ernest Hahn	Metropolitan Water District of Southern California	1	Affirmative	<p>MWDSC generally supports the core definition of the Bulk Electric System as proposed. However, some of the proposed Inclusions and Exclusions need to be clarified as identified below.</p> <p>Inclusion 5 should be changed to be consistent with the core definition and to clarify Reactive Power devices. Under I5, the additional phrase "or through a dedicated transformer with a high-side voltage of 100 kV or higher," appears to conflict with the core definition's phrase "and Real Power and Reactive Power resources connected at 100 kV or higher". For example, if you have a device connected to a 69Kv system which is used solely for an end-user's load, but the 69kv system is transformed up to a 115kV system, such device could be included as BES or you would have to define what is meant by "dedicated. If Reactive Power is meant to agree with the definition under NERC's Glossary of Terms, there should be consistency and less verbiage.</p> <p>MWDSC also agrees with WECC's comment that there should be some minimum threshold for Reactive Power devices similar to that identified for generating resources in Inclusion 2.</p> <p>MWDSC recommends that Inclusion 5 be changed as follows: I5 - "Reactive</p>

Voter	Entity	Segment	Vote	Comment
				<p>Power devices dedicated to support the BES that are connected at 100kV or higher, or through a transformer that is designated in Inclusion I1."</p> <p>Exclusion 4 appears to limit the devices just to retail customers. However, any end-user load, including wholesale or retail, should be included. NERC's Glossary of Terms uses the phrase "end-use customer", not retail customers to describe loads. MWDSC recommends that Exclusion 4 be changed as follows: E4 - Reactive Power devices owned and operated by an end-use customer solely for its own use.</p>
<p><b>Response:</b> The SDT refers MWDSC to the individual comment responses in the definition comment form as the comments expressed here are exactly identical to the comments submitted by MWDSC on that form.</p>				
William Palazzo	New York Power Authority	6	Negative	<p>1. The SDT has made clarifying changes to the core definition in response to industry comments. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments: In general NYPA agrees with the definition. However, NYPA believes that clarifying revisions need to be made as described in the responses to Questions 2 -11 below.</p> <p>2. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I1 (transformers)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: The wording of Inclusion I1 is not clear. The term transformers needs to be further defined with respect to auto transformers, phase angle regulators and generator step-up transformers. Recommend the following wording: "All transformers (including auto-transformers, voltage regulators, and phase angle regulators) with primary and secondary terminals operated at or above 100kV, and generator step-up transformers (GSU) with one terminal operated at or above 100KV, unless excluded by E1 or E3."</p> <p>3. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I2 (generation) including the reference to the ERO Statement of Compliance Registry Criteria? If you do not support this change or you agree in general but feel that alternative language</p>

Voter	Entity	Segment	Vote	Comment
				<p>would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: Recommend removing the reference to the Statement of Compliance Registry Criteria. The definition should be the governing document and provide the details of what generating resources should be included. The current language induces circular arguments without a true governing document. The definition should drive what appears in the Registry Criteria. Inclusion 12 should be revised to read: "Generating resources with a gross nameplate rating of 20MVA or greater, or generating plant/facility connected at a common bus, with an aggregate nameplate rating of 75MVA or greater and is directly connected to a BES Element." This is consistent with proposed Inclusion 12 and the current Compliance Registry Criteria.</p> <p>4. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion 13 (blackstart)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: Recommend that the concept and the words "material to and designated as part of" be included in Inclusion 13. Recommend rewording Inclusion 13 as follows "Blackstart resources material to and designated as part of the Transmission Operator's restoration plan."</p> <p>5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion 14 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: The term "common point" needs clarification with respect to connection to the BES. Recommend the following wording: "connected at a common point through a dedicated step-up transformer with a high-side voltage of 100 KV or above."</p> <p>6. The SDT has added specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion 15 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: Technical studies need to be conducted to</p>

Voter	Entity	Segment	Vote	Comment
				<p>confirm reactive resource impacts on the reliability of the BES. The inclusion of reactive resources is a significant expansion of the current BES definition and therefore requires technical justification for inclusion. Inclusion I5 as written is generally confusing with multiple references to other inclusions and exclusions in the definition. Recommend removing references to reactive resources from Phase 1 until technical justification can be demonstrated (as part of Phase 2).</p> <p>7. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E1 (radial system)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: The wording in E1c should more clearly reflect what is intended by using the term "non-retail". The E1 reference Note should be re-worded to state "Radial systems shall be assessed with all normally open switching devices in their open positions." The current wording is unclear with respect to the treatment of normally open switching devices. Recommend that load bus tie-breakers be excluded from the BES as these devices apply to the users of the BES. Recommend that the potential inclusion in the BES of protective relay systems which protect radial lines emanating from a ring bus or breaker and a half bus design be confirmed in Phase 2 pursuant to technical studies.</p> <p>8. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E2 (behind-the-meter generation)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: The wording of Exclusion E2 should be consistent with the Statement of Compliance Registry Criteria in Section III.c.4.</p> <p>9. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E3 (local network)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments: It is our understanding that a sub-team of the SDT performed a technical study to support the limits outlined in Exclusion E3.</p>

				<p>following wording: "All transformers (including autotransformers, voltage regulators, and phase angle regulators) with primary and secondary terminals operated at or above 100kV, and generator step-up transformers (GSU) with one terminal operated at or above 100KV, unless excluded by E1 or E3."</p> <p>3. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I2 (generation) including the reference to the ERO Statement of Compliance Registry Criteria? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: Recommend removing the reference to the Statement of Compliance Registry Criteria. The definition should be the governing document and provide the details of what generating resources should be included. The current language induces circular arguments without a true governing document. The definition should drive what New York Power Authority's Comments Final: October 05, 2011 Comment Form for 2nd Draft of Definition of BES (Project 2010-17) Page 4 of 6 appears in the Registry Criteria. Inclusion I2 should be revised to read: "Generating resources with a gross nameplate rating of 20MVA or greater, or generating plant/facility connected at a common bus, with an aggregate nameplate rating of 75MVA or greater and is directly connected to a BES Element." This is consistent with proposed Inclusion I2 and the current Compliance Registry Criteria.</p> <p>4. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I3 (blackstart)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: Recommend that the concept and the words "material to and designated as part of" be included in Inclusion I3. Recommend rewording Inclusion I3 as follows "Blackstart resources material to and designated as part of the Transmission Operator's restoration plan."</p> <p>5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I4 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language</p>

Voter	Entity	Segment	Vote	Comment
				<p>would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: The term "common point" needs clarification with respect to connection to the BES. Recommend the following wording: "connected at a common point through a dedicated step-up transformer with a high-side voltage of 100 KV or above."</p> <p>6. The SDT has added specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I5 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: Technical studies need to be conducted to confirm reactive resource impacts on the reliability of the BES. The inclusion of reactive resources is a significant expansion of the current BES definition and therefore requires technical justification for inclusion. Inclusion I5 as written is generally confusing with multiple references to other inclusions and exclusions in the definition. Recommend removing references to reactive resources from Phase 1 until technical justification can be demonstrated (as part of Phase 2). New York Power Authority's Comments Final: October 05, 2011 Comment Form for 2nd Draft of Definition of BES (Project 2010-17) Page 5 of 6</p> <p>7. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E1 (radial system)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: The wording in E1c should more clearly reflect what is intended by using the term "non-retail". The E1 reference Note should be re-worded to state "Radial systems shall be assessed with all normally open switching devices in their open positions." The current wording is unclear with respect to the treatment of normally open switching devices. Recommend that load bus tie-breakers be excluded from the BES as these devices apply to the users of the BES. Recommend that the potential inclusion in the BES of protective relay systems which protect radial lines emanating from a ring bus or breaker and a half bus design be confirmed in Phase 2 pursuant to technical studies.</p> <p>8. 				<p>Inclusion I5.            11. Are there any other concerns with this definition that haven't been covered in previous questions and comments remembering that the exception criteria are posted separately for</p>
<p><b>Response:</b> 1. The SDT refers NYPA to the responses below for Q2 – Q10.            2. The SDT believes the existing language is clear and the proposed additional language would be redundant. No change made.            3. The SDT made a clarifying change removing the ERO Statement of Compliance Registry Criteria reference in Inclusion I2, instead specifying the 20/75 MVA reference threshold values in order to avoid the possibility of the registry values being changed and thus affecting the BES Definition prior to the resolution of the threshold values in Phase 2 of this project.            4. The SDT believes that adding language such as “material to” does not provide clarity and remains immeasurable. No change made.            5. The “single point of connection of 100 kV or higher” is where the radial system will begin if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation.            6. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects of the definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will provide compelling justification. No change made.            7. “Non-retail generation” means that generation which is on the system (supply) side of the retail meter. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator</p>				

Voter	Entity	Segment	Vote	Comment
<p>from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator’s responsibility to indicate how a switch is used in the normal operating environment. The “single point of connection of 100 kV or higher” is where the radial system will begin if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. Treatment of protection systems is but one of many items to be studied and clarified in Phase II.</p> <p>8. The threshold levels of generators and the relationship between the ERO Statement of Compliance Registry Criteria and the BES definition will be considered in the Phase 2 review. However, the SDT believes that a value was needed for Phase I and decided to proceed with the single 75 MVA threshold. No change made.</p> <p>9. No study was run by the SDT concerning the limits in E3. The SDT does not see any conflict between the cited statement and the language in E3.</p> <p>10. The SDT believes the wording is clear and absent any concrete suggestions has not made a change in this regard.</p>				
Doug Peterchuck	Omaha Public Power District	1	Negative	<p>We believe that this version of the definition and associated Inclusion and Exclusion criteria will again create regional inconsistency in identifying BES facilities. We believe the best way to address this is to condense the definition by applying a bright-line threshold within the definition itself that uses the defined inclusions to describe transmission and generation facilities operating or connecting at 100 kV or above as BES facilities.</p> <p>Further, the definition should include existing registration criteria for generation facilities (including real and reactive resources), which includes both single units at or above 20 MVA and aggregate units at 75 MVA or above that are directly connected to facilities at 100kV or higher.</p> <p>The proposed Exception Process should only allow Registered Entities to remove facilities from BES designation based on technical justification (i.e. perform system impact studies to show facility not impacting reliable operation of BES). If the BES definition is properly created and defined, there should not be a need</p>

Voter	Entity	Segment	Vote	Comment
				<p>to have an exception process for a registered entity to add a facility to the BES. With coordination led by NERC, the RE should have the final approval of any registered entity requesting a facility exemption. Exemptions should be granted based on result of the system impact study performed. Saying this, the proposed exclusion list should actually be listed as "Typical Exceptions to be considered by Regional Entities and NERC".</p>
<p><b>Response:</b> The SDT strived to create a bright-line as requested in the comment. The inclusions and exclusions are seen as necessary clarifications to the core definition and every attempt was made to make them bright-line as well. The SDT has reverted to specific numeric thresholds consistent with the ERO Statement of Compliance Registry Criteria for Phase I. The exception process has been designed with maximum flexibility in mind to allow for all possible conditions. Therefore, it is set up to allow for both deletion and inclusion requests. Order 743 directs that the ERO be the final arbiter of exception requests.</p>				
Robert Kondziolka	Salt River Project	1	Negative	<p>Definition of Bulk Electric System (BES) The Blackstart "Cranking Path" has been deleted from Inclusion 3 of the BES definition. However, NERC standards EOP-005 and CIP-002, R1.2.4 require documenting the Cranking Path. In addition, CIP-002-4 identifies the Cranking Path as a Critical Asset in Attachment 1. Compliance to the NERC Standards needs to be an exact science whenever possible. SRP does not argue the inclusion or exclusion of Cranking Path. However, if it is excluded, guidance must be provided on whether or not a Cranking Path is subject to the previously mentioned Standards.</p> <p>Detailed Information to Support BES Exceptions Request SRP agrees with the WECC Staff recommendation on the "Detailed Information to Support BES Exceptions Request." "WECC Staff believes that the proposed Technical Principles for Demonstrating BES Exceptions Request does not provide the necessary clarity as to what applying entities must provide to support their request, nor does it provide any criteria for consistency among regions in their assessment of requests. We believe that the checklist items for transmission and generation facilities are appropriate questions that must be answered in considering all requests. However, without objective criteria defining what must be submitted and how to assess the materials submitted, the current methodology leaves it to</p>

Voter	Entity	Segment	Vote	Comment
				<p>each region to develop their own methodology and criteria for evaluating the submittals. We believe the lack of clarity regarding what studies must be submitted and what must be demonstrated by the studies submitted will be overly burdensome on the submitting entity and the Region, as multiple studies may be required for the two to agree that there is sufficient justification for an exemption request. We believe that additional work is necessary to develop clear, objective methods and criteria for identifying which facilities may be excluded from or should be included in the Bulk Electric System. Clear, objective methods and criteria will enable the submitter of requests to understand what is necessary for submitting an exception request and will provide for consistency among the regions in their initial assessment and recommendations to the ERO."</p>
John T. Underhill	Salt River Project	3	Negative	<p>Definition of Bulk Electric System (BES) The Blackstart "Cranking Path" has been deleted from Inclusion 3 of the BES definition. <p><b>Response:</b> Cranking Paths are subject to any standard in which they are specifically spelled out. The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.</p> <p>There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the</p>				

Voter	Entity	Segment	Vote	Comment
				<p>proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel’s findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren’t shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn’t been handled before by either party and there is a great deal of professional experience involved on both the submitter’s and the Regional Entity’s side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.</p> <p>Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.</p>

Voter	Entity	Segment	Vote	Comment
<p>Some commenters have asked whether a single ‘yes’ or ‘no’ response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of Procedure that states “No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or disapproved.”</p> <p>The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals.</p> <p>Finally, the SDT would point to the draft SAR for Phase II of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase I of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.</p>				
Barbara Constantinescu	Independent Electricity System Operator	2	Negative	This is our response to Question 4 in the comment form: We thank the SDT for excluding the cranking paths from the BES definition, a point we had raised in our comments to the previous posting. However, we had also disagreed with the inclusion of Blackstart Resources and reiterate our view that their inclusion is superfluous given there is already a designation specific for system restoration covered by an existing standard, to recognize their reliability impacts and to ensure their expected performance. NERC Standards EOP-005-2 stipulates the requirements for testing blackstart resource and cranking paths. This testing requirement suffices to ensure that the facilities critical to system restoration are functional when needed, which meets the intent of identifying their criticality to reliability. We therefore suggest removing Inclusion I3 entirely.

Voter	Entity	Segment	Vote	Comment
				<p>We support the provisions of E1 in principle but require clarification of some issues and suggest alternative wording in some cases. It is unclear if the connection voltage of generation referred to in E1.b affects whether a radial system could be excluded under E1 although from the context it appears that it would. For clarity we suggest appending "connected at 100 kV or higher." Please provide in the BES definition document an explanation of "non-retail" and "retail" generation used in E1.c.</p> <p>Additionally, despite the fact the revisions to Inclusion I3 (Blackstart Resources) removed any reference to Cranking Paths, Exclusion 1 (b) and (c) both indicate that the exclusion of a radial system would not be allowed if generation identified in I3 were connected to it. This implies that the Cranking Path for this Blackstart Resource would have to be BES. This appears to be an inconsistency. We suggest removing the phrase "not identified in Inclusion I3" in both instances. We disagree with notion that the capacity of generation connected to a radial system ought to determine whether that radial system should be classified as BES. Firstly, it is a given that the generation connected to the subject radial that meets the registry criteria would already be captured within the core BES definition and Inclusion I2.</p> <p>This is our response to Question 7 in the comment form: The function served by a radial that is of importance in the current context is that of delivering surplus power to the rest of the bulk power system and so, the impact on the BES of loss of the radial system or its connected generation needs to be considered. In our view, the "BES-status" of the radial itself is immaterial and so too is the aggregate capacity of generation resources connected to it. Detailed arguments regarding impact on the BES can be made in support of an application for an exclusion under the Exception Process, but it would be beneficial to avoid unnecessarily including a radial merely because it has more than 75 MVA of qualifying generation connected to it, without equal consideration of the connected load. To put a "bright line" on the consideration of impact referred to above, we suggest: In E1 (b): Replace "an aggregate capacity less than or equal to 75 MVA (gross</p>

Voter	Entity	Segment	Vote	Comment
				<p>nameplate rating)" with "a net capacity provided to the BES of less than or equal to 75 MVA." In E1 (c): Replace "an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating)" with "a net capacity of non-retail generation provided to the BES of 75 MVA." This wording would be consistent with E2 (i).</p> <p>Finally the word "affect" stated in the note accompanying E1 lends itself to mis-interpretation. We therefore suggest the following revision to achieve greater clarity: "This exclusion applies to radial systems connected by a normally open switch."</p> <p>This is our response to Question 9 of the comment form: Consistent with our comments in response to Q7, we propose removing E3 (a) since, as explicitly described in E3 (b), one of the characteristic of the LN is that power flows only into the LN. The level of generation contained within the LN is therefore immaterial, particularly where the most onerous contingency or system operating condition occurring within the LN, results in acceptable BES performance as defined by the applicable criteria of the NERC transmission planning standards. The generation connected within the LN that meets the registry criteria would already be captured within the definition of the BES as provided for in Inclusion I2.</p>
<p><b>Response:</b> The SDT refers IESO to the individual comment responses in the definition comment form as the comments expressed here are exactly identical to the comments submitted by IESO on that form.</p>				
Marie Knox	Midwest ISO, Inc.	2	Negative	<p>While we agree with the changes to the definition of the Bulk Electric System (BES), there are a few key refinements left to be addressed. The BES drafting team needs to clarify that facilities below 100 kV are defined "local distribution facilities", are beyond NERC jurisdiction, and are excluded from the NERC BES. Facilities below 100 kV are used for the local distribution of electric energy. We fear that equipment that is connected to the BES, would be considered a part of the BES as well, and we disagree.</p>

Voter	Entity	Segment	Vote	Comment
<p><b>Response:</b> The SDT points the commenter to the core definition which clearly states that the BES is 100 kV and above unless modified by the inclusions/exclusions and also clearly states that local distribution facilities are not included. The inclusions/exclusions were carefully developed to try to avoid bringing in any equipment that is truly local distribution. The SDT would also point out that the way the definition has been framed that it would not bring in local distribution facilities simply because they were connected to the BES at some location.</p>				
Alden Briggs	New Brunswick System Operator	2	Negative	Please see comments submitted by the Reliability Standards Committee. The draft definition will significantly increase the number of BES elements. Many elements and connected facilities will be added to the BES and subject to NERC standards under the draft definition. Most of these requirements for elements will unnecessary introduce administrative burden and operating expenses. As a NPCC study identifies, this would impose significant costs to the ratepayer, with little or no increase in reliability benefits to the Bulk Power System (BPS) as currently defined by NPCC.
<p><b>Response:</b> The SDT refers NBSO to the individual comment responses in the definition comment form as the comments expressed here are identical to the comments submitted by NBSO on that form.</p>				
Jack W Savage	Modesto Irrigation District	3	Negative	MID is voting No with the following comments. Inclusions and exclusions are based upon the ERO Statement of Compliance Registry Criteria - currently 75MVA. What is the SDT's technical justification for using this generation level? If 75MVA is the criteria for including facilities as part of the BES, why is that same criteria not applied at voltages below 100kv? Is 75MVA of generation within an area whose load far exceeds that 75MVA cause to classify that entire area as part of the BES and not exclude it as a Local Network? Why are customer owned generators treated differently than other generators? Where is "non-retail generation" defined? As worded, I5 will make any and all reactive devices connected at 100kv or higher part of the BES. Is it intended that capacitors attached to the tertiary of a 115/69kv transformer for local voltage support be included as part of the BES? By implication, if they are, then the 115/69kv transformer should also be included. Is that the intent? Did the SDT consider and attempt to include and reconcile the WECC BES Task

Voter	Entity	Segment	Vote	Comment
				Force's definition of the BES and their technical basis for defining exclusions? Please explain.
<p><b>Response:</b> As has been previously stated in the first posting consideration of comments, the SDT is using the existing thresholds for generation due to the scope limitations of the FERC Order. Phase II of this project will include a thorough investigation of, and a technical justification for, any threshold values used in the definition.</p> <p>The SDT is using the same criteria that exists in today's definition for generation threshold values and will be exploring all issues associated with these threshold values in Phase II of this project when more time will be available for technical analysis of the issues.</p> <p>The SDT recognizes that some candidate local networks will have far in excess of 75 MVA of load demand, yet it believes that the 75 MVA threshold value given in Exclusion E3.a is an appropriate level regardless of the amount of load. This value is consistent with the existing threshold of aggregate generation in the ERO Statement of Compliance Registry Criteria. The generation values used in the BES definition will receive more attention and refinement as part of phase 2 of this Project 2010-17.</p> <p>Customer owned generation has traditionally been treated differently and the SDT is retaining this important distinction. Non-retail generation is a widely used and understood term and is not defined here.</p> <p>The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p> <p>The SDT considered all of the previous work done by several of the regional entities in the revision of the definition. WECC is well represented on the SDT.</p>

Steven M. Jackson	Municipal Electric Authority of Georgia	3	Negative	MEAG believes that a Yes vote for the draft BES Definition will result in minimal or no changes. We have identified a few changes that if made will secure a Yes vote on the next ballot. The most important change is needed in I5 reactive resources noted below. I5 reactive resources - We feel that this inclusion should be limited to dynamic devices with an aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) connected through a common point. E1 - Non-retail generation needs to be defined to clarify why it is used in this exclusion. E2 (ii) The reference to generation on the customer's side of the retail meter needs to be clarified to provide a better understanding as to what is intended with this phrase. E3 b - We would agree with the exclusion if the wording of the exclusion includes the following phrase (in italics) added at the end of E3 b): Power flows only into the LN: The LN does not transfer energy originating outside the LN for delivery through the LN "under normal operating conditions".
Steven Grego	MEAG Power	5	Negative	MEAG believes that a Yes vote for the draft BES Definition will result in minimal or no changes. Voter	Entity	Segment	Vote	Comment
Spencer Tacke	Modesto Irrigation District	4	Negative	The choice of 75 MVA as the determining generating capacity seems to have been an arbitrary choice with no technical basis. We strongly support the E3 (Local Networks) exception, if it were not for the 75 MVA generation requirement. So I believe a technical basis for selecting 75 MVA as the generator size needs to be developed before the definition would be acceptable. Thank you.
<p><b>Response:</b> Comments were received that either posed a challenge to the generator thresholds in Exclusion E3.a or suggested that the Exclusion for local networks should be silent on generator thresholds until such time as the additional consideration of appropriate generation thresholds is addressed in Phase 2 of Project 2010-17. The SDT agrees that the threshold(s) for generation throughout the BES definition are appropriately addressed in Phase 2 of this effort; however, in the meantime and for the purpose of satisfying the Commission’s Order in 743 and 743a in a timely fashion, the SDT believes it is necessary to use a generation threshold that is consistent with the in-force ERO Statement of Compliance Registry Criteria.</p>				
Chifong Thomas	BrightSource Energy, Inc.	5	Negative	<p>BrightSource Energy supports the core definition of the Bulk Electric System as proposed. However, we believe the following clarification will be needed. For Inclusion 3 we agree that Blackstart units should be considered vital to the overall operation of the BES, and therefore included in the definition of the BES. However, we do not agree with the deletion of the cranking path from Inclusion 3. The cranking path should be included in the definition since NERC standards EOP-005 and CIP-002, R1.2.4 require documenting the cranking path and the revised CIP-002-4 identifies the cranking path as a critical asset. To be able to count on a Blackstart unit to perform as designed in the Blackstart Restoration Plan, it must be ensured that the cranking path is available.</p> <p>We believe that additional clarity is needed in the wording of Inclusion 4. It is our understanding, for example, that Inclusion 4 is not intended to include each individual wind turbine generating unit in a wind farm, or each PV panel as a BES element, but rather to include the point at which the aggregated capacity reaches the threshold of 75 MVA. However, the current wording of Inclusion 4 does not provide sufficient clarity. We believe that the wording of Inclusion 4 could be modified to add clarity on this topic.</p> <p>We believe that Inclusion 5 should be modified to identify some minimum Reactive Power threshold for static or dynamic devices similar to that identified for generating sources in Inclusion 2. As worded a 1 MVA device supplying or</p>

Voter	Entity	Segment	Vote	Comment
				<p>absorbing Reactive Power that is connected at 100 kV or higher would be included in the BES.</p> <p>We believe that Exclusion 2 should be modified to include a size threshold for individual generating units, similar to that identified in Inclusion 2. As currently worded Exclusion 2 places the same threshold (75 MVA) on a single generating unit as is placed on multiple generating units.</p>
<p><b>Response:</b> Cranking Paths identified in a Transmission Operator’s restoration plans are often composed of distribution system Elements. The Transmission Operator’s restoration plans identify a number of possible system restoration scenarios to address the uncertainty of the actual requirements needed to address a particular restoration event including Cranking Paths. Therefore, the SDT maintains that Cranking Paths are not required to be included in the BES definition as they are essentially a moving target and could include distribution Elements. The Cranking Paths issue will be discussed anew in Phase II of this project. No change made. Inclusion I4 denotes an aggregate threshold. This is clear from the requirement inclusion threshold of “aggregate capacity greater than 75 MVA (gross aggregate nameplate rating).”</p> <p>The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p> <p>The threshold levels of generators and the relationship between the ERO Statement of Compliance Registry Criteria and the BES definition will be considered in the Phase 2 review. However, the SDT believes that a value was needed for Phase I and decided to proceed with the single 75 MVA threshold. No change made.</p>				
Rex A Roehl	Indeck Energy Services, Inc.	5	Negative	As acknowledged in the response to Question 12 comments on the previous BES definition, the BES definition is expansive compared to the definition of the BPS in

Voter	Entity	Segment	Vote	Comment
				<p>the FPA Section 215. The inclusion of the limited Exclusions is an attempt to remedy the situation. However, the Exclusions need to include a fifth one that if, based on studies or other assessments, it can be shown that any transmission or generator element otherwise identified as part of the BES is not important to the reliability of the BPS, then that element should be excluded from the mandatory standards program. There has never been a study to show that elements, such as a 20 MW wind farm, 60 MW merchant generator (which operates infrequently in the depressed market) in a large BA (eg NYISO) or a radial transmission line connecting a small generator are important to the reliability of the BPS. They are covered by the mandatory standards program through the registration criteria. The BES Definition is the opportunity to permit an entity to demonstrate that an element is unimportant to reliability of the BPS. The SDT has identified a small subset of elements that it is willing to exclude. By their very nature, these exclusions dim the bright line that is the stated goal of this project. However, the SDT's foresight seems limited in its selections. Analytical studies are used to evaluate contingencies that could lead to the Big Three (cascading outages, instability or voltage collapse). Such a study showing that a transmission or generation element is bounded by the N-1 or N-2 contingency would exclude it from the BES definition. For example, in a BA with a NERC definition Reportable Disturbance of approximately 400 MW (eg NYISO), a 20 MW wind farm, 60 MW merchant generator or numerous other smaller facilities would be bounded by larger contingencies. It would take more than six 60 MW merchant generators with close location and common mode failure to even be a Reportable Disturbance, much less become the N-1 contingency for the Big Three. Exclusion E5 should be "E5 - Any facility that can be demonstrated to the Regional Entity by analytical study or other assessment to be unimportant to the reliability of the BPS (with periodic reports by the Regional Entity to NERC of any such assessments)."</p>
<p><b>Response:</b> The SDT refers Indeck to the individual comment responses in the definition comment form as the comments expressed here are identical to the comments submitted by Indeck on that form.</p>

Gerald Mannarino	New York Power Authority	5	Negative	<p>Comments: For Question 2 on page 2, recommend that the specific types of studies to be provided are defined to add consistency and transparency to the Exception request process. Recommend that the concept and the words “material to” be included as part of the question as follows “Is the facility material to permanent Flowgates in the Eastern Interconnection.....”</p> <p>For Question 4 on page 2, recommend that single contingency analysis be performed and submitted to demonstrate impacts to the BES.</p> <p>For Question 6 on page 3, recommend that “Cranking Path” be removed to be consistent with the draft BES Definition. Recommend that the concept and the words “material to and designated as part of” be included as part of the question. Recommend rewording Question 6 as follows “Is the facility a Blackstart resource material to and designated as part of the Transmission Operator’s restoration plan?”</p> <p>For Question 7 on page 3, facilities less than two years old or under construction would not be able to provide SCADA data for the most recent consecutive two calendar year period. Facility rating changes and the magnitude of such changes which trigger application or reapplication of the exception process are not addressed. Recommend that Question 7 be revised to address these issues.</p> <p>Comments: For Question 2 on page 4, recommend that the specific generator ancillary service products be defined to add consistency and transparency to the Exception Request process.</p> <p>For Question 3 on page 4, recommend that confirmation of must-run generation be provided by the Reliability Coordinator, Reliability Planner, or the Balancing Authority as a clarification to the “appropriate reference”.</p>
<p><b>Response:</b> These questions have been provided to those members of the SDT who are working on responses to the criteria posting questions. They will be responded to in detail in those documents.</p>				
Colin Anderson	Ontario Power Generation Inc.	5	Negative	<p>OPG continues to question the need for the changes required (and costs imposed) as a result of this new definition. This is particularly true in the NPCC region where an impact based methodology is being used to determine the set of BES elements. A very clear 100kV bright line, as proposed in this draft, will dramatically increase the list of generation elements that must meet reliability standards, without a corresponding increase in wide-area reliability.</p>

Voter	Entity	Segment	Vote	Comment
				<p>OPG recommends that the work planned for phase II, technical justification of the generation and voltage thresholds, should be completed before implementing the new definition of BES. OPG does not agree that the question of the 20 MVA (single) versus 75 MVA (aggregate) threshold should be deferred until a subsequent phase of the standard development process ("Phase II"). This question should be resolved now. In general, key elements of the development process should not be parsed out into multiple phases, in hopes that "Standard Development Fatigue" will eliminate critics of the approach.</p> <p>Further, selecting the generator terminals as the boundary for BES within the generating station means that the Isolated Phase Bus (IPB), which connects the generator terminals to the Low Voltage (LV) terminals of the generator step-up (GSU) transformer, is now included as a BES element. The IPB is operated at low voltage, no more than 22kV, so including it as a BES element is going beyond the FERC order 743 and 743a. OPG strongly recommends that the BES boundary be moved to the LV terminals of the GSU transformer.</p> <p>To assure availability of the generation blackstart resources identified in the Transmission Operator's Power System Restoration Plan the generators are tested according to the requirements of reliability standard EOP-009. Blackstart resources are only required post LOBES (Loss of Bulk Electric System) and in many cases do not contribute to the reliability of the BES under normal operating conditions. OPG recommends that this inclusion be removed from the new definition of BES.</p> <p>OPG disagrees in general with proceeding to implement a 100 kV brightline definition in the absence of a properly quantified cost/benefit analysis. Entities are being asked to incur a high cost for no demonstrated benefit in wide-area reliability.</p>
<p><b>Response:</b> The SDT refers OPG to the individual comment responses in the definition comment form as the comments expressed here are identical to the comments submitted by OPG on that form.</p>				
Roland Thiel	Platte River Power Authority	5	Negative	<p>Definition of BES Platte River believes that the SDT has made substantial progress towards a clear and workable definition of the BES. Although Platte River ballots "Negative" we strongly support the approach to defining the Bulk Electric System as proposed here. Platte River recognizes that, given the deadlines imposed by</p>

Voter	Entity	Segment	Vote	Comment
				<p>FERC in Order No. 743, it will not be possible for the SDT to conduct a technical analysis within the time available. Accordingly, Platte River agrees with the approach taken by the SDT, which is to propose a Phase II of the standards development process that would address the generator threshold level and other issues. However, it is our opinion that the second draft would benefit from further clarification or modification. That said, Platte River is prepared to support the BES definition as proposed by the SDT going forward. Platte River has taken the opportunity to provide this industry feedback, as it is our understanding that we will be afforded another ballot opportunity. If this were to be our sole occasion to ballot, we would vote "Affirmative" at this time. We are encouraged by the work that has been completed and we commend the SDT for their commitment and extensive work thus far.</p> <p>Detailed Information to Support BES Exceptions Requests Platte River believes that a Yes vote for the Technical Principles for Demonstrating BES Exceptions Request will result in minimal changes to today's process under the current definition which includes the language "as defined by the Regional Reliability Organization." While the proposed Technical Principles for Demonstrating BES Exceptions Request includes a checklist that must be submitted with exception requests, a yes vote will still require each region to develop their own methods and criteria for assessing materials submitted with exemption requests. We believe that a No vote with guidance to the drafting team that objective methods and criteria must be developed and applied continent-wide will result in the desired uniformity and consistency among regions in their assessment of exception requests.</p>
<p><b>Response:</b> Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. The first step in Phase II will be the posting of the Phase II draft SAR for comment. At that time, you will have the opportunity to submit comments for the inclusion of items and issues to be considered by the SDT in Phase II.</p> <p>The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT</p>				

Voter	Entity	Segment	Vote	Comment
				<p>would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.</p> <p>There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel's findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren't shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn't been handled before by either party and there is a great deal of professional experience involved on both the submitter's and the Regional Entity's side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.</p> <p>Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables</p>

Voter	Entity	Segment	Vote	Comment
				<p>to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.</p> <p>Some commenters have asked whether a single ‘yes’ or ‘no’ response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of Procedure that states “No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or disapproved.”</p> <p>The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals.</p> <p>Finally, the SDT would point to the draft SAR for Phase II of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase I of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.</p>

Voter	Entity	Segment	Vote	Comment
Steven Grega	Public Utility District No. 1 of Lewis County	5	Negative	The bright line definition makes the BES too inclusive. Many smaller facilities are caught in the definition that are NOT BES facilities. Would suggest only the major transmission cranking paths, in our area, as defined by WECC, should be included. Why subject so many to these regulation when there is no or little return on reliability to the system. We worry about compliance not reliability. In our case, our small public utility has a run-of-river 70MW hydro (29MWave), non-dispatchable, similar to wind. We made the mistake of connection to BPA's 230kV system rather than our 69kV system. Our portion of the 230kV is uncontrolled by a SCADA system. In our utility, we rely on phone calls for all outage reporting. Since the 230kV line our feeds our utility substation and we have an alternative 69kV connection, many time it is not a concern if the 230kV line is out. The definition of the BES should be limited to truly only the major transmission paths and major generation plants. I beleive it is good utility practce to make sure right of ways are clear and relays are tested, but a number of Standards go way too far with little or no benefit to the system, especially for smaller utilities. I think it is time that we step back and evaluate what is truly important in making the BES more reliable. Limiting the BES definition would be a good start.
<p><b>Response:</b> The bright-line definition is a continent-wide definition. In these instances, there will always be one off situations where the bright-line might not apply. With the changes to the ERO Rules of Procedure for exception requests, an entity will have the right to request exception from the definition even if the application of the bright-line would have brought them into the fold.</p>				
Dennis Kimm	MidAmerican Energy Co.	6	Negative	The BES definition needs additional specific inclusion or exclusion provisions that clearly exclude variable resource generation collector circuits rated below 100 kV and generators less than 20 MVA connected to those collector circuits in accordance with the registration criteria.
<p><b>Response:</b> Inclusion I4 denotes an aggregate threshold. This is clear from the requirement inclusion threshold of “aggregate capacity greater than 75 MVA (gross aggregate nameplate rating).”</p>				
Steven J Hulet	Salt River Project	6	Negative	The Blackstart “Cranking Path” has been deleted from Inclusion 3 of the BES definition. However, NERC standards EOP-005 and CIP-002, R1.2.4 require documenting the Cranking Path. In addition, CIP-002-4 identifies the Cranking Path as a Critical Asset in Attachment 1. Compliance to the NERC Standards needs to be an exact science whenever possible. SRP does not argue the

Voter	Entity	Segment	Vote	Comment
				inclusion or exclusion of Cranking Path. However, if it is excluded, guidance must be provided on whether or not a Cranking Path is subject to the previously mentioned Standards.
<b>Response:</b> Cranking Paths are subject to any standard in which they are specifically spelled out.				
Donald Nelson	Commonwealth of Massachusetts Department of Public Utilities	9	Negative	<p>Please refer to our detailed comments filed today. As described further in our comments, the MA DPU is primarily concerned with the substance of the definition and the process for developing this standard as follows: 1) Phased Approach. While well-intentioned, separating the BES definition project into two separate phases is problematic from both a procedural and substantive perspective. While we recognize that the filing due date is rapidly approaching, the BES definition cannot be considered in a vacuum, divorced from the concerns raised by a number of parties in response to past postings of the BES definition. The issues NERC has identified for consideration during the proposed "Phase 2" are inseparable from the development of the BES definition (e.g., generation thresholds, technical justification for the 100 kV threshold) and should be squarely addressed before a definition is adopted and ratepayers incur costs related to compliance with mandates that may or may not be revised through the second phase of the project. The importance of considering concerns before adopting a definition is heightened by the proposed two-year implementation requirement. This short implementation period almost guarantees that entities will commit resources shortly after adoption of the definition to ensure compliance within the mandated period. In other words, ratepayers will bear costs related to compliance irrespective of any change resulting from the Phase 2 process or the exception process. Expediency, while understandable given the filing deadline, must be balanced against the risk that a multi-phased approach could lead to significant consumer costs without attendant meaningful reliability benefits.</p> <p>2) Cost-Benefit Analysis. A cost impact analysis should be performed as part of developing any reliability standard. However, the development of the BES definition has failed to consider the cost impacts of the definition (and its inclusions and exclusions) and has not weighed these impacts against identified</p>

Voter	Entity	Segment	Vote	Comment
				<p>benefits that the definition would achieve. The MA DPU supported the May 21, 2011 comments from the New England States Committee on Electricity (“NESCOE”) on the last posting of the BES definition. In these comments, NESCOE stated that “any new costs a revised definition imposes - which fall ultimately on consumers - should provide meaningful reliability benefits.” A cost-benefit analysis should be integral to the development of a BES definition and, indeed, any reliability standard. This analysis should include a probabilistic risk assessment examining the likelihood of an event and the costs and risks resulting from such event, which should be weighed against the costs of complying with the proposed reliability measures.</p> <p>3) Technical Justification. In addition to performing a cost-benefit analysis, a technical basis must be provided to justify a proposed reliability standard. However, the proposed BES definition does not provide a technical justification for the 100 kV threshold, the threshold for generation resources, or other elements of the definition. As stated above, while well-intentioned and understandable, deferring this technical justification to a later and separate phase of the project is a flawed and potentially costly approach. Providing a technical justification for a reliability standard is a core function of standards development and should be addressed at the forefront of the process rather than relegated to a separate phase largely undertaken after a standard is filed.</p>
<p><b>Response:</b> 1. Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. The first step in Phase II will be the posting of the Phase II draft SAR for comment. At that time, you will have the opportunity to submit comments for the inclusion of items and issues to be considered by the SDT in Phase II. Since the revised definition relies heavily on the status quo of the current definition, the SDT does not anticipate that many entities will be burdened with additional costs.</p> <p>2. The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 &amp; 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the</p>				

Voter	Entity	Segment	Vote	Comment
<p>current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 &amp; 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes the best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.</p> <p>3. Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. The first step in Phase II will be the posting of the Phase II draft SAR for comment. At that time, you will have the opportunity to submit comments for the inclusion of items and issues to be considered by the SDT in Phase II. Technical justifications for all variables involved in the definition will be done in Phase II.</p>				
Diane J Barney	National Association of Regulatory Utility Commissioners	9	Negative	There is a lack of clarity as to how the information is to be used and by what weight in the exception process.
<p><b>Response:</b> The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.</p> <p>There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at</p>				

Voter	Entity	Segment	Vote	Comment
<p>as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel's findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that the explicit types of studies to be provided and how to interpret the information aren't shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn't been handled before by either party and there is a great deal of professional experience involved on both the submitter's and the Regional Entity's side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.</p> <p>Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber</p>				

Voter	Entity	Segment	Vote	Comment
<p>security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.</p> <p>Some commenters have asked whether a single ‘yes’ or ‘no’ response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of Procedure that states “No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or disapproved.”</p> <p>The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals.</p> <p>Finally, the SDT would point to the draft SAR for Phase II of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase I of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.</p>				
Thomas Dvorsky	New York State Department of Public Service	9	Negative	The currently proposed definition of the BES is based neither on a technical analysis nor on a cost impact study.
<p><b>Response:</b> Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. The first step in Phase II will be the posting of the Phase II draft SAR for comment. At that time, you will have the opportunity to submit comments for the inclusion of items and issues to be considered by the SDT in Phase II. Technical justifications for all variables involved in the definition will be done in Phase II.</p>

<p>The responsibilities assigned to the SDT included the revision of the definition of BES contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. The SDT’s efforts are directed at fulfilling their responsibilities and developing a definition that addresses the Commission’s concerns as expressed in the directives contained in Orders No. 743 &amp; 743-A. To accomplish these goals, the SDT has pursued a definition that remains as consistent as possible with the existing definition, while not significantly expanding or contracting the current scope of the BES or driving registration or de-registration. With this in mind, the SDT acknowledges that the current BES definition has varying degrees of Regional application and has resulted in different conclusions on what is currently considered to be part of the BES. This inconsistency in the application and subsequent results were also identified by the Commission in Orders No. 743 &amp; 743-A as a significant concern. The SDT acknowledges that by developing a bright-line definition coupled with the inconsistency in application of the current definition there is a potential for varying degrees of impact on Regions. Without an approved BES definition any assumptions utilized in a cost benefit analysis would be purely speculative and the results would have little meaning in regards to potential improvements in the reliable operation of the interconnected transmission grid on a continent-wide basis. Therefore, the SDT believes that best opportunity to address cost concerns will be through the development of Regional transition plans once the definition has been approved by the Commission.</p>				
Larry Nordell	Montana Consumer Counsel	8	Abstain	The BES definition must be cognizant of costs and benefits. At the very least it needs to have an exclusion for elements whose failure would have no consequential impacts on the bulk system, and an exclusion for elements for which the costs inclusion are clearly in excess of the benefits of inclusion.

John D Varnell	Tenaska Power Services Co.	6	Abstain	Which part of this definition has the highest priority inclusions or exclusions.
<p><b>Response:</b> The application of the draft ‘bright-line’ BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.</p> <p>Initially, the BES ‘core’ definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the ‘core’ definition identifies the Real Power and Reactive Power resources connected at 100 kV or higher as included in the BES. To fully appreciate the scope of the ‘core’ definition an understanding of the term Element is needed. Element is defined in the NERC Glossary of Terms as:</p> <p>“Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. “</p> <p>Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.</p> <p>Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.</p> <p>Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.</p>				

Voter	Entity	Segment	Vote	Comment
<p>Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions 12 – 15. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.</p> <p>Exclusion E2 provides for the exclusion of the Real Power resources that reside behind the retail meter (on the customer’s side) and supersedes inclusion I2.</p> <p>Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.</p> <p>In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.</p>				
William M Chamberlain	California Energy Commission	9	Affirmative	<p>While we are voting in favor of this definition as an improvement over the current status quo, we agree with WECC that additional improvements are necessary as set forth below. For Inclusion 3 we agree that Blackstart units should be considered vital to the overall operation of the BES, and therefore included in the definition of the BES. However, we do not agree with the deletion of the cranking path from Inclusion 3. The cranking path should be included in the definition since NERC standards EOP-005 and CIP-002, R1.2.4 require documenting the cranking path and the revised CIP-002-4 identifies the cranking path as a critical asset in Attachment 1. To be able to count on a Blackstart unit to perform as designed in the Blackstart Restoration Plan, it must be ensured that the cranking path is available.</p> <p>We believe that additional clarity is needed in the wording of Inclusion 4. It is our understanding, for example, that Inclusion 4 is not intended to include each individual wind turbine generating unit in a wind farm as a BES element, but</p>

Voter	Entity	Segment	Vote	Comment
				<p>rather to include the point at which the aggregation becomes large enough to meet the aggregate capacity threshold of 75 MVA. However, the response to comments from the last comment posting and the current wording of Inclusion 4 do not provide sufficient clarity to answer this question. We believe that the wording of Inclusion 4 could be modified to add clarity on this topic.</p> <p>We believe that Inclusion 5 should be modified to identify some minimum Reactive Power threshold for static or dynamic devices similar to that identified for generating sources in Inclusion 2. As worded a 1 MVA device supplying or absorbing Reactive Power that is connected at 100 kV or higher would be included in the BES. We believe that Exclusion 2 should be modified to include a size threshold for individual generating units, similar to that identified in Inclusion 2.</p> <p>As currently worded Exclusion 2 places the same threshold (75 MVA) on a single generating unit as is placed on multiple generating units.</p>
<p><b>Response:</b> Cranking Paths identified in a Transmission Operator’s restoration plans are often composed of distribution system Elements. The Transmission Operator’s restoration plans identify a number of possible system restoration scenarios to address the uncertainty of the actual requirements needed to address a particular restoration event including Cranking Paths. Therefore, the SDT maintains that Cranking Paths are not required to be included in the BES definition as they are essentially a moving target and could include distribution Elements. The Cranking Paths issue will be discussed anew in Phase II of this project. No change made. Inclusion I4 denotes an aggregate threshold. This is clear from the requirement inclusion threshold of “aggregate capacity greater than 75 MVA (gross aggregate nameplate rating).”</p> <p>The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction</p>				

Voter	Entity	Segment	Vote	Comment
<p>with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p> <p>The threshold levels of generators and the relationship between the ERO Statement of Compliance Registry Criteria and the BES definition will be considered in the Phase 2 review. However, the SDT believes that a value was needed for Phase I and decided to proceed with the single 75 MVA threshold. No change made.</p>				
Claston Augustus Sunanon	Orlando Utilities Commission	6	Affirmative	Orlando Utilities Commission supports the new definition, although our support is conditioned on: (1) a workable Exceptions process being developed in conjunction with the BES definition; and, (2) the SDT moving forward expeditiously on Phase II of the standards development process in accordance with the SAR recently put forward by the SDT, which would address a number of important technical issues that have been identified in the standards development process to date.
<p><b>Response:</b> The exceptions process and the definition are being worked on in parallel and will be filed as one document. Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. The first step in Phase II will be the posting of the Phase II draft SAR for comment. At that time, you will have the opportunity to submit comments for the inclusion of items and issues to be considered by the SDT in Phase II.</p>				
Brenda Powell	Constellation Energy Commodities Group	6	Affirmative	While we support the proposed definition to satisfy the FERC Order, we also support continued work on the threshold questions slated for "Phase II", in particular the refinement of the generation thresholds.
<p><b>Response:</b> Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. Thresholds will be analyzed at that time.</p>				
Michelle R D'Antuono	Occidental Chemical	5	Affirmative	1. The SDT has made clarifying changes to the core definition in response to industry comments. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments: However, one of the FERC directives in Order 743 charged NERC with delineating the difference between transmission and distribution. The Inclusions and Exclusions are a step in that direction, but this subject will need more consideration in Phase II.

Voter	Entity	Segment	Vote	Comment
				<p>2. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I1 (transformers)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments:</p> <p>3. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I2 (generation) including the reference to the ERO Statement of Compliance Registry Criteria? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. No: X Comments: Since an aggregate of 75 MVA is allowed at a single site, there is no basis for maintaining the 20 MVA for a single generator. The proposed MOD-026 assigns thresholds by region that are much higher than 20 MVA for modeling purposes. Since modeling generally would require more granularity than what is necessary for the reliable operation of the interconnected transmission system (BES), the SDT might want to review the threshold basis for NERC Project 2007-09 (Generator Verification). It is understood that the threshold will be reconsidered in Phase II of the BES Definition Project; however, a modest change from 20 to 75 MVA seems appropriate in the interim period justified by the current 75f MVA aggregate per site. For clarity purposes the following should be added at the end "unless excluded under Exclusion E2".</p> <p>4. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I3 (blackstart)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments:</p> <p>5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I4 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments: To distinguish this Inclusion from Inclusion I2, the SDT might want to clarify that the collection system (usually at voltage below 100</p>

Voter	Entity	Segment	Vote	Comment
				<p>KV anyway) is not part of the BES-just the resources and any transformers included by I1, if this is indeed the intent of this Inclusion.</p> <p>6. The SDT has added specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I5 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments:</p> <p>7. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E1 (radial system)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments: A much needed change from the first posting, as this will maintain the status quo referred to in the introduction text.</p> <p>8. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E2 (behind-the-meter generation)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments:</p> <p>9. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E3 (local network)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments: This Exclusion and Exclusion E1 aid in the delineation of distribution versus transmission.</p> <p>10. The SDT has added specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E4 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X Comments: This is a needed exception to Inclusion I5 as these reactive power resources are used by retail customers for power factor correction at their own facilities in order avoid imposed power factor penalties.</p> <p>11. Are there any other concerns with this definition that haven't been covered in</p>

Voter	Entity	Segment	Vote	Comment
				<p>previous questions and comments remembering that the exception criteria are posted separately for comment? Yes: X Comments: It might be worthwhile to explain the relationship (timeline) between the BES Definition implementation plan and the compliance implementation plan proposed in the BES RoP team's new Appendix 5C for the NERC Rules of Procedure.</p>
<p><b>Response:</b> 1. Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. The first step in Phase II will be the posting of the Phase II draft SAR for comment. At that time, you will have the opportunity to submit comments for the inclusion of items and issues to be considered by the SDT in Phase II.</p> <p>2. Thank you for your support.</p> <p>3. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. Correlation to MOD standards would be included in Phase II.</p> <p>4. Thank you for your support.</p> <p>5. The essential distinction between Inclusions I2 and I4 is that Inclusion I2 may not include generating resources that use lower voltage collection systems while Inclusion I4 is specifically designed to accomplish this purpose. Inclusion I4 speaks towards the inclusion of the resources themselves, not the transmission Element(s) of the collector systems operated below 100 kV or not included under Inclusion I2.</p> <p>6. – 10. Thank you for your support.</p> <p>11. For a newly identified Element(s) under the revised BES definition, the time period to be in full compliance with all applicable Reliability Standards is 24 months from the effective date of the definition. If the entity wishes to file for an exception of a newly</p>				

Voter	Entity	Segment	Vote	Comment
<p>identified Element(s) under the revised BES definition through the Rules of Procedure Exception Process, the entity will have 12 months from the effective date of the revised BES definition in which to file such a request. If the exception request is rejected or disapproved and the classification of the Element(s) remains as a BES Element, the Regional Entity and the owner of such a BES Element(s) shall agree to an Implementation Plan for full compliance obligations, which will establish an implementation date no earlier than the date established by the definition Implementation Plan (24 months from the effective date of the definition).</p>				
Gary Ofner	North Carolina Electric Membership Corp.	1	Affirmative	<p>In general, we support the proposed definition of the BES. However, we have identified a few concerns that warrant the SDT's consideration. We'd prefer to see the language from the ERO Statement of Compliance Registry Criteria repeated within the BES Definition itself instead of referencing an outside document. As it stands right now, the Compliance Registry Criteria needs to stay intact for Phase 1 of this project. That makes the Compliance Registry Criteria reliant on the BES Definition and vice versa.</p> <p>We understand that the Statement of Compliance Registry Criteria may be reviewed/revised at the same time Phase 2 of this project is being developed, therefore we agree with Inclusion 12 of this draft.</p> <p>Blackstart Resources can actually be on the distribution system. There is still the question of whether the distribution system would then be subjected to the enforceable standards. If so, there would most likely be a significant cost increase associated with tracking compliance for these distribution systems without a commensurate increase in reliability since Blackstart Resources are rarely used. This could very well cause entities to un-designate Blackstart Resources on distribution systems to avoid these distribution systems from becoming part of the BES. The same rationale that was used for eliminating cranking paths could also be applied to Blackstart Resources.</p> <p>A flowgate should not be used to limit applicability of E3. First, there is no definition for what constitutes a permanent flowgate. Second, flowgates are often created for a myriad of reasons that have nothing to do with them being necessary to operate the BES. While section c) in E3 attempts to limit the applicability to permanent flowgates, there is no definition for what constitutes a permanent flowgate particularly since no flowgate is truly permanent. The NERC Glossary of Terms definition of flowgate includes flowgates in the IDC. This is a</p>

				<p>problem because flowgates are included in the IDC for many reasons not just because reliability issues are identified. Flowgates could be included to simply study the impact of schedules on a particular interface as an example. It does not mean the interface is critical. As an example, it could be used to generate evidence that there are no transactional impacts to support exclusion from the BES. Furthermore, the list of flowgates in the IDC is dynamic. The master list of IDC flowgates is updated monthly and IDC users can add temporary flowgates at anytime. While the "permanent" adjective applied to flowgates probably limits the applicability from the "temporary" flowgates, it is not clear which of the monthly flowgates would be included from the IDC since they might be added one month and removed another. Flowgates are created for many reasons that have nothing to do with them being necessary to operate the BES. First, flowgates are created to manage congestion. The IDC is more of a congestion management tool than a reliability tool. FERC recognized this in Order 693, when they directed NERC to make clear in IRO-006 that the IDC should not be relied upon to relieve IROs that have been violated. Rather, other actions such as re-dispatch must be used in conjunction. Second, flowgates are used as a convenient point to calculate flows to sell transmission service. The characteristics of the flowgate make it a good proxy for estimating how much contractual use has been sold not necessarily how much flow will actually occur. While some flowgates definitely are created for reliability issues such as IROs, many simply are not. The term "non-retail generation" used in Exclusion E1 (item c) and again in E3 (item a) should be clarified (see comments for question 8 below). The Note after item c should also be clarified to indicate that closing a normally open switch doesn't affect this exclusion.</p>
Jeffrey S Brame	North Carolina Electric Membership Corp.	5	Affirmative	<p>In general, we support the proposed definition of the BES. However, we have identified a few concerns that warrant the SDT's consideration. <p><b>Response:</b> The SDT has reverted to specific numeric thresholds consistent with the ERO Statement of Compliance Registry Criteria for Phase I.</p> <p>Thank you for your support.</p> <p>The SDT disagrees that Blackstart Resources should not be included in the BES Definition. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all facilities necessary for operating an interconnected electric transmission network. The SDT interprets this to include operation under both normal and emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator’s restoration plan requirements for Real and Reactive Power capability, frequency, and voltage control. The associated resources of the electric system that can be isolated and then energized to deliver electric power during a restoration event are essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s restoration plan. For these reasons, the SDT continues to include Blackstart Resources identified in the Transmission Operator’s restoration plan as BES elements. No change made.</p> <p>The SDT believes that the language in Exclusion E3.c prohibiting “Flowgates” from qualifying for definitional exclusion is appropriate and necessary. As a definitional exclusion characteristic, Exclusion E3.c must follow the principle of being a bright-line and easily identifiable, and as such, the SDT feels that the definition cannot allow some types of Flowgates and disallow others. Flowgates must continue to be a prohibiting characteristic under Exclusion E3, since these facilities are more likely to be used in the transfer</p>				

Voter	Entity	Segment	Vote	Comment
<p>of bulk power than not. An entity who wishes to make a case for exclusion of a unique type of Flowgate facility can do so through the exception process. The SDT believes that the continued qualifier of “permanent” associated with the term “Flowgate” addresses the majority of the concern in this comment. No change made.</p> <p>“Non-retail generation” means that generation which is on the system (supply) side of the retail meter.</p> <p>Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator’s responsibility to indicate how a switch is used in the normal operating environment.</p>				
Paul Cummings	City of Redding	5	Affirmative	An affirmative vote is conditional on NERC's dedication to phase 2 of the Project.
<p><b>Response:</b> Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up.</p>				
Pawel Krupa	Seattle City Light	1	Affirmative	<p>Comments: 1. Core Definition: Yes Comments: Seattle City Light (SCL) believes that the SDT has made substantial progress towards a clear and workable definition of the BES. We strongly support the approach to defining the Bulk Electric System as proposed here. SCL recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct a technical analysis within the time available. Accordingly, SCL agrees with the approach taken by the SDT, which is to propose a Phase II of the standards development process that would address the generator threshold level and other issues. However, it is our opinion that the second draft would benefit from further clarification or modification in a number of respects, as are detailed in our comments.</p> <p>2. I1 - Transformer inclusions: No Comments: The wording of Inclusion I1 is not clear. The term transformers needs to be further defined with respect to multiphase transformers and generator step-up transformers. Recommend the following wording: “All transformers with at least two primary and secondary terminals operated at or above 100kV, and generator step-up transformers (GSU) with one terminal operated at or above 100kV, unless excluded by E1 or E3.”</p> <p>3. I2 - Generation Thresholds: Yes Comments: Recommend removing the</p>

				<p>reference to the Statement of Compliance Registry Criteria. The definition should be the governing document and provide the details of what generating resources should be included. The current language induces circular arguments without a true governing document. The definition should drive what appears in the Registry Criteria. Inclusion 12 should be revised to read: "Generating resources with a gross nameplate rating of 20MVA or greater, or generating plant/facility connected at a common bus, with an aggregate nameplate rating of 75MVA or greater and is directly connected to a BES Element." This is consistent with proposed Inclusion.</p> <p>4. 13 - Blackstart Units: Yes Comments: None</p> <p>5. 14 - Dispersed Power: No Comments: The term "common point" needs clarification with respect to connection to the BES. Recommend the following wording: "connected at a common point through a dedicated step-up transformer with a high-side voltage of 100 KV or above."</p> <p>6. 15 - Reactive Power devices: No Comments: Technical studies need to be conducted to confirm reactive resource impacts on the reliability of the BES. The inclusion of reactive resources is a significant expansion of the current BES definition and therefore requires technical justification for inclusion. Inclusion 15 as written is generally confusing with multiple references to other inclusions and exclusions in the definition. Recommend removing references to reactive resources from Phase 1 until technical justification can be demonstrated (as part of Phase 2).</p> <p>7. E1 - Radial System: Yes Comments: (1) The E1 Reference Note should be re-worded to state "Radial systems shall be assessed with all normally open switching devices in their open positions." The current wording is unclear with respect to the treatment of normally open switching devices. (2) Recommend that load bus tie-breakers be excluded from the BES as these devices apply to the users of the BES. (3) Recommend that the potential inclusion in the BES of protective relay systems which reach beyond a load network or ring bus should be confirmed in Phase 2 pursuant to technical studies.</p> <p>8. E2 - Behind-the-Meter-Generation: Yes Comments: The wording of Exclusion E2 should be consistent with the Statement of Compliance Registry Criteria in</p>

We strongly support the approach to defining the Bulk Electric System as proposed here. SCL recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct a technical analysis within the time available. Accordingly, SCL agrees with the approach taken by the SDT, which is to propose a Phase II of the standards development process that would address the generator threshold level and other issues. However, it is our opinion that the second draft would benefit from further clarification or modification in a number of respects, as are detailed in our comments.</p>
<p><b>Response:</b> 1. Thank you for your support.</p> <p>2. The SDT believes the existing language is clear and the proposed additional language would be redundant. No change made.</p> <p>3. The SDT has reverted to specific numeric thresholds consistent with the ERO Statement of Compliance Registry Criteria for Phase I.</p> <p>4. Thank you for your support.</p> <p>5. The “single point of connection of 100 kV or higher” is where the radial system will begin if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation.</p> <p>6. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the</p>				

Voter	Entity	Segment	Vote	Comment
<p>definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p> <p>7. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator’s responsibility to indicate how a switch is used in the normal operating environment. The treatment of protection systems is but one of many items to be analyzed in Phase II.</p> <p>8. The wording of Exclusion E2 is essentially the same as the wording on this topic in the ERO Statement of Registry Criteria which has been in existence for several years and is well understood in the industry. The roles of the Balancing Authority, Generator Owner, and Generator Operator are implied in the ERO Statement of Compliance Registry Criteria and the terms were added to Exclusion E2 as the result of industry requests for clarification.</p> <p>9. Several commenters suggested that the requirement under Exclusion E3.b should apply only during normal operating conditions, in other words, commenters felt that some power flow should be allowed to flow from the candidate local network back into the BES as long as it only occurred under abnormal conditions. To this suggestion, the SDT considered the addition of the phrase “under normal operating conditions”, as a qualifier to Exclusion E3.b, and determined that in order to maintain the intent of a bright-line characteristic in the BES definition such a qualifier could not be accommodated. However, the SDT pointed out that for those circumstances where a candidate for local network is unable to utilize the local network exclusion due to an abnormal situation that caused power to flow out of the network, the network could be a suitable candidate that could apply for exclusion under the Exception Process.</p> <p>10. See response in #6 above.</p> <p>11. Thank you for your support.</p>				
Long T Duong	Snohomish County PUD No. 1	1	Affirmative	The Public Utility District No. 1 of Snohomish County (“SNPD”) believes the SDT continues to make substantial progress towards a clear and workable definition of the Bulk Electric System (“BES”) that markedly improves both the existing definition and the SDT’s previous proposal. SNPD therefore strongly supports the new definition, although our support is conditioned on: (1) a workable Exceptions process being developed in conjunction with the BES definition; and,

Voter	Entity	Segment	Vote	Comment
				<p>(2) the SDT moving forward expeditiously on Phase II of the standards development process in accordance with the SAR recently put forward by the SDT, which would address a number of important technical issues that have been identified in the standards development process to date.</p> <p>Below are SNPD’s responses to the NERC comment form for the 2nd Draft of Definition of BES (Project 2010-17). SNPD believes the refinements below will clarify the current draft of the BES definition, without changing the current intent.</p> <p>1. The SDT has made clarifying changes to the core definition in response to industry comments. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Comments: SNPD strongly supports the following elements of the revised BES definition: (1) Clarification of how lists of Inclusions and Exclusions applies: The revised core definition moves the phrase “Unless modified by the lists shown below” to the beginning of the definition. This change makes clear that the Inclusions and Exclusions apply to all Elements that would otherwise be included in or excluded from the core definition (i.e., “all Transmission Elements operated at 100 kV or higher and Real Time and Reactive Power resources connected at 100 kV or higher”) and eliminates a latent ambiguity in the first draft of the definition, discussed further in our comments on the first draft.</p> <p>(2) The exclusion for Local Distribution Facilities. As the starting point for the BES definition, SNPD supports use of the phrase “all Transmission Elements” and the qualifying sentence: “This does not include facilities used in the local distribution of electric energy.” This language helps ensure that FERC, NERC, and the Regional Entities (“REs”) will act within the jurisdictional constraints Congress placed in Section 215 of the Federal Power Act (“FPA”). In Section 215(a)(1), Congress unequivocally excluded “facilities used in the local distribution of electric energy” from the keystone “bulk-power system” definition. 16 U.S.C. Â§ 824o(a)(1). Including the same language in the definition helps ensure that entities involved in enforcement of reliability standards will act within their statutory limits. In addition, as a practical matter, inclusion of the language will</p>

Voter	Entity	Segment	Vote	Comment
				<p>help focus both the industry and responsible agencies on the high-voltage interstate transmission system, where the reliability problems Congress intended to regulate - "instability, uncontrolled separation, [and] cascading failures," 16 U.S.C. Å§ 824o(a)(4) - will originate. At the same time, level-of-service issues arising in local distribution systems will be left to the authority of state and local regulatory agencies and governing bodies, just as Congress intended. 16 U.S.C. Å§ 824o(i)(2) (reserving to state and local authorities enforcement of standards for adequacy of service). For similar reasons, Snohomish believes use of the phrase "Transmission Elements" as the starting point for the base definition is desirable because both "Transmission" and "Elements" are already defined in the NERC Glossary of Terms Used, and the term "Transmission" makes clear that the BES includes only Elements used in Transmission and therefore excludes Elements used in local distribution of electric power.</p> <p>(3) Appropriate Generator Thresholds. In the standards development process, it has become apparent that the thresholds for classifying generators as BES in the current NERC Statement of Compliance Registry Criteria ("SCRC") (20 MVA for individual generators, 75 MVA for multiple generators aggregated at a single site), which predate the adoption of FPA Section 215, were never the product of a careful analysis to determine whether generators of that size are necessary for operation of the interconnected bulk transmission system. Ideally, such an analysis would be conducted as part of the current standards development process. Snohomish recognizes that, given the deadlines imposed by FERC in Order No. 743, it will not be possible for the SDT to conduct such an analysis within the time available. Accordingly, Snohomish agrees with the approach taken by the SDT, which is to propose a Phase II of the standards development process that would address the generator threshold issue and several other technical issues that have arisen during the current process. As long as Phase II proceeds expeditiously, Snohomish is prepared to support the BES definition as proposed by the SDT. While Snohomish strongly supports the overall approach adopted by the SDT and much of the specific language incorporated into the second draft of the BES definition, we believe the second draft would benefit from further clarification or modification in a number of respects, most of which are detailed in</p>

Voter	Entity	Segment	Vote	Comment
				<p>our subsequent answers. Our support for the definition is not contingent upon these changes being adopted.</p> <p>Further, we believe a workable Exclusion Process is essential for a BES Definition that will meet the legal requirements of FPA Section 215, especially for systems operating in the Western Interconnection.</p> <p>As detailed in our previous comments, Snohomish believes a 200-kV threshold would be more appropriate for WECC than a 100-kV threshold. In addition, a 200-kV threshold for the West is backed by solid technical analysis conducted by the WECC Bulk Electric System Definition Task Force, and repeated claims that there is no technical analysis to support this view is therefore incorrect. That being said, we raise the issue here to emphasize the importance of the Exclusions for Local Networks and Radial Systems and the Exceptions process. These Exclusions and the Exceptions are essential for a definition that works in the Western Interconnection because the core definition will be over-inclusive in our region. As long as those Exclusions and the Exceptions Process are retained in a form substantially equivalent to those produced by the SDT at this juncture, Snohomish will support the SDT's proposal and will not further pursue its claims regarding the 200-kV threshold.</p> <p>Finally, we suggest that the SDT language address the circumstance when a facility is covered by both an Inclusion and an Exclusion. We note that some of the inclusions already contain language addressing this question. For example, Inclusion 1 indicates that transformers falling within the specified parameters are part of the BES ". . . unless excluded under Exclusions E1 or E3." Where it is not already included, similar language should be included in the other Inclusions and/or Exclusions to explain whether the SDT intends the Inclusions or the Exclusions to predominate in situations where facilities might be covered by both. We suggest clarifying language in our comments to I1 and I4 below. 2. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I1 (transformers)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.</p> <p>Comments: We support the SDT's changes to the first Inclusion because it is</p>

<p><b>Response:</b> The SDT refers Snohomish to the individual comment responses in the definition comment form as the comments expressed here are identical to the comments submitted by Snohomish on that form.</p>				
Thomas Richards	Fort Pierce Utilities Authority	4	Affirmative	<p>FPUA supports the exclusion of Local Networks from the BES. Such systems are generally not "necessary for operating an interconnected electric transmission network," the standard in Orders 743 and 743-A. However, we have some suggestions to clarify the proposed language for this Exclusion. We have a major concern with the wording in E3 defining a Local Network. The requirement that "Power flows only into the LN" fails to recognize that loop flows are inevitable in a networked system, particularly during a contingency. It just doesn't make sense</p>

Voter	Entity	Segment	Vote	Comment
				<p>that E3 allows flows out of the LN when exporting power that was generated within the LN, yet de minimis loop flows are not. I am suggesting that the “Power flows only into the LN” requirement be replaced with different criteria to allow “minor” inadvertent transfers across the LN. Such a modification would bring E3 in line with the technical justification paper developed for this project. FPUA supports FMPA’s suggested change: “Power flows only into the LN, that is, at each individual connection at 100 kV or higher, the pre-contingency flow of power is from outside the LN into the LN for all hours of the previous 2 years” to help clarify the intent. Two years is suggested because it is the time period set out in the draft exception application form for which an applicant should state whether power flows through an Element to the BES.</p>
<p><b>Response:</b> Several commenters suggested that the requirement under Exclusion E3.b should apply only during normal operating conditions, in other words, commenters felt that some power flow should be allowed to flow from the candidate local network back into the BES as long as it only occurred under abnormal conditions. To this suggestion, the SDT considered the addition of the phrase “under normal operating conditions”, as a qualifier to Exclusion E3.b, and determined that in order to maintain the intent of a bright-line characteristic in the BES definition such a qualifier could not be accommodated. However, the SDT pointed out that for those circumstances where a candidate for local network is unable to utilize the local network exclusion due to an abnormal situation that caused power to flow out of the network, the network could be a suitable candidate that could apply for exclusion under the Exception Process.</p>				
Allen Mosher	American Public Power Association	4	Affirmative	<p>APPA would like to thank the Standard Drafting Team (SDT) for their work on this standard and will continue to support approval of the current draft of the Bulk Electric System (BES) definition to meet the FERC imposed deadline. APPA also fully supports immediate consideration in Phase 2 of this project of the technical issues raised by the drafting team and commenters in response to the current draft definition.</p> <p>The SDT should be applauded for addressing the issue of local distribution facilities by placing the exclusion in the BES definition itself: “This does not include facilities used in the local distribution of electric energy.” It is clearly spelled out in Section 215 that local distribution facilities are not subject to compliance with NERC standards. Including this statement in the definition ensures consistency between NERC’s technical standards and the legal foundation</p>

Voter	Entity	Segment	Vote	Comment
				<p>upon which these standards are based. The current BES definition allows for various interpretations which could allow for excessive compliance documentation on facilities that are not part of the BES. The drafting team has provided sufficient granularity through the specific inclusions and exclusions to provide clear direction to NERC, regional entities and registered entities on the specific subset of electric facilities that are included within (or excluded from) the BES.</p> <p>APPA applauds the SDT for understanding that many utilities have unique system configurations and there is a need to differentiate between networked and radial systems. Allowing the exclusion for radial systems serving only load to have a normally open switch between the BES and such a radial system provides an important distinction. This clarifies the issue that a single radial fed system is the same as a system with multiple feeds with normally open switches between them.</p> <p>The SDT should be commended for identifying and addressing the issue of local networks (LN). Even though these systems are built in a networked configuration, the electric energy delivered is intended only to serve local distribution load. APPA believes that level-of-service/quality-of-service issues arising in local distribution systems must be left to the authority of state and local regulatory agencies and governing bodies. Therefore local networks should be excluded from the BES.</p> <p>APPA is concerned that the 20MVA &amp; 75MVA generation threshold was not addressed in Phase 1 of this project, but fully recognizes the difficulty in timely completing development of the necessary technical studies and consensus development required to include this improvement in Phase 1. For these reasons, APPA supports the current draft BES definition and requests that the SDT move quickly to the phase 2 process to study what generation is necessary for reliable operation of the BES.</p> <p>APPA also requests more specificity on the detailed information required to support BES exceptions processed through the NERC Rules of Procedure drafting process. Additional technical specificity will help ensure consistency between regions and transparency for registered entities on the technical studies and data</p>

				required to support exception requests.
<p><b>Response:</b> Thank you for your support.</p> <p>Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up.</p> <p>The SDT understands the concerns raised by the commenters in not receiving hard and fast guidance on this issue. The SDT would like nothing better than to be able to provide a simple continent-wide resolution to this matter. However, after many hours of discussion and an initial attempt at doing so, it has become obvious to the SDT that the simple answer that so many desire is not achievable. If the SDT could have come up with the simple answer, it would have been supplied within the bright-line. The SDT would also like to point out to the commenters that it directly solicited assistance in this matter in the first posting of the criteria and received very little in the form of substantive comments.</p> <p>There are so many individual variables that will apply to specific cases that there is no way to cover everything up front. There are always going to be extenuating circumstances that will influence decisions on individual cases. One could take this statement to say that the regional discretion hasn't been removed from the process as dictated in the Order. However, the SDT disagrees with this position. The exception request form has to be taken in concert with the changes to the ERO Rules of Procedure and looked at as a single package. When one looks at the rules being formulated for the exception process, it becomes clear that the role of the Regional Entity has been drastically reduced in the proposed revision. The role of the Regional Entity is now one of reviewing the submittal for completion and making a recommendation to the ERO Panel, not to make the final determination. The Regional Entity plays no role in actually approving or rejecting the submittal. It simply acts as an intermediary. One can counter that this places the Regional Entity in a position to effectively block a submittal by being arbitrary as to what information needs to be supplied. In addition, the SDT believes that the visibility of the process would belie such an action by the Regional Entity and also believes that one has to have faith in the integrity of the Regional Entity in such a process. Moreover, Appendix 5C of the proposed NERC Rules of Procedure, Sections 5.1.5, 5.3, and 5.2.4, provide an added level of protection requiring an independent Technical Review Panel assessment where a Regional Entity decides to reject or disapprove an exception request. This panel's findings become part of the exception request record submitted to NERC. Appendix 5C of the proposed NERC Rules of Procedure, Section 7.0, provides NERC the option to remand the request to the Regional Entity with the mandate to process the exception if it finds the Regional Entity erred in rejecting or disapproving the exception request. On the other side of this equation, one could make an argument that the Regional Entity has no basis for what constitutes an acceptable submittal. Commenters point out that</p>				

Voter	Entity	Segment	Vote	Comment
				<p>the explicit types of studies to be provided and how to interpret the information aren't shown in the request process. The SDT again points to the variations that will abound in the requests as negating any hard and fast rules in this regard. However, one is not dealing with amateurs here. This is not something that hasn't been handled before by either party and there is a great deal of professional experience involved on both the submitter's and the Regional Entity's side of this equation. Having viewed the request details, the SDT believes that both sides can quickly arrive at a resolution as to what information needs to be supplied for the submittal to travel upward to the ERO Panel for adjudication.</p> <p>Now, the commenters could point to lack of direction being supplied to the ERO Panel as to specific guidelines for them to follow in making their decision. The SDT re-iterates the problem with providing such hard and fast rules. There are just too many variables to take into account. Providing concrete guidelines is going to tie the hands of the ERO Panel and inevitably result in bad decisions being made. The SDT also refers the commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.1 where the basic premise on evaluating an exception request must be based on whether the Elements are necessary for the reliable operation of the interconnected transmission system. Further, reliable operation is defined in the Rules of Procedure as operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements. The SDT firmly believes that the technical prowess of the ERO Panel, the visibility of the process, and the experience gained by having this same panel review multiple requests will result in an equitable, transparent, and consistent approach to the problem. The SDT would also point out that there are options for a submitting entity to pursue that are outlined in the proposed ERO Rules of Procedure changes if they feel that an improper decision has been made on their submittal.</p> <p>Some commenters have asked whether a single 'yes' or 'no' response to an item on the exception request form will mandate a negative response to the request. To that item, the SDT refers commenters to Appendix 5C of the proposed NERC Rules of Procedure, Section 3.2 of the proposed Rules of Procedure that states "No single piece of evidence provided as part of an Exception Request or response to a question will be solely dispositive in the determination of whether an Exception Request shall be approved or disapproved."</p> <p>The SDT would like to point out several changes made to the specific items in the form that were made in response to industry comments. The SDT believes that these clarifications will make the process tighter and easier to follow and improve the quality of the submittals.</p>

Voter	Entity	Segment	Vote	Comment
<p>Finally, the SDT would point to the draft SAR for Phase II of this project that calls for a review of the process after 12 months of experience. The SDT believes that this time period will allow industry to see if the process is working correctly and to suggest changes to the process based on actual real-world experience and not just on suppositions of what may occur in the future. Given the complexity of the technical aspects of this problem and the filing deadline that the SDT is working under for Phase I of this project, the SDT believes that it has developed a fair and equitable method of approaching this difficult problem. The SDT asks the commenter to consider all of these facts in making your decision and casting your ballot and hopes that these changes will result in a favorable outcome.</p>				
Greg Lange	Public Utility District No. 2 of Grant County	3	Affirmative	<p>The Public Utility District No. 1 of Grant County (“GCPD”) believes the SDT continues to make substantial progress towards a clear and workable definition of the Bulk Electric System (“BES”) that markedly improves both the existing definition and the SDT’s previous proposal. GCPD therefore strongly supports the new definition, although our support is conditioned on: (1) a workable Exceptions process being developed in conjunction with the BES definition; and, (2) the SDT moving forward expeditiously on Phase II of the standards development process in accordance with the SAR recently put forward by the SDT, which would address a number of important technical issues that have been identified in the standards development process to date.</p> <p>GCPD strongly supports the addition of the language regarding local distribution facilities, as it matches congressional intent to leave the regulation of these facilities to state and local authorities.</p> <p>We also support the SDT’s proposal to develop detailed guidance concerning the point of demarcation between BES and non-BES elements in the Phase II SAR. In this regard, we note that, while Inclusion 1 at least implicitly suggests that the dividing line between BES and non-BES Elements should be at the transformer where transmission-level voltages are stepped down to distribution-level voltages, we believe further clarification of this point of demarcation between the BES and non-BES Elements is necessary. Many different configurations of transformers and other equipment that may lie at the juncture between the BES and non-BES systems. If the point of demarcation is designated at the transformer without further elaboration, many entities that own equipment on the high side of a transformer will be swept into the BES, and thereby exposed to inappropriately</p>

Voter	Entity	Segment	Vote	Comment
				<p>stringent regulations and undue costs. For example, distribution-only utilities commonly own the switches, bus and transformer protection devices on the high side of transformers where they take delivery from their transmission provider. Ownership of these protective devices and high-voltage bus on the high side of the transformer should not cause these entities to be classified as BES owners. As the Phase II process moves forward, we recommend that SDT consider the extensive work performed on the point of demarcation question by the WECC BESDTF.</p> <p>GCPD does not support The inclusion of Reactive Power devices because Reactive Power devices produce power, they are “power producing resources” and we therefore believe Inclusion 5 is duplicative of Inclusion 4, which addresses “power producing devices.”</p> <p>Also, there is no capacity threshold specified in Inclusion 5 for Reactive Power devices that would be considered part of the BES. This is inconsistent with the approach taken in the balance of the definition, where thresholds are specified for generators and other types of power producing devices. Reactive Power devices should be subject to the same technical analysis for inclusion or exclusion that will cover generators in the Phase II process.</p> <p>GCPD strongly supports the revised Local Networks (“LNs”) exclusion from the BES. GCPD also supports specific refinements made to the LN exclusion by the SDT in the current draft of the BES definition. In particular, GCPD supports the clarification of the purposes of a LN. The current draft states that LNs connect at multiple points to “improve the level of service to retail customer Load and not to accommodate bulk power transfer across the interconnected system.” GCPD supports this change in language because it reflects the fundamental purposes of a LN and emphasizes one of the key distinctions between LNs and bulk transmission facilities. Similarly, we suggest that the SDT re-examine the assumptions underlying subparagraph (b), which seems to suggest that a local distribution system cannot be classified as a Local Network if power flows out of that system at any time, even if the amount is very small, the outward flow is only for a few hours a year, or the outward flow occurs only in an extreme contingency. Accordingly, we suggest that the initial clause of subparagraph (b)</p>

Voter	Entity	Segment	Vote	Comment
				be revised to read: "Except in unusual circumstances, power flows only into the LN."
<p><b>Response:</b> The exception process is being worked on in parallel with the definition. Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up. Thank you for your support. The development of demarcation points will be included in Phase 2 of this project. Work done at WECC and other regions will be utilized as appropriate. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made. Several commenters suggested that the requirement under Exclusion E3.b should apply only during normal operating conditions, in other words, commenters felt that some power flow should be allowed to flow from the candidate local network back into the BES as long as it only occurred under abnormal conditions. To this suggestion, the SDT considered the addition of the phrase "under normal operating conditions", as a qualifier to Exclusion E3.b, and determined that in order to maintain the intent of a bright-line characteristic in the BES definition such a qualifier could not be accommodated. However, the SDT pointed out that for those circumstances where a candidate for local network is unable to utilize the local network exclusion due to an abnormal situation that caused power to flow out of the network, the network could be a suitable candidate that could apply for exclusion under the Exception Process.</p>

<p><b>Response:</b> The exception process is being worked on in parallel with the definition. Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up.</p>				
CJ Ingersoll	Constellation Energy	3	Affirmative	While we support the proposed definition to satisfy the FERC Order, we also support continued work on the threshold questions slated for "Phase II", in particular the refinement of the generation thresholds.
<p><b>Response:</b> Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up.</p>				
Howard M. Mott Jr.	Clay Electric Cooperative	3	Affirmative	The Note under Exclusions: E1 - Radial Systems: should not include "...as depicted on prints or one-line diagrams..." and should be changed. "Note - A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion." I recommend the note be changed to read: Note - A normally open switching device between radial systems operated in a 'make-before-break' fashion does not affect this exclusion.
<p><b>Response:</b> Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator's responsibility to indicate how a switch is used in the normal operating environment.</p>				
Brian Fawcett	Clatskanie People's Utility District	3	Affirmative	1. The SDT has made clarifying changes to the core definition in response to industry comments. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: Yes No: Comments: We agree with the changes. We must point out that the overall flow, or how one proceeds through the inclusions and exclusions is not clear. Can an item that meets an inclusion be subsequently excluded? If so, this needs to be explicitly stated. So far, we only have the flow chart produced by the ROP team that indicates otherwise ( <a href="http://www.nerc.com/docs/standards/sar/20110428_BES_Flowcharts.pdf">http://www.nerc.com/docs/standards/sar/20110428_BES_Flowcharts.pdf</a> ). This was made evident by the question at the 9/28 webinar regarding an I5 capacitor on an E3 local network. The questioner thought the capacitor was BES per I5, but the answer was that it was excluded per E3. We can find no support for the

Voter	Entity	Segment	Vote	Comment
				<p>answer given. The listing of specific exclusions within I1 (exception proves the rule) argues for questioner’s stance that the capacitor is BES as written. Also, if included items could subsequently be excluded, they would be no different from any other item that met the voltage threshold of 100kV. There would be no need for any of the inclusions if all possible outputs from the inclusion tests go to the same exclusion test inputs.</p> <p>We strongly support the addition of the language regarding local distribution facilities, as it matches congressional intent to leave the regulation of these facilities to state and local authorities.</p> <p>2. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I1 (transformers)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments: Clatskanie PUD strongly agrees with this inclusion as written. It is consistent with the recent PRC-004 and PRC-005 interpretation and the NERC definition of Transmission. We believe the recent changes to this inclusion add clarity.</p> <p>3. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I2 (generation) including the reference to the ERO Statement of Compliance Registry Criteria? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: Referencing the Criteria which in turn references the BES definition creates a circular definition. Clatskanie PUD encourages the adoption of specific thresholds that are technically justified. We also note that the Criteria and its revisions do not go through the standards development process, so that thresholds may change with little warning and without triggering an implementation plan for facilities that may be swept into the BES as a result.</p> <p>4. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I3 (blackstart)? If you do not support this change or you agree in general but feel that alternative language</p>

Voter	Entity	Segment	Vote	Comment
				<p>would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments: We agree with the removal of the voltage language, since the inclusions and exclusions apply only to equipment over 100 kV.</p> <p>5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I4 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments: Clatskanie PUD agrees both with the inclusion and with the revised language. The revised language removes the need to provide a separate definition for "Collector System".</p> <p>6. The SDT has added specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I5 (reactive resources)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: While we agree that reactive devices of sizable capacity connected at 100 kV or higher are needed for BES reliability, Clatskanie PUD fails to see why this inclusion is needed as they are already captured by the 100 kV threshold. We would propose instead to eliminate this inclusion and substitute an exclusion for smaller capacity devices. If the SDT really believes an inclusion for reactive devices is needed, we suggest the SDT provide a technically justified capacity limit within the inclusion. In addition we suggest also including the phrase "...unless excluded under Exclusion E1, E2 or E4" similar to that in I1. Please see the answer to Q1 above Q10 below.</p> <p>7. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E1 (radial system)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: Clatskanie PUD notes that a new term has been introduced, "non-retail generation," with no definition provided. The answer to the question on this during the 9/28 webinar indicated that non-retail generation was behind the retail customer's meter. We can see no reason why</p>

Voter	Entity	Segment	Vote	Comment
				<p>the net-metered PV systems should count toward the aggregate limit (exceeding the limit means no exclusion) while a non-blackstart thermal plant doesn't (the radial system is excluded if any amount of load is present). We have also heard the SDT meant just the opposite of what was stated in the webinar. We ask that a reasonable definition for non-retail be provided within the BES definition document. We strongly agree that radial systems should be excluded and that the presence of normally open switching devices between radial systems should not cause them to be considered non-radial. Such a result would cause the removal of these devices to the detriment of the local level of service. We note that the singular "A normally open switching device" is used and suggest that an allowance be made for the possibility of multiple devices. "Normally open switching devices..."</p> <p>8. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E2 (behind-the-meter generation)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: X No: Comments:</p> <p>9. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E3 (local network)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: X Comments: We strongly agree that local networks should be excluded, since they act much like the radial systems excluded in E1 while providing a higher level of service to customers. These networks should not be discouraged in the name of reliability. We again object to the introduction of the new confusing term "non-retail generation" with no definition provided.</p>
<p><b>Response:</b> 1. The application of the draft 'bright-line' BES definition is a three (3) step process that when appropriately applied will identify the vast majority of BES Elements in a consistent manner that can be applied on a continent-wide basis.</p>				
<p>Initially, the BES 'core' definition is used to establish the bright-line of 100 kV, which is the overall demarcation point between BES and non-BES Elements. Additionally, the 'core' definition identifies the Real Power and Reactive Power resources connected at 100</p>				

Voter	Entity	Segment	Vote	Comment
<p>kV or higher as included in the BES. To fully appreciate the scope of the ‘core’ definition an understanding of the term Element is needed. Element as defined in the NERC Glossary of Terms as:</p> <p>“Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. “</p> <p>Element is basically any electrical device that is associated with the transmission or the generation (generating resources) of electric energy.</p> <p>Step two (2) provides additional clarification for the purposes of identifying specific Elements that are included through the application of the ‘core’ definition. The Inclusions address transmission Elements and Real Power and Reactive Power resources with specific criteria to provide for a consistent determination of whether an Element is classified as BES or non-BES.</p> <p>Step three (3) is to evaluate specific situations for potential exclusion from the BES (classification as non-BES Elements). The exclusion language is written to specifically identify Elements or groups of Elements for potential exclusion from the BES.</p> <p>Exclusion E1 provides for the exclusion of ‘transmission Elements’ from radial systems that meet the specific criteria identified in the exclusion language. This does not include the exclusion of Real Power and Reactive Power resources captured by Inclusions I2 – I5. The exclusion (E1) only speaks to the transmission component of the radial system. Similarly, Exclusion E3 (local networks) should be applied in the same manner. Therefore, the only inclusion that Exclusions E1 and E3 supersede is Inclusion I1.</p> <p>Exclusion E2 provides for the exclusion of the Real Power resources that reside behind-the-retail meter (on the customer’s side) and supersedes inclusion I2.</p> <p>Exclusion E4 provides for the exclusion of retail customer owned and operated Reactive Power devices and supersedes Inclusion I5.</p> <p>In the event that the BES definition incorrectly designates an Element as BES that is not necessary for the reliable operation of the</p>				

Voter	Entity	Segment	Vote	Comment
				<p>interconnected transmission network or an Element as non-BES that is necessary for the reliable operation of the interconnected transmission network, the Rules of Procedure exception process may be utilized on a case-by-case basis to either include or exclude an Element.</p> <p>2. Thank you for your support.</p> <p>3. The SDT has reverted to specific numeric thresholds consistent with the ERO Statement of Compliance Registry Criteria for Phase I.</p> <p>4. Thank you for your support.</p> <p>5. Thank you for your support.</p> <p>6. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p> <p>7. “Non-retail generation” means that generation which is on the system (supply) side of the retail meter. Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator’s responsibility to indicate how a switch is used in the normal operating environment.</p> <p>8. Thank you for your support.</p> <p>9. Thank you for your support. “Non-retail generation” means that generation which is on the system (supply) side of the retail meter.</p>

Gregg R Griffin	City of Green Cove Springs	3	Affirmative	<p>GCS appreciates the SDT's work on this project. For the most part, GCS supports what it believes to be the intent of the proposed language. The proposed specific exclusion of facilities used in the local distribution of electric energy is appropriate and consistent with Section 215 of the Federal Power Act. However, we have suggestions to better carry out what we believe to be the SDT's intent.</p> <p>The first sentence can be read as: "... all ... Real Power and Reactive Power resources connected at 100 kV or higher", which is surely not what the SDT intends. The basic problem is that Inclusions I2 and I4 do not modify the first sentence, e.g., from a set theory perspective, the set described by the first sentence includes the sets described in inclusions I2 and I4; hence, I2 and I4 do not modify the first sentence. From a literal reading, this would cause any size generator connected at 100 kV to be included, which is surely not the intent of the SDT. For similar reasons, the core definition and Inclusion I5 now has the effect of including all generators connected at 100 kV since a generator is a "dynamic device ... supplying or absorbing Reactive Power". The word "dedicated" in I5 is not sufficient in GCS's mind to unambiguously exclude generators from this statement. GCS suggests the following wording to address these issues: "Transmission Elements (not including elements used in the local distribution of electric energy) and Real Power and Reactive Power resources as described in the list below, unless excluded by Exclusion or Exception: a. Transmission Elements other than transformers and reactive resources operated at 100 kV or higher. b. Transformers with primary and secondary terminals operated at 100 kV or higher. c. Generating resource(s) (with gross individual or gross aggregate nameplate rating per the ERO Statement of Compliance Registry Criteria) including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above. d. Blackstart Resources identified in the Transmission Operator's restoration plan. e. Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above, but not including generation on the retail side of the retail meter. f. Non-generator static or dynamic devices dedicated to supplying or absorbing more than 6 MVAR of</p>

				<p>Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in bullet 2 above."</p> <p>2. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I1 (transformers)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: Yes No: Comments: Please see comments to Question 1</p> <p>3. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I2 (generation) including the reference to the ERO Statement of Compliance Registry Criteria? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: yes No: Comments: Please see comments to Question 1</p> <p>4. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I3 (blackstart)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: Yes No: Comments: Please see comments to Question 1.</p> <p>5. The SDT has revised the specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I4 (dispersed power)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: Yes No: Comments: We recommend clarifying that the dispersed power resources covered by this inclusion do not include generators on the retail side of the retail meter. Specifically, we recommend that the Inclusion read: "Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100kV or above, but not including generation on the retail side of the retail meter."</p> <p>6. The SDT has added specific inclusions to the core definition in response to industry comments. Do you agree with Inclusion I5 (reactive resources)? If you</p>

Voter	Entity	Segment	Vote	Comment
				<p>do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: No: Comments: To help clarify and to avoid inclusion of de minimis reactive resources, we propose a size threshold of 6 MVAR consistent with the smallest size generator included in the BES at a 0.95 power factor, which is a common leading power factor used in Facility Connection Requirements for generators. In other words, 6 MVAR is consistent with typically the least amount of MVAR required to be absorbed by the smallest generator meeting the registry criteria.</p> <p>7. The SDT has revised the specific exclusions to the core definition in response to industry comments. Do you agree with Exclusion E1 (radial system)? If you do not support this change or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. Yes: Yes No: Comments: GCS supports the exclusion of radial systems from the BES Definition. Such systems are generally not “necessary for operating an interconnected electric transmission network,” the standard in Orders 743 and 743-A. We have several suggestions to clarify the proposed language for this Exclusion. Proposed Exclusion E1 refers to “[a] group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher.” We appreciate the SDT’s clarification of the point of connection requirement, but the term “a single point of connection” should be further defined (more clearly than just by voltage), and should be generic enough to encompass the various bus configurations. It is not the case, for example, that each individual breaker position in a ring bus is a separate point of connection for this purpose; in that situation, a bus at one voltage level at one substation should be considered “a single point of connection.” Some examples of configurations that should be considered a single point of connection for this purpose are at <a href="https://www.frc.com/Standards/StandardDocs/BES/BESAppendixA_V4_clean.pdf">https://www.frc.com/Standards/StandardDocs/BES/BESAppendixA_V4_clean.pdf</a>, Examples 1-6.</p> <p>Although the core definition (appropriately) refers to “Transmission Elements” (with a capital “T”), proposed Exclusion E1 refers to “transmission Elements” (with a lowercase “t”). To avoid confusion, either “Transmission” should be</p>

Voter	Entity	Segment	Vote	Comment
				capitalized in both locations, or the word “transmission” should simply be deleted from Exclusion E1, leaving a “group of contiguous Elements.” We understand that the lack of capitalization may have been a deliberate choice by the SDT in an attempt to avoid confusion that SDT members believe exists in the Glossary definition.
<p><b>Response:</b> 1. – 4. The SDT refers the commenter to the first phrase of the core definition starting with “Unless modified...” which the SDT believes handles the concern brought out here. The SDT considered your wording changes in its deliberations and refers the commenter to the revised redline of the definition posted in response to the consideration of comments.</p> <p>5. The SDT further clarifies that generating units on the customer’s side of the retail meter are not included under Inclusion I4 since customer-side retail generation typically does not “utilize[e] a system designed primarily for aggregating capacity, connected at a common point at a voltage of 100 kV or above.”</p> <p>6. The SDT acknowledges and appreciates the comments and recommendations associated with modifications to the technical aspects (i.e., the bright-line and component thresholds) of the BES definition. However, the SDT has responsibilities associated with being responsive to the directives established in Orders No. 743 &amp; 743-A, particularly in regards to the filing deadline of January 25, 2012, and this has not afforded the SDT with sufficient time for the development of strong technical justifications that would warrant a change from the current values that exist through the application of the definition today. These and similar issues have prompted the SDT to separate the project into phases which will enable the SDT to address the concerns of industry stakeholders and regulatory authorities. Therefore, the SDT will consider all recommendations for modifications to the technical aspects of the definition for inclusion in Phase 2 of Project 2010-17 Definition of the Bulk Electric System. This will allow the SDT, in conjunction with the NERC Technical Standing Committees, to develop analyses which will properly assess the threshold values and provide compelling justification for modifications to the existing values. No change made.</p> <p>7. The “single point of connection of 100 kV or higher” is where the radial system will begin if it meets the language of Exclusion E1 including parts a, b, or c and does not necessarily include an automatic interrupting device (AID). For example, the start of the radial system may be a hard tap of the transmission line where no automatic interruption device is used. The owner of the transmission line will need to insure the reliability of the transmission line. Another example is the tap point within a ring or breaker and a half bus configuration could also be the beginning of the radial system and the owner of the bus would need to insure the reliability of the substation. The SDT considered the disposition of the word “transmission” in the context of Exclusion E1, and determined that retention of this word – in lower-case – is necessary to modify the word “Element”. This is meant to eliminate the generation that would otherwise be</p>

included in the term "Element".				
Thomas C Duffy	Central Hudson Gas & Electric Corp.	3	Affirmative	Due to the movement to a phased BES definition development process and assuming the definition is approved as proposed, there is an urgent need for NERC to provide clear guidance to Registered Entities regarding how to proceed with facilities and address changes to the NERC Compliance Registry registration obligations brought in/on by the application of the new definition. The problem stems from a likely scenario whereby the affected Registered Entities may be faced with an Implementation Plan and an Exception Request Procedure which must be completed prior to the completion of the Phase II definition development process. If that is the case, many Registered Entities will be confronted with either (1) spending large amounts of human and financial resources, not yet acquired, to address facilities/procedures necessary to address possible new compliance obligations only to find their efforts rendered unnecessary by the results produced in Phase II or, (2) waiting until the results of Phase II are provided and risking being found non-compliant and subject to substantial penalties in the future. Neither option can be viewed as a desirable, or for that matter, an acceptable position to be placed in.
<b>Response:</b> Part of the implementation plan for this project is for NERC to work with regional entities on transition plans. Those regional entities would then work with registered entities to try to avoid the situation described by the commenter.				
Richard K Vine	California ISO	2	Affirmative	We support the SDT's decision to exclude the cranking paths from the BES definition since testing and verification of the use of facilities in the cranking path is already covered by the appropriate EOP standards. However, we suggest removing the entirety of Inclusion I3. This inclusion is extraneous given there is already a designation specific for system restoration covered by an existing standard to recognize their reliability impacts and to ensure their expected performance. NERC Standards EOP-005-2 stipulates the requirements for testing blackstart resource and cranking paths. This testing requirement suffices to ensure that the facilities critical to system restoration are functional when needed, which meets the intent of identifying their criticality to reliability.

Voter	Entity	Segment	Vote	Comment
<p><b>Response:</b> The SDT disagrees that Blackstart Resources should not be included in the BES Definition. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all facilities necessary for operating an interconnected electric transmission network. The SDT interprets this to include operation under both normal and emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator’s restoration plan requirements for Real and Reactive Power capability, frequency, and voltage control. The associated resources of the electric system that can be isolated and then energized to deliver electric power during a restoration event are essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s restoration plan. For these reasons, the SDT continues to include Blackstart Resources identified in the Transmission Operator’s restoration plan as BES elements. <b>No change made.</b></p>				
James Jones	Southwest Transmission Cooperative, Inc.	1	Affirmative	<p>In general, we support the proposed definition of the BES. However, we have identified a few concerns that warrant the SDT’s consideration. We’d prefer to see the language from the ERO Statement of Compliance Registry Criteria repeated within the BES Definition itself instead of referencing an outside document. As it stands right now, the Compliance Registry Criteria needs to stay intact for Phase 1 of this project. That makes the Compliance Registry Criteria reliant on the BES Definition and vice versa. We understand that the Statement of Compliance Registry Criteria may be reviewed/revise at the same time Phase 2 of this project is being developed, therefore we agree with Inclusion I2 of this draft.</p> <p>Blackstart Resources can actually be on the distribution system. There is still the question of whether the distribution system would then be subjected to the enforceable standards. If so, there would most likely be a significant cost increase associated with tracking compliance for these distribution systems without a commensurate increase in reliability since Blackstart Resources are rarely used. This could very well cause entities to un-designate Blackstart Resources on distribution systems to avoid these distribution systems from becoming part of the BES. The same rationale that was used for eliminating cranking paths could also be applied to Blackstart Resources.</p> <p>A flowgate should not be used to limit applicability of E3. First, there is no</p>

Voter	Entity	Segment	Vote	Comment
				<p>definition for what constitutes a permanent flowgate. Second, flowgates are often created for a myriad of reasons that have nothing to do with them being necessary to operate the BES. While section c) in E3 attempts to limit the applicability to permanent flowgates, there is no definition for what constitutes a permanent flowgate particularly since no flowgate is truly permanent. The NERC Glossary of Terms definition of flowgate includes flowgates in the IDC. This is a problem because flowgates are included in the IDC for many reasons not just because reliability issues are identified. Flowgates could be included to simply study the impact of schedules on a particular interface as an example. It does not mean the interface is critical. As an example, it could be used to generate evidence that there are no transactional impacts to support exclusion from the BES. Furthermore, the list of flowgates in the IDC is dynamic. The master list of IDC flowgates is updated monthly and IDC users can add temporary flowgates at anytime. While the "permanent" adjective applied to flowgates probably limits the applicability from the "temporary" flowgates, it is not clear which of the monthly flowgates would be included from the IDC since they might be added one month and removed another. Flowgates are created for many reasons that have nothing to do with them being necessary to operate the BES. First, flowgates are created to manage congestion. The IDC is more of a congestion management tool than a reliability tool. FERC recognized this in Order 693, when they directed NERC to make clear in IRO-006 that the IDC should not be relied upon to relieve IROs that have been violated. Rather, other actions such as re-dispatch must be used in conjunction. Second, flowgates are used as a convenient point to calculate flows to sell transmission service. The characteristics of the flowgate make it a good proxy for estimating how much contractual use has been sold not necessarily how much flow will actually occur. While some flowgates definitely are created for reliability issues such as IROs, many simply are not. The term "non-retail generation" used in Exclusion E1 (item c) and again in E3 (item a) should be clarified (see comments for question 8 below). The Note after item c should also be clarified to indicate that closing a normally open switch doesn't affect this exclusion.</p>

<p>elements. No change made.</p> <p>The SDT believes that the language in Exclusion E3.c prohibiting “Flowgates” from qualifying for definitional exclusion is appropriate and necessary. As a definitional exclusion characteristic, Exclusion E3.c must follow the principle of being a bright-line and easily identifiable, and as such, the SDT feels that the definition cannot allow some types of Flowgates and disallow others. Flowgates must continue to be a prohibiting characteristic under Exclusion E3, since these facilities are more likely to be used in the transfer of bulk power than not. An entity who wishes to make a case for exclusion of a unique type of Flowgate facility can do so through the exception process. The SDT believes that the continued qualifier of “permanent” associated with the term “Flowgate” addresses the majority of the concern in this comment. No change made.</p> <p>“Non-retail generation” means that generation which is on the system (supply) side of the retail meter.</p> <p>Radial systems should be assessed with all normally open (NO) switches in the open position and these NO switches will not prevent the owner or operator from using this exclusion. The note provides an example that can be used to indicate the switch is operated in the normally open position; however, it is the owner and operator’s responsibility to indicate how a switch is used in the normal operating environment.</p>				
Jerome Murray	Oregon Public Utility Commission	9	Affirmative	With the condition that reference is not made to the NERC Statement of Compliance Registry Criteria (SCRC) within the BES definition. This circularity must be eliminated. Recommended language should be: “I2 - Generating resource(s) with a gross individual nameplate rating greater than 20 MVA or with a gross aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.”
<p><b>Response:</b> The SDT has reverted to specific numeric thresholds consistent with the ERO Statement of Compliance Registry Criteria for Phase I.</p>				
Gregory S Miller	Baltimore Gas & Electric Company	1	Affirmative	While BGE supports the proposed definition to satisfy the FERC Order, we also support continued work on the threshold questions slated for “Phase II”.
<p><b>Response:</b> Phase II will be starting up immediately following the filing of Phase I as the SDT resources get freed up.</p>				

Voter	Entity	Segment	Vote	Comment
Luther E. Fair	Gainesville Regional Utilities	1	Affirmative	GVL feels that the effort to improve this standard is heading in the right direction. We look forward to the phase 2 segment of the process where additional clarity can be offered. Thanks for all your hard work.
Mark B Thompson	Alberta Electric System Operator	2	Affirmative	The AESO agrees with the NERC BES definition. It should be noted however that when the AESO adopts a NERC definition in Alberta the AESO must consider the applicability of the NERC definition in Alberta which may result in revisions to such definition to align it with our current electric energy market framework.
Benjamin Friederichs	Big Bend Electric Cooperative, Inc.	3	Affirmative	I believe this definition would include those elements necessary to the reliable operation of the BES while excluding those elements that would not have a material impact. NERC's willingness to exclude radial 115kv transmission lines is especially beneficial to smaller utilities like us. Their inclusion would not improve the reliability of the BES, but would vastly increase our costs and regulatory/reporting burdens.
James L Layton	Blue Ridge Electric	3	Affirmative	The SDT has done a good job of clearly defining the BES and developing a clear inclusion and exculsion list.
Joe Noland	City of Cheney	3	Affirmative	The City of Cheney agrees with changes made to the BES definition
Jason Fortik	Lincoln Electric System	3	Affirmative	No comments.
Anthony Schacher	Salem Electric	3	Affirmative	Salem Electric is encouraged to see that the standard drafting team understands the reality that in many circumstances many small radially fed utilities have no effect on the bulk electric system. By permitting reasonable and prudent exceptions it will allow many of the small utilities to be able to spend our limited time and resources on the reliability of our systems for our end users, instead of undertaking unnecessary steps to protect a system upon which we have no effect. The exception process is thorough but still manageable for small utilities with limited resources. Salem Electric would like to thank the Standards Drafting Team for their hard work and dedication in defining the Bulk Electric System.
Bob C. Thomas	Illinois Municipal Electric Agency	4	Affirmative	Illinois Municipal Electric Agency (IMEA) appreciates the SDT's diligence in developing bright-line BES Definition language; particularly, language clarifying the exclusion of local distribution facilities, achieving more realistic/reasonable

Voter	Entity	Segment	Vote	Comment
				identification of radial systems, and recognizing the distinction of local networks. With its Affirmative vote, IMEA supports and recommends comments submitted by the Transmission Access Policy Study Group.
Frank R. McElvain	Siemens Energy, Inc.	7	Affirmative	I am not completely satisfied with the arbitrary nature of the 100 kV demarcation. I know of 60 kV systems that parallel 500 kV circuits. However, this draft captures my concept of the Bulk Electric System pretty well.
<b>Response:</b> Thank you for your support.				

**PETITION OF THE  
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION  
FOR APPROVAL OF A REVISED DEFINITION OF “BULK ELECTRIC SYSTEM”  
IN THE NERC GLOSSARY OF TERMS USED IN RELIABILITY STANDARDS**

**EXHIBIT E**

**COMPLETE DEVELOPMENT RECORD OF THE  
PROPOSED REVISED DEFINITION OF “BULK ELECTRIC SYSTEM”**

**Project 2010-17**  
**Proposed Definition of Bulk Electric System and Related Rules of Procedure Team**

[Related Files](#)

[BES Definition Project Fact Sheet](#)

Rules of Procedure Development Team: BES Definition Exception Process page, click [here](#).

**Status:**

The definition of Bulk Electric System, along with the application form to support requests for BES exceptions, were approved by the ballot pool. The NERC Board of Trustees will meet on January 18, 2012 to act on the definition and associated Rules of Procedure changes.

**Purpose/Industry Need:**

On November 18, 2010 FERC issued Order 743 and directed NERC to revise the definition of Bulk Electric System so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. Phase I of Project 2010-17 Definition of Bulk Electric System concluded on November 21, 2011 with stakeholder approval of a revised definition of Bulk Electric System and application form titled 'Detailed Information to Support an Exception Request' referenced in the Rules of Procedure Exception Process. The revised definition, modifications to the Rules of Procedure to provide a process for determining exceptions to the definition, and an application form to support that process, will all be presented to the NERC Board of Trustees for adoption and then filed with regulatory authorities for approval.

Phase II of the project is being initiated to develop appropriate technical justification to support refinements to the definition that were suggested by stakeholders during Phase I, and to refine the definition as technically justified.

**Related Rule of Procedure**

Related to the development of the definition, there is a Rules of Procedure modification underway. Click related files to see this activity.

Bulk Electric System Drafting Team  
c/o Peter Heidrich, Chairman  
pheidrich@frcc.com

Dear Peter and members of the Bulk Electric System Drafting Team:

I first want to acknowledge the dedication and extraordinary effort that the members of the drafting team have devoted and will continue to devote to the important issues surrounding the assignment to develop a revised definition of “bulk electric system”. One of the greatest strengths of the ERO model is its ability to bring together for the common good subject matter experts from across North America, and your work is strong evidence of that.

I am taking the unusual step of writing to you to raise a legal issue that I recently learned of. At the recent NERC Member Representatives Committee meeting in Vancouver, Peter Heidrich described a number of changes that the drafting team is considering for inclusion in its next draft of the proposed BES definition. One of those changes was to include in the definition the following sentence:

The bulk electric system shall not include facilities used in local distribution as determined by the applicable regulatory authority.

I fully agree with commenters and the drafting team that it would be useful and appropriate to include a statement in the BES definition that the BES does not include facilities used in local distribution. Such a statement would track a similar statement in section 215 of the Federal Power Act:

The term [bulk power system] does not include facilities used in the local distribution of electric energy. (Federal Power Act, Section 215(a)(1)).

However, the proposed statement goes beyond what is in section 215 and includes the phrase “as determined by the applicable regulatory authority.” The term “applicable regulatory authority” is not defined, but it is very broad. It could include state commissions, provincial governments, local city councils, and perhaps boards of directors of co-operatives. It could lead to a patchwork of different results.

What that means is every regulatory authority could be making a determination as to the scope of NERC’s authority and the scope of FERC’s authority under section 215. That situation is unworkable for NERC, and I believe it will be unacceptable to FERC.

BES Standard Drafting Team  
August 8, 2011  
Page 2

The issue of where to draw the line between local distribution and transmission has been addressed in many places over the years, for many purposes, under several different criteria. When the issue arises in the reliability context, it can be addressed by reference to those criteria. But It would be a mistake (and unnecessary) for NERC to put its thumb on the scale of where the line falls between state and federal jurisdiction by saying responsibility for making that decision is in the hands of whatever regulatory chooses to make the decision.

To repeat, I fully support the inclusion of a statement that the “bulk electric system” does not include facilities used in local distribution. My request is that you not include the additional phrase, “as determined by the applicable regulatory authority.”

I would be happy to discuss this matter with the team or team leadership.

Thank you for your attention.

Sincerely,

A handwritten signature in black ink that reads "David N. Cook". The signature is fluid and cursive, with the first letters of each name being capitalized and prominent.

## Standard Authorization Request Form

Title of Proposed Standard: NERC Glossary of Terms: Revision of the Bulk Electric System definition.	
Request Date:	December 6, 2010
SC Approval Date:	December 8, 2010

<b>SAR Requester Information</b>	<b>SAR Type</b> (Check a box for each one that applies.)
Name: Regional Bulk Electric System Definition Coordination Group	<input type="checkbox"/> New Standard
Primary Contact: Peter Heidrich (Manager of Reliability Standards, FRCC) Regional Participation: Michelle Mizumori, WECC; Phil Fedora, NPCC; Jeff Mitchell, RFC	<input checked="" type="checkbox"/> Revision to existing Definition
Telephone: (813) 207-7994 Fax: (813) 289-5646	<input type="checkbox"/> Withdrawal of existing Standard
E-mail: pheidrich@frcc.com	<input type="checkbox"/> Urgent Action

<p><b>Purpose</b> (Describe what the standard action will achieve in support of bulk power system reliability.)</p> <p>Revise the definition of Bulk Electric System (BES) to address the Federal Energy Regulatory Commission's (FERC) concerns as identified in FERC Order 693 issued on March 16, 2007 and directives in Order 743 issued on November 18, 2010 (Order 743) so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system.</p>
<p><b>Industry Need</b> (Provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)</p> <p>This project supports the EROs obligation to respond to the Commission's directives and recommendations relative to the definition of Bulk Electric System identified in Order No. 743.</p>
<p><b>Brief Description</b> (Provide a paragraph that describes the scope of this standard action.)</p> <p>Revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.</p>

**Detailed Description** (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR.)

Revise the definition of Bulk Electric System (BES) to address the Federal Energy Regulatory Commission's (FERC) concerns as identified in FERC Order 693 issued on March 16, 2007 and directives in Order 743 issued on November 18, 2010 (Order 743) so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system.

Existing NERC Glossary of Terms Definition of Bulk Electric System:

*As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.*

The authors are proposing a revised definition of the term BES to provide for improved clarity, to reduce ambiguity and to establish a universal "bright-line" for distinguishing between BES and non-BES Elements and Facilities.

This proposed definition provides consistency across the continent's reliability regions by establishing a definition that clearly describes what constitutes BES and non-BES Elements and Facilities. The BES definition references an exemption process (which may include regional differences as defined by Order 672 or jurisdictional exemptions as appropriate for those entities not subject to Section 215 of the Federal Power Act) that can be used to:

- Identify the Radial Transmission systems that are excluded from the BES;
- Identify Elements and Facilities operated at voltages of 100kV or higher that may be excluded from the BES; and
- Identify Elements and Facilities operated at voltages less than 100kV that may be included in the BES.

Proposed continent-wide definition of Bulk Electric System:

*Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process.*

The development, approval and application of the BES definition exemption process (including periodic review of exempted facilities) will be governed by revisions to the NERC Rules of Procedure, in close coordination with the revision of the BES definition.

However, as envisioned, the standard drafting team will work closely with the team developing the BES definition exemption process to develop a single coordinated implementation plan. It is also envisioned, that the team working to develop the BES definition exemption process will solicit input from drafting

## Standards Authorization Request Form

---

teams, stakeholders, and Regional Reliability Organizations in identifying physical and operational characteristics for consideration in developing the BES definition exemption process.

**Standards Authorization Request Form**

**Reliability Functions**

<b>The Standard will Apply to the Following Functions</b> <i>(Check box for each one that applies.)</i>		
<input checked="" type="checkbox"/>	Reliability Assurer	Monitors and evaluates the activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the bulk power system within a Reliability Assurer Area and adjacent areas.
<input checked="" type="checkbox"/>	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
<input checked="" type="checkbox"/>	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
<input type="checkbox"/>	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
<input checked="" type="checkbox"/>	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
<input checked="" type="checkbox"/>	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within its portion of the Planning Coordinator's Area.
<input checked="" type="checkbox"/>	Transmission Owner	Owns and maintains transmission facilities.
<input checked="" type="checkbox"/>	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
<input checked="" type="checkbox"/>	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within the Transmission Planner Area.
<input checked="" type="checkbox"/>	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
<input type="checkbox"/>	Distribution Provider	Delivers electrical energy to the End-use customer.
<input checked="" type="checkbox"/>	Generator Owner	Owns and maintains generation facilities.
<input checked="" type="checkbox"/>	Generator Operator	Operates generation unit(s) to provide real and reactive power.
<input type="checkbox"/>	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
<input checked="" type="checkbox"/>	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

***Reliability and Market Interface Principles***

<b>Applicable Reliability Principles</b> <i>(Check box for all that apply.)</i>	
<input checked="" type="checkbox"/>	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
<input checked="" type="checkbox"/>	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
<input checked="" type="checkbox"/>	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
<input checked="" type="checkbox"/>	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
<input checked="" type="checkbox"/>	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
<input checked="" type="checkbox"/>	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
<input checked="" type="checkbox"/>	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
<input checked="" type="checkbox"/>	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
<b>Does the proposed Standard comply with all of the following Market Interface Principles?</b> <i>(Select 'yes' or 'no' from the drop-down box.)</i>	
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

## **Proposed Continent-wide Definition of Bulk Electric System:**

**Bulk Electric System:** All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process.

## Proposed Continent-wide Definition of Bulk Electric System:

~~As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, Bulk Electric System: All Transmission and associated equipment, generally Generation Elements and Facilities operated at voltages of 100 kV or higher, necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial transmission facilities serving only load with one transmission source are generally not Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included in this~~ if approved through the BES definition exemption process.

## Project 2010-17 Definition of Bulk Electric System

### Background Information

#### Purpose

In support of the ERO's ability to respond to Commission directives and recommendations, this project will address the issues raised by the Commission, the ERO, the Regional Entities, and the industry as stated in FERC Order No. 693 and Order No. 743. In Order No. 743, the Commission directed the following:

- A. Utilize the NERC Standard Development Process to revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms.
- B. Develop a single Implementation Plan to address the application of the revised definition of the BES and the implementation of the exemption process.
- C. Utilize the NERC Rules of Procedure to develop and implement an 'exemption process' used to identify Elements and Facilities which will be included in or excluded from the BES.

This project will address items 'A' and 'B' and will coordinate efforts between the Standard Drafting Team (SDT) and the group working to develop the exemption process for inclusion in the NERC Rules of Procedure to ensure that the revised BES definition and exemption process result in an accurate, repeatable, and transparent method for the identification of BES and non-BES Elements and Facilities.

#### Introduction

The Regional Bulk Electric System Definition Coordination Group was established at the request of NERC senior management, prior to the issuance of Order 743, to gain continent-wide consistency in a revised definition of the Bulk Electric System (BES). The results of several industry driven Regional (FRCC, NPCC, RFC, and WECC) projects addressing the issue were compared and consolidated to achieve a common approach to defining the BES.

The Regional Bulk Electric System Definition Coordination Group is proposing a common approach to defining the BES to provide for improved clarity, to reduce ambiguity, and to establish a universal method ("bright-line") of distinguishing between BES and non-BES Elements and Facilities that is reflected in the Standards Authorization Request (SAR).

A common approach to the identification of BES Elements and Facilities will establish a repeatable method of correctly applying the NERC Reliability Standard requirements by the industry and facilitate consistent application of compliance efforts by the entities involved

internally and across Regional boundaries (i.e., FERC, ERO, Regional Entities, and registered entities).

This proposal would provide consistency across the nation's reliability regions by establishing a BES 'Framework' definition and a common set of criteria that clearly provide guidance for determining what constitutes BES and non-BES Elements and Facilities. The BES 'Framework' will also allow for application of an exemption process (which may include regional differences as defined by Order 672 or jurisdictional exemptions as appropriate for those entities not subject to Section 215 of the Federal Power Act) consistent with the criteria to technically assess whether or not an Element or Facility should be included or excluded from the BES as exceptions to the definition and criteria (with concurrence from the ERO). The development, approval, and utilization of the exemption process will be governed by revisions to the NERC Rules of Procedure to address this specific issue.

### **Proposed BES Criteria**

The Regional Bulk Electric System Definition Coordination Group proposed a set of criteria for the identification of BES Elements and Facilities recommended for inclusion in the proposed continent-wide definition of BES:

1. Transformers, other than Generator Step-up (GSU) transformers, including Phase Angle Regulators, with both primary and secondary windings of 100 kV or higher;
2. Individual generation resources (including GSU transformers and the associated generator interconnecting line lead(s)) greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above;
3. Generation plants (including GSU transformers and the associated generator interconnecting line lead(s)) with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above;
4. Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator's (TOP's) restoration plan;
5. Transmission Elements or Facilities operated at voltages below 100kV where the exemption process deems the Element or Facility to be included in the BES;
6. Individual generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation resources to be included in the BES; and
7. Generation plants with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at

voltages below 100kV where the exemption process deems the generation plants to be included in the BES.

The proposed criteria recommended for the exclusion of Elements and Facilities from the BES consist of:

1. Any radial Transmission Element or System, connected from one Transmission source to a Load-serving Element and/or generation resources not included in items 2, 3, 4, 6, and 7 above are excluded from the BES;
2. Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO); and
3. Generating plant control and operation functions which include relays and systems that control and protect the unit for boiler, turbine, environmental, and/or other plant restrictions.

These criteria will be vetted by the industry through the Standards Development Process via industry comments and eventual ballot. As envisioned, criteria that are applicable on a continent-wide basis will be added to the definition of BES; criteria that apply in some, but not all areas, will be addressed through the exemption process.

## Unofficial Comment Form for SAR and Proposed Definition of BES (Project 2010-17)

---

Please **DO NOT** use this form to submit comments. Please use the electronic comment form located at the link below to submit comments on the SAR and proposed modification to the definition of Bulk Electric System (Project 2010-17). The electronic comment form must be submitted by **January 21, 2011**.

[http://www.nerc.com/filez/standards/Project2010-17\\_BES.html](http://www.nerc.com/filez/standards/Project2010-17_BES.html)

If you have questions please contact Ed Dobrowolski at [Ed.Dobrowolski@nerc.net](mailto:Ed.Dobrowolski@nerc.net) or by telephone at 609-947-3673.

### Background:

FERC issued Order 743 on November 18, 2010 with the directives identified below:

16. After consideration of the comments submitted, the Commission adopts the NOPR's proposal with some modifications. The Commission directs the ERO to revise the definition of "bulk electric system" through the NERC Standards Development Process to address the Commission's concerns discussed herein. The Commission believes the best way to address these concerns is to eliminate the Regional Entities' discretion to define "bulk electric system" without ERO or Commission review, maintain a bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities, and adopt an exemption process and criteria for excluding facilities that are not necessary to operate an interconnected electric transmission network. However, NERC may propose a different solution that is as effective as, or superior to, the Commission's proposed approach in addressing the Commission's technical and other concerns so as to ensure that all necessary facilities are included within the scope of the definition.

The BES SAR authors are proposing a revised definition of the term BES to provide improved clarity, to reduce ambiguity and to establish a universal "bright-line" for distinguishing between BES and non-BES Elements and Facilities.

Proposed continent-wide definition of Bulk Electric System:

*Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process.*

This proposed definition provides consistency across the continent's reliability regions by establishing a definition that clearly describes what constitutes BES and non-BES Elements and Facilities. The BES definition references an exemption process (which may include regional differences as defined by Order 672 or jurisdictional exemptions as appropriate for those entities not subject to Section 215 of the Federal Power Act) that can be used to:

- Identify the Radial Transmission systems that are excluded from the BES;

## Unofficial Comment Form for SAR and Proposed Definition of BES (Project 2010-17)

---

- Identify Elements and Facilities operated at voltages of 100kV or higher that may be excluded from the BES; and
- Identify Elements and Facilities operated at voltages less than 100kV that may be included in the BES.

The development, approval and application of the BES definition exemption process (including periodic review of exempted facilities) will be governed by revisions to the NERC Rules of Procedure, in close coordination with the revision of the BES definition.

**Information collected from the following questions will assist both the BES Drafting Team and the group working to develop a BES Definition Exception Process.**

1. Should the following should be classified as part of the BES?

- Transformers, other than Generator Step-up (GSU) transformers, including Phase Angle Regulators, with both primary and secondary windings of 100 kV or higher

Yes       No

Comments:

2. Should the following be classified as part of the BES?

- Individual generation resources (including GSU transformers and the associated generator interconnecting line lead(s)) greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above

Yes       No

Comments:

3. Should the following be classified as part of the BES?

- Generation plants (including GSU transformers and the associated generator interconnecting line lead(s))with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above

Yes       No

Comments:

4. Should the following be classified as part of the BES?

- Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator's (TOP's) restoration plan

Yes       No

### **Background:**

FERC issued Order 743 on November 18, 2010 with the directives identified below:

16. After consideration of the comments submitted, the Commission adopts the NOPR's proposal with some modifications. The Commission directs the ERO to revise the definition of "bulk electric system" through the NERC Standards Development Process to address the Commission's concerns discussed herein. The Commission believes the best way to address these concerns is to eliminate the Regional Entities' discretion to define "bulk electric system" without ERO or Commission review, maintain a bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities, and adopt an exemption process and criteria for excluding facilities that are not necessary to operate an interconnected electric transmission network. However, NERC may propose a different solution that is as effective as, or superior to, the Commission's proposed approach in addressing the Commission's technical and other concerns so as to ensure that all necessary facilities are included within the scope of the definition.

NERC is working to address these directives with two activities – the definition of Bulk Electric System (BES) is being revised through the standard development process and a BES Definition Exception Process is being developed as a proposed modification to the Rules of Procedure.

The information you provide in response to the following questions may be used by the standard drafting team working to revise the definition of BES or by the group working to develop a BES Definition Exception Process.

## Official Comment form for BES Definition Exception Process

---

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:
- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

Justification:

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

- Continent-wide
- Interconnection-wide
- Region-wide
- Less than Region-wide
- Unknown

Comments relative to the proposed exclusion(s):

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **below 100kV** which should be considered for **inclusion** in the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for inclusion:
- b. Attach a generic one-line diagram depicting the Element or Facility (if available).
- c. Provide a technical justification for the inclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

Justification:

- d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this inclusion should apply, please select, "unknown."

- Continent-wide
- Interconnection-wide
- Region-wide
- Less than Region-wide
- Unknown

## Standards Announcement

Standards Authorization Request (SAR), Draft Definition and Exception  
Process Informal Comment Period Open  
December 17, 2010-January 21, 2011

**Now available at:** [http://www.nerc.com/filez/standards/Project2010-17\\_BES.html](http://www.nerc.com/filez/standards/Project2010-17_BES.html)

### **Project 2010-17: Definition of Bulk Electric System**

A proposed SAR, a proposed revision to the definition of “Bulk Electric System,” and a set of concepts for use in developing a BES Definition Exception Process have been posted for comment until **8 p.m. Eastern on January 21, 2011.**

### **Instructions**

Due to the nature of the comments we are seeking from stakeholders, there are **two different comment forms** and we ask that you complete both.

1. The SAR and BES comment form

Please use the [electronic form](#) to submit comments on the SAR and proposed definition of Bulk Electric System. If you experience any difficulties in using the electronic form, please contact Monica Benson at [monica.benson@nerc.net](mailto:monica.benson@nerc.net).

An off-line, unofficial copy of the SAR and BES Definition comment form is posted on the project page: [http://www.nerc.com/filez/standards/Project2010-17\\_BES.html](http://www.nerc.com/filez/standards/Project2010-17_BES.html)

2. The BES Definition Exception Process comment form

The BES Definition Exception Process comment form is also posted on the project page identified above. Please use the BES Definition Exception Process comment form to submit comments and supporting information relative to the concepts proposed for use in developing a BES Definition Exception Process. The BES Definition Exception Process comment form must be submitted to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “BES Definition” in the subject line.

### **Next Steps**

The drafting team will draft and post a summary of the responses to comments received during this period.

### **Project Background**

On November 18, 2010 FERC issued Order 743 and directed NERC to revise the definition of Bulk Electric System so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. Additional specificity will reduce ambiguity and establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

In addition, NERC was directed to develop a process for identifying any Elements or Facilities that should be excluded from the BES. NERC is working to address these directives with two activities – the definition of Bulk Electric System (BES) is being revised through the standard development process and a BES Definition Exception Process is being developed as a proposed modification to the NERC Rules of Procedure. Comments received in response to this initial posting will be used by the drafting team working on the revision to the definition and by the group working to develop the BES Definition Exception Process.

### **Standards Development Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

*For more information or assistance, please contact Monica Benson,  
Standards Process Administrator, at [monica.benson@nerc.net](mailto:monica.benson@nerc.net) or at 609.452.8060.*

**Question 1:**

If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a.** Identify the Element or Facility recommended for exclusion:
- b.** Provide a generic one-line diagram depicting the Element or Facility in question (if available).
- c.** Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).
- d.** Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:

As discussed in the comments of The Dow Chemical Company (“Dow”) on the recommended definition of BES, the 100 kV standard is inapplicable to generation and should not be used to identify generation facilities that are included in the BES, or that are eligible for an exception or exclusion. Instead, the NERC Statement of Compliance

Registry Criteria already sets forth criteria for determining when individual generating units and generating plants/facilities are not part of the bulk electrical system. Those existing standards and the generator-specific registration determinations that have been made using those standards should be preserved.

Dow does not object to retaining a 100 kV standard for identifying transmission facilities that should be considered part of the BES, but exclusions must be made for distribution facilities and interconnection facilities. If owners and/or operators of such facilities are required to secure an “exception” or “exclusion” from the 100 kV standard, then such process must ensure that exceptions or exclusions are available before mandatory reliability standards become applicable.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).

For a manufacturing site, distribution facilities deliver electricity from the generating plants and or the transmission grid to the manufacturing plants. Interconnection facilities are generally identified by reference to the point of interconnection with the transmission grid. Facilities located on the generator’s side of this interconnection up to the site transformers are generally considered interconnection facilities while facilities located at or beyond the point of interconnection are generally considered transmission facilities.

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The NERC Statement of Compliance Registry Criteria excludes certain generating facilities, because these generating facilities are not material to the reliability of the BES. Distribution facilities are expressly excluded from the definition of BES pursuant to Section 215 of the Federal Power Act. Distribution facilities are typically operated differently from transmission facilities. As such,

distribution facilities should not be subject to the same reliability standards as transmission facilities. FERC has recognized that interconnection facilities may or may not be material to the reliability of the BES. As such, FERC has held that a facts-and-circumstances analysis should be used to determine whether and to what extent such facilities should be considered part of the BES and, therefore, subject to mandatory reliability standards. *See New Harquahala Generating Company, LLC, 123 FERC ¶ 61,173 at P 44 (2008), clarified, 123 FERC ¶ 61,311 (2008).*

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

#### Continent-wide

#### Comments relative to the proposed exclusion(s):

At minimum, the exclusions applicable to distribution facilities and interconnection facilities should apply to all facilities that are subject to FERC's reliability jurisdiction under Section 215 of the Federal Power Act.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:

This question refers to “exclusions”; we believe, however, that the intent of this comment form is to elicit feedback on the process for “exemptions.” It is important to distinguish between the two concepts, as FERC did in Order 743. *See, e.g., Paragraph 1, which refers to “maintain[ing] a bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities,” as well as to “establish[ing] an exemption process and criteria.” (emphasis added).* In other words, in brief, an “exclusion” is outside of the BES by definition, whereas exempt Elements are removed on a case-by-case basis by going through a process.

FMPA draws the distinction as follows:

An exclusion is the removal of a category of Elements from the BES definition. The current BES definition explicitly carves out radials serving only load with one transmission source. This is a clear example of an exclusion. There is no “exclusion process” now, nor should there be one in the future; the point of an exclusion is that the class of excluded Elements can—without any process—be treated like sub-100 kV transmission, in that they are presumed to be non-BES unless a particular Element is demonstrated, on a case-by-case basis, to be properly included in the BES (see responses to Questions 5 and 11 in FMPA’ comments on BES definition, submitted today, and FMPA response to Question 2 below).

An exemption, on the other hand, is a finding that a particular Element, although nominally part of the BES, does not need to be included in the BES because it is not necessary for operating an interconnected transmission network.

Because exemptions are less clear-cut than exclusions, each exemption of an Element needs to be approved by NERC so that the Registered Entity and compliance authorities have certainty about the Elements with respect to which compliance is required. In many, perhaps all, cases, this process will likely require a case-by-case examination of each Element for which an exemption is requested.

FMPA responds to this question with respect to the one “exclusion” from the BES definition that we advocate, that of radial Transmission Elements serving only load and/or generation not registered pursuant to the Statement of Compliance Registry Criteria. We also propose uniform criteria for deciding, on a case-by-case basis, whether to grant requested exemptions from the BES, or to include nominally non-BES Elements in the BES. The process that we propose for exemption requests and proposed inclusions is discussed below in response to the invitation of “[c]omments relative to the proposed exclusion(s).”

**Exclusion:**

FMPA proposes only one exclusion from the BES definition, namely, “Radial Transmission Elements serving only load with one Transmission source are generally not included in this definition. A radial Transmission Element may be considered as ‘serving only load’ for purposes of the foregoing general exclusion even if it connects generation, so long as that generation is not registered pursuant to the Statement of Compliance Registry Criteria.” This formulation, which is discussed in FMPA’ comments submitted today on the BES definition, is intended to preserve the current exclusion of radials serving only load with one transmission source, and to clarify that the presence of a generator that is not registered under the Compliance Registry Criteria does not convert a radial into a BES Element. The end result is that radial transmission is excluded unless it connects generation that is registered pursuant to the Statement of Compliance Registry Criteria. Consistent with the Compliance Registry Criteria, a single generator under 20 MVA, or a plant under 75 MVA, if not designated as a Blackstart Resource needed for system restoration, is unlikely to affect the grid. Therefore, the presence of such generation should not require that an otherwise non-BES radial be included in the BES. Rooftop photovoltaic cells, for example, are increasingly common. If FMPA’ proposed clarification is not accepted, the presence of such insignificant generation could nullify the exclusion of radials to load with one transmission source, with no benefit to reliability.

**Exemption criteria**

FMPA has not yet developed a list of criteria that we believe to be exhaustive, though we emphasize that such a list must be an ultimate goal of this process. We propose the following criteria as a start:

FMPA proposes that at least two classes of elements be eligible to request an exemption:

i. Elements that are part of a radial “system” originating from a single BES source serving only load, as in the Florida Keys. Clarifications: a) radial system means any number of series and/or parallel Elements as long as they all originate from a single BES source and do not have another BES source; b) “single BES source” means one BES bus / substation / switching substation at one voltage level, and c) consistent with FMPA’ proposed exclusion of radials serving only load and unregistered generation, “serving only load” includes serving generation that is not registered through the Statement of Compliance Registry Criteria.

ii. Elements that are part of a “looped” system that has two transmission sources primarily for local quality of service to the retail customers supplied by the looped system in question and is not used for bulk electric system flow (e.g., the transfer distribution factor of flows across the looped system is low, representing a high impedance path across the looped system). Specific criteria might be: a) a looped system that participate in less than a 5% of transfer (e.g., 5% or less transfer distribution factor); and b) that the looped system in question does not limit transfers.

A radial or looped system to be exempted must meet the following criteria:

1. The radial or looped system may not contribute to any Category D or C contingency resulting in: 1) a supply / demand mismatch greater than the largest loss of source contingency in the Reliability Coordinator area; or 2) an Adverse Reliability Impact where, if the Element were not involved in those Category D or C contingencies, those thresholds would not be exceeded.

Studies to determine whether this criterion is met would be conducted in accordance with TPL-004-0 and TPL 003-0 standards (or corresponding contingencies in revision to the TPL standards) in the Short Term Planning Horizon. Although the above criteria are acceptable responses to a Category D contingency, the concept of the test is to see if a radial or looped system would cause a significantly worse response to Category C or D contingencies by testing the contingency with and without the radial or looped system. FMPA believes that such criteria are good indicators that a radial or looped system should be included in the BES as it highlights whether the protection systems are important for critical clearing times, and whether the radial or looped systems can contribute to an Adverse Reliability Impact in combination with other contingencies;

2. No portion of the radial or looped system may meet any of the conditions of Attachment 1 to CIP-002-4;

3. No portion of the radial or looped system may meet any of the conditions listed in items B1 to B5 of Attachment B to PRC-023-2;

4. No portion of the radial or looped system may be a part of, or be a limiting element of, any Path, Interchange, or Flowgate used in the calculation of ATC in accordance with standards MOD-028, MOD 029 or MOD 030; and

5. No portion of the radial or looped system may include a blackstart resource or cranking path deemed significant to the TOP or RC restoration plans of EOP-005, EOP-006 or EOP-007.

If a Registered Entity demonstrates to NERC that an Element that is nominally in the BES meets *all* of these criteria, the exemption would be granted.

Conversely, if NERC demonstrates that a nominally non-BES Element meets the negative of *any* of these criteria (*e.g.*, if any portion of the radial or looped system meets any of the conditions of Attachment 1 to CIP-002-4 or of Attachment B to PRC-023-2), the Element would be included in the BES.

Throughout these comments, FMPA refers to “Elements” and not to “facilities.” This is because “Facility” is defined in the NERC Glossary as “[a] set of electrical equipment that operates as a single Bulk Electric System Element....” Because these comments (and the BES definition) address whether Elements are or are not part of the BES, it is incorrect to refer to the Elements in question as “Facilities,” because a Facility is defined as a *BES* Element.

In developing the exemption/inclusion criteria and process, NERC and the SDT should bear in mind the requirement of Order 743: “NERC should develop an exemption process that includes *clear, objective, transparent, and uniformly applicable* criteria for exemption of facilities that are *not necessary for operating the grid.*” Paragraph 115 (emphasis added). NERC and the SDT should also bear in mind that FERC anticipates that between the BES definition and the exemption process, there will be only “minimal[]” effect on “small entities.” Order 743, Paragraph 169. Order 743 is referring to the Small Business Act definition of a “small electric utility” as one that has a total electric output of less than four million MWh in the preceding year. *See* BES NOPR, 133 FERC ¶ 61,150, Paragraph 35 & footnote 50.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** Radial Transmission Elements serving only load have been recognized for years as non-BES because such Elements are very unlikely to affect the BES. FERC stated in Order 743 that NERC may retain that exclusion.

Similarly, generators under 20 MVA and generating plants under 75 MVA are not subject to registration pursuant to the Statement of Compliance Registry Criteria, which has been accepted by FERC, because of the recognition that such generators are very unlikely to affect the BES. It is thus consistent with the Compliance Registry Criteria to exclude from the BES definition radials serving load with one

transmission source even if there is some generation on the radial, so long as none of the generation is registered. If the generation is not significant enough to be registered, it is not significant enough to transform an otherwise non-BES radial to load into a BES Element.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

### Continent-wide

The exclusion of radials to load and unregistered generation, as part of the BES definition, should apply on a continent-wide basis.

Each Element proposed for exemption or inclusion should be considered individually, under the same criteria (proposed above), applied uniformly continent-wide.

### Comments relative to the proposed exclusion(s):

#### Exemption and Inclusion Processes:

The exemption and inclusion processes should be designed to ensure continent-wide uniformity to the maximum extent possible. To that end, NERC must use a uniform process; the criteria for approving or denying an exemption, or for including an Element in the BES, must be clear; and entities must be able to appeal decisions to another body within NERC or to FERC.

In order to obtain an exemption, a Registered Entity should be required to demonstrate that the Element for which it is requesting an exemption is not "necessary for operating an interconnected electric transmission network." This is the standard set out in Order 743; it is also part of the definition of the "bulk-power system" in Section 215 of the Federal Power Act, 16 U.S.C. § 824o(a)(1)(A) (the other part of the statutory definition is "electric energy from generation facilities needed to maintain transmission system reliability," 16 U.S.C. § 824o(a)(1)(B)). Application of this standard should be informed by the statutory definitions of "reliability standard" ("a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system") and "reliable operation" ("operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements").

Conversely, to include a nominally non-BES Element in the BES, NERC should be required to demonstrate that the Element *is* necessary for operating an interconnected electric transmission network.

Criteria for determining whether an Element is or is not “necessary for operating an interconnected electric transmission network” are proposed in response to Question 1(a) above. The criteria should be uniform continent-wide, though they will be applied to each Element on a case-by-case basis.

Exemption requests and proposed inclusions should be decided by NERC staff in the first instance. FMPA does not believe that the exemption and inclusion processes should be delegated to the Regional Entities. In Order 743, FERC emphasized the need for continent-wide uniformity; in fact, it was inconsistency among regions that prompted Order 743. FMPA members’ experience with Regional registration processes suggests that Regional implementation of the BES exemption and inclusion processes is unlikely to yield the uniformity that FERC directed. Furthermore, implementing this FERC directive will unavoidably require significant personnel resources, either at NERC or at the Regions. Delegating the process to the Regions would impose additional costs due to the need for NERC to exercise strong oversight to attempt to maintain uniformity. It may be that after the exemption and inclusion processes have been in place for a few years and a body of precedent has been accumulated, delegation will be appropriate. At this time, however, NERC staff should make the initial decision on all exemption requests and proposed inclusions.

FMPA proposes, for the sake of consistency with the registration appeal process, that appeals of decisions on exemptions and inclusions be to the Board of Trustees Compliance Committee (BOTCC), with further appeals to FERC if necessary. Appeals to the BOTCC would consist of the record compiled by NERC Staff, and additional paper submissions by NERC Staff and the Registered Entity demonstrating why the Element(s) in question is or is not “necessary for operating an interconnected electric transmission network.” *See* NERC Rules of Procedure, Appendix 5A, “Organization Registration and Certification Manual,” at 14-16. Registered Entities should have the option of requesting a hearing. Hearing procedures could be modeled on the Compliance and Certification Committee’s “Hearing Procedures for Use in Appeals of Certification Matters,” in Appendix 4E of the NERC Rules of Procedure.

FMPA also suggests that decisions on exemptions and inclusions be made available to others, either subject to CEII protection or in a form suitable for public release. As precedent develops, Registered Entities will increasingly be able to judge for themselves the likelihood that a particular exemption will be granted, or that an appeal of an inclusion will succeed. We expect that giving Registered Entities more information on which to base their decisions will significantly reduce the burden on NERC of processing exemptions and inclusions.

We propose that BES Elements for which an exemption request is pending should continue to be included in the BES until the exemption and any appeals are decided,

and that non-BES Elements for which an inclusion is pending should continue to be non-BES until the inclusion and any appeals are decided.

The transition process should include an important exception to the general rule proposed for BES status during the pendency of an exemption request: to allow for a smooth transition, to the extent that Elements that are currently considered non-BES become BES under the new definition, those Elements should be permitted to request exemptions and to continue to be considered non-BES until their exemption requests and any appeals are decided.

**Telephone: 406-873-5566**

**Email: [joshd@glacierelectric.com](mailto:joshd@glacierelectric.com)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: Our delivery point, which is a loop-fed 115kV switching station.
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
  - c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** This station's main purpose is to be a delivery point for our system. We are a distribution cooperative that serves mainly residential and small commercial loads. Each year we peak around 35 MW and average around 22 MW. This station is loop fed by two 115 kV lines to give our members more reliability. No transmission planner, balancing authority, transmission operator, reliability coordinator, etc. has included this station in any critical path lists or system restoration plans. This station is not designated as critical asset by its balancing authority or transmission operator. The available short-circuit MVA at this station is 677 MVA. If a fault were to occur at this station, outages would be limited to the local area and the BES as a whole would not be adversely affected at all. It is our belief that facilities such as this are insignificant to the BES and do not need to be considered part of the BES.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

Continent-wide

[Continent-wide](#)

[Interconnection-wide](#)

[Region-wide](#)

**Comments relative to the proposed exclusion(s):**

[The BES functions to generate bulk power and transfer that bulk power to locations from which it is then distributed to end-use load. Elements that generate bulk power, transfer bulk power, or support the transfer of bulk power are part of the BES.](#)

[An element is necessary to reliably operate an interconnected transmission system if it significantly affects the ability of the BES to generate bulk power or carry bulk power to locations from which is it distributed to end-use load. While operating voltage \(i.e.,](#)

the proposed 100 kV bright-line) may be a clear and repeatable proxy for identifying those elements that are necessary to reliably operate an interconnected transmission system, it is a broad approach that may not adequately address specific examples. Moreover, engineering studies can be used to more granularly and accurately identify elements that are not needed to reliably operate an interconnected transmission system.

The thresholds on the indicators listed above may vary between interconnections and regions. For example, voltage deviation may be more relevant in the Western Interconnection (which is primarily stability limited) than in the Eastern Interconnection (which is primarily thermally limited).

- 1.** If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a.** Identify the Element or Facility recommended for exclusion: [The transmission lines dedicated to serve the native load in the Quebec Interconnection.](#)

**Guy Zito, Northeast Power Coordinating Council**

**Telephone: 212-840-1070**

**Email: [gzito@npcc.org](mailto:gzito@npcc.org)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

a. Identify the Element or Facility recommended for exclusion:

All step-down transformers with their low-side terminals operated at below 100 kV.

Radial taps from a BES feeder or bus connection to loads. All elements or facilities in series with excluded or exempt elements or facilities -- upstream to a designated point-of-demarcation with the BES and downstream to the customer meter or interconnection. (Refer to the response to Question 3, New York Indicator [NY-2] below, and the response to Question 13, proposed definition 'Point-of-Demarcation' in the BES Definition Comments provided separately). For example, upstream from an exempt or excluded feeder to the upstream-side of the disconnect switch connecting the excluded or exempted feeder to the BES, or if no disconnect switch is present, to the upstream BES supply-bus connection. This exclusion or exemption would extend to and also apply to related equipment, such as circuit switchers, circuit breakers, ground switches, disconnect switches, busses, etc. that are down-stream of the point-of-demarcation and in the same circuit with the exempted or excepted feeders and transformers.

Local generation and any facility associated with local generation serving as a load modifier to local load only. The power generated is demonstrated to be consumed locally and does not flow back into the BES. The operation (or loss) of the local generation and/or associated facilities does not materially impact any BES transmission facilities. If a local generator functions as a load modifier, and does not materially impact the BES, meaning that it is not necessary to maintain BES reliability, then it should be excluded from the definition of BES under the BES Exclusion process.

The transmission lines dedicated to serve the native load in the Quebec Interconnection.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). **Not Applicable**
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The FERC Seven Factor test has been shown to be a reliable, repeatable method for identifying facilities that are local distribution and separating

them from those facilities which perform a transmission function. The indicators of local distribution in the Commission’s seven-factor test<sup>1</sup> are:

- 1) Local distribution facilities are normally in close proximity to retail customers;
- 2) Local distribution facilities are primarily radial in character;
- 3) Power flows into local distribution systems, and rarely, if ever flows out;
- 4) When power enters a local distribution system, it is not reconsigned or transported on to some other market;
- 5) Power entering a local distribution system is consumed in a comparatively restricted geographic area;
- 6) Meters are based at the transmission / local distribution interface to measure flow into the local distribution system; and
- 7) Local distribution systems will be of reduced voltage.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion: **Those that have no impact to the reliability of the BES for any reason or could at anytime. Those that may or could through reconfiguration and or operating procedures must be included.**
- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).

In the diagram above, any equipment downstream of the “A” breaker that does not or could not trip and lockout a BES facility (e.g. line, transformer, etc.) may be excluded, however if equipment below the “A” breaker could or does trip and lockout a BES facility for any reason, then it should be included.

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** If the facility could never trip and lockout a BES facility, there is no reason to include it. However, caution and careful consideration must be used when exclusions are considered. There maybe times during topology changes or system re-configurations that certain facilities could trip and lockout a BES facility and therefore must be included.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

Continent-wide

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion: [Radial Transmission Elements and Systems - See comment below](#)

**Comments relative to the proposed exclusion(s):** [Radial Transmission Elements and Systems should be excluded from the Elements and Facilities classified as part of the BES but a clear NERC definition of radial is required to prevent misunderstandings and misapplications of the BES definition and exemption process. Also, there should be no regional differences in the BES definition or in the BES definition exemption process.](#)

**John W. Delucca, Lee County Electric Cooperative**

**Telephone: 239-656-2190**

**Email: [john.delucca@lcec.net](mailto:john.delucca@lcec.net)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: [Radial load serving elements that do not have an adverse effect upon the BES should be excluded. Also Transmission systems that have no adverse impact on the BES as evidenced by engineering design and criteria and load modeling should be excluded such as Non-FERC Jurisdictional Facilities; Radial Non-Transmission Load Serving Elements; Looped Non-Transmission Load Serving Elements; Looped Non-Transmission Load Serving Elements Designed & Installed with No Intent to Provide Transmission Load Service.](#)
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). [Please refer to Attachment 1b.6 – 1b.9 the draft BES Definition currently under review in the FRCC region. There are multiple single-lines included that represent a fair cross section of elements that should be excluded.](#)
  - c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** [The purpose of including facilities in the definition of BES is make them subject to federal regulations that are designed to serve the reliability needs of the BES and to prevent cascading of outages to a broad section of the BES. Certain elements operated at voltages of 100kV or higher have zero measurable impact to the reliable operation of the Interconnected BES. No practical purpose is served by including those elements, and if they are, it unnecessarily increases the cost of delivered power. The following list also should be considered, a\) No FERC Jurisdiction; b\) Facilities were/are designed, installed, and operated to serve local non-transmission loads; c\) Rates are designed to provide revenue to meet local non-transmission service; d\) Facilities were never designed or intended to provide capability of entity-to-entity, region-to-region load flows other than that required to meet local non-transmission service loads; e\) Reactance resources whose purpose is neutralizing non-transmission inductive loads and/or to compensate for “within entity” losses.](#)

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, “unknown.”

[Continent-wide](#)

**Comments relative to the proposed exclusion(s):** The submitted diagrams are not intended to represent every possible element that should be excluded Continent-wide. The complete list should be determined by the proposed task force in order that regional differences in system characteristics is taken into account. In addition, to insure continuity, but the final decision as to what meets the exclusion criteria should reside in the Region with appeal process to NERC and possibly FERC.

Interconnection-wide

Region-wide

Patrick Farrell, Southern California Edison Company

Telephone: 626-302-1321

Email: [Patrick.Farrell@sce.com](mailto:Patrick.Farrell@sce.com)

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: **The elements and facilities above 100kV that are shown through engineering studies to not be necessary to reliably operate an interconnected transmission system should be excluded. Additionally, the transmission facilities at 100kV and above that are radial in nature, used for load serving purposes, and which are not parallel to interconnected transmission systems should be excluded. As an example, in SCE’s system, the Valley 115kV system is radial in nature and the power flow is generally from 500kV to 115kV to serve load.**
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
  - c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** **An element or facility that is not necessary to reliably operate an interconnected transmission system need not be included in the BES. This can be assessed using engineering studies that show the effect of worst-case disturbances on multiple indicators such as frequency, voltage, system flows, operating limits, generator tripping, and cascading outages and/or islanding with the element or facility removed from service. If a system can maintain acceptable steady-state and dynamic performance during and after a worst-case disturbance with the element removed from service, that element or facility is not necessary to reliably operate the system.**

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

Continent-wide

Interconnection-wide

Region-wide

**Comments relative to the proposed exclusion(s):** **The Bulk Electric System (BES) functions to generate bulk power and transfer that bulk power to locations from which it is then distributed to end-use load. Elements that generate bulk power, transfer bulk power, or support the transfer of bulk power are part of the BES.**

An element is necessary to reliably operate an interconnected transmission system if it significantly affects the ability of the BES to generate bulk power or carry bulk power to locations from which it is distributed to end-use load. While operating voltage (i.e. the proposed 100kV bright-line) may be a clear and repeatable proxy for identifying those elements that are necessary to reliably operate an interconnected transmission system, it is a broad approach that may not adequately address specific examples. Engineering studies can be used to more granularly and accurately identify elements which are not needed to reliably operate an interconnected transmission system.

The thresholds on the indicators listed above may vary between interconnections and regions. For example, SCE's system has facilities rated at the 115kV level that are radial in nature for load serving purposes. Therefore, applying a 100kV bright-line may unnecessarily bring facilities that could be excluded through an engineering study.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: [City of Anaheim Lewis-Vermont 230kV radial transmission line and seven 230kV to 69kV transformer banks and associated substation equipment, which are also radial transmission elements serving load.](#)
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). **Refer to attachments:**
    - 1b.1 [Anaheim System One-Line,](#)
    - 1b.2 [Anaheim 220kV System,](#)
    - 1b.3 [Anaheim 69kV Bus Impedance Diagram](#)
  - c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** [The 220kV facilities owned and operated by Anaheim are radial transmission elements fed from one transmission source, i.e. Lewis Substation. Southern California Edison Company \(SCE\) and the California Independent System Operator \(CAISO\) are the TO/TOPs for the interconnection of Lewis Substation to the BES, including the protection system that de-energizes both Anaheim buses using SCE owned breakers without interrupting any BES transmission lines. The 220kV system owned and operated by the City of Anaheim is radial to the BES at Lewis Substation and feeds a 69kV sub-transmission system through three 220kV/69kV transformer banks. Anaheim is able to reliably serve 100% of its load using only three of the four banks at Lewis; however, to improve reliability within Anaheim, in 2008 Anaheim built a redundant substation \(Vermont Substation\) 1.5 miles from Lewis, which is connected via a 220kV transmission line. This line is not needed to maintain BES or Anaheim system reliability because it is in parallel with four \(4\) 69kV lines, which also connect Lewis to Vermont. Its only purpose is to provide backup transformation should there be a catastrophic failure of the Lewis transformer banks. Pursuant to an SCE-Anaheim operating order only three transformer banks may be in service at any time to limit short circuit duty, so the banks at Vermont are truly redundant.](#)

[Transmission elements serving radial load, radial distribution systems, or non-GO/GOP generation connected to such radial lines and excluded from BES. To eliminate reliability gaps, such radial transmission elements should be classified as "Distribution" equipment subject to DP standards, and the PRC and vegetation management standards should be made applicable to Distribution Providers and this equipment. This is consistent with the](#)

NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for radial transmission facilities that function as Distribution and are not required for the reliable operation of the BES.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:

All step-down transformers with their low-side terminals operated at below 100 kV. Radial taps from a BES feeder or bus connection to loads. All elements or facilities in-series with excluded or exempt elements or facilities -- upstream to a designated point-of-demarkation with the BES and downstream to the customer meter or interconnection. For example, upstream from an exempt or excluded feeder to the upstream-side of the disconnect switch connecting the excluded or exempted feeder to the BES, or if no disconnect switch is present, to the upstream BES supply-bus connection. This exclusion or exemption would extend to and also apply to related equipment, such as circuit switchers, circuit breakers, ground switches, disconnect switches, busses, etc. that are down-stream of the point-of-demarkation and in the same circuit with the exempted or excepted feeders and transformers.

Local generation and any facility associated with local generation serving as a load modifier to local load only. The power generated is demonstrated to be consumed locally and does not flow back into the BES. The operation (or loss) of the local generation and/or associated facilities does not materially impact any BES transmission facilities. If a local generator functions as a load modifier, and does not materially impact the BES, meaning that it is not necessary to maintain BES reliability, then it should be excluded from the definition of BES under the BES Exclusion process.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).

Not Applicable

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The FERC Seven Factor test has been shown to be a reliable, repeatable method for identifying facilities that are local distribution and separating them from those facilities which perform a transmission function. The indicators of local distribution in the Commission's seven-factor test<sup>2</sup> are:

- 1) Local distribution facilities are normally in close proximity to retail customers;
- 2) Local distribution facilities are primarily radial in character;
- 3) Power flows into local distribution systems, and rarely, if ever flows out;
- 4) When power enters a local distribution system, it is not reconsigned or transported on to some other market;
- 5) Power entering a local distribution system is consumed in a comparatively restricted geographic area;
- 6) Meters are based at the transmission / local distribution interface to measure flow into the local distribution system; and
- 7) Local distribution systems will be of reduced voltage.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: **Radial facilities and elements operating at or above 100 kV, that are connected to only load serving facilities operated at distribution voltage levels and that include a high side circuit breaker or circuit switcher should be excluded from the BES classification. While protective systems themselves are not by default part of the BES, nor should they be classified as a BES element, the breaker failure schemes associated with the high side circuit breaker or circuit switcher are part of a Protection System and should comply with the appropriate standards.**
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** Facilities such as that described in 1.a. are designed to support only one way power flow; from the BES to the load. Operation of the high side circuit breaker or circuit switcher, Device A, removes the transformer from service interrupting power flow to the load but will not interrupt power flow on the BES nor effect reliability of the BES. While protective systems themselves are not by default

part of the BES, nor should they be classified as a BES element, the breaker failure scheme associated with Device A has the potential of interrupting BES power flow by clearing Bus 1. For this reason, the breaker failure scheme is part of a Protection System and should comply with the appropriate standards.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

<sup>3</sup> On November 6, 2009, EDF, Inc. (“EDF”) and Constellation Energy Group, Inc. completed a transaction pursuant to which EDF acquired a 49.99 percent ownership interest in CENG. CENG was previously a wholly owned subsidiary of Constellation Energy Group, Inc.

**Comments relative to the proposed exclusion(s):**

As described in RFC's BES definition, the following elements should be excluded:

- (1) radial facilities connected to load serving facilities or individual generation resources smaller than 20 MVA or a generation plant with aggregate capacity less than 75 MVA where the failure of the radial facilities will not adversely affect the reliable steady-state operation of other facilities operated at voltages of 100 kV or higher and
- (2) balance of generating plant control and operation functions (other than protection systems that directly control the unit itself and step-up transformer); these facilities would include relays and systems that automatically trip a unit for boiler, turbine, environmental, and/or other plant restrictions, and
- (3) all other facilities operated at voltages below 100 kV.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages 100kV and above which should be considered for exclusion from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:

This question refers to “exclusions”; we believe, however, that the intent of this comment form is to elicit feedback on the process for “exemptions.” It is important to distinguish between the two concepts, as FERC did in Order 743. *See, e.g.*, Paragraph 1, which refers to “maintain[ing] a bright-line threshold that includes all facilities operated at or above 100 kV *except defined radial facilities*,” as well as to “establish[ing] an exemption process and criteria” (emphasis added). In other words, in brief, an “exclusion” is outside of the BES by definition, whereas exempt Elements are removed on a case-by-case basis by going through a process.

TAPS draws the distinction as follows:

An exclusion is the removal of a category of Elements from the BES definition. The current BES definition explicitly carves out radials serving only load with one transmission source. This is a clear example of an exclusion. There is no “exclusion process” now, nor should there be one in the future; the point of an exclusion is that the class of excluded Elements can—without any process—be treated like sub-100 kV transmission, in that they are presumed to be non-BES unless a particular Element is demonstrated, on a case-by-case basis, to be properly included in the BES (*see* responses to Questions 5 and 11 in TAPS’ comments on BES definition, submitted today, and TAPS response to Question 2 below).

An exemption, on the other hand, is a finding that a particular Element, although nominally part of the BES, does not need to be included in the BES because it is not necessary for operating an interconnected transmission network.

Because exemptions are less clear-cut than exclusions, each exemption of an Element needs to be approved by NERC so that the Registered Entity and compliance authorities have certainty about the Elements with respect to which compliance is required. In many, perhaps all, cases, this process will likely require a case-by-case examination of each Element for which an exemption is requested.

TAPS responds to this question with respect to the one “exclusion” from the BES definition that we advocate, that of radial Transmission Elements serving only load and/or generation not registered pursuant to the Statement of Compliance Registry Criteria. We also propose uniform criteria for deciding, on a case-by-case

basis, whether to grant requested exemptions from the BES, or to include nominally non-BES Elements in the BES. The process that we propose for exemption requests and proposed inclusions is discussed below in response to the invitation of “[c]omments relative to the proposed exclusion(s).”

#### Exclusion:

TAPS proposes only one exclusion from the BES definition, namely, “Radial Transmission Elements serving only load with one Transmission source are generally not included in this definition. A radial Transmission Element may be considered as ‘serving only load’ for purposes of the foregoing general exclusion even if it connects generation, so long as that generation is not registered pursuant to the Statement of Compliance Registry Criteria.” This formulation, which is discussed in TAPS’ comments submitted today on the BES definition, is intended to preserve the current exclusion of radials serving only load with one transmission source, and to clarify that the presence of a generator that is not registered under the Compliance Registry Criteria does not convert a radial into a BES Element. The end result is that radial transmission is excluded unless it connects generation that is registered pursuant to the Statement of Compliance Registry Criteria. Consistent with the Compliance Registry Criteria, a single generator under 20 MVA, or a plant under 75 MVA, if not designated as a Blackstart Resource needed for system restoration, is unlikely to affect the grid. Therefore, the presence of such generation should not require that an otherwise non-BES radial be included in the BES. Rooftop photovoltaic cells, for example, are increasingly common. If TAPS’ proposed clarification is not accepted, the presence of such insignificant generation could nullify the exclusion of radials to load with one transmission source, with no benefit to reliability.

#### Exemption criteria

TAPS has not yet developed a list of criteria that we believe to be exhaustive, though we emphasize that such a list must be an ultimate goal of this process. We propose the following criteria as a start:

TAPS proposes that at least two classes of facilities be eligible to request an exemption:

- i. Elements that are part of a radial “system” originating from a single BES source serving only load, as in the Florida Keys. Clarifications: a) radial system means any number of series and/or parallel Elements as long as they all originate from a single BES source and do not have another BES source; b) “single BES source” means one BES bus / substation / switching substation at one voltage level, and c) consistent with TAPS’ proposed exclusion of radials serving only load and unregistered generation, “serving only load” includes serving generation that is not registered through the Statement of Compliance Registry Criteria.

ii. Elements that are part of a “looped” system that has two transmission sources primarily for local quality of service to the retail customers supplied by the looped system in question and is not used for bulk power system flow (*e.g.*, the transfer distribution factor of flows across the looped system is low, representing a high impedance path across the looped system). Specific criteria might be: a) a looped system that participates in less than a 5% of transfer (*e.g.*, 5% or less transfer distribution factor); and b) that the looped system in question does not limit transfers.

A radial or looped system to be exempted must meet the following criteria:

1. The radial or looped system may not contribute to any Category D or C contingency resulting in: 1) a supply / demand mismatch greater than the largest loss of source contingency in the Reliability Coordinator area; or 2) an Adverse Reliability Impact where, if the Element were not involved in those Category D or C contingencies, those thresholds would not be exceeded.

Studies to determine whether this criterion is met would be conducted in accordance with TPL-004-0 and TPL-003-0 standards (or corresponding contingencies in revision to the TPL standards) in the Short Term Planning Horizon. Although the above criteria are acceptable responses to a Category D contingency, the concept of the test is to see if a radial or looped system would cause a significantly worse response to Category C or D contingencies by testing the contingency with and without the radial or looped system. TAPS believes that such criteria are good indicators that a radial or looped system should be included in the BES as it highlights whether the protection systems are important for critical clearing times, and whether the radial or looped systems can contribute to an Adverse Reliability Impact in combination with other contingencies;

2. No portion of the radial or looped system may meet any of the conditions of Attachment 1 to CIP-002-4;

3. No portion of the radial or looped system may meet any of the conditions listed in items B1 to B5 of Attachment B to PRC-023-2;

4. No portion of the radial or looped system may be a part of, or be a limiting element of, any Path, Interchange, or Flowgate used in the calculation of ATC in accordance with standards MOD-028, MOD-029 or MOD-030; and

5. No portion of the radial or looped system may include a Blackstart Resource or cranking path deemed significant to the TOP or RC restoration plans of EOP-005, EOP-006 or EOP-007.

If a Registered Entity demonstrates to NERC that an Element that is nominally in the BES meets *all* of these criteria, the exemption would be granted.

Conversely, if NERC demonstrates that a nominally non-BES Element meets the negative of *any* of these criteria (e.g., if any portion of the radial or looped system meets any of the conditions of Attachment 1 to CIP-002-4 or of Attachment B to PRC-023-2), the Element would be included in the BES.

Throughout these comments, TAPS refers to “Elements” and not to “facilities.” This is because “Facility” is defined in the NERC Glossary as “[a] set of electrical equipment that operates as a single Bulk Electric System Element...” Because these comments (and the BES definition) address whether Elements are or are not part of the BES, it is incorrect to refer to the Elements in question as “Facilities,” because a Facility is defined as a *BES* Element.

In developing the exemption/inclusion criteria and process, NERC and the SDT should bear in mind the requirement of Order 743: “NERC should develop an exemption process that includes *clear, objective, transparent, and uniformly applicable* criteria for exemption of facilities that are *not necessary for operating the grid.*” Paragraph 115 (emphasis added). NERC and the SDT should also bear in mind that FERC anticipates that between the BES definition and the exemption process, there will be only “minimal[]” effect on “small entities.” Order 743, Paragraph 169. Order 743 is referring to the Small Business Act definition of a “small electric utility” as one that has a total electric output of less than four million MWh in the preceding year. *See* March 18, 2010 BES Notice of Proposed Rulemaking, Paragraph 35 & footnote 50.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** Radial Transmission Elements serving only load have been recognized for years as non-BES because such Elements are very unlikely to affect the BES. FERC stated in Order 743 that NERC may retain that exclusion.

Similarly, generators under 20 MVA and generating plants under 75 MVA are not subject to registration pursuant to the Statement of Compliance Registry Criteria, which has been accepted by FERC, because of the recognition that such generators are very unlikely to affect the BES. It is thus consistent with the Compliance Registry Criteria to exclude from the BES definition radials serving load with one transmission source even if there is some generation on the radial, so long as none of the generation is registered. If the generation is not significant enough to be registered, it is not significant enough to transform an otherwise non-BES radial to load into a BES Element.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

Continent-wide

The exclusion of radials to load and unregistered generation, as part of the BES definition, should apply on a continent-wide basis.

Each Element proposed for exemption or inclusion should be considered individually, under the same criteria (proposed above), applied uniformly continent-wide.

**Comments relative to the proposed exclusion(s):**

Exemption and Inclusion Processes:

The exemption and inclusion processes should be designed to ensure continent-wide uniformity to the maximum extent possible. To that end, NERC must use a uniform process; the criteria for approving or denying an exemption, or for including an Element in the BES, must be clear; and entities must be able to appeal decisions to another body within NERC or to FERC.

In order to obtain an exemption, a Registered Entity should be required to demonstrate that the Element for which it is requesting an exemption is not “necessary for operating an interconnected electric transmission network.” This is the standard set out in Order 743 (*e.g.*, Paragraph 1); it is also part of the definition of the “bulk-power system” in Section 215 of the Federal Power Act, 16 U.S.C. § 824o(a)(1)(A). Application of this standard should be informed by the statutory definitions of “reliability standard” (“a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system,” 16 U.S.C. § 824o(a)(3)) and “reliable operation” (“operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements,” 16 U.S.C. § 824o(a)(4)).

Conversely, to include a nominally non-BES Element in the BES, NERC should be required to demonstrate that the Element *is* necessary for operating an interconnected electric transmission network.

Criteria for determining whether an Element is or is not “necessary for operating an interconnected electric transmission network” are proposed in response to Question 1(a) above. The criteria should be uniform continent-wide, though they will be applied to each Element on a case-by-case basis.

Exemption requests and proposed inclusions should be decided by NERC staff in the first instance. TAPS does not believe that the exemption and inclusion processes should be delegated to the Regional Entities. In Order 743, FERC emphasized the need for continent-wide uniformity; in fact, it was inconsistency among regions that

prompted Order 743. TAPS members' experience with Regional registration processes suggests that Regional implementation of the BES exemption and inclusion processes is unlikely to yield the uniformity that FERC directed. Furthermore, implementing this FERC directive will unavoidably require significant personnel resources, either at NERC or at the Regions. Delegating the process to the Regions would impose additional costs due to the need for NERC to exercise strong oversight to attempt to maintain uniformity. It may be that after the exemption and inclusion processes have been in place for a few years and a body of precedent has been accumulated, delegation will be appropriate. At this time, however, NERC staff should make the initial decision on all exemption requests and proposed inclusions.

TAPS proposes, for the sake of consistency with the registration appeal process, that appeals of decisions on exemptions and inclusions be to the Board of Trustees Compliance Committee (BOTCC), with further appeals to FERC if necessary. Appeals to the BOTCC would consist of the record compiled by NERC Staff, and additional paper submissions by NERC Staff and the Registered Entity demonstrating why the Element(s) in question is or is not "necessary for operating an interconnected electric transmission network." See NERC Rules of Procedure, Appendix 5A, Organization Registration and Certification Manual at 14-16. Registered Entities should have the option of requesting a hearing. Hearing procedures could be modeled on the Compliance and Certification Committee's "Hearing Procedures for Use in Appeals of Certification Matters," in Appendix 4E of the NERC Rules of Procedure.

TAPS also suggests that decisions on exemptions and inclusions be made available to others, either subject to CEII protection or in a form suitable for public release. As precedent develops, Registered Entities will increasingly be able to judge for themselves the likelihood that a particular exemption will be granted, or that an appeal of an inclusion will succeed. We expect that giving Registered Entities more information on which to base their decisions will significantly reduce the burden on NERC of processing exemptions and inclusions.

We propose that BES Elements for which an exemption request is pending should continue to be included in the BES until the exemption and any appeals are decided, and that non-BES Elements for which an inclusion is pending should continue to be non-BES until the inclusion and any appeals are decided.

The transition process should include an important exception to the general rule proposed for BES status during the pendency of an exemption request: to allow for a smooth transition, to the extent that Elements that are currently considered non-BES become BES under the new definition, those Elements should be permitted to request exemptions and to continue to be considered non-BES until their exemption requests and any appeals are decided.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: [Non-radial transmission systems which provide reliable service to load-service substations. There are two examples where this applies: 1.\) The non-radial transmission system serving a metro area load at 138 kV where 230 kV and higher voltage systems surround the area and provide the bulk electric system transfer, and 2.\) The non-radial transmission loops that serve rural area load at 138 kV that are essentially tangential to the bulk electric transfer path.](#)
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). [Refer to Attachment 1b.4](#)
  - c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** [Large load-serving substations require non-radial service to ensure acceptable reliability performance. Such transmission systems do not carry bulk power transfers as there are substantial higher voltage transmission lines that surround the metro area which carry the bulk transfers. Idaho Power has evaluated serving the area from systems that are sourced from only a single bulk substation. Such a configuration would result in requiring an additional 100 miles of transmission to compared to the existing network configuration.](#)

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

[Continent-wide](#)

**Telephone: 262-506-6913**

**Email: [apusztai@atcllc.com](mailto:apusztai@atcllc.com)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: **Exclude transmission lines that are operated at 100 kV and above that are operationally radial transmission elements because of a operating restriction that prevents the line from being operated as a network transmission element.**
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).

The transmission line between Source Line #1 and Sources Line #2 would be a Network element if the bus-tie circuit breaker was closed, However, Operating Procedures require the bus-tie circuit breaker to be normally open (N.O.) So, the load on Bus 1 is served by the radial line segment from Source Line #1 and the load on Bus 2 is served by the radial line segment from Source Line #2.

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** Although the transmission element (line) between network Source #1 and network Source #2 could be a network element if the bus-tie breaker is closed, the two line sections are normally operated as two different radial elements. So, the radial Transmission Element exclusion should apply.

**1.** If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

**a.** Identify the Element or Facility recommended for exclusion:

- [Radial lines](#)
- [Local distribution networks, generators, generation plants, loads, transformers, reactive devices, and protection and control system found to not cause adverse reliability impacts on neighboring bulk system Elements and Facilities using a performance-based exclusion process.](#)

**b.** Provide a generic one-line diagram depicting the Element or Facility in question (if available).

[Assuming FERC continues to insist upon a 100kV “bright line” definition, we support a process to exclude systems operating at 100kV and above that do not cause adverse reliability impacts on the neighboring bulk transmission system. For facilities operating at 100kV or above, the exclusion process should allow exclusion of those elements that, using a performance-based assessment, are demonstrated to operate without causing adverse reliability impacts on neighboring bulk system.](#)

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The ultimate goal of the Reliability Standards process should be to achieve reliable operation of the bulk transmission system, as defined by Congress. The term “reliable operation” was a term specifically defined in FPA Section 215 to include standards assuring the operation of bulk transmission system elements “within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance. . . or unanticipated failure of system elements.” 16 U.S.C. § 825o(a)(4). Congress specifically precluded the mandatory reliability system from enforcing standards for adequacy of service, which were left to state and local authorities. 16 U.S.C. § 825o(i)(2).

Recognizing that Congress intended the mandatory reliability regime to focus on thermal, voltage, and stability limits on the bulk system rather than more generally on levels of service to retail customers, the Standards Development Team should define the Bulk Electric System to include only those facilities whose failure or mis-operation meaningfully threatens to produce instability, uncontrolled separation, or cascading failures on the bulk system. As a legal matter, expanding the definition to include local distribution facilities and facilities that do not threaten thermal, voltage or stability impacts on the bulk system exceeds the permissible scope of NERC Reliability Standards and FERC authority under FPA Section 215. As a practical matter, mandating adherence to Reliability Standards for facilities, or equipment, that do not cause adverse reliability impacts on the neighboring bulk system is a significant diversion of funds and resources that will produce little or no benefits in terms of improved reliability of the bulk system.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

Continent-wide

Interconnection-wide

**Comments relative to the proposed exclusion(s):** The WECC Bulk Electric System Definition Task Force (“BESDTF”) has carefully considered and provided an extensive record of technical support for excluding Radial Facilities and Local Distribution Networks from the BES. While we recognize that physical differences between the electric system in WECC and other reliability regions may justify different approaches in those regions, we commend the work of the BESDTF to the standard drafting team.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion: [All the SS\\_ 115 kV buses in the attached one-lines as well as the connecting lines should be excluded from consideration since they are radial serving load. Additional facilities may be put through the exclusion process, and excluded if shown not to be needed for “reliable operation” as defined in 16 U.S.C. § 824o\(a\)\(4\).](#)
- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). [Refer to Attachment 1b.10 & 1b.11](#)
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** [These SS\\_ facilities in the diagram are operated radially and are used to distribute energy locally. The FPA specifically excludes “facilities used in the local distribution of electric energy” \(16 U.S.C. § 824o\(a\)\(1\)\) and prohibits FERC from enforcing standards for adequacy of service \(16 U.S.C. § 824o\(i\)\(2\)\). In addition, any faults or failures in these facilities will only affect the local area, and not cause instability, uncontrolled separation, or cascading outages \(16 U.S.C. § 824o\(a\)\(4\)\). These facilities should be excluded by inspection, and should not be required to go through an exemption process.](#)

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

[X Continent-wide](#)

**Comments relative to the proposed exclusion(s):** [The two diagrams illustrate the overreaching approach that WECC is presently using. Documents on the RFC web site prove that the WECC approach is not at all universal.](#)

[The SS2 bus is presently considered by WECC to be BES because it has two transmission sources, NON-RADIAL SUB 1 and NON-RADIAL SUB 3, even though the K9-5 at SS3 is normally open. WECC considers any possible second source regardless of the system is operated. Any faults at SS3 or in the supplying lines will result only in a local outage. We hope the SDT will consider actual operating conditions when it defines “radial” and “one transmission source.”](#)

The 115 kV bus at SS6 is considered by WECC to be BES because it has two transmission sources, one by way of NON-RADIAL SUB 4 and the other by way of NON-RADIAL SUB 5 (off the one-line to the right). We don't think that is what NERC meant by "transmission source." A fault on the SS6 bus would result in a local outage affecting only the four substations tapped off the NON-RADIAL SUB 4/SUB 5 line. We assume that if the risk of such an outage was unacceptable, the serving transmission company would have required protection at the tap points. We hope the SDT will properly clarify what is meant by a transmission source.

All the SS 115 kV buses shown also have multiple transmission sources by way of normally open tie switches on the 12.47 kV system. Again we hope the SDT will consider operating philosophies when defining "radial" and "one transmission source."

All the substation transformers in the diagrams are considered by WECC to be BES because one winding exceeds 100 kV. We understand the SDT properly intends to look at the lowest voltage winding rather than the highest.

Except for the fuses at SS8, all the SS transformer protection systems are considered by WECC to be BES subject to PRC-005. This is not because the transformers are considered to BES, but because relay operation results in tripping a circuit switcher that exceeds 100 kV. We expect the SDT will properly consider the zone of protection rather than the voltage of the interrupting device.

Please also consider the 115 kV lines joining the NON-RADIAL SUBs in the two diagrams. While most of them cannot be considered to be radial with one transmission source, they are not used to transport bulk power. Their purpose is the local distribution of power. Parallel 230 kV lines (not shown in the diagrams) are responsible for the bulk power transport. The WECC Bulk Electric System Definition Task Force has been working on a definition of "local distribution networks" that would properly classify the 115 kV lines as non-BES. We hope the SDT will look at the work the BESDTF has done.

**Question 2:**

- 2.** If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:
  - a.** Identify the Element or Facility recommended for inclusion:
  - b.** Attach a generic one-line diagram depicting the Element or Facility (if available).
  - c.** Provide a technical justification for the inclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).
  - d.** Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this inclusion should apply, please select, "unknown."

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for inclusion:

FMPA' proposed criteria for inclusion are listed above in response to Question 1(a). As stated above, there should be no "generic" or "categorical" inclusions. Inclusions, like exemptions, should be considered on a case-by-case basis. The *criteria* by which proposed inclusions or requested exemptions are judged, however, should be uniform across the continent.

- d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this inclusion should apply, please select, "unknown."

Continent-wide

**Comments relative to the proposed inclusion(s):** This question appears to assume that all inclusions in the BES will be categorical, rather than case-by-case. This is inappropriate. Inclusions, like exclusions, should involve case-specific consideration of the uniform, continent-wide criteria.

The inclusion process should be the mirror image of the exemption process: it is NERC, rather than the Registered Entity, who initiates the process, and the burden is on NERC to demonstrate that the Element to be included is "necessary for operating an interconnected electric transmission network." The processes should otherwise be identical: the initial determination should be made by NERC staff, with appeals to the Board of Trustees Compliance Committee, and to FERC if necessary. The proposed process is discussed in more detail in response to Question 1 above.

[X Continent-wide](#)

[X Interconnection-wide](#)

[X Region-wide](#)

**Comments relative to the proposed inclusion(s):** [While operating voltage \(i.e. the proposed 100kV bright-line\) may be a clear and repeatable proxy for identifying those elements that are necessary to reliably operate an interconnected transmission system, it is a broad approach that may not adequately address specific examples. Engineering studies can be used to more granularly and accurately identify elements which are not needed to reliably operate an interconnected transmission system.](#)

The thresholds on the indicators listed above may vary between interconnections and regions. For example, SCE's system has facilities rated at the 115kV level that are radial in nature for load serving purposes. Therefore, applying a 100kV bright-line may unnecessarily bring facilities that could be excluded through an engineering study.

d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this inclusion should apply, please select, "unknown."

Unknown

Comments relative to the proposed inclusion(s): The scenario below should be considered and worked through as part of the development of the definition and exemptions. As stated in questions 2, 3, 8 of the BES definition comment questionnaire it is unclear as to how treatment of facilities would occur, especially if there are multiple/separate owners of each wind farm, even though they aggregate to a common bus that connects to the transmission system. Treatment of the bus and breakers between each wind farm and the transformer also needs to be contemplated and addressed in the definition or exclusion process.

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for inclusion: TAPS' proposed criteria for inclusion are listed above in response to Question 1(a). As stated above, there should be no "generic" or "categorical" inclusions. Inclusions, like exemptions, should be considered on a case-by-case basis. The *criteria* by which proposed inclusions or requested exemptions are judged, however, should be uniform across the continent.

**Comments relative to the proposed inclusion(s):** This question appears to assume that all inclusions in the BES will be categorical, rather than case-by-case. This is inappropriate. Inclusions, like exclusions, should involve case-specific consideration of the uniform, continent-wide criteria.

The inclusion process should be the mirror image of the exemption process: it is NERC, rather than the Registered Entity, who initiates the process, and the burden is on NERC to demonstrate that the Element to be included is "necessary for operating an interconnected electric transmission network." The processes should otherwise be identical: the initial determination should be made by NERC staff, with appeals to the Board of Trustees Compliance Committee, and to FERC if necessary. The proposed process is discussed in more detail in response to Question 1 above.

Continent-wide

Interconnection-wide

Comments relative to the proposed inclusion(s): The BESDTF has developed an approach in which certain facilities operating at voltages below 100kV would be included in the BES, but facilities not falling within these specific, defined categories would not be included in the BES unless the RRO could demonstrate that the facility creates a material impact threatening the reliable operation of the bulk interconnected system. We believe this is a sensible approach to this question.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** There are three parts to the work that need to be accomplished to fulfill the intent of the Commission's Order; 1) revision of the definition of Bulk Electric System, 2) development of exemption criteria and 3) development of a process for applying the exemption criteria. The first two parts of the work should be accomplished using the standards development process. This work is technical in nature and therefore should be developed by technical experts in the industry. The Rules of Procedure change process should be reserved for the mechanics of administering the exemption process.

The Regions should administer the exemption process with NERC serving an oversight role to ensure consistency among the Regions. This would fit logically with the Regions' administration of other processes such as the registration process.

Each registered entity that identifies Transmission or Generation Elements or Facilities that should be included or excluded from the Bulk Electric System should submit an application to the Region, including the information sought in parts a, b and c of questions 1 and 2 in this document (i.e., identification of the Element or Facility, diagram, and technical justification). The Region should then review the request through a stakeholder technical committee using the criteria approved through the standards development process. NERC should periodically review all applications of the exemption process to ensure consistency in the Regions' application of the criteria.

**Email: [mmizumori@wecc.biz](mailto:mmizumori@wecc.biz)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** In addition to defining functional characteristics that can be used for an exemption process, the use of engineering studies that demonstrate the effect of an element on system performance must also be allowed, but must include clearly-defined and technically-justified assumptions, metrics, and thresholds. To the extent that there are physical differences between regions or interconnections, variations between those regions and interconnections must be allowed. However; all assumptions, metrics, and thresholds must be thoroughly vetted and approved by NERC as part of the NERC Exemption Process. Furthermore, it would be helpful if NERC could clarify the process that it will use to develop the Exemption Process and Criteria, including how the team will be populated, how coordination with the Drafting Team will be assured, and how the vetting process would occur. It is important that the team developing the exemption criteria includes technical experts from the stakeholder community.

**Telephone: 720-962-7431**

**Email: [dunn@wapa.gov](mailto:dunn@wapa.gov)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** The use of engineering system studies that demonstrate the impact of an Element on system performance must be allowed to demonstrate inclusion/exclusion to the BES. To the extent there are physical differences between Regions, variations between those Regions must be allowed. Also – the Exception Definition Task Force needs to be a stakeholder-populated/ -driven process.

The exemption process should be part and parcel of the definition. Exemption language furthermore must be explicit and unambiguous. The WECC Bulk Electric Definition Task Force (BESDTF) has expended considerable effort over the last two years exploring important issues pertaining to exempting elements from the BES including;

- a.** Lines of demarcation between BES and non-BES elements
- b.** Definition of ‘radial’
- c.** High voltage distribution networks.
- d.** Impact assessment methodologies.

**Alain Pageau, Hydro-Québec TransÉnergie**

**Telephone: 514 879-4100 #5414**

**Email: [pageau.alain@hydro.qc.ca](mailto:pageau.alain@hydro.qc.ca)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** For the Canadian entities, the inclusion or exclusion of equipment and facilities in the BES must be also approved by the Canadian regulators. (as answer 2c). We believe that it is very difficult to propose first a definition for the BES and only after an Exemption process. Both aspects influence each other and both should be carried out together.

**Guy Zito, Northeast Power Coordinating Council**

**Email: [gzito@npcc.org](mailto:gzito@npcc.org)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

[1] [Seven Factor Test](#) – NPCC participating members believe that the BES Exclusion process should place substantial weight upon Factor 3 from the FERC Seven Factor test. Factor 3 states, “Power flows into local distribution systems, and rarely, if ever flows out.”<sup>1</sup> We also believe that Factor 7 has been broadly interpreted by FERC, State Commissions and the Courts to **include** facilities serving a distribution function and operated at 100 kV and above.<sup>2,3,4,5,6,7</sup>

[2] [NPCC A-10 Methodology for Determine BPS Elements](#) – NPCC participating member believe the A-10 Criteria methodology that NPCC uses to determine its BPS elements can be further utilized to identify critical system components that may be operated below the 100 kV threshold. The Criteria may also be used in lieu of the use of “higher” thresholds that appear or are contemplated in some of the ERO standards such as FAC-003 cites 200kV and above, the TPL-001 currently under development may specify a 200 kV threshold for some “more stringent” planning criteria. These higher thresholds may lend themselves to the use of an “impact based” methodology that could be used to determine where more stringent requirements may need to be applied.

[3] [New York State Public Service Commission \(NYSPSC\)](#) - In Opinion No. 97-12, Case 97-E-0251, the NYSPSC provided utilities under its jurisdiction explicit guidance for

---

<sup>1</sup> We view the term “rarely” as used in Factor 3 to be bounded on the upside by a reverse power flow rate of no more than 10% of all hours and a peak reverse power flow (MW) amount of no more than 50% of peak inflows.

<sup>8</sup> STATE OF NEW YORK PUBLIC SERVICE COMMISSION, OPINION NO. 97-12 in CASE 97-E-0251 - *Proceeding on Motion of the Commission to Distinguish Bulk Electric Transmission System from Local Distribution Facilities*.

**Jim Uhrin**      **ReliabilityFirst Corporation**

**Telephone:** 330.247.3058

**Email:** [jim.uhrin@rfirst.org](mailto:jim.uhrin@rfirst.org)

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** ReliabilityFirst would like to see this as a simple and easy-to-follow definition. The exclusion process needs to be clear without room for discussion or interpretation.

- There must be a common framework developed, along with a single NERC-wide BES definition.
- The definition should serve as a common approach for the identification of BES Elements and Facilities that are subject to compliance.
- The definition and approach for the determination must be repeatable.
- The method must clearly identify the BES elements for use by the industry.
- In order to obtain consistency, the definition, application and criteria must be used across Regional Entity boundaries.
- The revised BES definition should be consistent with the Statement of Compliance Registry Criteria so as not to create a conflict between the two, and could possibly simply reference the Criteria for issues such as size of generating units (e.g., 20 MVA units and 75 MVA plants) included in the BES.
- The criteria for exemption should be included within the BES definition, and the exemption process should contain only the procedure for submitting and determination of such. The exemption process should not contain a third set of criteria (in addition to the BES definition itself and the Statement of Compliance Registry Criteria) in which to make a determination of facilities to be monitored for compliance to standards.
- With the revised BES definition containing specific requirements for inclusion in the BES, will the separate Statement of Compliance Registry Criteria even be needed?

**Joe Petaski, Manitoba Hydro**

**Telephone: 204-487-5332**

**Email: [jpetaski@hydro.mb.ca](mailto:jpetaski@hydro.mb.ca)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

- a. A NERC definition of ‘radial’ is required to prevent misapplication of the BES definition and exemption process.
- b. There should be no regional differences in the BES definition or in the BES definition exemption process.
- c. There should be equal representation from the regions to draft this standard
- d. There should be consistent wording to describe the process - exception or exemption.

**John W. Delucca, Lee County Electric Cooperative**

**Email: [john.delucca@lcec.net](mailto:john.delucca@lcec.net)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** The exception process under draft in the FRCC region should serve as a strong basis that could be applied Continent-wide. Also while the exclusion process should be administered within the Region there needs to be an appeals process in place that progresses quickly. In addition, a Region should not be allowed to allege violations of reliability standards related to a system while in the appeals process. If the appeal is not upheld the entity should then be allowed time to bring the system into compliance. Also for consideration Bright-line” methodology seems to be the “easy button” solution, but this “one-size fits all” places the burden on entities to obtain exclusions. From an entity’s viewpoint, move the “bright-line threshold” to non-radial facilities operating at or greater than 230 kV, and adopt an inclusion process and criteria for including facilities that are necessary to operate an interconnected electric transmission network.

**Email: [dan.rochester@ieso.ca](mailto:dan.rochester@ieso.ca)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** We have difficulties understanding the intent of this Comment Form and the content in Q1 and Q2, above, which appear to be templates for information to be included in an exclusion/inclusion request rather than asking for comments on each of the listed items.

1. Is the intent of this Comment Form to obtain:
  - a. Recommendations of the criteria to be considered in developing deviations from the default criteria for classifying Elements and Facilities as part of the BES?
  - b. Assessment of the templates proposed in Q1 and Q2?
2. The concept paper that is posted alongside the SAR and proposed definition is not referenced in this Comment Form. Is it the drafting team's intent to solicit comments on the concept paper?
3. In the concept paper, three exemption criteria are presented. We do not have any issue with the first and third criteria but are concerned that Criterion #2 is not a criterion. It states that:

“Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO).”

This criterion appears to reference yet another set of criteria not already included in the set or the concept paper. In fact, this “referenced” set needs to be clearly stipulated to ensure that applicants are fully aware of the conditions under which an Element or Facility operated at 100 kV or above can be deemed not necessary to support bulk power system reliability and, conversely, the conditions for an Element or Facility operated at below 100 kV to be included. The “templates” presented in Q1 and Q2 of this Comment Form also do not convey the needed conditions.

We believe it is the clear conditions for exclusion (Elements/Facilities of 100 kV and above) and inclusion (below 100 kV) that need to be developed and fully vetted. We urge the drafting team to proceed to developing these criteria expeditiously so as to support the assessment and approval of the revised definition of BES.

4. We strongly advocate that the exemption process allows for a registered entity to submit the results of an objective, impact-based assessment process in support of its application for exemption of facilities that would otherwise be classified as part of the BES. This

assessment process, when consistently applied in a non-arbitrary manner, would yield results that demonstrate concretely, that the facilities for which the exemption is being sought, do not impact the BES.

5. Finally, given that the exemption process will be used to included and exclude transmission facilities we suggest either of the following as a more appropriate name: “BES Classification Exception Process” or “BES Classification Review Process”.

NEW YORK INDICATORS (FINAL REVISED VERSION)

[NY-1] A transmission system delivers power from generation plants to local distribution systems. Where a generator directly supplies a local distribution system, the need for a transmission system to deliver its output to load depends on the size of the generator in relation to the minimum load of that system.

[NY-2] Transmission systems end at the high-voltage terminals or at the disconnect switch of a substation transformer; if no transformer is present, the transmission system ends at the bus tap of the local distribution feeder.

<sup>16</sup> STATE OF NEW YORK PUBLIC SERVICE COMMISSION, OPINION NO. 97-12 in CASE 97-E-0251 - *Proceeding on Motion of the Commission to Distinguish Bulk Electric Transmission System from Local Distribution Facilities*.

**Alice Ireland, Xcel Energy**

**Telephone: 303-571-7868**

**Email: [alice.murdock@xcelenergy.com](mailto:alice.murdock@xcelenergy.com)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** Xcel Energy agrees that the FERC Order 743 directs NERC to modify the Rules of Procedure to include the process for how an entity or region may initiate an exclusion or inclusion. However, we do not agree that FERC also directed that the actual criteria and technical specifics for inclusion or exclusion be developed as part of the Rules of Procedure. Furthermore, since the inclusion/exclusion criteria is a key component to the definition of BES, we feel the criteria should be treated as part of the definition development and developed in the same manner as the definition itself. (Preferably by the same drafting team.)

It is also not clear as to why the Reliability Assurer is included as an applicable entity in the SAR.

**Allen Mosher, American Public Power Association**

**Telephone: 202-467-2944**

**Email: [amosher@publicpower.org](mailto:amosher@publicpower.org)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exemption Process.

**Comments:**

The Concept Paper states at page 1 that in Order 743, FERC directed NERC to do the following:

- A. Utilize the NERC Standard Development Process to revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms.
- B. Develop a single Implementation Plan to address the application of the revised definition of the BES and the implementation of the exemption process.
- C. Utilize the NERC Rules of Procedure to develop and implement an 'exemption process' used to identify Elements and Facilities which will be included in or excluded from the BES.

The Concept Paper continues to state that:

This project will address items 'A' and 'B' and will coordinate efforts between the Standard Drafting Team (SDT) and the group working to develop the exemption process for inclusion in the NERC Rules of Procedure to ensure that the revised BES definition and exemption process result in an accurate, repeatable, and transparent method for the identification of BES and non-BES Elements and Facilities.

APPA agrees that the standards process must be used to develop the revised BES definition and that NERC has been directed to use its Rules of Procedure process to develop an ROP-based procedure to implement an exemption/exclusion/inclusion process. However, the FERC directives do not speak to how and by whom the technical methodology, study criteria and data requirements for requesting and receiving approval for an exemption should be developed.

To the maximum extent possible, subject to time constraints imposed by FERC, this inherently technical methodology needs to be developed through the NERC standards development process, in conjunction with development of the revised definition of BES. Separate development will significantly hamper development of industry consensus in support of the revised BES definition and the yet to be developed ROP modifications for the exemption process.

The most critical question is how do we arrive at a commonly agreed upon, widely accessible, transparent, and replicable continent-wide methodology to determine whether

each specific facility is or is not “necessary to operate an interconnected electric transmission network” to quote from paragraph 16 of Order 743. While each region may have a separate model reflecting its topology and system performance characteristics, a continent-wide approach is required to address FERC concerns about inconsistency across regions that are not the result of physical differences.

The statutory definition of the term bulk-power system defines the outer extent of facilities that can be included (at least within the United States) within the NERC definition of BES. FPA section 215(a)(1) states that the bulk-power system includes “(A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability.” Further, the term BPS “does not include facilities used in the local distribution of electric energy.” [emphasis added].

Similarly, “reliable operation” is defined at 215(a)(4) to mean “operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.”

These definitions appear to point to two basic questions for the classification of each facility or element as BES or non-BES:

1. Is the facility or element necessary for reliable operation because it contributes significant capability to the interconnected transmission network?
2. Will the misoperation or unanticipated failure of the facility or element adversely affect the reliable operation of the interconnected transmission network?

APPA suggests that the BES SDT or separate study teams should be directed to establish the outline for this study methodology. APPA further suggests that BES sub-teams be established to address the Proposed BES Criteria in the Concept Paper. Separate sub-teams should be established to address detailed system configuration and study methodology issues affecting:

1. Radials serving load (with and without distribution voltage generation not subject to registration)
2. Other transmission elements that entities seek to include in or exclude from the BES.
3. Generating plant equipment that entities seek to include in or exclude from the BES.
4. Technical issues raised by the FERC Seven Factor Test for Local Distribution Facilities.

Separate sub-teams are appropriate because the study issues are likely to be quite distinct. For example, radials serving only load do not provide alternative pathways for reliable BES

operations, as might some sub-100 kV facilities. Mixing the two teams together might slow progress on identification of various commonly used radial to load center configurations that with proper protection schemes do not have the potential to adversely affect the BES. A focused effort on permissible exclusions of radials serving load is essential to prevent distribution providers from adopting less reliable system configurations to serve their loads because they are concerned that the preferred configuration will make them subject to registration as TOs and/or TOPs.

Note that the proposed sub-teams do not necessarily have to be populated by members of the SDT. The new standards process allows SDTs to gather informal input from a variety of sources. However, development and posting for industry comment of the minimum acceptable characteristics of the study methodology to be used in the Exceptions Process should be the responsibility of the BES SDT.

The Comment Form on the Exclusion Process poses reasonable questions and it is my hope that registered entities and regional entities identify numerous candidate facilities and elements for inclusion or exclusion from the BES, accompanied by one-line diagrams that lay out each of the permutations for such facilities that are candidates for exclusion/inclusion. These facilities range from simple radial transmission lines and distribution step-down transformers to 100 kV class distribution networks that operate radially from the BES. I also hope that entities submit extensive technical documentation to explain why such facilities should be excluded from or included in the BES.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** Each inclusion and exclusion should be based solely on its technical justification.

“The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”

**John P. Hughes, Electricity Consumers Resource Council (ELCON)**

**Telephone: 202-682-1390**

**Email: [jhughes@elcon.org](mailto:jhughes@elcon.org)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** ELCON members have always supported fair and effective reliability efforts at NERC. However, the expansion of the standards compliance responsibility implied by the NERC Concept Document goes too far. As written, this proposal could have the effect of devaluing a large number of industrial owned electrical power assets by forcing industrials to meet new and unnecessary compliance obligations. Many will be forced to choose to either accept a significant new cost or fire sale their assets to local providers increasing the purchaser's market power in the process. ELCON feels the addition of new compliance obligations should not be done in such a wholesale manner but instead done on an exception and as needed basis that factors in both a realistic appraisal of the underlying risk and the economic burden imposed on the registered entity relative to the expected benefits.

Specific recommendations and concerns are:

1. An Overarching “Principle” for the Identification of BES Elements and Facilities Must be the Guidance Provided by FERC That Significant Expansion of the Compliance Registry is Not Contemplated.

In FERC's March 18, 2010 Notice of Proposed Rulemaking (NOPR) on the Revision to Electric Reliability Organization Definition of Bulk Electric System, the Commission stated regarding the revision to the BES definition:

This proposal would eliminate the discretion provided in the current definition for a Regional Entity to define “bulk electric system” within a region. Importantly, however, we emphasize that we are not proposing to eliminate all regional variations and we do not anticipate that the proposed change would affect most entities. ¶ 16. ... the Commission does not believe that the proposal would have an immediate effect on entities in any Regional Entity other than NPCC. ¶ 27.

Similarly, in Order No. 743, the Commission stated:

We expect that our decision to direct NERC to develop a uniform modified definition of “bulk-electric system” will eliminate regional discretion and ambiguity. The change will not significantly increase the scope of the present definition, which applies to transmission, generation and interconnection facilities. The proposed exemption process will provide sufficient means for entities that do not believe particular facilities are necessary for operating the interconnected transmission system to apply for an exemption. ¶ 144.

One area where the proposed BES definition and exception process will significantly expand the Compliance Registry is the criteria applicable to behind-the-meter generation (primarily cogeneration facilities). We urge that the BES definition should not change the currently applicable 20 MVA / 75 MVA generation size threshold applicable to generation facilities or the manner in which that threshold is currently applied, with behind-the-meter cogeneration facilities evaluated based on the net capacity actually provided to the grid.

2. A Second Overarching “Principle” for the Identification of BES Elements and Facilities Is the Need to Clarify Which Facilities Perform a True Transmission Function and Excluding Facilities That Perform a Local Distribution Function, As Required by Law.

Congress stated in Federal Power Act section 215:

**SEC. 215. ELECTRIC RELIABILITY.**

“(a) DEFINITIONS.—For purposes of this section:

“(1) The term ‘bulk-power system’ means—

“(A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and

“(B) electric energy from generation facilities needed to maintain transmission system reliability.

The term does not include facilities used in the local distribution of electric energy.

There has been little attempt by NERC to clarify what in fact are “facilities used in the local distribution of electric energy” even though any plain English application of the term makes such a determination self-evident. The proposed BES definition should expressly exclude facilities used in the local distribution of electric energy, and the identification of such facilities is independent of the identification of BES transmission. Facilities used for local distribution are NOT the residual of any determination of what are BES transmission facilities.

3. A Third Overarching “Principle” for the Identification of BES Elements and Facilities Must be Recognition of the Risk Imposed by the Element or Facility, and the Economic Burden of the Owner/Operator of the Element of Facility.

The efforts of the BES Standards Drafting Team follow the release of two important policy documents.

First, on January 18, 2011, the White House issued an Executive Order (“Improving Regulation and Regulatory Review”) by President Obama regarding improvements to federal regulations and the review of existing regulations to ensure, among other things, that a regulation be proposed or adopted “only upon reasoned determination that its benefits justify its costs,” and that regulations be tailored “to impose the least burden on society.”

Second, the NERC Planning Committee issued on January 10, 2011, “Risk-Based Reliability Compliance – White Paper Concept Discussion,” which attempts to advance “processes and procedures to prioritize [NERC’s] efforts and ‘tiering’ elements of its programs to maximize their value and optimize the benefit/cost of effort from stakeholders.” This white paper complements the President’s Executive Order.

ELCON believes that BES exclusion criteria and process should recognize and exclude elements and facilities in which the risk to bulk electric system reliability is at most theoretical or speculative, and where the compliance burden clearly outweighs the benefits. Such a determination should recognize the historical record of the element or facility in terms of the owner or operator’s coordination with the BA or control area, and transmission operators. This principle should be applied to the development of exclusion/inclusion criteria for private lines that connect loads and behind-the-meter generation to true BES Elements and Facilities.

4. An Additional Principle for the Identification of BES Elements and Facilities Should Be the Explicit Recognition on How the Element or Facility is Actually Operated or Used, Not Its Physical or Nominal Rating That May be Irrelevant to Reliability Considerations.

In Order No. 743, FERC clarified that it did not intend to require NERC to utilize the term “rated at” rather than the term “operated at” for the voltage threshold in the revised BES definition. A principle for the identification of BES Elements and Facilities should be such recognition and not exclusively on the rated value of an Element or Facility. This principle should be used to retain the exclusion in the Statement of Compliance Registry Criteria (Revision 5.0) for “net capacity provided to the bulk power system” in the context of the 20 MVA generating unit and 75 MVA generating plant thresholds. The “net capacity” applies to capacity “put” of a behind-the-meter generator whose predominant function is to serve load at the same site.

5. An Additional Principle for the Identification of BES Elements and Facilities Should be the Exclusion of PSEs That Do Not Own or Operate Physical Assets and Whose Power Transactions Are Exclusively Financial in Nature.

Many PSEs that operate in FERC jurisdictional organized wholesale markets (i.e., ISOs and RTOs) do not own, operate or lease physical assets and are currently bombarded with data requests that assume that they own or control such assets. An example of a superfluous data request is to prove that adequate reactive power has been procured to support the load. This is a question that should not have been asked and displays a profound ignorance of the operation of ISO/RTO markets. One potential solution to this problem is to create two subsets of PSEs: one that owns and operates physical assets that are used to serve their loads, and a second that does not.

Some Regional Entities have also begun to ask questions that require PSEs to reveal the details of specific commercial transactions. This raises a broader question on what NERC and regional compliance staffs and auditors “need to know” and whether such questions are an abuse of their enforcement authority.

6. Any Attempt to Make Demand Side Management (DSM) Measures an Element or Facility of BES Will Be Shortsighted and Counterproductive.

Proposals that unilaterally and arbitrarily remove exclusions for generation and transmission, including the application of new compliance obligations to DSM programs, go far beyond what FERC intended in its guidance for revisions. Any new requirement concerning voluntary DSM adds cost to a process that so far has only acted to support reliability with performance equal to and sometimes superior to traditional providers. How is it that a potential resource that can contribute to maintaining reliability is now so quickly identified as a risk? We warn against the overzealous pursuit of control over every asset and resource on the electric system. This mindset will only breed cynicism and end the willingness of potentially dispatchable loads to cooperate with the real operators and owners of the BES.

A recently issued FERC study highlights the potential value to reliability of DSM (in the form of dispatchable demand response) (See Joseph H. Eto et al., [Use of Frequency Response Metrics to Assess the Planning and Operating Requirements for Reliable Integration of Variable Renewable Generation](#), LBNL-4142E, December 2010). To reliably integrate greater amounts of wind energy resources to the bulk electric system, the study recommended the:

Expanded use of demand response that is technically capable of providing frequency control (potentially including smart grid applications), starting with broader industry appreciation of the role of demand response in augmenting primary and secondary frequency control reserves.

7. Revising the Definition of BES Does Not Justify Shifting the Plenary Burden for BPS Reliability from Utilities to Utility Customers. A BES Principle Should Recognize That the Obligation to Serve Applies in One Direction.

The only reason the bulk power system exists is to deliver electric power to residential households, commercial businesses, government facilities and industrial facilities of all sizes. The value of a reliable BPS is dependent on the needs of end use customers. Nothing in the legislative history of section 215 of the Federal Power Act suggests that Congress wittingly intended to change that relationship.

The burden of complying with NERC Reliability Standards is a cost of doing business for utility providers of generation, transmission and distribution services. Generation and interconnection facilities of industrial customers are almost never intended for or used to “operate the interconnected transmission network.” Those facilities are integral to a manufacturing process, including purchasing power from the grid. They were built in expectation that the BPS was prudently planned and operated by utilities. The rare exceptions are administered under applicable tariffs or contracts, and are already Registered Entities.

Part of NERC’s effort should include defining the line between a BES asset that is used to deliver power and an End User asset that’s sole purpose is to serve the End User’s load. The NERC Functional Model includes a vague definition of End-use Customer. The problem is determining the scope of an end-use device. If an industrial company owns a 138 kV to 13.8 kV transformer that feeds its plant, is that an end-use device or a transmission asset that is used to transmit power to the low voltage distribution network within the manufacturing facility? Any work to revise the definition of the BES should also include a clarification of its boundaries. We believe that NERC should not expand the scope of the BES to include assets within end-use customer’s private use networks.

8. An Additional BES Principle Should be that BES Elements and Facilities be Limited to Only Functions Currently Specified in the NERC Functional Model (Version 5).

NERC’s development of the revised BES definition and exclusion/inclusion criteria and processes should be limited to functions specified in the NERC Functional Model (Version 5).

9. NERC is Encouraged to Propose a “Different Solution” That is as Effective as, or Superior to, the Commission’s Proposed Approach. The Proposed Principles for the Exclusion of Elements and Facilities from the BES Should Include a Process for Categorical Exclusion Based on Common Physical Characteristics.

The Commission stated in Order No. 743 regarding its proposed revision of the BES definition (and presumably the exclusion/inclusion criteria and processes):

... NERC may propose a different solution that is as effective as, or superior to, the Commission’s proposed approach in addressing the Commission’s technical and other concerns so as to ensure that all necessary facilities are included within the scope of the definition. ¶ 16.

In addition, specific to the exclusion of Elements and Facilities from the BES, the Final Rule did not adopt the exclusion process proposed in the NOPR (i.e., facility-by-facility review). In the Final Order, FERC directed NERC to develop an exclusion process “with practical application that is less burdensome than the NOPR proposal.”

FERC has also allowed NERC to consider concerns (mainly industrials’) regarding “exclusion categories” in developing the exclusion process and criteria. ¶ 120.

ELCON interprets the Commission’s statements to mean that the agency is open to developing a more efficient compliance process, including processes that minimize unnecessary regulatory burdens on potential Registered Entities and the administrative costs of NERC and RE compliance operations. In the spirit of “streamlining” NERC and the REs’ review of smaller entities, ELCON recommends the addition of a principle on the exclusion of Elements and Facilities from the BES that encourages a process for categorical exclusion of entities based on common physical characteristics.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** While the Regional Bulk Electric System Coordination Group has done an admirable job at drafting an initially proposed list of inclusion and exclusion criteria, Constellation strongly suggests that the continued work on criteria be orchestrated through the FERC-approved standard development process and not as part of a Rules of Procedure revision. We view development of the technical criteria for both the BES definition and exemption process as a single exercise.

The compliance implications and technical nature of such criteria make it imperative that industry input be considered in a transparent stakeholder process. It is appropriate for NERC to develop aspects such as the administrative management, the role and interaction of the regions, an appeal process, etc. However, due to the technical aspects of BES operation, the drafting team members are best suited to devise criteria for inclusion or exclusion of facilities to the BES.

To clarify the distinction between the exception process and the exception criteria, the purpose statement in the concept document should add a fourth bullet to read:

- A. Utilize the NERC Standard Development Process to revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms.
- B. Utilize the NERC Standard Development Process to develop exception criteria to be utilized in the exception process. Develop a single Implementation Plan to address the application of the revised definition of the BES and the implementation of the exemption process.

---

<sup>17</sup> On November 6, 2009, EDF, Inc. (“EDF”) and Constellation Energy Group, Inc. completed a transaction pursuant to which EDF acquired a 49.99 percent ownership interest in CENG. CENG was previously a wholly owned subsidiary of Constellation Energy Group, Inc.

- C. Utilize the NERC Rules of Procedure to develop and implement an 'exemption process' used to identify Elements and Facilities which will be included in or excluded from the BES.

The revised definition should expressly incorporate exclusions for facilities below 100 kV. Entities should not have to seek an exemption for facilities below 100 kV or for radial lines. They should be clearly excluded in the BES definition itself. We encourage the drafting team to embrace a design concept that seeks to maximize the “brightness” of bright line criteria. The BES exemption process should contemplate very few exemptions. The TFE process is an example of a process not to be repeated here.

In addition, Constellation is not convinced that creation of a definition and an exception process is the best course to respond to the FERC directives. We are concerned that the current approach of a simple, all inclusive definition coupled with an exception criteria and process will not draw on the fundamentals underpinning the existing definition and create a cumbersome and unnecessary exception process.

As an alternative, we propose that the standard drafting team utilize the Compliance Registry Criteria – Section III (Rules of Procedure Appendix 5B) along with definition threshold language to develop a more comprehensive definition. Further, we propose that the BES drafting team incorporate the criteria directly into the revised BES definition, replacing the term “bulk power system” in each criterion with “greater than 100 kV.” It will make for a longer definition, but by aligning the facilities requiring registration as those defined as BES, the definition will more clearly determine the line between BES and non-BES. It is preferable that non-BES facilities be excluded by the definition language rather than to define BES broadly and require non-BES facilities go through an exception process. Ideally, this approach can eliminate the need for an onerous exemption process as well as eliminate the need for Section III of the Registry Criteria in the Rules of Procedure.

For special case facilities deemed non-BES by the revised definition that may warrant consideration for inclusion, an “opt-in” evaluation could be conducted.

The rules of procedure process may be used to develop the “opt-in” process that would replace the proposed exception concept; however, the drafting team, perhaps in collaboration with regional entities, should develop any opt-in criteria needed for the process. Again, it is appropriate for NERC to develop aspects such as the administrative management, the role and interaction of the regions, an appeal process, etc. However, due to the technical aspects of BES operation, the drafting team members are best suited to devise criteria for non-BES facilities to warrant inclusion in the BES.

We find that this approach to revising the BES definition would satisfy the FERC directives in Order 743 by encompassing all facilities necessary for operating an interconnected electric transmission network into a national level, bright-line definition. This approach will improve the clarity and consistency of the BES definition for application by Industry and NERC as well as avoiding creation of a potentially cumbersome exception process.

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** CWLP has chosen to comment on the inclusion/exclusion process as a whole. The current lack of detailed, firm administrative guidelines as well as an unambiguous process for resolving disputes between parties involved in the process of adjudicating inclusions/exclusions is problematic. It is CWLP's belief that developing the proposed administrative framework for the process is needed first. Focusing on the data to be submitted as shown in (1) and (2) above does not address the scope, nature, and criteria applicable to the review of requests for inclusions/exclusions. Regardless, CWLP feels strongly that the sole basis for approval or rejection of a request should be technical justification.

Speaking to the process in general, any inclusion or exclusion should be a specific request for a specific facility; continent-wide, interconnect-wide, and region-wide applicability for inclusions/exclusions departs from the intent of FERC Order 743 to establish a definition without regional variances.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

- a. ATC feels strongly that the exemption criteria need to be developed by the SDT. NERC Staff should focus on the process (identification, notification, appeal and rights) but the SDT is in the better position to develop the technical basis of the exemption criteria.
- b. The NERC process for exclusion or inclusion must clearly address who is responsible for submitting an Element or Facility Exception Process. Is it limited to the asset owner of the Element or Facilities, or is it open to neighboring entities that may want to initiate a request for exemption or inclusion to the BES?
- c. Also, ATC believes the process should allow for multi-year distinctions for exceptions. In other words, if a Registered Entity gets an Element or Facility excluded, then that exclusion or inclusion should be allowed for 3 or more years. Annual certifications and approval are too restrictive.
- d. ATC also supports the comments as submitted by EEI REAC on the Draft Concept Paper on the Definition of BES Project 2010-17

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** We have difficulties understanding the intent of this Comment Form and the content in Q1 and Q2, above, which appear to be templates for information to be included in an exclusion/inclusion request rather than asking for comments on each of the listed items.

1. Is the intent of this Comment Form to obtain:
  - a. Recommendations of the criteria to be considered in developing deviations from the default criteria for classifying Elements and Facilities as part of the BES?
  - b. Assessment of the templates proposed in Q1 and Q2?
2. The concept paper that is posted alongside the SAR and proposed definition is not referenced in this Comment Form. Is it the drafting team's intent to solicit comments on the concept paper?
3. In the concept paper, three exemption criteria are presented. We do not have any issue with the first and third criteria but are concerned that Criterion #2 is not a criterion. It states that:

“Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO).”

This criterion appears to reference yet another set of criteria not already included in the set or the concept paper. In fact, this “referenced” set needs to be clearly stipulated to ensure that applicants are fully aware of the conditions under which an Element or Facility operated at 100 kV or above can be deemed not necessary to support bulk power system reliability and, conversely, the conditions for an Element or Facility operated at below 100 kV to be included. The “templates” presented in Q1 and Q2 of this Comment Form also do not convey the needed conditions.

We believe it is the clear conditions for exclusion (Elements/Facilities of 100 kV and above) and inclusion (below 100 kV) that need to be developed and fully vetted. We urge the drafting team to proceed to developing these criteria expeditiously so as to support the assessment and approval of the revised definition of BES.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

1. We have a number of concerns related to the initial SAR proposal:

- a) The primary concern expressed by FERC in Order No. 743 was the discretion the current definition accords to the RROs to develop their own definition of the BES without approval by NERC or FERC. See Order No. 743, 133 FERC ¶ 61,150 at P 16 (2010) (FERC believes the “best way to address these concerns is to eliminate the Regional Entities’ discretion to define ‘bulk electric system’ without ERO or Commission review”); at 30 (same). Hence, we believe FERC’s concern can be addressed by simply removing the phrase “As defined by the Regional Reliability Organization” from the existing definition. The result would be that the RROs could then develop regionally-appropriate rules based on the uniform definition, which NERC and FERC could then approve, giving deference to the technical findings of the RROs and NERC, as the FPA requires. FPA Section 215(d), 16 U.S.C. § 825o(d). We urge the standards drafting team to consider the virtues of such a minimalist approach and then focus on alternative approaches that will achieve FERC’s aim more effectively and/or at lower cost, and on the exemption process, which will, unless FERC abandons its insistence on a 100-kV bright-line threshold, be the most important aspect of the standards development process.
- b) The definition proposed in the SAR would incorporate “All Transmission and Generation Elements and Facilities” that are “necessary to support bulk power system reliability.” We applaud the effort to properly restrict the definition of BES using the NERC-defined terms “Transmission,” “Generation,” “Elements” and “Facilities.” By using these terms, the drafting team recognizes that Congress excluded from the statutory “Bulk-Power System” definition “facilities used in the local distribution of electric energy,” FPA Section 215(a)(1), 16 U.S.C. § 825o(a)(1), and has thereby excluded such facilities from the reach of the mandatory reliability system. Similarly, by focusing the definition on “Transmission” and “Generation,” the standards drafting team recognizes that Congress limited the reach of reliability standards to: (1) “facilities and control systems necessary for operating an interconnected electric energy transmission network,” and, (2) “electric energy from generation facilities needed to maintain transmission system reliability.” Id.

When viewed in the context of the proposed BES definition, however, we are concerned that incorporating the terms as defined in the NERC Glossary may create unnecessary confusion and ambiguity. For example, the NERC Glossary defines “Facility” as “[a] set of electrical equipment that operates as a single Bulk Electric System Element.” But attempting to define BES by using a term that itself incorporates “Bulk Electric System” is circular and is likely to create confusion in applying the revised definition. Similarly, “Generation” is not specifically defined in the NERC Glossary of Terms, creating potential confusion.

Finally, the NERC Glossary defines “Transmission” in part as “the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers.” This creates the potential for an over-inclusive definition since “Transmission” could, by this definition, be understood to encompass only the last transformation of voltage to end-user level voltage in a system, whereas distribution systems generally include several downward transformations of voltage between the point of bulk delivery and the end-use consumer. One could argue that each of the segments between delivery of bulk power to the local distribution utility and that utility’s step-down transformers is, by the terms of the definition, merely moving power “between points of supply” and only the last segment includes the “point at which [power] is transformed for delivery to customers.” This, of course, would improperly classify a large portion of most distribution system as “Transmission.”

For these reasons, it may be necessary to define “Generation” and to more precisely define “Facility” and “Transmission” as part of the standards drafting process.

We note, on the other hand, that “reliable operation” was a term specifically defined by Congress in FPA Section 215 to include the operation of BES elements “within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance. . . or unanticipated failure of system elements.” 16 U.S.C. § 825o(a)(4). Congress specifically precluded the mandatory reliability system from enforcing standards for adequacy of service, which were left to state and local authorities. 16 U.S.C. § 825o(i)(2). Accordingly, we applaud the standards drafting team for including in the BES only facilities “necessary to support bulk power system reliability,” because the use of the italicized term at least implicitly excludes from the definition facilities that affect only the levels of service that were explicitly excluded from the mandatory reliability regime by Congress and do not affect “reliable operation” of the BES as Congress defined it.

- c) The proposed SAR definition unnecessarily restricts the exclusion in the existing definition for radial facilities. The existing definition provides that radial facilities are “generally not included” in the BES. The proposed new definition would significantly restrict this exclusion, excluding radial systems from the BES only if they are excluded through the “BES definition exemption process.” We believe there is no reason to make radial systems and other elements of the electric system

that, because of their limited interaction with the bulk system, have no meaningful impact on bulk system reliability go through a potentially onerous exemption process. Rather, such systems should be presumptively excluded from the definition, as they are now. Further, for the reasons set forth in detail by the WECC BESDTF, local distribution networks in the West should be subject to a similar categorical exclusion, subject to inclusion in the BES only upon a demonstration that the network creates substantial reliability risks for the bulk system. This approach is consistent with FERC's direction that "radial facilities, as well as facilities used in the local distribution of electric energy as provided in Section 215, will continue to be excluded." Order No. 743 at P 120.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

1. The work that has been completed by the WECC Bulk Electric System Definition Task Force is based on sound engineering principles and appears to be a comprehensive solution to defining the BES and providing a means for exceptions to the 100 kV “bright line” criteria. The NERC BES Drafting Team is urged accept the proposal in whole or include contained principles to guide NERC’s process for exception.
2. There is serious concern in the Western Interconnection that if a strict 100 kV bright line is mandated that billions of dollars will be needed to be upgrade 100kV to 200 kV distribution elements to comply with NERC reliability/security standards. There is a significant potential for unintended consequences. A serious one is that there could be substantially less monetary resources available for new transmission investment for high impact BES elements and for relieving congestion. Another is FERC would arguably be negating the 7 factor test for distribution facilities, extending FERC jurisdiction over distribution facilities, bringing costs for such facilities into the FERC tariffs, and reducing PUC state review of such investments. These could result in substantial cost increases and/or reliability issues for electric consumers.

**Comments:**

1. We have a number of concerns related to the initial SAR proposal:

- a) The primary concern expressed by FERC in Order No. 743 was the discretion the current definition accords to the RROs to develop their own definition of the BES without approval by NERC or FERC. *See* Order No. 743, 133 FERC ¶ 61,150 at P 16 (2010) (FERC believes the “best way to address these concerns is to eliminate the Regional Entities’ discretion to define ‘bulk electric system’ *without ERO or Commission review*“); at 30 (same). Hence, we believe FERC’s concern can be addressed by simply removing the phrase “As defined by the Regional Reliability Organization” from the existing definition. The result would be that the RROs could then develop regionally-appropriate rules based on the uniform definition, which NERC and FERC could then approve, giving deference to the technical findings of the RROs and NERC, as the FPA requires. FPA Section 215(d), 16 U.S.C. § 824o(d). We urge the standards drafting team to consider the virtues of such a minimalist approach and then focus on alternative approaches that will achieve FERC’s aim more effectively and/or at lower cost, and on the exemption process, which will, unless FERC abandons its insistence on a 100-kV bright-line threshold, be the most important aspect of the standards development process.
- b) The definition proposed in the SAR would incorporate “All *Transmission and Generation Elements and Facilities*” that are “necessary to support bulk power system *reliability*.” We applaud the effort to properly restrict the definition of BES using the NERC-defined terms “Transmission,” “Generation,” “Elements” and “Facilities.” By using these terms, the drafting team recognizes that Congress excluded from the statutory “Bulk-Power System” definition “facilities used in the local distribution of electric energy,” FPA Section 215(a)(1), 16 U.S.C. § 824o(a)(1), and has thereby excluded such facilities from the reach of the mandatory reliability system. Similarly, by focusing the definition on “Transmission” and “Generation,” the standards drafting team recognizes that Congress limited the reach of reliability standards to: (1) “facilities and control systems necessary for operating an interconnected electric energy transmission network,” and, (2) “electric energy from generation facilities needed to maintain transmission system reliability.” *Id.*

When viewed in the context of the proposed BES definition, however, we are concerned that incorporating the terms as defined in the NERC Glossary may create unnecessary confusion and ambiguity. For example, the NERC Glossary defines “Facility” as “[a] set of electrical equipment that operates as a single Bulk Electric System Element.” But attempting to define BES by using a term that itself incorporates “Bulk Electric System” is circular and is likely to create confusion in applying the revised definition. Similarly, “Generation” is not specifically defined in the NERC Glossary of Terms, creating potential confusion.

Finally, the NERC Glossary defines “Transmission” in part as “the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers.” This creates the potential for an over-inclusive definition since “Transmission” could, by this definition, be understood to encompass only the last transformation of voltage to end-user level voltage in a system, whereas distribution systems generally include several downward transformations of voltage between the point of bulk delivery and the end-use consumer. One could argue that each of the segments between delivery of bulk power to the local distribution utility and that utility’s step-down transformers is, by the terms of the definition, merely moving power “between points of supply” and only the last segment includes the “point at which [power] is transformed for delivery to customers.” This, of course, would improperly classify a large portion of most distribution system as “Transmission.”

For these reasons, it may be necessary to define “Generation” and to more precisely define “Facility” and “Transmission” as part of the standards drafting process.

We note, on the other hand, that “reliable operation” was a term specifically defined by Congress in FPA Section 215 to include the operation of BES elements “within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance. . . or unanticipated failure of system elements.” 16 U.S.C. § 824o(a)(4). Congress specifically precluded the mandatory reliability system from enforcing standards for adequacy of service, which were left to state and local authorities. 16 U.S.C. § 824o(i)(2). Accordingly, we applaud the standards drafting team for including in the BES only facilities “necessary to support bulk power system *reliability*,” because the use of the italicized term at least implicitly excludes from the definition facilities that affect only the levels of service that were explicitly excluded from the mandatory reliability regime by Congress and do not affect “reliable operation” of the BES as Congress defined it.

- c) The proposed SAR definition unnecessarily restricts the exclusion in the existing definition for radial facilities. The existing definition provides that radial facilities are “generally not included” in the BES. The proposed new definition would significantly restrict this exclusion, excluding radial systems from the BES

only if they are excluded through the “BES definition exemption process.” We believe there is no reason to make radial systems and other elements of the electric system that, because of their limited interaction with the bulk system, have no meaningful impact on bulk system reliability, go through a potentially onerous exemption process. Rather, such systems should be presumptively excluded from the definition, as they are now. Further, for the reasons set forth in detail by the WECC BESDTF, local distribution networks in the West should be subject to a similar categorical exclusion, subject to inclusion in the BES only upon a demonstration that the network creates substantial reliability risks for the bulk system. This approach is consistent with FERC’s direction that “radial facilities, as well as facilities used in the local distribution of electric energy as provided in Section 215, will continue to be excluded.” Order No. 743 at P 120.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** Our understanding of the FERC Order was that the threshold would be 100 kV “except for defined radial facilities” and that they also ordered NERC to adopt an “**exemption process**”. The question confuses the two distinct parts by speaking of an “**exception process**” never ordered by FERC. We urge the SDT to clearly define “radial” in such a way that no external “process” is needed, and that radial facilities can easily be determined by each registered entity by inspection. And if they have facilities that don’t meet the radial definition, they may still be put through a formal exemption process and be exempted if they are found not to contribute to reliable operation of the BPS.

The WECC Bulk Electric System Definition Task Force has done extensive work on this topic. Please consider their current work when drafting the BES definition and exemption process.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** Based on the information posted by the North American Electric Reliability Corporation (NERC) on its plans to address Order No. 743 of the Federal Energy Regulatory Commission (FERC), NextEra Energy, Inc.1 (NextEra) believes that NERC (and associated drafting teams) should slightly modify its direction to more closely align with FERC's proposed framework. In Order No. 743, at paragraph 30, FERC stated that:

The Commission believes the best way to address these concerns is to eliminate the regional discretion in the ERO's current definition, maintain the bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities, and establish an exemption process and criteria for excluding facilities the ERO determines are not necessary for operating the interconnected transmission network. It is important to note that Commission is not proposing to change the threshold value already contained in the definition, but rather seeks to eliminate the ambiguity created by the current characterization of that threshold as a general guideline.

1 NextEra registered entities, which include NextEra Energy Resources, Inc. and Florida Power & Light Company, operate in the eight NERC regions. **Official Comment form for BES Definition Exception Process** FERC also provided NERC with the opportunity to propose an alternative approach. NextEra believes, however, that FERC's proposed framework is appropriately designed to enhance the definition of the Bulk Electric System (BES) in the NERC glossary, and to separately develop a process to apply for and receive, as appropriate, an exemption from the BES definition. Although it appears that NERC and the drafting teams may also be inclined to proceed as suggested by FERC, there are indications in the questionnaire and BES concept paper that there may be some thought to deviating from FERC's proposal.

A review of the information posted by NERC seems to indicate NERC's intention to have a drafting team develop a revised BES definition via the standards development process (*i.e.*, Appendix 3A of the NERC Rules of Procedure). It also seems that NERC is interested in assigning a "working group" to separately develop an exemption process that would be implemented as a new process in the NERC Rules of Procedure. NextEra agrees with this approach.

NextEra's concerns stem from some of the words in the proposed BES definition, the BES concept paper and the questions asked, which seem to suggest an unnecessarily overlapping definition and exemption process, and a movement toward an exemption process based on categories rather than criteria. Thus, to address these concerns NextEra proposes the

following enhancements to more clearly separate the BES definition and exemption process, and align each more closely with Order No. 743.

As for the BES definition, NextEra encourages the drafting team to solely focus its efforts on the definition. The currently posed revised BES definition reads as follows:

**Bulk Electric System:** All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process.

NextEra maintains that this is not the correct starting point, nor consistent with Order No. 743 or the other material posted by NERC, that suggests a more definitive separation of the BES definition from the exemption process. Thus, NextEra proposes that the definition be revised to read as follows:

**Bulk Electric System:** All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher, unless a Transmission or Generation Element or Facility has been exempted pursuant to the exemption process set forth in the NERC Rules of Procedure. **Official Comment form for BES Definition Exception Process** This proposed BES definition more clearly and cleanly separates the BES definition from the exemption process. It also does not add unnecessary qualifiers or verbiage that may result in confusion.

NextEra is also concerned that the working group assigned to the exemption process may initially be more focused on developing categories, instead of an exemption process and associated criteria. Given the unique circumstances of the interconnected BES, including system topology, NextEra does not believe that it would be a productive exercise for the exemption working group to focus on types, groups or categories of equipment; instead, its efforts should focus on developing specific objective criteria to judge the reasonableness of a request or application for an exemption. This approach also seems more in line with FERC's statement in Order No. 743 at paragraph 115:

NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid. The ERO also should determine any related changes to its Rules of Procedures that may be required to implement the exemption process, and file the proposed exemption process and rule changes with the Commission. The challenges of developing an exemption process also include ensuring that any applicant is afforded due process and balanced decision-making, as required by section 215 of the Federal Power Act. Thus, the exemption process must address legal, regulatory and technical issues.

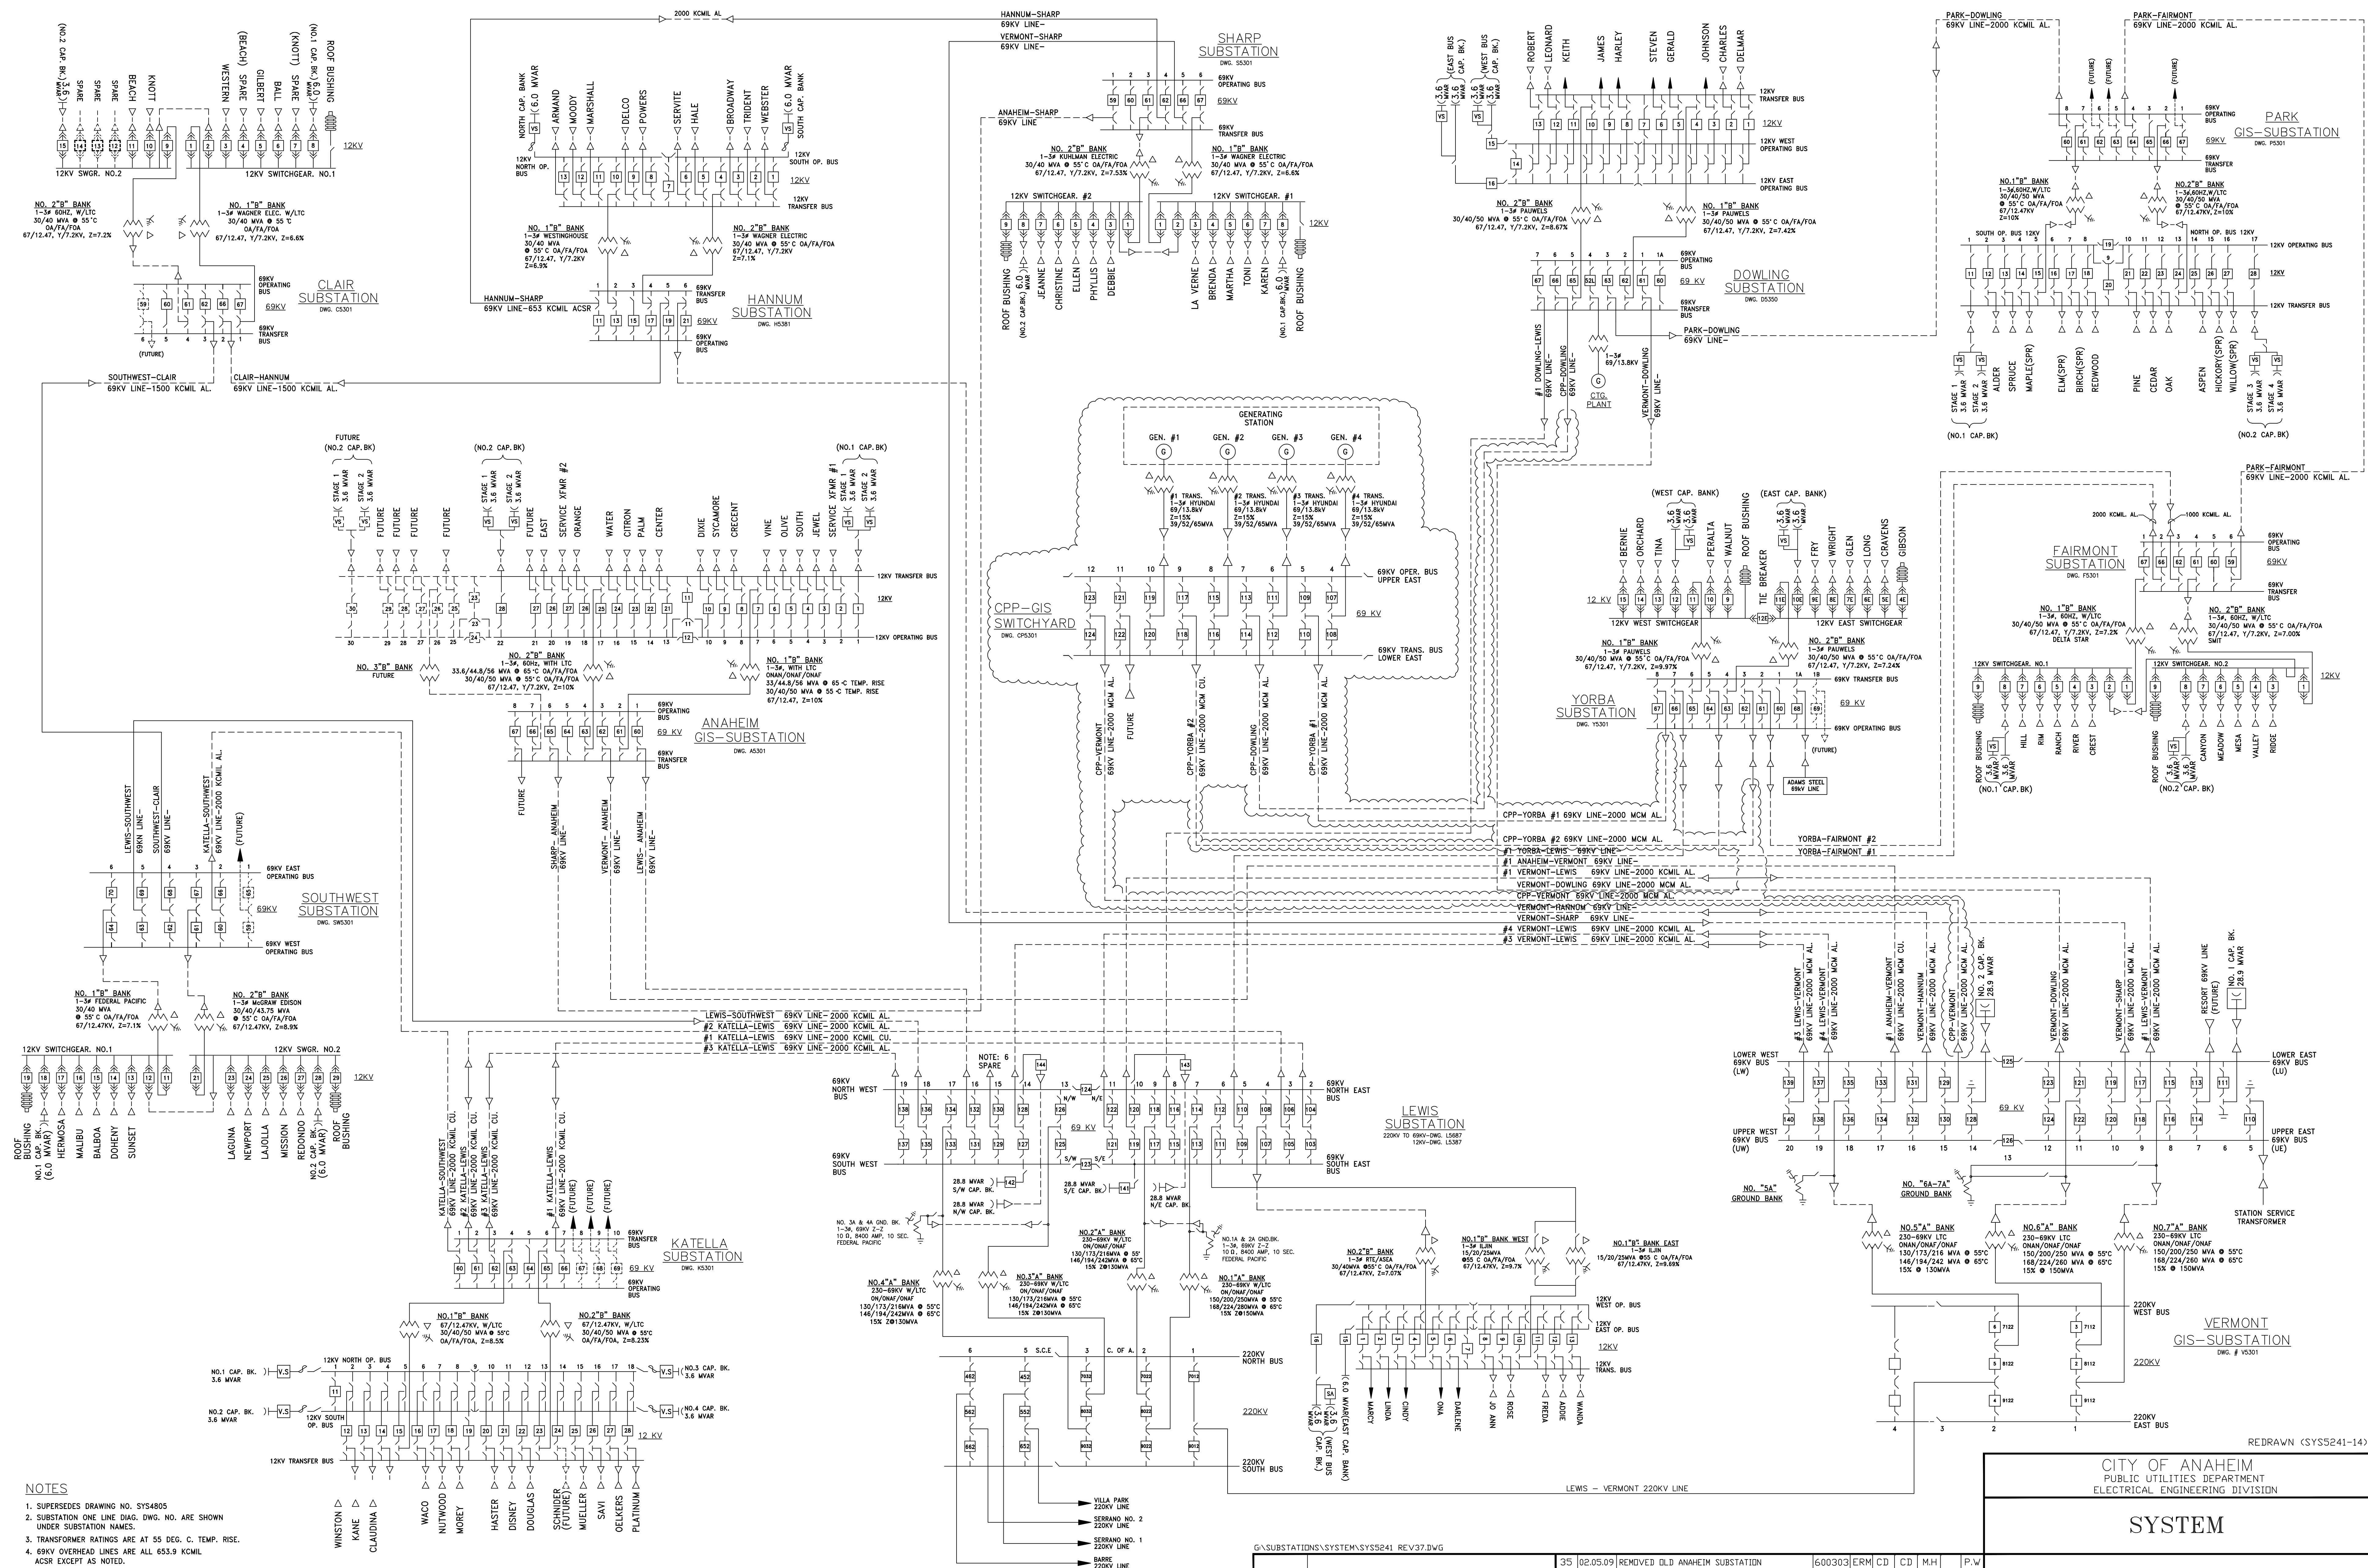

Accordingly, NextEra requests that NERC assemble a working group (perhaps via the Standards Committee) to develop the exemption process that is comprised of stakeholders

with legal, regulatory and technical experience. Without this balance of disciplines, NextEra is concerned that a technical-heavy working group will attempt to develop a “fix,” instead of a process whereby applicants may request an exemption, and have that exemption judged by specific criteria and pursuant to a process that affords due process and balanced decision-making.

It is not clear whether an exemption working group has already been assembled. If it has, NextEra requests that NERC consider restructuring of the group consistent with NextEra’s proposal.

In summary, NextEra requests that the BES definition drafting team adopt NextEra’s proposed definition of BES. NextEra also requests that NERC assemble a cross-functional working group to develop an exemption process based on specific criteria (rather than categories), and a process that affords applicants due process and balanced decision-making.

Official Comment form for BES Definition Exception Process

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

Justification: Large load-serving substations require non-radial service to ensure acceptable reliability performance. Such transmission systems do not carry bulk power transfers as there are substantial higher voltage transmission lines that surround the metro area which carry the bulk transfers. Idaho Power has evaluated serving the area from systems that are sourced from only a single bulk substation. Such a configuration would result in requiring an additional 100 miles of transmission to compared to the existing network configuration.

## Official Comment form for BES Definition Exception Process

Attachment 1**DRAFT Bulk Electric System Facilities****Excerpts from Proposal 6 – 1/5/11****Date: not yet approved****I. CLASSIFICATION**

The following Table provides the framework for classification of Elements as BES or non-BES. In addition, the Table identifies the Elements which are subject to inclusion or exclusion based on the process set forth in Appendix A

	<u>Description of Element</u>	<u>Included in BES and cannot be excluded through an exception process regardless of voltage level</u>	<u>Included in BES but could be excluded through an exception process</u>	<u>Not included in BES. Could be included through an exception process</u>
A	<b>Elements</b> that provide Nuclear Off-Site Power Supply	<b>Yes</b>		
B	<b>Elements</b> that interconnects a Backstart Resource, or are part of a black-start Cranking Path <sup>1</sup> as included in the system restoration plan <sup>2</sup> of a Transmission Operator or Balancing Authority.	<b>Yes</b>		
C	<b>Elements</b> that are part of a WECC Transfer Path identified in the list of Major WECC Transmission Paths in Attachment 2, TOP-007-WECC-1.	<b>Yes</b>		
D	<b>Elements</b> operated above 100 kV (except G and H below)		<b>Yes</b>	
E	Generating Units and the associated <b>Generator Interconnection Elements</b> operated at or above 100 kV that meet the registration criteria in Section III (c) of NERC's Statement of Compliance Registry Criteria.		<b>Yes</b>	
F	<b>Elements</b> operated below 100 kV.			<b>Yes</b>

<sup>1</sup> Cranking Path is defined in the NERC Glossary.

<sup>2</sup> NERC Standard EOP-005, Attachment 1 sets forth the elements for consideration in a system restoration plan.

H	<b>Local Distribution Networks</b> operated below 200 kV.			<b>Yes</b>

**Table 1 – BES Classification**

**II. DEFINITIONS**

<b>Automatic Fault Interrupting Device (AFID)</b>	A device that operates automatically (i.e., without operator intervention) to interrupt fault current. Such devices include circuit breakers, vacuum interrupters, and fuses.
<b>Demarcation Point</b>	A physical location that indicates a change from <b>BES Elements</b> to non-BES <b>Elements</b> .
<b>Local Distribution Network</b>	<p><b>Local Distribution Networks</b> are groups of <b>Elements</b> that function to distribute power to load rather than to transfer bulk power from location to location. <b>Local Distribution Networks</b> are connected to the BES at more than one location to improve the level of service to retail customer load. <b>Local Distribution Networks</b> must meet the following requirements:</p> <ul style="list-style-type: none"> <li>a. <b>Must be connected through automatic fault-interrupting devices.</b> All <b>Local Distribution Network</b> connections to BES <b>Elements</b> must be through <b>Automatic Fault-Interrupting Devices</b>.</li> <li>b. <b>Limits on connected generation.</b> If the network includes generation, it qualifies as a <b>Local Distribution Network</b> only if: (1) no single generator or line contingency could cause the loss of generation larger than the threshold for Generator Operator/Generator Owner registration set forth in the NERC Statement of Compliance Registry Criteria, and (2) the generation has not been designated, or is under contract, as a “must-run” generator or otherwise required to operate under some circumstances for BES transmission reliability.</li> <li>c. <b>Power flows into the Local Distribution Network.</b> Net power flows into, not out of, the <b>Local Distribution Network</b> under non-contingency conditions. “Net” power means the algebraic</li> </ul>

**Official Comment form for BES Definition Exception Process**

---

	<p>sum of flows at all points at which the <b>Local Distribution Network</b> connects to the BES. This requirement may be demonstrated by providing (1) any continuous 8760-hour meter data within the last two years from all boundary points of the <b>Local Distribution Network</b> or (2) if continuous 8760-hour data is not available, the entity and WECC Staff may mutually agree upon a data period.</p> <p>d. <b>Not used to transfer bulk power</b></p> <ul style="list-style-type: none"> <li>▪ The <b>Local Distribution Network</b> does not have, or contribute to, an established Path rating, WECC Operating Transfer Capability, nor a published TTC for flow through the <b>Local Distribution Network</b>.</li> <li>• Opening one or more connections from the <b>Local Distribution Network</b> to the BES does not decrease (but may improve), the established WECC Transfer Capability of (a) parallel transfer path(s) or <b>Elements</b>.</li> <li>▪ The <b>Local Distribution Network</b> is not used to schedule energy originating outside of the <b>Local Distribution Network</b> for delivery across and outside the <b>Local Distribution Network</b> to other entity systems that are otherwise physically interconnected through to the BES by interconnections with third party systems.</li> </ul> <p>A <b>Local Distribution Network</b> that does not meet the criteria for exemption in this definition <b>may be excluded from</b> the BES by demonstrating that it is <b>not necessary for the operation</b> of an interconnected transmission system through the process set forth in Appendix A to this Policy.</p>
<b>Element</b>	<b>Element</b> means any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.
<b>Generator Interconnection Elements</b>	<p><b>Generator Interconnection Elements (GIEs)</b> are sole-use facilities for the purpose of connecting the generating unit(s) to the transmission grid. In this regard, the sole-use facility only transmits power associated with the interconnecting generator, whether delivered to the grid or delivered to the generator for station service or auxiliary load, or delivered to meet cogeneration load requirements.</p> <p>These <b>GIEs</b> are <b>BES Elements</b> to the extent that their connected generating units are considered part of the BES. The point of interconnection with the transmission system is the location at which operating responsibility for the Generator Interconnection Facility changes between the Transmission Operator and the Generator Operator. The principles expressed in this definition cannot and will not take effect until the relevant standards are modified to apply to these <b>GIEs</b> as Generator Owners and Generator Operators.</p>
<b>Qualifying Radial Element</b>	<b>Qualifying Radial Elements</b> are radial <b>Elements</b> that meet the following criteria:

**Official Comment form for BES Definition Exception Process**

---

	<p>a. <b>Normally not operated in parallel.</b> Transmission <b>Elements</b> that are normally operated as radial <b>Elements</b> are not deemed part of the BES, even if the radial <b>Elements</b> can be connected to the BES at more than one location through one or more normally open switches. To qualify, normally open switches, if any, which can be used to parallel the otherwise radial <b>Elements</b>, must be shown in operating diagrams and/or operating procedures as normally open. A normally open switch may be closed for a short period of time only to avoid interruption of service when load is transferred from one radial source to another radial source.</p> <p>b. <b>Limitations on connected generation.</b> The radial <b>Element</b> does not connect generating a unit or units which either (1) for any single unit, is greater than 20 MVA and interconnected at or above 100 kV or, for multiple units, are greater than 75 MVA in total or (2) has been designated and is under contract as a “must-run” generator or otherwise required to operate under some circumstances for BES transmission reliability.</p> <p>c. <b>Must be connected through an automatic fault-interrupting device.</b> <b>Qualifying Radial Elements</b> must be connected to the BES through an <b>Automatic Fault-Interrupting Device</b>. <b>Elements</b> connected to other <b>Elements</b> via a “hard tap” (not through an <b>Automatic Fault-Interrupting Device</b>) carry the same BES status as the <b>Element</b> to which they are connected. However, a hard-tapped <b>Element</b> may still be excluded from the BES through the material impact assessment set forth in Appendix A.</p> <p>If an <b>Element</b> meets all the requirements of a <b>Qualifying Radial Element</b>, all <b>Elements</b> downstream from the <b>Qualifying Radial Element</b> are also excluded from the BES. The upper extent of a set of <b>Qualifying Radial Elements</b> is identified by its <b>Demarcation Point</b>.</p>
--	---

**III. OTHER PROVISIONS**

1. **Demarcation Points.** Please see Appendix C for a discussion regarding **Demarcation Points**.
  2. **Separate ownership.** An **Element** that meets the qualifications for exclusion from the BES shall be deemed non-BES. In the case in which two or more parties own separate (parts of a) connected **Element(s)** that meet the qualifications for exclusion from the BES, nothing in this policy is intended to preclude the owners of any non-BES **Element(s)** from voluntarily complying with mandatory reliability standards related to that non-BES **Element(s)**.
-

**Attachment 2**

**Appendix C – Draft 1/15/2011)**

**Demarcation Principles**

The following points serve to explain the rationale for the demarcation points between BES and Non-BES elements. Note that the diagrams in this Appendix C are only intended to provide examples of the demarcation between BES and non-BES, and not as a substitute for the narrative definition.

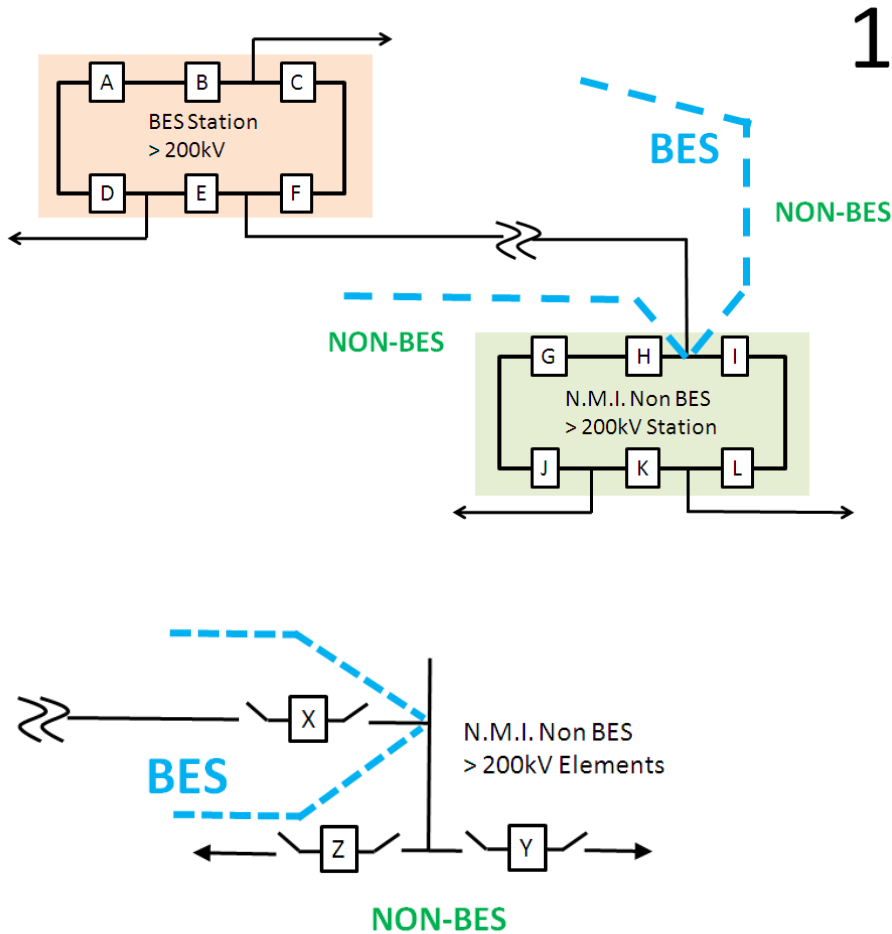

**Summary of Principles**

The demarcation principles are listed here along with a statement explaining the rationale for each, and are depicted in the various single-line diagrams that follow.

Official Comment form for BES Definition Exception Process

**Principle 1:**

A line connecting a BES bus to a bus that has been found to have no impact to the BES through the application of an MIA, shall be designated BES.

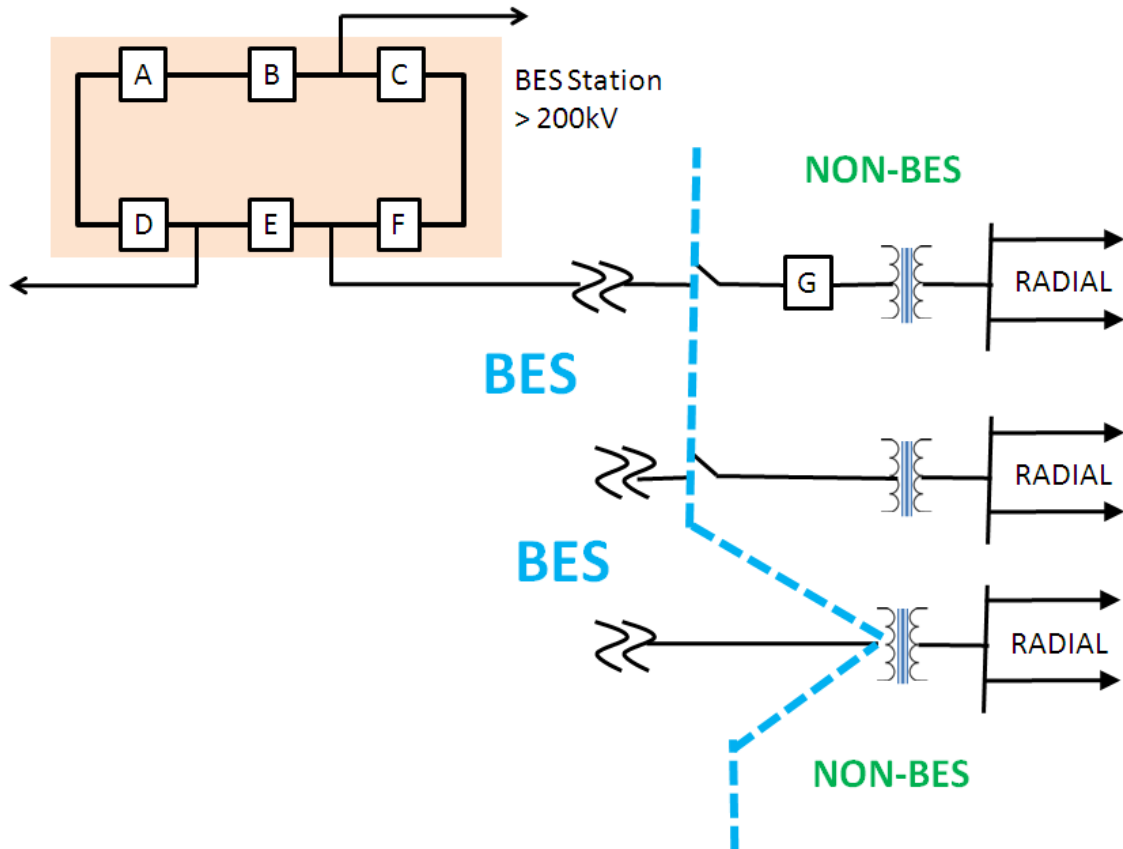

**Rationale:**

As the MIA process is applied to individual power system buses, line elements that connect BES buses to MIA-excluded non-BES buses represent a transition between BES and non-BES. The line connecting the bus excluded from the BES by MIA to a BES bus shall be designated BES by default, because it is indeterminate where along the line length the impact changes from material to immaterial to the reliability of the BES. The demarcation point is the physical connection of the line to the non-BES bus.

Official Comment form for BES Definition Exception Process

**Principle 2:**

A radial line having an operating voltage greater than 200kV is designated as BES from its point of connection with its source up to the point where the line is terminated at a physical disconnect switch within a receiving substation, or, if no switch exists in the receiving substation, the high side bushings of the receiving substation transformer(s).

**Rationale:**

A radial line operated at above 200kV is brought into the BES through footnote 4 of the NERC Statement of Compliance Registry Criteria, provided, however, this line may be excluded through the MIA process.

## Official Comment form for BES Definition Exception Process

**Principle 3:**

Except for Generator Step-up Transformers (GSU), provided that the high voltage side of a transformer is primarily protected by an Automatic Fault Interrupting Device (AFID), the transformer always takes the status of the low voltage side. For GSU's, the transformer's classification is that of the associated Generator Interconnection Element(s).

**Rationale:**

The presence of an AFID (or in the instance of ring bus or breaker-and-a-half scheme, AFIDs) allows the transformer to be considered as a separable unit serving the function of providing connection and transformation of the high side to the low side. Where the electric facilities on the low side are non-BES, the transformer is simply an extension of these non-BES facilities, providing delivery and connectivity from the BES source. For a GSU, the transformer is clearly an extension of the functionality provided by the Generator Interconnection Element(s), namely, to move bulk power from the BES generator to the BES network, and hence, the classification of the GSU must be matched to the GIE.

Official Comment form for BES Definition Exception Process

**Principle 4:**

The connection of a 200 kV or higher voltage bus to a non-BES transformer is also designated non-BES provided that the connection in its entirety is located within the confines of a substation/switching station perimeter.

**Rationale:**

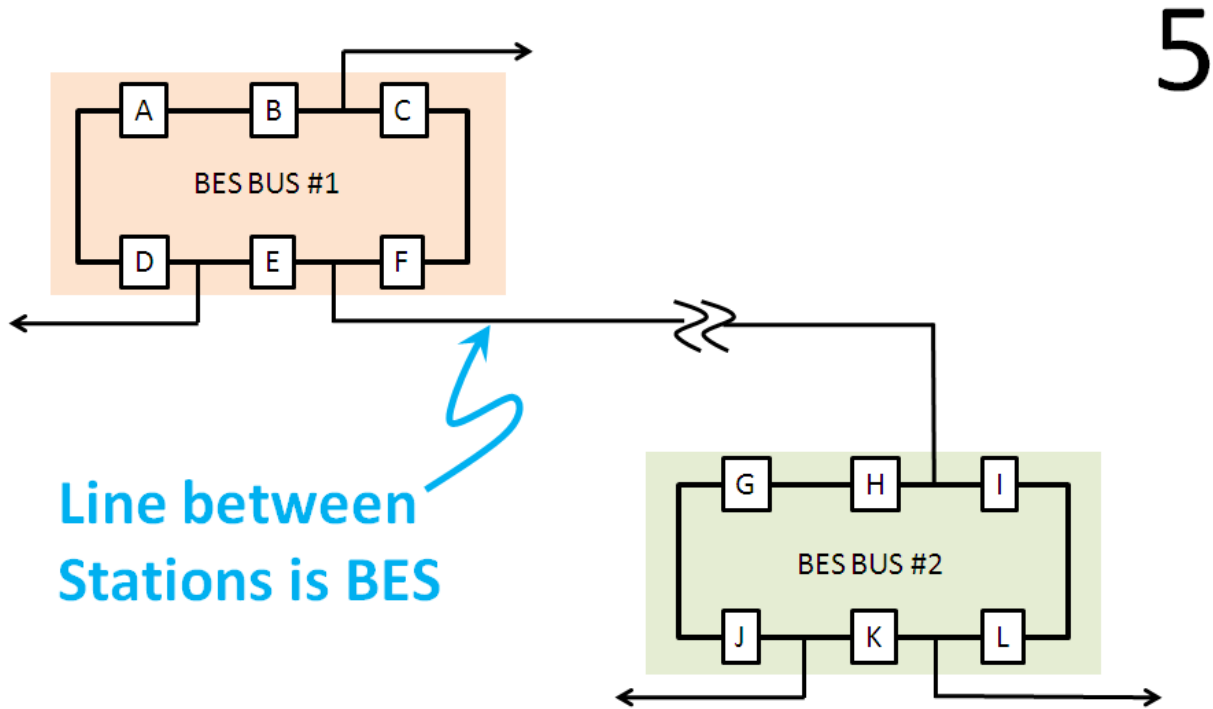

Within a substation, the connection from the BES to the non-BES transformer is considered to be an extension of the transformer itself. Had the lead line to this transformer extended outside the confines of the substation, it would be considered to be a line, rather than a bus extension, and would be addressed in a fashion similar to Principle 2 above.

Official Comment form for BES Definition Exception Process

**Principle 5:**

*A line directly connecting one BES bus to another BES bus shall also be designated as BES.*

**Rationale:**

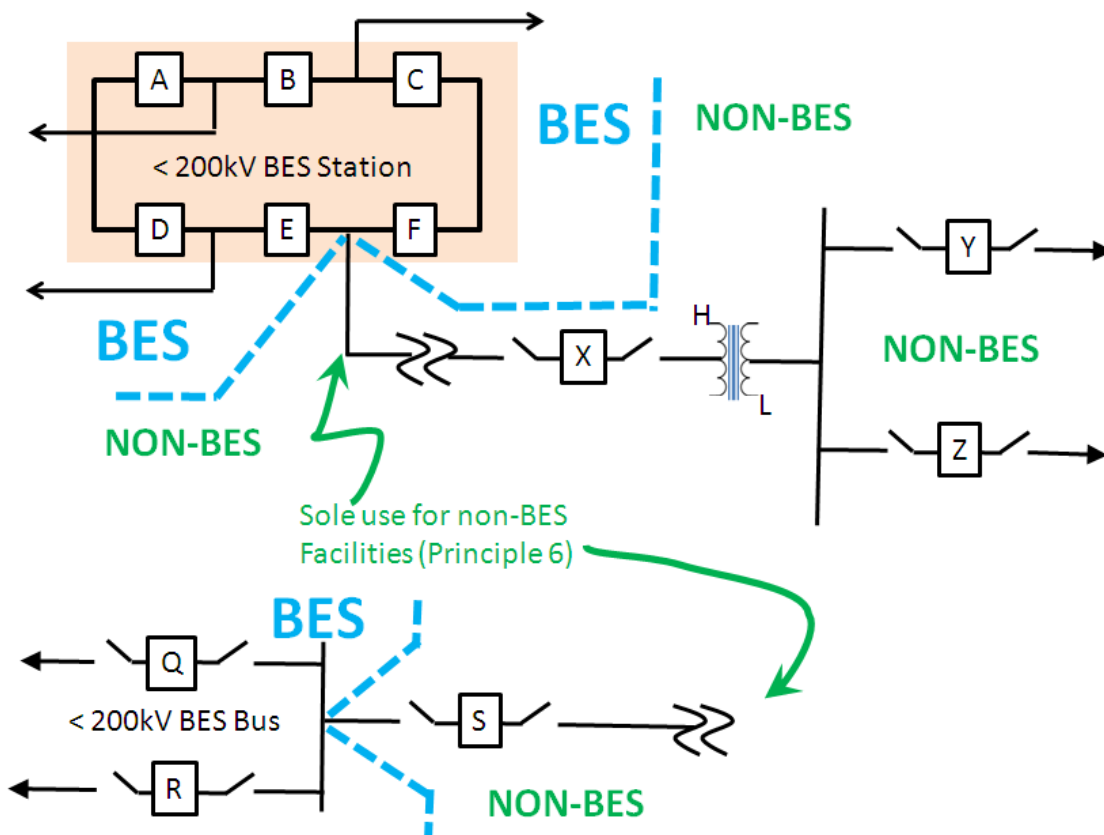

As both BES buses in question are directly connected to one another via a line element, that line element becomes an integral part of the BES. Note that this only affects direct connections between BES buses. If transformations or other intermediary network facilities are electrically connected between the bounds of two BES buses, they may qualify for Local Distribution Network exclusion from the BES.

Official Comment form for BES Definition Exception Process

**Principle 6:**

Where power flows through an AFID and connecting elements from a 200kV or lower BES bus solely to a non-BES element, that AFID and connecting elements shall be deemed non-BES. If the flow serves a BES element or a combination of BES and non-BES elements, the AFID and connecting elements carrying such dual purpose flow shall be considered to be BES.

6

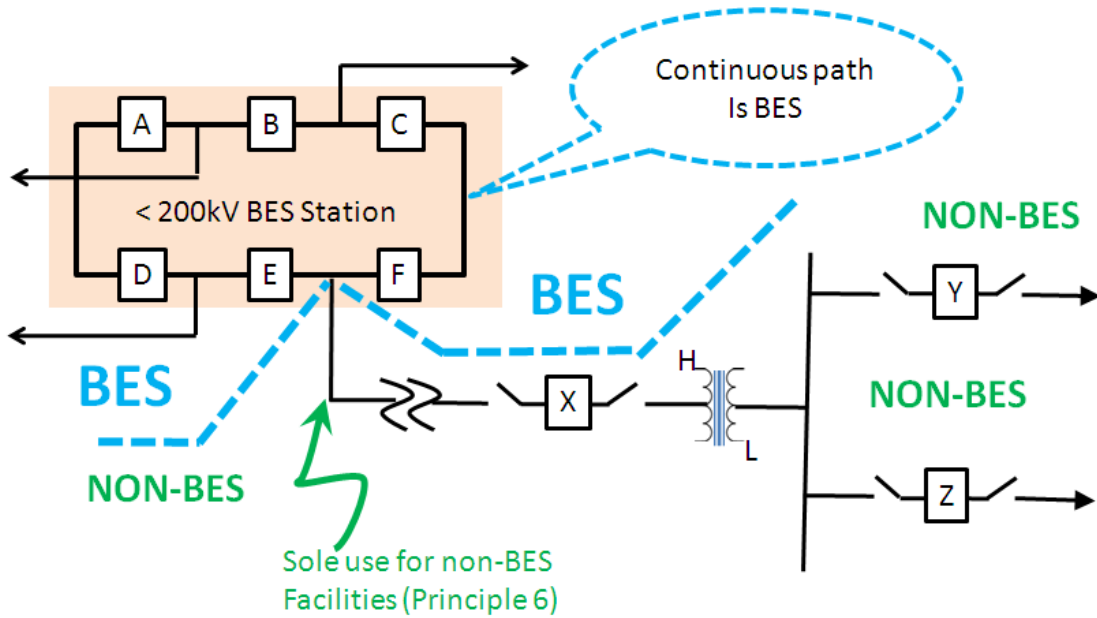

Rationale:

Where the sole use of an element is to provide connectivity from the BES to a non-BES element, the element itself is serving an entirely non-BES function. This applies only to 200kV and below, as above 200kV, footnote 4 of the NERC Statement of Compliance Registry Criteria becomes applicable. (See Principle 2 above.) If any of the flow on the subject element also serves (flows through?) a BES element, the element is serving a BES function, and it should therefore be classified as BES. [The concept of “BES flow” makes me wonder if we won’t have to define what “BES flow” is.]

**Principle 7:**

Official Comment form for BES Definition Exception Process

The continuous path at a common voltage within a substation between two BES buses shall also be designated as BES.

Rationale:

This is similar to Principle 5. The direct connection between BES buses is carrying BES flow, and hence, is serving a BES function.

## Official Comment form for BES Definition Exception Process

**Principle 8:**

While Transmission Protection Systems are not elements of the BES, owing to the fact that they are secondary voltage sensing/control systems, some Transmission Protection Systems affect the reliability of the Bulk Electric System. Particularly, the Protection Systems associated with BES equipment (those that initiate opening of BES interrupting devices) shall be deemed to “affect the reliability of the BES” as in the context of NERC Standard PRC-005-1.

8

BDT - This diagram does not go with principle 8 and will be deleted from principle 8, but a principle 9 should probably be added to elaborate on the demarcation point between a non-BES generator and the BES.

**Rationale:**

Per the text in NERC Standard PRC-005-1, Transmission Protection Systems may “affect the reliability of the Bulk Electric System”, and these are the ones that are subject to the requirements of this Standard. Therefore, it is recognized that Transmission Protection Systems themselves, are not BES components, but certainly may affect the reliability of the BES. Transmission Protection Systems that detect faults on non-BES elements and initiate opening of only non-BES elements do not have any impact on the reliability of the BES. However, certain backup protection systems for non-BES elements (for example, breaker failure protection schemes) can initiate the opening of BES breakers. [All Transmission Protection Systems whose purpose is to detect faults on the BES clearly have an effect on the reliability of the BES.]

## FRCC Bulk Electric System

### Purpose:

The Bulk Electric System, as defined by the NERC Reliability Standards Glossary, provides the ability to define and specify detail on a regional basis. The NERC definition is:

“As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.”

The FRCC Regional Entity is further defining the definition to clarify and reduce ambiguity.

### The Bulk Electric System within the FRCC footprint is defined as all:

1. Electrical generation resources greater than 20 MVA (gross nameplate rating) or a generation plant with aggregate capacity greater than 75 MVA ((gross aggregate nameplate rating) including generator step-up (GSU) transformers and associated equipment from the generator terminals to the high side of the GSU)) connected at voltages of 100 kV or higher (high side of GSU).
2. Transmission Elements and associated equipment, operated at voltages of 100 kV or higher.
3. Transformers (other than generator step-up (GSU) transformers) with both primary and secondary windings of 100 kV or higher.

### The FRCC Bulk Electric System excludes:

- Any radial Transmission Element or System connected from one transmission source to load serving Elements and/or generation resources not included in item 1 above, where a loss of the radial Elements or System will not result in an Adverse Reliability Impact.
- Generating plant control and operation functions which include relays and systems that control and protect the unit for boiler, turbine, environmental, and/or other plant restrictions.
- All other Elements operated at voltages below 100 kV.

Final Version 9/1/2010

Approved by the FRCC Board of Directors \_\_\_\_\_

Effective Dates:

FRCC BES Definition, Appendix A: Clarification to the FRCC Bulk Electric System (BES) Definition for Radial Transmission Elements or Systems Exclusion, and Appendix C: Adverse Reliability Impact Study Requirements: 1<sup>st</sup> day of the 3<sup>rd</sup> calendar quarter following regulatory approval.  
Appendix B: FRCC regional application of the term “transmission Protection Systems”: 1<sup>st</sup> day of the 7<sup>th</sup> calendar quarter following regulatory approval.

**Supporting Documentation**

- a) See Appendix A for further clarification of radial Transmission Elements or Systems.
- b) See Appendix B for further clarification of transmission Protection Systems.
- c) See Appendix C for further clarification of Adverse Reliability Impact Study requirements.

## Appendix A

### Clarification to the FRCC Bulk Electric System (BES) Definition for Radial Transmission Elements or Systems Exclusion

This is a clarification to the FRCC BES definition exclusion list regarding the exclusion of radial Transmission Elements / System. Since it is impractical to document every situation for exclusion of radial Transmission Elements / System, examples are provided for general clarification.

The exclusion states: “Radial Transmission Element or System connected from one transmission source to load serving Elements and/or generation resources not included in 1) above ...”, in general, unregistered generation<sup>1</sup>, “... where a loss of the radial Elements or System will not result in an Adverse Reliability Impact”.

There are a few principles that are applied in determining if radial Elements / Systems are excluded:

- Radial System can be a collection of parallel Elements as long as the radial System originates at one transmission source and that the System does not connect to a second transmission source under normal operations.
  - FRCC considers normal operations (i.e. normal system configuration) in determining whether Elements / Systems are radial and does not consider alternate configurations. For instance, entities may install normally open switches between radial Elements/ Systems and operate the switches in a ‘make-before-break’ fashion to allow for system reconfiguration to maintain continuity of electrical service to customers.
- One transmission source is a contiguous bus configuration (e.g. ring bus, breaker-and-a-half scheme, etc.) comprised of one or more BES Elements operated at one voltage level 100kV or higher.
- Adverse Reliability Impact is as defined in the NERC Glossary of Terms. Studies are necessary to determine if an Adverse Reliability Impact can result from the loss of a radial Element / System if the peak loads or generation resources within the radial Element / System exceed one-half of the largest single loss of source contingency in the FRCC region. Studies will be performed by the responsible entity and approved by the FRCC Planning Committee.

---

<sup>1</sup> Unregistered generation means that generation that does not meet the registration criteria described in NERC’s Statement of Compliance Registry Criteria.

Appendix A: Radial Transmission Elements / Systems Exclusions

---

The following examples are provided for clarification of where the boundary between BES and radial exclusions are located.

## Appendix A: Radial Transmission Elements / Systems Exclusions

Example One:

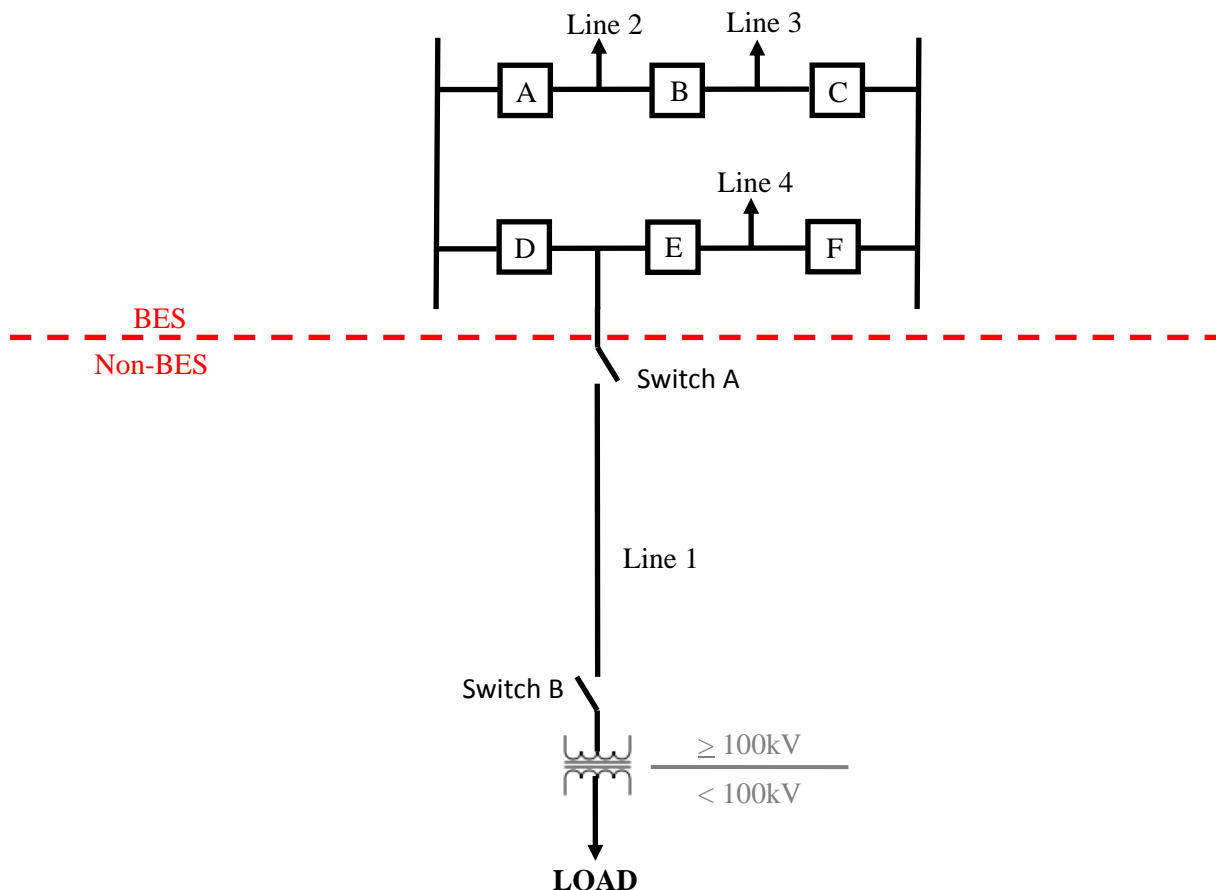

In this example:

- Lines 1 & 2, breaker 'A' and the associated buses (> 100kV) are part of the BES.
  - The > 100 kV bus is the single transmission source.
- Radial Exclusion:
  - Both transformers and the illustrated switches are radial and excluded from the definition of the BES as long as the loss of the < 100 kV bus does not result in an Adverse Reliability Impact.
- The border between BES and non-BES is at the bus (source) side of the > 100 kV transformer switches.

Appendix A: Radial Transmission Elements / Systems Exclusions

Example Two:

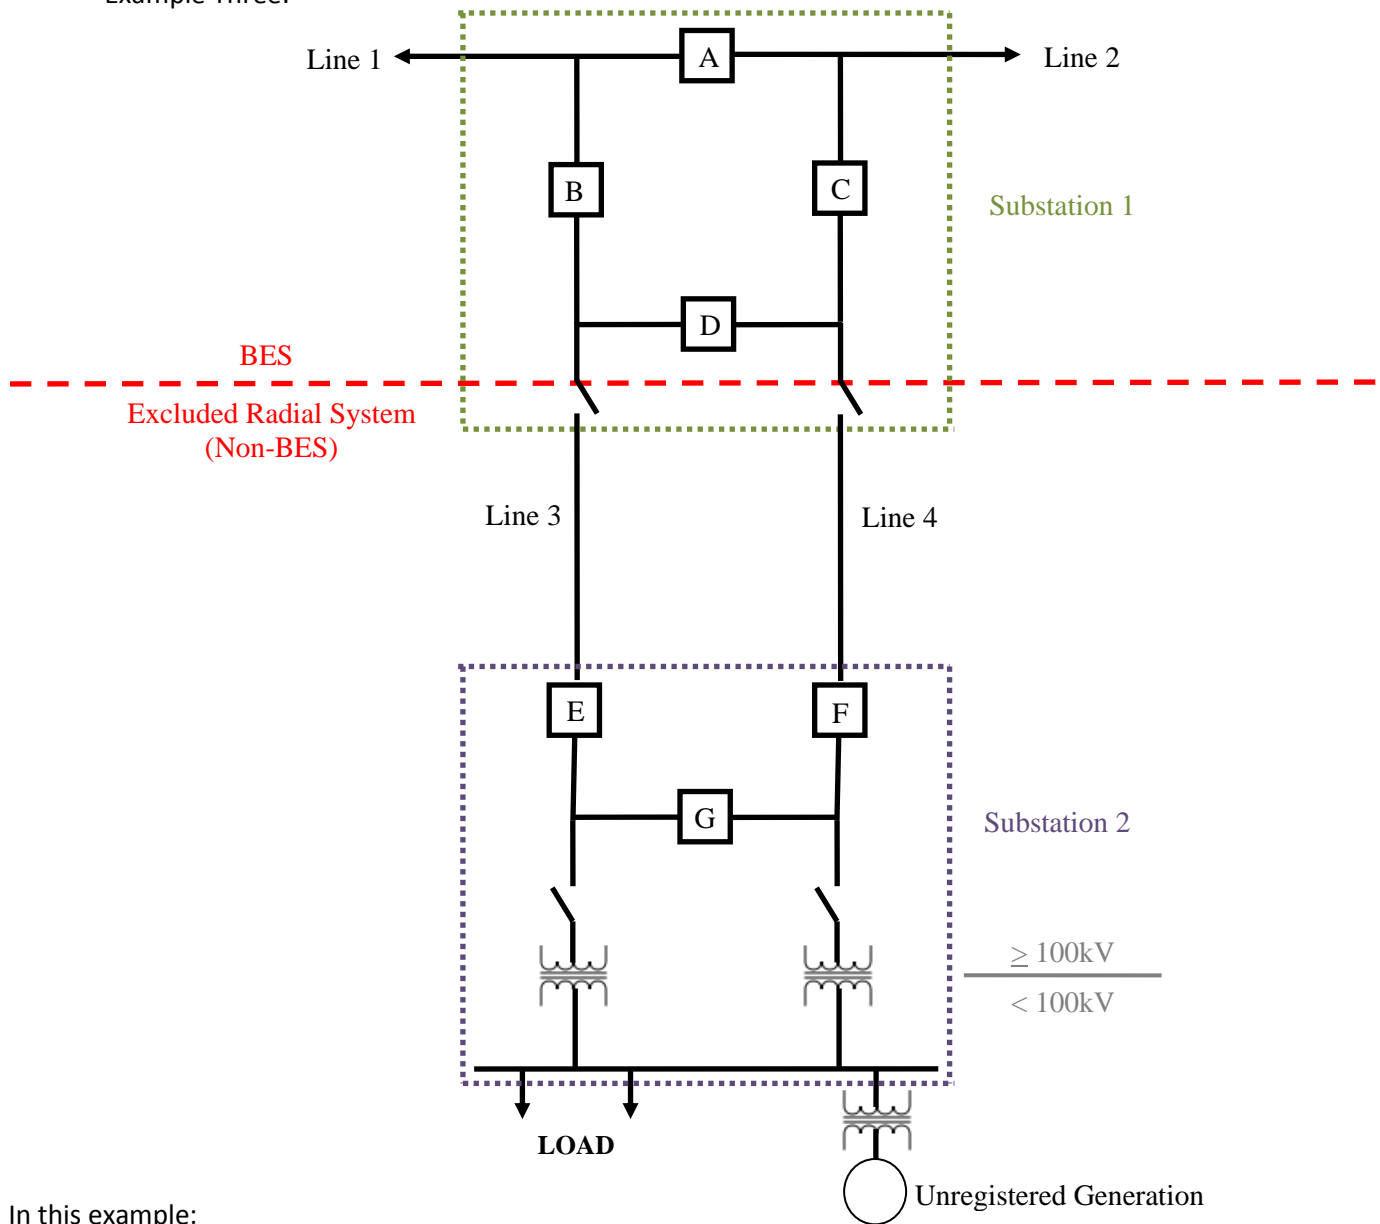

In this example:

- Lines 2, 3 and 4 are networked lines and part of the BES.
- Radial Exclusion:
  - Line 1 and associated switch are radial and are not part of the BES, as long as the loss of the radial system or portions thereof does not cause an Adverse Reliability Impact.
  - The transformer and associated switch are not part of the BES.
- The border between BES and the radial exclusion would be at bus (source) side of the Line 1 switch.
- If Switch A at the top of Line 1 does not exist then the BES/non-BES dashed line moves down to the source side of Switch B connected to Line 1.

Appendix A: Radial Transmission Elements / Systems Exclusions

Example Three:

In this example:

- Lines 1 and 2 and substation 1 are part of the BES.
- Radial Exclusion:
  - Lines 3 and 4, substation 2, and the transformers comprise the radial system since it serves only load and unregistered generation and is excluded from the BES as long as the loss of the radial system, or portions thereof (e.g., loss of all generation without loss of load, visa versa, or loss of the entire radial system) does not cause an Adverse Reliability Impact.
- The border between BES and the radial exclusion would be at bus (source) side of the Line 3 & 4 line switches at substation 1.

## Appendix A: Radial Transmission Elements / Systems Exclusions

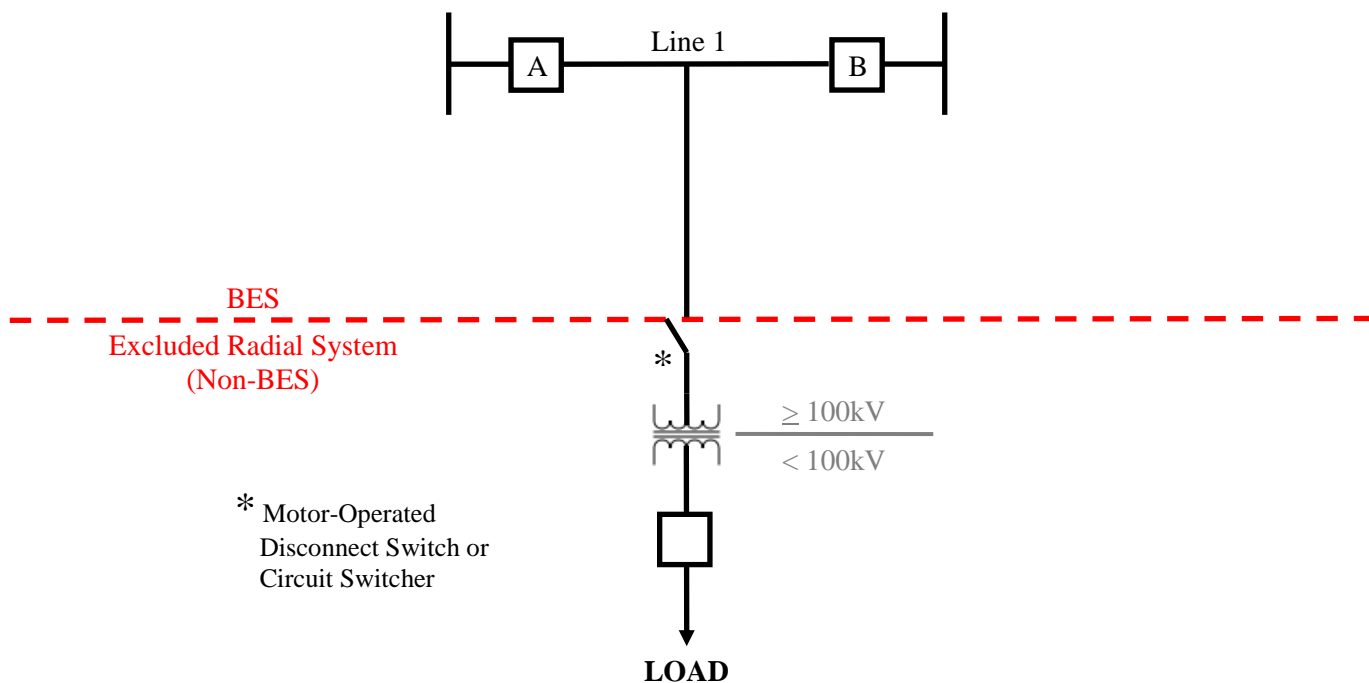

Example Four:

- Line 1, Line 2 and the ring bus comprised of breakers A, B, C and D are part of the BES.
- Radial Exclusion:
  - The transformers, the ring bus comprised of breakers E, F, G and H and the radial Elements serving only load emanating from that ring bus comprise the radial system as long as the loss of the radial system does not cause an Adverse Reliability Impact.
- The border between BES and the radial exclusion would be at bus (source) side of the transformer switches on the high side of the transformers.

## Appendix A: Radial Transmission Elements / Systems Exclusions

Example Five:

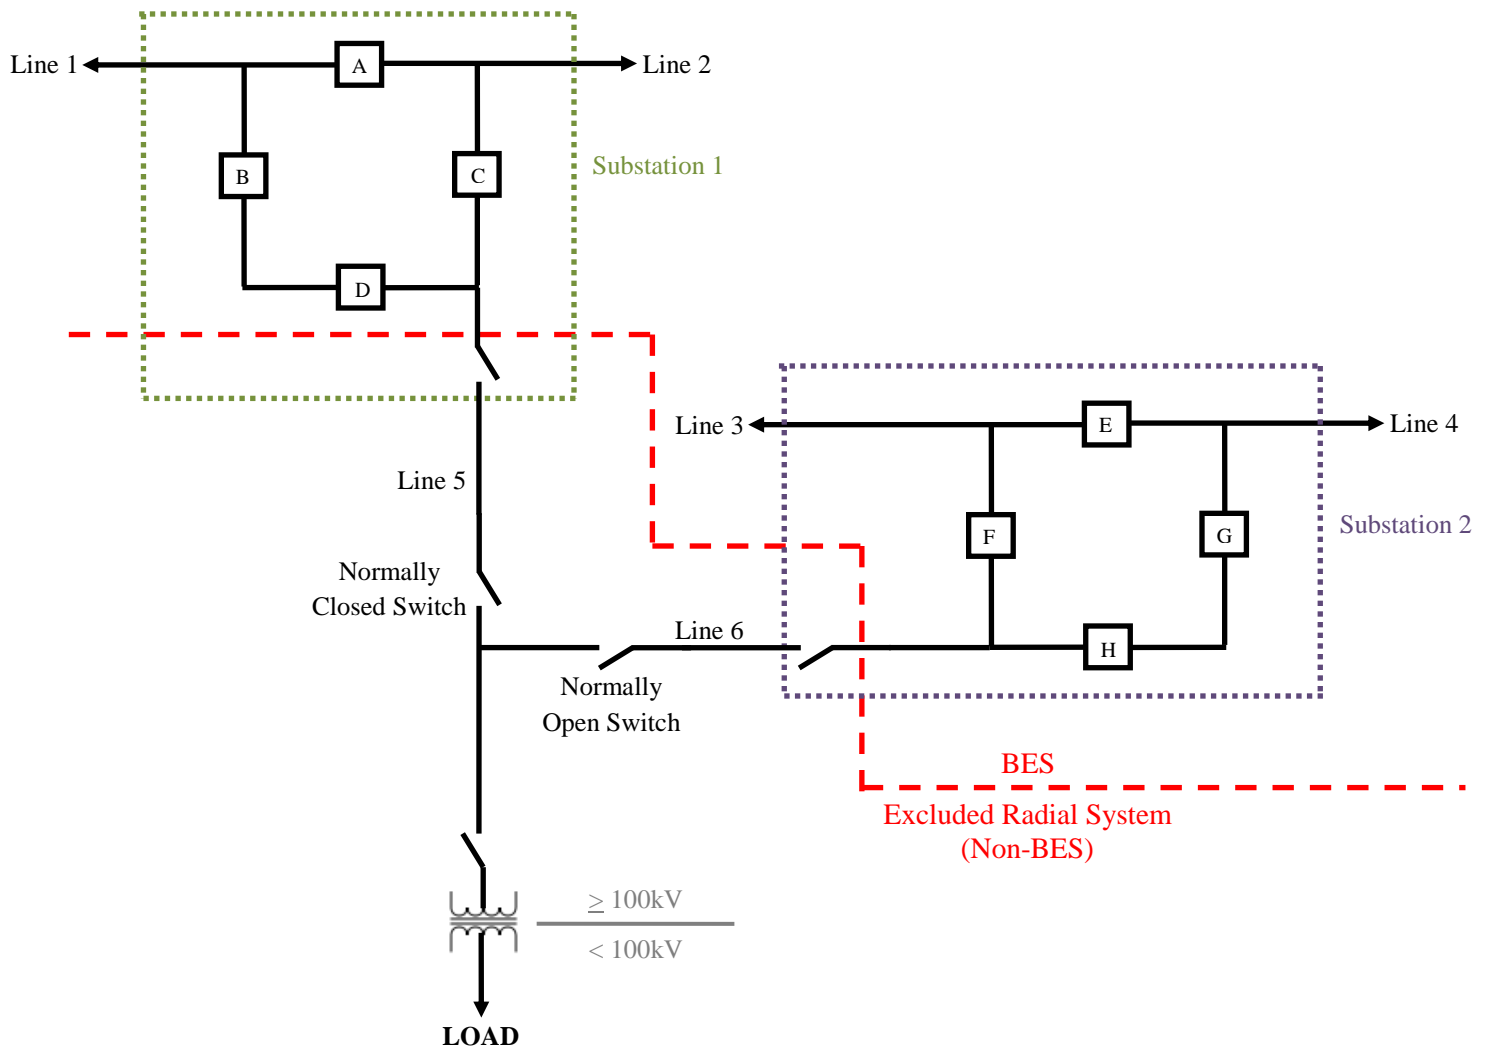

In this example:

- Line 1 is a network line supplying a tapped substation, and the line, including the tapped segment to the radial substation, is part of the BES since the entire line is operated as a single BES Element.
- Radial Exclusion:
  - The tap substation is radial and not part of the BES as long as the loss of the radial system or portions thereof does not cause an Adverse Reliability Impact.
- The boundary between the BES and the radial exclusion is at the line (source) side of the switch at the tapped substation.

## Appendix A: Radial Transmission Elements / Systems Exclusions

## Example Six:

In this example:

- Lines 1, 2, 3 & 4 and Substations 1 and 2 are part of the BES.
- Radial Exclusion:
  - Line 5 & 6 and the associated switches are radial and are not part of the BES as long as the loss of the radial systems or portions thereof does not cause an Adverse Reliability Impact.
  - The transformer and associated switch are not part of the BES.

**Note: 'Make-before-break' switching to change the source from Substation 1 to Substation 2 does not void the radial exclusion.**

- The border between BES and the radial exclusion would be at bus (source) side of the Line 5 & 6 line switches at Substations 1 & 2 respectively.

## **Appendix B**

### **FRCC regional application of the term “transmission Protection Systems”**

This is a clarification of the FRCC regional application of the term “transmission Protection Systems” as used in the PRC -series Reliability Standards. Since it is impractical to document every situation for Protection Systems, examples are provided for general clarification.

Protection Systems, as defined by this Appendix B, are included in the definition of “transmission Protection Systems” for application of NERC PRC-series Reliability Standards.

- Protection Systems included in the application of the term “transmission Protection Systems”:
  - Protection Systems that detect faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from a BES Element.

The following examples are provided for clarification of the definition of “transmission Protection Systems”.

In general, a two step process is followed:

1. Identify which Elements are considered BES
2. Determine which Protection Systems detect faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trip an interrupting device that interrupts current supplied directly from a BES Element.

Note: Isolation/disconnect switches are omitted in these examples (i.e., breaker disconnects, transformer isolation, etc.) except where such switches are relevant to operation of transmission Protection Systems.

## Appendix B – Clarification of “transmission Protection Systems”

Example One:

In this example:

- Circuit breakers 'A' and 'B' and Transmission Line 1 are part of the BES.
- Protection Systems for Transmission Line 1 including the radial tap are “transmission Protection Systems.”
- The transformer and associated switches are not part of the BES.
- Protection Systems for the transformer are not “transmission Protection Systems” because the transformer is not a BES Element.

Appendix B – Clarification of “transmission Protection Systems”

Example Two:

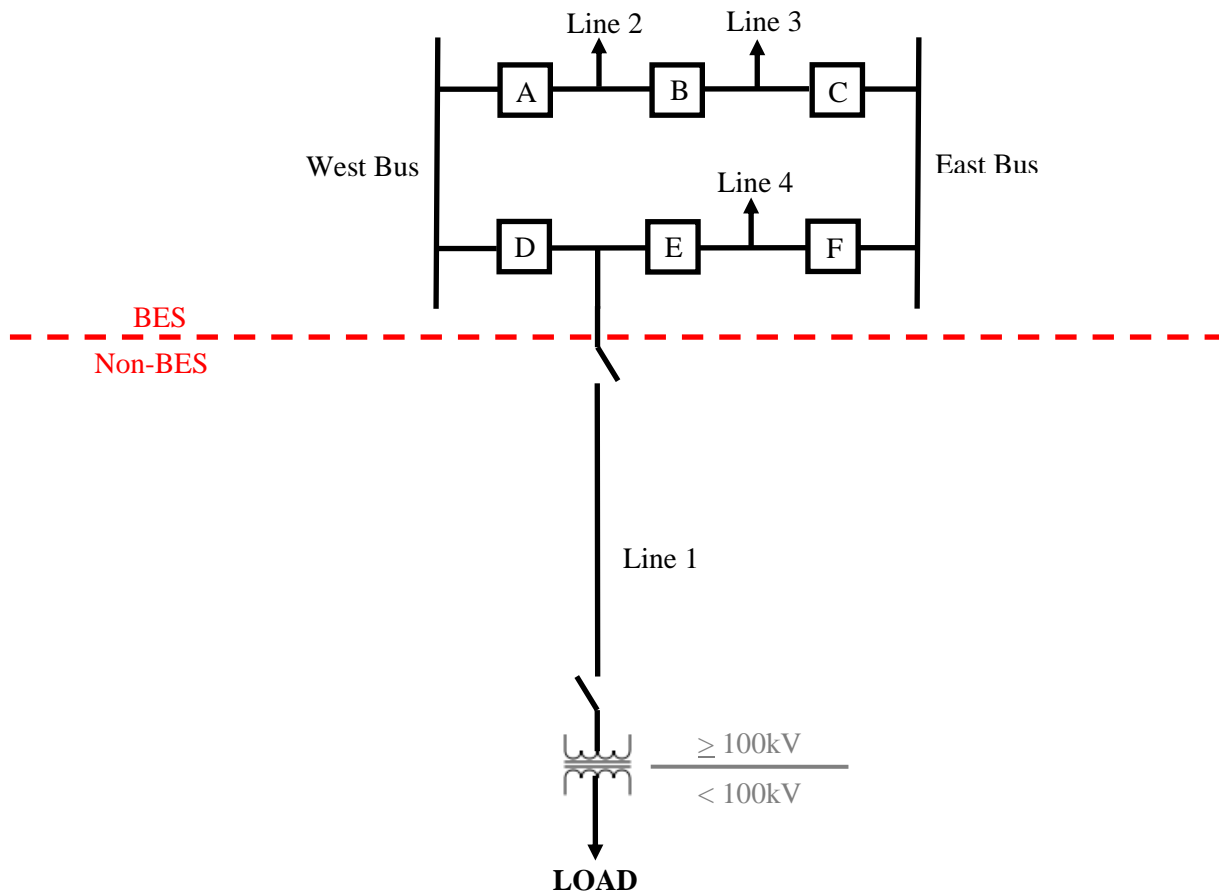

In this example:

- Circuit breaker ‘A’ and Transmission Lines 1 & 2 are part of the BES.
- The transformers and associated switches are not part of the BES.
- Protection Systems for Transmission Lines 1 & 2 are “transmission Protection Systems”.
- Protection Systems for the transformer are not “transmission Protection Systems” because the transformer is not a BES Element.

## Appendix B – Clarification of “transmission Protection Systems”

Example Three:

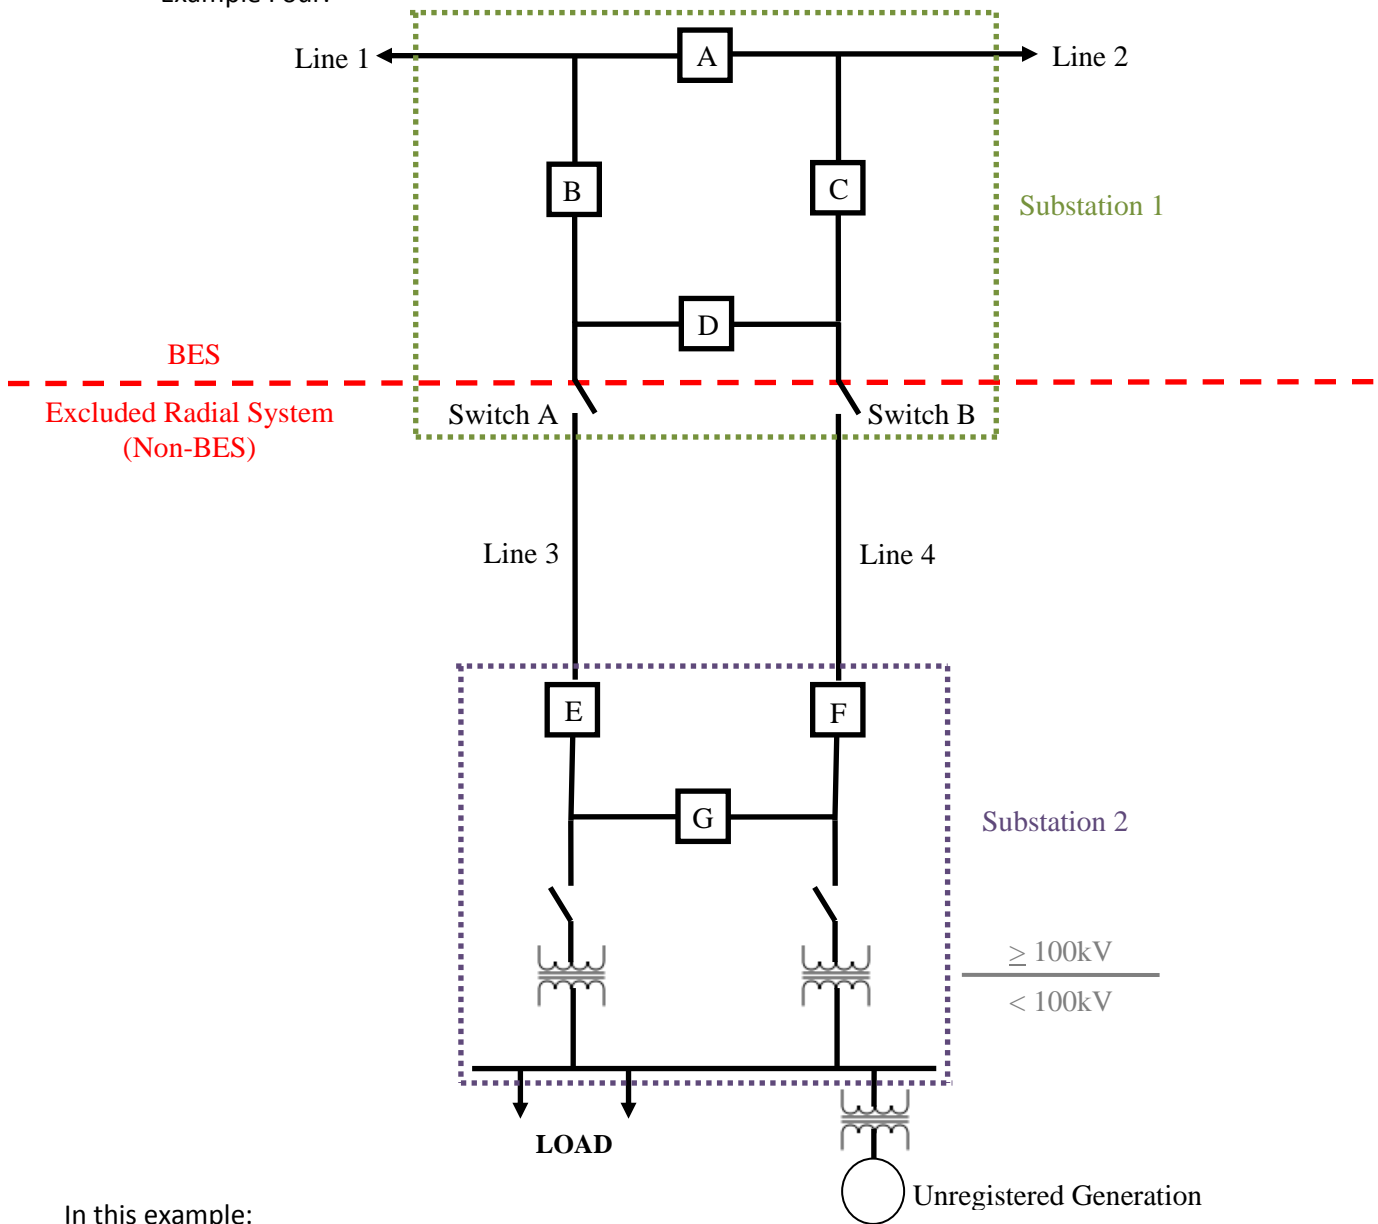

In this example:

- Lines 2, 3 and 4 and the substation, including the East and West bus, are part of the BES.
- Line 1, including the transformer and the associated switches, is radial and not part of the BES.
- The Protection System for the bus/line between breakers D and E and the associated tap is a “transmission Protection System.”
- Protection Systems for the transformer are not “transmission Protection Systems” because the transformer is not a BES Element.

Appendix B – Clarification of “transmission Protection Systems”

• Example Four:

In this example:

- Transmission Lines 1 & 2 and circuit breakers A, B, C and D are part of the BES.
- Circuit breakers 'E', 'F' and 'G', Transmission Lines 3 & 4 and the transformers are not part of the BES.
- The Protection Systems for the bus sections between breakers B and D and breakers C and D including the bus sections connecting to the source side of Switch A and Switch B are “transmission Protection Systems.”

## Appendix C

### Adverse Reliability Impact Study Requirements

#### Purpose

Adverse Reliability Impact Study is the analysis (steady-state screening and if required dynamic stability analysis) performed by a functional entity that wishes to apply for exclusion of a radial system which exceeds the triggering parameter defined by the “Study Triggers” from the Regional Bulk Electric System (BES).

#### Study Triggers

Studies are necessary to determine if an Adverse Reliability Impact<sup>1</sup> can result from the loss of a radial Element / System if the peak loads or generation resources within the radial Element / System exceed one-half of the largest single loss of source contingency in the FRCC region.

If the entity’s proposed radial system is above the established triggering parameter the entity will be required to perform an Adverse Reliability Impact Study and submit for approval in accordance with the ‘Approval Process’ defined in this document. This impact study should evaluate the loss of the proposed radial system applying the following study parameters.

#### Study Parameters

- Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- Study FRCC Region transmission facilities to ensure that they remain within applicable ratings and voltage limits.
- Include loss of entire radial system as a contingency event.
- At a minimum, studies should cover a five (5) year period.
- Additional studies as requested by the FRCC Regional Entity Planning Committee.

#### Study Frequency

Adverse Reliability Impact Studies will be conducted every five (5) years or when system configuration changes dictate a need for re-evaluation or as requested by the FRCC Regional Entity (RE)

---

<sup>1</sup>The *NERC Glossary of Terms (dated: April 20, 2009)* defines Adverse Reliability Impact as: The impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.

Appendix C – Adverse Reliability Impact Study Requirements

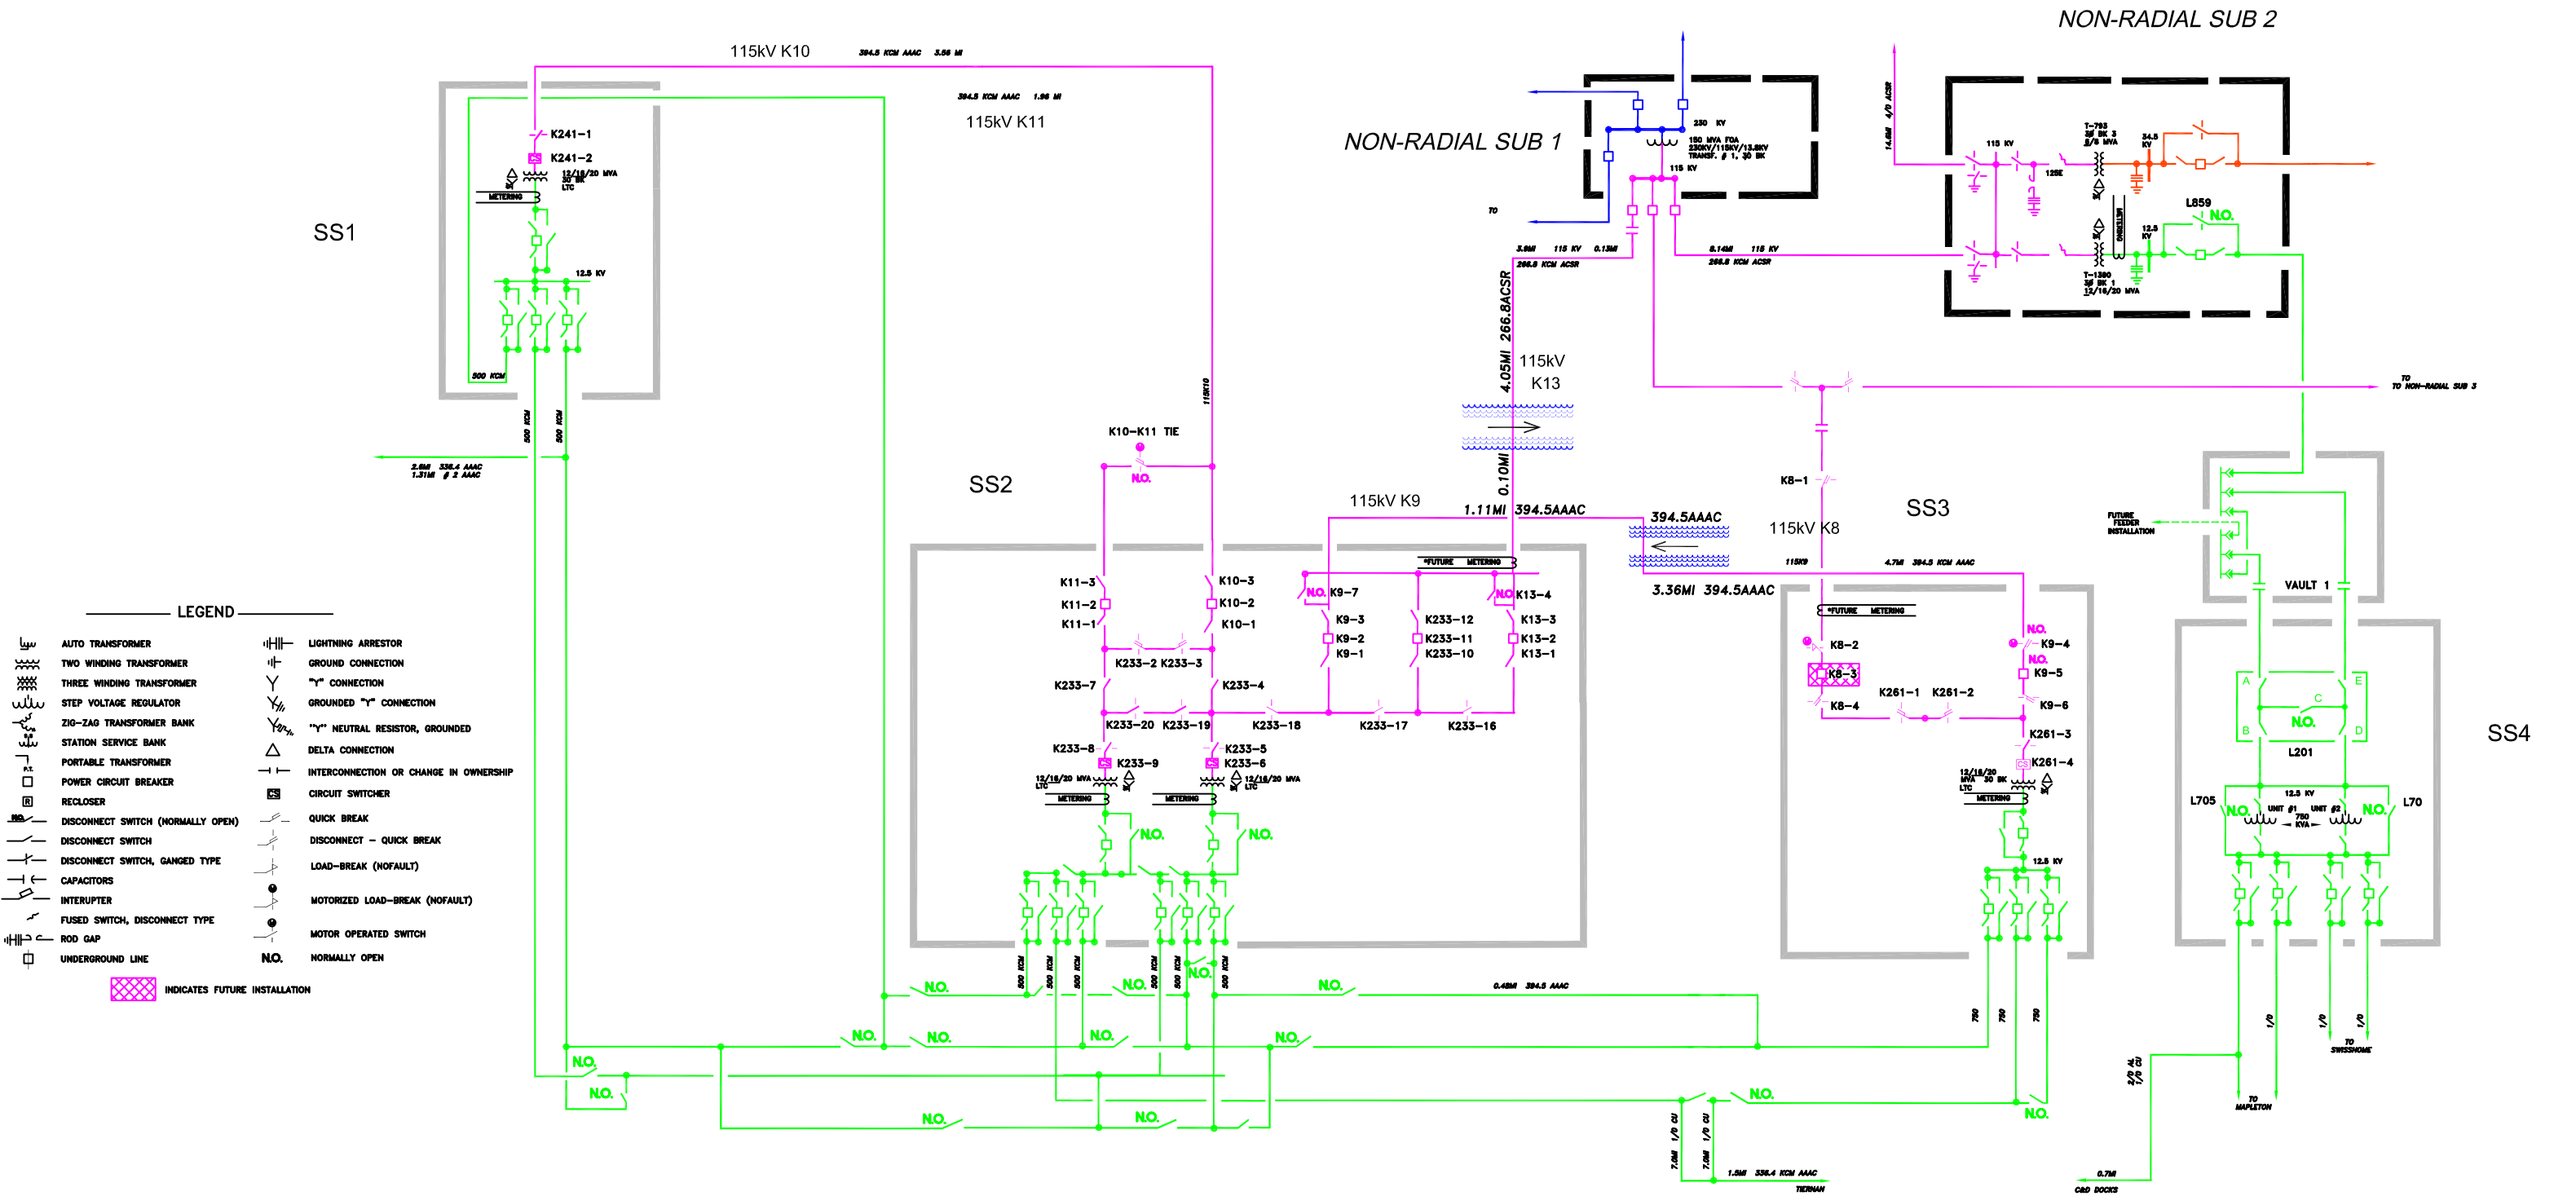

---

Planning Committee (PC). FRCC Standing Committees may also make a request to the FRCC RE PC for studies to be performed.

**FRCC Regional Entity Planning Committee Approval Process**

All requests for Radial Element/System Exclusions should be submitted to the FRCC RE PC for review and approval. The FRCC RE PC will review the Adverse Reliability Impact Study (steady-state screening and if required dynamic stability analysis) and will determine if the identified Radial Element/System meets all criteria for exclusion.

- Requests for radial exclusions (below triggering parameters) should include the following:
  - Executive Summary/Outcome Justification
  - Assumptions and Methodologies
  
- Requests for radial exclusions (at or above triggering parameters) should include the following:
  - Executive Summary/Outcome Justification
  - Assumptions and Methodologies
  - Study Results

## Consideration of Comments on Definition of Bulk Electric System— Project 2010-17

Following the development of this report, the leadership of the BES Definition SDT and Rules of Procedure teams met with the leadership of the Standards Program and the Standards Committee and determined that the BES Definition SDT will assume responsibility for working with stakeholders to identify what evidence is needed to support a request for an exception to the BES definition.

The BES Definition team will solicit stakeholder input to identify the evidence an entity will need to provide when submitting a request for an exception to the definition of BES. While the determination of what evidence will be needed to support a request for a BES Definition Exception will be developed using NERC's standard development process, a decision on where the final product will reside - in the definition of BES, or as an attachment (e.g., a procedure identifying what evidence to produce when applying for a BES exception) to the Rules of Procedure will be made jointly by the leadership of the Standards Program and the Standards Committee at a later stage. Given the time constraints of this project, having all the technical clarity associated with this project developed by a single team seemed the most efficient decision.

The Definition of Bulk Electric System Drafting Team thanks all commenters who submitted comments on the SAR and proposed modification to the definition of Bulk Electric System. These standards were posted for a 30-day public comment period from December 17, 2010 through January 21, 2011. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 82 sets of comments, including comments from more than 175 different people from approximately 129 companies representing 10 of the 10 Industry Segments as shown in the table on the following pages.

[http://www.nerc.com/filez/standards/Project2010-17\\_BES.html](http://www.nerc.com/filez/standards/Project2010-17_BES.html)

Prior to the issuance of Order 743a, the SDT carefully weighed the many suggestions received in these comments as well as reviewing numerous documents from Regional Entities and other sources in coming up with a revised definition shown here:

**Bulk Electric System (BES):** All Transmission Elements operated at 100 kV or higher, Real Power resources as described below, and Reactive Power resources connected at 100 kV or higher unless such designation is modified by the list shown below.

### Inclusions:

- 11 - Transformers, other than generator step-up (GSU) transformers, including phase angle regulators, with two windings of 100 kV or higher unless excluded under Exclusions E1 and E3.

- I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.
- I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.
- I4 - Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator's restoration plan regardless of voltage.
- I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.

**Exclusions:**

- E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:
  - a) Only serving Load. A normally open switching device between radial systems may operate in a 'make-before-break' fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,
  - b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,
  - c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.
- E2 - A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer's side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.
- E3 - Local distribution networks (LDNs): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the interconnected System. LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:
  - a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
  - b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;
  - c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;
  - d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
  - e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a

comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

The SDT has made corresponding changes to the appropriate wording of the SAR and is now asking the Standards Committee for approval to move this project to the definition development phase.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at [herb.schrayshuen@nerc.net](mailto:herb.schrayshuen@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

---

<sup>1</sup> The appeals process is in the Reliability Standards Development Procedures: <http://www.nerc.com/standards/newstandardsprocess.html>.

**Index to Questions:**

1.	Should the following be classified as part of the BES? .....	16
	• Transformers, other than Generator Step-up (GSU) transformers, including Phase Angle Regulators, with both primary and secondary windings of 100 kV or higher .....	16
2.	Should the following be classified as part of the BES? .....	30
	• Individual generation resources (including GSU transformers and the associated generator interconnecting line lead(s)) greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above .....	30
3.	Should the following be classified as part of the BES? .....	46
	• Generation plants (including GSU transformers and the associated generator interconnecting line lead(s))with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above.....	46
4.	Should the following be classified as part of the BES? .....	59
	• Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator’s (TOP’s) restoration plan.....	59
5.	Should the following be classified as part of the BES? .....	71
	• Transmission Elements or Facilities operated at voltages below 100kV where the exemption process deems the Element or Facility to be included in the BES.....	71
6.	Should the following be classified as part of the BES? .....	81
	• Individual generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation resources to be included in the BES .....	81
7.	Should the following be classified as part of the BES? .....	94
	• Generation plants with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation plants to be included in the BES .....	94
8.	Should the following be excluded from the Elements and Facilities classified as part of the BES? .....	106
	• Any radial Transmission Element or System, connected from one Transmission source to a Load-serving Element and/or generation resources not included in items 2, 3, 4, 6, and 7 above are excluded from the BES .....	106
9.	Should the following be excluded from the Elements and Facilities classified as part of the BES? .....	119
	• Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO) .....	119

10. Should the following be excluded from the Elements and Facilities classified as part of the BES? ..... 129
  - Generating plant control and operation functions which include relays and systems that control and protect the unit for boiler, turbine, environmental, and/or other plant restrictions..... 129
11. Do you believe that the proposed definition of BES, accompanied by a separate BES Definition Exception Process meets the reliability-related intent of the directives in Order 743?..... 138
12. If you have a proposal for an equally efficient and effective method of achieving the reliability- related intent of the directives in Order 743, please provide your proposal here.  
157
13. Please provide any other information that you feel would be helpful to the drafting team working on the definition of BES. .... 171

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

**1. Should the following be classified as part of the BES?**

- **Transformers, other than Generator Step-up (GSU) transformers, including Phase Angle Regulators, with both primary and secondary windings of 100 kV or higher**

**Summary Consideration:** Stakeholders who responded to this question were evenly divided with about half the respondents indicating support for the proposal, and the other half disagreeing with at least some part of the proposal.

The SDT has clarified the definition based on industry comments regarding the classification of transformers.

Included in the BES: I1 - Transformers, other than generator step-up (GSU) transformers, including phase angle regulators, with two windings of 100 kV or higher unless excluded under Exclusions E1 and E3.

Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:

- a) Only serving Load. A normally open switching device between radial systems may operate in a 'make-before-break' fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,
- b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,
- c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.

Excluded from the BES: E3 - Local distribution networks (LDN): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the interconnected System. LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:

- a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
- b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;
- c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;
- d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
- e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	<ol style="list-style-type: none"> <li>1. Exclusions should be applied to radial non-transmission facilities serving a distribution function. Step-down transformers with the low-side terminals serving non-BES facilities, which are serving a distribution function, should not be part of the definition of BES.</li> <li>2. Transformers, other than GSUs, with both primary and secondary winding above 100kV, and performing a transmission function, should be classified as BES.</li> <li>3. Transformers other than GSUs, with both primary and secondary windings above 100kV, and only providing a distribution function should be classified as non-BES.</li> <li>4. Transformers other than GSUs, with their secondary windings or both primary and secondary windings operated below 100kV should not be included in the definition of BES.</li> </ol>
<p><b>Response:</b></p> <ol style="list-style-type: none"> <li>1. The SDT has excluded local distribution networks as shown: <ul style="list-style-type: none"> <li>• Excluded from the BES: E3 - Local distribution networks (LDNs): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the interconnected System. The SDT feels that your comment does not illustrate a readily identifiable bright-line designation as there is no definition for distribution. However, the SDT has determined that such transformers on a radial system will be non-BES.</p> <p>4. The SDT agrees with your suggestion and has incorporated it in its latest proposal.</p>
Electric Market Policy	No	Dominion could respond yes if the sentence read “All transformers, including Generator Step-up (GSU) transformers and Phase Angle Regulators, with both primary and secondary windings of 100 kV or higher.
ExxonMobil Research and Engineering	No	Transformers like all elements should be included based on their function; however, the use of an element's rating or operating voltage may provide a good guideline for selecting elements to review for inclusion in the BES.
<p><b>Response:</b> The SDT does not share your view on the inclusion of all transformers and feels that transformers used in Transmission and generation should be included. The SDT agrees that operating voltage is a good guideline for applying the definition of BES.</p>		
PacifiCorp	No	<p>In Order No. 743, the Commission directed NERC to adopt an exemption process for excluding facilities from the definition of the BES that are not necessary to operate an interconnected electric transmission network. In order to determine which facilities may be excluded, there must be criteria and a methodology that may be applied to identify which facilities are “necessary” to operate an interconnected electric transmission network and which “transmission and generation” facilities are not. In other words, there must be a clear way to determine what makes a particular facility is “necessary” for bulk system operation. Application of the criteria and methodology will result in the identification of the facilities that may be excluded. The comment questions asked in this questionnaire cannot be answered in a meaningful way absent this methodology. Significant efforts have been undertaken by the WECC Bulk Electric System Definition Task Force (BESDTF) over the course of the past year to identify some initial criteria and methodologies. These efforts are ongoing and should be supported by the NERC drafting team. For example: Transformers should not be included or excluded solely based on their voltage classifications (high side and low side). Transformers which are necessary to operate the interconnected network should be included as part of the regulated BES. Transformers which are not “necessary for the operation of the interconnected network” should be excluded. A methodology needs to be developed to determine which transformers may be excluded as part of the</p>

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 1 Comment
		regulated BES.
<p><b>Response:</b> The SDT is aware of the WECC Bulk Electric System Definition Task Force’s efforts and has considered that work. The SDT has revised the definition and included specific inclusion and exclusion designations. Bright-line designations will be developed as part of this project and the process will handle any exceptions and those will be addressed through the revision of the Rules of Procedure which is a separate parallel effort to the development of the BES definition by another team. Your comments will be forwarded to the Rules of Procedure Team.</p>		
Hydro-Québec	No	For questions 1 to 10, refer to questions 11 to 13.
<p><b>Response:</b> Please see responses to questions 11 to 13.</p>		
National Rural Electric Cooperative Association (NRECA)	No	This should not be dependent only on the voltage, but also on where the transformer, etc., is located on the system. For example, if such a transformer is on a radial line of any transmission voltage that is serving only load, then it should not be considered part of the BES.
Orange and Rockland Utilities, Inc.	No	Exclusions should be applied to radial non-transmission facilities serving a distribution function. Step-down transformers with the low-side terminals serving non-BES facilities, which are serving a distribution function, should not be part of the definition of BES. Transformers, other than GSUs, with both primary and secondary winding above 100kV should be classified as BES. However, it is our belief that transformers with either a primary or secondary winding below 100kV should not be included directly or through the separate BES Definition Exception Process.
City of Anaheim	No	Transformers with secondary windings of 100kV or less should not be part of the BES if they feed radial load or radial distribution systems; provided, however, to eliminate any reliability gaps, such transformers should be classified as "Distribution" equipment subject to DP standards, and the PRC and vegetation management standards should be made applicable to Distribution Providers and including this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for radial transmission facilities that function as Distribution and are not required for the reliable operation of the BES.
Southern California Edison Company	No	The presence of an Automatic Fault Interrupting Device (or in the instance of a ring bus or breaker-and-a-half configuration) allows the transformer to be considered as a separate unit serving the function of providing connection and transformation of the high-side to the low-side. Where the electric facilities on the low-side are below 100kV, the transformer is simply an extension of non-BES facilities, providing delivery and connectivity from the BES sources.

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 1 Comment
PPL Energy Plus	No	Certain transformers with primary and secondary windings greater than 100 kV may serve transmission lines with only radial load and should therefore be excluded from the BES definition (without requiring application for an exemption on a case-by-case basis). The BES definition should be modified to incorporate this exclusion.
LG&E and KU Energy LLC	No	Certain transformers connected with both primary and secondary windings of 100 kV or higher serving only radial load should be excluded from the BES definition (without requiring application for an exemption on a case-by-case basis). The BES definition should be modified to incorporate this exclusion.
Central Lincoln	No	While we believe the SAR is on the right track here, we note that many transformers with both windings above 100 kV may be installed on radial systems. We also note that the FERC order excepted “defined radial facilities,” and expect NERC to provide a definition for “radial” so that facilities that meet this criteria may be excluded by inspection rather than by going through an exemption process. It should also be clarified that transformer protection systems are part of the BES only if installed to protect BES transformers.
PUD No.1 of Clallam County	No	
Lewis County PUD	No	
<p><b>Response:</b> The SDT agrees with your suggestion and has incorporated it in its latest proposal.</p> <ul style="list-style-type: none"> <li>Included in the BES: I1 - Transformers, other than generator step-up (GSU) transformers, including phase angle regulators, with two windings of 100 kV or higher unless excluded under Exclusions E1 and E3.</li> </ul> <p>Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:</p> <ol style="list-style-type: none"> <li>Only serving Load. Or,</li> <li>Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.</li> </ol>		
American Municipal Power	No	
Occidental Energy Ventures Corp	No	This would require further study in order to answer in the affirmative.
<p><b>Response:</b> Thank you for your comment.</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 1 Comment
Indeck Energy Services	No	The threshold issue is whether the equipment affects the reliability of the Bulk Power System, as defined in the FPA. By requesting a BES definition that greatly expands the jurisdiction of the NERC Standards beyond the scope of the BPS, FERC and NERC are outside of their legal jurisdiction. NERC is responsible to the FPA through the FERC, but not to the FERC instead of the FPA. NPCC had the correct approach until FERC required it to register every entity down to 20 MW. Reliability is the issue, and in a 30,000+ MW system like NYISO, a 20, 50 or 150 MW piece of equipment cannot cause a Reportable Disturbance (under NERC's definition), so how can it have a significant impact on reliability? Deferring the development of the exemption process to a separate, and possibly much delayed, process of modifying the Rules of Procedure is disingenuous.
<p><b>Response:</b> The SDT has been tasked with coming up with a revised definition of the Bulk Electric System. The SDT is following through on this charge. Bright-line designations will be developed as part of this project and the ROP process will handle any exemptions or inclusions and those will be addressed through the revision of the Rules of Procedure which is a separate parallel effort to the development of the BES definition utilizing a different team.</p>		
Glacier Electric Cooperative	No	I think it depends on the transformer. If the loss of the transformer would significantly affect the reliability of the grid, then, yes, it should be included. However, if the loss of the transformer would not significantly affect the reliability of the grid, then, no, it should not be included no matter what voltage it is connected at.
ReliabilityFirst	Yes	In some cases, facilities that need included do not have both windings operated at 100 kV or higher. This needs further detail and definition to be helpful in determining if the facility is included or excluded. An example of this is a distribution transformer (e.g. 138/34 kV) tapped from a BES line with a high side protective device (such as a circuit switcher or ground switch), in which case the BES line to which it is connected will trip (and may or not lockout) for a fault in the transformer. Should the distribution transformer lockout the BES line to which it is connected, and then it should be included in the BES. If the distribution transformer only trips the BES line to which it is connected (and successfully recloses), it could be argued whether it should be included in the BES or not. But this issue needs to be addressed in the revised BES definition.
<p><b>Response:</b> The SDT feels that your comment does not illustrate a readily identifiable bright-line designation. Bright-line designations will be developed as part of this project and the ROP process will handle any exemptions or inclusions and those will be addressed through the revision of the Rules of Procedure; which is a separate parallel effort to the development of the BES definition. Your comments will be forwarded to the Rules of Procedure Team.</p>		
Snohomish County PUD	No	We note that many transformers with both windings above 100 kV may be installed on radial systems or local networks used to provide local distribution service. Transformers installed on such systems should not be part of the BES regardless of operating voltage. We also note that in Order No. 743, FERC made clear that it
PNGC Power	No	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 1 Comment
Blachly-Lane Electric Co-op	No	<p>does not intend the Standards Drafting Team to change the exception for radial facilities, and expects the standards development process to provide a definition for “radial” so that facilities that meet this criteria may be excluded by inspection rather than by going through an exemption process.</p> <p>The Standards Drafting Team should also clarify that transformer protection systems are part of the BES only if installed to protect “BES transformers” (transformer with both windings above 200kV).</p>
Clearwater Power Co.	No	
Douglas Electric Cooperative	No	
Central Electric Cooperative, Inc. (Redmond Oregon)	No	
Raft River Rural Electric Cooperative	No	
Northern Lights Inc.	No	
Salmon River Electric Cooperative	No

Lincoln Electric Cooperative	No	

Organization	Yes or No	Question 1 Comment
Fall River Electric Cooperative	No	<p><b>Response:</b> The SDT agrees with your suggestion and has incorporated it in its latest proposal.</p> <ul style="list-style-type: none"> <li>Included in the BES: I1 - Transformers, other than generator step-up (GSU) transformers, including phase angle regulators, with two windings of 100 kV or higher unless excluded under Exclusions E1 and E3.</li> </ul> <p>Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:</p> <ol style="list-style-type: none"> <li>Only serving Load. A normally open switching device between radial systems may operate in a ‘make-before-break’ fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,</li> <li>Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,</li> <li>Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.</li> </ol> <p>The SDT has discussed this issue and will be seeking guidance from FERC staff in regards to the directives in FERC Order No. 743 and how they potentially apply to Protection Systems. Protection Systems are not currently within the scope of the SAR for this project and any significant expansion could potentially jeopardize the ability of the SDT to complete this project and file in accordance with the Commission directed time requirements in FERC Order No. 743.</p>
Utility Services	No	<p>Initially, yes; however, such a classification could be exempted upon a NERC review of the technical justification for exemption.</p> <p>We suggest that the BES definition be changed to: All Transmission and Generation Elements operated at voltages of 100 kV or higher; unless modified by the BES Exemption Process.</p> <p>We note that the term Facility, as defined in the NERC Glossary, implies that it is part of the BES. We suggest that the BES definition just use the term Element since Facility is already defined as being a part of the BES.</p> <p>We envision the BES Exemption Process containing 3 sub-processes; one for Exclusion, one for Exemption, and one for Inclusion. Each sub-process will establish provisions and guidelines for the three different tasks. In order to ensure consistency across the continent, it is our view that NERC will be the facilitator of these processes. We believe that NERC may choose to provide that some of these tasks may be performed at the regional levels through the existing delegation agreements.</p> <p>For “Exclusion”, we envision NERC establishing a first set of Exclusions, with FERC’s acceptance, that Registered Entities can utilize as a means to justify not registering within the ERO or as a means to not have</p>

Organization	Yes or No	Question 1 Comment
		<p>to meet the compliance obligations of specific reliability standards and or requirements. NERC would also be in a position to add or remove Exclusions provided such was performed through notification to the industry and industry's acceptance. If a Registered Entity uses a listed accepted Exclusion, it would be our expectation that the RE would be treated in a manner similar to an unregistered organization, in that penalties or sanctions could not be assessed during the exclusionary period. NERC would have the ability to revoke an RE's use of an Exclusion prospectively only. However, If NERC or the Regional Entity determined that a Registered Entity intentionally claimed an accepted Exclusion; and it turned out to be knowingly false, the Registered Entity would be subject to penalties and or sanctions appropriate to the period of the falsehood. In order for Elements to be "Included" or "Exempted", we envision that NERC will establish a set of criteria including outlining the types of permissible technical studies or documentation necessary to seek inclusion or an exemption.</p> <p>We feel that any inclusion or exemption should be handled on an Element by Element basis, not by broad application of a set of Elements. Each should be judged based upon its technical merits of the Element(s) involved.</p> <p>While an inclusion or exemption is pending, the Registered Entity shall not be subject to the performance obligations under the any reliability standard(s) associated with the Element(s) being considered.</p> <p>For Inclusion, any Registered Entity may submit Element(s) with the appropriate materials meeting the criteria for Inclusion.</p> <p>For there to be consistency within the ERO, NERC must be the evaluator of the requests. We believe there must be a measurable, not subjective, improvement in the reliability of the transmission system for the Element(s) to be included.</p> <p>All Registered Entities, including applicable RCs, BAs, TOPs, and Regional Entities, who would be impacted by the proposed Inclusion must be provided sufficient notice and time to participate in the consideration process. NERC shall render a decision following the timely submission from the potentially impacted Registered Entities.</p> <p>For an Exemption to be granted, any Registered Entity may submit Element(s) with the appropriate materials meeting the criteria for Exemption.</p> <p>For there to be consistency within the ERO, NERC must be the evaluator of the requests. We believe there must be no measurable, not subjective, decrease in the reliability of the transmission system for the Element(s) to be included.</p> <p>All Registered Entities, including applicable RCs, BAs, TOPs, and Regional Entities, who would be impacted by the proposed exemption must be provided sufficient notice and time to participate in the consideration process. NERC shall render a decision following the timely submission from the potentially impacted</p>

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 1 Comment
		<p>Registered Entities.</p> <p>We note that BES Exemption Process must be an active and ongoing aspect of the ERO program. With the addition of new or deletion of existing Transmission and Generation Elements, Facilities, or systems; it needs to be recognized that Exclusions, Inclusions, and Exemptions could possibly need alteration over time. By establishing appropriate guidelines and processes, the ERO will be able to monitor and maintain information of what is the bulk electric system or BES.</p>
<p><b>Response:</b> The SDT thanks you for your comments on the inclusion of transformers.</p> <p>The SDT agrees with your view that a briefer, more concise definition is beneficial and has incorporated it in the latest proposal.</p> <p>The SDT agrees with the use of the term, “Elements” rather than “Facilities” and has corrected its use throughout the proposal.</p> <p>The SDT does not share your view of the BES exception process. Bright-line designations will be developed as part of this project and the ROP process will handle any exceptions and those will be addressed through the revision of the Rules of Procedure which is a separate parallel effort to the development of the BES definition utilizing a different team. Your comments will be forwarded to the Rules of Procedure Team.</p>		
The Dow Chemical Company		<p>The Dow Chemical Company (“Dow”) recommends that NERC finalize a basic framework for identifying BES facilities before evaluating individual facilities or types of facilities. Such a framework is recommended by Dow in response to questions #11 and #12 below.</p>
<p><b>Response:</b> See response to Q11 &amp; 12.</p>		
<p>Constellation Power Source Generation, Inc. (“CPSG”) filing on behalf of Constellation Energy Group, Inc. (“CEG”), Constellation Energy Commodities Group, Inc. (“CCG”), Constellation Energy Control and Dispatch, LLC (“CDD”), Constellation NewEnergy, Inc., (“CNE”) and Constellation Energy Nuclear Group, LLC, (“CENG”)</p>	Yes	<p>Constellation firmly believes that the classifications found in the Compliance Registry Criteria - Section III (Rules of Procedure Appendix 5B), such as that cited in this question, provide a useful basis to create a comprehensive, revised BES definition.</p> <p>Further, we propose that the BES drafting team incorporate the criteria directly into the revised BES definition, replacing the term “bulk power system” in each criterion with “greater than 100 kV.” This would then include assets that are currently registered as BES elements as well as those that may have been previously excluded due to Regional exemption variances. Structuring the revised BES definition to clarify both the inclusions and exclusions, can, ideally, eliminate the need for an onerous exemption process as well as eliminate the need for Section III of the Registry Criteria.</p> <p>Please see our response to question 12 for more detail on a proposed alternative approach to structuring the BES definition revision.</p>
<p><b>Response:</b> The SDT agrees and has incorporated as one of its goals that it will not drive a change in the registry criteria if at all possible. .</p>		

Organization	Yes or No	Question 1 Comment
<p>The SDT agrees with your suggestion and has incorporated it in its latest proposal. Please see response to Question 12.</p>		
Florida Municipal Power Agency	Yes	In general, yes, unless it is part of a radial Element that is excluded from the BES.
Transmission Access Policy Study Group	Yes	<p>See FMPA response to Question 12 below. Throughout these comments, FMPA refers to “Elements” and not to “facilities.”</p> <p>This is because “Facility” is defined in the NERC Glossary as “[a] set of electrical equipment that operates as a single Bulk Electric System Element...” Because these comments (and the BES definition) address whether Elements are or are not part of the BES, it is incorrect to refer to the Elements in question as “Facilities,” because a Facility is defined as a BES Element.</p>
<p><b>Response:</b> The SDT agrees with your suggestion and has incorporated it in its latest proposal.</p> <ul style="list-style-type: none"> <li>Included in the BES: I1 - Transformers, other than generator step-up (GSU) transformers, including phase angle regulators, with two windings of 100 kV or higher unless excluded under Exclusions E1 and E3.</li> </ul> <p>Excluded from the BES: Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:</p> <ol style="list-style-type: none"> <li>Only serving Load. A normally open switching device between radial systems may operate in a ‘make-before-break’ fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,</li> <li>Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,</li> <li>Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.</li> </ol> <p>See response to Q12.</p> <p>The SDT agrees with the use of the term, “Elements” rather than “Facilities” and has corrected its use throughout the proposal.</p>		
NERC Staff	Yes	Please see additional comments in Attachment 3 at the end of this report.
<p><b>Response:</b> Please see response to Q13.</p>		
Public Service Enterprise Group Company	Yes	The PSEG Companies consider transformers with primary and secondary windings of greater than 100 kV, and which are not GSU transformers to be part of the BES.

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 1 Comment
Competitive Suppliers	Yes	EPISA believes that it is appropriate that transformers other than generator step-up transformers, including Phase Angle Regulators, with primary and secondary windings of 100 kV or higher should be classified as part of the BES under the proposed definition for Project 2010-17.
SERC EC Planning Standards Subcommittee	Yes	
MRO's NERC Standards Review Subcommittee	Yes	Yes, since FERC has directed the bright-line criteria is 100kV or above.
IRC Standards Review Committee	Yes	
Bonneville Power Administration	Yes	
FirstEnergy Corp	Yes	
SERC OC Standards Review Group	Yes	
Arizona Public Service Company	Yes	AZPS agrees that Transformers, other than Generator Step-up (GSU) transformers, including Phase Angle Regulators, with both primary and secondary windings of 100 kV or higher should be classified as part of the BES.
Pepco Holdings Inc.	Yes	Transformers with primary greater than 100kv (connected to a BES facility) but a secondary less than 100kv are not specially addressed. They should be specially "excluded" and not part of an exemption process.
LCRA Transmission Services Corporation	Yes	ERCOT, this would include the 138:345-kV autotransformers.
Manitoba Hydro	Yes	
North Carolina EMC	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 1 Comment
on behalf of Teck Metals Ltd.	Yes	
Southern California Edison	Yes	SCE currently reports on many of its transformers with both primary and secondary windings of 100kV or higher.
on behalf of Catalyst Paper Corporation	Yes	
City of Grand Island	Yes	
ISO New England Inc.	Yes	
Entergy Services	Yes	
United Illuminating Company	Yes	
American Transmission company	Yes	
City of Austin dba Austin Energy	Yes	
Duke Energy	Yes	Only those transformers that are not a radial Transmission Element should be included.
The Dayton Power and Light Company	Yes	
ITC Holdings Corp	Yes	
BGE	Yes	No comment.
City Water Light and Power (CWLP) - Springfield, IL	Yes	
American Electric Power (AEP)	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

---

Organization	Yes or No	Question 1 Comment
Southern Company	Yes	Only non-radial networked transformers with both primary and secondary voltages >_100kV should be included in the BES definition.
Idaho Power	Yes	
Independent Electricity System Operator	Yes	Conditional on having an exemption criteria/process which must still be developed.
Springfield Utility Board	Yes	If BOTH primary AND secondary windings are 100kV or higher
Clark Public Utilities	Yes	
Xcel Energy	Yes	
City of Redding	Yes	Only if the elements or facilities are shown through engineering studies to be necessary to reliably operate an interconnected transmission system.
<p><b>Response:</b> Thank you for your response. Please see the summary consideration immediately under the question. Several stakeholders made suggestions that were adopted by the drafting team.</p>		

**2. Should the following be classified as part of the BES?**

- **Individual generation resources (including GSU transformers and the associated generator interconnecting line lead(s)) greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above**

**Summary Consideration:** Most Stakeholders who responded to this question disagreed with at least some part of the proposal.

The SDT has discussed the history and determination of the 20 MVA threshold for inclusion of generating units in the Statement of Compliance Registry Criteria and subsequently into a draft definition of the BES. Two Regional Entities (FRCC and RFC) specifically use this criterion in each of their current BES definitions. The 20 MVA unit is a low enough level to capture most generating units that have an effect on the reliability of the BES and that may be dispatched by Balancing Authorities, but allows for the exclusion of smaller units, such as 10 MVA units, connected to the BES that may not be dispatched by Balancing Authorities. The SDT believes that the 20 MVA threshold for inclusion of generating units connected at 100 kV and above is proper for inclusion in the BES since there is no technical basis to change the values contained in the Statement of Compliance Registry Criteria. The SDT also has carefully discussed the inclusion of generator step-up (GSU) transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable. The SDT believes it does not make sense to include generation in the BES without including the Facilities to transfer power from a generating unit to the BES. The GSUs and line leads must be a part of the BES the same as other Facilities are part of the BES.

Commenters have suggested other thresholds (anywhere from 0 to 100 MVA) for generation plants to be included into the BES definition. However, as of this date commenters have not submitted technical justification upon which to base a significant departure from the generation MVA thresholds included in the NERC Statement of Compliance Registry Criteria.

Included in the BES: I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.

Included in BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.

Included in the BES: I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.

Excluded from the BES: E2 - A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer's side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	Some generators act as a local load modifier, regardless of connected voltage. The power generated is consumed locally and does not flow up onto the BES, nor does its operation materially impact any BES transmission facilities. If a generator functions as a local load modifier and does not materially impact the BES, meaning that it is not necessary to maintain BES reliability, then it should be excluded from the definition of BES under the BES Exemption Process.
Orange and Rockland Utilities, Inc.	No	Some generators act as a local load modifier, regardless of connected voltage. The power generated is consumed locally and does not flow up onto the BES, nor does its operation materially impact any BES transmission facilities. If a generator functions as a local load modifier and does not materially impact the BES, meaning that it is not necessary to maintain BES reliability, then it should be excluded from the definition of BES under the BES Exemption process.
<p><b>Response:</b> The SDT has discussed the behind-the-meter customer generation issues and has addressed it in the revised BES definition.</p> <p>Excluded from the BES: E2 - A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer's side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in items I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.</p>		
Public Service Enterprise Group Company	No	The concept of a stand-alone generator connected through a single GSU transformer to the grid at greater than 100kV should be included as part of the BES. However, the term "generation resources" is too vague leading to possible misinterpretation as to what associated generator resource elements are to be included within the BES. All those "resources" and any connected element would be part of the BES? The definition should clearly describe (with examples) of the intent of what should be included within the BES scope.. (e.g. Would a station service transformer connected at 26kV which is part of the generation "resource" be included as a BES element)?
<p><b>Response:</b> The SDT has discussed what constitutes a "generation resource" including balance of generation plant controls and auxiliary equipment and believes that balance of plant equipment is not within the scope of this project. The term "generation resource" is no longer used in the revised definition. Certain equipment, such as protection systems and under-frequency Load shed controls, may not be part of the BES, but may be subject to specific NERC standards requirements. Generation plant controls should be treated in a similar fashion.</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 2 Comment
Electric Market Policy	No	Dominion does not agree that a generation resource should be classified as part of the BES. Dominion supports the criteria for registering owners, operators, and users of the bulk power system, as indicated in the current Statement of Compliance Registry Criteria .
<p><b>Response:</b> The SDT has carefully considered this matter, and believes that generating units and plants are an integral part of the BES, without which it could not function, and therefore, should be included in the BES.</p>		
SERC OC Standards Review Group	No	<p>We do not agree with the inclusion of GSU transformers and associated interconnecting line leads. Lines and transformers should be included based upon the voltage and not the function they serve.</p> <p>We support the inclusion of all non-radial lines operated at a voltage of 100 kV or higher as well as all transformers with both primary and secondary windings operated at 100 kV or higher.</p> <p>We do not support generic inclusions of any radial lines or transformers with primary or secondary windings operated below 100kV. Our response in question 13 amplifies this statement.</p>
<p><b>Response:</b> The SDT has carefully discussed the inclusion of GSU transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable. The SDT believes it does not make sense to include generation in the BES without including the Facilities to transfer power from a generating unit to the BES. The GSUs and line leads must be a part of the BES the same as other Facilities are part of the BES.</p> <p>Please also see the response to Q13.</p>		
PacifiCorp	No	<p>In Order No. 743, the Commission directed NERC to adopt an exemption process for excluding facilities from the definition of the BES that are not necessary to operate an interconnected electric transmission network. In order to determine which facilities may be excluded, there must be criteria and a methodology that may be applied to identify which facilities are “necessary” to operate an interconnected electric transmission network and which “transmission and generation” facilities are not. In other words, there must be a clear way to determine what makes a particular facility is “necessary” for bulk system operation. Application of the criteria and methodology will result in the identification of the facilities that may be excluded. The comment questions asked in this questionnaire cannot be answered in a meaningful way absent this methodology. Significant efforts have been undertaken by the WECC Bulk Electric System Definition Task Force (BESDTF) over the course of the past year to identify some initial criteria and methodologies. These efforts are ongoing and should be supported by the NERC drafting team. For example: Generation units should not be included or excluded solely based on a their gross nameplate rating and the operating voltage at which they are connected to transmission facilities. Generation resources which are necessary to operate the interconnected network should be included as part of the regulated BES. Generating units which are not “necessary for the operation of the interconnected network” should be excluded. A methodology needs to be developed to</p>

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 2 Comment
		determine which generating units may be excluded as part of the regulated BES.
Central Lincoln	No	The generation resources so described should be presumed to be part of the BES unless or until they have been through the exemption process and as a result have been classified as non-BES.
PUD No.1 of Clallam County	No	The generation resources so described should be presumed to be part of the BES unless or until they have been through the exemption process and as a result have been classified as non-BES. The 20 MVA threshold is too low for many parts of the system. The interconnecting source impedance and adjacent facilities may have a more significant impact on the BES than the MVA of a machine. A 100 MVA plant connected to a high fault duty/low source impedance system may create little to thermal or transient stability concerns even under delayed clearing. However a 25 MVA plant connected to a low fault duty/high source impedance system may create concerns on a weak system. or above.
Snohomish County PUD	No	The generation resources described should not be presumed to be part of the BES. The criteria above are intended to identify GO/GOP registration as a user/owner/operator rather than to identify BES elements. On this score, we note there has been considerable confusion between the NERC Statement of Registry Criteria, which is merely intended to establish a list of entities that may presumptively be required to comply with Reliability Standards, and the BES definition, which defines which facilities are ultimately protected by Reliability Standards. In defining the BES, those concepts should be kept separate.
<p><b>Response:</b> The SDT believes the revised definition contains enough criteria (both for exceptions and inclusions) to determine most, if not all, of the Elements that will be part of the BES. The SDT also believes that the criteria for including generating units 20 MVA and greater that are connected to the BES at 100 kV and above provides the “bright-line” criteria that will eliminate the ambiguity the Commission cited in Order 743.</p> <p>The separate exception process will be drafted by the Rules of Procedure Drafting Team with the DBES SDT developing the bright-line criteria. There will be coordination between the two groups in this effort.</p>		
Hydro-Québec		For questions 1 to 10, refer to questions 11 to 13.
<p><b>Response:</b> Please see response to Q11 to Q13.</p>		
City of Redding	No	The NERC Registration Criteria thresholds were a good start at the time of implementation of the compliance program, however there is no engineering evidence that all of the facilities are necessary to reliably operate an interconnected transmission system.
Independent Electricity System	No	To be totally consistent with the 100 kV bright line approach, any Elements and Facilities that are not operated at voltages of 100 kV or higher should be excluded unless otherwise determined to be included

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 2 Comment
Operator		through the exemption/inclusion process being developed.
Lewis County PUD	No	20MVA generation resources should not be part of the BES. This size generating resource is too small to affect the BES. Suggest the minimum size BES resource be changed to 100MVA for a single generator. If a smaller threshold is used then the RE or BA should demonstrate to the GO that this resource is critical to the BES
ITC Holdings Corp	No	20 MVA is too small a unit to be included in the BES definition. The definition should include units or plants with 75 MVA or more
Glacier Electric Cooperative	No	Once again, I believe it depends on the facility and whether or not it has a significant impact on the grid.
American Municipal Power	No	Suggest 50 MVA
Arizona Public Service Company	No	The minimum size should be 50 MVA connected to 200 kV or higher. Small generators or plants do not materially impact the reliability of the BES and do not need to be included.
PPL Energy Plus	No	The 20 MVA threshold appears to be arbitrary and will include many small generation facilities that have minimal impact on BES reliability, A 200 MVA aggregate threshold for generating units at the same site would be more appropriate. Generators that are smaller than 200 MVA are not likely to have a significant impact on the BES and should be excluded from the definition (without requiring application for an exemption on a case-by-case basis). The BES definition should be modified to incorporate this exclusion.(See also response to Question 8.)
LG&E and KU Energy LLC	No	
<p><b>Response:</b> The SDT has carefully considered this threshold, and believes that the 20 MVA unit is a low enough level to capture most generating units that have an effect on the reliability of the BES and may be dispatched by Balancing Authorities, but allows the exclusion of smaller units, such as 10 MVA units, connected to the BES that may not be dispatched by Balancing Authorities. The SDT believes the 20 MVA threshold for inclusion of generating units connected to the BES is proper.</p>		
ExxonMobil Research and Engineering	No	I have reservations about the removal of the ability to use the net rating of a generation asset as the generator rating (i.e. the use of gross rating of a machine instead of net rating of the energy provided to the BES). Many industrial companies have back up power agreements with utilities to cover the loss of internal generation assets. The requirement to ensure that this back up power can be provided should be part of the NERC requirements for Transmission Operators and Balancing Authorities (e.g. the VAR-001 requirement for TOPs to obtain the necessary reactive resources to cover normal and contingency operations). The reliability goals and strategy of some large electricity consumers that this change is targeting differ from the bulk

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 2 Comment
		<p>electric system. For instance, a petrochemical facility that utilizes generation to offset the load seen by the BES may desire to disconnect from the bulk electric system during an event in order to preserve the stability of the private use network that supplies electricity to the equipment that control its chemical processes. As history has demonstrated, the most dangerous activities that petrochemical facilities undertake are the shutdown and startup of their processes.</p> <p>As a side note, the term 'directly connected' should be added to the NERC glossary. The concept of 'directly connected' is the key to understanding which generators are included in the BES and which generators are exempted.</p>
<p><b>Response:</b> The SDT has carefully considered “behind-the-meter” generation, and considers it to be an exclusion to the BES. The SDT agrees with the language currently contained in the Statement of Compliance Registry Criteria regarding the exemption of net capacity associated with a retail meter.</p> <p>Excluded from the BES: A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer’s side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.</p> <p>With the revised definition and designations, the SDT does not believe that the term ‘directly connected’ needs to be utilized or defined.</p>		
on behalf of Teck Metals Ltd.	No	
Indeck Energy Services	No	Same response as Question 1
on behalf of Catalyst Paper Corporation	No	
Clark Public Utilities	No	
<p><b>Response:</b> Please see response to Question 1.</p>		
City of Grand Island	No	<p>This is a registration criteria issue. Can this project directly cause changes in the registration criteria?</p> <p>20 MVA is too low. That size of generator can not affect the Adequate Level of Reliability of the BES. 100 MVA is appropriate for this region.</p>
<p><b>Response:</b> The goal of the SDT is not to change registration criteria if at all possible. In this case, the SDT has adopted the registration criteria and no changes are necessary.</p>		

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 2 Comment
<p>The SDT has carefully considered this threshold, and believes that the 20 MVA unit is a low enough level to capture most generating units that have an effect on the reliability of the BES and may be dispatched by Balancing Authorities, but allows the exclusion of smaller units, such as 10 MVA units, directly connected to the BES that may not be dispatched by Balancing Authorities. The SDT believes the 20 MVA threshold for inclusion of generating units directly connected to the BES is proper.</p>		
City of Anaheim	No	<p>Unless the generator is required to maintain BES reliability, i.e. black start, etc., the GSU and gen tie should be excluded from the BES; provided, however, to eliminate any reliability gaps, such generation-tie equipment should be classified as "Generator" equipment subject to GO/GOP standards, and the PRC and vegetation management standards should be made applicable to GO/GOPs and this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for non-critical generation-tie transmission elements that are not required for the reliable operation of the BES.</p>
<p><b>Response:</b> The SDT has carefully discussed the inclusion of GSU transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable. The SDT believes it does not make sense to include generation in the BES without including the Facilities to transfer power from a generating unit to the BES. The GSUs and line leads must be a part of the BES the same as other Facilities are part of the BES. The SDT has carefully considered additional Facilities that may be included in the BES due to this project and the ramifications on registration of GO/GOPs and TO/TOPs. However, the SDT must satisfy the Commission Order and do what is best for reliability of the BES. The development of the BES definition is not meant to result in registration of GO/GOPs as TO/TOPs. That issue will be addressed as needed in Project 2010-07: Generator Requirements at the Transmission Interface.</p>		
PNGC Power	No	<p>The generation resources described should not be presumed to be part of the BES. The criteria above are intended to identify GO/GOP registration as a user/owner/operator rather than to identify BES elements. On this score, we note there has been considerable confusion between the NERC Statement of Registry Criteria, which is merely intended to establish a list of entities that may presumptively be required to comply with Reliability Standards, and the BES definition, that defines which facilities are ultimately protected by Reliability Standards. In defining the BES, those concepts should be kept separate. In general, we do not believe that every generator rated at, or greater than, 20MVA should automatically be 'assumed' to be part of the BES. We do believe that some of the Mandatory Reliability Standards should apply however. This leads to an issue which might be somewhat philosophical, but, in this case, has real-world implications. We do not believe that the BES is contiguous. That is, say every generator which is greater than 20MVA is assumed to be part of the BES, does that mean that all the lines and equipment associated with this generator are also part of the BES? We do not think so, hence the possibility that the BES is non-contiguous. We also believe that some of the Mandatory Reliability Standards can apply to non-BES facilities, and equipment. A good example is the UFLS standards. As you might realize some UFLS relays are on lines rated well below 100kV. So in this case, a generator rated at 20MVA might not be part of the BES, but still the standards that apply to</p>

<p>an effect on the reliability of the BES and may be dispatched by Balancing Authorities, but allows the exclusion of smaller units, such as 10 MVA units, directly connected to the BES that may not be dispatched by Balancing Authorities. The SDT believes the 20 MVA threshold for inclusion of generating units directly connected to the BES is proper. The SDT also believes that the criteria of including generating units 20 MVA and greater that are connected to the BES at 100 kV and above provides the “bright-line” criteria that will eliminate the ambiguity the Commission cited in Order 743.</p>		
Southern Company	No	<p>Lines and transformers should be included based upon the voltage and not the function they serve. We support the inclusion of all non-radial lines operated at a voltage of 100 kV or higher as well as all transformers with both primary and secondary windings operated at 100 kV or higher. We do not support generic inclusions of any radial lines or transformers with primary or secondary windings operated below 100kV. Our response in question 13 amplifies this statement. Individual, non-blackstart, generator resources of 20MVA are too small to impact the reliability of the BES. We recommend single resource (unit) inclusion threshold be increased to 75MVA to match the threshold indicated in Q3 below for the aggregated case. Units smaller than 75MVA could be included using the “exemption process” or the NERC Compliance Registry Criteria could be changed.</p>
<p><b>Response:</b> Lines and transformers are discussed as part of Questions 1 and 5.</p> <p>The SDT has carefully considered this threshold, and believes that the 20 MVA unit is a low enough level to capture most generating units that have an effect on the reliability of the BES and may be dispatched by Balancing Authorities, but allows the exclusion of smaller units, such as 10 MVA units, directly connected to the BES that may not be dispatched by Balancing Authorities. The SDT believes the 20 MVA threshold for inclusion of generating units connected to the BES is proper.</p>		
The Dow Chemical Company		<p>As discussed in response to question #12 below, issues relating to the registry criteria applicable to generation resources should not be revisited at this time.</p>
<p><b>Response:</b> See response to Q12.</p>		
Bonneville Power Administration	Yes	<p>Generation resources should also define how wind generation is included in this clarification (by turbine, by string, etc)</p>
<p><b>Response:</b> Wind generating units would be included or excluded based upon the criteria for dispersed generation, generating units, and multiple generating units.</p> <p>Included in the BES: 15 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.</p>		
Florida Municipal Power Agency	Yes	<p>1. For the sake of clarity and consistency, the BES should track the Statement of Compliance Registry Criteria</p>

Organization	Yes or No	Question 2 Comment
Transmission Access Policy Study Group	Yes	<p>wherever possible. In this case, for example, generation resources with respect to which an entity is registered as a Generator Owner or Generator Operator should be included in the BES, while non-registered generation resources should not be included in the BES.</p> <p>2. FMPA' proposal, as further explained in response to the questions below, is introduced here in the interests of clarity. FMPA proposes that the BES definition should establish the universe of Elements that are, absent other factors, considered part of the BES. FMPA supports continuing to use a general 100 kV threshold, and basing the inclusion of generators in the BES on whether the generation is registered pursuant to the Statement of Compliance Registry Criteria. There is one "exclusion" in the definition proposed by FMPA, i.e., the existing exclusion for radial transmission serving only load with one transmission source (with a proposed clarification). Unlike the definition proposed in the draft SAR, therefore, but like the current definition, FMPA' proposal treats radial transmission Elements serving only load with one transmission source like sub-100 kV Elements, in that they are presumed to be non-BES unless a showing has been made, on a case-by-case basis, that a particular radial Element is necessary for operating the interconnected electric transmission network. The current definition of the BES excludes "radial transmission facilities serving only load with one transmission source," and FERC stated in Order 743 that it did not intend to require a change to that exclusion. It is very important that radial transmission serving only load with one transmission source remain excluded from the BES; if such radials instead had to go through an exemption process, as the SDT's proposed definition suggests, the burden on small entities and on NERC and the Regional Entities would be staggering since it would be presumed that the radial would be part of the BES until exempted (opt-out), where it should be that the radial should be excluded from the BES unless there is a determination that it should be part of the BES (opt-in).</p> <p>3. As explained in more detail in response to Question 8 below, FMPA supports adding the clarification that radials serving generation that is not registered pursuant to the Statement of Compliance Registry Criteria are covered by the exclusion of radials serving only load with one transmission source. Of course, the application of the definition of the BES is dynamic. For example, in considering whether new generation connected by what had previously been a radial to load should be registered, NERC may also reevaluate the exclusion of the radial.</p> <p>4. FMPA' proposed definition of the BES is: In general, the Bulk Electric System includes all Transmission Elements operated at voltages of 100 kV or higher, and all generation resources registered pursuant to the Statement of Compliance Registry Criteria. Radial Transmission Elements serving only load with one Transmission source are generally not included in this definition. A radial Transmission Element may be considered as "serving only load" for purposes of the foregoing general exclusion even if it connects generation, so long as that generation is not registered pursuant to the Statement of Compliance Registry Criteria. An Element that nominally meets the general BES criteria, but which an entity demonstrates, on a case-by-case basis, is not necessary for operating the interconnected electric transmission network, shall be exempted from the BES pursuant to the NERC exemption process. An Element that does not nominally meet the general BES criteria, but which NERC demonstrates, on a case-by-case basis, is necessary for</p>

Organization	Yes or No	Question 2 Comment
		<p>operating the interconnected electric transmission network, shall be included in the BES pursuant to the NERC inclusion process.</p> <p>5. As FMPA' proposed definition suggests, FMPA proposes that entities be able to seek "exemptions" for Elements nominally included in the BES; obtaining an exemption would require a demonstration that the Element to be exempted is not necessary for operating the interconnected electric transmission network. Elements for which NERC has approved exemptions would not be part of the BES.</p> <p>Conversely, FMPA proposes that NERC have the authority, upon a case-by-case demonstration that a particular Element that is not nominally included in the BES is necessary for operating the interconnected electric transmission network, to add such an Element to the BES.</p> <p>6. Please see also FMPA' Official Comment Form for BES Definition Exception Process, submitted today.</p>
<p><b>Response:</b></p> <ol style="list-style-type: none"> <li>1. The SDT agrees that the definition should track the registry criteria. One of the basic tenets of the SDT scope is to not expand the registry criteria if at all possible.</li> <li>2. The SDT has revised the definition and included specific inclusion and exclusion criteria that address these issues. The SDT also believes that the revised definition provides the "bright-line" criteria that will eliminate the ambiguity the Commission cited in Order 743. The separate exception process will be drafted by the Rules of Procedure Team with the DBESSDT developing the criteria. There will be coordination between the two groups in this effort.</li> <li>3. ReliabilityFirst	Yes	<p>It is recommended that the term "directly connected" be defined and examples of this term are included in the ERO definition.</p> <p>Also, most wind farms have multiple transformations when connected to the BES and the intent should be to capture these wind farms in the BES, so more specific language is most likely needed in the definition to capture them.</p>
<p><b>Response:</b> The SDT has revised the definition and "directly connected" is no longer utilized in the revised draft definition.</p> <p>The SDT has addressed the issue of wind generation in the revised draft definition.</p> <p>Included in the BES: I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.</p>		

Organization	Yes or No	Question 2 Comment
NERC Staff	Yes	Please see additional comments at the end of this report.
<b>Response:</b> Please see response to Q13.		
Constellation Power Source Generation, Inc. (“CPSG”) filing on behalf of Constellation Energy Group, Inc. (“CEG”), Constellation Energy Commodities Group, Inc. (“CCG”), Constellation Energy Control and Dispatch, LLC (“CDD”), Constellation NewEnergy, Inc., (“CNE”) and Constellation Energy Nuclear Group, LLC, (“CENG”)	Yes	<p>Constellation firmly believes that the classifications found in the Compliance Registry Criteria - Section III (Rules of Procedure Appendix 5B), such as that cited in this question, provide a useful basis to create a comprehensive, revised BES definition.</p> <p>Further, we propose that the BES drafting team incorporate the criteria directly into the revised BES definition, replacing the term “bulk power system” in each criterion with “greater than 100 kV.” This would then include assets that are currently registered as BES elements as well as those that may have been previously excluded due to Regional exemption variances. Structuring the revised BES definition to clarify both the inclusions and exclusions, can, ideally, eliminate the need for an onerous exemption process as well as eliminate the need for Section III of the Registry Criteria.</p> <p>Please see our response to question 11 for more detail on a proposed alternative approach to structuring the BES definition revision.</p>
<p><b>Response:</b> The SDT agrees that the definition should track the registry criteria. One of the basic tenets of the SDT scope is to not expand the registry criteria if at all possible</p> <p>The SDT agrees and has made the suggested change.</p> <p>See response to Q11.</p>		
Occidental Energy Ventures Corp	Yes	<p>Many generator interconnection lines are operated at voltages greater than 100KV, but have traditionally not been considered part of the the transmission system. Rather these lines have been considered part of the generation system and, for quite some time, have been constructed and operated according to interconnection agreements which specify design and protection criteria. The BES definition should not be constructed in either a direct or implied manner that would alter the interconnection line status as being part of the Generation Facilities. Otherwise, it could result in registration of GO/GOPs as TO/TOPs. The issue of what additional standards, if any, should apply to these generation interconnection lines is the subject of Project 2010-07 and should be resolved by that standards development effort, not by a definition change. The proposed definition appears not to violate the inclusion of the interconnection line as part of the Generation Facility while still providing for these lines to be part of the BES, however, some clarification might be advisable (e.g., a statement that interconnection lines are part of the Generation Facility or are Generation Elements).</p>

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 2 Comment
<p><b>Response:</b> The SDT has carefully considered additional Facilities that may be included in the BES due to this project and the ramifications on registration of GO/GOPs and TO/TOPs. However, the SDT must satisfy the Commission Order and do what is best for reliability of the BES. The development of the BES definition is not meant to result in registration of GO/GOPs as TO/TOPs. That issue will be addressed as needed in Project 2010-07: Generator Requirements at the Transmission Interface.</p>		
American Transmission company	Yes	<p>For clarity, ATC suggests that the (gross nameplate rating) be changed to read “(gross generator nameplate rating)” and further classified as part of the BES given that a fault or outage of the individual generator resource greater than 20 MVA would not maintain an Adequate Level of Reliability of the BES.</p>
<p><b>Response:</b> The SDT discussed this and does not agree with the suggested wording change.</p>		
LCRA Transmission Services Corporation	Yes	<p>The 20 MVA threshold is too low. Should consider the region’s or area’s reserve margin to determine the appropriate level of individual generator loss. Leave this to the region to determine.</p>
<p><b>Response:</b> The SDT has carefully considered this threshold, and believes that the 20 MVA unit is a low enough level to capture most generating units that have an effect on the reliability of the BES and may be dispatched by Balancing Authorities, but allows the exclusion of smaller units, such as 10 MVA units, connected to the BES that may not be dispatched by Balancing Authorities. The SDT believes the 20 MVA threshold for inclusion of generating units connected to the BES is proper. The SDT’s goal is to “eliminate the regional discretion in the ERO’s current definition”, which is specifically stated in the Commission’s Order.</p>		
Utility Services	Yes	<p>Initially, yes; however, such a classification could be exempted upon a NERC review of the technical justification for exemption.</p>
<p><b>Response:</b> The SDT believes the revised definition will contain enough criteria to determine most, if not all, of the Facilities that will be part of the BES. The exception process will be handled through the revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition. Your comments will be forwarded to the Rules of Procedure Team.</p>		
Xcel Energy	Yes	<p>Xcel Energy believes that clarity should be added as to what constitutes an individual generation resource and a generating plant, especially as it pertains to multiple owner facilities and aggregating facilities such as wind or solar farms (which may also have multiple owners for discreet facilities that tie into a common bus). Discussion and controversy in other NERC and regional forums and standard development teams indicates that this is not well defined. It may be that the Statement of Compliance Registry needs to be enhanced if it forms the foundation for which these items are to be understood.</p>

Organization	Yes or No	Question 2 Comment
		<p><b>Response:</b> The new wording for generating units in the revised definition has addressed this issue. The Statement of Compliance Registry Criteria should agree with the BES definition, as they are intended not to be in conflict with each other.</p> <p>Included in the BES: I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.</p> <p>Included in BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.</p> <p>Included in the BES: I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.</p>
<p>MRO's NERC Standards Review Subcommittee</p>	<p>Yes</p>	<p>The SAR DT should use caution if the above statement is to be used within a guideline or rational box. The use of the word “interconnecting line leads may be somewhat ambiguous and lead to other confusion.</p> <p>GSU should be spelled out as a “generator step up transformer” and properly used within the statement: Individual generation resources (including Generator Step Up transformers and the associated generator interconnecting line lead(s)) greater than 20 MVA (gross nameplate rating) directly connected via a Generator Step-Up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above.</p> <p>For clarity, the NSRS suggests that the (gross nameplate rating) be changed to read “(gross generator nameplate rating)” and further classified as part of the BES given that a fault or outage of the individual generator resource greater than 20 MVA would not maintain an Adequate Level of Reliability of the BES.</p>
		<p><b>Response:</b> The term “interconnecting lines leads” has been deleted in the revised definition.</p> <p>Included in the BES: I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.</p> <p>Included in BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.</p> <p>All acronyms used in the definition and supporting materials will be spelled out.</p> <p>The SDT discussed the wording change to the term “gross generator nameplate rating” and does not agree with the suggested wording change.</p>
<p>SERC EC Planning Standards Subcommittee</p>	<p>Yes</p>	
<p>IRC Standards Review</p>	<p>Yes</p>	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 2 Comment
Committee		
FirstEnergy Corp	Yes	
Competitive Suppliers	Yes	
Pepco Holdings Inc.	Yes	
Manitoba Hydro	Yes	Increasing numbers of small generators could create reliability issues if excluded.
North Carolina EMC	Yes	
Southern California Edison	Yes	SCE currently reports on individual generation resources (including GSU transformers and the associated generator interconnecting line lead(s)) greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above. SCE does not feel a blanket inclusion of all the listed equipment is needed.
Southern California Edison Company	Yes	A GSU transformer is clearly an extension of the functionality provided by the Generator Interconnection Elements, namely, to move bulk power from the BES generator to the BES network, and hence, the classification of the GSU transformer should match that of the Generator Interconnection Elements.
Entergy Services	Yes	
City of Austin dba Austin Energy	Yes	
Duke Energy	Yes	
The Dayton Power and Light Company	Yes	
BGE	Yes	No comment.
City Water Light and Power (CWLP) - Springfield, IL	Yes	

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 2 Comment
American Electric Power (AEP)	Yes	
Idaho Power	Yes	
Springfield Utility Board	Yes	"directly connected" is important.
<b>Response:</b> Thank you for your response. Please see the summary consideration immediately under the question. Several stakeholders made suggestions that were adopted by the drafting team.		

**3. Should the following be classified as part of the BES?**

- **Generation plants (including GSU transformers and the associated generator interconnecting line lead(s))with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above**

**Summary Consideration:** While many commenters did agree with the proposal, most commenters who responded to this question disagreed with some aspect of the proposal.

The SDT believes that generation plants larger than 75 MVA connected above 100kV need to be included within the BES definition. This threshold is based on the generation threshold values found in the NERC Statement of Compliance Registry Criteria. Also, two Regional Entities (FRCC and RFC) specifically use this criterion in each of their current BES definitions. The 75 MVA plant is a low enough level to capture most generating plants that would have an effect on the reliability of the interconnected Transmission network.

Commenters have suggested other thresholds (anywhere from 0 to 300 MVA) for generation plants to be included into the BES definition. However, as of this date commenters have not submitted technical justification upon which to base a significant departure from the generation MVA thresholds included in the NERC Statement of Compliance Registry Criteria.

Included in BES: I3 – Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.

Included in BES: I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.

Excluded from BES: E2 - A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer’s side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.

Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	No	Refer to the response Question 2 above. The answer depends on whether the generator output is consumed locally or is necessary to maintain the reliability of the BES.
PUD No.1 of Clallam County	No	See comments to question2.
Orange and Rockland Utilities, Inc.	No	Refer to the response Question 2 above. The answer depends on whether the generator output is consumed locally or is necessary to maintain the reliability of the BES.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 3 Comment
City of Redding	No	As in question 2, there is no engineering evidence that all of the facilities are necessary to reliably operate an interconnected transmission system.
<b>Response:</b> Please see response to Q2.		
Electric Market Policy	No	Dominion does not agree that generation plants should be classified as part of the BES. Dominion supports the criteria for registering owners, operators, and users of the bulk power system, as indicated in the current Statement of Compliance Registry Criteria .
<p><b>Response:</b> Dominion makes the suggestion that all generators be excluded from the BES, however, Dominion does not provide a technical justification for this significant departure.</p> <p>The SDT believes that generation plants larger than 75 MVA connected above 100kV need to be included within the BES definition. The exception process should allow for the possibility that certain generating plants larger than 75 MVA can be excluded if it can be proven that such plants are not necessary for operating the interconnected Transmission network. Additionally, the Commission in its Order 743 suggests that the revised BES definition should include exception processes for exclusion/inclusion of various Elements. The process for such exclusions/inclusions will be developed as part of the revision to the NERC Rules of Procedure by a different team in a parallel effort to the development of this BES definition.</p>		
SERC OC Standards Review Group	No	<p>We do not agree with the inclusion of GSU transformers and associated interconnecting line leads. Lines and transformers should be included based upon the voltage and not the function they serve.</p> <p>We support the inclusion of all non-radial lines operated at a voltage of 100 kV or higher as well as all transformers with both primary and secondary windings operated at 100 kV or higher. We do not support generic inclusions of any radial lines or transformers with primary or secondary windings operated below 100kV. Our response in question 13 amplifies this statement.</p>
<p><b>Response:</b> SERC has not provided justification for excluding all GSU transformers and associated interconnecting lines leads from the BES.</p> <p>The SDT believes that generation plants larger than 75 MVA connected above 100kV including GSU transformers and interconnecting line leads need to be included within the BES.</p> <p>The SDT has revised the definition and included specific inclusion and exclusion criteria that address these issues.</p> <p>Included in BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.</p>		
PacifiCorp	No	In Order No. 743, the Commission directed NERC to adopt an exemption process for excluding facilities from the definition of the BES that are not necessary to operate an interconnected electric transmission network.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 3 Comment
		<p>In order to determine which facilities may be excluded, there must be criteria and a methodology that may be applied to identify which facilities are “necessary” to operate an interconnected electric transmission network and which “transmission and generation” facilities are not. In other words, there must be a clear way to determine what makes a particular facility is “necessary” for bulk system operation. Application of the criteria and methodology will result in the identification of the facilities that may be excluded. The comment questions asked in this questionnaire cannot be answered in a meaningful way absent this methodology. Significant efforts have been undertaken by the WECC Bulk Electric System Definition Task Force (BESDTF) over the course of the past year to identify some initial criteria and methodologies. These efforts are ongoing and should be supported by the NERC drafting team. For example: Generation plants should not be included or excluded solely based on a their gross nameplate rating and the operating voltage at which they are connected to transmission facilities. Generation plants which are necessary to operate the interconnected network should be included as part of the regulated BES. Generating plants which are not “necessary for the operation of the interconnected network” should be excluded. A methodology needs to be developed to determine which generating plants may be excluded as part of the regulated BES.</p>
<p><b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the exception process, which is being developed as a modification to the NERC Rules of Procedure (ROP). This exception process will be a parallel effort to this BES definition development. The SDT further acknowledges the work of WECC and other regional entities (e.g., RFC, FRCC, and NPCC) in proposing the BES definition, bright lines, and exclusion/inclusion criteria and processes. The work of these regional entities has greatly helped the SDT.</p> <p>The SDT believes that generation plants larger than 75 MVA connected above 100kV need to be included within the BES definition. The exception process should allow for the possibility that certain generating plants larger than 75 MVA can be excluded if it can be proven that such plants are not necessary for operating the interconnected Transmission network. Additionally, the Commission in its Order 743 suggests that the revised BES definition should include exception processes for exclusion/inclusion of various Elements. The process for such exclusions/inclusions will be developed as part of the revision to the NERC Rules of Procedure by a different team in a parallel effort to the development of this BES definition.</p>		
PPL Energy Plus	No	See response to Questions 2 and 8.
LG&E and KU Energy LLC	No	See response to Questions 2 and 8.
<p><b>Response:</b> See response to Q2 &amp; Q8.</p>		
ExxonMobil Research and Engineering	No	<p>I have reservations about the removal of the ability to use the net rating of a generation asset as the generator rating (i.e. the use of gross rating of a machine instead of net rating of the energy provided to the BES). Many industrial companies have back up power agreements with utilities to cover the loss of internal generation assets. The requirement to ensure that this back up power can be provided should be part of the NERC requirements for Transmission Operators and Balancing Authorities (e.g. the VAR-001 requirement for</p>

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 3 Comment
		<p>TOPs to obtain the necessary reactive resources to cover normal and contingency operations). The reliability goals and strategy of some large electricity consumers that this change is targeting differ from the bulk electric system. For instance, a petrochemical facility that utilizes generation to offset the load seen by the BES may desire to disconnect from the bulk electric system during an event in order to preserve the stability of the private use network that supplies electricity to the equipment that control its chemical processes. As history has demonstrated, the most dangerous activities that petrochemical facilities undertake are the shutdown and startup of their processes. As a side note, the term 'directly connected' should be added to the NERC glossary. The concept of 'directly connected' is the key to understanding which generators are included in the BES and which generators are exempted.</p>
<p><b>Response:</b> The SDT's proposed BES definition has exclusion criteria that address these issues.</p> <p>Excluded from BES: E2 - A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer's side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.</p>		
Arizona Public Service Company	No	<p>The minimum plant size should be 300 MVA. Smaller plants do not materially impact the reliability of the BES.</p>
<p><b>Response:</b> The SDT appreciates the suggestion of a 300 MVA generation threshold for materiality of impact, however, as of this date sufficient technical justification has not been submitted upon which to base a significant departure from the generation MVA thresholds included in the NERC Statement of Compliance Registry Criteria.</p> <p>The SDT believes that generation plants larger than 75 MVA connected above 100kV need to be included within the BES definition. The exception process should allow for the possibility that certain generating plants larger than 75 MVA can be excluded if it can be proven that such plants are not necessary for operating the interconnected Transmission network. Additionally, the Commission in its Order 743 suggests that the revised BES definition should include exception processes for exclusion/inclusion of various Elements. The process for such exclusions/inclusions will be developed as part of the revision to the NERC Rules of Procedure by a different team in a parallel effort to the development of this BES definition.</p>		
Central Lincoln	No	<p>The generation resources so described should be presumed to be part of the BES unless or until they have been through the exemption process and as a result have been classified as non-BES.</p>
<p><b>Response:</b> Thank you for your response. The SDT agrees.</p>		
American Municipal Power	No	<p>Suggest 125 MVA</p>

Organization	Yes or No	Question 3 Comment
<p><b>Response:</b> The SDT appreciates the suggestion of a 125 MVA generation threshold, however, as of this date sufficient technical justification has not submitted upon which to base a significant departure from the generation MVA thresholds included in the NERC Statement of Compliance Registry Criteria.</p> <p>The SDT believes that generation plants larger than 75 MVA connected above 100kV need to be included within the BES definition. The exception process should allow for the possibility that certain generating plants larger than 75 MVA can be excluded if it can be proven that such plants are not necessary for operating the interconnected Transmission network. Additionally, the Commission in its Order 743 suggests that the revised BES definition should include exception processes for exclusion/inclusion of various Elements. The process for such exclusions/inclusions will be developed as part of the revision to the NERC Rules of Procedure by a different team in a parallel effort to the development of this BES definition.</p>		
City of Anaheim	No	Unless the generator is required to maintain BES reliability, i.e. black start, etc., the GSU and gen tie should be excluded from the BES; provided, however, to eliminate any reliability gaps, such generation-tie equipment should be classified as "Generator" equipment subject to GO/GOP standards, and the PRC and vegetation management standards should be made applicable to GO/GOPs and this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for non-critical generation-tie transmission elements that are not required for the reliable operation of the BES.
<p><b>Response:</b> The SDT appreciates the City's suggestions, however; the City's recommendations go beyond the SAR scope of work given to the SDT. The SDT has not been charged with determining the applicability of various standards.</p> <p>Also, as of this date sufficient justification has not been submitted demonstrating that GSU transformers and interconnecting generation ties should be excluded from the BES.</p> <p>The SDT believes that generation plants larger than 75 MVA connected above 100kV need to be included within the BES definition. The exception process</p>

Organization	Yes or No	Question 3 Comment
NewEnergy, Inc., (“CNE”) and Constellation Energy Nuclear Group, LLC, (“CENG”)		<p>eliminate the need for Section III of the Registry Criteria.</p> <p>Please see our response to question 11 for more detail on a proposed alternative approach to structuring the BES definition revision.</p>
<p><b>Response:</b> the SDT agrees that the Registry Criteria is a valuable resource for deliberations on a BES definition and has utilized it whenever possible.</p> <p>The SDT agrees and has made the suggested change.</p> <p>See response to Question 11.</p>		
Occidental Energy Ventures Corp	Yes	<p>Many generator interconnection lines are operated at voltages greater than 100KV, but have traditionally not been considered part of the the transmission system. Rather these lines have been considered part of the generation system and, for quite some time, have been constructed and operated according to interconnection agreements which specify design and protection criteria. The BES definition should not be constructed in either a direct or implied manner that would alter the interconnection line status as being part of the Generation Facilities. Otherwise, it could result in registration of GO/GOPs as TO/TOPs. The issue of what additional standards, if any, should apply to these generation interconnection lines is the subject of Project 2010-07 and should be resolved by that standards development effort, not by a definition change. The proposed definition appears not to violate the inclusion of the interconnection line as part of the Generation Facility while still providing for these lines to be part of the BES, however, some clarification might be advisable (e.g., a statement that interconnection lines are part of the Generation Facility or are Generation Elements).</p>
<p><b>Response:</b> The SDT appreciates the Occidental's suggestions, however; the recommendations go beyond the SAR scope of work given to the SDT. The SDT has not been charged with determining the applicability of various standards.</p>		
American Transmission company	Yes	<p>For clarity, ATC suggests that the “. . . aggregate capacity greater than 75 MVA . . . “ wording be changed to read, “. . . aggregate generator capacity greater than 75 MVA. . . and further classified as part of the BES given that a fault or outage of the aggregate generator capacity greater than 75 MVA would not maintain an Adequate Level of Reliability of the BES.</p>
<p><b>Response:</b> The SDT appreciates the ATC's concern; however, ATC has not provided rationale for the change.</p>		
Xcel Energy	Yes	<p>Xcel Energy believes that clarity should be added as to what constitutes an individual generation resource and a generating plant, especially as it pertains to multiple owner facilities and aggregating facilities such as wind or solar farms (which may also have multiple owners for discreet facilities that tie into a common bus). Discussion and controversy in other NERC and regional forums and standard development teams indicates</p>

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 3 Comment
		that this is not well defined. It may be that the Statement of Compliance Registry needs to be enhanced if it forms the foundation for which these items are to be understood.
<p><b>Response:</b> The SDT has revised the BES definition and has included specific inclusion and exclusion criteria that addresses dispersed generation plants (including wind and solar farms, which may contain multiple owners).</p> <p>Included in BES: I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.</p> <p>The SDT has not been charged with making changes to NERC's Statement of Compliance Registry Criteria and has adopted a goal of not changing that criteria if at all possible.</p>		
Bonneville Power Administration	Yes	There needs to be additional clarity on the definition of generation plant. Wind generation needs to be incorporated.
<p><b>Response:</b> The SDT has revised the BES definition and has included specific inclusion and exclusion criteria that addresses dispersed generation plants (including wind and solar farms).</p> <p>Included in BES: I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.</p>		
NERC Staff	Yes	Please see additional comments at the end of this document.
<p><b>Response:</b> These comments were submitted in response to the concepts paper and were considered</p>		
MRO's NERC Standards Review Subcommittee	Yes	See question 2 for similar comments and it is apparent that the SDT is trying to model the BES definition on the Statement of Compliance Registry Criteria (v5). Recommend that this question be struck. Question 2 above addresses connection requirements of Generators. For clarity, NSRS suggests that the “. . . aggregate capacity greater than 75 MVA . . .” wording be changed to read, “. . . aggregate generator capacity greater than 75 MVA. . . and further classified as part of the BES given that a fault or outage of the aggregate generator capacity greater than 75 MVA would not maintain an Adequate Level of Reliability of the BES.
<p><b>Response:</b> The SDT appreciates the comments; however, the SDT has not received sufficient technical justification upon which to base a significant departure from the generation MVA thresholds included in the NERC's Statement of Compliance Registry Criteria. MRO has not provided a rationale for making the language change.</p>		
ReliabilityFirst	Yes	It is recommended that the term “directly connected” be defined and examples of this term are included in the

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 3 Comment
		ERO definition.
<b>Response:</b> The SDT has revised the definition and the term “directly connected” is no longer utilized.		
SERC EC Planning Standards Subcommittee	Yes	
Public Service Enterprise Group Company	Yes	Yes, but see comments in section 2 above.
IRC Standards Review Committee	Yes	
Florida Municipal Power Agency	Yes	See FMPA response to Question 2 above.
FirstEnergy Corp	Yes	
Transmission Access Policy Study Group	Yes	See TAPS response to Question 2 above.

Idaho Power	Yes	
Springfield Utility Board	Yes	"directly connected" is important.
Clark Public Utilities	Yes	
<b>Response:</b> Thank you for your response. Please see the summary consideration immediately under the question. Several stakeholders made suggestions that were adopted by the drafting team.		

4. Should the following be classified as part of the BES?

- **Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator’s (TOP’s) restoration plan**

Summary Consideration: There was no consensus amongst commenters who responded to this question. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, to meet a Transmission Operator’s restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from a Blackstart Resource is essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator’s restoration plan as BES Elements.

Organization	Yes or No	Question 4 Comment
SERC EC Planning Standards Subcommittee	No	A blackstart designation should not necessarily make it part of the BES.
Southern Company	No	
<p><b>Response:</b> The SDT disagrees. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator’s restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator’s restoration plan as BES Elements.</p>		
Public Service Enterprise Group Company	No	Including these in the definition of BES would impose compliance obligations for these assets even if below 100kV at the same level as assets at or above the 100kV level. Blackstart Resources and Cranking Paths below 100kV do not impact the reliability of the BES and thus should not be required to comply with all standards as if they did. For example, 26kV cranking path protection systems typically only trip the 26kV, not 100kV or higher BES transmission facilities, thus do not impact the BES, and should not be required to meet

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 4 Comment
		<p>BES compliance standards for system protection. That assets can have different impacts and thus different levels of required compliance is expressly recognized in the recently stakeholder approved CIP-002-4 draft standard where blackstart cranking paths must be included as critical assets subject to CIP protections only to the point where two or more path options exist. Rather than include all Blackstart Resources and the designated Blackstart Cranking Paths indentified in the Transmission Operator's (TOP's) restoration plan in the blanket definition of BES, the drafting team should be directed to develop a definition that states that these assets are not part of the BES except where specifically identified in a requirement of a standard as needing to be compliant. For example, a standard requiring testing of Blackstart units would result in a Blackstart unit being deemed BES for purposes of that standard only.</p>
FirstEnergy Corp	No	<p>Blackstart generation and cranking paths do not need to be defined as being part of the BES. Rather, they are more appropriately reflected as supporting and restoring operation of the BES. Not all aspects of the BES reliability standards pertain to BES facilities. For example, UFLS and UVLS installed on a distribution system are important to arrest BES reliability concerns but they are not needed in what defines the BES. Similarly, blackstart generation and Cranking Paths do not need to be inclusive of what defines the BES but are important aspects of a restoration plan to re-establish a functioning BES.</p>
American Transmission company	No	<p>Blackstart Resources and designated blackstart Cranking Paths should not be classified as part of the BES, except those Elements and/or Facilities that are rated 100 kV or more and with a gross generator nameplate rating of 20 MVA or more.</p>
City of Austin dba Austin Energy	No	<p>Just because a unit can be used for black start should not - by definition - mean it is part of the BES. For example, there may be a very small unit which can be used for black start and the operating utility should not have to comply with all the NERC Standards all the time when that asset becomes "important" only during a black start event. Additionally, protective systems associated with small black start units would have to fulfill the same reliability requirements as any other BES generator even though those protective systems would have little purpose during a black start event.</p>
<p><b>Response:</b> The SDT disagrees. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator's restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator's system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths indentified in the Transmission Operator's restoration plan as BES Elements.</p>		

Organization	Yes or No	Question 4 Comment
<p>Again, Facilities identified as necessary for blackstart capability (both Blackstart Resources and the blackstart Cranking Path) in a Transmission Operator's restoration plan should be designated as part of the BES, and be subject to the corresponding NERC Standards referencing the BES.</p> <p>A review of the NERC Reliability Standards will be undertaken once the BES Definition is finalized to clearly delineate responsibilities for owners and operators of BES designated Facilities.</p>		
<p>MRO's NERC Standards Review Subcommittee</p>	<p>No</p>	<p>This question is irrelevant to the scope of this project. A Blackstart Resource may be a 10 MVA unit connected at the distribution level of voltage and within the TOP's Restoration Plan. Just because the unit is within the TOP's Restoration Plan does not make it a BES connected asset. CIP-002-4 is already industry approved and may "push" both large and small entities to remove these units from the TOP's Restoration Plan due to the Critical Asset label. If the Blackstart Resource is connected via GSU at 100 kV then it would be part of the BES. If the SDT is worried that a Blackstart Resource will not be maintained or tested, those requirements are within EOP-005-1 (and yet to be approved EOP-005-2). Blackstart Resources and designated blackstart Cranking Paths should not be classified as part of the BES, except those Elements and/or Facilities that are rated 100 kV or more and with a gross nameplate rating of 20 MVA or more.</p>
<p><b>Response:</b> The SDT disagrees. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator's restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator's system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator's restoration plan as BES Elements.</p> <p>For example, BES generation may require external Interconnections and Facilities in order to provide power to auxiliary equipment within the plant during times of system restoration.</p>		
<p>IRC Standards Review Committee</p>	<p>No</p>	<p>NERC Standards EOP-00-2 stipulates the requirements for testing Blackstart Resource and Cranking Paths. This testing requirement ensures that the facilities critical to system restoration are functional when needed. Inclusion of any resources or transmission paths as BES Elements/Facilities intended for use for system restoration should be determined using the criteria 1-3, above.</p>
<p><b>Response:</b> The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. <p>connection to the remainder of the System, in order to meet a Transmission Operator’s restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator’s restoration plan as BES Elements.</p> <p>A review of the NERC Reliability Standards will be conducted once the BES Definition is finalized in order to clearly delineate responsibilities for owners and operators of BES designated Facilities.</p>		
PacifiCorp	No	<p>In Order No. 743, the Commission directed NERC to adopt an exemption process for excluding facilities from the definition of the BES that are not necessary to operate an interconnected electric transmission network. In order to determine which facilities may be excluded, there must be criteria and a methodology that may be applied to identify which facilities are “necessary” to operate an interconnected electric transmission network and which “transmission and generation” facilities are not. In other words, there must be a clear way to determine what makes a particular facility is “necessary” for bulk system operation. Application of the criteria and methodology will result in the identification of the facilities that may be excluded. The comment questions asked in this questionnaire cannot be answered in a meaningful way absent this methodology. Significant efforts have been undertaken by the WECC Bulk Electric System Definition Task Force (BESDTF) over the course of the past year to identify some initial criteria and methodologies. These efforts are ongoing and should be supported by the NERC drafting team. For example: Blackstart Resources and designated blackstart Cranking Paths should be included only if they are deemed necessary to restore the interconnected electric transmission network.</p>
ISO New England Inc.	No	<ol style="list-style-type: none"> <li>1. Revise the statement, “Blackstart Resources and the designated blackstart Cranking identified in the Transmission Operator’s (TOP’s) restoration plan.” to “Blackstart Resources “material to” and designated as part of a Transmission Operator’s (TOPs) restoration plan.” Reason - Some regions have many blackstart units that are not material to a TOPs restoration plan. These units need not register and be subjected to the NERC Standards. Only those deemed material (i.e., “key facilities”) should be classified as part of the BES. See NERC Registry Criteria for reference to “material” in describing, and qualifying, what constitutes Blackstart Resources.”</li> <li>2. NERC Standard EOP-00-2 stipulates the requirements for testing Blackstart Resources and Cranking Paths. This testing requirement suffices to ensure that the facilities critical to system restoration are functional when needed. Designating these facilities as BES Elements or Facilities beyond the 100 kV bright line criterion will impose unnecessary requirements for these facilities which may not contribute to the BES reliability for everyday operations. If indeed any of these facilities are deemed necessary to support BES reliability for everyday operation, they will be identified through either the 100 kV bright line criterion or the</li> </ol>

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 4 Comment
		exemption/inclusion process.
<p><b>Response:</b> The SDT disagrees. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator’s restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator’s restoration plan as BES Elements.</p> <p>The SDT assumes that the Blackstart Resources and designated blackstart Cranking Paths included in the Transmission Operator’s restoration plans are those deemed necessary or required to reliably restore the system, or they wouldn’t be included in the plan, subjecting them to the NERC Standard testing requirements.</p>		
Arizona Public Service Company	No	With all of the new NERC Standards in place, a blackout should be an extremely rare event; therefore, classifying Blackstart units or Cranking Paths is not needed.
<p><b>Response:</b> The SDT disagrees. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator’s restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator’s restoration plan as BES Elements.</p> <p>Again, the Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. This determination is based on the reliable restoration of the system, independent of likelihood of the assumed occurrence of the need for restoration.</p>		
Independent Electricity System Operator	No	NERC Standards EOP-00-2 stipulates the requirements for testing Blackstart Resource and Cranking Paths. This testing requirement suffices to ensure that the facilities critical to system restoration are functional when needed. Designating these facilities as BES Elements or Facilities beyond the 100 kV bright line criterion will impose unnecessary requirements for these facilities which may not contribute to the BES reliability at times other than during system restoration. If indeed any of these facilities are deemed necessary to support bulk power system reliability at times other than during system restoration, they will be identified through either the 100 bright line criterion or the exemption/inclusion process.

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 4 Comment
American Electric Power (AEP)	No	Should be re-written to state that only those Blackstart Resources in the Transmission Operator’s (TOP’s) restoration plan be classified as part of the BES.
City Water Light and Power (CWLP) - Springfield, IL	No	CWLP feels that blackstart resources and cranking paths not otherwise qualified as a part of the BES based on other criteria should not be included in the definition of BES solely based on their status as blackstart-capable units. Requirements for blackstart resources and cranking paths are already addressed by existing and proposed EOP standards and we feel that arbitrarily classifying these elements as part of the BES may create undue burden on Transmission Owners when the same reliability result can be achieved through more directed effort in the EOP standards. Further, while such blackstart resources and cranking paths may support operation of the BES, they need not be strictly included in the definition of BES to achieve the desired reliability result.
City of Grand Island	No	Not across the board. Generator criteria from questions 2 and 3 can apply to blackstart generators as well. Otherwise the exception process can be used.
Southern California Edison	No	SCE does not feel a blanket inclusion of all the listed equipment is needed.
Pepco Holdings Inc.	No	To remain consistent with the proposed definition of facilities 100kv and above, this should not be included. Inclusion would not result in a more reliable system or reduce risk.
Electric Market Policy	No	Dominion does not agree that Blackstart Resources should be classified as part of the BES. Dominion supports the criteria for registering owners, operators, and users of the bulk power system, as indicated in the current Statement of Compliance Registry Criteria .
Central Lincoln	No	The generation resources so described should be presumed to be part of the BES unless or until they have been through the exemption process and as a result have been classified as non-BES.
Lewis County PUD	No	
Entergy Services	No	
The Dayton Power and Light Company	No	
Snohomish County PUD	No	The generation resources so described should be presumed to be part of the BES unless they have been

<p><b>Response:</b> The SDT disagrees. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator’s restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator’s restoration plan as BES Elements.</p> <p>Again, Facilities critically identified as necessary for blackstart capability (both Blackstart Resources and the blackstart Cranking Path) in a Transmission Operator’s restoration plan should be designated as part of the BES, and be subject to the corresponding NERC Standards referencing the BES.</p>		
BGE	No	This proposal as written could lead to a reduction in the number of blackstart units which rely on cranking paths of less than 100 kV and not currently classified as BES, thereby reducing BES reliability.
<p><b>Response:</b> The SDT disagrees. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator’s restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator’s system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator’s restoration plan as BES Elements.</p> <p>The Transmission Operator will remain responsible for maintaining a viable restoration plan, regardless of the BES definition.</p>		
Constellation Power Source Generation, Inc. (“CPSG”) filing on behalf of Constellation Energy Group, Inc. (“CEG”), Constellation Energy Commodities Group, Inc. (“CCG”), Constellation Energy Control and Dispatch, LLC	No	<p>This proposal as written could lead to a reduction in the number of blackstart units which rely on cranking paths of less than 100 kV and not currently classified as BES, thereby reducing BES reliability. To account for this potential gap, Constellation firmly believes that the classifications found in the Compliance Registry Criteria - Section III (Rules of Procedure Appendix 5B), such as that cited in this question, provide a useful basis to create a comprehensive, revised BES definition.</p> <p>Further, we propose that the BES drafting team incorporate the criteria directly into the revised BES definition, replacing the term “bulk power system” in each criterion with “greater than 100 kV.” This would then include</p>

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 4 Comment
("CDD"), Constellation NewEnergy, Inc., ("CNE") and Constellation Energy Nuclear Group, LLC, ("CENG")		<p>assets that are currently registered as BES elements as well as those that may have been previously excluded due to Regional exemption variances. As an example, the Compliance Registry Criteria includes any generator, regardless of size, that is a blackstart unit material to and designated as part of a transmission operator entity's restoration plan. The Compliance Registry also includes transmission as elements above 100kV or that is critical as defined by the Regional Entity (excluding radial facilities as described in the current BES definition). Structuring the revised BES definition to clarify both the inclusions and exclusions, can, ideally, eliminate the need for an onerous exemption process.</p> <p>Please see our response to question 12 for more detail on a proposed alternative approach to structuring the BES definition revision.</p>
<p><b>Response:</b> The SDT disagrees. The Commission directed NERC to revise its BES definition to ensure that the definition encompasses all Facilities necessary for operating an interconnected electric Transmission network. The SDT interprets this to include operation under both normal and Emergency conditions, which includes situations related to black starts and system restoration. Blackstart Resources have the ability to be started without support from the System or can be energized without connection to the remainder of the System, in order to meet a Transmission Operator's restoration plan requirements for real and reactive power capability, frequency, and voltage control. The portion of the electric system that can be isolated and then energized to deliver electric power from Blackstart Resources are essential to enable the startup of one or more other generating units as defined in the Transmission Operator's system restoration plan. For these reasons, the SDT has included Blackstart Resources and the corresponding designated blackstart Cranking Paths identified in the Transmission Operator's restoration plan as BES Elements.</p> <p>The SDT agrees and has made the suggested change and replaced the term "bulk power system" in each criterion with "greater than 100 kV."</p> <p>Please see response to Q12.</p>		
The Dow Chemical Company		As discussed in response to question #12 below, issues relating to the registry criteria applicable to generation resources should not be revisited at this time.
<p><b>Response:</b> Please see response to Q12.</p>		
ReliabilityFirst	Yes	<p>It is recommended that the term "cranking path" be defined and examples of this term be provided.</p> <p>Also, does the term "cranking paths" include all paths or just the primary path if there are multiple paths available?</p>
<p><b>Response:</b> The NERC Glossary of Terms defines 'Cranking Path' as "A portion of the electric system that can be isolated and then energized to deliver electric power from a generation source to enable the startup of one or more other generating units".</p>		
NERC Staff	Yes	Please see additional comments at the end of this document.

SERC OC Standards Review Group	Yes	
Transmission Access Policy Study Group	Yes	See TAPS response to Question 2 above.
PPL Energy Plus	Yes	Blackstart Resources and the designated blackstart Cranking Paths identified in the TOP's restoration plan are a special case and warrant inclusion in the BES definition regardless of voltage because of their importance to BES reliability. However, this would not be the case for other facilities operated below 100 kV.
LG&E and KU Energy LLC	Yes	
Competitive Suppliers	Yes	
ExxonMobil Research and Engineering	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 4 Comment
LCRA Transmission Services Corporation	Yes	This is critical for system restoration.
PUD No.1 of Clallam County	Yes	Based on the current Reliability Standards practices it may be advantageous to reduce the number of blackstart generation and cranking paths to limit exposure to BES applicable standards. At this time if a registered entity has multiple blackstart units, it may be advantageous to reduce or decommission the number to avoid compliance risks. The current requirements may ultimately reduce the number of blackstart units and reduce BES electric reliability. It may make more sense to identify subset of critical blackstart projects and associated cranking paths as BES elements. The generation resources so described should be presumed to be part of the BES unless or until they have been through the exemption process and as a result have been classified as non-BES.
Manitoba Hydro	Yes	
American Municipal Power	Yes	
North Carolina EMC	Yes	
on behalf of Teck Metals Ltd.	Yes	
Indeck Energy Services	Yes	
Southern California Edison Company	Yes	
on behalf of Catalyst Paper Corporation	Yes	
Occidental Energy Ventures Corp	Yes	
City of Anaheim	Yes	
Glacier Electric Cooperative	Yes	These resources are significant to the BES and should be included.

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 4 Comment
United Illuminating Company	Yes	
Orange and Rockland Utilities, Inc.	Yes	
Utility Services	Yes	
Duke Energy	Yes	
ITC Holdings Corp	Yes	Yes, but the Blackstart Resources identified as the PRIMARY resources in the System Restoration Plan should be the focus.
Idaho Power	Yes	
<b>Response:</b> Thank you for your response.		

5. Should the following be classified as part of the BES?

- Transmission Elements or Facilities operated at voltages below 100kV where the exemption process deems the Element or Facility to be included in the BES

**Summary Consideration:** Most commenters who responded to this question indicated disagreement with the proposal however there was no consensus amongst the alternate proposals offered, and the proposals suggesting other thresholds were not supported with any technical justification. The SDT has reviewed the industry comments on this issue, debated the topic, and has come to an agreement that the bright-line designation for Transmission Elements is 100kV and above. Any deviations from the bright-line designation (beyond those identified in the revised definition of BES), including Transmission Elements operated below 100kV, will be handled through the Rules of Procedure process that is being developed by a separate team.

Organization	Yes or No	Question 5 Comment
SERC EC Planning Standards Subcommittee	No	We prefer a bright-line rule of 100 kV. The exception process should not be used to include facilities operated at voltages below 100 kV.
Arizona Public Service Company	No	There are no practical cases where the facilities below 100 kV impact the major load centers or BES.
North Carolina EMC	No	Transmission elements or facilities operated at voltages below 100kV should only be included in the BES if identified by the RRO as critical to the BES.
Southern California Edison Company	No	The Exemption Process should apply to transmission elements or facilities greater than 100kV only. Facilities operated below 100kV are generally used for distribution purposes.
BGE	No	This proposal as written could lead to the inclusion of elements or facilities which have no material reliability impact on the interconnected transmission system.
Southern Company	No	We prefer a bright-line rule of 100 kV. The exception process should not be used to include facilities operated at voltages below 100 kV.
ExxonMobil Research and Engineering	Yes	It is conceivable that, in some areas, the Bulk Electric System may include transmission assets that are rated and operated at 69kV or below.

**Response:** The SDT appreciates the preference of several entities to utilize strict bright-line criteria of Facilities at 100kV and above that would be considered for inclusion in the BES. The SDT has carefully considered this matter, and believes that the exception process must allow for the possibility that certain Facilities

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 5 Comment
<p>operated at voltages below 100kV could have appreciable influence over the reliable operation of the interconnected network Transmission grid, thereby warranting examination through an exception process for inclusion in the BES. The SDT expects that these exceptions for Facilities operated at voltages below 100kV will be relatively rare. The criteria for such inclusion will be developed as part of this project and the ROP process will be handled by a separate team through the revision to the Rules of Procedure, in an effort parallel to the development of the BES definition.</p>		
ITC Holdings Corp	No	PRC023 has developed a process for specification of critical lines below 100 kV. This same process should be used to include below 100 kV lines in the BES
Florida Municipal Power Agency	No	<p>This Question refers to including an Element in the BES through the exemption process, suggesting that the SDT is contemplating a single process for including nominally non-BES Elements in the BES and for exempting nominally BES Elements from the BES. While it would make sense for the two processes to be similar, they cannot be identical: The burden should be on the entity requesting an exemption to show that an Element that is nominally part of the BES is nevertheless not necessary for operating the interconnected electric transmission network and thus should be exempted from the BES. In contrast, with respect to transmission operated at voltages below 100 kV, it is NERC that must show, on a case-by-case basis, that transmission that is not nominally part of the BES is nevertheless necessary for operating the interconnected electric transmission network and thus should be included in the BES. Transmission operated at voltages below 100 kV should only be classified as part of the BES if the inclusion process, assessing each Element on a case-by-case basis, based on a uniform set of criteria, results in a finding that the particular Element should be included in the BES.</p>
Transmission Access Policy Study Group	No	
<p><b>Response:</b> The process for inclusions and exclusions will be developed by a separate team as part of the revision to the Rules of Procedure, in an effort parallel to the development of the BES definition. Your comments will be forwarded to the Rules of Procedure Team.</p>		
FirstEnergy Corp	No	<p>We do not agree with an "exemption process" being associated with "including facilities". We suggest keeping the exemption process separate from the identification of critical sub 100kV facilities that will be included in the BES. We do agree that a consistent continent-wide approach for identifying these facilities is a worthwhile goal but should be a secondary priority to establishing the BES definition and BES exemption process.</p>
<p><b>Response:</b> The SDT envisions an “exception process”, and regrets the use of “exemption” in the original SAR. The processes for inclusions and exclusions will be developed by a separate team as part of the revision to the Rules of Procedure, in an effort parallel to the development of the BES definition. Your comments will be forwarded to the Rules of Procedure Team.</p>		
American Electric Power (AEP)	No	<p>Exemption processes are distinctly different than inclusion processes, and clarification is needed to address their differences. There should be two distinct processes. Until details of such processes and their related criteria are better defined, it is difficult to provide substantive comments.</p>

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 5 Comment
MRO's NERC Standards Review Subcommittee	No	FERC has directed (in section 30 of FERC Order 743) that NERC have an established “exemption” process to remove this judgment from the Regions in defining what the BES is. However, the applicable process should be called an “exception” process, not an “exemption” process that infers the concept of “exclusion” and further classified as part of the BES given that a fault or an outage on the Transmission Element or Facility at voltages below 100kV would not maintain an Adequate Level of Reliability of the BES.
PacifiCorp	No	In paragraph 121 of Order No. 743, the Commission states that it agrees that the ERO should develop a parallel process for including as part of the bulk electric system “critical” facilities, operated at less than 100 kV, that the Regional Entities determine are necessary for operating the interconnected transmission network. (emphasis added) Further, the Commission stated that “[w]e believe that it would be worthwhile for NERC to consider formalizing the criteria for inclusion of critical facilities operated below 100 kV in developing the exemption process.” (emphasis added) PacifiCorp believes that it is appropriate to use the same criteria to determine what elements or facilities should be included in the definition of Bulk Electric System as those used to determine what elements or facilities should be excluded from the definition. However, the formal process used for exclusion (i.e. the exemption process) of facilities above 100 kV should not be the same process as the process for inclusion of sub-100 kV facilities. As PacifiCorp understands it, per the Commission, the exemption process will require a facility-by-facility approval by NERC for exemption whereas inclusion of sub-100 kV facilities will involve a Regional Entity determination that such facilities must be included. These should therefore be separate processes.
Central Lincoln	No	Including elements through an exemption process is bound to create confusion and misunderstandings between the registrants and REs. Please include such elements through an inclusion process. It should also be clarified that registrants are not required to put all sub-100 kV elements through this process; the burden should be on the RE to include elements of particular concern.
PUD No.1 of Clallam County	No	
<p><b>Response:</b> The SDT acknowledges that the term “exemption” is inappropriate in the context of these proposed “inclusions”, and subsequent drafts will refer to the “exception” process suggested by the Commission in its Order 743. The process for such inclusions will be developed by a separate team through the revision to the Rules of Procedure, in an effort parallel to the development of the BES definition.</p>		
Pepco Holdings Inc.	No	Some details on the exemption process must be known before accepting this. Who can submit an exemption (DP, GO, GOP, TO, TOP, RC, etc)? How do interested parties get informed? Can others intervene?
Occidental Energy Ventures Corp	No	Until the expemtion process is finalized, it is not prudent to answer in the affirmative.
Energy Services	No	Our response to this question depends on the details of the “exemption process”, including what entity has the

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 5 Comment
		final decision and how it is implemented. Please see our response to Q13 below.
City Water Light and Power (CWLP) - Springfield, IL	No	While CWLP agrees with the general concept of inclusion by exception (as opposed to exemption), we have concerns regarding the lack of detailed definition of this process, especially the administrative process for disputes regarding inclusion of elements in the BES. Without firm administrative rules for resolving disputes based on technical justification, we cannot support this measure currently.
Manitoba Hydro		It is confusing to use the term “exemption process” to determine what is included. Abstain until exemption process has been defined.
Duke Energy		There is not enough information available at this time to adequately evaluate this question. It would be necessary to have a list of exemption criteria or more detail on the exemption process to address this question. This is one of the reasons that the exemption criteria should be developed through the standards development process along with the definition.
Xcel Energy		Xcel Energy does not disagree that there may be situations where elements below 100KV may need to be included, but we have concerns about the exemption process. This undeveloped process presents itself as a wild card to entities, and will most likely present inconsistencies between regions based upon each Region's preference. Additionally, does the Regional Methodology require any approval (e.g. ERO) other than the Region's own process? The “exclusions” process indicates that the ERO has the final approval authority to exclude an item from the BES. Why would the same not apply for including something into the BES based on the Region's Methodology?
IRC Standards Review Committee	Yes	We generally support the concept but we need to assess the criteria for the exception, which have not been developed. Further, the wording seems to present a circular argument. We suggest the following revised wording to more clearly convey this criterion: Transmission Elements or Facilities operated at voltages below 100kV that are deemed to be included in the BES as determined by the exception/inclusion process.
<p><b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the exception process, which is being developed by a separate team as a modification to the Rules of Procedure in an effort parallel with the development of the BES definition.</p>

<b>Response:</b> See Response to Question 1.		
Snohomish County PUD	No	Snohomish agrees that certain Elements or Facilities operated at voltages below 100 kV may need to be classified as part of the BES if engineering studies demonstrate those Elements or Facilities to be necessary to the reliable operation of the bulk transmission system. We disagree, however, that inclusion of such facilities should be part of the exemption process. The exemption process should be focused on facilities operating at voltages above 100 kV that nonetheless are exempt because they are local distribution facilities or are demonstrated by engineering analysis to be unnecessary for the reliable operation of the interconnected bulk transmission grid. The inclusion of facilities below 100 kV should be a separate process in which the RRO is required to demonstrate that the facility has a material impact on the interconnected bulk transmission system despite its low operating voltage
<b>Response:</b> The SDT acknowledges that the term “exemption” is inappropriate in the context of proposed “inclusions” and “exclusions”, and subsequent drafts will refer to the “exception” process suggested by the Commission in its Order 743. The process for such inclusions and exclusions will be developed as part of the revision to the Rules of Procedure by a separate team, in an effort parallel to the development of the BES definition. The SDT appreciates the preference of several entities to utilize strict bright-line criteria of facilities greater than 100kV that would be considered for inclusion in the BES. The SDT has carefully considered this matter, and believes that the exception process must allow for the possibility that certain Facilities operated at voltages below 100kV could have appreciable influence over the reliable operation of the interconnected network Transmission grid, thereby warranting examination through an exception process for inclusion in the BES. The SDT expects that these exceptions for Facilities operated at voltages below 100kV will be relatively rare.		
Lewis County PUD	No	Including elements through an exemption process is bound to create confusion and misunderstandings between the registrants and REs. <p><b>Response:</b> The SDT acknowledges that the term “exemption” is inappropriate in the context of these proposed “inclusions”, and subsequent drafts will refer to the “exception” process suggested by the Commission in its Order 743. The process for such inclusions will be developed by a separate team through the revision to the Rules of Procedure, in an effort parallel to the development of the BES definition.</p>		
<p>Constellation Power Source Generation, Inc. (“CPSG”) filing on behalf of Constellation Energy Group, Inc. (“CEG”), Constellation Energy Commodities Group, Inc. (“CCG”), Constellation Energy Control and Dispatch, LLC (“CDD”), Constellation NewEnergy, Inc., (“CNE”) and Constellation Energy Nuclear Group, LLC, (“CENG”)</p>	No	<p>Although Constellation believes that it may be appropriate to include some of the elements above in the BES, this proposal will lead to the inclusion of elements or facilities which have no material impact on the interconnected transmission system. Furthermore, the use of an exemption process to include assets is confusing. Constellation proposes that the BES drafting team structure the revised BES definition to clarify both the inclusions and exclusions as completely as possible. If a separate “opt-in” process is deemed necessary (in anticipation of a few exceptions to the definition) then the drafting team should develop criteria for such a process. Using this approach the sentence above would then read “Transmission Elements or Facilities operated at voltages below 100kV where a Regional Entity deems the Element or Facility to be included in the BES.”</p>
<p><b>Response:</b> The SDT appreciates the preference of several entities to utilize strict bright-line criteria of Facilities at 100kV or above that would be considered for inclusion in the BES. The SDT has carefully considered this matter, and believes that the exception process must allow for the possibility that certain Facilities operated at voltages below 100kV could have appreciable influence over the reliable operation of the interconnected network Transmission grid, thereby warranting examination through an exception process for inclusion in the BES. The SDT expects that these exceptions for Facilities operated at voltages below 100kV will be relatively rare. The criteria for such inclusion will be developed as part of this project and the ROP process will be handled by a separate team through the revision to the Rules of Procedure, in an effort parallel to the development of the BES definition.</p> <p>The SDT acknowledges that the term “exemption” is inappropriate in the context of proposed “inclusions” and “exclusions”, and subsequent drafts will refer to the “exception” process suggested by the Commission in its Order 743.</p>		

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 5 Comment
Springfield Utility Board	No	Why would an entity want to include an element in the definition of the BES? If an entity has a 69kV line that the ERO believes should be part of the BES but the entity does not want it part of the BES who initiates and pays for the exemption process? Does the ERO have the ability to initiate the process? If the owner of the Transmission Element or Facility is the only one that can initiate and exemption process and they do not want to what is the remedy if the line is necessary for bulk electric system reliability?
<p><b>Response:</b> The bright-line designation will be developed as part of this project and the ROP process will be handled through the revision to the Rules of Procedure by a separate team in an effort parallel to the development of the BES definition. Your comments will be forwarded to the Rules of Procedure Team.</p>		
National Rural Electric Cooperative Association (NRECA)		Without exemption criteria to review, it is too early to explicitly answer this question. However, the concept appears to be logical as long as it is also paired with the ability of an entity that owns facilities above 100kV to appeal the inclusion of its facilities as part of the BES. Such an appeal would need to be supported by a technical justification demonstrating why certain facilities should not be classified as part of the BES. In addition, it is critical for exemption criteria to be based on operating voltage, not design voltage. Using design voltage in the criteria would provide a disincentive to build for future expansion. This could have significant negative impacts on BES reliability.
<p><b>Response:</b> The process for such inclusions and exclusions will be developed by a separate team as part of the revision to the Rules of Procedure, in an effort parallel to the development of the BES definition. Your comments will be forwarded to the Rules of Procedure Team.</p>		
The Dow Chemical Company		Dow recommends that NERC finalize a basic framework for identifying BES facilities before evaluating individual facilities or types of facilities. Such a framework is recommended by Dow in response to questions #11 and #12 below.

NERC Staff	Yes	Please see additional comments at the end of this document.
<p><b>Response:</b> See response to Q13.</p>		

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 5 Comment
SERC OC Standards Review Group	Yes	We think the process should be an “exception” rather than an “exemption”.
City of Grand Island	Yes	Exemption process should be termed “exception” process. Exception means not conforming to general rule, whereas exemption primarily means exclusion. This process will be difficult to develop and administer and is counter productive to “bright line” philosophy. Thus the bright lines should be at a high level resulting in fewer challenges. The exception process must consider the impact of a fault or outage of that facilities on the Adequate Level of Reliability (NERC defined term) of the BES.
American Transmission company	Yes	However, the applicable process should be called an “exception” process, not an “exemption” process that infers the concept of “exclusion” and further classified as part of the BES given that a fault or an outage on the Transmission Element or Facility at voltages below 100kV would not maintain an Adequate Level of Reliability of the BES.
<p><b>Response:</b> The SDT acknowledges that the term “exemption” is inappropriate in the context of these proposed “inclusions”, and subsequent drafts will refer to the “exception” process suggested by the Commission in its Order 743. The process for such inclusions will be developed by a separate team through the revision to the Rules of Procedure, in an effort parallel to the development of the BES definition.</p>		
City of Redding	Yes	If the exemption process is based on reliable engineering studies.
City of Anaheim	Yes	
Public Service Enterprise Group Company	Yes	No Comment
Bonneville Power Administration	Yes	
Electric Market Policy	Yes	Dominion conceptually supports an exemption process whereby NERC or the RRO could apply to have an element included or excluded from the BES definition. Such process recognizes that it may be necessary to include elements that do not meet the bright line criteria but are necessary for operating an interconnected transmission network. Such process should be developed through the existing NERC standards development process and include a robust appeals process for the owner/operator of any element so included or excluded.
LCRA Transmission Services Corporation	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 5 Comment
PPL Energy Plus	Yes	Yes, PPL Energy Plus supports an exemption process provided the Exemption process follows FERCs Order 743 paragraph 115: “NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid.”
LG&E and KU Energy LLC	Yes	
ReliabilityFirst	Yes	It is recommended that the exemption process be defined and criteria setup so that a common approach across the ERO can be used to include these facilities.
Southern California Edison	Yes	SCE currently reports on transmission elements or facilities operated at voltages below 100kV that are interconnected with other utilities.
Glacier Electric Cooperative	Yes	Yes - this is assuming that the exemption process is an accurate way to truly determine whether or not a facility is significant to the grid.
ISO New England Inc.	Yes	
United Illuminating Company	Yes	
City of Austin dba Austin Energy	Yes	This answer assumes that an appropriate engineering study is performed to determine that the asset is necessary for the reliability of the BES.
The Dayton Power and Light Company	Yes	
Independent Electricity System Operator	Yes	We generally support the concept but we need to assess the criteria for the exception, which have not been developed. Further, the wording seems to present a circular argument. We suggest the following revised wording to more clearly convey this criterion: Transmission Elements or Facilities operated at voltages below 100kV that are deemed to be included in the BES as determined by the exception/inclusion process
Clark Public Utilities	Yes	

**Response:** The SDT thanks you for your comments.

6. Should the following be classified as part of the BES?

- Individual generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation resources to be included in the BES

**Summary Consideration:** Most commenters who responded to this question indicated disagreement with the proposal, however there was no consensus amongst the alternate proposals offered, and the proposals suggesting other thresholds were not supported with any technical justification. The SDT has reviewed the industry comments on this issue, debated the topic, and come to an agreement that the bright-line designation for individual generating units is 20 MVA and 100 kV. Any deviations from the bright-line designation would be handled through the pending Rules of Procedure process. Included in the BES: I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.

Organization	Yes or No	Question 6 Comment
SERC EC Planning Standards Subcommittee	No	We prefer a bright-line rule of 100 kV. The exception process should not be used to include facilities operated at voltages below 100 kV.
Public Service Enterprise Group Company	No	The intent of the BES definition is to address the reliability of the bulk electric system and associated elements. The generation connected at less than 100kV should not be classified as BES - it should be considered to be within the same category as radial connected facilities serving load (which is not included as part of the BES).
<p><b>Response:</b> In Order No. 743, the Commission directed NERC to adopt an inclusion process for including in the BES definition Facilities operated at voltages below 100 kV. The Commission believes that NERC should “consider formalizing the criteria for inclusion of critical facilities operated below 100 kV in developing the exemption process.” The DBES SDT and NERC Rules of Procedure team are responding to FERC’s directive.</p>		
Florida Municipal Power Agency	No	See FMPA response to Question 5 above. Generation resources of any size directly connected via a step-up transformer(s) to transmission operated at voltages below 100 kV should only be classified as part of the BES if the generation resource is registered pursuant to the Statement of Compliance Registry Criteria or if the inclusion process, assessing each generation resource on a case-by-case basis based on a uniform set of criteria, results in a finding that the particular generation resource should be included in the BES. The standards for registering a generator should be the same as those for including it in the BES.
Transmission Access Policy Study Group	No	
<p><b>Response:</b> The SDT agrees with the comment that designation of these generators as BES would occur only if the pending Rules of Procedure process deems them to be BES, and such a designation would necessarily warrant registration per the terms of the NERC Statement of Compliance Registry Criteria (SCRC).</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 6 Comment
<p>The scope of the SDT does not extend to revisions of the SCRC; however, recommendations for revision of the SCRC may result from the definition development.</p>		
PacifiCorp	No	<p>In Order No. 743, the Commission directed NERC to adopt an exemption process for excluding facilities from the definition of the BES that are not necessary to operate an interconnected electric transmission network. In order to determine which facilities may be excluded, there must be criteria and a methodology that may be applied to identify which facilities are “necessary” to operate an interconnected electric transmission network and which “transmission and generation” facilities are not. In other words, there must be a clear way to determine what makes a particular facility is “necessary” for bulk system operation. Application of the criteria and methodology will result in the identification of the facilities that may be excluded. The comment questions asked in this questionnaire cannot be answered in a meaningful way absent this methodology. Significant efforts have been undertaken by the WECC Bulk Electric System Definition Task Force (BESDTF) over the course of the past year to identify some initial criteria and methodologies. These efforts are ongoing and should be supported by the NERC drafting team. For example: Generation units should not be included or excluded solely based on a their gross nameplate rating and the operating voltage at which they are connected to transmission facilities. Generation units which are necessary to operate the interconnected network should be included as part of the regulated BES. Generating units which are not “necessary for the operation of the interconnected network” should be excluded. A methodology needs to be developed to determine which generating units may be excluded as part of the regulated BES.</p>
<p><b>Response:</b> The SDT believes that the criteria enumerated in the current Statement of Compliance Registry Criteria should be the template (or “methodology” as used in the comment) for defining the bright-line exception criteria in Project 2010-17. The SDT plans to review past efforts of Regional Entities to develop their own BES definition.</p>		
ExxonMobil Research and Engineering	No	See comments on questions 2 and 3.
<p><b>Response:</b> See response to Q2 &amp; Q3.</p>		
Arizona Public Service Company	No	<p>Individual generation resources less than 50 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100 kV do not materially impact the reliability of the BES and therefore, should not be classified as part of the BES.</p>
<p><b>Response:</b> The SDT believes that the criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17. The comment provides no technical justification for departing from existing practices defined by the Statement of Compliance Registry Criteria.</p>		

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 6 Comment
Pepco Holdings Inc.	No	Some details on the exemption process must be known before accepting this. Who can submit an exemption (DP, GO, GOP, TO, TOP, RC, etc)? How do interested parties get informed? Can others intervene? Would the other facilities completing the connection to a BES facility be automatically included?
<p><b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the pending Rules of Procedure process, which is to be developed in an effort parallel with this BES definition development. The SDT believes that the criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line criteria in Project 2010-17. The SDT will coordinate its efforts with the NERC ROP team developing the Rules of Procedure process to develop a single coordinated implementation plan that will define the responsibilities of various parties.</p>		
American Municipal Power	No	
on behalf of Teck Metals Ltd.	No	
on behalf of Catalyst Paper Corporation	No	
Idaho Power	No	
Clark Public Utilities	No	
<p><b>Response:</b> Thank you for your response.</p>		
Indeck Energy Services	No	Same Response as Question 1
<p><b>Response:</b> See response to Q1.</p>		
Southern California Edison	No	SCE currently reports on generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages above 100kV. SCE does not feel it is necessary to report on generation below 100kV.
<p><b>Response:</b> In Order No. 743, the Commission directed NERC to adopt an inclusion process for including in the BES definition Facilities operated at voltages below 100 kV. The Commission believes that NERC should “consider formalizing the criteria for inclusion of critical facilities operated below 100 kV in developing the exemption process.”</p>		
Southern California Edison Company	No	In SCE's system, generation resources are used to offset load being served by distribution facilities. This means that generation does not flow through step-up transformers into the 100kV and above system.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 6 Comment
		Therefore, those generation resources which are used to provide power to local load within a distribution system should not be included as part of the BES. The Exemption Process should not be applied to such resources.
<p><b>Response:</b> The SDT believes that such generation resources will be excluded as part of the BES unless the Facilities are otherwise deemed material to the reliability of the BES by a ROP to the pending Rules of Procedure exception process. In a section in the revised BES definition on Local Distribution Networks, the SDT is considering the issue of generation resources used to offset Load being served by distribution Facilities.</p>		
ISO New England Inc.	No	<p>1. Yes - There are situations as envisioned in the Registry Criteria clause, i.e., “Any generator, regardless of size, that is material to the reliability of the bulk power system” where reliability would be threatened without such inclusion. Similarly, cases can be made for materiality to the reliability of the bulk power system for units &lt; 20 MVA directly connected at 100 kV or greater and for units &lt; 20 MVA connected at any voltage level. The exemption process developed should account for any and all situations where a generator, or group of generators, may be deemed material to support a BES function such as riding through an UFLS event. Just as UFLS Relays have been stated to be material to the reliability of the bulk power system, despite their location on the lower voltage distribution systems, any size generator at any voltage level may be found, through an analysis, to have a supporting role in protecting the BES during a postulated system disturbance.</p> <p>2. No - In general small generators connected at voltages of 100 kV and greater and those larger generators connected at voltages less than 100 kV do not impact the reliability of the BES and to classify them as BES and require them to register with NERC and abide by all NERC Reliability Standards would place an undue burden on the Generator Owners/Operators with little or no perceived reliability benefit. A more reasonable process would allow a systematic analysis to define the material need of such otherwise exempted generators and allow these generators to be registered on a “requirement basis”, a process which FERC has encouraged, and is an approach recognized in NERC’s “Statement of Registry Criteria” (See “Notes to Above Criteria” #4, page 10).</p>
Electric Market Policy	No	Dominion does not agree that a generation resource should be classified as part of the BES. Dominion supports the criteria for registering owners, operators, and users of the bulk power system, as indicated in the current Statement of Compliance Registry Criteria.
Constellation Power Source Generation, Inc. (“CPSG”) filing on behalf of Constellation Energy Group, Inc. (“CEG”), Constellation Energy Commodities Group, Inc.	No	Although Constellation believes that it may be appropriate to include some of the elements above in the BES, this proposal will lead to the inclusion of elements or facilities which have no material impact on the interconnected transmission system. Furthermore, the use of an exemption process to include assets is confusing. Constellation proposes that the BES drafting team structure the revised BES definition to clarify both the inclusions and exclusions as completely as possible. If a separate “opt-in” process is deemed necessary (in anticipation of a few exceptions to the definition) then the drafting team should develop criteria

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 6 Comment
(“CCG”), Constellation Energy Control and Dispatch, LLC (“CDD”), Constellation NewEnergy, Inc., (“CNE”) and Constellation Energy Nuclear Group, LLC, (“CENG”)		for such a process. Using this approach the sentence above would then read “Individual generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where a Regional Entity deems the generation resources to be included in the BES.”
<p><b>Response:</b> The SDT agrees that criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17. FERC Order No. 743 states that changes to the BES definition “will not significantly increase the scope of the present definition, which applies to transmission, generation and interconnection facilities.”</p>		
Snohomish County PUD	No	The NERC GOTO Task Force considered the issue of whether dedicated interconnection facilities connecting BES generation to the BES transmission system should also be classified as BES. The Task Force concluded that it is unnecessary to classify such facilities as part of the BES and that reliability would not be compromised as long as those interconnection facilities are required to comply with few reliability standards, primarily those related to vegetation management. The standards drafting group should follow the recommendation of the GOTO Task Force when considering the status of interconnection facilities and should consider those recommendations when considering related questions such as the status of radial lines that both interconnect a generator and serve distribution functions.
<p><b>Response:</b> The SDT acknowledges the work of Project 2010-07 Generator Requirements at the Transmission Interface regarding the classification rationale for generation interconnection Facilities and has considered it in the development process of the BES definition. The subject of this question was focused upon the generating elements themselves, rather than the associated interconnection Facilities. The SDT has carefully considered this matter, and believes that the pending Rules of Procedure exception process must allow for the possibility that certain generating units larger than 20 MVA yet connected below 100kV could have appreciable influence over the reliable operation of the interconnected network Transmission grid, thereby warranting a submittal through the ROP process for inclusion in the BES. The SDT expects that these exceptions for generating units larger than 20 MVA, yet connected to the grid at below 100kV, will be relatively rare. Additionally, the Commission in its Order No. 743 suggests that the revised BES definition should include exception processes for inclusion of these sorts of Elements. The process for such inclusions will be developed as part of the revision to the Rules of Procedure, in an effort parallel to the development of this BES definition.</p>		
Central Lincoln	No	Including elements through an exemption process is bound to create confusion and misunderstandings between the registrants and REs. Please include such elements through an inclusion process. It should also be clarified that registrants are not required to put all sub-100 kV elements through this process; the burden should be on the RE to include elements of particular concern.
PUD No.1 of Clallam County	No	
PNGC Power	No

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 6 Comment
Fall River Electric Cooperative	No	
<p><b>Response:</b> The SDT agrees. In Order No. 743, the Commission directed NERC to adopt an inclusion process for including in the BES definition Facilities operated at voltages below 100 kV. The Commission believes that NERC should “consider formalizing the criteria for inclusion of critical facilities operated below 100 kV in developing the exemption process.”</p>		
ITC Holdings Corp	No	The lower limit for BES generators should be 75 MVA. As long as this Plant is connected to the 100 kV or greater, it should be included. Below 100 kV, only if it meets the critical test.
<p><b>Response:</b> The SDT believes that criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17. FERC Order No. 743 states that changes to the BES definition “will not significantly increase the scope of the present definition, which applies to transmission, generation and interconnection facilities.” As envisioned, Regional Entities will be able to request the inclusion of Elements below 100 kV in the pending Rules of Procedure exception process and will bear the burden of proof that such Elements are critical Facilities.</p>		
BGE	No	This proposal as written could lead to the inclusion of elements or facilities which have no material reliability impact on the interconnected transmission system.
<p><b>Response:</b> The SDT believes that criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17. In addition, potential registrants may use the pending Rules of Procedure exception process to demonstrate the lack of materiality.</p>		
City Water Light and Power (CWLP) - Springfield, IL	No	While CWLP agrees with the general concept of inclusion by exception (as opposed to exemption), we have concerns regarding the lack of detailed definition of this process, especially the administrative process for disputes regarding inclusion of elements in the BES. Without firm administrative rules for resolving disputes based on technical justification, we cannot support this measure currently.
<p><b>Response:</b> NERC is obligated under Order No. 743 to develop an exception process (including revisions to the NERC ROP) and implementation plan to administer a revised BES definition and associated exception criteria, and a dispute resolution process. The SDT acknowledges that commenters will need to reserve judgment on the pending Rules of Procedure exception process, which is to be developed in an effort parallel with this BES definition development.</p>		
Lewis County PUD	No	I find it hard to believe that elements connected at less than 100kV are part of the BES. The burden of proof to include elements in the BES should be on the RE not the owner of such facilities.
<p><b>Response:</b> In Order No. 743, the Commission directed NERC to adopt an inclusion process for including in the BES definition Facilities operated at voltages below 100 kV. The Commission believes that NERC should “consider formalizing the criteria for inclusion of critical facilities operated below 100 kV in developing the exemption process.” Thus, as envisioned, Regional Entities will be able to request the inclusion of Elements below 100 kV in the pending Rules of Procedure</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 6 Comment
exception process and will bear the burden of proof that such Elements are critical Facilities.		
American Electric Power (AEP)	No	Please see response provided to question 5.
<b>Response:</b> See response to Q5.		
Southern Company	No	We prefer a bright-line rule of 100 kV. The exception process should not be used to include facilities operated at voltages below 100 kV.
<b>Response:</b> The SDT believes that the criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the “bright-line” exception criteria in Project 2010-17. In Order No. 743, the Commission also directed NERC to adopt an inclusion process for including in the BES definition Facilities operated at voltages below 100 kV. The Commission believes that NERC should “consider formalizing the criteria for inclusion of critical facilities operated below 100 kV in developing the exemption process.” As envisioned, Regional Entities will be able to request the inclusion of Elements below 100 kV in the pending Rules of Procedure exception process and will bear the burden of proof that such Elements are critical Facilities.		
Independent Electricity System Operator	No	Again, we need to assess the criteria for the exception, which have not been developed.  Also, the proposed wording seems to present a circular argument. We suggest to change the wording as follows: Individual generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV that are deemed to be included in the BES as determined by the exception/inclusion process.
<b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the exception process, which is to be developed as a modification to the Rules of Procedure in an effort parallel with this BES definition development.  The SDT notes the suggested language in this comment, and has considered it in the development of the revised definition of BES.		
Springfield Utility Board	No	"directly connected" is important.
<b>Response:</b> The SDT has revised the definition and that term is no longer utilized.  Included in the BES: I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.		
Manitoba Hydro		Abstain until exemption process has been defined.
Occidental Energy Ventures Corp	No	Until the exemption process is finalized, it is not prudent to answer in the affirmative.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 6 Comment
Duke Energy		There is not enough information available at this time to adequately evaluate this question. It would be necessary to have a list of exemption criteria or more detail on the exemption process to address this question. This is one of the reasons that the exemption criteria should be developed through the standards development process along with the definition.
<p><b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the pending Rules of Procedure exception process, which is to be developed in a parallel effort with this BES definition development. Nonetheless, the SDT believes that criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17. The exception criteria (now included in the revised definition of BES) provides for both inclusions and exclusions. FERC Order No. 743 states that changes to the BES definition “will not significantly increase the scope of the present definition, which applies to transmission, generation and interconnection facilities.”</p>		
Northeast Power Coordinating Council		Refer to the response to Question 13.
<p><b>Response:</b> See response to Q13.</p>		
Entergy Services		Our response to this question depends on the details of the “exemption process”, including what entity has the final decision and how it is implemented. Please see our response to Q13 below.
Orange and Rockland Utilities, Inc.		<p>The purpose of this question is hard to ascertain. The BES exemption process has not yet been finalized or approved. So, it is somewhat difficult to know a priori whether any individual generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV should or should not be classified as part of the BES definition.</p> <p>This document uses both “exemption process” and “exception process”. Recommend that the phraseology be standardized on “exception process” as the exception (not the exemption) can be to include or exclude elements and facilities.</p> <p>Refer to the response to Question 13.</p>
<p><b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the pending Rules of Procedure exception process, which is to be developed in an effort parallel with this BES definition development. Nonetheless, the SDT believes that criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17. The exception criteria will provide for both inclusions and exclusions. FERC Order No. 743 states that changes to the BES definition “will not significantly increase the scope of the present definition, which applies to transmission, generation and interconnection facilities.”</p> <p>See response to Q13.</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 6 Comment
Xcel Energy		Xcel Energy does not disagree that there may be situations where generators greater than 20 MVA individually or 75 MVA in aggregate are connected via step up Transformers below 100 KV that may need to be included, but we have concerns about the exemption process. This undeveloped process presents itself as a wild card to entities, and will most likely present inconsistencies between regions based upon each Region's preference. Additionally, does the Regional Methodology require any approval (e.g. ERO) other than the Region's own process? The "exclusions" process indicates that the ERO has the final approval authority to exclude an item from the BES. Why would the same not apply for including something into the BES based on the Region's Methodology?
<p><b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the pending Rules of Procedure exception process, which is to be developed in an effort parallel with this BES definition development. Nonetheless, the SDT believes that criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17. The exception criteria will provide for both inclusions and exclusions. The SDT notes that a stated purpose of Order No. 743 was to eliminate the regional discretion allowed in the existing definition of BES and remove any ambiguity regarding who is required to comply and accomplish the goal of reducing inconsistencies across regions. As per FERC Order No. 672, any regional variations must be approved by FERC, and generally must be more "stringent" than NERC criteria. As envisioned, Regional Entities will be able to question the outcome of bright-line criteria in the BES definition in the pending Rules of Procedure exception process and will bear the burden of proof that such Elements are critical Facilities or not. FERC Order No. 743 states that changes to the BES definition "will not significantly increase the scope of the present definition, which applies to transmission, generation and interconnection facilities."</p>		
The Dow Chemical Company		As discussed in response to question #12 below, issues relating to the registry criteria applicable to generation resources should not be revisited at this time.
<p><b>Response:</b> See response to Q12.</p>		
City of Grand Island	Yes	See comments for items 2 and 5.
<p><b>Response:</b> See response to Q2 &amp; Q5.</p>		
NERC Staff	Yes	Please see additional comments at the end of this document.
<p><b>Response:</b> See response to Q13.</p>		
PPL Energy Plus	Yes	Yes, PPL Energy Plus supports an exemption process provided the Exemption process follows FERCs Order 743 paragraph 115: "NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid." As written, however, the 20 MVA threshold does not appear to have been developed per FERC's requirements
LG&E and KU Energy LLC	Yes	

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 6 Comment
		for the reasons discussed in the response to Questions 2 and 8.
<p><b>Response:</b> The SDT is committed to drafting a BES definition and exception criteria that will enable the pending Rules of Procedure exception process “that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid.” The SDT believes that the criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17.</p>		
Utility Services	Yes	See the answer to Question 1.
<p><b>Response:</b> See response to Q1.</p>		
American Transmission company	Yes	However, the applicable process should be called an “exception” process, not an “exemption” process that infers the concept of “exclusion” and further classified as part of the BES given that a fault or an outage on individual generation resources greater than 20MVA would not maintain an Adequate Level of Reliability of the BES.
<p><b>Response:</b> The SDT has adopted the use of the terms “exception criteria” and “exception process.”</p>		
SERC OC Standards Review Group	Yes	We think the process should be an “exception” rather than an “exemption”. This question seems illogical since the last part of the question assumes the generator is already part of the BES through the determination of the exemption process. If the question was actually generators less than 20 MVA, we don’t agree.
<p><b>Response:</b> The SDT has adopted the use of the terms “exception criteria” and “exception process.” The SDT believes that the criteria enumerated in the current Statement of Compliance Registry Criteria should be the template for defining the bright-line exception criteria in Project 2010-17.</p>		
IRC Standards Review Committee	Yes	Again, we need to assess the criteria for the exception, which have not been developed.  Also, the proposed wording seems to present a circular argument. We suggest to change the wording as follows: Individual generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV that are deemed to be included in the BES as determined by the exception/inclusion process.
<p><b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the pending Rules of Procedure exception process, which is to be developed in an effort parallel with this BES definition development.</p> <p>The SDT notes the suggested language in this comment, and has considered it in the development of the revised definition of BES., Included in the BES: I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage</p>		

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 6 Comment
of 100 kV or above.		
MRO's NERC Standards Review Subcommittee	Yes	FERC has directed (in section 30 of FERC Order 743) that NERC have an established “exemption” process to remove this judgment from the Regions in defining what the BES is. However, the applicable process should be called an “exception” process, not an “exemption” process that infers the concept of “exclusion” and further classified as part of the BES given that a fault or an outage on individual generation resources greater than 20MVA would not maintain an Adequate Level of Reliability of the BES.
<b>Response:</b> The SDT has adopted the use of the terms “exception criteria” and “exception process” in its work. Note, however, that neither term is used in the proposed definition of BES.		
City of Redding	Yes	If the exemption process is based on engineering studies targeted to identify those facilities necessary to reliably operate the interconnected transmission system.
City of Anaheim	Yes	
Bonneville Power Administration	Yes	
LCRA Transmission Services Corporation	Yes	
North Carolina EMC	Yes	
ReliabilityFirst	Yes	It is recommended that the exemption process be defined and criteria setup so that a common approach across the ERO can be used to include these facilities.
Glacier Electric Cooperative	Yes	Yes - Once again, this is assuming that the exemption process is an accurate way to truly determine whether or not a facility is significant to the grid.
United Illuminating Company	Yes	Any Generator directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation resources to be included in the BES should be part of BES . There should not be a MVA threshold
City of Austin dba Austin Energy	Yes	This answer assumes that an appropriate engineering study is performed to determine that the asset is necessary for the reliability of the BES.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 6 Comment
The Dayton Power and Light Company	Yes	
<b>Response:</b> Thank you for your response. This criterion was not changed, but is now embedded in the revised definition of BES.		

**7. Should the following be classified as part of the BES?**

- **Generation plants with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation plants to be included in the BES**

**Summary Consideration:** Most commenters who responded to this question indicated disagreement with the proposal however there was no consensus amongst the alternate proposals offered, and the proposals suggesting other thresholds were not supported with any technical justification. The SDT has reviewed the industry comments on this issue, debated the topic, and come to an agreement that the bright-line designation for multiple generating units is 75 MVA and 100 kV as shown below. Any deviations from the bright-line designation would be handled through the Rules of Procedure process.

Included in BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.

Several comments indicated that local distribution networks should be excluded, and the drafting team adopted this suggestion and added the following to the list of “Exclusions” from the 100 kV threshold that are included in the revised definition of BES.

Excluded from the BES: E3 - Local distribution networks (LDN): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the Interconnected System. LDN’s are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:

- Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
- Limits on connected generation: The LDN, nor its underlying Elements, includes no more than a total of 75 MVA generation;
- Power flows only into the Local Distribution Network: The generation within the LDN shall not exceed the electric Demand within the LDN;
- Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
- Not part of a Flowgate or Transfer Path: The LDN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

Organization	Yes or No	Question 7 Comment
SERC EC Planning Standards Subcommittee	No	We prefer a bright-line rule of 100 kV. The exception process should not be used to include facilities operated at voltages below 100 kV.

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 7 Comment
BGE	No	This proposal as written could lead to the inclusion of elements or facilities which have no material reliability impact on the interconnected transmission system.
<p><b>Response:</b> The SDT has reviewed the industry comments on this issue, debated the topic, and come to an agreement that the bright-line designation for multiple generating units is 75 MVA and 100 kV. Any deviations from the bright-line designation will be handled through the Rules of Procedure process. The process for such inclusions will be developed as part of the revision to the Rules of Procedure by another team, in an effort parallel to the development of this BES definition.</p>		
IRC Standards Review Committee	No	Same comment as in Q6, above.
Public Service Enterprise Group Company	No	See the response to item 6 above.
Snohomish County PUD	No	See response to question 6
Independent Electricity System Operator	No	Same comment as in Q6, above.
<p><b>Response:</b> See response to Q6.</p>		
Florida Municipal Power Agency	No	See FMPA responses to Questions 5 and 6 above.
Transmission Access Policy Study Group	No	
<p><b>Response:</b> See responses to Q5 &amp; Q6.</p>		
Electric Market Policy	No	Dominion does not agree that generation plants should be classified as part of the BES.
<p><b>Response:</b> The SDT finds no basis for the exclusion of generation plants from the BES, and continues to believe that generation is an integral part of the BES which any core BES definition must necessarily include.</p>		
PacifiCorp	No	In Order No. 743, the Commission directed NERC to adopt an exemption process for excluding facilities from the definition of the BES that are not necessary to operate an interconnected electric transmission network.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 7 Comment
		<p>In order to determine which facilities may be excluded, there must be criteria and a methodology that may be applied to identify which facilities are “necessary” to operate an interconnected electric transmission network and which “transmission and generation” facilities are not. In other words, there must be a clear way to determine what makes a particular facility is “necessary” for bulk system operation. Application of the criteria and methodology will result in the identification of the facilities that may be excluded. The comment questions asked in this questionnaire cannot be answered in a meaningful way absent this methodology.</p> <p>Significant efforts have been undertaken by the WECC Bulk Electric System Definition Task Force (BESDTF) over the course of the past year to identify some initial criteria and methodologies. These efforts are ongoing and should be supported by the NERC drafting team. For example: Generation plants should not be included or excluded solely based on a their gross nameplate rating and the operating voltage at which they are connected to transmission facilities. Generation plants which are necessary to operate the interconnected network should be included as part of the regulated BES. Generating plants which are not “necessary for the operation of the interconnected network” should be excluded. A methodology needs to be developed to determine which generating plants may be excluded as part of the regulated BES.</p>
<p><b>Response:</b> The SDT acknowledges that commenters will need to reserve judgment on the process, which is to be developed as a modification to the Rules of Procedure by another team in an effort parallel with this BES definition development.</p> <p>The SDT acknowledges the work of the WECC BESDTF, and in keeping with the concepts of that work, envisions that the process will identify for inclusion in the BES only those generators that are necessary to operate the interconnected network.</p>		
ExxonMobil Research and Engineering	No	See comments on questions 2 and 3.
<p><b>Response:</b> See responses to Q2 &amp; Q3.</p>		
Arizona Public Service Company	No	Generation plants with aggregate capacity of less than 300 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100 kV do not materially impact the reliability of the BES and therefore, should not be classified as part of the BES.
<p><b>Response:</b> The SDT appreciates the suggestion of a 300 MVA threshold for materiality of impact; however, it sees no technical justification upon which to base a significant departure from the generation MVA thresholds included in the NERC Statement of Compliance Registry Criteria. The SDT has reviewed the industry comments on this issue, debated the topic, and come to an agreement that the bright-line designation for multiple generating units is 75 MVA and 100 kV. Any deviations from the bright-line designation will be handled through the Rules of Procedure process. The process for such inclusions will be developed as part of the revision to the Rules of Procedure by another team, in an effort parallel to the development of this BES definition.</p>		

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 7 Comment
Pepco Holdings Inc.	No	Some details on the exemption process must be known before accepting this. Who can submit an exemption (DP, GO, GOP, TO, TOP, RC, etc)? How do interested parties get informed? Can others intervene? Would the other facilities completing the connection to a BES facility be automatically included?
American Municipal Power	No	
on behalf of Teck Metals Ltd.	No	
on behalf of Catalyst Paper Corporation	No	
Occidental Energy Ventures Corp	No	Until the exemption process is finalized, it is not prudent to answer in the affirmative.
Idaho Power	No	
Springfield Utility Board	No	
Clark Public Utilities	No	
<b>Response:</b> The SDT acknowledges that commenters may need to reserve judgment on the exception process, which is to be developed as a modification to the Rules of Procedure in an effort parallel with this BES definition development.		
North Carolina EMC	No	Generation facilities operated at voltages below 100kV should only be included in the BES if identified by the RRO as critical to the BES.
<b>Response:</b> The SDT envisions that the exception process that would be used to possibly include such Facilities will identify for inclusion in the BES only those generating plants that are essential to the reliable operation of the interconnected system. This process is being developed as a revision to the NERC Rules of Procedure by another team in an effort parallel to the development of this BES definition.		
Indeck Energy Services	No	Same Response as Question 1
Utility Services	Yes	See the answer to Question 1.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 7 Comment
<p><b>Response:</b> See response to Q1.</p>		
Southern California Edison	No	<p>SCE currently reports on generation plants with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages above 100kV. SCE does not feel it is necessary to report on generation below 100kV.</p>
<p><b>Response:</b> While the definition of the BES is a different matter than data reporting for generation plants, the SDT has incorporated a BES designation it believes will address your concerns.</p> <p>Included in BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.</p>		
Southern California Edison Company	No	<p>In SCE's system, generation resources are used to offset load being served by distribution facilities. This means that generation does not flow through step-up transformers into the 100kV and above system. Therefore, those generation resources which are used to provide power to local load within a distribution system should not be included as part of the BES. The Exemption Process should not be applied to such resources.</p>
<p><b>Response:</b> In its latest revision of the BES definition, the SDT has incorporated a designation for local distribution networks (LDN) for exclusion from the BES.</p> <ul style="list-style-type: none"> <li>• Excluded from the BES: E3 - Local distribution networks (LDNs): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the interconnected System. LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:             <ol style="list-style-type: none"> <li>a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;</li> <li>b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;</li> <li>c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;</li> <li>d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and</li> <li>e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).</li> </ol> </li> </ul>		
ISO New England Inc.	No	<p>See the comments provided in response to question 7.</p>

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

The Dow Chemical Company		As discussed in response to question #12 below, issues relating to the registry criteria applicable to generation resources should not be revisited at this time.
<p><b>Response:</b> See response to Q12.</p>		
Manitoba Hydro		Abstain until exemption process has been defined.
Duke Energy		There is not enough information available at this time to adequately evaluate this question. It would be necessary to have a list of exemption criteria or more detail on the exemption process to address this question. This is one of the reasons that the exemption criteria should be developed through the standards development process along with the definition.
<p><b>Response:</b> Thank you for your response. The revised definition of BES includes both a “bright-line” characteristic and a list of criteria that will be used to make definitional inclusions and exclusions to that bright line,</p>		
Entergy Services		Our response to this question depends on the details of the “exemption process”, including what entity has the final decision and how it is implemented. Please see our response to Q13 below.
Northeast Power Coordinating Council		Refer to the response to Question 13.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 7 Comment
NERC Staff	Yes	Please see additional comments at the end of this document.
<b>Response:</b> See response to Q13.		
Xcel Energy		Xcel Energy does not disagree that there may be situations where generators greater than 20 MVA individually or 75 MVA in aggregate are connected via step up Transformers below 100 KV that may need to be included, but we have concerns about the exemption process. This undeveloped process presents itself as a wild card to entities, and will most likely present inconsistencies between regions based upon each Region's preference. Additionally, does the Regional Methodology require any approval (e.g. ERO) other than the Region's own process? The "exclusions" process indicates that the ERO has the final approval authority to exclude an item from the BES. Why would the same not apply for including something into the BES based on the Region's Methodology?
<b>Response:</b> A separate Rules of Procedure (ROP) team is undertaking to develop a process for Facilities that do not fit within the bright-line definition. The details of the process are still under discussion and development. However, the SDT expects that ERO will have an oversight role on the Regional Process.		
ReliabilityFirst	Yes	It is recommended that the exemption process and the term "directly connected" be defined and criteria setup so that a common approach for including plants of this size be used across the ERO for reviewing these facilities and making this determination.
<b>Response:</b> The SDT believes that the phrase "directly connected" has been addressed in the latest revision. The SDT replaced this term with more descriptive language.  Included in BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.		
City of Grand Island	Yes	See comments for items 3 and 5.
<b>Response:</b> See responses to Q3 & Q5.		
PPL Energy Plus	Yes	Yes, PPL Energy Plus supports an exemption process provided the Exemption process follows FERCs Order 743 paragraph 115: "NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid." As written, however, the 75 MVA does not appear to have been developed per FERC's requirements for the reasons discussed in the response to Questions 2 and 8.
LG&E and KU Energy LLC	Yes

---

Organization	Yes or No	Question 7 Comment
Glacier Electric Cooperative	Yes	Yes - Once again, this is assuming that the exemption process is an accurate way to truly determine whether or not a facility is significant to the grid.
United Illuminating Company	Yes	Generation Plants directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation resources to be included in the BES should be part of BES . There should not be a MVA threshold
City of Austin dba Austin Energy	Yes	This answer assumes that an appropriate engineering study is performed to determine that the asset is necessary for the reliability of the BES.
The Dayton Power and Light Company	Yes	
<p><b>Response:</b> Thank you for your response.</p>		

**8. Should the following be excluded from the Elements and Facilities classified as part of the BES?**

- **Any radial Transmission Element or System, connected from one Transmission source to a Load-serving Element and/or generation resources not included in items 2, 3, 4, 6, and 7 above are excluded from the BES**

**Summary Consideration:** Most commenters who responded to this question indicated agreement with the proposal. The SDT agrees with the majority of industry comments and has developed “bright-line” exclusions for designated radial systems (only serving Load and designated generation resources) as part of the revised BES definition in the NERC Glossary without going through the exception process being developed separately as part of the revision to the Rules of Procedure by another team in an effort parallel to the development of this BES definition.

The revised definition includes a list of “Inclusions” and “Exclusions” from the 100 kV threshold and no longer references any ‘exemption process’. Based on stakeholder comments, the following “Exclusions,” relative to radial systems, has been added to the revised definition of BES:

- Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:
  - d) Only serving Load. A normally open switching device between radial systems may operate in a ‘make-before-break’ fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,
  - e) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,
  - f) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.

Based on stakeholder comments, the following “Exclusions,” relative to local distribution networks, has been added to the revised definition of BES:

- Excluded from the BES: E3 - Local distribution networks (LDNs): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the interconnected System. LDN’s are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:
  - a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
  - b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;
  - c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;
  - d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
  - e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 8 Comment
Electric Market Policy	No	Dominion supports bright line exclusions of radial lines regardless of their kV rating. Radial lines to/from solely generation facilities and radial lines to/from load are comparable in terms of their impact on an interconnected transmission network. There are situations where these radials make a meaningful and required contribution to the operation of an interconnected transmission network and there are other locations/situations where these radials do not. Therefore, radial lines should only be specifically included in the definition of BES after the RRO has demonstrated that inclusion of the radial is necessary to operate an interconnected transmission network and the owner/operator of the radial line has had the opportunity to exercise its aforementioned appeal rights.
Independent Electricity System Operator	Yes	Classification of all radial facilities operated at voltages of 100 kV and above as part of the BES by default would be unnecessary and administratively inefficient, and could potentially lead to delays in the review and approval of other exemption requests. As such, the proposed definitions should be revised to clearly define what radial Transmission Elements will not be included as part of the BES. This would be consistent with FERC’s intention expressed in Paragraph 55 of Order 743 to not alter the part of the approved definition that deals with “radial transmission facilities serving only load”. Additionally, to ensure a common understanding of the meaning of “radial” and to promote consistency in its application, we believe “radial” should be defined after seeking stakeholder input and added to the NERC Glossary.
MRO's NERC Standards Review Subcommittee	Yes	However, the NSRS agrees that a radial transmission element or system directly connected from one Transmission source to a Load-serving Element and/or generation resources are excluded as part of the BES given that a fault or an outage of the radial transmission element or system would not impact the Adequate Level of Reliability of the BES.
SERC EC Planning Standards Subcommittee	Yes	The definition should clearly state that these elements are excluded. It currently implies that the exception process would have to be applied to exclude radial elements.
Florida Municipal Power Agency	Yes	Radial Transmission Elements connected from one Transmission source to a Load-serving Element and/or generation resources not included in items 2, 3, 4, 6, and 7 above should be excluded from the BES. It is very important that the exclusion of radial transmission serving only load with one transmission source be recognized as a categorical exclusion from the BES definition, not merely as grounds for requesting an exemption. In that way, such radials do not have to go through an exemption process, but are treated the same as sub-100 kV Transmission, as they are today. In other words, such Elements could be included in the BES only if a case-by-case assessment pursuant to the inclusion process demonstrates that a particular radial Element is necessary for operating the interconnected electric transmission network. If every such Element instead had to go through a case-by-case exemption process in order to be exempted from the BES, there would be a staggering burden on small entities and on NERC to process exemption requests for all of
Transmission Access Policy Study Group	Yes	

Organization	Yes or No	Question 8 Comment
		<p>the radials serving only load with one transmission source that are excluded from the BES under the current definition. Order 743 does not require NERC to impose any new burdens on entities who own radials serving only load that are currently excluded from the BES.FMPA supports adding to the current exclusion a specification that “A radial Transmission Element may be considered as ‘serving only load’ for purposes of the foregoing general exclusion even if it connects generation, so long as that generation is not registered pursuant to the Statement of Compliance Registry Criteria.” We believe that this formulation captures the generation intended in this Question’s reference to “generation resources not included in items 2, 3, 4, 6, and 7 above.” The FERC-approved Compliance Registry Criteria recognize that a small generator, so long as it is not a “blackstart unit material to and designated as part of a transmission operator entity’s restoration plan,” is not material to the reliability of the BES. It follows, therefore, that if a radial line would not be included in the BES but for the presence of this inconsequential generation, the presence of such non-registered generation does not cause the line to become necessary for operating an interconnected electric transmission system. For example, rooftop photovoltaic cells are now common enough that allowing their presence to prevent a radial from being excluded would render the exclusion of radials to load meaningless. Of course, the application of the definition of the BES is dynamic. For example, in considering whether new generation connected by what had previously been a radial to load should be registered, NERC may also reevaluate the exclusion of the radial. There is no basis for differentiating between radials serving only load, and radials serving load with insignificant generation. Neither is necessary for operating an interconnected electric transmission network, and so both should be excluded from the BES absent a specific demonstration as to the materiality of a particular radial. Finally, it may be appropriate for Registered Entities to have the option of submitting to NERC an informational filing listing their excluded radials. Whether or not a Registered Entity submits such an informational filing to NERC, a Registered Entity’s claimed exclusion of a radial serving only load and/or unregistered generation should apply unless and until the radial is added to the BES through the inclusion process (see FMPA comments on BES exemption process submitted today).</p>
SERC OC Standards Review Group	Yes	<p>We assume the question was meant to read: Any radial Transmission Element or System, connected from one Transmission source to a Load-serving Element and/or generation resources not included in items 2, 3, 4, 6 and 7 above. Any ac transmission Facility composed of Transmission Line(s), substation Facilities, and transformers that is connected to BES ac Transmission Facilities at only one point by automatic interruption devices (e.g., circuit breaker or fuse), and is not capable of being switched so as to be simultaneously connected to BES ac transmission Facilities at a second point, should be considered an “excluded radial transmission Facility.”</p>
Southern Company	Yes	
<p><b>Response:</b> The SDT agrees and has developed “bright-line” exclusions for designated radial systems (only serving Load and designated generation resources) as part of the revised BES definition in the NERC Glossary without going through the exemption process being developed separately as part of the revision to the Rules of Procedure by another team in an effort parallel to the development of this BES definition.</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 8 Comment
<p>Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:</p> <ul style="list-style-type: none"> <li>a) Only serving Load. A normally open switching device between radial systems may operate in a ‘make-before-break’ fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,</li> <li>b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,</li> <li>c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.</li> </ul> <p>Any deviations from the bright-line designation would be handled through the Rules of Procedure process.</p>		
PPL Energy Plus	No	<p>a) By not allowing exclusion of the generators listed under Items 2,3,4,6,&amp;7, this exclusion is really a blanket inclusion of all generators over 20MVA. This blanket inclusion is discriminatory because it does not take into consideration FERC’s orders in Order 743 paragraph 38 that states it is the parallel nature of the lines (and generator lead lines are not parallel to the Interconnected Network) that justify their inclusion in the BES, NOT the radial nature of their service. The blanket inclusion of items 2,3,4,6&amp;7 also does not appear to account for FERC Order 743 in paragraph 120 that encourages exclusion of radial facilities.</p> <p>b)Further, for the reasons provided in brackets beside the quoted text below, the stated exemption (which is really a blanket inclusion of items 2,3,4,6&amp;7) appears to ignore FERC Order 743 paragraph 73 which recognizes that Network Transmission Facilities with specific characteristics should be included in the BES and most generator lead lines fail to meet the criteria laid out by FERC:</p> <ul style="list-style-type: none"> <li>i.most 100 kV lines are parallel to other HV/EHV lines and are significantly loaded by failure of the HV/EHV lines. [this is not the case with 20 MVA generators]</li> <li>ii.connect “significant” generation. [less than 200 MVA is generally not significant to the BES]</li> <li>iii.may be part of a defined transfer path or flowgate. [rarely if ever for a generator]</li> <li>iv.are capable of causing or contributing to major disturbances. [rarely if ever will this apply to a generator since an N-1 will take out most generators and the reliability of the Interconnected Network is rarely affected by an N-1.]</li> </ul>
LG&E and KU Energy LLC	No	
PacifiCorp	No	<p>In Order No. 743, the Commission stated that it believes that the best way to address their concerns is to eliminate the Regional Entities’ discretion to define “bulk electric system” without ERO or Commission review, maintain a bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities, and adopt an exemption process and criteria for excluding facilities that are not necessary to operate an interconnected electric transmission network. PacifiCorp believes that the correct interpretation of this</p>

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 8 Comment
		sentence is that certain defined radial facilities may be excluded from the definition of BES without going through the exemption process. The Commission, in paragraph 119 of Order No. 743, does state that the ERO “could track exemptions for radial facilities,” however, PacifiCorp believes that this step is unnecessary and would be unduly burdensome for both NERC and registered entities. Therefore a clear definition of excluded radial transmission elements must be developed and should be defined in the NERC Glossary or in the BES definition itself.
Springfield Utility Board	No	This question is unclear. There is no NERC definition of "radial" or "Radial". Does this mean transmission systems normally operated radially but that could be operated in such a way that the system was not radial that are owned by an LSE/DP and not a TOP/TO (for example) or transmission system?  If radial includes systems "normally operated radial" then "Yes".
Lewis County PUD	No	We note that “radial” and “one Transmission source” are not presently defined. Any radial Transmission Element or System, connected from one Transmission source to a Load-serving Element and/or generation resources less than 150MVA should be excluded from the BES. We object to requiring such elements to go through an exemption process to become excluded.
Constellation Power Source Generation, Inc. (“CPSG”) filing on behalf of Constellation Energy Group, Inc. (“CEG”), Constellation Energy Commodities Group, Inc. (“CCG”), Constellation Energy Control and Dispatch, LLC (“CDD”), Constellation NewEnergy, Inc., (“CNE”) and Constellation Energy Nuclear Group, LLC, (“CENG”)	Yes	Constellation believes that the BES definition should incorporate exclusions where possible to eliminate the need for going through an exclusion process for common facilities that should not be classified as BES.
FirstEnergy Corp	Yes	Needs to be directly identified in the BES definition and not subject to the exemption process.
<p><b>Response:</b> The SDT agrees and has developed “bright-line” exclusions for designated radial systems (only serving Load and designated generation resources) as part of the revised BES definition in the NERC Glossary without going through the exception process being developed separately as part of the revision to the Rules of Procedure by another team in an effort parallel to the development of this BES definition.</p>		

Consideration of Comments on Definition of Bulk Electric System – Project 2010-17

Organization	Yes or No	Question 8 Comment
<p>Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:</p> <ul style="list-style-type: none"> <li>a) Only serving Load. A normally open switching device between radial systems may operate in a ‘make-before-break’ fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,</li> <li>b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,</li> <li>c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.</li> </ul>		
United Illuminating Company	No	<p>Generator Resources should not be excluded. Load connected by a single radial line can be excluded.</p>
<p><b>Response:</b> The current Compliance Registry Criteria already excludes certain generator resources from registration. The SDT agrees with this concept and is continuing that line of thought in the revised definition. The SDT agrees.</p>		
ITC Holdings Corp	No	
National Rural Electric Cooperative Association (NRECA)		<p>Without explicit exemption criteria to review, it is too early to answer this question. Final exemption criteria must provide for consistency across all Regional Entities when determining the inclusion or exclusion of radial facilities as part of the BES. All exemption criteria must be explicit and unambiguous in order to provide as much certainty as possible. Work done by the Regional Entities on exemption criteria should be reviewed to determine its usefulness to the SDT. The SDT should consider that load-serving radial transmission lines of any voltage should be excluded from the BES, especially since these lines are localized and do not affect the integrity of the BES, i.e., load flow, power flow and short circuit studies. The SDT must also pay particular attention to the PRC standards and its applicability to radial facilities.</p>
<p><b>Response:</b> Thank you for your response.</p>		
The Dow Chemical Company		<p>Dow recommends that NERC finalize a basic framework for identifying BES facilities before evaluating individual facilities or types of facilities. Such a framework is recommended by Dow in response to questions #11 and #12 below.</p>
<p><b>Response:</b> See responses to Q11 &amp; 12.</p>		

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 8 Comment
Central Lincoln	Yes	We note, however, that “radial” and “one Transmission source” are not presently defined and are not treated the same way by the various REs. Please define “radial” in terms of a normal operating mode and clarify that “one Transmission source” may branch out to have multiple paths to generation upstream of the radial tap. As noted elsewhere, we object to requiring such elements to go through an exemption process to become excluded.
PUD No.1 of Clallam County	Yes	
PNGC Power	Yes

Organization	Yes or No	Question 8 Comment
Umatilla Electric Co-op	Yes	
West Oregon Electric Cooperative	Yes	
Lincoln Electric Cooperative	Yes	
Fall River Electric Cooperative	Yes	
<p><b>Response:</b> The SDT agrees and has developed “bright-line” exclusions for designated radial systems (only serving Load and designated generation resources) as part of the revised BES definition in the NERC Glossary without going through the exception process being developed separately as part of the revision to the Rules of Procedure by another team in an effort parallel to the development of this BES definition.</p> <p>Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:</p> <ul style="list-style-type: none"> <li>a) Only serving Load. A normally open switching device between radial systems may operate in a ‘make-before-break’ fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,</li> <li>b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,</li> <li>c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.</li> </ul> <p>Radial systems will be clearly described in the exclusion designations.</p>		
Xcel Energy		<p>Xcel Energy has provided a diagram to Ed Dobrowolski on 1/21/11 that lays out a scenario that should be considered and worked through as part of the development of the definition and exemptions. As stated in questions 2 &amp; 3 it is unclear as to how treatment of facilities would occur, especially if there are multiple/separate owners of each wind farm, even though they aggregate to a common bus that connects to the transmission system. Treatment of the bus and breakers between each wind farm and the transformer also needs to be contemplated and addressed in the definition or exclusion process.</p>
<p><b>Response:</b> See responses to Q2 &amp; Q3.</p>		
Indeck Energy Services	Yes	Same Response as Question 1

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 8 Comment
<b>Response:</b> See response to Q1.		
NERC Staff		Please see additional comments at the end of this document.
<b>Response:</b> See response to Q13.		
ExxonMobil Research and Engineering	Yes	NERC should follow the model of RFC and provide an appendix that provides examples of what type of radial feeds are exempted. NERC should also utilize IEEE C37.95: Guide for the Protective Relaying of Utility-Consumer Interconnections Section 4, which details typical interconnection facilities, as a reference when developing their concept of the BES. Addressing typical interconnection facility configurations will assist the NERC SDT in developing a clear and concise definition that provides a precise line of demarcation between elements of the BES and end use customer facilities.
<b>Response:</b> The SDT believes that a bright-line definition such as provided in the latest revision is more useful than examples in appendices.		
Pepco Holdings Inc.	Yes	Radial transmission element or system and load-serving elements need to be defined.
Manitoba Hydro	Yes	Radial transmission elements and systems should be excluded, but a clear NERC definition of radial is required.
Duke Energy	Yes	Radial Transmission Element or System needs to be more clearly defined.
<b>Response:</b> The SDT believes that with the revisions made to the proposed definition that no other definitions will be required.		
Idaho Power	Yes	This should be expanded to transmission elements or systems that source load serving stations. Two examples are: 1.) The non-radial transmission system serving a metro area load at 138 kV where 230 kV and higher voltage systems surround the area and provide the bulk electric system transfer, and 2.) The non-radial transmission loops that serve rural area load at 138 kV that are essentially tangential to the bulk electric transfer path.
<p><b>Response:</b> The SDT has discussed this at length and has drafted exclusions for local distribution networks that should address these concerns and that will be available for review and comments.</p> <p>Excluded from the BES: E1 - Local Distribution Networks (LDN): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the Interconnected System. LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 8 Comment
<p>of service to retail customer Load. The LDN is characterized by all of the following:</p> <ul style="list-style-type: none"> <li>a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;</li> <li>b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;</li> <li>c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;</li> <li>d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and</li> <li>e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).</li> </ul>		
Public Service Enterprise Group Company	Yes	See the response to item 6 above.
<p><b>Response:</b> See response to Q6.</p>		
Northeast Power Coordinating Council	Yes	
City of Redding	Yes	However, the NERC GO/TO work should incorporated.
City of Anaheim	Yes	Transmission elements serving radial load, radial distribution systems, or non-GO/GOP generation connected to such radial lines and excluded from BES; provided, however, to eliminate any reliability gaps, such radial transmission elements should be classified as "Distribution" equipment subject to DP standards, and the PRC and vegetation management standards should be made applicable to Distribution Providers and this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for radial transmission facilities that function as Distribution and are not required for the reliable operation of the BES.
IRC Standards Review Committee	Yes	
Bonneville Power Administration	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 8 Comment
Competitive Suppliers	Yes	The consideration and criteria about whether radials should be included as elements of the BES or not, needs to ensure consistency across the Regional Entities, based upon the future revised BES definition and the exemption criteria. Much of the consideration from the prior questions is based on generators and their size as measured by their capacity and connection voltage. While EPSA believes that there are some facilities that should be included (but not all) the “Yes” response to this question is really dependent on the exemption criteria developed by the Standard Drafting Team for radial lines. The “bright-line” criteria from earlier questions are not sufficient to make an assertion about what is necessary for reliability with respect to radial lines. Criteria about generators and their connections is one piece for ensuring reliability. Further bright-line criteria need to be determined for load-serving elements on par with the generator criteria relevant for reliability. The BES definition additionally needs to recognize that load and generation can have similar affects on the BES because both can affect BES voltage and frequency. As written, the BES definition appears to apply to generation but not load when in fact the BES sees the difference between load and generation mainly as the direction of power flow.
Arizona Public Service Company	Yes	
LCRA Transmission Services Corporation	Yes	
American Municipal Power	Yes	
North Carolina EMC	Yes	Radial facilities meeting the above criteria should be automatically exempted from classification as a part of the BES and should not be required to go through a separate exemption process.
ReliabilityFirst	Yes	As long the facility is purely radial and could under no circumstance or system topology (i.e. via switching or re-configuration) trip/lockout a BES facility.
on behalf of Teck Metals Ltd.	Yes	Parallel transmission lines from a single source (substation) to a single load should be excluded from the BES, with the consent/request of the owner of the connected load (and/or all customers that constitute the connected load).
Southern California Edison	Yes	SCE currently does not report on any radial Transmission Element or System, connected from one Transmission source to a Load-serving Element and/or generation resources not included in items 2, 3, 4, 6, and 7 and believes the above should be excluded.

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 8 Comment
Southern California Edison Company	Yes	
on behalf of Catalyst Paper Corporation	Yes	Parallel transmission lines from a single source (substation) to a single load should be excluded from the BES, with the consent/request of the owner of the connected load (and/or all customers that constitute the connected load).
City of Grand Island	Yes	
Occidental Energy Ventures Corp	Yes	The existing exclusion for radial lines serving load should be maintained. If clarification of the existing language concerning radials is required, the exclusion and definition of “radial systems,” including the explanation of “normal operations,” contained in the BES Concept Document seems to accurately reflect radials serving load or small generators that should be excluded from the BES. FERC orders directing change in the BES definition support maintaining this exclusion.
City of Anaheim	Yes	Transmission elements serving radial load, radial distribution systems, or non-GO/GOP generation connected to such radial lines and excluded from BES; provided, however, to eliminate any reliability gaps, such radial transmission elements should be classified as "Distribution" equipment subject to DP standards, and the PRC and vegetation management standards should be made applicable to Distribution Providers and this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for radial transmission facilities that function as Distribution and are not required for the reliable operation of the BES.
Glacier Electric Cooperative	Yes	I don't think a radial transmission system would ever have a significant impact on the BES, so they should be excluded.
ISO New England Inc.	Yes	Per FERC Order 743, paragraph 55, the Commission declared, "As we stated in the NOPR, we do not seek to modify the second part of the definition through this Final Rule, which states that "radial transmission facilities" serving only load with one transmission source are generally not included in this definition." ISO-NE maintains that this definition of radial should be the default position and only in cases where other radial configurations are to be considered should they be examined as part of any exemption or exclusion methodology that is developed by NERC in accordance with Order 743.
Entergy Services	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 8 Comment
Snohomish County PUD	Yes	FERC Order No. 743 is clear that FERC did not intend to disturb the existing exemption for radial facilities. Accordingly, radial systems should be excluded from the BES. This should not change if the radial system is used to interconnect a BES generator for reasons set forth in the GOTO Task Force report.
Orange and Rockland Utilities, Inc.	Yes	
American Transmission company	Yes	ATC agrees that a radial transmission element or system directly connected from one Transmission source to a Load-serving Element and/or generation resources are excluded as part of the BES given that a fault or an outage of the radial transmission element or system would not maintain an Adequate Level of Reliability of the BES.
Utility Services	Yes	
City of Austin dba Austin Energy	Yes	
The Dayton Power and Light Company	Yes	
BGE	Yes	BGE believes that the BES definition should incorporate exclusions where possible to eliminate the need for going through an exclusion process for common facilities which should not be classified as BES.
City Water Light and Power (CWLP) - Springfield, IL	Yes	
American Electric Power (AEP)	Yes	Yes, and we believe that this exclusion should be applied to both Transmission and Generation.
Clark Public Utilities	Yes	
<p><b>Response:</b> Thank you for your comments. The revised definition includes a list of “Inclusions” and “Exclusions” from the 100 kV threshold and no longer references any ‘exemption process’. Based on stakeholder comments, the drafting team added “Exclusions,” to the BES definition relative to radial systems and local distribution networks.</p>		

**9. Should the following be excluded from the Elements and Facilities classified as part of the BES?**

- **Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO)**

**Summary Consideration:** The majority of the industry responded positively to this question. However, the SDT understands that the process is still in development and that may affect actual responses. The SDT is striving to develop a revised “bright-line” definition that contains certain inclusions/exclusions and that should remove any confusion. A separate Rules of Procedure (ROP) team is undertaking to develop a separate process for Facilities that entities may choose to follow for their unique/special circumstances that do not fit within the definition and its designation.

Organization	Yes or No	Question 9 Comment
IRC Standards Review Committee	No	We find this exclusion criteria to be redundant. We believe that the proposed definition together with the basic inclusion criteria suffice to provide a bright line framework for determining Elements/Facilities that should be included as BES. Having this exclusion criteria confuses the bright line approach and does not add any value to the basic definition and inclusion criteria.
Independent Electricity System Operator	No	We find this exclusion criteria to be redundant. We believe that the proposed definition together with the basic inclusion criteria suffice to provide a bright line framework for determining Elements/Facilities that should be included as BES. Having this exclusion criteria confuses the bright line approach and does not add any value to the basic definition and inclusion criteria.
Electric Market Policy	Yes	Dominion conceptually supports an exemption process whereby NERC or the RRO could apply to have an element included or excluded from the BES definition. Such process recognizes that it may be necessary to include elements that do not meet the bright line criteria but are necessary for operating an interconnected transmission network. Such process should be developed through the existing NERC standards development process and include a robust appeals process for the owner/operator of any element so included or excluded.
Constellation Power Source Generation, Inc. (“CPSG”) filing on behalf of Constellation Energy Group, Inc. (“CEG”), Constellation Energy Commodities Group, Inc. (“CCG”), Constellation Energy Control and Dispatch, LLC	Yes	Constellation recognizes the value in clarifying the Definition of Bulk Electric System into a bright line threshold consistently applied across the regions. However, we are concerned that the current approach of a simple, all inclusive definition coupled with an exception criteria and process will not draw on the fundamentals underpinning the existing definition and create a cumbersome and unnecessary exception process. As an alternative, we propose that the standard drafting team utilize the -Section III (Rules of Procedure Appendix 5B) along with definition threshold language to develop a more comprehensive definition. Regardless of approach, any elements and facilities found to meet the criteria for exemption should be exempted. The development of such criteria should be part of the BES drafting team’s

Organization	Yes or No	Question 9 Comment
("CDD"), Constellation NewEnergy, Inc., ("CNE") and Constellation Energy Nuclear Group, LLC, ("CENG")		responsibility.
<p><b>Response:</b> Your comments are noted. The SDT is striving to develop a "bright-line" definition that will contain certain inclusions/exclusions and that should remove any confusion. A separate Rules of Procedure (ROP) team is undertaking to develop a separate process for Facilities that entities may choose to follow for their unique/special circumstances that do not fit within the definition and its designation.</p>		
Occidental Energy Ventures Corp	No	Until the exemption process is finalized, it is not prudent to answer in the affirmative.
Manitoba Hydro		Abstain until exemption process has been defined.
<p><b>Response:</b> The SDT understands that the process is still in development and how that may affect your response.</p>		
National Rural Electric Cooperative Association (NRECA)		<p>Without specific exemption criteria to review, it is too early to explicitly answer this question. However, the concept appears to be logical. All exemption criteria must be explicit and unambiguous in order to provide as much certainty as possible.</p> <p>Work done by the Regional Entities on exemption criteria should be reviewed to determine its usefulness to the SDT.</p>
PacifiCorp	Yes	<p>In Order No. 743, the Commission directed NERC to adopt an exemption process for excluding facilities from the definition of the BES that are not necessary to operate an interconnected electric transmission network. In order to determine which facilities may be excluded, there must be criteria and a methodology that may be applied to identify which facilities are "necessary" to operate an interconnected electric transmission network and which "transmission and generation" facilities are not. In other words, there must be a clear way to determine what makes a particular facility is "necessary" for bulk system operation. Application of the criteria and methodology will result in the identification of the facilities that may be excluded. The comment questions asked in this questionnaire cannot be answered in a meaningful way absent this methodology.</p> <p>Significant efforts have been undertaken by the WECC Bulk Electric System Definition Task Force (BESDTF) over the course of the past year to identify some initial criteria and methodologies. These efforts are ongoing and should be supported by the NERC drafting team.</p>
<p><b>Response:</b> The SDT is striving to develop a "bright-line" definition that will contain certain inclusions/exclusions and that should remove any confusion. A separate Rules of Procedure (ROP) team is undertaking to develop a separate process for Facilities that entities may choose to follow for their unique/special</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 9 Comment
<p>circumstances that do not fit within the definition and its designation.                      Work done by Regional Entities is one of many inputs to the SDT deliberations.</p>		
Xcel Energy		<p>This undeveloped process presents itself as a wild card to entities, and will most likely present inconsistencies between regions based upon each Region's preference. Additionally, does the Regional Methodology require any approval (e.g. ERO) other than the Region's own process? The "exclusions" process indicates that the ERO has the final approval authority to exclude an item from the BES. Why would the same not apply for including something into the BES based on the Region's Methodology?</p>
MRO's NERC Standards Review Subcommittee	Yes	<p>This will give the industry a clear set of criteria to follow which is FERC approved. If a Regional Entity has a need to alter this process there are processes in place for them to pursue a variance. However, the applicable process should be called an "exception" process to avoid the connotation that "exemption" process has for the "inclusion" aspect of the process. NSRS believes the exemption process, review and approval, would be best handled by the Regional Entity (RE) since they have more knowledge on the transmission system in their region. The "who" and "what" will have to be spelled out clearly in the criteria for the exception process.</p>
<p><b>Response:</b> A separate Rules of Procedure (ROP) team is undertaking to develop a process for Facilities that do not fit within the bright-line definition. The details of the process are still under discussion and development. However, the SDT expects that ERO will have an oversight role on the Regional Process.</p>		
The Dow Chemical Company		<p>Dow recommends that NERC finalize a basic framework for identifying BES facilities before evaluating individual facilities or types of facilities. Such a framework is recommended by Dow in response to questions #11 and #12 below.</p>
<p><b>Response:</b> See responses to Q11 &amp; 12.</p>		
Entergy Services		<p>Our response to this question depends on the details of the "exemption process", including what entity has the final decision and how it is implemented. Please see our response to Q13 below.</p>
Northeast Power Coordinating Council	Yes	<p>Refer to the response to Question 13.</p>
FirstEnergy Corp	Yes	<p>Yes, but the process should be simple, rarely used with a high threshold for removing any 100kV and above facility from the normally defined BES. Please see our Question 13 response for further views.</p>

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 9 Comment
NERC Staff	Yes	Please see additional comments at the end of this document.
Orange and Rockland Utilities, Inc.	Yes	Refer to the response to Question 13.
<b>Response:</b> See response to Q13.		
Florida Municipal Power Agency	Yes	It is important to maintain the distinction between “exclusions” and “exemptions.” The SDT seems at times to use the words interchangeably. An exclusion is a categorical carve-out from the BES definition, such that excluded Elements are treated the same as sub-100 kV Transmission. FMPA proposes the following exclusion, which would retain the existing exclusion of radials serving only load with one Transmission source, clarified to add radials serving inconsequential generation to the exclusion: Radial Transmission Elements serving only load with one Transmission source are generally not included in this definition. A radial Transmission Element may be considered as “serving only load” for purposes of the foregoing general exclusion even if it connects generation, so long as that generation is not registered pursuant to the Statement of Compliance Registry Criteria. To obtain an exemption, on the other hand, an entity must go through the NERC exemption process. If the owner or operator of an Element that is nominally part of the BES can demonstrate to NERC that the particular Element meets the criteria for demonstrating that it is not necessary for operating the interconnected electric transmission network, that Element should be granted an exemption and thus considered non-BES. (See also FMPA comments on BES exemption process submitted today.) Requests for exemptions should be decided by NERC, not the Regional Entities, in order to foster continent-wide uniformity.
Transmission Access Policy Study Group	Yes	
<b>Response:</b> Your comments are noted. The SDT is striving to develop a “bright-line” definition that will contain certain inclusions/exclusions and that should remove any confusion. A separate Rules of Procedure (ROP) team is undertaking to develop a separate process for Facilities that entities may choose to follow for their unique/special circumstances that do not fit within the definition and its designation.		
Pepco Holdings Inc.	Yes	<ol style="list-style-type: none"> <li>1. The proposed BES definition should be expanded to contain more specific criteria for what is excluded (and included) to minimize the need for exemptions. The exemption process should only be needed for a few special situations that are not covered in the criteria.</li> <li>2. The exemption process should rest with the regional entity.</li> </ol>
<b>Response:</b> 1. Your comments are noted. The SDT is striving to develop a “bright-line” definition that will contain certain inclusions/exclusions and that should remove any confusion. 2. A separate Rules of Procedure (ROP) team is undertaking to develop a process. Regional entities are expected to have an important role in the exception

		for the exception process. For consistency, it is appropriate for the ERO to monitor and concur with the exceptions.
<p><b>Response:</b> A separate Rules of Procedure (ROP) team is undertaking to develop an exception (inclusion/exclusion) process. Regional entities are expected to have an important role in the exception process. However, as directed by FERC, it is expected that the ERO would have an oversight and/or approval role. The details of the process are still under discussion and development.</p>		
City Water Light and Power (CWLP) - Springfield, IL	Yes	CWLP generally agrees with this point, but would like to see a firm, detailed administrative process for resolving disputes for exemptions with technical justification as the guiding principle.
<p><b>Response:</b> A separate Rules of Procedure (ROP) team is undertaking to develop an exception process for Facilities that do not fit within the bright-line definition. The details of the process are still under discussion and development.</p>		
American Electric Power (AEP)	Yes	As noted in our response to question 5, we believe that an exemption process is needed, though substantive comments cannot be made until details of such a process and its related criteria are provided.
<p><b>Response:</b> See response to Q5.</p>		
Springfield Utility Board	Yes	Who can apply? Who pays for the process? Is there a time frame for approval? Is the registered entity required to meet reliability requirements for the Element or Facility while it is in the exemption process? Part of the concern is that there are Elements and Facilities that are not necessary for the reliability for the BES but if they were included as part of the BES definition would significantly harm the entity financially to meet compliance with no measurable impact to reliability.
<p><b>Response:</b> A separate Rules of Procedure (ROP) team is undertaking to develop an exception process for Facilities that do not fit within the bright-line definition. The details of the process are still under discussion and development. The SDT will forward your comments to the ROP team for consideration as part of their process.</p>		
City of Redding	Yes	The key element is a good exemption process based on sound engineering principles.
City of Anaheim	Yes	
SERC EC Planning Standards Subcommittee	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 9 Comment
Public Service Enterprise Group Company	Yes	No Comment
Bonneville Power Administration	Yes	
PPL Energy Plus	Yes	Yes, PPL Energy Plus support an exemption process for facilities (such as radial generation service and 100 kV looped load service) provided the Exemption process follows FERCs Order 743 paragraph 115: "NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid."
LG&E and KU Energy LLC	Yes	
ExxonMobil Research and Engineering	Yes	There should be an exemption process. There should also be a documented process for appealing the determination of whether or not a facility is part of the BES.
Arizona Public Service Company	Yes	
LCRA Transmission Services Corporation	Yes	
American Municipal Power	Yes	
North Carolina EMC	Yes	If elements or facilities meet one of the BES definition classifications identified in Questions 1-7 above, the owner of the facility or element should be able to apply for an exemption through the exemption process. In other words, the criteria outlined in Questions 1-7 should be considered a "bright-line" criteria for inclusion in the BES. If a facility meets one or more of these criteria, it can only be excluded from the BES by applying for an exemption through the exemption process.
ReliabilityFirst	Yes	However, the exemption process and criteria needs to be clearly defined so that a common approach across the ERO is used when this determination is made.
on behalf of Teck Metals Ltd.	Yes	
Southern California Edison	Yes	SCE agrees Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO).

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 9 Comment
Southern California Edison Company	Yes	
on behalf of Catalyst Paper Corporation	Yes	
City of Grand Island	Yes	
Glacier Electric Cooperative	Yes	Yes - This is assuming that the exemption process is an accurate way to truly determine whether or not a facility is significant to the grid. I think such an analytical method will be much more effective and accurate than a bright-line approach.
ISO New England Inc.	Yes	We generally support this approach, subject to the assessment of the detailed exemption/inclusion criteria and process.
Snohomish County PUD	Yes	If the Element or Facility is demonstrated through engineering studies performed as part of the exemption process to be unnecessary for the reliable operation of the interconnected bulk transmission system, the Element or Facility should not be classified as part of the BES regardless of its operating voltage.
City of Austin dba Austin Energy	Yes	
Duke Energy	Yes	
The Dayton Power and Light Company	Yes	
ITC Holdings Corp	Yes	
BGE	Yes	No comment.
Southern Company	Yes	Yes, provided the evaluation method is clear, understandable, and technically based.
Idaho Power	Yes

Organization	Yes or No	Question 9 Comment
Clark Public Utilities	Yes	
<b>Response:</b> Thank you for your response.		

**10. Should the following be excluded from the Elements and Facilities classified as part of the BES?**

- **Generating plant control and operation functions which include relays and systems that control and protect the unit for boiler, turbine, environmental, and/or other plant restrictions**

**Summary Consideration:** Most commenters who responded to this question indicated agreement with the proposal. The SDT has discussed generator plant controls and operation functions and feels that they should not be included in the BES definition. It was determined that balance of plant equipment, including control and operation functions, fall within the scope of existing reliability standards. However, the SDT believes the inclusion of generator leads and the GSU for some configurations have been established by the SDT through discussions of the elements and resources material integral to the reliable operation of the BES. The bright-line designation will be developed as part of this project and the ROP process will be handled through the revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition.

The revised BES definition includes the following “Inclusions” as elements of the BES:

Included in the BES: I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.

Included in the BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.

Organization	Yes or No	Question 10 Comment
Bonneville Power Administration	No	However, if the generator is not part of BES, then the plant control and operation functions should not be included in the BES as well.
Glacier Electric Cooperative	No	Once again, it depends on the facility's significant impact to the grid.
Manitoba Hydro		If there is an impact to frequency or voltage response or facility ratings it should be included.
City of Austin dba Austin Energy	Yes	This response assumes the question refers to devices within the plant itself. In other words, the relays, etc. within the plant and used to protect the generation assets should not be included in the definition of BES. Additionally, many generation units have a design basis allowing some equipment to trip without impact to the generation output.
City of Redding	Yes	Only the relays and protection schemes that protect BES equipment (example is a BES substation bus), not power plant equipment. Exception could be a RMR unit.

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 10 Comment
<p><b>Response:</b> The SDT has discussed generator plant controls and operation functions and feels that they should not be included in the BES definition. It was determined that balance of plant equipment, including control and operation functions, fall within the scope of existing reliability standards.</p>		
Duke Energy	No	Boiler, turbine, environmental or other control systems that are designed to automatically trip a BES facility in the normal system configuration, when operating correctly for their intended function, should be included in the BES definition.
ReliabilityFirst		Several of these examples listed could in fact force a unit or units out of service, thereby causing a negative impact (such as lowering frequency, etc.) to the BES. However, there should be some additional thought for exclusion of balance of plant facilities, such as the boiler, turbine, and environmental and auxiliary equipment (i.e. scrubber, baghouse, precipitator, fuel/ash coal handling, cooling water, etc.), if they cannot trip the unit off-line.
<p><b>Response:</b> The SDT has discussed generator plant controls and operation functions including those associated with balance of plant equipment such as boiler, turbine, environmental and other control systems and feels that they should not be included in the BES definition. It was determined that balance of plant equipment, including control and operation functions, fall within the scope of existing reliability standards.</p>		
LCRA Transmission Services Corporation	No	
American Municipal Power	No	
<p><b>Response:</b> Thank you for your response.</p>		
NERC Staff	No	Please see additional comments at the end of this document.
<p><b>Response:</b> See response to Q13.</p>		
The Dow Chemical Company		As discussed in response to question #12 below, issues relating to the registry criteria applicable to generation resources should not be revisited at this time.
<p><b>Response:</b> See response to Q12.</p>		
Competitive Suppliers		Plant controls and other systems on the generation side from the point of interconnection should not be included in the BES definition because they do not significantly affect the reliability of the interconnected

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 10 Comment
		electric network. EPSA recommends that the standards drafting team develop a BES exemption criteria that considers the impact of all equipment (including lead lines and GSUs) on the generator side from the point of interconnection on the reliability of the BES.
<p><b>Response:</b> The SDT has discussed generator plant controls and operation functions and feels that they should not be included in the BES definition. It was determined that balance of plant equipment, including control and operation functions, fall within the scope of existing reliability standards. The bright-line designation will be developed as part of this project and the process will be handled through the revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition. Your comments will be forwarded to the Rules of Procedure Team.</p>		
Arizona Public Service Company	Yes	The above description for defining the exclusion is vague and too difficult to determine where the exclusion applies for a Generator. AZPS recommends identifying exclusions for all systems which are not electrically/magnetically connected to generation elements including the GSU, line leads and the generator or its protection systems.
City of Anaheim	Yes	Unless the generator is required to maintain BES reliability, i.e. black start, etc., the GSU and gen tie should be excluded from the BES; provided, however, to eliminate any reliability gaps, such generation-tie equipment should be classified as "Generator" equipment subject to GO/GOP standards, and the PRC and vegetation management standards should be made applicable to GO/GOPs and this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for non-critical generation-tie transmission elements that are not required for the reliable operation of the BES.
<p><b>Response:</b> The inclusion of generator leads and the GSU for some configurations have been established by the SDT through discussions of the elements and resources material integral to the reliable operation of the BES.</p> <p>Included in the BES: I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.</p> <p>Included in the BES: I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.</p>		
Indeck Energy Services	Yes	Same Response as Question 1
<p><b>Response:</b> See response to Q1.</p>		
Springfield Utility Board	Yes	Individual loads equal to or below 25 MW (one customer on a line) served by Transmission Facilities greater than 100kV and the Transmission Facilities themselves should be excluded for the same reason. Entity registration is based on aggregate loads. But a 10 MW load may served by an LSE that has a 200 MW peak

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 10 Comment
		is part of the BES while the same 10 MW load served by a 20 MW LSE would not be part of the BES. From a reliability perspective this is inconsistent. Either a facility is or isn't necessary for the reliability of the BES. If a facility isn't necessary because an entity does not meet registration thresholds then the same facility should be excluded from the BES for an entity that is registered.
<p><b>Response:</b> The SDT has decided to stay with the limits in the NERC Statement of Compliance Registry Criteria with regard to the size of generators that will be included in the BES.</p>		
City of Anaheim	Yes	Unless the generator is required to maintain BES reliability, i.e. black start, etc., the GSU and gen tie should be excluded from the BES; provided, however, to eliminate any reliability gaps, such generation-tie equipment should be classified as "Generator" equipment subject to GO/GOP standards, and the PRC and vegetation management standards should be made applicable to GO/GOPs and this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for non-critical generation-tie transmission elements that are not required for the reliable operation of the BES.
Northeast Power Coordinating Council	Yes	These systems are internal protection systems and will not impact the reliability of the BES.
SERC EC Planning Standards Subcommittee	Yes	
Public Service Enterprise Group Company	Yes	The relays and systems described above should not be classified as part of the BES. The intent of the BES definition and applicable standards should not include these items as this would further confuse the BES boundary scope rather than clarify what should be included. The described functions and controls by themselves do not add to BES reliability.
MRO's NERC Standards Review Subcommittee	Yes	This will give our industry a clear defining line of what is a BES Facility and what it is comprised of.
IRC Standards Review Committee	Yes	
Florida Municipal Power Agency	Yes	Excluding such generating plant control and operation functions, which have to do with mechanical energy, rather than electric energy, would be consistent with Section 215 of the Federal Power Act, which states that the Bulk Power System includes "electric energy from generation facilities needed to maintain transmission system reliability." There are standards, such as PRC-024, FAC-008, and FAC-009, regulating total unit performance and ratings, which necessarily covers component performance as well. Therefore, no purpose
Transmission Access Policy Study Group	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 10 Comment
		would be served by including these types of items in a granular way in the BES definition.
FirstEnergy Corp	Yes	Yes these should be excluded from the BES definition. If there is a reliability need related to these devices a standard could be written even though they are not included within the BES definition. Our position is similar to our prior stated view on the blackstart and cranking path.
Electric Market Policy	Yes

<b>Response:</b> Thank you for your response.		

**11.** Do you believe that the proposed definition of BES, accompanied by a separate BES Definition Exception Process meets the reliability-related intent of the directives in Order 743?

**Summary Consideration:** Most commenters who responded to this question indicated disagreement with the proposal, indicating a preference to have more details in the definition. The SDT will develop the BES definition and associated criteria. The SDT intends to develop criteria that will be explicit enough so that the owners/operators of the vast majority of Facilities will not have to seek a case-by-case exception on whether their Facilities are part of the BES. This includes addressing radial Transmission serving only Load.

A separate ROP team will develop the procedures for seeking an exception that is not clearly addressed by the definition and criteria. The SDT understands the importance of the exception process being developed in parallel with the BES definition and associated criteria and will closely coordinate with the ROP team that is responsible for developing that process. As the SDT develops the modified BES definition and associated criteria, it will carefully consider Canadian-specific issues and the current NERC Statement of Compliance Registry Criteria.

Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:

- a) Only serving Load. A normally open switching device between radial systems may operate in a 'make-before-break' fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,
- b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,
- c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.

Excluded from the BES: E3 - Local distribution networks (LDNs): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the interconnected System. LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:

- a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
- b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;
- c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;
- d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
- e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 11 Comment
Public Service Enterprise Group Company	No	There is still room for misinterpretation. The definition of the BES should be as explicit as possible since it affects the majority of the standards.
<b>Response:</b> The SDT is developing a bright-line BES definition and associated criteria that will address as many Facilities as possible.		
Florida Municipal Power Agency	No	The proposed definition abandons the current exclusion of radials serving only load with one transmission source that Order 743 specifically left in place, and instead conflates “excluded” Elements with Elements for which an “exemption” can be sought. The proposed definition would thus require entities to seek an exemption, presumably on a case-by-case basis, for every > 100 kV radial serving only load with one transmission source. FERC did not intend to direct such a result in Order 743, but rather intended to allow the current exclusion of such radials to load to continue. Furthermore, to comply with Order 743, the new BES definition and exemption/inclusion processes must ensure uniformity throughout the United States. Thus there must be a uniform process; clear criteria for exemption and inclusion; and a right to appeal decisions to a higher body within NERC and/or to FERC.
Transmission Access Policy Study Group	No	
<p><b>Response:</b> The SDT has proposed the following radial exclusion from the BES as part of its revised definition. The SDT believes that this will address your concern.</p> <p>Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:</p> <ul style="list-style-type: none"> <li>a) Only serving Load. A normally open switching device between radial systems may operate in a ‘make-before-break’ fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,</li> <li>b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,</li> <li>c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.</li> </ul>		
Electric Market Policy	No	See comments at bottom of questionnaire (Q13).
<b>Response:</b> See response to Q13.		
PPL Energy Plus	No	For the reasons discussed above, the proposed BES definition does not take into account FERC’s desire to only include Facilities in the BES that have an impact on the reliability of the Interconnected Electric Network.
LG&E and KU Energy LLC	No	

Organization	Yes or No	Question 11 Comment
<p><b>Response:</b> The SDT assumes that you are referring to responses that you provided to earlier questions. See above responses.</p>		
Competitive Suppliers	No	<p>The intent of the directives in Order 743 is to, “direct NERC to develop a uniform modified definition of Bulk-electric system [that] will eliminate regional discretion and ambiguity”. In Order 743 the Commission also finds that the exemption process needs to work with the definition. Paragraph 115 from the BES final rule states “NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid. The ERO also should determine any related changes to its Rules of Procedures (ROP) that may be required to implement the exemption process, and file the proposed exemption process and rule changes with the Commission.” This section does not direct NERC to use the ROP modification process to develop “separate” exemption criteria. It only recommends that NERC modify its ROP for any related changes to implement the exemption process, not for developing the exemption criteria. BES exemption criteria need to be developed through the NERC standards development procedure by the Standard Drafting Team (SDT) that is modifying the BES definition. The exemption criteria need to be done by the same group that forms the definition so that the exemptions are crafted to fit with the new BES definition. The definition and the exemption criteria need to be meshed and work together.</p>
<p><b>Response:</b> The SDT will develop the BES definition and associated criteria. A separate Rules of Procedure (ROP) team will develop the procedures for seeking an exception that is not clearly addressed by the definition and criteria. The SDT will closely coordinate with the ROP team.</p>		
PacifiCorp	No	<p>The proposed definition does not meet the reliability-related intent of the directives in Order 743 in two respects. First, the second clause of the first sentence of the proposed definition re-introduces the ambiguity that the Commission believes a bright-line threshold will eliminate. The first sentence states that the BES is “all Transmission and Generation Elements and Facilities operated voltages of 100 kV or higher necessary to support bulk power system reliability.” (emphasis added). PacifiCorp understands that the intent of this language is to indicate that only some subset of 100 kV facilities (those necessary for reliability) are included in the definition of the BES. However, this language is ambiguous in that it does not make it clear that the only way to exempt 100 kV and above facilities (other than certain defined radial facilities) from the definition is to utilize the exemption process. Second, the proposed definition does not make it clear that certain defined radial facilities may be excluded from the definition without utilizing the exemption process.</p> <p>PacifiCorp proposes the following: Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher except [defined radial facilities]. Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher may be excluded if they are not necessary to operate an interconnected electric transmission network. Transmission and Generation Elements and Facilities operated at voltages of 100 kV or lower must be included if they are necessary to operate an interconnected electric transmission network. The criteria for determining whether Elements and</p>

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 11 Comment
		Facilities are necessary to operate an interconnected electric transmission network are defined in the BES definition exemption process.
<p><b>Response:</b> The SDT is developing criteria that will be explicit enough so that the owners/operators of the vast majority of Facilities will not have to seek a case-by-case decision on whether their Facilities are part of the BES. This includes addressing radial Transmission serving only Load.</p> <p>Excluded from the BES: E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:</p> <ul style="list-style-type: none"> <li>a) Only serving Load. Xcel Energy	No	
Manitoba Hydro	No	<p>No. The proposed definition includes the wording '...necessary to support bulk power system reliability' which increases ambiguity and reduces the 100kV and above bright line distinction. This wording should be removed. Manitoba Hydro suggests the following: Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher except defined radial facilities. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process.</p>
<p><b>Response:</b> The SDT has revised the definition and the wording is no longer utilized.</p>		
Indeck Energy Services	No	Same Response as Question 1
<p><b>Response:</b> See response to Q1.</p>		
Southern California Edison	No	SCE believes that the 100kV brightline threshold is sufficient.
<p><b>Response:</b> Thank you for your comment. Please see the revised definition – it includes a detailed list of inclusions/exclusions to minimize the need to use the BES Exception Process.</p>		
City of Grand Island	No	This question is premature given that the BES Exception Process has not been developed.
Occidental Energy Ventures Corp	No	Until the exemption process is finalized, it is not prudent to answer in the affirmative.
<p><b>Response:</b> The SDT understands the importance of this process being developed in parallel with the BES definition and associated criteria.</p>		
Central Lincoln	No	The order was to provide a definition that excepted radial facilities and to create an exemption process for

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 11 Comment
PUD No.1 of Clallam County	No	other facilities not necessary for operating the interconnected network. The SAR proposes to treat the two the same. This will cause unneeded expense, delay, and uncertainty for those radial facilities that could simply be eliminated by inspection. This would work against reliability by misdirecting resources toward the elements tied up in the process, and possibly away from the elements that should be included. The SAR also fails to meet the order by failing to apply it to all entity types. We fail to see how a bright line is achieved if DPs, PSEs, and IAs work from a definition different from all the other types of registered entities. Please edit the SAR to include all entity types.

The Dow Chemical Company	No	<p>Order No. 743 correctly recognizes that local distribution facilities are expressly excluded from the definition of “Bulk-Power System” set forth in Section 215 of the Federal Power Act. See Order No. 743 at P 37. As such, local distribution facilities must also be excluded from the definition of BES adopted by NERC. That is not the case with respect to the proposed definition, which makes no mention whatsoever of local distribution facilities. Instead, the proposed definition simply provides that certain facilities, including “Radial Transmission systems, may be excluded . . . if approved through the BES definition exemption process.” While this language presumably is an acknowledgement that Radial Transmission lines perform a local distribution function and should be excluded, numerous other types of facilities also perform a local distribution function and should also be excluded regardless of their voltage. For example, Dow and certain of its subsidiaries, including Union Carbide Corporation, own and operate electrical facilities at a number of industrial sites within the U.S. In all cases, a tie line or lines connect the industrial site to the electric transmission grid. Power is delivered from the electric transmission grid to the industrial site through the tie line(s). Lines within the industrial site then deliver power to individual manufacturing plants within the site. Additionally, cogeneration facilities are located at a number of industrial sites owned by Dow and Union</p>

Organization	Yes or No	Question 11 Comment
		<p>Carbide Corporation, principally in Texas and Louisiana. These cogeneration facilities generate power that is primarily distributed within the industrial site and used for manufacturing plant operations. In some instances, excess power not required for plant operations is delivered into the electric transmission grid through the tie line(s) connecting the industrial site to the grid. While the tie lines and internal lines at these industrial sites can be fairly significant in terms of voltage, they do not perform anything that resembles a transmission function. Rather than transmit power long distances from generation to load centers, the tie lines and internal lines perform a local distribution function consisting of the distribution of power brought in from the grid or generated internally to different manufacturing plants within each industrial site. In some cases, the facilities also perform an interconnection function to the extent they enable excess power from cogeneration facilities to be delivered into the grid. The voltage of the tie lines and internal lines at these industrial sites is dictated by the load and basic configuration of each site. Higher voltage lines (&gt;100 kV) are used to reduce line losses while meeting applicable load requirements. That does not mean that such lines perform a transmission function. Indeed, just as a line that delivers power into a home, or from a home to an accompanying garage, is considered a distribution facility and not a transmission facility, the same is true of lines that deliver power into industrial sites owned by Dow or its subsidiaries (even though such lines also may be used to deliver excess power to the transmission grid) or within those sites. The definition of BES adopted by NERC should explicitly provide for these types of local distribution facilities to be categorically excluded.</p>
City of Redding	No	<p>The current definition goes to far; local governments, cities, and citizens have been given the right to decide the level of reliability of their distribution system. FERC &amp; NERC were not given jurisdiction over local distribution facilities. Note: many local distribution facilities are operated above 100 kV.</p>

**Response:** The SDT is developing a BES definition and associated criteria that it believes will address your concerns.

- Excluded from the BES: E3 - Local distribution networks (LDNs): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the interconnected System. LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:
  - a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
  - b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;
  - c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;
  - d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
  - e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 11 Comment
<p>is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).</p>		
<p>National Rural Electric Cooperative Association (NRECA)</p>	<p>No</p>	<p>It is too early to determine the effectiveness of the proposed BES definition and BES criteria included in the draft SAR. However, the concept of a BES definition and BES criteria, along with BES exemption criteria, appears, at least from a preliminary standpoint, to be a satisfactory direction to begin the process. The concepts presented in the draft SAR should not preclude any other potential direction for the SDT to explore at this point in the process. The proposed BES definition in the SAR should be considered only as an alternative for the SDT to consider in its work, not a final definition or a definition that precludes other proposed definitions.</p>
<p><b>Response:</b> The SDT considers the proposed BES definition in the SAR as a starting point for SDT consideration.</p>		
<p>Duke Energy</p>	<p>No</p>	<p>The high level direction does, but the details need to be defined before this question can be answered affirmatively.</p>
<p><b>Response:</b> The SDT is developing a BES definition and associated criteria that it believes will address your concerns.</p>		
<p>American Electric Power (AEP)</p>	<p>No</p>	<p>It's not clear how the criteria in the concept paper will be related back to the overall definition of BES. We recommend that the finalized criteria be included verbatim in the definition, or that the definition refer to an official companion document. The definition cannot automatically include all equipment (both primary-voltage and the associated auxiliary equipment) by default.</p>
<p><b>Response:</b> The SDT considers the concept paper one of the starting points for SDT consideration. The finalized criteria will be included in the definition.</p>		
<p>Springfield Utility Board</p>	<p>No</p>	<p>SUB appreciates the work to provide a clearer definition of the BES, but the proposed language is ambiguous. The existing definition is: "As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition." The proposed definition is: "Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process." Looking at the first sentence, 100kV or higher facilities are part of the BES ONLY if they are necessary to support bulk power system reliability. As written, if a registered entity determines that a 100kV or higher facility is not necessary for BPS system reliability then the facility may be excluded. If the intent is to</p>

Organization	Yes or No	Question 11 Comment
		<p>assume that all 100kV and above facilities are necessary for BPS reliability, SUB strongly disagrees. To avoid confusion, SUB suggests that the first sentence state: "Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher." The language "necessary to support bulk power system reliability." should be deleted.</p> <p>Turning to the second sentence: "Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process." The approved April 2010 NERC Glossary of Terms includes definitions for "Elements", "Facilities", and "Transmission", but does not have a definition for "Radial" or "Radial Transmission", "Radial Transmission systems", "Transmission systems", or "systems". SUB does not know what this language is intended to mean. If the language "Radial Transmission systems" means an Transmission Element or Facility normally operated open then SUB agrees with this language. If all Elements or Facilities are outright excluded from being excluded from the BES because they could "potentially" be operated closed, this language has little value as most facilities have the "potential" to operated closed. SUB has concerns that EROs are making interpretation of language, such as "radial", without going through a required interpretation public process and are just "announcing" what language means. Is is not uncommon for an ERO to announce a definition for an undefined term and then tell registered entities that they need to request a formal interpretation from NERC in order to modify an informal ERO interpretation. SUB would like to eliminate this confusion - starting with the BES definition which is confusing and may perpetuate an informal interpretation process. SUB proposes that the second sentence read: "Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process. Radial Transmission systems include Elements or Facilities normally operated open."</p> <p>Lastly, why would an entity want to include an Element or Facility that would otherwise be excluded? If an ERO determines that an Element or Facility below 100kV is necessary for reliability would the ERO be able to initiate an exemption process to include the Element or Facility without the owners knowledge or consent? What if the owner is not a Registered Entity? This inclusion language for elements below 100kV is unclear in terms of the application, implementation, or intent.</p>
<p><b>Response:</b> The proposed BES definition included in the SAR is only a starting point for the SDT. The SDT intends to address the issues you have identified in its efforts to develop a BES definition and associated criteria. The initial thinking is that for Facilities captured as BES by the definition/criteria, if an owner/operator believed those Facilities should not be considered BES, that owner/operator would need to technically demonstrate why such Facilities should be excluded. In addition, for Facilities that are not captured as BES by the definition/criteria, if the ERO or a Regional Entity believed those Facilities should be considered as BES, then the ERO or the Regional Entity would need to technically demonstrate why such Facilities should be included. It is the intent of the SDT that the BES definition and associated criteria it develops will address the vast majority of Facilities and minimize the need for technical demonstration by owners/operators or</p>		

Organization	Yes or No	Question 11 Comment
the ERO and regional Entities.		
Electricity Consumers Resource Council (ELCON)	No	<p>The Electricity Consumers Resource Council (ELCON) appreciates the opportunity to submit the following comments on the draft concept document prepared by the Regional Bulk Electric System Definition Coordination Group (RBESCG), a team of representatives of the Regional Entities (REs).ELCON is the national group representing the interests of large industrial consumers of electricity. Many ELCON member facilities are Registered Entities. One or more ELCON members are registered as: BA, IA, GO, GOP, TO, TOP, TSP, PA, RP, LSE, and PSE. However, the most common registered functions of large industrial end users are GO, GOP and PSE by virtue of the need to supply a complex industrial process with low-cost thermal energy and/or low-cost electric energy.The stated purpose of the concept document is to provide a “common approach” for:</p> <ul style="list-style-type: none"> <li>o Defining the BES and therefore improve the clarity, reduce ambiguity and establish a universal method (i.e., bright line) for distinguishing between BES and non-BES Elements and Facilities.</li> <li>o Identifying BES Elements and Facilities so as to establish a “repeatable” method for applying NERC Reliability Standard requirements and facilitate consistent application of compliance efforts across regional boundaries.CommentsELCON members have always supported fair and effective reliability efforts at NERC. However, the expansion of the standards compliance responsibility implied by the NERC Concept Document goes too far. As written, this proposal could have the effect of devaluing a large number of industrial owned electrical power assets by forcing industrials to meet new and unnecessary compliance obligations. Many will be forced to choose to either accept a significant new cost or fire sale their assets to local providers increasing the purchaser’s market power in the process. ELCON feels the addition of new compliance obligations should not be done in such a wholesale manner but instead done on an exception and as needed basis that factors in both a realistic appraisal of the underlying risk and the economic burden imposed on the registered entity relative to the expected benefits.</li> </ul> <p>Specific recommendations and concerns are:</p> <ol style="list-style-type: none"> <li>1. An Overarching “Principle” for the Identification of BES Elements and Facilities Must be the Guidance Provided by FERC That Significant Expansion of the Compliance Registry is Not Contemplated.In FERC’s March 18, 2010 Notice of Proposed Rulemaking (NOPR) on the Revision to Electric Reliability Organization Definition of Bulk Electric System, the Commission stated regarding the revision to the BES definition:“This proposal would eliminate the discretion provided in the current definition for a Regional Entity to define “bulk electric system” within a region. Importantly, however, we emphasize that we are not proposing to eliminate all regional variations and we do not anticipate that the proposed change would affect most entities.” ¶ 16.“... the Commission does not believe that the proposal would have an immediate effect on entities in any Regional Entity other than NPCC.” ¶ 27.Similarly, in Order No. 743, the Commission stated:“We expect that our decision to direct NERC to develop a uniform modified definition of 'bulk-electric system' will eliminate</li> </ol>

Organization	Yes or No	Question 11 Comment
		<p>regional discretion and ambiguity. The change will not significantly increase the scope of the present definition, which applies to transmission, generation and interconnection facilities. The proposed exemption process will provide sufficient means for entities that do not believe particular facilities are necessary for operating the interconnected transmission system to apply for an exemption." ¶ 144. One area where the proposed BES definition and exception process will significantly expand the Compliance Registry is the criteria applicable to behind-the-meter generation (primarily cogeneration facilities). We urge that the BES definition should not change the currently applicable 20 MVA / 75 MVA generation size threshold applicable to generation facilities or the manner in which that threshold is currently applied, with behind-the-meter cogeneration facilities evaluated based on the net capacity actually provided to the grid.</p> <p>2. A Second Overarching "Principle" for the Identification of BES Elements and Facilities Is the Need to Clarify Which Facilities Perform a True Transmission Function and Excluding Facilities That Perform a Local Distribution Function, As Required by Law. Congress stated in Federal Power Act section 215: SEC. 215. ELECTRIC RELIABILITY." (a) DEFINITIONS.-For purposes of this section: (1) The term 'bulk-power system' means- (A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy. There has been little attempt by NERC to clarify what in fact are "facilities used in the local distribution of electric energy" even though any plain English application of the term makes such a determination self-evident. The proposed BES definition should expressly exclude facilities used in the local distribution of electric energy, and the identification of such facilities is independent of the identification of BES transmission. Facilities used for local distribution are NOT the residual of any determination of what are BES transmission facilities.</p> <p>3. A Third Overarching "Principle" for the Identification of BES Elements and Facilities Must be Recognition of the Risk Imposed by the Element or Facility, and the Economic Burden of the Owner/Operator of the Element of Facility. The efforts of the BES Standards Drafting Team follow the release of two important policy documents. First, on January 18, 2011, the White House issued an Executive Order ("Improving Regulation and Regulatory Review") by President Obama regarding improvements to federal regulations and the review of existing regulations to ensure, among other things, that a regulation be proposed or adopted "only upon reasoned determination that its benefits justify its costs," and that regulations be tailored "to impose the least burden on society." Second, the NERC Planning Committee issued on January 10, 2011, "Risk-Based Reliability Compliance - White Paper Concept Discussion," which attempts to advance "processes and procedures to prioritize [NERC's] efforts and 'tiering' elements of its programs to maximize their value and optimize the benefit/cost of effort from stakeholders." This white paper complements the President's Executive Order. ELCON believes that BES exclusion criteria and process should recognize and exclude elements and facilities in which the risk to bulk electric system reliability is at most theoretical or speculative, and where the compliance burden clearly outweighs the benefits. Such a determination should recognize the</p>

Organization	Yes or No	Question 11 Comment
		<p>historical record of the element or facility in terms of the owner or operator’s coordination with the BA or control area, and transmission operators. This principle should be applied to the development of exclusion/inclusion criteria for private lines that connect loads and behind-the-meter generation to true BES Elements and Facilities.</p> <p>4. An Additional Principle for the Identification of BES Elements and Facilities Should Be the Explicit Recognition on How the Element or Facility is Actually Operated or Used, Not Its Physical or Nominal Rating That May be Irrelevant to Reliability Considerations. In Order No. 743, FERC clarified that it did not intend to require NERC to utilize the term “rated at” rather than the term “operated at” for the voltage threshold in the revised BES definition. A principle for the identification of BES Elements and Facilities should be such recognition and not exclusively on the rated value of an Element or Facility. This principle should be used to retain the exclusion in the Statement of Compliance Registry Criteria (Revision 5.0) for “net capacity provided to the bulk power system” in the context of the 20 MVA generating unit and 75 MVA generating plant thresholds. The “net capacity” applies to capacity “put” of a behind-the-meter generator whose predominant function is to serve load at the same site.</p> <p>5. An Additional Principle for the Identification of BES Elements and Facilities Should be the Exclusion of PSEs That Do Not Own or Operate Physical Assets and Whose Power Transactions Are Exclusively Financial in Nature. Many PSEs that operate in FERC jurisdictional organized wholesale markets (i.e., ISOs and RTOs) do not own, operate or lease physical assets and are currently bombarded with data requests that assume that they own or control such assets. An example of a superfluous data request is to prove that adequate reactive power has been procured to support the load. This is a question that should not have been asked and displays a profound ignorance of the operation of ISO/RTO markets. One potential solution to this problem is to create two subsets of PSEs: one that owns and operates physical assets that are used to serve their loads, and a second that does not. Some Regional Entities have also begun to ask questions that require PSEs to reveal the details of specific commercial transactions. This raises a broader question on what NERC and regional compliance staffs and auditors “need to know” and whether such questions are an abuse of their enforcement authority.</p> <p>6. Any Attempt to Make Demand Side Management (DSM) Measures an Element or Facility of BES Will Be Shortsighted and Counterproductive. Proposals that unilaterally and arbitrarily remove exclusions for generation and transmission, including the application of new compliance obligations to DSM programs, go far beyond what FERC intended in its guidance for revisions. Any new requirement concerning voluntary DSM adds cost to a process that so far has only acted to support reliability with performance equal to and sometimes superior to traditional providers. How is it that a potential resource that can contribute to maintaining reliability is now so quickly identified as a risk? We warn against the overzealous pursuit of control over every asset and resource on the electric system. This mindset will only breed cynicism and end the willingness of potentially dispatchable loads to cooperate with the real operators and owners of the BES. A recently issued FERC study highlights the potential value to reliability of DSM (in the form of dispatchable</p>

Organization	Yes or No	Question 11 Comment
		<p>demand response) (See Joseph H. Eto et al., Use of Frequency Response Metrics to Assess the Planning and Operating Requirements for Reliable Integration of Variable Renewable Generation, LBNL-4142E, December 2010). To reliably integrate greater amounts of wind energy resources to the bulk electric system, the study recommended the:"Expanded use of demand response that is technically capable of providing frequency control (potentially including smart grid applications), starting with broader industry appreciation of the role of demand response in augmenting primary and secondary frequency control reserves."</p> <p>7. Revising the Definition of BES Does Not Justify Shifting the Plenary Burden for BPS Reliability from Utilities to Utility Customers. A BES Principle Should Recognize That the Obligation to Serve Applies in One Direction.The only reason the bulk power system exists is to deliver electric power to residential households, commercial businesses, government facilities and industrial facilities of all sizes. The value of a reliable BPS is dependent on the needs of end use customers. Nothing in the legislative history of section 215 of the Federal Power Act suggests that Congress wittingly intended to change that relationship. The burden of complying with NERC Reliability Standards is a cost of doing business for utility providers of generation, transmission and distribution services. Generation and interconnection facilities of industrial customers are almost never intended for or used to "operate the interconnected transmission network." Those facilities are integral to a manufacturing process, including purchasing power from the grid. They were built in expectation that the BPS was prudently planned and operated by utilities. The rare exceptions are administered under applicable tariffs or contracts, and are already Registered Entities. Part of NERC's effort should include defining the line between a BES asset that is used to deliver power and an End User asset that's sole purpose is to serve the End User's load. The NERC Functional Model includes a vague definition of End-use Customer. The problem is determining the scope of an end-use device. If an industrial company owns a 138 kV to 13.8 kV transformer that feeds its plant, is that an end-use device or a transmission asset that is used to transmit power to the low voltage distribution network within the manufacturing facility? Any work to revise the definition of the BES should also include a clarification of its boundaries. We believe that NERC should not expand the scope of the BES to include assets within end-use customer's private use networks. (See our recommendation #2 above)</p> <p>8. An Additional BES Principle Should be that BES Elements and Facilities be Limited to Only Functions Currently Specified in the NERC Functional Model (Version 5).NERC's development of the revised BES definition and exclusion/inclusion criteria and processes should be limited to functions specified in the NERC Functional Model (Version 5).</p> <p>9. NERC is Encouraged to Propose a "Different Solution" That is as Effective as, or Superior to, the Commission's Proposed Approach. The Proposed Principles for the Exclusion of Elements and Facilities from the BES Should Include a Process for Categorical Exclusion Based on Common Physical Characteristics.The Commission stated in Order No. 743 regarding its proposed revision of the BES definition (and presumably the exclusion/inclusion criteria and processes):"... NERC may propose a different solution that is as effective as, or superior to, the Commission's proposed approach in addressing the Commission's</p>

Organization	Yes or No	Question 11 Comment
		<p>technical and other concerns so as to ensure that all necessary facilities are included within the scope of the definition." ¶ 16. In addition, specific to the exclusion of Elements and Facilities from the BES, the Final Rule did not adopt the exclusion process proposed in the NOPR (i.e., facility-by-facility review). In the Final Order, FERC directed NERC to develop an exclusion process "with practical application that is less burdensome than the NOPR proposal." FERC has also allowed NERC to consider concerns (mainly industrials') regarding "exclusion categories" in developing the exclusion process and criteria. ¶ 120. ELCON interprets the Commission's statements to mean that the agency is open to developing a more efficient compliance process, including processes that minimize unnecessary regulatory burdens on potential Registered Entities and the administrative costs of NERC and RE compliance operations. In the spirit of "streamlining" NERC and the REs' review of smaller entities, ELCON recommends the addition of a principle on the exclusion of Elements and Facilities from the BES that encourages a process for categorical exclusion of entities based on common physical characteristics.</p>
<p><b>Response:</b> The SDT considers the proposed BES definition in the SAR as a starting point for SDT consideration. As it develops a modified BES definition and associated criteria, it is carefully reviewing and considering the NERC Statement of Compliance Registry Criteria. The SDT has considered your comments in developing a modified BES definition and associated criteria. The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions while addressing most, if not all, of the provided suggestions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition. NERC will follow the due process established for changes to the Glossary of terms. This new definition addresses radial Loads, generation, and local distribution networks.</p>		
<p>Constellation Power Source Generation, Inc. ("CPSG") filing on behalf of Constellation Energy Group, Inc. ("CEG"), Constellation Energy Commodities Group, Inc. ("CCG"), Constellation Energy Control and Dispatch, LLC ("CDD"), Constellation NewEnergy, Inc., ("CNE") and Constellation Energy Nuclear Group, LLC, ("CENG")</p>	<p>Yes</p>	<p>Paragraph 115 from the BES final rule states "NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid. The ERO also should determine any related changes to its Rules of Procedures (ROP) that may be required to implement the exemption process, and file the proposed exemption process and rule changes with the Commission." This section does not direct NERC to use the ROP modification process to develop "separate" exemption criteria. It only recommends that NERC modify its ROP for any related changes to implement the exemption process, not the exemption criteria itself. The compliance implications and technical nature of such criteria make it imperative that industry input be considered in a transparent stakeholder process. It is appropriate for NERC to develop aspects such as the administrative management, the role and interaction of the regions, an appeal process, etc. However, due to the technical aspects of BES operation, the drafting team members are best suited to devise criteria for non-BES facilities to warrant inclusion in the BES. As currently proposed, the definition language and the exception criteria are not being developed in the properly coordinated fashion. This should change. Further, Constellation is not convinced that creation of a definition and an exception process is the best course to respond to the FERC directives. In question 12, an alternative approach is proposed.</p>

Consideration of Comments on Definition of Bulk Electric System – Project 2010-17

Organization	Yes or No	Question 11 Comment
City Water Light and Power (CWLP) - Springfield, IL	Yes	CWLP feels, again, that the lack of a firm, detailed administrative process for exemptions hampers the proposed BES definition in meeting the intent of Order 743
American Transmission company	Yes	However, ATC does not want to appear to endorse any separate BES Definition Exception and Inclusion Processes until one has been clearly proposed and meets the reliability-related intent of the Order 743 directives. Furthermore, ATC believes the separate Exception and Inclusion Processes should be subject to the same Standards Development review and approval process as the associated BES definition.
MRO's NERC Standards Review Subcommittee	Yes	However, NSRS does not want to appear to endorse any separate BES Definition Exception Process until one has been clearly proposed and meets the reliability-related intent of the Order 743 directives. Furthermore, NSRS believes the separate Exception Process should be subject to the Standards ("Definition") Development Process as the associated BES definition.
<p><b>Response:</b> The SDT is developing the BES definition and associated criteria. A separate Rules of Procedure (ROP) team will develop the procedures for seeking an exception that is not clearly addressed by the definition and criteria. The SDT will closely coordinate with the ROP team.</p>		
APPA	Yes	I agree that the proposed definition meets the intent of Order 743. However, the separate development of exception criteria outside of the standards development process does raise concerns. See response to Question 12.
<p><b>Response:</b> See response to Q12.</p>		
Pepco Holdings Inc.		See comments above and below.
<p><b>Response:</b> See responses above and below.</p>		
Hydro-Québec		For the Canadian entities, it is important to consider that the definition of the Bulk Electric System must also be approved by the Canadian regulators.
<p><b>Response:</b> The SDT is aware of the issues related to Canadian utilities and regulators and will consider those as it develops a modified BES definition and associated criteria.</p>		
Utility Services	Yes	However, Utility Services would like to suggest alternative definitions for Bulk Electric System and BES Exemption Process. We have presented our proposed definitions in the answer to Question 1. While the proposed definition may meet the Order, Utility Services believes that the definition can be made cleaner and

<b>Response:</b> See response to Q1.		
United Illuminating Company	Yes	Order 743 focused on the definition of BES and the exemption process. Although not part of the SAR or ORDER 743, UI suggests NERC provide an explanation in the implementation plan of the impact on the registry criteria. Will the Registry Criteria serve as another filter for identifying which entities will be part of Compliance Monitoring
<b>Response:</b> As the SDT develops a modified BES definition and associated criteria, it will be carefully reviewing and considering the NERC Statement of Compliance Registry Criteria.		
Northeast Power Coordinating Council	Yes	A qualified “Yes”. The BES exemption process has not yet been written. So, it is somewhat difficult to know in advance that this approach meets the reliability-related intent of the directives in Order 743. While in general agreement with this conclusion, there is concern that the BES definition and BES exception process do not yet adequately address a “point-of-demarcation” between the BES Facilities and Elements and non-BES facilities and elements (lower case). Propose to add two new terms for the NERC Glossary of Terms in our reply to Question 13, in order to identify a point-of-demarcation and more fully respond to this question.
Orange and Rockland Utilities, Inc.	Yes	
<b>Response:</b> The SDT will consider your concerns in its deliberations as it moves forward in revising the definition. .		
City of Anaheim	Yes	
IRC Standards Review Committee	Yes	The definition is critically dependent on the detailed exemption/inclusion criteria and process, which has not been developed.
Bonneville Power Administration	Yes	
FirstEnergy Corp	Yes	However, BES definition changes are needed to establish a bright-line for the BES.
SERC OC Standards Review Group	Yes	
LCRA Transmission Services Corporation	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 11 Comment
American Municipal Power	Yes	
North Carolina EMC	Yes	
ReliabilityFirst	Yes	A single and uniform definition that includes exemption criteria and an exemption process must be the result of this effort. Then this material must be consistently used by all of the Regional Entities across the ERO in order to achieve the directives set forth in Order 743.
on behalf of Teck Metals Ltd.	Yes	
Southern California Edison Company	Yes	
on behalf of Catalyst Paper Corporation	Yes	
City of Anaheim	Yes	
Glacier Electric Cooperative	Yes	I have not seen the BES Definition Exception Process, but I trust it will be an accurate method.
ISO New England Inc.	Yes	
Snohomish County PUD	Yes	While Snohomish believes FERC substantially overstepped its statutory authority in Order No. 743 for the reasons set forth in its comments and petition for rehearing filed with FERC in that docket, we nonetheless support FERC's underlying goal to assure reliable operation of the interconnected bulk transmission system. Within the constraints imposed by FERC, we believe the approach of defining the BES and then establishing an exemption process to exclude Facilities and Elements that are not necessary for the reliable operation of the interconnected bulk transmission system should meet FERC's reliability goals while mitigating the excessive compliance costs that will arise from blunt application of a 100-kV brightline threshold. Nothing stated in these comments, however, should be interpreted as withdrawing or waiving any objection Snohomish has made to Order No. 743.
City of Austin dba Austin Energy	Yes	
The Dayton Power and Light	Yes	

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Yes or No	Question 11 Comment
Company		
ITC Holdings Corp	Yes	As long as the PRC023 Critical criteria is used for below 100 kV is used for inclusion.
BGE	Yes	No comment.
Southern Company	Yes	The framework appears to be in place to respond to the directive; however, the details of the “exemption process” remain to be fully developed.
Idaho Power	Yes	
Independent Electricity System Operator	Yes	The definition is critically dependent on the detailed exemption/inclusion criteria and process, which has not been developed. We advocate that the revised BES definition and the exemption/inclusion process and criteria be developed at the same time and preferably by the same drafting team to ensure consistency in approach, since these issues are very closely interrelated.
Clark Public Utilities	Yes	
<p><b>Response:</b> Thank you for your response. Please see the revised definition –it includes a detailed list if inclusions/exclusions to minimize the need to use the BES Exception Process.</p>		

**12. If you have a proposal for an equally efficient and effective method of achieving the reliability- related intent of the directives in Order 743, please provide your proposal here.**

**Summary Consideration:** The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations (included within the body of the definition), will provide a bright-line definition, clarity, and consistency across the regions while addressing most, if not all, of the provided suggestions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition. NERC will follow the due process established for changes to the Glossary of terms. This new definition addresses radial Loads, generation, and local distribution networks. Furthermore, the SDT has utilized many resources to provide this clarity including the Compliance Registry Criteria and the WECC BESDTF recommendations.

Organization	Question 12 Comment
Public Service Enterprise Group Company	The BES definition impacts many standards and has been the source of misunderstanding with subsequent requests for interpretations. In this one case, a stand alone interpretive descriptive document with clear lines of demarcation using example one lines and associated notes in lieu of a three sentence description that attempts to describe all elements of the BES could be considered.
Manitoba Hydro	Manitoba Hydro supports a true bright-line threshold that includes all facilities operated at or above 100kV except defined radial facilities. There should be no regional differences in the definition or exemption process and the regional discretion should be removed from the BES definition.
ReliabilityFirst	The ERO and the Regional Entities should develop and propose the common BES definition and exemption process, submit it to FERC, and allow for the FERC process, whereby the industry provides its comments, etc., to be used to finalize this definition, exemption process and criteria.
United Illuminating Company	The BES definition should be very clear and simple.
ITC Holdings Corp	Exclusion criteria should be determined at the NERC level and implemented continent wide by the Regions, rather than allowing each Region to come up with their own policy and criteria on exclusions.
<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition.</p>	
MRO's NERC Standards Review	Proposed Bulk Electric System definition: Facilities operated at voltages of 100 kV or higher necessary to support the

Organization	Question 12 Comment
Subcommittee	<p>interconnected transmission network reliability (Note see the NERC approved exemption process for Facilities that are and are not considered part of the BES).</p> <p>Rational:1. NERC defines Facilities as “a set of electrical equipment that operates as a single BES Element. Since Element is part of the Facilities NERC definition it is not needed to be repeated.</p> <p>2. Section 30 of FERC Order 743 “all facilities operated at or above 100kV” should be included in the bright-line criteria.</p> <p>3. This new language eliminates the ambiguity as directed in FERC Order 743 whereby the Region cannot establish other bright-line criteria for what the BES is.</p> <p>4. This reinforces foot note 41 by stating exactly what “reliability” of the BES needs to be reinforced. The “interconnected transmission reliability should also be used in any “exemption criteria” that the SDT formulates in the future.</p> <p>5. The removal of bulk power system reliability is still a somewhat ambiguous term and FERC has stated that the BPS definition is not within the scope of this FERC Order.</p> <p>6. Note that the NERC defined term of Facility contains the word BES. So, as written, a Facility is energized at 100kV or above. The capitalized word of Facility cannot be used in the inclusion process since those facilities would be below the 100kV level.</p>
<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition.</p> <p>Section 30 of FERC Order 743 directs the ERO to include exclusions as deemed appropriate, such as radials.</p> <p>The SDT agrees that the term BPS is not in scope and also stipulates that this work is focused on defining the BES.</p> <p>The SDT recognized the problem with Facility and has corrected that in the revised work.</p>	
City of Anaheim	<p>Transmission elements serving radial load, radial distribution systems, or non-GO/GOP generation connected to such radial lines and excluded from BES; provided, however, to eliminate any reliability gaps, such radial transmission elements should be classified as "Distribution" equipment subject to DP standards, and the PRC and vegetation management standards should be made applicable to Distribution Providers and this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for radial transmission facilities that function as Distribution and are not required for the reliable operation of the BES.</p> <p>Transformers with secondary windings of 100kV or less should not be part of the BES if they feed radial load or radial distribution systems; provided, however, to eliminate any reliability gaps, such transformers should be classified as "Distribution" equipment subject to DP standards, and the PRC and vegetation management standards should be made applicable to Distribution Providers and including this equipment. This is consistent with the NERC Reliability Functional</p>

**Consideration of Comments on Definition of Bulk Electric System — Project 2010-17**

Organization	Question 12 Comment
	<p>Model and is more efficient than requiring TO/TOP registration for radial transmission facilities that function as Distribution and are not required for the reliable operation of the BES.</p> <p>Unless the generator is required to maintain BES reliability, i.e. black start, etc., the GSU and gen tie should be excluded from the BES; provided, however, to eliminate any reliability gaps, such generation-tie equipment should be classified as "Generator" equipment subject to GO/GOP standards, and the PRC and vegetation management standards should be made applicable to GO/GOPs and this equipment. This is consistent with the NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for non-critical generation-tie transmission elements that are not required for the reliable operation of the BES.</p>
<p>Florida Municipal Power Agency</p> <p>Transmission Access Policy Study Group</p>	<p>FMPA proposes that the BES be defined as: In general, the Bulk Electric System includes all Transmission Elements operated at voltages of 100 kV or higher, and all generation resources registered pursuant to the Statement of Compliance Registry Criteria. Radial Transmission Elements serving only load with one Transmission source are generally not included in this definition. A radial Transmission Element may be considered as "serving only load" for purposes of the foregoing general exclusion even if it connects generation, so long as that generation is not registered pursuant to the Statement of Compliance Registry Criteria. An Element that nominally meets the general BES criteria, but which an entity demonstrates, on a case-by-case basis, is not necessary for operating the interconnected electric transmission network, shall be exempted from the BES pursuant to the NERC exemption process. An Element that does not nominally meet the general BES criteria, but which NERC demonstrates, on a case-by-case basis, is necessary for operating the interconnected electric transmission network, shall be included in the BES pursuant to the NERC inclusion process.</p> <p>There should be an exemption process with clear criteria pursuant to which an entity can attempt to demonstrate that although a particular Element is nominally part of the BES, it is not necessary for operating the interconnected electric transmission network. Elements for which an exemption is granted would be considered non-BES. FMPA's proposed criteria and exemption process are discussed in FMPA' comments on BES exemption process submitted today.</p> <p>There should be an inclusion process with clear criteria pursuant to which NERC may show, on a case-by-case basis, that although a particular non-BES Element is nominally not part of the BES, it is necessary for operating the interconnected electric transmission network and should therefore be considered part of the BES. FMPA' proposed criteria and inclusion process are discussed in FMPA' comments on BES exemption process submitted today.</p>
	<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition.</p> <p>This new definition addresses radial Loads.</p>

Organization	Question 12 Comment
<b>Response:</b> See response to Q11.	
PPL Energy Plus	The determination of whether or not a facility is part of the BES should consider FERC’s Order 743 paragraph 73 which clearly states the network nature of the BES. FERC states that the ability to overload parallel facilities (Order 743 paragraph 73) is a key feature of an element in the BES.
LG&E and KU Energy LLC	
<b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition. Elements such as Transmission lines are included and excluded in the BES based on this bright-line definition. Furthermore, entities will need to continue to meet all the performance of Facilities per the applicable NERC standards.	
Competitive Suppliers	Initial EPSA suggestions for meeting the directives for Order 743 are included in the answer to question 11. Additionally, EPSA recommends that the drafting team can benefit from utilizing the Compliance Registry Criteria in the BES definition. By using the classifications found in the Compliance Registry Criteria - Section III (Rules of Procedure Appendix 5B), of which much is alluded to in the questions included on this comment form, can provide a useful basis to create a comprehensive, revised BES definition. Further, competitive suppliers recommend that the BES drafting team incorporate the criteria directly into the revised BES definition, replacing the term "bulk power system" in each criteria with "100 kV." Structuring the revised BES definition to clarifying that aligns with the Compliance Registration criteria will ensure against complex exemption process as well as eliminate the need for Section III of the Registry Criteria.
<b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition. Furthermore, the SDT has utilized many resources during the development of this definition including the Compliance Registry Criteria.

<b>Response:</b> See response to Q13.	
NextEra Energy Inc.	Based on the information posted by the North American Electric Reliability Corporation (NERC) on its plans to address Order No. 743 of the Federal Energy Regulatory Commission (FERC), NextEra Energy, Inc. (NextEra) believes that NERC (and associated drafting teams) should slightly modify its direction to more closely align with FERC’s proposed framework. In Order No. 743, at paragraph 30, FERC stated that:The Commission believes the best way to address these concerns is to

Organization	Question 12 Comment
	<p>eliminate the regional discretion in the ERO’s current definition, maintain the bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities, and establish an exemption process and criteria for excluding facilities the ERO determines are not necessary for operating the interconnected transmission network. It is important to note that Commission is not proposing to change the threshold value already contained in the definition, but rather seeks to eliminate the ambiguity created by the current characterization of that threshold as a general guideline. FERC also provided NERC with the opportunity to propose an alternative approach. NextEra believes, however, that FERC’s proposed framework is appropriately designed to enhance the definition of the Bulk Electric System (BES) in the NERC glossary, and to separately develop a process to apply for and receive, as appropriate, an exemption from the BES definition. Although it appears that NERC and the drafting teams may also be inclined to proceed as suggested by FERC, there are indications in the questionnaire and BES concept paper that there may be some thought to deviating from FERC’s proposal. A review of the information posted by NERC seems to indicate NERC’s intention to have a drafting team develop a revised BES definition via the standards development process (i.e., Appendix 3A of the NERC Rules of Procedure).</p> <p>It also seems that NERC is interested in assigning a “working group” to separately develop an exemption process that would be implemented as a new process in the NERC Rules of Procedure. NextEra agrees with this approach. NextEra’s concerns stem from some of the words in the proposed BES definition, the BES concept paper and the questions asked, which seem to suggest an unnecessarily overlapping definition and exemption process, and a movement toward an exemption process based on categories rather than criteria.</p> <p>Thus, to address these concerns NextEra proposes the following enhancements to more clearly separate the BES definition and exemption process, and align each more closely with Order No. 743. As for the BES definition, NextEra encourages the drafting team to solely focus its efforts on the definition. The currently posed revised BES definition reads as follows: Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process. NextEra maintains that this is not the correct starting point, nor consistent with Order No. 743 or the other material posted by NERC, that suggests a more definitive separation of the BES definition from the exemption process. Thus, NextEra proposes that the definition be revised to read as follows: Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher, unless a Transmission or Generation Element or Facility has been exempted pursuant to the exemption process set forth in the NERC Rules of Procedure. This proposed BES definition more clearly and cleanly separates the BES definition from the exemption process. It also does not add unnecessary qualifiers or verbiage that may result in confusion.</p> <p>NextEra is also concerned that the working group assigned to the exemption process may initially be more focused on developing categories, instead of an exemption process and associated criteria. Given the unique circumstances of the interconnected BES, including system topology, NextEra does not believe that it would be a productive exercise for the exemption working group to focus on types, groups or categories of equipment; instead, its efforts should focus on developing specific objective criteria to judge the reasonableness of a request or application for an exemption. This approach also seems more in line with FERC’s statement in Order No. 743 at paragraph 115: NERC should develop an</p>

Organization	Question 12 Comment
	<p>exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid. The ERO also should determine any related changes to its Rules of Procedures that may be required to implement the exemption process, and file the proposed exemption process and rule changes with the Commission. The challenges of developing an exemption process also include ensuring that any applicant is afforded due process and balanced decision-making, as required by section 215 of the Federal Power Act. Thus, the exemption process must address legal, regulatory and technical issues. Accordingly, NextEra requests that NERC assemble a working group (perhaps via the Standards Committee) to develop the exemption process that is comprised of stakeholders with legal, regulatory and technical experience. Without this balance of disciplines, NextEra is concerned that a technical-heavy working group will attempt to develop a “fix,” instead of a process whereby applicants may request an exemption, and have that exemption judged by specific criteria and pursuant to a process that affords due process and balanced decision-making. It is not clear whether an exemption working group has already been assembled. If it has, NextEra requests that NERC consider restructuring of the group consistent with NextEra’s proposal. In summary, NextEra requests that the BES definition drafting team adopt NextEra’s proposed definition of BES. NextEra also requests that NERC assemble a cross-functional working group to develop an exemption process based on specific criteria (rather than categories), and a process that affords applicants due process and balanced decision-making.</p>
<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition.</p> <p>The new definition removes the term “general” and provides more specific wording.</p> <p>NERC will follow the due process established for changes to the Glossary of Terms.</p>	
<p>Pepco Holdings Inc.</p>	<p>The RFC BES Definition and Clarifications could be used as a model for definition. It specifically incorporates additional detail of what is included and what is excluded.</p>
<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. The SDT has utilized many resources during the development of this definition including the work done by RFC.</p>	
<p>Indeck Energy Services</p>	<p>The BES definition should be the same as the FPA Bulk Power System definition! It will not be a bright line, like &gt;100 kV. It will focus NERC's efforts on the real reliability issues rather than chasing many small entities through paper exercises that make someone feel that they are punishing unreliable behavior. Such exercises over the last 3 years have not measurably improved reliability, in fact, NERC doesn't seem to know how to measure reliability in its purest form. It can monitor operating and planning parameters of the BPS, but none of them truly measure reliability. The July, 2010 FERC Technical Conference showed how far off NERC is when a FERC Commissioner had to state that preventing "loss of load" does not define reliability. As referred to in the FPA, preventing cascading outages defines reliability. How does having a Sabotage</p>

	and Bomb Threat procedure at a 100 MW wind farm prevent cascading outages?
<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions.</p>	
Snohomish County PUD	<p>Snohomish has worked extensively with the WECC Bulk Electric System Task Force ("BESDTF") over the last two years and, while we disagree with certain details of the BESDTF approach (in particular, we believe a 200-kV threshold rather than a 100-kV threshold more appropriately reflects conditions in the Western Interconnection), we believe the approach developed by the BESDTF will achieve the reliability goals laid down by FERC in Order No. 743 while at the same time excluding facilities from the BES that have no meaningful impact on the reliable operation of the bulk transmission system, which thereby minimizes unnecessary compliance costs. Accordingly, we commend the work of the BESDTF to the standards drafting team. Given the relatively short deadline imposed by FERC for completion of work on the revised definition, we believe it will be necessary for the standards drafting team to rely on existing work of groups like the BESDTF rather than re-inventing the wheel.</p>
Central Lincoln	<p>The WECC Bulk Electric System Definition Task Force has made significant progress in defining the BES. We encourage the SAR to look at the work they've done.</p>

<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. The SDT has utilized many resources during the development of this definition including the work done by the WECC BESDTF.</p>	
The Dow Chemical Company	<p>As discussed above, the proposed definition of BES is flawed because it fails to expressly exclude local distribution facilities. It is also confusing, particularly with respect to its use and application of the 100 kV standard. As the definition is written, the 100 kV standard would apply to both transmission and generation facilities - i.e., "All Transmission and Generation Elements and Facilities" - even though voltage is primarily a measure of transmission capability with little applicability to generation. Such a standard would, depending on how it is applied, be inconsistent with the generation criteria already set forth in the NERC Statement of Compliance Registry Criteria. In the case of Dow and Union Carbide Corporation, these criteria establish a generally-applicable 20 MVA threshold applicable to exports of electricity to the transmission grid from individual generating units and a 75 MVA threshold applicable to exports of electricity to the transmission grid from generating plants/facilities.</p>

Organization	Question 12 Comment
	<p>The BES definition should not change the currently applicable 20 MVA / 75 MVA generation size threshold applicable to generation facilities or the manner in which that threshold is currently applied, with behind-the-meter cogeneration facilities evaluated based on the net capacity actually provided to the grid. The best approach might be to define BES as simply consisting of three types of facilities: (1) BES Generation; (2) BES Transmission; and (3) BES Protection and Controls. Those terms would then be defined by reference to criteria set forth in NERC's Statement of Compliance Registry Criteria. For example, the term BES Generation would be defined as individual generating units or generating plants or facilities that meet the criteria set forth in the Statement of Compliance Registry Criteria.</p> <p>This approach would provide greater clarity. It would also generally preserve the status quo, which is particularly important in the context of generation. NERC and the Regional Entities have already made significant progress in deciding what generators should be subject to compliance with mandatory reliability standards and what generators should be exempted. Nothing in Order No. 743 requires that those determinations be revisited.</p> <p>The issues raised in Order No. 743 will, however, likely require revisions to the transmission-related criteria set forth in NERC's Statement of Compliance Registry Criteria. Dow is not in principle opposed to the retention of the 100 kV standard that is already set forth in the registry criteria, but it must be clarified to apply to facilities that perform a transmission function while excluding facilities that perform a local distribution function. The criteria should also preserve the "material to reliability" standard that is set forth in the proposed definition, i.e., that facilities must be "necessary to support bulk power system reliability" in order to be considered part of the BES. This standard is particularly important in the context of interconnection facilities that connect generation resources to the transmission grid. FERC has recognized that such facilities do not neatly qualify as either transmission facilities or distribution facilities, but that such facilities should nevertheless be considered part of the BES and subject to mandatory reliability standards only if they are determined to be "material to the reliability of the bulk power system." See <i>New Harquahala Generating Company, LLC</i>, 123 FERC ¶ 61,173 at P 44 (2008), clarified, 123 FERC ¶ 61,311 (2008). Based on these considerations, the criteria set forth in the NERC Statement of Compliance Registry Criteria should be structured so as to define "BES Transmission" as including: (1) facilities that perform a transmission function, that are operated at voltages of 100 kV or higher, and that are materially necessary to support bulk power system reliability; and (2) any other facility that performs a transmission function that is found to be materially necessary to support bulk power system reliability. To the extent an interconnection line from a BES Generation facility is materially necessary to support bulk power reliability, that interconnection line should be treated as part of the BES Generation facility, rather than a BES Transmission facility. Such a structure would preserve the bright-line 100 kV standard preferred by FERC, while defining and applying the standard in a manner that appropriately preserves the distinctions that are recognized for local distribution and interconnection facilities, and that ensures that all facilities that materially affect reliability are covered by the standards.</p> <p>Of course, once a definition for BES Transmission is adopted, the next step is to develop a process for applying that definition so as to identify specific facilities that qualify as BES Transmission facilities, and that are subject to mandatory reliability standards. Owners and operators should be afforded an opportunity in the process to demonstrate that their facilities should be excluded because they either: (1) perform a distribution function; (2) are not materially necessary to support bulk power system reliability; or (3) are included as part of BES Generation facilities. Such an opportunity must be</p>

Organization	Question 12 Comment
	provided before facilities become subject to mandatory BES Transmission reliability standards.
	<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. BGE	<p>It is preferable that non-BES facilities be excluded by the definition language rather than to define BES broadly and require non-BES facilities go through an exception process. For those special case facilities that may exist, an “opt-in” evaluation could be conducted. We find that this approach to revising the BES definition would satisfy the FERC directives in Order 743 by encompassing all facilities necessary for operating an interconnected electric transmission network into a national level, bright-line definition. This approach will improve the clarity and consistency of the BES definition for application by Industry and NERC as well as avoiding creation of a potentially cumbersome exception process. The rules of procedure process may be used to develop the “opt-in” process that would replace the proposed exception concept; however, the drafting team, perhaps in collaboration with regional entities, should develop any opt-in criteria needed for the process. It is appropriate for NERC to develop aspects such as the administrative management, the role and interaction of the regions, an appeal process, etc. However, due to the technical aspects of BES operation, the drafting team members are best suited to devise criteria for non-BES facilities to warrant inclusion in the BES.</p>
Constellation Power Source Generation, Inc. (“CPSG”) filing on behalf of Constellation Energy Group, Inc. (“CEG”), Constellation Energy Commodities Group, Inc. (“CCG”), Constellation Energy Control and Dispatch, LLC (“CDD”), Constellation NewEnergy, Inc., (“CNE”) and Constellation Energy Nuclear	<p>Constellation recognizes the value in clarifying the Definition of Bulk Electric System into a bright line threshold consistently applied across the regions. However, we are concerned that the current approach of a simple, all inclusive definition coupled with an exception criteria and process will not draw on the fundamentals underpinning the existing definition and create a cumbersome and unnecessary exception process. As an alternative, we propose that the standard drafting team utilize the Compliance Registry Criteria-Section III (Rules of Procedure Appendix 5B) along with definition threshold language (such as 100 kV) to develop a more comprehensive definition. Further, we propose that the BES drafting team incorporate the criteria directly into the revised BES definition, replacing the term “bulk power system” in each criterion with “greater than 100 kV.” This will make for a longer definition, but by aligning the facilities requiring registration as those defined as BES, the definition will more clearly determine the line between BES and non-BES. It is preferable that non-BES facilities be excluded by the definition language rather than to define BES broadly and require non-BES facilities go through an exception process. Ideally, this approach can eliminate the need for an onerous exemption process as well as eliminate the need for Section III of the Registry Criteria in the Rules of Procedure. For special case facilities deemed non-BES by the revised definition that</p>

Organization	Question 12 Comment
Group, LLC, (“CENG”)	<p>may warrant consideration for inclusion, an “opt-in” evaluation could be conducted. The rules of procedure process may be used to develop the “opt-in” process that would replace the proposed exception concept; however, the drafting team, perhaps in collaboration with regional entities, should develop any opt-in criteria needed for the process. Again, it is appropriate for NERC to develop aspects such as the administrative management, the role and interaction of the regions, an appeal process, etc. However, due to the technical aspects of BES operation, the drafting team members are best suited to devise criteria for non-BES facilities to warrant inclusion in the BES. We find that this approach to revising the BES definition would satisfy the FERC directives in Order 743 by encompassing all facilities necessary for operating an interconnected electric transmission network into a national level, bright-line definition. This approach will improve the clarity and consistency of the BES definition for application by Industry and NERC as well as avoiding creation of a potentially cumbersome exception process.</p>
<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition. <p><b>Response:</b> See response to Q11. The SDT has no control over the logistics of the system for providing comments. However, a Word version was posted on the project web page for review.</p>	
APPA	<p>The Concept Paper states at page 1 that in Order 743, FERC directed NERC to do the following:</p> <ul style="list-style-type: none"> <li>A. Utilize the NERC Standard Development Process to revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms.</li> <li>B. Develop a single Implementation Plan to address the application of the revised definition of the BES and the implementation of the exemption process.</li> <li>C. Utilize the NERC Rules of Procedure to develop and implement an ‘exemption process’ used to identify Elements and Facilities which will be included in or excluded from the BES.</li> </ul> <p>The Concept Paper continues to state that: This project will address items ‘A’ and ‘B’ and will coordinate efforts between the Standard Drafting Team (SDT) and the group working to develop the exemption process for inclusion in the NERC Rules of Procedure to ensure that the revised BES definition and exemption process result in an accurate, repeatable, and</p>

Organization	Question 12 Comment
	<p>transparent method for the identification of BES and non-BES Elements and Facilities.</p> <p>APPA agrees that the standards process must be used to develop the revised BES definition and that NERC has been directed to use its Rules of Procedure process to develop an ROP-based procedure to implement an exemption/exclusion/inclusion process. However, the FERC directives do not speak to how and by whom the technical methodology, study criteria and data requirements for requesting and receiving approval for an exemption should be developed.</p> <p>To the maximum extent possible, subject to time constraints imposed by FERC, this inherently technical methodology needs to be developed through the NERC standards development process, in conjunction with development of the revised definition of BES. Separate development will significantly hamper development of industry consensus in support of the revised BES definition and the yet to be developed ROP modifications for the exemption process.</p> <p>The most critical question is how do we arrive at a commonly agreed upon, widely accessible, transparent, and replicable continent-wide methodology to determine whether each specific facility is or is not “necessary to operate an interconnected electric transmission network” to quote from paragraph 16 of Order 743. While each region may have a separate model reflecting its topology and system performance characteristics, a continent-wide approach is required to address FERC concerns about inconsistency across regions that are not the result of physical differences.</p> <p>The statutory definition of the term bulk-power system defines the outer extent of facilities that can be included (at least within the United States) within the NERC definition of BES. FPA section 215(a)(1) states that the bulk-power system includes “(A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability.” Further, the term BPS “does not include facilities used in the local distribution of electric energy.” [emphasis added]. Similarly, “reliable operation” is defined at 215(a)(4) to mean “operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.” These definitions appear to point to two basic questions for the classification of each facility or element as BES or non-BES:</p> <ol style="list-style-type: none"> <li>1. Is the facility or element necessary for reliable operation because it contributes significant capability to the interconnected transmission network?</li> <li>2. Will the misoperation or unanticipated failure of the facility or element adversely affect the reliable operation of the interconnected transmission network? APPA suggests that the BES SDT or separate study teams should be directed to establish the outline for this study methodology.</li> </ol> <p>APPA further suggests that BES sub-teams be established to address the Proposed BES Criteria in the Concept Paper. Separate sub-teams should be established to address detailed system configuration and study methodology issues affecting:</p>

Organization	Question 12 Comment
	<p>1. Radials serving load (with and without distribution voltage generation not subject to registration)</p> <p>2. Other transmission elements that entities seek to include in or exclude from the BES.</p> <p>3. Generating plant equipment that entities seek to include in or exclude from the BES.</p> <p>4. Technical issues raised by the FERC Seven Factor Test for Local Distribution Facilities.</p> <p>Separate sub-teams are appropriate because the study issues are likely to be quite distinct. For example, radials serving only load do not provide alternative pathways for reliable BES operations, as might some sub-100 kV facilities. Mixing the two teams together might slow progress on identification of various commonly used radial to load center configurations that with proper protection schemes do not have the potential to adversely affect the BES. A focused effort on permissible exclusions of radials serving load is essential to prevent distribution providers from adopting less reliable system configurations to serve their loads because they are concerned that the preferred configuration will make them subject to registration as TOs and/or TOPs.</p> <p>Note that the proposed sub-teams do not necessarily have to be populated by members of the SDT. The new standards process allows SDTs to gather informal input from a variety of sources. However, development and posting for industry comment of the minimum acceptable characteristics of the study methodology to be used in the Exceptions Process should be the responsibility of the BES SDT.</p> <p>The Comment Form on the Exclusion Process poses reasonable questions and it is my hope that registered entities and regional entities identify numerous candidate facilities and elements for inclusion or exclusion from the BES, accompanied by one-line diagrams that lay out each of the permutations for such facilities that are candidates for exclusion/inclusion. These facilities range from simple radial transmission lines and distribution step-down transformers to 100 kV class distribution networks that operate radially from the BES. I also hope that entities submit extensive technical documentation to explain why such facilities should be excluded from or included in the BES.</p> <p>Good luck!</p>
	<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition.</p> <p>NERC will follow the due process established for changes to the Glossary of Terms.</p> <p>This new definition addresses radial Loads, generation, and local distribution networks.</p>
Xcel Energy	<p>Xcel Energy agrees that the FERC Order 743 directs NERC to modify the Rules of Procedure to include the process for how an entity or region may initiate an exclusion or inclusion. However, we do not agree that FERC also directed that the actual criteria and technical specifics for inclusion or exclusion be developed as part of the Rules of Procedure. Furthermore, since</p>

Organization	Question 12 Comment
	<p>the inclusion/exclusion criteria is a key component to the definition of BES, we feel the criteria should be treated as part of the definition development and developed in the same manner as the definition itself. (Preferably by the same drafting team.)</p>
<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition.</p> <p>NERC will follow the due process established for changes to the Glossary of Terms.</p>	
<p>City of Redding</p>	<p>Please consider the WECC Bulk Electric Definition Task Force work to date.</p> <p>See Attachment 1 at the end of this document.</p> <p>See Attachment 2 at the end of this document.</p>
<p><b>Response:</b> The SDT appreciates these observations and believes that our new definition with the exclusion and inclusion designations will provide a bright-line definition, clarity, and consistency across the regions that will address many, if not all, of the issues in the provided examples. This definition will eliminate regional discretion and any questions on this bright-line definition will be handled through a revision to the Rules of Procedure by a separate team in an effort parallel to the development of this BES definition.</p> <p>Furthermore, the SDT has utilized many resources to provide this clarity including the Compliance Registry Criteria and the work in the WECC BESDTF recommendations.</p>	

**13. Please provide any other information that you feel would be helpful to the drafting team working on the definition of BES.**

**Summary Consideration:** The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The exception criteria use the same bright-line criteria to provide further guidance as to whether an Element is considered BES or non-BES. The SDT believes that this is the best method to address the Commission’s concerns of establishing a bright-line definition of the BES that is clear, unambiguous, and provides for consistent application across the continent.

The SDT acknowledges the comments and concerns related to the Exception Process and recognizes that the forum for providing these comments to the NERC Rules of Procedure Team was not established prior to this posting. The revision process for the NERC ROP to develop the Exception Process will be coordinated by NERC staff and governed by current practice for administering such revisions. All comments pertaining to the Exception Process, the NERC ROP Team, and the ROP revision process will be forwarded to the appropriate parties for consideration.

The SDT acknowledges the industry’s concerns surrounding the separation of work to different teams in response to the directives in FERC Order No. 743. Based on the Commission imposed time requirements for filing and the amount of work required to be responsive to the directives in Order No. 743 the decision was made to establish two teams working in close coordination to address the issues related to the project. The SDT is committed to that close coordination between the development of the core definition of the BES and the exception criteria by the SDT and the development of the Exception Process by the NERC ROP Team. The goal is to have parallel postings from each aspect of the project, which will enable the industry to review the entire project ‘package’ at one time and effectively provide comments simultaneously on the core definition exception criteria with its associated lists of “inclusions” and “exclusions” and the Exception Process.

Organization	Yes or No	Question 13 Comment
Northeast Power Coordinating Council	a.)	Proposed definitions to be added to the NERC Glossary of Terms: BES Exemption Process: The review processes for (a) excluding or exempting facilities and Elements from the BES that are determined not to be necessary to support bulk power system reliability (e.g., radial elements), and (b) including Elements operated at voltages below 100 kV that are determined to be necessary to support bulk power system reliability. By identifying all such BES and non-BES facilities and elements, the BES Exemption Process will establish the Points-of-Demarcation between Facilities and BES Elements and non-BES facilities and Elements. Point-of-Demarcation: A physical point and/or electrical connection between facilities and BES Elements and non-BES facilities and elements, e.g., the upstream terminals of a disconnect switch (or a buss connection) representing the boundary between a BES supply bus and a non-BES radial feeder. The BES exemption process has not yet been written. So, it is somewhat difficult to know a priori whether any element, elements or a group of elements or facilities should or should not be classified as part of the BES definition.
	b.)	This document uses both “exemption process” and “exception process”. Recommend that the phraseology be standardized on “exception process” as the exception (not the exemption) can be to include or exclude elements and

Organization	Yes or No	Question 13 Comment
		<p>facilities.</p> <p>c.) It is envisioned that the BES Exception Process will contain 3 sub-processes; one for Exclusion, one for Exemption, and one for Inclusion. Each sub-process will establish provisions and guidelines for the three different tasks. In order to ensure consistency across the continent, it is our view that NERC should be the facilitator of these processes. NERC may choose to have some of these tasks performed at the regional levels through the existing delegation agreements.</p> <p>d.) The BES Exception Process must be an active and ongoing aspect of the ERO program. With the addition of new or deletion of existing Transmission and Generation Elements, Facilities, or systems. It needs to be recognized that Exclusions, Inclusions, and Exemptions might need alteration over time. By establishing appropriate guidelines and processes, the ERO will be able to monitor and maintain information on what is the Bulk Electric System, or BES.</p> <p>e.) The exception (exemption) process should clearly address the process and requirements for FERC non-jurisdictional entities (such as the Canadian entities) with the exception of the interconnections between them and those entities under FERC jurisdiction, and/or those entities having a direct impact on those interconnections.</p> <p>f.) Classification of all radial facilities operated at voltages of 100 kV and above as part of the BES by default would be unnecessary and administratively inefficient, because the operation of all radial facilities do not have a significant operational impact on the BES. Those radial facilities not having a significant impact should be excluded from the BES. If they aren't, it could lead to delays in the review and approval of other exemption requests. As such, the proposed BES definition should be revised to clearly define what radial Transmission Elements will not be included as part of the BES. This would be consistent with FERC's intention expressed in Paragraph 55 of Order 743 to not alter the part of the approved definition that deals with "radial transmission facilities serving only load".</p> <p>g.) Additionally, to ensure a common understanding of the meaning of "radial" and to promote consistency in its application, "radial" should be defined and added to the NERC Glossary.</p>
<p><b>Response:</b></p> <p>a.) With the proposed revisions to the definition of BES, at this time, the SDT does not contemplate adding any additional definitions beyond BES. In regards to the term "BES Exception Process"; it has been determined that the process will reside in the NERC Rules of Procedure (ROP) and therefore it seems logical that the purpose of the process would be defined within the boundaries of the NERC ROP.</p> <p>b.) The inconsistency of the use of 'exemption' vs. 'exception' in several documents has been identified by the SDT and the team has determined that 'exception' is the proper term to be used in reference to the Bulk Electric System definition and supporting processes.</p> <p>c.) The 'Exception Process' will be developed by the NERC Rules of Procedure Drafting Team while coordinating with the DBES SDT. The 'Exception Process' and the responsibilities associated with the implementation and oversight will be defined by the NERC Rules of Procedure Team. Based on the</p>		

Organization	Yes or No	Question 13 Comment
		<p>language contained in FERC Order No. 743, there are Commission expectations associated with the process oversight by the ERO and allowances for the delegation of responsibilities to Regional Entities as appropriate, while ensuring the process is clear and capable of being applied consistently, objectively, and uniformly across all regions.</p> <p>d.) The SDT agrees that the Bulk Electric System is dynamic and that the implementation and continued application of the BES Definition and supporting processes will require active oversight and management to ensure that changing conditions (i.e., operational &amp; new construction) surrounding the Bulk Electric System will be addressed and result in proper evaluation and identification of BES &amp; non-BES Elements. The current scope of the Standard Authorization Request (SAR) for Project 2010-17 Definition of Bulk Electric System does not include the development of the 'Exception Process'. The 'Exception Process', including the implementation and continued application of the process will be developed by the NERC ROP Team.</p> <p>e.) The SDT has established non-jurisdictional representation to address the concerns of the applicable entities (i.e., Canadian entities) in regards to the application of a continent-wide 'bright-line' definition of the Bulk Electric System and the exception criteria listed in the definition. NERC Staff has determined the needs of the NERC Rules of Procedure Team in regards to the diversity of the membership and the technical expertise required to appropriately modify the ROP in response to the directives identified in FERC Order No. 743.</p> <p>f.) The SDT has further developed the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The 'exception criteria' utilizes the same 'bright-line' approach to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line for identifying Generation Facilities, Radials, etc.). The exception criteria has been listed in the revised definition of BES.</p> <p>g.) With the proposed revisions to the definition of BES, at this time, the SDT does not contemplate adding any additional definitions beyond BES.</p>
MRO's NERC Standards Review Subcommittee		<p>A. What time frame is the SDT considering for the implementation of this definition and process once approved, allowing enough time for the entities to provide justification, and then make the necessary changes to their internal programs?</p> <p>B. Recommend the BES SDT be consistent with the generation registration criteria and the Protection System definition and other documents. For example, what is a "common bus" as stated in the generation registration criteria.</p> <p>C. Please review and update the concept paper. The concept paper does not specifically call out Transmission Lines above 100 kV as in the BES definition (the proposed definition does, however) and there is a circular exemption criteria in the concept paper. In criterion #2, it refers to the exemption process "consistent with the criteria". The criteria exempt generating plant controls and Transmission Elements or Systems that are radial to a load or generator not included in the BES List. However, the BES list is defined prior to the criteria in the concept paper. Exemption criterion #1 points to BES list elements #6 and #7, which in turn, refer to the exemption process. But, the exemption criteria never define how to exempt the elements referred to in #6 and #7.</p> <p>D. How often would a Registered Entity revisit this Exception Process? NSRS can envision a scenario where they are doing that every year or two because of the changes in load, generation, and transmission. The process should also allow for</p>

Organization	Yes or No	Question 13 Comment
		<p>multi-year distinctions for exceptions. In other words, if a Registered Entity gets a facility excluded, then that exclusion should be allowed for 3 or more years. Annual certifications and approval are too restrictive.</p> <p>E. NSRS believes the exception criteria needs to be developed by the SDT. NERC Staff should focus on the process (identification, notification, appeal and rights) but the SDT is in the better position to develop the technical piece of the exception criterion.</p>
<p><b>Response:</b></p> <p>A. The SDT has established basic goals and assumptions that will be used to guide the development of the BES definition and supporting documents. The assumptions include: ‘The revised definition will not significantly expand or contract what are currently considered BES Elements, nor will the revised definition drive entity registration or de-registration’. Based on these goals and assumptions the overall impact of the revised definition is expected to be minimized for the majority of the Regions and Registered Entities. However, once the definition and supporting documents are nearing completion, the impact of the revised definition will be assessed and the Implementation Plan and Transition Plans will be developed to provide an appropriate time-period for entities to establish compliance with the applicable Reliability Standards.</p> <p>B. The SDT has established basic goals and assumptions that will be used to guide the development of the BES definition and supporting documents. The assumptions include: ‘The revised definition will not significantly expand or contract what is currently considered to be BES Elements, nor will the revised definition drive entity registration or de-registration’. Based on these goals and assumptions and in the absence of technical justification, the current generator registration criteria appears to be the logical starting point for assessing BES Elements. The goal of the SDT is to establish a component-based ‘bright-line’ definition which enables the proper assessment of BES and non-BES Elements. The ‘bright-line’ associated with the identification of Protection Systems which are applicable to the PRC series of Reliability Standards is not necessarily at the same point. The SDT has discussed this issue and will be seeking guidance from FERC staff in regards to the directives in FERC Order No. 743 and how they potentially apply to Protection Systems. Protection Systems are not currently within the scope of the SAR for this project and any significant expansion could potentially jeopardize the ability of the SDT to complete this project and file in accordance with the Commission directed time requirements in FERC Order No. 743.</p> <p>C. The SDT is not considering updating the concept paper as future work will be in crafting the actual definition and designations.</p> <p>D. The SDT agrees that the Bulk Electric System is dynamic and that the implementation and continued application of the BES Definition and supporting processes will require active oversight and management to ensure that changing conditions (i.e., operational &amp; new construction) surrounding the Bulk Electric System will be addressed and result in proper periodic evaluation and identification of BES &amp; non-BES Elements. The current scope of the Standard Authorization Request (SAR) for Project 2010-17 Definition of Bulk Electric System does not include the development of the ‘Exception Process’. The specific review/re-assessment ‘time periods’ associated with the identified exceptions (inclusions &amp; exclusions) will be drafted by the NERC ROP Team and vetted through the ROP Revision Process.</p> <p>E. The current scope of Project 2010-17 includes the development of the exception criteria. Additionally, the SDT will have representation on the NERC ROP Team to ensure that consistency is maintained throughout the development of the revised definition and the Exception Process.</p>		

Organization	Yes or No	Question 13 Comment
IRC Standards Review Committee		<p>a. On the SAR, it indicates an SC approval date of December 8. It is misleading since the SC did not approve the SAR; it only approved posting of the SAR for industry comment.</p> <p>b. We have a concern with the concept paper on the exemption/inclusion criteria/process. Please see other comments on that paper submitted separately.</p> <p>c. We suggest use of consistent term between “exception” and “exemption”.</p> <p>d. We suggest the exception/inclusion criteria to be included in the definition and developed/approved by the balloting body. Determining these criteria via any other processes will not provide the industry the opportunity to fully vet the criteria.</p> <p>e. The SAR indicates that “...the definition drafting team will work closely with the team developing the BES definition exemption process to develop a single coordinated implementation plan. It is also envisioned, that the team working to develop the BES definition exemption process will solicit input from drafting teams, stakeholders...” We find this confusing and have a concern that having two teams working on this definition/criteria package leads to misalignment and confusion. Further, while the definition drafting team is formed by a nomination process and appointed by the NERC Standards Committee, there is no transparency and/or public announcement to solicit nominations for the team working to develop the exemption process. We urge the NERC Standards Committee to direct the definition drafting team to also be responsible for developing the exemption process, and include the exemption criteria as part of the definition hence subjecting them to industry comment and balloting.</p>
<p><b>Response:</b></p> <p>a. The default language in the form is misleading and implies that the NERC Standards Committee's approval is required. Per the NERC Standard Process Manual the Standards Committee authorizes posting of the SAR for industry comment. The DBES SDT will provide a recommendation to NERC Standards Staff to revise the SAR form to read, "Date SC Authorized Posting the SAR".</p> <p>b. Please see comment responses to other questions.</p> <p>c. The inconsistency of the use of 'exemption' vs. 'exception' in several documents has been identified by the SDT and the SDT has determined that 'exception' is the proper term to be used in reference to the Bulk Electric System definition and supporting processes.</p> <p>d. The current scope of Project 2010-17 includes the development of the exception criteria and the revised definition of BES includes a proposed list of criteria for "Inclusions" and a proposed list for "Exclusions". Additionally, the SDT will have representation on the NERC ROP Team to ensure that consistency is maintained throughout the development of the revised definition and the Exception Process.</p> <p>e. The passage from the SAR that is referenced in the comment is addressing the need for a single Implementation Plan that takes into consideration all</p>		

Organization	Yes or No	Question 13 Comment
<p>aspects of this project. The Implementation Plan will need to address the impact of the revised BES definition and exception criteria, the Exception Process (ROP) and the Regional Transition Plans. The current scope of Project 2010-17 includes the development of the exception criteria. Additionally, the SDT will have representation on the NERC ROP Team to ensure that consistency is maintained throughout the development of the revised definition and the Exception Process. The revision process for the NERC ROP will be utilized to develop the Exception Process and will be coordinated by NERC staff and governed by current practice for administering such revisions. The NERC ROP Team will be established by NERC staff and include representation from the DBES SDT along with industry experts and NERC staff personnel. The process for establishing the NERC ROP Team will be determined and administered by NERC staff.</p>		
Bonneville Power Administration		<ol style="list-style-type: none"> <li>1. Define the definition of generation resources and plants, specifically wind.</li> <li>2. Ensure that the exemption process incorporates all lines in service, outage conditions, etc.</li> <li>3. Ensure that BA's have the ability to recommend inclusion in the BES, if the BA determines the facility has an impact on the BES.</li> </ol>
<p><b>Response:</b></p> <ol style="list-style-type: none"> <li>1. The term is no longer used in the definition.</li> <li>2. The SDT has developed the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The 'exception criteria' utilizes the same type of 'bright-line' criteria approach to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The idea of injecting the 'current operational conditions' (lines in service, outage conditions, etc.) of Elements poses difficulties with the universal application of the definition to achieve consistent results across the continent. Additionally, the idea of 'current operational conditions' (lines in service, outage conditions, etc.) suggests that these conditions are subject to change and therefore could result in different assessments when identifying BES and non-BES Elements.</li> <li>3. The responsibilities associated with the Exception Process will be determined and established by the NERC ROP Team as part of the Exception Process.</li> </ol>		
FirstEnergy Corp		<ol style="list-style-type: none"> <li>a.) FirstEnergy supports a new BES definition that will provide a clear bright-line of electric facilities deemed inclusive to the BES. The exclusion process should be a simple, continent wide, rarely used with high-thresholds for removing any 100kV and above facility from the BES. The exclusion process and BES definition change should also include a practical means for transition for any affected companies.</li> <li>b.) The BES definition should explicitly contain language to exclude radial to load transmission operated at 100kV and above voltage levels. Presently, it seems that radial transmission to load "may" be excluded, subject to the exemption process. The excluded radial facilities described by the BES definition should be simply defined and avoid overly complicated scenarios for qualify a facility as radial transmission.</li> </ol>

Organization	Yes or No	Question 13 Comment
		<p>c.) BES definition clarity can be accomplished by incorporating aspects of the concept paper’s proposed “BES Criteria” as being part and parcel of the overall BES definition. Doing so will establish the desired BES bright-line by further describing facilities as “in” or “out” by definition and avoid an overly complicated exclusion process.</p> <p>d.) The exclusion process should be rarely used, having a narrow expectation for removing facilities from the BES and thus avoid an overly burdensome administrative process. From an exclusion view, the BES definition should directly exclude radial 100kV and higher transmission, facilities operated below 100kV unless deemed critical to the BES by the Regional Entity and any 100kV and higher facility qualified by the BES exemption process.</p> <p>e.) Further, we support EEI’s views that the BES Definition and the technical aspects of the exemption criteria (outside of the definition) should be treated as a single standards development project and performed by this drafting team.</p> <p>f.) We also support a parallel effort by NERC staff, subject to industry review/comment, of revising the Rules of Procedure to account for the process oriented information that would point to the technical exemption criteria/guidance developed by the standard drafting team.</p> <p>g.) Finally, the concept paper awkwardly describes an “exclusion process” that would identify any sub 100kV facilities that would be “included” in the BES. The criterion developed for potentially including sub 100kV facilities should be separately developed or at least not referenced within an “exclusion process”. Additionally care should be taken to not cast the net too wide in this regard. While we propose a high threshold for excluding 100kV facilities from the BES, we similarly propose a high threshold for inclusion of sub 100kV facilities. The primary focus of this drafting team should be the drafting of the new BES definition and the technical BES exemption criteria. The development of continent-wide criteria for including other sub 100kV facilities in the BES should be treated as a secondary priority for meeting the milestone expectations of the FERC compliance filing.</p>
<p><b>Response:</b></p> <p>a.) The SDT agrees with the comments. The Implementation Plan will need to address the impact of the revised BES definition and exception criteria, the Exception Process (ROP) and the Regional Transition Plans on affected entities and provide sufficient time to ensure a smooth transition into the realm of mandatory and enforceable Reliability Standards.</p> <p>b.) The SDT has further developed the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements with a list of exceptions. The ‘exception criteria’ utilizes the same ‘bright-line’ criteria approach to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.).</p> <p>c.) The SDT agrees with the comments and has established the tight linkage between the core definition of the BES with the component-based ‘bright-line’ exception criteria.</p>		

Organization	Yes or No	Question 13 Comment
		<p>d.) The Exception Process will be employed when the bright-line core definition and its associated exception criteria cannot be applied to a specific Element. It is anticipated by the SDT that the 'bright-line' will be the definitive approach to identifying BES and non-BES Elements for the vast majority of the system configurations across the continent and utilization of the Exception Process will be limited to the remaining Elements.</p> <p>e.) The current scope of Project 2010-17 includes the development of the exception criteria and these have been included in the revised definition of BES. Additionally, the SDT will have representation on the NERC ROP Team to ensure that consistency is maintained throughout the development of the revised definition and the Exception Process.</p> <p>f.) The revision process for the NERC ROP will be utilized to develop the Exception Process and will be coordinated by NERC staff and governed by current practice for administering such revisions. The NERC ROP Team will be established by NERC staff and will include representation from the DBESSDT along with industry experts and NERC staff personnel. The process for establishing the NERC ROP Team will be determined and administered by NERC staff.</p> <p>g.) It is the vision of the SDT that the process to include Elements within the BES and the ability to exclude Elements from the BES should parallel each other and require the same level of technical justification to achieve consistent results.</p>
Electric Market Policy		<p>Dominion supports, in large part, EEI's response to the draft concept paper. Dominion provides the following comments on the proposed exemption process. NERC should use the FERC-approved standards development process to develop the Bulk Electric System (BES) definition and the exemption process in a single, integrated and stakeholder approved process. To this end, Dominion conceptually supports an exemption process whereby NERC or the RRO could apply to have an element included or excluded from the BES definition. Such process recognizes that it may be necessary to include elements that do not meet the bright line criteria but are necessary for operating an interconnected transmission network. Such process should be developed through the existing NERC standards development process and include a robust appeals process for the owner/operator of any element so included or excluded.</p> <p>Dominion supports bright line exclusions of all elements rated at less than 100 kV, any transformer that has a primary or secondary winding of less than 100 kV, and all radial lines regardless of their kV rating. Radial lines to/from solely generation facilities and radial lines to/from load are comparable in terms of their impact on an interconnected transmission network. There are situations where these radials make a meaningful and required contribution to the operation of an interconnected transmission network and there are other locations/situations where these radials do not. Therefore, radial lines should only be specifically included in the definition of BES after the RRO has demonstrated that inclusion of the radial is necessary to operate an interconnected transmission network and the owner/operator of the radial line has had the opportunity to exercise its aforementioned appeal rights. Adopting this paradigm would prevent a gap in the application of reliability standards. Specifically, all radial lines would either be included in the definition of BES or would be captured via the NERC registry under distribution or generation.</p>

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 13 Comment
		<p>Dominion supports the criteria for registering owners, operators, and users of the bulk power system, as indicated in the current Statement of Compliance Registry Criteria . Adoption of the foregoing process would insure confidence in entities that the compliance registration process is equitable and fair.</p>
<p><b>Response:</b> The NERC Standard Processes Manual is the governing document for the development of the revised BES definition and exception criteria. The SDT is continuing the development of the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The 'exception criteria' use the same 'bright-line' criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e. bright-line criteria for identifying Generation Facilities, Radials, etc.).</p> <p>The revision process for the NERC ROP will be utilized to develop the Exception Process and will be coordinated by NERC staff and governed by current practice for administering such revisions. The NERC ROP Team will be established by NERC staff and will include representation from the DBESSDT along with industry experts and NERC staff personnel. The process for establishing the NERC ROP Team will be determined and administered by NERC staff.</p> <p>The development of the core definition of the BES and the exception criteria by the SDT will be closely coordinated with the development of the Exception Process by the NERC ROP Team. The goal (identified key to the project's success) is to have parallel postings from each aspect of the project, which will enable the industry to review the entire project 'package' at one time and effectively provide comments simultaneously on the core definition, the exception criteria, and the Exception Process. Based on the Commission imposed time requirements for filing and the amount of work required to be responsive to the directives in Order No. 743, the decision was made to establish two teams working in close coordination to address the issues related to the project.</p> <p>See responses to EEI comments.</p>		
SERC OC Standards Review Group		<p>We agree that Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher that are necessary to support bulk power system reliability should be included. Elements and Facilities operated at voltages of 100kV or higher, including radial elements, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process."The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."</p>
Competitive Suppliers		<p>EPSC recognizes the value in revising the BES definition so that a bright-line proxy can be consistently applied by the NERC Regional Entities. It is important that this definition be completed so that the drafting team work sequentially by determining the new BES definition and then move on to developing a exemption process that can work efficiently with that new definition</p>
<p><b>Response:</b> The DBESSDT acknowledges your comments and thanks you for the support of the presented concepts.</p>		
Hydro-Quebec		<p>For Canadian entities, inclusion or exclusion of equipment and facilities in the BES must be also approved by Canadian regulators. Common interconnection between two jurisdictions must be included in BES when at</p>

Organization	Yes or No	Question 13 Comment
		<p>least one Facilities is necessary for the reliability of BES.</p> <p>The transmission lines dedicated to serve the native load in Quebec Interconnection should be excluded, considering that the Quebec Interconnection is one of the four recognized interconnection.</p> <p>Finally, we believe that it is very difficult to propose first a definition for the BES and only after an Exemption process. Both aspects influence each other and both should be conducted together.</p>
<p><b>Response:</b> The SDT has established non-jurisdictional representation to address the concerns of the applicable entities (e.g., Canadian entities) in regards to the application of a continent-wide ‘bright-line’ definition of the Bulk Electric System and exception criteria. NERC Staff has determined the needs of the NERC Rules of Procedure Team in regards to the diversity of the membership and the technical expertise required to appropriately modify the ROP in response to the directives identified in FERC Order No. 743.</p> <p>Transmission Lines dedicated to serving native Load are an identified concern in several Regions and Interconnections. The issues surrounding this concern and the development of potential bright-line criteria are currently being considered by the SDT.</p> <p>The development of the core definition of the BES and the exception criteria by the SDT will be closely coordinated with the development of the Exception Process by the NERC ROP Team.</p>		
PPL Energy Plus		<p>Please consider that it is the magnitude of MVA flow on a facility and the subsequent impact on the remaining facilities that defines when a facility is in the BES rather than just the direction of the real power flowing on the facility.</p>
LG&E and KU Energy LLC		
<p><b>Response:</b> The SDT has developed the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The ‘exception criteria’ (now proposed as part of the definition of BES) utilizes the same ‘bright-line’ criteria approach to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The idea of injecting the ‘current operational conditions’ (i.e., MVA flow) of Elements poses difficulties with the universal application of the definition to achieve consistent results across the continent. Additionally, the idea of ‘current operational conditions’ (i.e., MVA flow) suggests that these conditions are subject to change and therefore could result in different assessments when identifying BES and non-BES Elements.</p>		
ExxonMobil Research and Engineering		<p>Industrial facilities must retain the ability to control their electric facilities in order to ensure that the system is designed to provide for the safest and most reliable source of electric power for the control of their processes. The definition of the bulk electric system and the exemption process should address this fact and exclude or provide a process to exclude industrial facilities from all or a select number of NERC requirements when there is a conflict between the requirements designed to ensure the reliability of BES and the safe operation of chemical processes.</p>
<p><b>Response:</b> The SDT has established basic goals and assumptions that will be used to guide the development of the BES definition and supporting documents.</p>		

Organization	Yes or No	Question 13 Comment
		<p>The assumptions include: ‘The revised definition will not significantly expand or contract what are currently considered BES Elements, nor will the revised definition drive entity registration or de-registration’. Based on these goals and assumptions the overall impact of the revised definition is expected to be minimized for the majority of the Regions and Registered Entities. The SDT is currently working toward an equitable solution concerning industrial customers based on language currently contained in the Registry Criteria which establishes guidance for addressing ‘behind the meter generation’.</p>
NERC Staff		See Attached.
<p><b>Response:</b> The SDT will consider your comments in the further development of the core definition and the exception criteria.</p>		
Edison Electric Institute		<p>Order 743 / NERC BES Project Edison Electric Institute Responses to Draft Concept Paper General Issues: On behalf of its member companies, Edison Electric Institute (EEI) appreciates the opportunity to offer the following brief comments on NERC Project 2010-17 for developing response to FERC Order No. 743, definition of Bulk Electric System and an exemptions process for certain facilities. EEI is the association of the nation’s shareholder-owned electric companies, international affiliates, and industry associates worldwide. EEI’s U.S. members serve approximately 95 percent of the ultimate consumers served by the shareholder-owned segment of the electric utility industry and approximately 70 percent of all electric utility ultimate consumers in the nation. Virtually all EEI members are required to comply with the mandatory electric reliability standards established by the ERO and approved by the Commission, pursuant to section 215 of the Federal Power Act. As a process matter, EEI develops comments such as these through a disciplined and well-practiced process that includes broad distribution of draft documents to member companies, conference calls, and email exchanges, all conducted to ensure that EEI speaks with broad member company support and with as much specificity as possible. For additional information about the roster of membership, NERC staff should contact EEI directly.</p> <p>The concept paper envisions two parts of the project - (1) development of the technical criteria for the BES definition through the NERC Standards Development Process and (2) development of the Rules of Procedure for the exemption process.</p> <ul style="list-style-type: none"> <li>a.) NERC should use the FERC-approved standards development process for developing the technical criteria for both the BES definition and exemptions. EEI views this as a single exercise, that is, the BES definition and technical aspects relating to exemptions as a single project.</li> <li>b.) EEI members believe that this is a critical project and understands various concerns about timeliness and process efficiency, and therefore recommends that stakeholders make strong commitments now to a project plan that will ensure a timely compliance filing at FERC. The drafting team should also expedite development of a project plan that shows tasks, deliverables, and milestone dates for the entire one-year timeline.</li> </ul>

Organization	Yes or No	Question 13 Comment
		<p>c.) EEI reads Order No. 743 as suggesting that NERC should develop appropriate changes to the Rules of Procedure (ROP) to accommodate the process and due process features of the BES exemptions process, including matters such as administrative procedure, decision authority, appeals and other due process matters, and requests for changes. EEI strongly believes that the technical matters are best resolved in the FERC-approved standards development process, which for this project includes the BES definition and the various technical criteria to be used to define exemptions. NERC should manage the development of ROP changes through an open process that considers stakeholder comments and recommendations.</p> <p>d.) Alternatively, if NERC decides to develop various technical criteria for the granting of exemptions through the Rules of Procedure, EEI strongly encourages NERC to plainly describe the process plan, which will help communicate to companies how the process will be open, inclusive, transparent, and ensure due process.</p> <p>e.) Issues recommended for drafting team consideration: Order No. 743 provides that the best way to address its concerns about the definition of BES is to eliminate the regional discretion in the current definition, maintain the bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities and establish an exemption process and criteria for excluding facilities that the ERO determines are not necessary for operating the interconnected transmission network. (P 30) Because transmission lines below 100 kV and radial lines are not included in the definition of BES, the standards drafting project should ensure that the definition expressly incorporates these exclusions. Entities should not have to seek an exemption for facilities below 100 kV or for radial lines. They should be clearly excluded in the BES definition itself.</p> <p>f.) Removing regional discretion does not imply that regions have no role. EEI also encourages NERC in the ROP to delegate the authority to grant exemptions in the first instance to the Regional Entities. NERC should maintain oversight authority, including review of decisions for consistent application of the criteria.</p> <p>g.) Applicants for exemptions should be able to appeal adverse Regional Entity decisions to NERC. The NERC Compliance Registry process should serve as a general model.</p> <p>h.) The BES definition must also address the statutory exclusion for facilities used in “local distribution.” Section 215 plainly excludes facilities used in local distribution from jurisdiction and EEI notes that the definition is applied under other provisions of the Federal Power Act. The exemptions process should provide that previous or future regulatory decisions regarding local distribution facilities can serve as an</p>

Organization	Yes or No	Question 13 Comment
		<p>exemption criterion. While Order 743 does not provide explicit guidance on this issue, EEI urges the drafting team to expand the concept paper to include how this issue will be addressed. If the concept paper is not expanded to include this issue, NERC needs to plainly say where the issue will be addressed.</p> <p>i.) Order 743 made references to facilities below 100 kv that might be defined as necessary for operating an interconnected transmission network, and asked that whatever processes are used to make jurisdictional decisions are rolled into the NERC process. In addition, the order referred to several “technical concerns” that might inform jurisdictional decisions on specific facilities greater than 100 kv, which are scattered references throughout the order. For example: operate in parallel with other high voltage and extra-high voltage facilities (P. 73), interconnect significant amounts of generation and (possibly) operate as a defined flowgate (P. 73), will experience similar loadings as high voltage or extra-high voltage facilities at any given time (P. 73), can cause or contribute to significant bulk power system disturbances and cascading outages (P. 73), will be relied upon during contingency operations (P. 73), are not primarily radial in character (P. 39), multiple interconnections of facilities (to other higher voltage facilities) do not constrain an otherwise limited geographical area (P. 39), overall, (implementation of) the proposed definition may not result in a reduction in reliability (P. 74), facilities that, when they fail, cause or influence significant loss of load (PP. 87, 89). Order No. 743 does not explicitly connect these criteria to the process to be developed; however, the drafting team in its plan should explain how it will address them, as required by the order (P 74). EEI encourages the drafting team to seek informal agreement with FERC staff on these various “technical concerns” prior to significantly advancing the project.</p> <p>j.) As a design matter, EEI encourages the drafting team to endorse a principle to seek to maximize the “brightness” of bright line criteria. While this may produce a longer or more detailed definition, EEI believes that greater demarcation at the outset will help reduce companies’ uncertainty, and help avoid the need to maintain a costly and bureaucratic exemptions process. EEI has previously offered comments on many occasions to both FERC and NERC in support of a ‘simple and clean’ TFE process.</p> <p>k.) EEI urges the drafting team to resist the temptation to create a complicated ‘Rube Goldberg’ device for BES exemptions. Order No. 743 (PP 77-78, 84-85) criticizes the NPCC impact-based study as failing to identify many facilities that are necessary for operating an interconnected transmission network. However, the order does not reject such studies generically, and plainly states that the Commission is not dictating the substance or content of the exemptions process. (P 114) The concept paper needs to clarify whether requests for exemptions may use impact-based studies to support their requests.</p> <p>l.) The concept paper reflects an awkwardly-worded reference (Item #6, proposed BES criteria) to the effect that certain facilities will be deemed included in the BES “...where the exemptions process</p>

Organization	Yes or No	Question 13 Comment
		<p>deems...” In the paragraph at the top of p. 2, the concept paper refers to the exemption process as seeking to determine “...whether a facility should be included or excluded...” EEI requests clarification that an exemptions process will be used to determine facilities for exclusions and not inclusions, and based on a 100 kv bright-line criterion for inclusion. Alternatively, the concept paper should clarify the general intention of this particular criterion.</p> <p>m.) As previously stated, the proposed ROP to be developed should codify the process - and due process - aspects of the exemptions process. The exemptions process should strike the right balance in establishing the criteria for exemptions to ensure that the process does not become mired in attenuated processes such as those developed for the TFE process.</p>

**Response:**

- a.) The NERC Standard Processes Manual is the governing document for the development of the revised BES definition and exception criteria. The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The ‘exception criteria’ (now proposed as part of the definition of BES) utilizes the same ‘bright-line’ criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.).
- b.) The SDT agrees with the critical nature of the project and the need to provide deliverables within the Commission directed time frame. The SDT has developed and posted a project schedule which identifies the tasks, deliverables, and milestone dates for the entire project. The schedule is publically posted and available on the project page (Project 2010-17 Definition of the Bulk Electric System) of the NERC website.
- c.) The revision process for the NERC ROP will be utilized to develop the Exception Process and will be coordinated by NERC staff and governed by current practice for administering such revisions. The NERC ROP Team will be established by NERC staff and will include representation from the DBESSDT along with industry experts and NERC staff personnel. The process for establishing the NERC ROP Team will be determined and administered by NERC staff.
- d.) The SDT has determined that one of the keys to success for this team and the NERC ROP Team is effective communication that provides the industry with an understanding of the project plan and concepts, which will emphasize the development process attributes of openness, inclusiveness, transparency, and due process.
- e.) The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The ‘exception criteria’ utilizes the same ‘bright-line’ criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying Generation Facilities, Radials, etc.). The tight linkage between the core definition and the exception criteria provides the framework for identifying BES and non-BES for the vast majority of the Elements under consideration. The remaining Elements that cannot be definitively indentified as BES or non-BES utilizing the core definition and exception criteria would be candidates for application of the Exception Process where the technical justification would be required to identify Elements as

Organization	Yes or No	Question 13 Comment
		<p>BES (inclusions) or non-BES (exclusions).</p> <p>f.) The 'Exception Process' and the responsibilities associated with the implementation and oversight will be defined by the NERC Rules of Procedure Team. Based on the language contained in FERC Order No. 743, there are Commission expectations associated with the process oversight by the ERO and allowances for the delegation of responsibilities to Regional Entities as appropriate, while ensuring the process is clear and capable of being applied consistently, objectively and uniformly across all regions.</p> <p>g.) The SDT agrees that within the NERC ROP Exception Process, entities should have the opportunity to appeal decisions made by the Regional Entities and the ERO concerning the inclusion or exclusion of Elements in relation to the BES.</p> <p>h.) The SDT agrees that the issues surrounding 'local distribution networks' deserve consideration when developing the BES Designations. See the revised definition as it proposes exclusions for local distribution networks that meet certain criteria.</p> <p>i.) The SDT will consider your comments in the further development of the core definition and the exception criteria and will seek clarity on the issues identified in future discussions with FERC staff.</p> <p>j.) The SDT has developed the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The 'exception criteria' utilizes the same 'bright-line' criteria approach to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.).</p> <p>k.) The specific methodology associated with establishing the technical justification of inclusions to or exclusions from the BES will be determined and vetted by the NERC ROP Team utilizing the revision process for the NERC ROP and will be coordinated by NERC staff and governed by current practice for administering such revisions.</p> <p>l.) The SDT disagrees with the commenter in that any Exception Process should establish a process for exceptions from and inclusions to the BES. As stated in FERC Order No. 743, P83 "The Commission's proposed approach to addressing these concerns will enable affected entities to pursue exemptions for facilities they believe should not be included in the bulk electric system, and also will allow Regional Entities to add facilities below 100 kV they believe should be included". The Regional Entities currently have the authority to include Elements operated at voltages below 100 kV that are deemed necessary for the reliable operation of the BES. The Order does not eliminate this authority, but rather emphasizes the need to maintain the Regional Entity's ability of establishing inclusions to the BES through the Exception Process.</p> <p>m.) The revision process for the NERC ROP will be utilized to develop the Exception Process and will be coordinated by NERC staff and governed by current practice for administering such revisions. With that in mind, the SDT agrees with the commenter in that the Exception Process should carry the same characteristics as the core definition and exception criteria: clear, unambiguous, repeatable, and establish consistency on a continent-wide basis.</p>
Pepco Holdings Inc.		<p>1. The definition should be expanded to contain what is excluded to minimize the need for exemptions. For example radial facilities should by definition be excluded and not have to go through a formal exemption</p>

Organization	Yes or No	Question 13 Comment
		<p>process. Other “generic” criteria identified should also be excluded.</p> <p>2. The exemption process needs to be well designed to minimize the effort. The exemption process development should incorporate lessons learned and experience from the TFE process, so that this new process is more manageable.</p> <p>3. Instead of two separate groups, one working on the definition and one on the exemption process, one group should handle both activities to assure continuity and consistency.</p> <p>4. Any data required for the exemption process needs to be kept secure and not posted on an open source.</p> <p>5. PHI is supportive the EEI comments offered on the BES Project.</p>
<p><b>Response:</b></p> <ol style="list-style-type: none"> <li>The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). Organization	Yes or No	Question 13 Comment
5. See responses to EEI comments.		
PUD No.1 of Clallam County		<p>Due to the lack of clarity around the current definition of the Bulk Electric System ("BES") the NERC Statement of Compliance Registry Criteria is often used/misused to define elements of the BES. The registration criterion uses many undefined terms as well as "bright line" thresholds that that in many cases have little to no technical basis. One example is using "gross nameplate rating" when the machine size may be significantly limited by boiler capacity on a cogeneration steam plant or water on a hydro plant. In addition there is no technical or reliability bases used to identify the low MVA/MW thresholds used in the load and generation thresholds for the DP, GO, GOp registrations.</p> <p>The Standards Authorization Requests (SARs) should also address how, or if the registration criteria is used in identifying BES elements. We believe the Registration Criteria should not be used to identify BES elements; it should be used as indented, to address functional registration.</p>
<p><b>Response:</b> The SDT is continuing the development of the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The 'exception criteria' (now proposed as part of the definition of BES) utilizes the same 'bright-line' criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying Generation Facilities, Radials, etc.). 		<p>the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The ‘exception criteria’ (now proposed for inclusion in the definition of BES) utilizes the same ‘bright-line’ criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation facilities, radials, etc.). In the development of the exception criteria, the SDT has considered your comments.</p>
<p>City of Grand Island</p>		<p>a.) The NERC defined Adequate Level of Reliability is the governing factor on whether or not a facility really has an impact on the BES. Currently the standards are applied far too broadly and numerous small entities are needlessly involved. This project should pull the standards/compliance environment back to entities that have a real impact.</p> <p>b.) Exemption process should be termed “exception” process. Exception means not conforming to general rule, whereas exemption primarily means exclusion. This process will be difficult to develop and administer and is counterproductive to “bright line” philosophy. Thus the bright lines should be at a high level resulting in fewer exceptions. The exception process must consider the impact of a fault or outage of that facility on the Adequate Level of Reliability of the BES.</p> <p>c.) The exception process development should be simultaneous to the BES definition project. It’s all one, not two pieces. In addition if this is a direct impact on registration criteria, then that should be part of the project as well.</p>
<p><b>Response:</b></p> <p>a.) The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The ‘exception criteria’ (now proposed for inclusion in the definition of BES) utilizes the same ‘bright-line’ criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The SDT believes that this method of identification will provide the desired clarity requested by the industry and directed by the Commission while ensuring that consistent results will be produced universally across the continent. In the development of the core definition and the exception criteria, the SDT has considered your comments.</p> <p>b.) The inconsistency of the use of ‘exemption’ vs. ‘exception’ in several documents has been identified by the SDT and the team has determined that ‘exception’ is the proper term to be used in reference to the Bulk Electric System definition and supporting processes.</p> <p>The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). Occidental Energy Ventures Corp		<p>Demand Side Management. One commenter has apparently suggested that "Demand Side Management" relied on to provide Contingency Reserves be included in the BES definition. On the surface, this seems reasonable. However, this would possibly subject aggregators of DSM resources to registration as a yet unknown resource type. The DSM resources could be located on lower voltage distribution systems that should not be part of the BES. Once again, the issue of DSM registration is being pursued under a separate NERC initiative and should be resolved by that process rather than a broadening of the definition of BES which forces registration of entities not currently registered. This also could provide a disincentive for potential DSM development, which the Federal Energy Regulatory Commission (FERC) is on record as trying to foster as a peak shaving resource. When the issues surrounding DSM as a resource are resolved by due process, any recommendations could include a change to the definition of BES, if actually required. Finally, this issue is not part of the FERC directives for changing the BES definition.</p> <p>Self-Generation and Cogeneration. One commenter has apparently suggested that self-generation as currently defined and excluded in the Statement of Compliance Registry should not be excluded from the definition of BES based on the "immediate-term impact on reliability." This same commenter notes that, in order to be excluded under the current BES definition, the self-generation is required to purchase back-up (stand-by) power for the generation in case of an outage. Paying for this standby power (which is essentially "extra" reserve power) is one reason for allowing the self-generation to be excluded from the BES. Once again, subjecting self-generation/cogeneration to NERC regulatory requirements is not one of the directives from the FERC concerning the BES definition and could provide a disincentive for cogeneration, which has been historically supported by FERC and the federal government. Hence, suggestions such as this are out of the scope of this process.</p>
<p><b>Response:</b> The SDT has established basic goals and assumptions that will be used to guide the development of the BES definition and supporting documents. The assumptions include: 'The revised definition will not significantly expand or contract what are currently considered BES Elements, nor will the revised</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 13 Comment
<p>definition drive entity registration or de-registration. Based on these goals and assumptions the overall impact of the revised definition is expected to be minimized for the majority of the Regions and Registered Entities. The SDT will consider your comments in the further development of the core definition, the exception criteria and the Exception Process.</p>		
<p>Glacier Electric Cooperative</p>		<p>I highly encourage the development of a method that utilizes engineering analyses to more accurately define which elements are truly significant to the BES and which are not. Thanks for taking on the challenge to improve the BES definition.</p>
<p><b>Response:</b> The SDT is continuing the development of the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The 'exception criteria' (now proposed for inclusion in the definition of BES) utilizes the same 'bright-line' criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The SDT believes that this method of identification will provide the desired clarity requested by the industry and directed by the Commission while ensuring that consistent results will be produced universally across the continent. exception criteria</p>		
<p>Entergy Services</p>		<p>a.) The following are Entergy's comments concerning the scope and implementation of the requested work, the draft SAR, draft standard, draft criteria, draft exemption criteria, exemption process, and implementation process. We suggest the SAR and the standard development be revised to reflect the comments below. In particular, we believe there are several parts to the scope of this project.</p> <p>First, the development of the revised definition of the BES including all inclusion / exemption criteria and the development of the implementation plan for that revised definition should be developed through the Standards Development Process. All future inclusion / exemption criteria would also be developed through the Standards Development Process. The process for changing the Rules of Procedure should be used for the development, approval and application of the process for obtaining an exemption of specific facilities. It would be helpful, but not required, that the development of the standard and the changes to the ROP proceed together.</p> <p>b.) We suggest there be one continent-wide definition of BES with no exemption criteria specific to a particular region...</p> <p>DEFINITION OF BES, INCLUSION CRITERIA and EXEMPTION CRITERIA We suggest the definition of BES be the following: Bulk Electric System: All Transmission and Generation Elements and Facilities conforming to the Inclusion Criteria and Exemption Criteria identified below. Elements and Facilities operated at voltages of 100kV or higher may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process included in the NERC Rules of Procedure.</p> <p>INCLUSION CRITERIA1. All transmission and generation elements and facilities operated at voltages of</p>

Organization	Yes or No	Question 13 Comment
		<p>100 kV or higher,</p> <p>2... Transformers, other than Generator Step-up (GSU) transformers, including Phase Angle Regulators, with both primary and secondary windings of 100 kV or higher;</p> <p>3. Individual generation resources (including GSU transformers and the associated generator interconnecting line lead(s)) greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above;</p> <p>4. Generation plants (including GSU transformers and the associated generator interconnecting line lead(s)) with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above;</p> <p>5. Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator's (TOP's) restoration plan;</p> <p>6. Transmission Elements or Facilities operated at voltages below 100kV where the exemption process deems the Element or Facility to be included in the BES;</p> <p>7. Individual generation resources greater than 20 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation resources to be included in the BES; and</p> <p>8. Generation plants with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Facilities operated at voltages below 100kV where the exemption process deems the generation plants to be included in the BES.</p> <p>EXEMPTION CRITERIA1. Any radial Transmission Element or System, connected from one Transmission source to a Load-serving Element and/or generation resources not included in items 2, 3, 4, 6, and 7 above are excluded from the BES;</p> <p>2. Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO); and</p> <p>3. Generating plant control and operation functions which include relays and systems that control and protect the unit for boiler, turbine, environmental, and/or other plant restrictions.</p> <p>IMPLEMENTATION PLAN FOR REVISED DEFINITION OF BES The Standard Drafting Team will develop for industry comment an Implementation Plan for the revised definition of BES.</p>
<p><b>Response:</b></p>		

Organization	Yes or No	Question 13 Comment
		<p>a.) The NERC Standard Processes Manual is the governing document for the development of the revised BES definition and exception criteria. The SDT is continuing the development of the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The 'exception criteria' (now proposed for inclusion in the definition of BES) utilizes the same 'bright-line' criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e. bright-line criteria for identifying generation Facilities, radials, etc.).</p> <p>The revision process for the NERC ROP will be utilized to develop the Exception Process and will be coordinated by NERC staff and governed by current practice for administering such revisions. The NERC ROP Team will be established by NERC staff and will include representation from the DBES SDT along with industry experts and NERC staff personnel. The process for establishing the NERC ROP Team will be determined and administered by NERC staff.</p> <p>The development of the core definition of the BES and the exception criteria by the SDT will be closely coordinated with the development of the Exception Process by the NERC ROP Team. The goal (identified key to the project's success) is to have postings from each aspect of the project, which will enable the industry to review the entire project 'package' at one time and effectively provide comments simultaneously on the core definition, the exception criteria and the Exception Process. Based on the Commission imposed time requirements for filing and the amount of work required to be responsive to the directives in Order No. 743, the decision was made to establish two teams working in close coordination to address the issues related to the project.</p> <p>b) FERC Order No. 743 provides specific direction on the elimination of the regional discretion which is allowed under the current definition of the Bulk Electric System. The SDT fully intends to be responsive to the Commission directives.</p> <p>The SDT has considered your comments in the further development of the core definition and the exception criteria. See the proposed revised definition of BES with its lists of "Inclusions" and "Exclusions."</p>
Snohomish County PUD		<p>While we recognize that the Standards Drafting Team is a technical body and is not charged with interpreting legal doctrine, we nonetheless urge the Drafting Team to bear in mind the statutory limitations on the definition of the BES. If the BES definition is drafted with these limits in mind, the process will more easily meet with industry acceptance. If the BES definition adopted by the drafting team fails to meet these limits, by contrast, its efforts are likely to result in extended litigation that will be counterproductive to the goal of improving the reliability of the bulk delivery system. The definition of "bulk-power system" adopted by Congress in Section 215 of the Federal Power Act is the ultimate source of the Standards Drafting Team's authority and the Team should therefore pay particular attention to that statutory definition: The term 'bulk-power system' means-(A) Facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and(B) Electric energy from generation facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy. This definition, and in particular the language italicized above, imposes clear restrictions on the definition to be developed by the Drafting Team.</p>

Organization	Yes or No	Question 13 Comment
		<p>These restrictions are:</p> <p>a. Only facilities “necessary for” the operation of the interconnected bulk transmission network can be included in the BES. Snohomish believes the most logical way to determine whether facilities are “necessary for” operation of the bulk system is through engineering-based studies demonstrating that particular Facilities or Elements play a material role in the operation of the bulk grid.</p> <p>b. Generation facilities can be included in the BES only if they are “needed to maintain” the reliability of the bulk system. Accordingly, as noted above, the thresholds used in the NERC Statement of Registry Compliance are not determinative of whether a generator is necessary to maintain bulk system reliability. That determination is an engineering-based assessment and the fact that a generator may exceed the 20 MW capacity threshold in the Registry Statement does not mean that the generator is “needed to maintain” bulk system reliability. It may well not be.</p> <p>c. “Reliability” was also given a specific meaning by Congress when it drafted Section 215. Specifically, the statute defines “reliable operation” to mean “operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of sudden disturbances, including . . . unanticipated failure of system elements.” Accordingly, the BES definition should focus on facilities that are necessary to ensure that the bulk transmission system does not suffer instability, uncontrolled separation, or cascading failures. Facilities that do not threaten these kinds of severe consequences should not be included in the BES.</p> <p>d. The definition explicitly excludes “facilities used in the local distribution of electric energy.” The definition adopted by the Standards Drafting Team must therefore unequivocally exclude all local distribution facilities. In light of these statutory constraints, Snohomish supports as part of the Standards Drafting Team’s process the creation of a categorical exclusion from the BES for systems that meet NERC’s historical definition of Local Network. As explained in more detail below, Local Networks are operated to provide service to specific, geographically-limited service areas and do not affect the reliable operation of the bulk transmission system. Accordingly, there is no good reason to include Local Networks in the BES and to do so would be contrary to the language in the statute discussed above. Historically, NERC employed a definition of “Local Networks” and NERC’s “Bulk Electric System” definition distinguished between the “Bulk Transmission System” and “Sub-transmission.” More recently, those distinctions have been lost, diverting attention away from critical elements of the transmission system that, if they fail, threaten cascading outages or other large-scale events, and increasing attention to facilities that, if they fail, threaten only to disrupt service in a localized areas. The Standards Drafting Team can remedy this over breadth problem by categorically excluding facilities meeting the definition of “Local Networks” from the BES definition. Until a few years ago, NERC used the following definition of “Local Network”: Local Network- a non-radial portion of a bulk electric system whose customers may be interrupted for the loss of a single transmission element (100 kV or more). This loss of load is only</p>

Organization	Yes or No	Question 13 Comment
		<p>allowed in those rare circumstances when it is impractical (e.g., long transmission distances, extremely high costs with low benefits) to avoid interruption of service to a portion or all of the customers in the network due to the network being directly connected to or supplied by the faulted transmission system element (e.g., generator, transmission circuit, transformer). The resulting customer interruption should be of relatively low probability of occurrence and limited in magnitude (less than 100 MW). The interruption of such local network customers shall not impact the overall security of the interconnected transmission systems. The term Local Network is currently used in the NERC TPL Reliability Standard. However the definition is no longer defined in the NERC Standard Glossary of Terms. The important distinctions between Local Networks and the Bulk Electric System have been further obscured by changes in NERC’s BES definition. The “Bulk Electric System” definition that appeared in the Glossary of Terms reference document approved by both the NERC EC and OC at a joint meeting of those committees on July 16, 1996, distinguished between “Transmission” and “Sub-transmission”:</p> <p><b>Bulk Electric System</b> - A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and bulk transmission system. Where</p> <p><b>Transmission</b> - An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems.</p> <p><b>Bulk Transmission</b> - A functional or voltage classification relating to the higher voltage portion of the transmission system.</p> <p><b>Sub-transmission</b> - A functional or voltage classification relating to the lower voltage portion of the transmission system.</p> <p>The current version of the BES definition does not, by contrast, make such a distinction: <b>Bulk Electric System</b> - As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition. The definitional changes have diverted attention away from the systems that pose the greatest risks of cascading outages and toward systems that do not threaten such widespread reliability impacts. Protecting the electric system from wide-spread cascading outages and focusing on protecting equipment and isolating cascading outages has historically been the primary goal of NERC reliability efforts and, as FPA Section 215 requires, should remain so now and in the future. It is clear, however, that there are real distinctions between “Bulk Transmission,” “Sub-transmission,” and “Local Networks” in terms of their impacts on bulk system reliability. We propose that, in order to restore these important distinctions, WECC categorically exclude systems meeting the definition of Local Network from its BES definition. Doing so will refocus the NERC-WECC reliability mission on those systems that most effect bulk system reliability, while excluding from the BES ambit those systems whose impacts are purely local.</p> <p>As noted above, Snohomish has participated in and supports the work of the WECC BESDTF. The BESDTF’s current proposal contains a categorical exclusion for Local Networks along the lines of the one we advocate here and the BESDTF has developed an extensive factual and technical record supporting its approach. We urge the Standards Drafting Team to follow that approach.</p>

Organization	Yes or No	Question 13 Comment
<p><b>Response:</b> The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The ‘exception criteria’ (now proposed for inclusion in the definition of BES) utilizes the same ‘bright-line’ criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The SDT believes that this method of identification will provide the desired clarity requested by the industry and directed by the Commission while ensuring that consistent results will be produced universally across the continent. In the development of the core definition and the exception criteria, the SDT has considered your comments.</p>		
United Illuminating Company		<p>Any technical definition should provide the means to differentiate facilities used in local distribution since these facilities are excluded from the statutory definition of bulk-power system. The definition of BES should be very broad or bright.</p>
<p><b>Response:</b> The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The ‘exception criteria’ (now proposed for inclusion in the definition of BES) utilizes the same ‘bright-line’ criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The SDT believes that this method of identification will provide the desired clarity requested by the industry and directed by the Commission while ensuring that consistent results will be produced universally across the continent. In the development of the core definition and the exception criteria, the SDT has considered your comments.</p>		
Orange and Rockland Utilities, Inc.		<p><b>a.)</b> Proposed definitions to be added to the NERC Glossary of Terms: BES Exemption Process: The review processes for (a) excluding facilities and elements from the BES that are determined not to be necessary to support bulk power system reliability (e.g., radial elements), and (b) including Elements operated at voltages below 100 kV that are determined to be necessary to support bulk power system reliability. By identifying all such BES and non-BES facilities and elements, the BES Exemption Process will establish the Points-of-Demarcation between Facilities and BES Elements and non-BES facilities and elements.</p> <p>Point-of-Demarcation: A physical point and/or electrical connection between facilities and BES Elements and non-BES facilities and elements, e.g., the upstream terminals of a disconnect switch (or a buss connection) representing the boundary between a BES supply bus and a non-BES radial feeder.</p> <p><b>b.)</b> The BES exemption process has not yet been finalized or approved. So, it is somewhat difficult to know a priori whether any element, elements or a group of elements or facilities should or should not be classified as part of the BES definition.</p> <p><b>c.)</b> This document uses both “exemption process” and “exception process”. Recommend that the phraseology be standardized on “exception process” as the exception (not the exemption) can be to include or exclude elements and facilities.</p>

Organization	Yes or No	Question 13 Comment
		<p><b>d.)</b> It is envisioned that the BES Exemption Process will contain 3 sub-processes; one for Exclusion, one for Exemption, and one for Inclusion. Each sub-process will establish provisions and guidelines for the three different tasks. In order to ensure consistency across the continent, it is our view that NERC should be the facilitator of these processes. NERC may choose to have some of these tasks performed at the regional levels through the existing delegation agreements.</p> <p><b>e.)</b> The BES Exemption Process must be an active and ongoing aspect of the ERO program. With the addition of new or deletion of existing Transmission and Generation Elements, facilities, or systems. It needs to be recognized that Exclusions, Inclusions, and Exemptions might need alteration over time. By establishing appropriate guidelines and processes, the ERO will be able to monitor and maintain information of what is the Bulk Electric System, or BES.</p>
<p>Response:</p> <p>a.) The SDT is not currently contemplating any additional definitions beyond BES. In regards to the term “BES Exemption Process”; it has been determined that the process will reside in the NERC Rules of Procedure (ROP) and therefore it seems logical that the purpose of the process would be defined within the boundaries of the NERC ROP.</p> <p>b.) Exception criteria Agree. The Exemption Process is being developed by a separate team and will be posted for stakeholder comment.</p> <p>c.) The inconsistency of the use of ‘exemption’ vs. ‘exception’ in several documents has been identified by the SDT and the team has determined that ‘exception’ is the proper term to be used in reference to the Bulk Electric System definition and supporting processes.</p> <p>d.) The ‘Exception Process’ will be developed by the NERC Rules of Procedure Team while coordinating with the DBESSDT. The ‘Exception Process’ and the responsibilities associated with the implementation and oversight will be defined by the NERC Rules of Procedure Team. Based on the language contained in FERC Order No. 743, there are Commission expectations associated with the process oversight by the ERO and allowances for the delegation of responsibilities to Regional Entities as appropriate, while ensuring the process is clear and capable of being applied consistently, objectively, and uniformly across all regions. Note, however, that the drafting team has revised the definition of BES so that it now includes the exceptions (both inclusions and exclusions) stakeholders have already proposed be applied to the 100 kV bright line threshold.</p> <p>e.) The SDT agrees that the Bulk Electric System is dynamic and that the implementation and continued application of the BES Definition and supporting processes will require active oversight and management to ensure that changing conditions (i.e., operational &amp; new construction) surrounding the Bulk Electric System will be addressed and result in proper evaluation and identification of BES &amp; non-BES Elements.</p>		
American Transmission company		<p>1. ATC suggests that once the term “exemption” is replaced with the term “exception”, then consider modifying the BES definition wording to, “All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher, necessary to support bulk power system reliability. Elements and Facilities</p>

Organization	Yes or No	Question 13 Comment
		<p>operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded through the BES definition exception process and Elements and Facilities operated at voltages less than 100kV may be included through the BES definition exception process”.</p> <p>2. The “Concept Paper” does not specifically call out Transmission Lines above 100 kV as in the BES definition (the proposed definition does, however) and there is a circular exemption criteria in the concept paper. In criterion #2, it refers to the exemption process "consistent with the criteria". The criteria exempt generating plant controls and Transmission Elements or Systems that are radial to a load or generator not included in the BES List. However, the BES list is defined prior to the criteria in the concept paper. Exception criterion #1 points to BES list elements #6 and #7, which in turn, refer to the exception process. But, the exemption criteria never define how to exempt the elements referred to in #6 and #7.</p> <p>3. The revised definition of the BES and exception process does not address a timeframe for the implementation of this standard once approved, allowing enough time for the entities to provide justification, and then make the necessary changes to their internal programs?</p> <p>4. How often would a Registered Entity revisit this Exception Process? ATC can envision a scenario where they are doing that every year or two because the loads, generation and transmission changes. The process should also allow for multi-year distinctions for exceptions. In other words, if a Registered Entity gets a facility excluded, then that exclusion should be allowed for 3 or more years. Annual certifications and approval are too restrictive.</p> <p>5. ATC believes the exception criteria needs to be developed by the SDT. NERC Staff should focus on the process (identification, notification, appeal and rights) but the SDT is in the better position to develop the technical piece of the exception criterion.</p> <p>6. ATC also supports the comments as submitted by EEI REAC on the Draft Concept Paper on the Definition of BES Project 2010-17.</p>
<p><b>Response:</b></p> <ol style="list-style-type: none"> <li data-bbox="121 1097 1927 1187">1. The SDT has considered your comments in the further development of the core definition and the exception criteria. The drafting team has revised the definition of BES so that it now includes the exceptions stakeholders have already proposed be applied to the 100 kV bright line threshold. The word, “exemption” is not used in the proposed definition of BES.</li> <li data-bbox="121 1235 1955 1292">2. The SDT has considered your comments in the further development of the core definition and the exception criteria. Please see the revised definition of BES.</li> <li data-bbox="121 1325 1902 1354">3. Organization	Yes or No	Question 13 Comment
		<p>regional Transition Plans on affected entities and provide sufficient time to ensure a smooth transition into the realm of mandatory and enforceable Reliability Standards.</p> <p>4. The 'Exception Process' will be developed by the NERC Rules of Procedure Team while coordinating with the DBESSDT. The DBESSDT recognizes that the Bulk Electric System is dynamic and that the implementation and continued application of the BES Definition and supporting processes will require active oversight and management to ensure that changing conditions (i.e., operational &amp; new construction) surrounding the Bulk Electric System will be addressed and result in proper evaluation and identification of BES &amp; non-BES Elements. The time frames associated with the 'review' processes will be determined by the NERC ROP Team. The revision process for the NERC ROP will be utilized to develop the Exception Process and will be coordinated by NERC staff and governed by current practice for administering such revisions.</p> <p>5. The SDT is continuing the development of the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The 'exception criteria' (now proposed for inclusion in the definition of BES) utilizes the same 'bright-line' criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The tight linkage between the core definition and the exception criteria provides the framework for identifying BES and non-BES for the vast majority of the Elements under consideration. The remaining Elements that cannot be definitively identified as BES or non-BES utilizing the core definition and exception criteria would be candidates for application of the Exception Process where the technical justification would be required to identify Elements as BES (inclusions) or non-BES (exclusions).</p> <p>The 'Exception Process' will be developed by the NERC Rules of Procedure Team while coordinating with the DBES SDT.</p> <p>6. See responses to EEI comments.</p>
The Dow Chemical Company		Dow has reviewed and generally supports the comments prepared by The Electricity Consumers Resource Council (ELCON).
<b>Response:</b> See response to ELCON comments.		
National Rural Electric Cooperative Association (NRECA)		<p>a.) BES definition exemption criteria must be developed by the same SDT that is modifying the BES definition and through the standards development procedure. The BES exemption criteria must not be developed by a separate group outside of the standard development procedure, e.g., through a NERC Rules of Procedure (ROP) modification process as is currently proposed in the SAR. The BES exemption process, not criteria, can be included in the ROP by utilizing the process for making such modifications to the ROP. The BES definition exemption process should refer to the procedure for applying for such an exemption, not the criteria that such an exemption application would be based upon. It is critical for the final SAR to provide clarity as it relates to what is considered exemption criteria and exemption process.</p>

Organization	Yes or No	Question 13 Comment
		<p><b>b.)</b> We appreciate the work of the Regional BES Definition Coordination Group, however, this group must conclude its work now that a SAR has been proposed and is posted for comment. This group can provide comment on this SAR and future products from the SDT in same way as any other stakeholder can provide comment. Having a parallel effort led by Regional Entity staff, outside the formal Project 2010-17 SDT process, will create confusion and potentially cause inefficient use of industry resources. All efforts should be focused on the formal standard development activities including related future comment and ballot periods. Compliance registry criteria should only be reviewed and potentially modified if specifically needed to implement a modified BES definition and associated exemption criteria.</p> <p><b>c.)</b> The SDT is tasked with addressing definition modifications to ensure consistent and uniform application of the BES definition across the Regional Entities. The focus of the SDT's work should first be on the BES definition and exemption criteria. Any Compliance Registry Criteria modifications would have to be approached very carefully as it was developed through a lengthy stakeholder consensus process.</p>
<p><b>Response:</b></p> <p><b>a.)</b> The NERC Standard Processes Manual is the governing document for the development of the revised BES definition and exception criteria. The SDT is continuing the development of the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements. The 'exception criteria' (now proposed for inclusion in the definition of BES) utilizes the same 'bright-line' criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.).</p> <p>The revision process for the NERC ROP will be utilized to develop the Exception Process and will be coordinated by NERC staff and governed by current practice for administering such revisions. The NERC ROP Team will be established by NERC staff and will include representation from the DBESSDT along with industry experts and NERC staff personnel. The process for establishing the NERC ROP Team will be determined and administered by NERC staff.</p> <p>The development of the core definition of the BES and the exception criteria by the SDT will be closely coordinated with the development of the Exception Process by the NERC ROP team. The goal (identified key to the project's success) is to have postings from each aspect of the project, which will enable the industry to review the entire project 'package' at one time and effectively provide comments simultaneously on the core definition, the exception criteria, and the Exception Process. Based on the Commission imposed time requirements for filing and the amount of work required to be responsive to the directives in Order No. 743 the decision was made to establish two teams working in close coordination to address the issues related to the project.</p> <p><b>b.)</b> When the NERC Standards Committee accepted the SAR and established the SDT, the RBESDCG acknowledged that the primary development of definition and supporting documents had shifted from the RBESDCG to the SDT. The RBESDCG agrees that parallel efforts will result in inconsistencies and disruption of the SDTs efforts. Therefore, the RBESDCG forwarded all applicable work products to the SDT and to the NERC ROP Team for consideration. Going forward, the RBESDCG will support the development of the definition, supporting documents, and the revisions to the ROP by collectively participating in the respective development processes (i.e., providing consensus comments to posting and participating in the associated</p>		

Consideration of Comments on Definition of Bulk Electric System — Project 2010-17

Organization	Yes or No	Question 13 Comment
		<p>balloting process).</p> <p>c.) Any impact of the revised core definition, the exception criteria, or Exception Process on the current Registry Criteria will be addressed in the Implementation Plan.</p>
City of Austin dba Austin Energy		<p>The word “exemption” in the last line is confusing. Lines above 100kV would be “exempted” from inclusion as part of the BES. Lines below 100kV would be “added” to the BES (under certain circumstances) which, technically, is not an “exemption.” (In fact, the Word document on the NERC web page refers to the process as an “Exception Process”) AE recommends the following language: Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, and Elements and Facilities operated at voltages less than 100kV may be included if approved through the process described in the BES Definition Exception Process.</p>
<p><b>Response:</b> The inconsistency of the use of ‘exemption’ vs. ‘exception’ in several documents has been identified by the SDT and the team has determined that ‘exception’ is the proper term to be used in reference to the Bulk Electric System definition and supporting processes. In the development of the core definition and the exception criteria, the SDT has considered your comments. Please see the revised definition of BES – it now includes a list of both “Inclusions” and “Exclusions” as part of the definition and no longer references an exemption (or exception) process).</p>		
Duke Energy		<p>There should be a provision for the Planning Coordinator or Transmission Planner to include individual generators and generation plants that are not included in these criteria through a technical evaluation, either in the definition or in the inclusion of facilities below 100 kV portion of the exemption process. For example, generating facilities connected to generator step up transformers below 100 kV that have a demonstrated ability to have a significantly adverse affect on the reliability on the bulk power grid or a major urban load center should be included.</p>
<p><b>Response:</b> The SDT agrees with the commenter, in that any Exception Process should establish a process for exceptions from and inclusions to the BES. As stated in FERC Order No. 743, P83 “The Commission’s proposed approach to addressing these concerns will enable affected entities to pursue exemptions for facilities they believe should not be included in the bulk electric system, and also will allow Regional Entities to add facilities below 100 kV they believe should be included”. The Regional Entities currently have the authority to include Elements operated at voltages below 100 kV that are deemed necessary for the reliable operation of the BES. The Order does not eliminate this authority, but rather emphasizes the need to maintain the Regional Entity’s ability of establishing inclusions to the BES through the Exception Process. Under these circumstances, the SDT feels that a Planning Coordinator or Transmission Planner could pursue inclusion of selected Elements into the BES by lobbying with their Regional Entity. exception criteria</p>		
BGE		<p>a.) NERC should use the FERC-approved standards development process for developing the technical criteria for both the BES definition and exemptions process. We view this as a single exercise. BGE</p>

Organization	Yes or No	Question 13 Comment
		<p>feels joint development of the BES Definition &amp; Exception Process under a single SDT would be preferable. The standards drafting project should ensure that the definition expressly incorporates these exclusions for facilities below 100 kV. Entities should not have to seek an exemption for facilities below 100 kV or for radial lines. They should be clearly excluded in the BES definition itself.</p> <p><b>b.)</b> We encourage the drafting team to embrace a design concept that seeks to maximize the “brightness” of bright line criteria. The BES exemptions process should contemplate very few exemptions. The TFE process is an example of a process not to be repeated here.</p>
<p><b>Response:</b></p> <p><b>a.)</b> The development of the core definition of the BES and the exception criteria by the SDT will be closely coordinated with the development of the Exception Process by the NERC ROP Team. The goal (identified key to the project’s success) is to have postings from each aspect of the project, which will enable the industry to review the entire project ‘package’ at one time and effectively provide comments simultaneously on the core definition, the exception criteria and the Exception Process. Based on the Commission imposed time requirements for filing and the amount of work required to be responsive to the directives in Order No. 743 the decision was made to establish two teams working in close coordination to address the issues related to the project.</p> <p><b>b.)</b> The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The ‘exception criteria’ (now proposed for inclusion in the definition of BES) utilizes the same ‘bright-line’ criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The tight linkage between the core definition and the exception criteria provides the framework for identifying BES and non-BES for the vast majority of the Elements under consideration. The remaining Elements that cannot be definitively identified as BES or non-BES utilizing the core definition and exception criteria would be candidates for application of the Exception Process where the technical justification would be required to identify Elements as BES (inclusions) or non-BES (exclusions).</p>		
<p>City Water Light and Power (CWLP) - Springfield, IL</p>		<p>Relative to the BES Definition Exclusion Process, CWLP has chosen to comment on the inclusion/exclusion process as a whole. The current lack of detailed, firm administrative guidelines as well as an unambiguous process for resolving disputes between parties involved in the process of adjudicating inclusions/exclusions is problematic. It is CWLP’s belief that developing the proposed administrative framework for the process is needed first. Focusing on the data to be submitted as shown in (1) and (2) above does not address the scope, nature, and criteria applicable to the review of requests for inclusions/exclusions. Regardless, CWLP feels strongly that the sole basis for approval or rejection of a request should be technical justification.</p> <p>Speaking to the process in general, any inclusion or exclusion should be a specific request for a specific facility; continent-wide, interconnect-wide, and region-wide applicability for inclusions/exclusions departs from the intent of FERC Order 743 to establish a definition without regional variances.</p>
<p><b>Response:</b> The SDT has considered your comments in the further development of the core definition and the exception criteria .</p>		

Organization	Yes or No	Question 13 Comment
		<p>The SDT is continuing the development of the concept of a component-based 'bright-line' definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). 		<p>Process by the NERC ROP Team. The goal (identified key to the project’s success) is to have postings from each aspect of the project, which will enable the industry to review the entire project ‘package’ at one time and effectively provide comments simultaneously on the core definition, the exception criteria, and the Exception Process. Based on the Commission imposed time requirements for filing and the amount of work required to be responsive to the directives in Order No. 743 the decision was made to establish two teams working in close coordination to address the issues related to the project.</p> <p><b>b.</b> The SDT is not contemplating any further definitions beyond BES based on the latest revision to the definition. Please see the revised definition of BES as this incorporates more details about including specific generation elements.</p>
<p>Independent Electricity System Operator</p>		<p>a. On the SAR, it indicates an SC approval date of December 8. It is misleading since the SC did not approve the SAR; it only approved posting of the SAR for industry comment.</p> <p>b. We have a concern with the concept paper on the exemption/inclusion criteria/process. Please see other comments on that paper submitted separately.</p> <p>c. We suggest use of consistent term between “exception” and “exemption”.</p> <p>d. We suggest the exception/inclusion criteria to be included in the definition and developed/approved by the balloting body. Determining these criteria via any other processes will not provide the industry the opportunity to fully vet the criteria.</p> <p>e. The SAR indicates that “...the definition drafting team will work closely with the team developing the BES definition exemption process to develop a single coordinated implementation plan. It is also envisioned, that the team working to develop the BES definition exemption process will solicit input from drafting teams, stakeholders....” We find this confusing and have a concern that having two teams working on this definition/criteria package leads to misalignment and confusion. Further, while the definition drafting team is formed by a nomination process and appointed by the NERC Standards Committee, there is no transparency and/or public announcement to solicit nominations for the team working to develop the exemption process. We urge the NERC Standards Committee to direct the definition drafting team to also be responsible for developing the exemption process, and include the exemption criteria as part of the definition hence subjecting them to industry comment and balloting.</p>
<p><b>Response:</b></p> <p>a. The default language in the form is misleading and implies that the NERC Standards Committee’s approval is required. Per the NERC Standard Process Manual the Standards Committee authorizes posting of the SAR for industry comment. The DBES SDT will provide a recommendation to NERC Standards Staff to revise the SAR form to read, “Date SC Authorized Posting the SAR”.</p> <p>b. The SDT has considered your comments in the further development of the core definition and the exception criteria. Note that the revised definition of BES now includes lists of criteria for both “inclusion” and “exclusion”.</p>		

Organization	Yes or No	Question 13 Comment
		<p>c. The inconsistency of the use of ‘exemption’ vs. ‘exception’ in several documents has been identified by the SDT and the team has determined that ‘exception’ is the proper term to be used in reference to the Bulk Electric System definition and supporting processes.</p> <p>d. The SDT is continuing the development of the concept of a component-based ‘bright-line’ definition which consists of a core definition that establishes the overall starting point for assessing BES and non-BES Elements (100 kV threshold). The ‘exception criteria’ (now proposed for inclusion in the definition of BES) utilizes the same ‘bright-line’ criteria to provide further guidance as to whether an Element is considered BES or non-BES (i.e., bright-line criteria for identifying generation Facilities, radials, etc.). The tight linkage between the core definition and the exception criteria provides the framework for identifying BES and non-BES for the vast majority of the Elements under consideration. APPA		See text submitted under Question 12.
<b>Response:</b> See response to Q12.		
Xcel Energy		It is not clear as to why the Reliability Assurer is included as an applicable entity in the SAR.

Organization	Yes or No	Question 13 Comment
		<p><b>Response:</b> The NERC Functional Model Version 5 defines the role of the Reliability Assurer as: “The functional entity that monitors and evaluates the activities related to planning and operations, and coordinates activities of functional entities to secure the reliability of the Bulk Electric System within a Reliability Assurer area and adjacent areas”. Any revision to the definition of the Bulk Electric System could potentially expand or contract the ‘Reliability Assurer area’ which would have a direct effect on the responsibilities indentified in the Functional Model.</p>

**Summary Consideration:** Prior to the issuance of Order 743a, the SDT reviewed all of the provided material and used this material and the examples supplied in its consideration of the revised definition of the Bulk Electric System (BES). The goal of the SDT is to provide a bright-line definition of BES which adheres to the guidelines and directives in Order 743. This bright-line definition contains certain inclusions and exclusions for specific equipment and configurations. The SDT believes that this definition now answers many of the questions raised by industry and encompasses most of the examples provided. However, no bright-line definition will be able to capture all of the concerns or situations. Accordingly, and consistent with Order 743, another aspect of this project is to establish an exception process with criteria based on reliability principles for the Interconnected BES that will be incorporated in NERC’s Rules of Procedure (ROP) that will allow a process for the inclusion or exclusion of a particular BES Element from the definition. This ROP work effort will be done by a separate team but the DBESSDT will be in close coordination with that team.

**Question 1:**

If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:
- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).
- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

**Email: [JAGray3@dow.com](mailto:JAGray3@dow.com)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:

As discussed in the comments of The Dow Chemical Company (“Dow”) on the recommended definition of BES, the 100 kV standard is inapplicable to generation and should not be used to identify generation facilities that are included in the BES, or that are eligible for an exception or exclusion. Instead, the NERC Statement of Compliance

Registry Criteria already sets forth criteria for determining when individual generating units and generating plants/facilities are not part of the bulk electrical system. Those existing standards and the generator-specific registration determinations that have been made using those standards should be preserved.

Dow does not object to retaining a 100 kV standard for identifying transmission facilities that should be considered part of the BES, but exclusions must be made for distribution facilities and interconnection facilities. If owners and/or operators of such facilities are required to secure an “exception” or “exclusion” from the 100 kV standard, then such process must ensure that exceptions or exclusions are available before mandatory reliability standards become applicable.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).

For a manufacturing site, distribution facilities deliver electricity from the generating plants and or the transmission grid to the manufacturing plants. Interconnection facilities are generally identified by reference to the point of interconnection with the transmission grid. Facilities located on the generator’s side of this interconnection up to the site transformers are generally considered interconnection facilities while facilities located at or beyond the point of interconnection are generally considered transmission facilities.

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The NERC Statement of Compliance Registry Criteria excludes certain generating facilities, because these generating facilities are not material to the reliability of the BES. Distribution facilities are expressly excluded from the definition of BES pursuant to Section 215 of the Federal Power Act. Distribution facilities are typically operated differently from transmission facilities. As such,

distribution facilities should not be subject to the same reliability standards as transmission facilities. FERC has recognized that interconnection facilities may or may not be material to the reliability of the BES. As such, FERC has held that a facts-and-circumstances analysis should be used to determine whether and to what extent such facilities should be considered part of the BES and, therefore, subject to mandatory reliability standards. *See New Harquahala Generating Company, LLC, 123 FERC ¶ 61,173 at P 44 (2008), clarified, 123 FERC ¶ 61,311 (2008).*

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

#### Continent-wide

#### Comments relative to the proposed exclusion(s):

At minimum, the exclusions applicable to distribution facilities and interconnection facilities should apply to all facilities that are subject to FERC's reliability jurisdiction under Section 215 of the Federal Power Act.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:

This question refers to “exclusions”; we believe, however, that the intent of this comment form is to elicit feedback on the process for “exemptions.” It is important to distinguish between the two concepts, as FERC did in Order 743. *See, e.g., Paragraph 1, which refers to “maintain[ing] a bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities,” as well as to “establish[ing] an exemption process and criteria.” (emphasis added).* In other words, in brief, an “exclusion” is outside of the BES by definition, whereas exempt Elements are removed on a case-by-case basis by going through a process.

FMPA draws the distinction as follows:

An exclusion is the removal of a category of Elements from the BES definition. The current BES definition explicitly carves out radials serving only load with one transmission source. This is a clear example of an exclusion. There is no “exclusion process” now, nor should there be one in the future; the point of an exclusion is that the class of excluded Elements can—without any process—be treated like sub-100 kV transmission, in that they are presumed to be non-BES unless a particular Element is demonstrated, on a case-by-case basis, to be properly included in the BES (see responses to Questions 5 and 11 in FMPA’ comments on BES definition, submitted today, and FMPA response to Question 2 below).

An exemption, on the other hand, is a finding that a particular Element, although nominally part of the BES, does not need to be included in the BES because it is not necessary for operating an interconnected transmission network.

Because exemptions are less clear-cut than exclusions, each exemption of an Element needs to be approved by NERC so that the Registered Entity and compliance authorities have certainty about the Elements with respect to which compliance is required. In many, perhaps all, cases, this process will likely require a case-by-case examination of each Element for which an exemption is requested.

FMPA responds to this question with respect to the one “exclusion” from the BES definition that we advocate, that of radial Transmission Elements serving only load and/or generation not registered pursuant to the Statement of Compliance Registry Criteria. We also propose uniform criteria for deciding, on a case-by-case basis, whether to grant requested exemptions from the BES, or to include nominally non-BES Elements in the BES. The process that we propose for exemption requests and proposed inclusions is discussed below in response to the invitation of “[c]omments relative to the proposed exclusion(s).”

#### Exclusion:

FMPA proposes only one exclusion from the BES definition, namely, “Radial Transmission Elements serving only load with one Transmission source are generally not included in this definition. A radial Transmission Element may be considered as ‘serving only load’ for purposes of the foregoing general exclusion even if it connects generation, so long as that generation is not registered pursuant to the Statement of Compliance Registry Criteria.” This formulation, which is discussed in FMPA’ comments submitted today on the BES definition, is intended to preserve the current exclusion of radials serving only load with one transmission source, and to clarify that the presence of a generator that is not registered under the Compliance Registry Criteria does not convert a radial into a BES Element. The end result is that radial transmission is excluded unless it connects generation that is registered pursuant to the Statement of Compliance Registry Criteria. Consistent with the Compliance Registry Criteria, a single generator under 20 MVA, or a plant under 75 MVA, if not designated as a Blackstart Resource needed for system restoration, is unlikely to affect the grid. Therefore, the presence of such generation should not require that an otherwise non-BES radial be included in the BES. Rooftop photovoltaic cells, for example, are increasingly common. If FMPA’ proposed clarification is not accepted, the presence of such insignificant generation could nullify the exclusion of radials to load with one transmission source, with no benefit to reliability.

#### Exemption criteria

FMPA has not yet developed a list of criteria that we believe to be exhaustive, though we emphasize that such a list must be an ultimate goal of this process. We propose the following criteria as a start:

FMPA proposes that at least two classes of elements be eligible to request an exemption:

i. Elements that are part of a radial “system” originating from a single BES source serving only load, as in the Florida Keys. Clarifications: a) radial system means any number of series and/or parallel Elements as long as they all originate from a single BES source and do not have another BES source; b) “single BES source” means one BES bus / substation / switching substation at one voltage level, and c) consistent with FMPA’ proposed exclusion of radials serving only load and unregistered generation, “serving only load” includes serving generation that is not registered through the Statement of Compliance Registry Criteria.

ii. Elements that are part of a “looped” system that has two transmission sources primarily for local quality of service to the retail customers supplied by the looped system in question and is not used for bulk electric system flow (e.g., the transfer distribution factor of flows across the looped system is low, representing a high impedance path across the looped system). Specific criteria might be: a) a looped system that participate in less than a 5% of transfer (e.g., 5% or less transfer distribution factor); and b) that the looped system in question does not limit transfers.

A radial or looped system to be exempted must meet the following criteria:

1. The radial or looped system may not contribute to any Category D or C contingency resulting in: 1) a supply / demand mismatch greater than the largest loss of source contingency in the Reliability Coordinator area; or 2) an Adverse Reliability Impact where, if the Element were not involved in those Category D or C contingencies, those thresholds would not be exceeded.

Studies to determine whether this criterion is met would be conducted in accordance with TPL-004-0 and TPL 003-0 standards (or corresponding contingencies in revision to the TPL standards) in the Short Term Planning Horizon. Although the above criteria are acceptable responses to a Category D contingency, the concept of the test is to see if a radial or looped system would cause a significantly worse response to Category C or D contingencies by testing the contingency with and without the radial or looped system. FMPA believes that such criteria are good indicators that a radial or looped system should be included in the BES as it highlights whether the protection systems are important for critical clearing times, and whether the radial or looped systems can contribute to an Adverse Reliability Impact in combination with other contingencies;

2. No portion of the radial or looped system may meet any of the conditions of Attachment 1 to CIP-002-4;

3. No portion of the radial or looped system may meet any of the conditions listed in items B1 to B5 of Attachment B to PRC-023-2;

4. No portion of the radial or looped system may be a part of, or be a limiting element of, any Path, Interchange, or Flowgate used in the calculation of ATC in accordance with standards MOD-028, MOD 029 or MOD 030; and

5. No portion of the radial or looped system may include a blackstart resource or cranking path deemed significant to the TOP or RC restoration plans of EOP-005, EOP-006 or EOP-007.

If a Registered Entity demonstrates to NERC that an Element that is nominally in the BES meets *all* of these criteria, the exemption would be granted.

Conversely, if NERC demonstrates that a nominally non-BES Element meets the negative of *any* of these criteria (*e.g.*, if any portion of the radial or looped system meets any of the conditions of Attachment 1 to CIP-002-4 or of Attachment B to PRC-023-2), the Element would be included in the BES.

Throughout these comments, FMPA refers to “Elements” and not to “facilities.” This is because “Facility” is defined in the NERC Glossary as “[a] set of electrical equipment that operates as a single Bulk Electric System Element....” Because these comments (and the BES definition) address whether Elements are or are not part of the BES, it is incorrect to refer to the Elements in question as “Facilities,” because a Facility is defined as a *BES* Element.

In developing the exemption/inclusion criteria and process, NERC and the SDT should bear in mind the requirement of Order 743: “NERC should develop an exemption process that includes *clear, objective, transparent, and uniformly applicable* criteria for exemption of facilities that are *not necessary for operating the grid.*” Paragraph 115 (emphasis added). NERC and the SDT should also bear in mind that FERC anticipates that between the BES definition and the exemption process, there will be only “minimal[]” effect on “small entities.” Order 743, Paragraph 169. Order 743 is referring to the Small Business Act definition of a “small electric utility” as one that has a total electric output of less than four million MWh in the preceding year. *See* BES NOPR, 133 FERC ¶ 61,150, Paragraph 35 & footnote 50.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** Radial Transmission Elements serving only load have been recognized for years as non-BES because such Elements are very unlikely to affect the BES. FERC stated in Order 743 that NERC may retain that exclusion.

Similarly, generators under 20 MVA and generating plants under 75 MVA are not subject to registration pursuant to the Statement of Compliance Registry Criteria, which has been accepted by FERC, because of the recognition that such generators are very unlikely to affect the BES. It is thus consistent with the Compliance Registry Criteria to exclude from the BES definition radials serving load with one

transmission source even if there is some generation on the radial, so long as none of the generation is registered. If the generation is not significant enough to be registered, it is not significant enough to transform an otherwise non-BES radial to load into a BES Element.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

### **Continent-wide**

The exclusion of radials to load and unregistered generation, as part of the BES definition, should apply on a continent-wide basis.

Each Element proposed for exemption or inclusion should be considered individually, under the same criteria (proposed above), applied uniformly continent-wide.

### **Comments relative to the proposed exclusion(s):**

#### Exemption and Inclusion Processes:

The exemption and inclusion processes should be designed to ensure continent-wide uniformity to the maximum extent possible. To that end, NERC must use a uniform process; the criteria for approving or denying an exemption, or for including an Element in the BES, must be clear; and entities must be able to appeal decisions to another body within NERC or to FERC.

In order to obtain an exemption, a Registered Entity should be required to demonstrate that the Element for which it is requesting an exemption is not "necessary for operating an interconnected electric transmission network." This is the standard set out in Order 743; it is also part of the definition of the "bulk-power system" in Section 215 of the Federal Power Act, 16 U.S.C. § 824o(a)(1)(A) (the other part of the statutory definition is "electric energy from generation facilities needed to maintain transmission system reliability," 16 U.S.C. § 824o(a)(1)(B)). Application of this standard should be informed by the statutory definitions of "reliability standard" ("a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system") and "reliable operation" ("operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements").

Conversely, to include a nominally non-BES Element in the BES, NERC should be required to demonstrate that the Element *is* necessary for operating an interconnected electric transmission network.

Criteria for determining whether an Element is or is not “necessary for operating an interconnected electric transmission network” are proposed in response to Question 1(a) above. The criteria should be uniform continent-wide, though they will be applied to each Element on a case-by-case basis.

Exemption requests and proposed inclusions should be decided by NERC staff in the first instance. FMPA does not believe that the exemption and inclusion processes should be delegated to the Regional Entities. In Order 743, FERC emphasized the need for continent-wide uniformity; in fact, it was inconsistency among regions that prompted Order 743. FMPA members’ experience with Regional registration processes suggests that Regional implementation of the BES exemption and inclusion processes is unlikely to yield the uniformity that FERC directed. Furthermore, implementing this FERC directive will unavoidably require significant personnel resources, either at NERC or at the Regions. Delegating the process to the Regions would impose additional costs due to the need for NERC to exercise strong oversight to attempt to maintain uniformity. It may be that after the exemption and inclusion processes have been in place for a few years and a body of precedent has been accumulated, delegation will be appropriate. At this time, however, NERC staff should make the initial decision on all exemption requests and proposed inclusions.

FMPA proposes, for the sake of consistency with the registration appeal process, that appeals of decisions on exemptions and inclusions be to the Board of Trustees Compliance Committee (BOTCC), with further appeals to FERC if necessary. Appeals to the BOTCC would consist of the record compiled by NERC Staff, and additional paper submissions by NERC Staff and the Registered Entity demonstrating why the Element(s) in question is or is not “necessary for operating an interconnected electric transmission network.” *See* NERC Rules of Procedure, Appendix 5A, “Organization Registration and Certification Manual,” at 14-16. Registered Entities should have the option of requesting a hearing. Hearing procedures could be modeled on the Compliance and Certification Committee’s “Hearing Procedures for Use in Appeals of Certification Matters,” in Appendix 4E of the NERC Rules of Procedure.

FMPA also suggests that decisions on exemptions and inclusions be made available to others, either subject to CEII protection or in a form suitable for public release. As precedent develops, Registered Entities will increasingly be able to judge for themselves the likelihood that a particular exemption will be granted, or that an appeal of an inclusion will succeed. We expect that giving Registered Entities more information on which to base their decisions will significantly reduce the burden on NERC of processing exemptions and inclusions.

We propose that BES Elements for which an exemption request is pending should continue to be included in the BES until the exemption and any appeals are decided,

and that non-BES Elements for which an inclusion is pending should continue to be non-BES until the inclusion and any appeals are decided.

The transition process should include an important exception to the general rule proposed for BES status during the pendency of an exemption request: to allow for a smooth transition, to the extent that Elements that are currently considered non-BES become BES under the new definition, those Elements should be permitted to request exemptions and to continue to be considered non-BES until their exemption requests and any appeals are decided.

**Email: [joshd@glacierelectric.com](mailto:joshd@glacierelectric.com)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: Our delivery point, which is a loop-fed 115kV switching station.
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
  - c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** This station's main purpose is to be a delivery point for our system. We are a distribution cooperative that serves mainly residential and small commercial loads. Each year we peak around 35 MW and average around 22 MW. This station is loop fed by two 115 kV lines to give our members more reliability. No transmission planner, balancing authority, transmission operator, reliability coordinator, etc. has included this station in any critical path lists or system restoration plans. This station is not designated as critical asset by its balancing authority or transmission operator. The available short-circuit MVA at this station is 677 MVA. If a fault were to occur at this station, outages would be limited to the local area and the BES as a whole would not be adversely affected at all. It is our belief that facilities such as this are insignificant to the BES and do not need to be considered part of the BES.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

- 1.** If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a.** Identify the Element or Facility recommended for exclusion: [The transmission lines dedicated to serve the native load in the Quebec Interconnection.](#)

**Guy Zito, Northeast Power Coordinating Council**

**Telephone: 212-840-1070**

**Email: [gzito@npcc.org](mailto:gzito@npcc.org)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

a. Identify the Element or Facility recommended for exclusion:

All step-down transformers with their low-side terminals operated at below 100 kV.

Radial taps from a BES feeder or bus connection to loads. All elements or facilities in series with excluded or exempt elements or facilities -- upstream to a designated point-of-demarcation with the BES and downstream to the customer meter or interconnection. (Refer to the response to Question 3, New York Indicator [NY-2] below, and the response to Question 13, proposed definition 'Point-of-Demarcation' in the BES Definition Comments provided separately). For example, upstream from an exempt or excluded feeder to the upstream-side of the disconnect switch connecting the excluded or exempted feeder to the BES, or if no disconnect switch is present, to the upstream BES supply-bus connection. This exclusion or exemption would extend to and also apply to related equipment, such as circuit switchers, circuit breakers, ground switches, disconnect switches, busses, etc. that are down-stream of the point-of-demarcation and in the same circuit with the exempted or excepted feeders and transformers.

Local generation and any facility associated with local generation serving as a load modifier to local load only. The power generated is demonstrated to be consumed locally and does not flow back into the BES. The operation (or loss) of the local generation and/or associated facilities does not materially impact any BES transmission facilities. If a local generator functions as a load modifier, and does not materially impact the BES, meaning that it is not necessary to maintain BES reliability, then it should be excluded from the definition of BES under the BES Exclusion process.

The transmission lines dedicated to serve the native load in the Quebec Interconnection.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). **Not Applicable**
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The FERC Seven Factor test has been shown to be a reliable, repeatable method for identifying facilities that are local distribution and separating

them from those facilities which perform a transmission function. The indicators of local distribution in the Commission’s seven-factor test<sup>1</sup> are:

- 1) Local distribution facilities are normally in close proximity to retail customers;
- 2) Local distribution facilities are primarily radial in character;
- 3) Power flows into local distribution systems, and rarely, if ever flows out;
- 4) When power enters a local distribution system, it is not reconsigned or transported on to some other market;
- 5) Power entering a local distribution system is consumed in a comparatively restricted geographic area;
- 6) Meters are based at the transmission / local distribution interface to measure flow into the local distribution system; and
- 7) Local distribution systems will be of reduced voltage.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion: [Radial Transmission Elements and Systems - See comment below](#)

**Comments relative to the proposed exclusion(s):** [Radial Transmission Elements and Systems should be excluded from the Elements and Facilities classified as part of the BES but a clear NERC definition of radial is required to prevent misunderstandings and misapplications of the BES definition and exemption process. Also, there should be no regional differences in the BES definition or in the BES definition exemption process.](#)

**John W. Delucca, Lee County Electric Cooperative**

**Telephone: 239-656-2190**

**Email: [john.delucca@lcec.net](mailto:john.delucca@lcec.net)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: [Radial load serving elements that do not have an adverse effect upon the BES should be excluded. Also Transmission systems that have no adverse impact on the BES as evidenced by engineering design and criteria and load modeling should be excluded such as Non-FERC Jurisdictional Facilities; Radial Non-Transmission Load Serving Elements; Looped Non-Transmission Load Serving Elements; Looped Non-Transmission Load Serving Elements Designed & Installed with No Intent to Provide Transmission Load Service.](#)
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). [Please refer to Attachment 1b.6 – 1b.9 the draft BES Definition currently under review in the FRCC region. There are multiple single-lines included that represent a fair cross section of elements that should be excluded.](#)
  - c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** [The purpose of including facilities in the definition of BES is make them subject to federal regulations that are designed to serve the reliability needs of the BES and to prevent cascading of outages to a broad section of the BES. Certain elements operated at voltages of 100kV or higher have zero measurable impact to the reliable operation of the Interconnected BES. No practical purpose is served by including those elements, and if they are, it unnecessarily increases the cost of delivered power. The following list also should be considered, a\) No FERC Jurisdiction; b\) Facilities were/are designed, installed, and operated to serve local non-transmission loads; c\) Rates are designed to provide revenue to meet local non-transmission service; d\) Facilities were never designed or intended to provide capability of entity-to-entity, region-to-region load flows other than that required to meet local non-transmission service loads; e\) Reactance resources whose purpose is neutralizing non-transmission inductive loads and/or to compensate for “within entity” losses.](#)

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, “unknown.”

[Continent-wide](#)

**Comments relative to the proposed exclusion(s):** The submitted diagrams are not intended to represent every possible element that should be excluded Continent-wide. The complete list should be determined by the proposed task force in order that regional differences in system characteristics is taken into account. In addition, to insure continuity, but the final decision as to what meets the exclusion criteria should reside in the Region with appeal process to NERC and possibly FERC.

X Continent-wide

X Interconnection-wide

X Region-wide

**Comments relative to the proposed exclusion(s):** **The Bulk Electric System (BES) functions to generate bulk power and transfer that bulk power to locations from which it is then distributed to end-use load. Elements that generate bulk power, transfer bulk power, or support the transfer of bulk power are part of the BES.**

An element is necessary to reliably operate an interconnected transmission system if it significantly affects the ability of the BES to generate bulk power or carry bulk power to locations from which it is distributed to end-use load. While operating voltage (i.e. the proposed 100kV bright-line) may be a clear and repeatable proxy for identifying those elements that are necessary to reliably operate an interconnected transmission system, it is a broad approach that may not adequately address specific examples. Engineering studies can be used to more granularly and accurately identify elements which are not needed to reliably operate an interconnected transmission system.

The thresholds on the indicators listed above may vary between interconnections and regions. For example, SCE's system has facilities rated at the 115kV level that are radial in nature for load serving purposes. Therefore, applying a 100kV bright-line may unnecessarily bring facilities that could be excluded through an engineering study.

**Email: [mrobledo@anaheim.net](mailto:mrobledo@anaheim.net)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: [City of Anaheim Lewis-Vermont 230kV radial transmission line and seven 230kV to 69kV transformer banks and associated substation equipment, which are also radial transmission elements serving load.](#)
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). **Refer to attachments:**
    - 1b.1 [Anaheim System One-Line,](#)
    - 1b.2 [Anaheim 220kV System,](#)
    - 1b.3 [Anaheim 69kV Bus Impedance Diagram](#)
  - c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** [The 220kV facilities owned and operated by Anaheim are radial transmission elements fed from one transmission source, i.e. Lewis Substation. Southern California Edison Company \(SCE\) and the California Independent System Operator \(CAISO\) are the TO/TOPs for the interconnection of Lewis Substation to the BES, including the protection system that de-energizes both Anaheim buses using SCE owned breakers without interrupting any BES transmission lines. The 220kV system owned and operated by the City of Anaheim is radial to the BES at Lewis Substation and feeds a 69kV sub-transmission system through three 220kV/69kV transformer banks. Anaheim is able to reliably serve 100% of its load using only three of the four banks at Lewis; however, to improve reliability within Anaheim, in 2008 Anaheim built a redundant substation \(Vermont Substation\) 1.5 miles from Lewis, which is connected via a 220kV transmission line. This line is not needed to maintain BES or Anaheim system reliability because it is in parallel with four \(4\) 69kV lines, which also connect Lewis to Vermont. Its only purpose is to provide backup transformation should there be a catastrophic failure of the Lewis transformer banks. Pursuant to an SCE-Anaheim operating order only three transformer banks may be in service at any time to limit short circuit duty, so the banks at Vermont are truly redundant.](#)

[Transmission elements serving radial load, radial distribution systems, or non-GO/GOP generation connected to such radial lines and excluded from BES. To eliminate reliability gaps, such radial transmission elements should be classified as "Distribution" equipment subject to DP standards, and the PRC and vegetation management standards should be made applicable to Distribution Providers and this equipment. This is consistent with the](#)

NERC Reliability Functional Model and is more efficient than requiring TO/TOP registration for radial transmission facilities that function as Distribution and are not required for the reliable operation of the BES.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:

All step-down transformers with their low-side terminals operated at below 100 kV. Radial taps from a BES feeder or bus connection to loads. All elements or facilities in-series with excluded or exempt elements or facilities -- upstream to a designated point-of-demarkation with the BES and downstream to the customer meter or interconnection. For example, upstream from an exempt or excluded feeder to the upstream-side of the disconnect switch connecting the excluded or exempted feeder to the BES, or if no disconnect switch is present, to the upstream BES supply-bus connection. This exclusion or exemption would extend to and also apply to related equipment, such as circuit switchers, circuit breakers, ground switches, disconnect switches, busses, etc. that are down-stream of the point-of-demarkation and in the same circuit with the exempted or excepted feeders and transformers.

Local generation and any facility associated with local generation serving as a load modifier to local load only. The power generated is demonstrated to be consumed locally and does not flow back into the BES. The operation (or loss) of the local generation and/or associated facilities does not materially impact any BES transmission facilities. If a local generator functions as a load modifier, and does not materially impact the BES, meaning that it is not necessary to maintain BES reliability, then it should be excluded from the definition of BES under the BES Exclusion process.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).

Not Applicable

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The FERC Seven Factor test has been shown to be a reliable, repeatable method for identifying facilities that are local distribution and separating them from those facilities which perform a transmission function. The indicators of local distribution in the Commission's seven-factor test<sup>2</sup> are:

- 1) Local distribution facilities are normally in close proximity to retail customers;
- 2) Local distribution facilities are primarily radial in character;
- 3) Power flows into local distribution systems, and rarely, if ever flows out;
- 4) When power enters a local distribution system, it is not reconsigned or transported on to some other market;
- 5) Power entering a local distribution system is consumed in a comparatively restricted geographic area;
- 6) Meters are based at the transmission / local distribution interface to measure flow into the local distribution system; and
- 7) Local distribution systems will be of reduced voltage.

<sup>1</sup> Ref. FERC Order No. 888 at 31,771 and 31,981, e.g., *Promoting Wholesale Competition Through Open Access Non-Discriminatory Transmission Services by Public Utilities*

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for exclusion: **Radial facilities and elements operating at or above 100 kV, that are connected to only load serving facilities operated at distribution voltage levels and that include a high side circuit breaker or circuit switcher should be excluded from the BES classification. While protective systems themselves are not by default part of the BES, nor should they be classified as a BES element, the breaker failure schemes associated with the high side circuit breaker or circuit switcher are part of a Protection System and should comply with the appropriate standards.**
  - b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** Facilities such as that described in 1.a. are designed to support only one way power flow; from the BES to the load. Operation of the high side circuit breaker or circuit switcher, Device A, removes the transformer from service interrupting power flow to the load but will not interrupt power flow on the BES nor effect reliability of the BES. While protective systems themselves are not by default

part of the BES, nor should they be classified as a BES element, the breaker failure scheme associated with Device A has the potential of interrupting BES power flow by clearing Bus 1. For this reason, the breaker failure scheme is part of a Protection System and should comply with the appropriate standards.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

<sup>3</sup> On November 6, 2009, EDF, Inc. (“EDF”) and Constellation Energy Group, Inc. completed a transaction pursuant to which EDF acquired a 49.99 percent ownership interest in CENG. CENG was previously a wholly owned subsidiary of Constellation Energy Group, Inc.

**Comments relative to the proposed exclusion(s):**

As described in RFC's BES definition, the following elements should be excluded:

- (1) radial facilities connected to load serving facilities or individual generation resources smaller than 20 MVA or a generation plant with aggregate capacity less than 75 MVA where the failure of the radial facilities will not adversely affect the reliable steady-state operation of other facilities operated at voltages of 100 kV or higher and
- (2) balance of generating plant control and operation functions (other than protection systems that directly control the unit itself and step-up transformer); these facilities would include relays and systems that automatically trip a unit for boiler, turbine, environmental, and/or other plant restrictions, and
- (3) all other facilities operated at voltages below 100 kV.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages 100kV and above which should be considered for exclusion from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion:

This question refers to “exclusions”; we believe, however, that the intent of this comment form is to elicit feedback on the process for “exemptions.” It is important to distinguish between the two concepts, as FERC did in Order 743. *See, e.g.*, Paragraph 1, which refers to “maintain[ing] a bright-line threshold that includes all facilities operated at or above 100 kV *except defined radial facilities*,” as well as to “establish[ing] an exemption process and criteria” (emphasis added). In other words, in brief, an “exclusion” is outside of the BES by definition, whereas exempt Elements are removed on a case-by-case basis by going through a process.

TAPS draws the distinction as follows:

An exclusion is the removal of a category of Elements from the BES definition. The current BES definition explicitly carves out radials serving only load with one transmission source. This is a clear example of an exclusion. There is no “exclusion process” now, nor should there be one in the future; the point of an exclusion is that the class of excluded Elements can—without any process—be treated like sub-100 kV transmission, in that they are presumed to be non-BES unless a particular Element is demonstrated, on a case-by-case basis, to be properly included in the BES (*see* responses to Questions 5 and 11 in TAPS’ comments on BES definition, submitted today, and TAPS response to Question 2 below).

An exemption, on the other hand, is a finding that a particular Element, although nominally part of the BES, does not need to be included in the BES because it is not necessary for operating an interconnected transmission network.

Because exemptions are less clear-cut than exclusions, each exemption of an Element needs to be approved by NERC so that the Registered Entity and compliance authorities have certainty about the Elements with respect to which compliance is required. In many, perhaps all, cases, this process will likely require a case-by-case examination of each Element for which an exemption is requested.

TAPS responds to this question with respect to the one “exclusion” from the BES definition that we advocate, that of radial Transmission Elements serving only load and/or generation not registered pursuant to the Statement of Compliance Registry Criteria. We also propose uniform criteria for deciding, on a case-by-case

basis, whether to grant requested exemptions from the BES, or to include nominally non-BES Elements in the BES. The process that we propose for exemption requests and proposed inclusions is discussed below in response to the invitation of “[c]omments relative to the proposed exclusion(s).”

Exclusion:

TAPS proposes only one exclusion from the BES definition, namely, “Radial Transmission Elements serving only load with one Transmission source are generally not included in this definition. A radial Transmission Element may be considered as ‘serving only load’ for purposes of the foregoing general exclusion even if it connects generation, so long as that generation is not registered pursuant to the Statement of Compliance Registry Criteria.” This formulation, which is discussed in TAPS’ comments submitted today on the BES definition, is intended to preserve the current exclusion of radials serving only load with one transmission source, and to clarify that the presence of a generator that is not registered under the Compliance Registry Criteria does not convert a radial into a BES Element. The end result is that radial transmission is excluded unless it connects generation that is registered pursuant to the Statement of Compliance Registry Criteria. Consistent with the Compliance Registry Criteria, a single generator under 20 MVA, or a plant under 75 MVA, if not designated as a Blackstart Resource needed for system restoration, is unlikely to affect the grid. Therefore, the presence of such generation should not require that an otherwise non-BES radial be included in the BES. Rooftop photovoltaic cells, for example, are increasingly common. If TAPS’ proposed clarification is not accepted, the presence of such insignificant generation could nullify the exclusion of radials to load with one transmission source, with no benefit to reliability.

Exemption criteria

TAPS has not yet developed a list of criteria that we believe to be exhaustive, though we emphasize that such a list must be an ultimate goal of this process. We propose the following criteria as a start:

TAPS proposes that at least two classes of facilities be eligible to request an exemption:

- i. Elements that are part of a radial “system” originating from a single BES source serving only load, as in the Florida Keys. Clarifications: a) radial system means any number of series and/or parallel Elements as long as they all originate from a single BES source and do not have another BES source; b) “single BES source” means one BES bus / substation / switching substation at one voltage level, and c) consistent with TAPS’ proposed exclusion of radials serving only load and unregistered generation, “serving only load” includes serving generation that is not registered through the Statement of Compliance Registry Criteria.

ii. Elements that are part of a “looped” system that has two transmission sources primarily for local quality of service to the retail customers supplied by the looped system in question and is not used for bulk power system flow (*e.g.*, the transfer distribution factor of flows across the looped system is low, representing a high impedance path across the looped system). Specific criteria might be: a) a looped system that participates in less than a 5% of transfer (*e.g.*, 5% or less transfer distribution factor); and b) that the looped system in question does not limit transfers.

A radial or looped system to be exempted must meet the following criteria:

1. The radial or looped system may not contribute to any Category D or C contingency resulting in: 1) a supply / demand mismatch greater than the largest loss of source contingency in the Reliability Coordinator area; or 2) an Adverse Reliability Impact where, if the Element were not involved in those Category D or C contingencies, those thresholds would not be exceeded.

Studies to determine whether this criterion is met would be conducted in accordance with TPL-004-0 and TPL-003-0 standards (or corresponding contingencies in revision to the TPL standards) in the Short Term Planning Horizon. Although the above criteria are acceptable responses to a Category D contingency, the concept of the test is to see if a radial or looped system would cause a significantly worse response to Category C or D contingencies by testing the contingency with and without the radial or looped system. TAPS believes that such criteria are good indicators that a radial or looped system should be included in the BES as it highlights whether the protection systems are important for critical clearing times, and whether the radial or looped systems can contribute to an Adverse Reliability Impact in combination with other contingencies;

2. No portion of the radial or looped system may meet any of the conditions of Attachment 1 to CIP-002-4;

3. No portion of the radial or looped system may meet any of the conditions listed in items B1 to B5 of Attachment B to PRC-023-2;

4. No portion of the radial or looped system may be a part of, or be a limiting element of, any Path, Interchange, or Flowgate used in the calculation of ATC in accordance with standards MOD-028, MOD-029 or MOD-030; and

5. No portion of the radial or looped system may include a Blackstart Resource or cranking path deemed significant to the TOP or RC restoration plans of EOP-005, EOP-006 or EOP-007.

If a Registered Entity demonstrates to NERC that an Element that is nominally in the BES meets *all* of these criteria, the exemption would be granted.

Conversely, if NERC demonstrates that a nominally non-BES Element meets the negative of *any* of these criteria (e.g., if any portion of the radial or looped system meets any of the conditions of Attachment 1 to CIP-002-4 or of Attachment B to PRC-023-2), the Element would be included in the BES.

Throughout these comments, TAPS refers to “Elements” and not to “facilities.” This is because “Facility” is defined in the NERC Glossary as “[a] set of electrical equipment that operates as a single Bulk Electric System Element...” Because these comments (and the BES definition) address whether Elements are or are not part of the BES, it is incorrect to refer to the Elements in question as “Facilities,” because a Facility is defined as a *BES* Element.

In developing the exemption/inclusion criteria and process, NERC and the SDT should bear in mind the requirement of Order 743: “NERC should develop an exemption process that includes *clear, objective, transparent, and uniformly applicable* criteria for exemption of facilities that are *not necessary for operating the grid.*” Paragraph 115 (emphasis added). NERC and the SDT should also bear in mind that FERC anticipates that between the BES definition and the exemption process, there will be only “minimal[]” effect on “small entities.” Order 743, Paragraph 169. Order 743 is referring to the Small Business Act definition of a “small electric utility” as one that has a total electric output of less than four million MWh in the preceding year. *See* March 18, 2010 BES Notice of Proposed Rulemaking, Paragraph 35 & footnote 50.

- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available).
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** Radial Transmission Elements serving only load have been recognized for years as non-BES because such Elements are very unlikely to affect the BES. FERC stated in Order 743 that NERC may retain that exclusion.

Similarly, generators under 20 MVA and generating plants under 75 MVA are not subject to registration pursuant to the Statement of Compliance Registry Criteria, which has been accepted by FERC, because of the recognition that such generators are very unlikely to affect the BES. It is thus consistent with the Compliance Registry Criteria to exclude from the BES definition radials serving load with one transmission source even if there is some generation on the radial, so long as none of the generation is registered. If the generation is not significant enough to be registered, it is not significant enough to transform an otherwise non-BES radial to load into a BES Element.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

Continent-wide

The exclusion of radials to load and unregistered generation, as part of the BES definition, should apply on a continent-wide basis.

Each Element proposed for exemption or inclusion should be considered individually, under the same criteria (proposed above), applied uniformly continent-wide.

**Comments relative to the proposed exclusion(s):**

Exemption and Inclusion Processes:

The exemption and inclusion processes should be designed to ensure continent-wide uniformity to the maximum extent possible. To that end, NERC must use a uniform process; the criteria for approving or denying an exemption, or for including an Element in the BES, must be clear; and entities must be able to appeal decisions to another body within NERC or to FERC.

In order to obtain an exemption, a Registered Entity should be required to demonstrate that the Element for which it is requesting an exemption is not “necessary for operating an interconnected electric transmission network.” This is the standard set out in Order 743 (*e.g.*, Paragraph 1); it is also part of the definition of the “bulk-power system” in Section 215 of the Federal Power Act, 16 U.S.C. § 824o(a)(1)(A). Application of this standard should be informed by the statutory definitions of “reliability standard” (“a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system,” 16 U.S.C. § 824o(a)(3)) and “reliable operation” (“operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements,” 16 U.S.C. § 824o(a)(4)).

Conversely, to include a nominally non-BES Element in the BES, NERC should be required to demonstrate that the Element *is* necessary for operating an interconnected electric transmission network.

Criteria for determining whether an Element is or is not “necessary for operating an interconnected electric transmission network” are proposed in response to Question 1(a) above. The criteria should be uniform continent-wide, though they will be applied to each Element on a case-by-case basis.

Exemption requests and proposed inclusions should be decided by NERC staff in the first instance. TAPS does not believe that the exemption and inclusion processes should be delegated to the Regional Entities. In Order 743, FERC emphasized the need for continent-wide uniformity; in fact, it was inconsistency among regions that

prompted Order 743. TAPS members' experience with Regional registration processes suggests that Regional implementation of the BES exemption and inclusion processes is unlikely to yield the uniformity that FERC directed. Furthermore, implementing this FERC directive will unavoidably require significant personnel resources, either at NERC or at the Regions. Delegating the process to the Regions would impose additional costs due to the need for NERC to exercise strong oversight to attempt to maintain uniformity. It may be that after the exemption and inclusion processes have been in place for a few years and a body of precedent has been accumulated, delegation will be appropriate. At this time, however, NERC staff should make the initial decision on all exemption requests and proposed inclusions.

TAPS proposes, for the sake of consistency with the registration appeal process, that appeals of decisions on exemptions and inclusions be to the Board of Trustees Compliance Committee (BOTCC), with further appeals to FERC if necessary. Appeals to the BOTCC would consist of the record compiled by NERC Staff, and additional paper submissions by NERC Staff and the Registered Entity demonstrating why the Element(s) in question is or is not "necessary for operating an interconnected electric transmission network." See NERC Rules of Procedure, Appendix 5A, Organization Registration and Certification Manual at 14-16. Registered Entities should have the option of requesting a hearing. Hearing procedures could be modeled on the Compliance and Certification Committee's "Hearing Procedures for Use in Appeals of Certification Matters," in Appendix 4E of the NERC Rules of Procedure.

TAPS also suggests that decisions on exemptions and inclusions be made available to others, either subject to CEII protection or in a form suitable for public release. As precedent develops, Registered Entities will increasingly be able to judge for themselves the likelihood that a particular exemption will be granted, or that an appeal of an inclusion will succeed. We expect that giving Registered Entities more information on which to base their decisions will significantly reduce the burden on NERC of processing exemptions and inclusions.

We propose that BES Elements for which an exemption request is pending should continue to be included in the BES until the exemption and any appeals are decided, and that non-BES Elements for which an inclusion is pending should continue to be non-BES until the inclusion and any appeals are decided.

The transition process should include an important exception to the general rule proposed for BES status during the pendency of an exemption request: to allow for a smooth transition, to the extent that Elements that are currently considered non-BES become BES under the new definition, those Elements should be permitted to request exemptions and to continue to be considered non-BES until their exemption requests and any appeals are decided.

**1.** If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

**a.** Identify the Element or Facility recommended for exclusion:

- Radial lines
- Local distribution networks, generators, generation plants, loads, transformers, reactive devices, and protection and control system found to not cause adverse reliability impacts on neighboring bulk system Elements and Facilities using a performance-based exclusion process.

**b.** Provide a generic one-line diagram depicting the Element or Facility in question (if available).

Assuming FERC continues to insist upon a 100kV “bright line” definition, we support a process to exclude systems operating at 100kV and above that do not cause adverse reliability impacts on the neighboring bulk transmission system. For facilities operating at 100kV or above, the exclusion process should allow exclusion of those elements that, using a performance-based assessment, are demonstrated to operate without causing adverse reliability impacts on neighboring bulk system.

- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The ultimate goal of the Reliability Standards process should be to achieve reliable operation of the bulk transmission system, as defined by Congress. The term “reliable operation” was a term specifically defined in FPA Section 215 to include standards assuring the operation of bulk transmission system elements “within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance. . . or unanticipated failure of system elements.” 16 U.S.C. § 825o(a)(4). Congress specifically precluded the mandatory reliability system from enforcing standards for adequacy of service, which were left to state and local authorities. 16 U.S.C. § 825o(i)(2).

Recognizing that Congress intended the mandatory reliability regime to focus on thermal, voltage, and stability limits on the bulk system rather than more generally on levels of service to retail customers, the Standards Development Team should define the Bulk Electric System to include only those facilities whose failure or mis-operation meaningfully threatens to produce instability, uncontrolled separation, or cascading failures on the bulk system. As a legal matter, expanding the definition to include local distribution facilities and facilities that do not threaten thermal, voltage or stability impacts on the bulk system exceeds the permissible scope of NERC Reliability Standards and FERC authority under FPA Section 215. As a practical matter, mandating adherence to Reliability Standards for facilities, or equipment, that do not cause adverse reliability impacts on the neighboring bulk system is a significant diversion of funds and resources that will produce little or no benefits in terms of improved reliability of the bulk system.

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

Continent-wide

Interconnection-wide

**Comments relative to the proposed exclusion(s):** The WECC Bulk Electric System Definition Task Force (“BESDTF”) has carefully considered and provided an extensive record of technical support for excluding Radial Facilities and Local Distribution Networks from the BES. While we recognize that physical differences between the electric system in WECC and other reliability regions may justify different approaches in those regions, we commend the work of the BESDTF to the standard drafting team.

**Email: [jdmartinsen@snopud.com](mailto:jdmartinsen@snopud.com)**

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

a. Identify the Element or Facility recommended for exclusion:

- Radial lines
- Local distribution networks, generators, generation plants, loads, transformers, reactive devices, and protection and control system found to not cause adverse reliability impacts on neighboring bulk system Elements and Facilities using a performance-based exclusion process.

b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). Assuming FERC continues to insist upon a 100-kV “bright line” definition, SNPD supports a process to exclude systems operating at 100 kV and above that do not cause adverse reliability impacts on the neighboring bulk transmission system. For facilities operating at 100 kV or above, the exclusion process should allow exclusion of those elements that, using a performance-based assessment, are demonstrated to operate without causing adverse reliability impacts on neighboring bulk system.

Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** The ultimate goal of the Reliability Standards process should be to achieve reliable operation of the bulk transmission system, as defined by Congress. The term “reliable operation” was a term specifically defined in FPA Section 215 to include standards assuring the operation of bulk transmission system elements “within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance. . . or unanticipated failure of system elements.” 16 U.S.C. § 824o(a)(4). Congress specifically precluded the mandatory reliability system from enforcing standards for adequacy of service, which were left to state and local authorities. 16 U.S.C. § 824o(i)(2).

Recognizing that Congress intended the mandatory reliability regime to focus on thermal, voltage and stability limits on the bulk system rather than more generally on levels of service to retail customers, the Standards Development Team should define the Bulk

Electric System to include only those facilities whose failure or mis-operation meaningfully threatens to produce instability, uncontrolled separation, or cascading failures on the bulk system. As a legal matter, expanding the definition to include local distribution facilities and facilities that do not threaten thermal, voltage or stability impacts on the bulk system exceeds the permissible scope of NERC Reliability Standards and FERC authority under FPA Section 215. As a practical matter, mandating adherence to Reliability Standards for facilities that do not cause adverse reliability impacts on the neighboring bulk system is a significant diversion of funds and resources that will produce little or no benefits in terms of improved reliability of the bulk system.

- c. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this exclusion should apply, please select, "unknown."

Continent-wide

Interconnection-wide

**Comments relative to the proposed exclusion(s):** The WECC Bulk Electric System Definition Task Force ("BESDTF") has carefully considered and provided an extensive record of technical support for excluding Radial Facilities and Local Distribution Networks from the BES. While we recognize that physical differences between the electric system in WECC and other reliability regions may justify different approaches in those regions, we commend the work of the BESDTF to the standard drafting team.

1. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **100kV and above** which should be considered for **exclusion** from the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for exclusion: [All the SS\\_ 115 kV buses in the attached one-lines as well as the connecting lines should be excluded from consideration since they are radial serving load. Additional facilities may be put through the exclusion process, and excluded if shown not to be needed for “reliable operation” as defined in 16 U.S.C. § 824o\(a\)\(4\).](#)
- b. Provide a generic one-line diagram depicting the Element or Facility in question (if available). [Refer to Attachment 1b.10 & 1b.11](#)
- c. Provide a technical justification for the exclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** [These SS\\_ facilities in the diagram are operated radially and are used to distribute energy locally. The FPA specifically excludes “facilities used in the local distribution of electric energy” \(16 U.S.C. § 824o\(a\)\(1\)\) and prohibits FERC from enforcing standards for adequacy of service \(16 U.S.C. § 824o\(i\)\(2\)\). In addition, any faults or failures in these facilities will only affect the local area, and not cause instability, uncontrolled separation, or cascading outages \(16 U.S.C. § 824o\(a\)\(4\)\). These facilities should be excluded by inspection, and should not be required to go through an exemption process.](#)

- d. Identify if this exclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this exclusion should apply, please select, “unknown.”

[X Continent-wide](#)

**Comments relative to the proposed exclusion(s):** [The two diagrams illustrate the overreaching approach that WECC is presently using. Documents on the RFC web site prove that the WECC approach is not at all universal.](#)

[The SS2 bus is presently considered by WECC to be BES because it has two transmission sources, NON-RADIAL SUB 1 and NON-RADIAL SUB 3, even though the K9-5 at SS3 is normally open. WECC considers any possible second source regardless of the system is operated. Any faults at SS3 or in the supplying lines will result only in a local outage. We hope the SDT will consider actual operating conditions when it defines “radial” and “one transmission source.”](#)

The 115 kV bus at SS6 is considered by WECC to be BES because it has two transmission sources, one by way of NON-RADIAL SUB 4 and the other by way of NON-RADIAL SUB 5 (off the one-line to the right). We don't think that is what NERC meant by "transmission source." A fault on the SS6 bus would result in a local outage affecting only the four substations tapped off the NON-RADIAL SUB 4/SUB 5 line. We assume that if the risk of such an outage was unacceptable, the serving transmission company would have required protection at the tap points. We hope the SDT will properly clarify what is meant by a transmission source.

All the SS 115 kV buses shown also have multiple transmission sources by way of normally open tie switches on the 12.47 kV system. Again we hope the SDT will consider operating philosophies when defining "radial" and "one transmission source."

All the substation transformers in the diagrams are considered by WECC to be BES because one winding exceeds 100 kV. We understand the SDT properly intends to look at the lowest voltage winding rather than the highest.

Except for the fuses at SS8, all the SS transformer protection systems are considered by WECC to be BES subject to PRC-005. This is not because the transformers are considered to BES, but because relay operation results in tripping a circuit switcher that exceeds 100 kV. We expect the SDT will properly consider the zone of protection rather than the voltage of the interrupting device.

Please also consider the 115 kV lines joining the NON-RADIAL SUBs in the two diagrams. While most of them cannot be considered to be radial with one transmission source, they are not used to transport bulk power. Their purpose is the local distribution of power. Parallel 230 kV lines (not shown in the diagrams) are responsible for the bulk power transport. The WECC Bulk Electric System Definition Task Force has been working on a definition of "local distribution networks" that would properly classify the 115 kV lines as non-BES. We hope the SDT will look at the work the BESDTF has done.

**Question 2: Summary Consideration:** Prior to the issuance of Order 743a, the SDT reviewed all of the provided material and used this material and the examples supplied in its consideration of the revised definition of the Bulk Electric System (BES). The goal of the SDT is to provide a bright-line definition of BES which adheres to the guidelines and directives in Order 743. This bright-line definition contains certain inclusions and exclusions for specific equipment and configurations. The SDT believes that this definition now answers many of the questions raised by industry and encompasses most of the examples provided. However, no bright-line definition will be able to capture all of the concerns or situations. Accordingly, and consistent with Order 743, another aspect of this project is to establish an exception process with criteria based on reliability principles for the Interconnected BES that will be incorporated in NERC’s Rules of Procedure (ROP) that will allow a process for the inclusion or exclusion of a particular BES Element from the definition. This ROP work effort will be done by a separate team but the DBESSDT will be in close coordination with that team.

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for inclusion:
  - b. Attach a generic one-line diagram depicting the Element or Facility (if available).
  - c. Provide a technical justification for the inclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).
  - d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this inclusion should apply, please select, “unknown.”

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:
- a. Identify the Element or Facility recommended for inclusion:

FMPA' proposed criteria for inclusion are listed above in response to Question 1(a). As stated above, there should be no "generic" or "categorical" inclusions. Inclusions, like exemptions, should be considered on a case-by-case basis. The *criteria* by which proposed inclusions or requested exemptions are judged, however, should be uniform across the continent.

- d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this inclusion should apply, please select, "unknown."

Continent-wide

**Comments relative to the proposed inclusion(s):** This question appears to assume that all inclusions in the BES will be categorical, rather than case-by-case. This is inappropriate. Inclusions, like exclusions, should involve case-specific consideration of the uniform, continent-wide criteria.

The inclusion process should be the mirror image of the exemption process: it is NERC, rather than the Registered Entity, who initiates the process, and the burden is on NERC to demonstrate that the Element to be included is "necessary for operating an interconnected electric transmission network." The processes should otherwise be identical: the initial determination should be made by NERC staff, with appeals to the Board of Trustees Compliance Committee, and to FERC if necessary. The proposed process is discussed in more detail in response to Question 1 above.

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:

- a. Identify the Element or Facility recommended for inclusion: Elements or Facilities that are shown through engineering studies to be necessary to reliably operate an interconnected bulk electric system may need to be included even if operated at voltages below 100kV. Additionally, there are transmission facilities at 100kV and above that are radial in nature and used for load serving purposes that are not parallel to interconnected transmission systems. As an example, in SCE's system the Valley 115kV system is radial in nature and the power flow is generally from 500kV to 115kV to serve load.
- b. Attach a generic one-line diagram depicting the Element or Facility (if available).
- c. Provide a technical justification for the inclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** An element or facility that is necessary to reliably operate an interconnected transmission system should be included in the BES. This can be measured using engineering studies that show the effect of worst-case disturbances on multiple indicators such as frequency, voltage, system flows, operating limits, generator tripping, and cascading outages and/or islanding. If the system cannot maintain acceptable steady-state and dynamic performance without the subject element in service, that element is necessary to reliably operate the system.

- d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this inclusion should apply, please select, "unknown."

X Continent-wide

X Interconnection-wide

X Region-wide

**Comments relative to the proposed inclusion(s):** While operating voltage (i.e. the proposed 100kV bright-line) may be a clear and repeatable proxy for identifying those elements that are necessary to reliably operate an interconnected transmission system, it is a broad approach that may not adequately address specific examples. Engineering studies can be used to more granularly and accurately identify elements which are not needed to reliably operate an interconnected transmission system.

The thresholds on the indicators listed above may vary between interconnections and regions. For example, SCE's system has facilities rated at the 115kV level that are radial in nature for load serving purposes. Therefore, applying a 100kV bright-line may unnecessarily bring facilities that could be excluded through an engineering study.

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:

d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this inclusion should apply, please select, "unknown."

Unknown

Comments relative to the proposed inclusion(s): The scenario below should be considered and worked through as part of the development of the definition and exemptions. As stated in questions 2, 3, 8 of the BES definition comment questionnaire it is unclear as to how treatment of facilities would occur, especially if there are multiple/separate owners of each wind farm, even though they aggregate to a common bus that connects to the transmission system. Treatment of the bus and breakers between each wind farm and the transformer also needs to be contemplated and addressed in the definition or exclusion process.

**Amir Hammad, Constellation Power Source Generation, Inc., Et all**

**CPSG is filing the comments below on behalf of:**

Constellation Energy Group, Inc.  
Baltimore Gas & Electric Company  
Constellation Energy Commodities Group, Inc.

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:
  - a. Identify the Element or Facility recommended for inclusion: TAPS' proposed criteria for inclusion are listed above in response to Question 1(a). As stated above, there should be no "generic" or "categorical" inclusions. Inclusions, like exemptions, should be considered on a case-by-case basis. The *criteria* by which proposed inclusions or requested exemptions are judged, however, should be uniform across the continent.

**Comments relative to the proposed inclusion(s):** This question appears to assume that all inclusions in the BES will be categorical, rather than case-by-case. This is inappropriate. Inclusions, like exclusions, should involve case-specific consideration of the uniform, continent-wide criteria.

The inclusion process should be the mirror image of the exemption process: it is NERC, rather than the Registered Entity, who initiates the process, and the burden is on NERC to demonstrate that the Element to be included is "necessary for operating an interconnected electric transmission network." The processes should otherwise be identical: the initial determination should be made by NERC staff, with appeals to the Board of Trustees Compliance Committee, and to FERC if necessary. The proposed process is discussed in more detail in response to Question 1 above.

**2.** If you believe there are Transmission or Generation Elements or Facilities operated at voltages below 100kV which should be considered for inclusion in the Elements and Facilities classified as part of the BES:

- a.** Identify the Element or Facility recommended for inclusion: [In rare cases, facilities operating below 100kV should be considered for inclusion in the BES, but only if the RRO provides clear evidence that such facilities threaten to cause instability, uncontrolled separation, or cascading outages on the bulk transmission system if those facilities are not included as part of the BES.](#)
- b.** Attach a generic one-line diagram depicting the Element or Facility (if available).
- c.** Provide a technical justification for the inclusion (provide justification here or attach a supplemental document or URL link to publicly posted document if available).

**Justification:** [As discussed above, the ultimate goal of the standards drafting process must be to ensure the reliable operation of the bulk transmission system, so that the risks of instability, uncontrolled separation, and cascading outages on the bulk system are reduced. In rare cases, it is possible that facilities operating at voltages below 100kV may create risks of this kind to the bulk system. However, caution should be used when identifying parallel lower voltage systems that reduce transfers on higher voltage systems as reliability concerns. In many cases these concerns are commercial in nature and the burden to resolve these capacity issues should be placed on the TSP.](#)

- d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don't know how widely this inclusion should apply, please select, "unknown."

Continent-wide

Interconnection-wide

Comments relative to the proposed inclusion(s): The BESDTF has developed an approach in which certain facilities operating at voltages below 100kV would be included in the BES, but facilities not falling within these specific, defined categories would not be included in the BES unless the RRO could demonstrate that the facility creates a material impact threatening the reliable operation of the bulk interconnected system. We believe this is a sensible approach to this question.

2. If you believe there are Transmission or Generation Elements or Facilities operated at voltages **below 100kV** which should be considered for **inclusion** in the Elements and Facilities classified as part of the BES:
- a. Identify the Element or Facility recommended for inclusion: **This burden would be on the Regional Entity rather than the Registered Entity. Facilities that are not radial serving only load may be put through an inclusion process (similar to, but with the opposite effect of the exclusion process) to determine if they are needed for “reliable operation” as defined in 16 U.S.C. § 824o(a)(4).**
  - d. Identify if this inclusion should apply on a continent-wide basis, interconnection-wide basis, region-wide basis, or less than a region-wide basis. If you don’t know how widely this inclusion should apply, please select, “unknown.”

Continent-wide

**Question 3: Summary Consideration:** Prior to the issuance of Order 743a, the SDT reviewed all of the provided material and used this material and the examples supplied in its consideration of the revised definition of the Bulk Electric System (BES). The goal of the SDT is to provide a bright-line definition of BES which adheres to the guidelines and directives in Order 743. This bright-line definition contains certain inclusions and exclusions for specific equipment and configurations. The SDT believes that this definition now answers many of the questions raised by industry and encompasses most of the examples provided. However, no bright-line definition will be able to capture all of the concerns or situations. Accordingly, and consistent with Order 743, another aspect of this project is to establish an exception process with criteria based on reliability principles for the Interconnected BES that will be incorporated in NERC’s Rules of Procedure (ROP) that will allow a process for the inclusion or exclusion of a particular BES Element from the definition. This ROP work effort will be done by a separate team but the DBESSDT will be in close coordination with that team.

**Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** There are three parts to the work that need to be accomplished to fulfill the intent of the Commission's Order; 1) revision of the definition of Bulk Electric System, 2) development of exemption criteria and 3) development of a process for applying the exemption criteria. The first two parts of the work should be accomplished using the standards development process. This work is technical in nature and therefore should be developed by technical experts in the industry. The Rules of Procedure change process should be reserved for the mechanics of administering the exemption process.

The Regions should administer the exemption process with NERC serving an oversight role to ensure consistency among the Regions. This would fit logically with the Regions' administration of other processes such as the registration process.

Each registered entity that identifies Transmission or Generation Elements or Facilities that should be included or excluded from the Bulk Electric System should submit an application to the Region, including the information sought in parts a, b and c of questions 1 and 2 in this document (i.e., identification of the Element or Facility, diagram, and technical justification). The Region should then review the request through a stakeholder technical committee using the criteria approved through the standards development process. NERC should periodically review all applications of the exemption process to ensure consistency in the Regions' application of the criteria.

**Michelle Mizumori, Western Electricity Coordinating Council**

**Telephone: 801-819-7624**

**Email: [mmizumori@wecc.biz](mailto:mmizumori@wecc.biz)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** In addition to defining functional characteristics that can be used for an exemption process, the use of engineering studies that demonstrate the effect of an element on system performance must also be allowed, but must include clearly-defined and technically-justified assumptions, metrics, and thresholds. To the extent that there are physical differences between regions or interconnections, variations between those regions and interconnections must be allowed. However; all assumptions, metrics, and thresholds must be thoroughly vetted and approved by NERC as part of the NERC Exemption Process. Furthermore, it would be helpful if NERC could clarify the process that it will use to develop the Exemption Process and Criteria, including how the team will be populated, how coordination with the Drafting Team will be assured, and how the vetting process would occur. It is important that the team developing the exemption criteria includes technical experts from the stakeholder community.

**Brandy A. Dunn, Western Area Power Administration**

**Telephone: 720-962-7431**

**Email: [dunn@wapa.gov](mailto:dunn@wapa.gov)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** The use of engineering system studies that demonstrate the impact of an Element on system performance must be allowed to demonstrate inclusion/exclusion to the BES. To the extent there are physical differences between Regions, variations between those Regions must be allowed. Also – the Exception Definition Task Force needs to be a stakeholder-populated/ -driven process.

The exemption process should be part and parcel of the definition. Exemption language furthermore must be explicit and unambiguous. The WECC Bulk Electric Definition Task Force (BESDTF) has expended considerable effort over the last two years exploring important issues pertaining to exempting elements from the BES including;

- a.** Lines of demarcation between BES and non-BES elements
- b.** Definition of ‘radial’
- c.** High voltage distribution networks.
- d.** Impact assessment methodologies.

**Alain Pageau, Hydro-Québec TransÉnergie**

**Telephone: 514 879-4100 #5414**

**Email: [pageau.alain@hydro.qc.ca](mailto:pageau.alain@hydro.qc.ca)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** For the Canadian entities, the inclusion or exclusion of equipment and facilities in the BES must be also approved by the Canadian regulators. (as answer 2c). We believe that it is very difficult to propose first a definition for the BES and only after an Exemption process. Both aspects influence each other and both should be carried out together.

Email: [gzito@npcc.org](mailto:gzito@npcc.org)

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

[1] [Seven Factor Test](#) – NPCC participating members believe that the BES Exclusion process should place substantial weight upon Factor 3 from the FERC Seven Factor test. Factor 3 states, “Power flows into local distribution systems, and rarely, if ever flows out.”<sup>1</sup> We also believe that Factor 7 has been broadly interpreted by FERC, State Commissions and the Courts to **include** facilities serving a distribution function and operated at 100 kV and above.<sup>2,3,4,5,6,7</sup>

[2] [NPCC A-10 Methodology for Determine BPS Elements](#) – NPCC participating member believe the A-10 Criteria methodology that NPCC uses to determine its BPS elements can be further utilized to identify critical system components that may be operated below the 100 kV threshold. The Criteria may also be used in lieu of the use of “higher” thresholds that appear or are contemplated in some of the ERO standards such as FAC-003 cites 200kV and above, the TPL-001 currently under development may specify a 200 kV threshold for some “more stringent” planning criteria. These higher thresholds may lend themselves to the use of an “impact based” methodology that could be used to determine where more stringent requirements may need to be applied.

[3] [New York State Public Service Commission \(NYSPSC\)](#) - In Opinion No. 97-12, Case 97-E-0251, the NYSPSC provided utilities under its jurisdiction explicit guidance for

<sup>5</sup> Case No. U-13862, August 26, 2003 meeting of the Michigan Public Service Commission in Lansing, Michigan.

<sup>6</sup> “With regard to the deference it would provide to recommendations by state regulatory authorities concerning where to draw the jurisdictional line between FERC jurisdictional transmission facilities and state-jurisdictional local distribution facilities, FERC provided the following guidelines:… (e) If the utility's classifications and/or cost allocations are supported by the state regulatory authorities and are consistent with the principles established in Order No. 888, FERC **will defer to such classifications** and/or cost allocations.” FERC comments filing by *Central Illinois Light Company*, Docket EL03-39-000, filed Dec. 20, 2002.

<sup>7</sup> *Mansfield Municipal Electric Department v. New England Power Co.*, 97 FERC ¶ 61,134 (2001). “...the Municipals' facilities have all of these [Seven Factor Test] indicators except the last one. The voltage of the lines is 115 kV, the same voltage as the transmission grid. As discussed supra, the voltage alone is not dispositive of the issue as to whether a line is distribution or transmission. We must also look at the function.”

determining the point-of-demarcation between transmission facilities under FERC jurisdiction and distribution

facilities under NYSPSC jurisdiction.<sup>8</sup> Appendix C to this Order established three (3) measures that utilities were instructed to use in determining the classification of transmission and distribution assets.

[4] FERC non-jurisdictional entities such as the Canadian Provinces.

The exemption process should clearly address the process and requirements for FERC non-jurisdictional entities (such as the Canadian entities) with the exception of the interconnections between them and those entities under FERC jurisdiction, and/or those entities having a direct impact on those interconnections. See **APPENDIX C**

---

<sup>8</sup> STATE OF NEW YORK PUBLIC SERVICE COMMISSION, OPINION NO. 97-12 in CASE 97-E-0251 - *Proceeding on Motion of the Commission to Distinguish Bulk Electric Transmission System from Local Distribution Facilities*.

**Jim Uhrin**      **ReliabilityFirst Corporation**

**Telephone: 330.247.3058**

**Email: [jim.uhrin@rfirst.org](mailto:jim.uhrin@rfirst.org)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** ReliabilityFirst would like to see this as a simple and easy-to-follow definition. The exclusion process needs to be clear without room for discussion or interpretation.

- There must be a common framework developed, along with a single NERC-wide BES definition.
- The definition should serve as a common approach for the identification of BES Elements and Facilities that are subject to compliance.
- The definition and approach for the determination must be repeatable.
- The method must clearly identify the BES elements for use by the industry.
- In order to obtain consistency, the definition, application and criteria must be used across Regional Entity boundaries.
- The revised BES definition should be consistent with the Statement of Compliance Registry Criteria so as not to create a conflict between the two, and could possibly simply reference the Criteria for issues such as size of generating units (e.g., 20 MVA units and 75 MVA plants) included in the BES.
- The criteria for exemption should be included within the BES definition, and the exemption process should contain only the procedure for submitting and determination of such. The exemption process should not contain a third set of criteria (in addition to the BES definition itself and the Statement of Compliance Registry Criteria) in which to make a determination of facilities to be monitored for compliance to standards.
- With the revised BES definition containing specific requirements for inclusion in the BES, will the separate Statement of Compliance Registry Criteria even be needed?

**Email: [jpetaski@hydro.mb.ca](mailto:jpetaski@hydro.mb.ca)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

- a. A NERC definition of ‘radial’ is required to prevent misapplication of the BES definition and exemption process.
- b. There should be no regional differences in the BES definition or in the BES definition exemption process.
- c. There should be equal representation from the regions to draft this standard
- d. There should be consistent wording to describe the process - exception or exemption.

**Email: [john.delucca@lcec.net](mailto:john.delucca@lcec.net)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** The exception process under draft in the FRCC region should serve as a strong basis that could be applied Continent-wide. Also while the exclusion process should be administered within the Region there needs to be an appeals process in place that progresses quickly. In addition, a Region should not be allowed to allege violations of reliability standards related to a system while in the appeals process. If the appeal is not upheld the entity should then be allowed time to bring the system into compliance. Also for consideration Bright-line” methodology seems to be the “easy button” solution, but this “one-size fits all” places the burden on entities to obtain exclusions. From an entity’s viewpoint, move the “bright-line threshold” to non-radial facilities operating at or greater than 230 kV, and adopt an inclusion process and criteria for including facilities that are necessary to operate an interconnected electric transmission network.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** We have difficulties understanding the intent of this Comment Form and the content in Q1 and Q2, above, which appear to be templates for information to be included in an exclusion/inclusion request rather than asking for comments on each of the listed items.

1. Is the intent of this Comment Form to obtain:
  - a. Recommendations of the criteria to be considered in developing deviations from the default criteria for classifying Elements and Facilities as part of the BES?
  - b. Assessment of the templates proposed in Q1 and Q2?
2. The concept paper that is posted alongside the SAR and proposed definition is not referenced in this Comment Form. Is it the drafting team's intent to solicit comments on the concept paper?
3. In the concept paper, three exemption criteria are presented. We do not have any issue with the first and third criteria but are concerned that Criterion #2 is not a criterion. It states that:

“Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO).”

This criterion appears to reference yet another set of criteria not already included in the set or the concept paper. In fact, this “referenced” set needs to be clearly stipulated to ensure that applicants are fully aware of the conditions under which an Element or Facility operated at 100 kV or above can be deemed not necessary to support bulk power system reliability and, conversely, the conditions for an Element or Facility operated at below 100 kV to be included. The “templates” presented in Q1 and Q2 of this Comment Form also do not convey the needed conditions.

We believe it is the clear conditions for exclusion (Elements/Facilities of 100 kV and above) and inclusion (below 100 kV) that need to be developed and fully vetted. We urge the drafting team to proceed to developing these criteria expeditiously so as to support the assessment and approval of the revised definition of BES.

4. We strongly advocate that the exemption process allows for a registered entity to submit the results of an objective, impact-based assessment process in support of its application for exemption of facilities that would otherwise be classified as part of the BES. This

assessment process, when consistently applied in a non-arbitrary manner, would yield results that demonstrate concretely, that the facilities for which the exemption is being sought, do not impact the BES.

5. Finally, given that the exemption process will be used to included and exclude transmission facilities we suggest either of the following as a more appropriate name: “BES Classification Exception Process” or “BES Classification Review Process”.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

[1] [Seven Factor Test](#) – NPCC participating members believe that the BES Exclusion process should place substantial weight upon Factor 3 from the FERC Seven Factor test. Factor 3 states, “Power flows into local distribution systems, and rarely, if ever flows out.”<sup>9</sup> We also believe that Factor 7 has been broadly interpreted by FERC, State Commissions and the Courts to **include** facilities serving a distribution function and operated at 100 kV and above.  
10,11,12,13,14,15

[2] [NPCC A-10 Methodology for Determine BPS Elements](#) – NPCC participating member believe the A-10 Criteria methodology that NPCC uses to determine its BPS elements can be further utilized to identify critical system components that may be below the 100 kV threshold. The Criteria may also be used in lieu of the use of “higher” thresholds that appear or are contemplated in some of the ERO standards such as FAC-003 cites 200kV and above, the TPL-001 currently under development may specify a 200 kV threshold for some “more stringent” planning criteria. These higher thresholds may lend themselves to the use of an “impact based” methodology that could be used to determine where more stringent requirements may need to be applied.

[3] [New York State Public Service Commission \(NYSPSC\)](#) - In Opinion No. 97-12, Case 97-E-0251, the NYPSC provided utilities under its jurisdiction explicit guidance for determining the point-of-demarcation between transmission facilities under FERC

---

<sup>9</sup> We view the term “rarely” as used in Factor 3 to be bounded on the upside by a reverse power flow rate of no more than 10% of all hours and a peak reverse power flow (MW) amount of no more than 50% of peak inflows.

jurisdiction and distribution facilities under NYSPSC jurisdiction.<sup>16</sup> Appendix C to this Order established three (3) measures that utilities were instructed to use in determining the classification of transmission and distribution assets. See **APPENDIX C**

NEW YORK INDICATORS (FINAL REVISED VERSION)

[NY-1] A transmission system delivers power from generation plants to local distribution systems. Where a generator directly supplies a local distribution system, the need for a transmission system to deliver its output to load depends on the size of the generator in relation to the minimum load of that system.

[NY-2] Transmission systems end at the high-voltage terminals or at the disconnect switch of a substation transformer; if no transformer is present, the transmission system ends at the bus tap of the local distribution feeder.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** Xcel Energy agrees that the FERC Order 743 directs NERC to modify the Rules of Procedure to include the process for how an entity or region may initiate an exclusion or inclusion. However, we do not agree that FERC also directed that the actual criteria and technical specifics for inclusion or exclusion be developed as part of the Rules of Procedure. Furthermore, since the inclusion/exclusion criteria is a key component to the definition of BES, we feel the criteria should be treated as part of the definition development and developed in the same manner as the definition itself. (Preferably by the same drafting team.)

It is also not clear as to why the Reliability Assurer is included as an applicable entity in the SAR.

**Email: [amosher@publicpower.org](mailto:amosher@publicpower.org)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exemption Process.

**Comments:**

The Concept Paper states at page 1 that in Order 743, FERC directed NERC to do the following:

- A. Utilize the NERC Standard Development Process to revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms.
- B. Develop a single Implementation Plan to address the application of the revised definition of the BES and the implementation of the exemption process.
- C. Utilize the NERC Rules of Procedure to develop and implement an 'exemption process' used to identify Elements and Facilities which will be included in or excluded from the BES.

The Concept Paper continues to state that:

This project will address items 'A' and 'B' and will coordinate efforts between the Standard Drafting Team (SDT) and the group working to develop the exemption process for inclusion in the NERC Rules of Procedure to ensure that the revised BES definition and exemption process result in an accurate, repeatable, and transparent method for the identification of BES and non-BES Elements and Facilities.

APPA agrees that the standards process must be used to develop the revised BES definition and that NERC has been directed to use its Rules of Procedure process to develop an ROP-based procedure to implement an exemption/exclusion/inclusion process. However, the FERC directives do not speak to how and by whom the technical methodology, study criteria and data requirements for requesting and receiving approval for an exemption should be developed.

To the maximum extent possible, subject to time constraints imposed by FERC, this inherently technical methodology needs to be developed through the NERC standards development process, in conjunction with development of the revised definition of BES. Separate development will significantly hamper development of industry consensus in support of the revised BES definition and the yet to be developed ROP modifications for the exemption process.

The most critical question is how do we arrive at a commonly agreed upon, widely accessible, transparent, and replicable continent-wide methodology to determine whether

each specific facility is or is not “necessary to operate an interconnected electric transmission network” to quote from paragraph 16 of Order 743. While each region may have a separate model reflecting its topology and system performance characteristics, a continent-wide approach is required to address FERC concerns about inconsistency across regions that are not the result of physical differences.

The statutory definition of the term bulk-power system defines the outer extent of facilities that can be included (at least within the United States) within the NERC definition of BES. FPA section 215(a)(1) states that the bulk-power system includes “(A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability.” Further, the term BPS “does not include facilities used in the local distribution of electric energy.” [emphasis added].

Similarly, “reliable operation” is defined at 215(a)(4) to mean “operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.”

These definitions appear to point to two basic questions for the classification of each facility or element as BES or non-BES:

1. Is the facility or element necessary for reliable operation because it contributes significant capability to the interconnected transmission network?
2. Will the misoperation or unanticipated failure of the facility or element adversely affect the reliable operation of the interconnected transmission network?

APPA suggests that the BES SDT or separate study teams should be directed to establish the outline for this study methodology. APPA further suggests that BES sub-teams be established to address the Proposed BES Criteria in the Concept Paper. Separate sub-teams should be established to address detailed system configuration and study methodology issues affecting:

1. Radials serving load (with and without distribution voltage generation not subject to registration)
2. Other transmission elements that entities seek to include in or exclude from the BES.
3. Generating plant equipment that entities seek to include in or exclude from the BES.
4. Technical issues raised by the FERC Seven Factor Test for Local Distribution Facilities.

Separate sub-teams are appropriate because the study issues are likely to be quite distinct. For example, radials serving only load do not provide alternative pathways for reliable BES

operations, as might some sub-100 kV facilities. Mixing the two teams together might slow progress on identification of various commonly used radial to load center configurations that with proper protection schemes do not have the potential to adversely affect the BES. A focused effort on permissible exclusions of radials serving load is essential to prevent distribution providers from adopting less reliable system configurations to serve their loads because they are concerned that the preferred configuration will make them subject to registration as TOs and/or TOPs.

Note that the proposed sub-teams do not necessarily have to be populated by members of the SDT. The new standards process allows SDTs to gather informal input from a variety of sources. However, development and posting for industry comment of the minimum acceptable characteristics of the study methodology to be used in the Exceptions Process should be the responsibility of the BES SDT.

The Comment Form on the Exclusion Process poses reasonable questions and it is my hope that registered entities and regional entities identify numerous candidate facilities and elements for inclusion or exclusion from the BES, accompanied by one-line diagrams that lay out each of the permutations for such facilities that are candidates for exclusion/inclusion. These facilities range from simple radial transmission lines and distribution step-down transformers to 100 kV class distribution networks that operate radially from the BES. I also hope that entities submit extensive technical documentation to explain why such facilities should be excluded from or included in the BES.

**Email: [jhughes@elcon.org](mailto:jhughes@elcon.org)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** ELCON members have always supported fair and effective reliability efforts at NERC. However, the expansion of the standards compliance responsibility implied by the NERC Concept Document goes too far. As written, this proposal could have the effect of devaluing a large number of industrial owned electrical power assets by forcing industrials to meet new and unnecessary compliance obligations. Many will be forced to choose to either accept a significant new cost or fire sale their assets to local providers increasing the purchaser's market power in the process. ELCON feels the addition of new compliance obligations should not be done in such a wholesale manner but instead done on an exception and as needed basis that factors in both a realistic appraisal of the underlying risk and the economic burden imposed on the registered entity relative to the expected benefits.

Specific recommendations and concerns are:

1. An Overarching “Principle” for the Identification of BES Elements and Facilities Must be the Guidance Provided by FERC That Significant Expansion of the Compliance Registry is Not Contemplated.

In FERC's March 18, 2010 Notice of Proposed Rulemaking (NOPR) on the Revision to Electric Reliability Organization Definition of Bulk Electric System, the Commission stated regarding the revision to the BES definition:

This proposal would eliminate the discretion provided in the current definition for a Regional Entity to define “bulk electric system” within a region. Importantly, however, we emphasize that we are not proposing to eliminate all regional variations and we do not anticipate that the proposed change would affect most entities. ¶ 16. ... the Commission does not believe that the proposal would have an immediate effect on entities in any Regional Entity other than NPCC. ¶ 27.

Similarly, in Order No. 743, the Commission stated:

We expect that our decision to direct NERC to develop a uniform modified definition of “bulk-electric system” will eliminate regional discretion and ambiguity. The change will not significantly increase the scope of the present definition, which applies to transmission, generation and interconnection facilities. The proposed exemption process will provide sufficient means for entities that do not believe particular facilities are necessary for operating the interconnected transmission system to apply for an exemption. ¶ 144.

One area where the proposed BES definition and exception process will significantly expand the Compliance Registry is the criteria applicable to behind-the-meter generation (primarily cogeneration facilities). We urge that the BES definition should not change the currently applicable 20 MVA / 75 MVA generation size threshold applicable to generation facilities or the manner in which that threshold is currently applied, with behind-the-meter cogeneration facilities evaluated based on the net capacity actually provided to the grid.

2. A Second Overarching “Principle” for the Identification of BES Elements and Facilities Is the Need to Clarify Which Facilities Perform a True Transmission Function and Excluding Facilities That Perform a Local Distribution Function, As Required by Law.

Congress stated in Federal Power Act section 215:

**SEC. 215. ELECTRIC RELIABILITY.**

“(a) DEFINITIONS.—For purposes of this section:

“(1) The term ‘bulk-power system’ means—

“(A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and

“(B) electric energy from generation facilities needed to maintain transmission system reliability.

The term does not include facilities used in the local distribution of electric energy.

There has been little attempt by NERC to clarify what in fact are “facilities used in the local distribution of electric energy” even though any plain English application of the term makes such a determination self-evident. The proposed BES definition should expressly exclude facilities used in the local distribution of electric energy, and the identification of such facilities is independent of the identification of BES transmission. Facilities used for local distribution are NOT the residual of any determination of what are BES transmission facilities.

3. A Third Overarching “Principle” for the Identification of BES Elements and Facilities Must be Recognition of the Risk Imposed by the Element or Facility, and the Economic Burden of the Owner/Operator of the Element of Facility.

The efforts of the BES Standards Drafting Team follow the release of two important policy documents.

First, on January 18, 2011, the White House issued an Executive Order (“Improving Regulation and Regulatory Review”) by President Obama regarding improvements to federal regulations and the review of existing regulations to ensure, among other things, that a regulation be proposed or adopted “only upon reasoned determination that its benefits justify its costs,” and that regulations be tailored “to impose the least burden on society.”

Second, the NERC Planning Committee issued on January 10, 2011, “Risk-Based Reliability Compliance – White Paper Concept Discussion,” which attempts to advance “processes and procedures to prioritize [NERC’s] efforts and ‘tiering’ elements of its programs to maximize their value and optimize the benefit/cost of effort from stakeholders.” This white paper complements the President’s Executive Order.

ELCON believes that BES exclusion criteria and process should recognize and exclude elements and facilities in which the risk to bulk electric system reliability is at most theoretical or speculative, and where the compliance burden clearly outweighs the benefits. Such a determination should recognize the historical record of the element or facility in terms of the owner or operator’s coordination with the BA or control area, and transmission operators. This principle should be applied to the development of exclusion/inclusion criteria for private lines that connect loads and behind-the-meter generation to true BES Elements and Facilities.

4. An Additional Principle for the Identification of BES Elements and Facilities Should Be the Explicit Recognition on How the Element or Facility is Actually Operated or Used, Not Its Physical or Nominal Rating That May be Irrelevant to Reliability Considerations.

In Order No. 743, FERC clarified that it did not intend to require NERC to utilize the term “rated at” rather than the term “operated at” for the voltage threshold in the revised BES definition. A principle for the identification of BES Elements and Facilities should be such recognition and not exclusively on the rated value of an Element or Facility. This principle should be used to retain the exclusion in the Statement of Compliance Registry Criteria (Revision 5.0) for “net capacity provided to the bulk power system” in the context of the 20 MVA generating unit and 75 MVA generating plant thresholds. The “net capacity” applies to capacity “put” of a behind-the-meter generator whose predominant function is to serve load at the same site.

5. An Additional Principle for the Identification of BES Elements and Facilities Should be the Exclusion of PSEs That Do Not Own or Operate Physical Assets and Whose Power Transactions Are Exclusively Financial in Nature.

Many PSEs that operate in FERC jurisdictional organized wholesale markets (i.e., ISOs and RTOs) do not own, operate or lease physical assets and are currently bombarded with data requests that assume that they own or control such assets. An example of a superfluous data request is to prove that adequate reactive power has been procured to support the load. This is a question that should not have been asked and displays a profound ignorance of the operation of ISO/RTO markets. One potential solution to this problem is to create two subsets of PSEs: one that owns and operates physical assets that are used to serve their loads, and a second that does not.

Some Regional Entities have also begun to ask questions that require PSEs to reveal the details of specific commercial transactions. This raises a broader question on what NERC and regional compliance staffs and auditors “need to know” and whether such questions are an abuse of their enforcement authority.

**6. Any Attempt to Make Demand Side Management (DSM) Measures an Element or Facility of BES Will Be Shortsighted and Counterproductive.**

Proposals that unilaterally and arbitrarily remove exclusions for generation and transmission, including the application of new compliance obligations to DSM programs, go far beyond what FERC intended in its guidance for revisions. Any new requirement concerning voluntary DSM adds cost to a process that so far has only acted to support reliability with performance equal to and sometimes superior to traditional providers. How is it that a potential resource that can contribute to maintaining reliability is now so quickly identified as a risk? We warn against the overzealous pursuit of control over every asset and resource on the electric system. This mindset will only breed cynicism and end the willingness of potentially dispatchable loads to cooperate with the real operators and owners of the BES.

A recently issued FERC study highlights the potential value to reliability of DSM (in the form of dispatchable demand response) ([See Joseph H. Eto et al., Use of Frequency Response Metrics to Assess the Planning and Operating Requirements for Reliable Integration of Variable Renewable Generation, LBNL-4142E, December 2010](#)). To reliably integrate greater amounts of wind energy resources to the bulk electric system, the study recommended the:

Expanded use of demand response that is technically capable of providing frequency control (potentially including smart grid applications), starting with broader industry appreciation of the role of demand response in augmenting primary and secondary frequency control reserves.

**7. Revising the Definition of BES Does Not Justify Shifting the Plenary Burden for BPS Reliability from Utilities to Utility Customers. A BES Principle Should Recognize That the Obligation to Serve Applies in One Direction.**

The only reason the bulk power system exists is to deliver electric power to residential households, commercial businesses, government facilities and industrial facilities of all sizes. The value of a reliable BPS is dependent on the needs of end use customers. Nothing in the legislative history of section 215 of the Federal Power Act suggests that Congress wittingly intended to change that relationship.

The burden of complying with NERC Reliability Standards is a cost of doing business for utility providers of generation, transmission and distribution services. Generation and interconnection facilities of industrial customers are almost never intended for or used to “operate the interconnected transmission network.” Those facilities are integral to a manufacturing process, including purchasing power from the grid. They were built in expectation that the BPS was prudently planned and operated by utilities. The rare exceptions are administered under applicable tariffs or contracts, and are already Registered Entities.

Part of NERC's effort should include defining the line between a BES asset that is used to deliver power and an End User asset that's sole purpose is to serve the End User's load. The NERC Functional Model includes a vague definition of End-use Customer. The problem is determining the scope of an end-use device. If an industrial company owns a 138 kV to 13.8 kV transformer that feeds its plant, is that an end-use device or a transmission asset that is used to transmit power to the low voltage distribution network within the manufacturing facility? Any work to revise the definition of the BES should also include a clarification of its boundaries. We believe that NERC should not expand the scope of the BES to include assets within end-use customer's private use networks.

8. An Additional BES Principle Should be that BES Elements and Facilities be Limited to Only Functions Currently Specified in the NERC Functional Model (Version 5).

NERC's development of the revised BES definition and exclusion/inclusion criteria and processes should be limited to functions specified in the NERC Functional Model (Version 5).

9. NERC is Encouraged to Propose a "Different Solution" That is as Effective as, or Superior to, the Commission's Proposed Approach. The Proposed Principles for the Exclusion of Elements and Facilities from the BES Should Include a Process for Categorical Exclusion Based on Common Physical Characteristics.

The Commission stated in Order No. 743 regarding its proposed revision of the BES definition (and presumably the exclusion/inclusion criteria and processes):

... NERC may propose a different solution that is as effective as, or superior to, the Commission's proposed approach in addressing the Commission's technical and other concerns so as to ensure that all necessary facilities are included within the scope of the definition. ¶ 16.

In addition, specific to the exclusion of Elements and Facilities from the BES, the Final Rule did not adopt the exclusion process proposed in the NOPR (i.e., facility-by-facility review). In the Final Order, FERC directed NERC to develop an exclusion process "with practical application that is less burdensome than the NOPR proposal."

FERC has also allowed NERC to consider concerns (mainly industrials') regarding "exclusion categories" in developing the exclusion process and criteria. ¶ 120.

ELCON interprets the Commission's statements to mean that the agency is open to developing a more efficient compliance process, including processes that minimize unnecessary regulatory burdens on potential Registered Entities and the administrative costs of NERC and RE compliance operations. In the spirit of "streamlining" NERC and the REs' review of smaller entities, ELCON recommends the addition of a principle on the exclusion of Elements and Facilities from the BES that encourages a process for categorical exclusion of entities based on common physical characteristics.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** While the Regional Bulk Electric System Coordination Group has done an admirable job at drafting an initially proposed list of inclusion and exclusion criteria, Constellation strongly suggests that the continued work on criteria be orchestrated through the FERC-approved standard development process and not as part of a Rules of Procedure revision. We view development of the technical criteria for both the BES definition and exemption process as a single exercise.

The compliance implications and technical nature of such criteria make it imperative that industry input be considered in a transparent stakeholder process. It is appropriate for NERC to develop aspects such as the administrative management, the role and interaction of the regions, an appeal process, etc. However, due to the technical aspects of BES operation, the drafting team members are best suited to devise criteria for inclusion or exclusion of facilities to the BES.

To clarify the distinction between the exception process and the exception criteria, the purpose statement in the concept document should add a fourth bullet to read:

- A. Utilize the NERC Standard Development Process to revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms.
- B. Utilize the NERC Standard Development Process to develop exception criteria to be utilized in the exception process. Develop a single Implementation Plan to address the application of the revised definition of the BES and the implementation of the exemption process.

---

<sup>17</sup> On November 6, 2009, EDF, Inc. (“EDF”) and Constellation Energy Group, Inc. completed a transaction pursuant to which EDF acquired a 49.99 percent ownership interest in CENG. CENG was previously a wholly owned subsidiary of Constellation Energy Group, Inc.

- C. Utilize the NERC Rules of Procedure to develop and implement an 'exemption process' used to identify Elements and Facilities which will be included in or excluded from the BES.

The revised definition should expressly incorporate exclusions for facilities below 100 kV. Entities should not have to seek an exemption for facilities below 100 kV or for radial lines. They should be clearly excluded in the BES definition itself. We encourage the drafting team to embrace a design concept that seeks to maximize the “brightness” of bright line criteria. The BES exemption process should contemplate very few exemptions. The TFE process is an example of a process not to be repeated here.

In addition, Constellation is not convinced that creation of a definition and an exception process is the best course to respond to the FERC directives. We are concerned that the current approach of a simple, all inclusive definition coupled with an exception criteria and process will not draw on the fundamentals underpinning the existing definition and create a cumbersome and unnecessary exception process.

As an alternative, we propose that the standard drafting team utilize the Compliance Registry Criteria – Section III (Rules of Procedure Appendix 5B) along with definition threshold language to develop a more comprehensive definition. Further, we propose that the BES drafting team incorporate the criteria directly into the revised BES definition, replacing the term “bulk power system” in each criterion with “greater than 100 kV.” It will make for a longer definition, but by aligning the facilities requiring registration as those defined as BES, the definition will more clearly determine the line between BES and non-BES. It is preferable that non-BES facilities be excluded by the definition language rather than to define BES broadly and require non-BES facilities go through an exception process. Ideally, this approach can eliminate the need for an onerous exemption process as well as eliminate the need for Section III of the Registry Criteria in the Rules of Procedure.

For special case facilities deemed non-BES by the revised definition that may warrant consideration for inclusion, an “opt-in” evaluation could be conducted.

The rules of procedure process may be used to develop the “opt-in” process that would replace the proposed exception concept; however, the drafting team, perhaps in collaboration with regional entities, should develop any opt-in criteria needed for the process. Again, it is appropriate for NERC to develop aspects such as the administrative management, the role and interaction of the regions, an appeal process, etc. However, due to the technical aspects of BES operation, the drafting team members are best suited to devise criteria for non-BES facilities to warrant inclusion in the BES.

We find that this approach to revising the BES definition would satisfy the FERC directives in Order 743 by encompassing all facilities necessary for operating an interconnected electric transmission network into a national level, bright-line definition. This approach will improve the clarity and consistency of the BES definition for application by Industry and NERC as well as avoiding creation of a potentially cumbersome exception process.

**Email: [shaun.anders@cwlp.com](mailto:shaun.anders@cwlp.com)**

- 3.** Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** CWLP has chosen to comment on the inclusion/exclusion process as a whole. The current lack of detailed, firm administrative guidelines as well as an unambiguous process for resolving disputes between parties involved in the process of adjudicating inclusions/exclusions is problematic. It is CWLP's belief that developing the proposed administrative framework for the process is needed first. Focusing on the data to be submitted as shown in (1) and (2) above does not address the scope, nature, and criteria applicable to the review of requests for inclusions/exclusions. Regardless, CWLP feels strongly that the sole basis for approval or rejection of a request should be technical justification.

Speaking to the process in general, any inclusion or exclusion should be a specific request for a specific facility; continent-wide, interconnect-wide, and region-wide applicability for inclusions/exclusions departs from the intent of FERC Order 743 to establish a definition without regional variances.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

- a. ATC feels strongly that the exemption criteria need to be developed by the SDT. NERC Staff should focus on the process (identification, notification, appeal and rights) but the SDT is in the better position to develop the technical basis of the exemption criteria.
- b. The NERC process for exclusion or inclusion must clearly address who is responsible for submitting an Element or Facility Exception Process. Is it limited to the asset owner of the Element or Facilities, or is it open to neighboring entities that may want to initiate a request for exemption or inclusion to the BES?
- c. Also, ATC believes the process should allow for multi-year distinctions for exceptions. In other words, if a Registered Entity gets an Element or Facility excluded, then that exclusion or inclusion should be allowed for 3 or more years. Annual certifications and approval are too restrictive.
- d. ATC also supports the comments as submitted by EEI REAC on the Draft Concept Paper on the Definition of BES Project 2010-17

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** We have difficulties understanding the intent of this Comment Form and the content in Q1 and Q2, above, which appear to be templates for information to be included in an exclusion/inclusion request rather than asking for comments on each of the listed items.

1. Is the intent of this Comment Form to obtain:
  - a. Recommendations of the criteria to be considered in developing deviations from the default criteria for classifying Elements and Facilities as part of the BES?
  - b. Assessment of the templates proposed in Q1 and Q2?
2. The concept paper that is posted alongside the SAR and proposed definition is not referenced in this Comment Form. Is it the drafting team's intent to solicit comments on the concept paper?
3. In the concept paper, three exemption criteria are presented. We do not have any issue with the first and third criteria but are concerned that Criterion #2 is not a criterion. It states that:

“Elements and Facilities identified through application of the exemption process, consistent with the criteria, where the exemption process deems that the Element or Facility should be excluded from the BES (with concurrence from the ERO).”

This criterion appears to reference yet another set of criteria not already included in the set or the concept paper. In fact, this “referenced” set needs to be clearly stipulated to ensure that applicants are fully aware of the conditions under which an Element or Facility operated at 100 kV or above can be deemed not necessary to support bulk power system reliability and, conversely, the conditions for an Element or Facility operated at below 100 kV to be included. The “templates” presented in Q1 and Q2 of this Comment Form also do not convey the needed conditions.

We believe it is the clear conditions for exclusion (Elements/Facilities of 100 kV and above) and inclusion (below 100 kV) that need to be developed and fully vetted. We urge the drafting team to proceed to developing these criteria expeditiously so as to support the assessment and approval of the revised definition of BES.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

1. We have a number of concerns related to the initial SAR proposal:

- a) The primary concern expressed by FERC in Order No. 743 was the discretion the current definition accords to the RROs to develop their own definition of the BES without approval by NERC or FERC. See Order No. 743, 133 FERC ¶ 61,150 at P 16 (2010) (FERC believes the “best way to address these concerns is to eliminate the Regional Entities’ discretion to define ‘bulk electric system’ without ERO or Commission review”); at 30 (same). Hence, we believe FERC’s concern can be addressed by simply removing the phrase “As defined by the Regional Reliability Organization” from the existing definition. The result would be that the RROs could then develop regionally-appropriate rules based on the uniform definition, which NERC and FERC could then approve, giving deference to the technical findings of the RROs and NERC, as the FPA requires. FPA Section 215(d), 16 U.S.C. § 825o(d). We urge the standards drafting team to consider the virtues of such a minimalist approach and then focus on alternative approaches that will achieve FERC’s aim more effectively and/or at lower cost, and on the exemption process, which will, unless FERC abandons its insistence on a 100-kV bright-line threshold, be the most important aspect of the standards development process.
- b) The definition proposed in the SAR would incorporate “All Transmission and Generation Elements and Facilities” that are “necessary to support bulk power system reliability.” We applaud the effort to properly restrict the definition of BES using the NERC-defined terms “Transmission,” “Generation,” “Elements” and “Facilities.” By using these terms, the drafting team recognizes that Congress excluded from the statutory “Bulk-Power System” definition “facilities used in the local distribution of electric energy,” FPA Section 215(a)(1), 16 U.S.C. § 825o(a)(1), and has thereby excluded such facilities from the reach of the mandatory reliability system. Similarly, by focusing the definition on “Transmission” and “Generation,” the standards drafting team recognizes that Congress limited the reach of reliability standards to: (1) “facilities and control systems necessary for operating an interconnected electric energy transmission network,” and, (2) “electric energy from generation facilities needed to maintain transmission system reliability.” Id.

When viewed in the context of the proposed BES definition, however, we are concerned that incorporating the terms as defined in the NERC Glossary may create unnecessary confusion and ambiguity. For example, the NERC Glossary defines “Facility” as “[a] set of electrical equipment that operates as a single Bulk Electric System Element.” But attempting to define BES by using a term that itself incorporates “Bulk Electric System” is circular and is likely to create confusion in applying the revised definition. Similarly, “Generation” is not specifically defined in the NERC Glossary of Terms, creating potential confusion.

Finally, the NERC Glossary defines “Transmission” in part as “the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers.” This creates the potential for an over-inclusive definition since “Transmission” could, by this definition, be understood to encompass only the last transformation of voltage to end-user level voltage in a system, whereas distribution systems generally include several downward transformations of voltage between the point of bulk delivery and the end-use consumer. One could argue that each of the segments between delivery of bulk power to the local distribution utility and that utility’s step-down transformers is, by the terms of the definition, merely moving power “between points of supply” and only the last segment includes the “point at which [power] is transformed for delivery to customers.” This, of course, would improperly classify a large portion of most distribution system as “Transmission.”

For these reasons, it may be necessary to define “Generation” and to more precisely define “Facility” and “Transmission” as part of the standards drafting process.

We note, on the other hand, that “reliable operation” was a term specifically defined by Congress in FPA Section 215 to include the operation of BES elements “within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance. . . or unanticipated failure of system elements.” 16 U.S.C. § 825o(a)(4). Congress specifically precluded the mandatory reliability system from enforcing standards for adequacy of service, which were left to state and local authorities. 16 U.S.C. § 825o(i)(2). Accordingly, we applaud the standards drafting team for including in the BES only facilities “necessary to support bulk power system reliability,” because the use of the italicized term at least implicitly excludes from the definition facilities that affect only the levels of service that were explicitly excluded from the mandatory reliability regime by Congress and do not affect “reliable operation” of the BES as Congress defined it.

- c) The proposed SAR definition unnecessarily restricts the exclusion in the existing definition for radial facilities. The existing definition provides that radial facilities are “generally not included” in the BES. The proposed new definition would significantly restrict this exclusion, excluding radial systems from the BES only if they are excluded through the “BES definition exemption process.” We believe there is no reason to make radial systems and other elements of the electric system

that, because of their limited interaction with the bulk system, have no meaningful impact on bulk system reliability go through a potentially onerous exemption process. Rather, such systems should be presumptively excluded from the definition, as they are now. Further, for the reasons set forth in detail by the WECC BESDTF, local distribution networks in the West should be subject to a similar categorical exclusion, subject to inclusion in the BES only upon a demonstration that the network creates substantial reliability risks for the bulk system. This approach is consistent with FERC's direction that "radial facilities, as well as facilities used in the local distribution of electric energy as provided in Section 215, will continue to be excluded." Order No. 743 at P 120.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:**

1. The work that has been completed by the WECC Bulk Electric System Definition Task Force is based on sound engineering principles and appears to be a comprehensive solution to defining the BES and providing a means for exceptions to the 100 kV “bright line” criteria. The NERC BES Drafting Team is urged accept the proposal in whole or include contained principles to guide NERC’s process for exception.
2. There is serious concern in the Western Interconnection that if a strict 100 kV bright line is mandated that billions of dollars will be needed to be upgrade 100kV to 200 kV distribution elements to comply with NERC reliability/security standards. There is a significant potential for unintended consequences. A serious one is that there could be substantially less monetary resources available for new transmission investment for high impact BES elements and for relieving congestion. Another is FERC would arguably be negating the 7 factor test for distribution facilities, extending FERC jurisdiction over distribution facilities, bringing costs for such facilities into the FERC tariffs, and reducing PUC state review of such investments. These could result in substantial cost increases and/or reliability issues for electric consumers.

**Comments:**

1. We have a number of concerns related to the initial SAR proposal:

- a) The primary concern expressed by FERC in Order No. 743 was the discretion the current definition accords to the RROs to develop their own definition of the BES without approval by NERC or FERC. *See* Order No. 743, 133 FERC ¶ 61,150 at P 16 (2010) (FERC believes the “best way to address these concerns is to eliminate the Regional Entities’ discretion to define ‘bulk electric system’ *without ERO or Commission review*“); at 30 (same). Hence, we believe FERC’s concern can be addressed by simply removing the phrase “As defined by the Regional Reliability Organization” from the existing definition. The result would be that the RROs could then develop regionally-appropriate rules based on the uniform definition, which NERC and FERC could then approve, giving deference to the technical findings of the RROs and NERC, as the FPA requires. FPA Section 215(d), 16 U.S.C. § 824o(d). We urge the standards drafting team to consider the virtues of such a minimalist approach and then focus on alternative approaches that will achieve FERC’s aim more effectively and/or at lower cost, and on the exemption process, which will, unless FERC abandons its insistence on a 100-kV bright-line threshold, be the most important aspect of the standards development process.
- b) The definition proposed in the SAR would incorporate “All *Transmission and Generation Elements and Facilities*” that are “necessary to support bulk power system *reliability*.” We applaud the effort to properly restrict the definition of BES using the NERC-defined terms “Transmission,” “Generation,” “Elements” and “Facilities.” By using these terms, the drafting team recognizes that Congress excluded from the statutory “Bulk-Power System” definition “facilities used in the local distribution of electric energy,” FPA Section 215(a)(1), 16 U.S.C. § 824o(a)(1), and has thereby excluded such facilities from the reach of the mandatory reliability system. Similarly, by focusing the definition on “Transmission” and “Generation,” the standards drafting team recognizes that Congress limited the reach of reliability standards to: (1) “facilities and control systems necessary for operating an interconnected electric energy transmission network,” and, (2) “electric energy from generation facilities needed to maintain transmission system reliability.” *Id.*

When viewed in the context of the proposed BES definition, however, we are concerned that incorporating the terms as defined in the NERC Glossary may create unnecessary confusion and ambiguity. For example, the NERC Glossary defines “Facility” as “[a] set of electrical equipment that operates as a single Bulk Electric System Element.” But attempting to define BES by using a term that itself incorporates “Bulk Electric System” is circular and is likely to create confusion in applying the revised definition. Similarly, “Generation” is not specifically defined in the NERC Glossary of Terms, creating potential confusion.

Finally, the NERC Glossary defines “Transmission” in part as “the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers.” This creates the potential for an over-inclusive definition since “Transmission” could, by this definition, be understood to encompass only the last transformation of voltage to end-user level voltage in a system, whereas distribution systems generally include several downward transformations of voltage between the point of bulk delivery and the end-use consumer. One could argue that each of the segments between delivery of bulk power to the local distribution utility and that utility’s step-down transformers is, by the terms of the definition, merely moving power “between points of supply” and only the last segment includes the “point at which [power] is transformed for delivery to customers.” This, of course, would improperly classify a large portion of most distribution system as “Transmission.”

For these reasons, it may be necessary to define “Generation” and to more precisely define “Facility” and “Transmission” as part of the standards drafting process.

We note, on the other hand, that “reliable operation” was a term specifically defined by Congress in FPA Section 215 to include the operation of BES elements “within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance. . . or unanticipated failure of system elements.” 16 U.S.C. § 824o(a)(4). Congress specifically precluded the mandatory reliability system from enforcing standards for adequacy of service, which were left to state and local authorities. 16 U.S.C. § 824o(i)(2). Accordingly, we applaud the standards drafting team for including in the BES only facilities “necessary to support bulk power system *reliability*,” because the use of the italicized term at least implicitly excludes from the definition facilities that affect only the levels of service that were explicitly excluded from the mandatory reliability regime by Congress and do not affect “reliable operation” of the BES as Congress defined it.

- c) The proposed SAR definition unnecessarily restricts the exclusion in the existing definition for radial facilities. The existing definition provides that radial facilities are “generally not included” in the BES. The proposed new definition would significantly restrict this exclusion, excluding radial systems from the BES

only if they are excluded through the “BES definition exemption process.” We believe there is no reason to make radial systems and other elements of the electric system that, because of their limited interaction with the bulk system, have no meaningful impact on bulk system reliability, go through a potentially onerous exemption process. Rather, such systems should be presumptively excluded from the definition, as they are now. Further, for the reasons set forth in detail by the WECC BESDTF, local distribution networks in the West should be subject to a similar categorical exclusion, subject to inclusion in the BES only upon a demonstration that the network creates substantial reliability risks for the bulk system. This approach is consistent with FERC’s direction that “radial facilities, as well as facilities used in the local distribution of electric energy as provided in Section 215, will continue to be excluded.” Order No. 743 at P 120.

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** Our understanding of the FERC Order was that the threshold would be 100 kV “except for defined radial facilities” and that they also ordered NERC to adopt an “**exemption process**”. The question confuses the two distinct parts by speaking of an “**exception process**” never ordered by FERC. We urge the SDT to clearly define “radial” in such a way that no external “process” is needed, and that radial facilities can easily be determined by each registered entity by inspection. And if they have facilities that don’t meet the radial definition, they may still be put through a formal exemption process and be exempted if they are found not to contribute to reliable operation of the BPS.

The WECC Bulk Electric System Definition Task Force has done extensive work on this topic. Please consider their current work when drafting the BES definition and exemption process.

**Email: [Brian.J.Murphy@fpl.com](mailto:Brian.J.Murphy@fpl.com)**

3. Please provide any other information that you feel would be helpful to the group working to develop a BES Definition Exception Process.

**Comments:** Based on the information posted by the North American Electric Reliability Corporation (NERC) on its plans to address Order No. 743 of the Federal Energy Regulatory Commission (FERC), NextEra Energy, Inc.1 (NextEra) believes that NERC (and associated drafting teams) should slightly modify its direction to more closely align with FERC's proposed framework. In Order No. 743, at paragraph 30, FERC stated that:

The Commission believes the best way to address these concerns is to eliminate the regional discretion in the ERO's current definition, maintain the bright-line threshold that includes all facilities operated at or above 100 kV except defined radial facilities, and establish an exemption process and criteria for excluding facilities the ERO determines are not necessary for operating the interconnected transmission network. It is important to note that Commission is not proposing to change the threshold value already contained in the definition, but rather seeks to eliminate the ambiguity created by the current characterization of that threshold as a general guideline.

1 NextEra registered entities, which include NextEra Energy Resources, Inc. and Florida Power & Light Company, operate in the eight NERC regions. **Official Comment form for BES Definition Exception Process** FERC also provided NERC with the opportunity to propose an alternative approach. NextEra believes, however, that FERC's proposed framework is appropriately designed to enhance the definition of the Bulk Electric System (BES) in the NERC glossary, and to separately develop a process to apply for and receive, as appropriate, an exemption from the BES definition. Although it appears that NERC and the drafting teams may also be inclined to proceed as suggested by FERC, there are indications in the questionnaire and BES concept paper that there may be some thought to deviating from FERC's proposal.

A review of the information posted by NERC seems to indicate NERC's intention to have a drafting team develop a revised BES definition via the standards development process (*i.e.*, Appendix 3A of the NERC Rules of Procedure). It also seems that NERC is interested in assigning a "working group" to separately develop an exemption process that would be implemented as a new process in the NERC Rules of Procedure. NextEra agrees with this approach.

NextEra's concerns stem from some of the words in the proposed BES definition, the BES concept paper and the questions asked, which seem to suggest an unnecessarily overlapping definition and exemption process, and a movement toward an exemption process based on categories rather than criteria. Thus, to address these concerns NextEra proposes the

following enhancements to more clearly separate the BES definition and exemption process, and align each more closely with Order No. 743.

As for the BES definition, NextEra encourages the drafting team to solely focus its efforts on the definition. The currently posed revised BES definition reads as follows:

**Bulk Electric System:** All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process.

NextEra maintains that this is not the correct starting point, nor consistent with Order No. 743 or the other material posted by NERC, that suggests a more definitive separation of the BES definition from the exemption process. Thus, NextEra proposes that the definition be revised to read as follows:

**Bulk Electric System:** All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher, unless a Transmission or Generation Element or Facility has been exempted pursuant to the exemption process set forth in the NERC Rules of Procedure. **Official Comment form for BES Definition Exception Process** This proposed BES definition more clearly and cleanly separates the BES definition from the exemption process. It also does not add unnecessary qualifiers or verbiage that may result in confusion.

NextEra is also concerned that the working group assigned to the exemption process may initially be more focused on developing categories, instead of an exemption process and associated criteria. Given the unique circumstances of the interconnected BES, including system topology, NextEra does not believe that it would be a productive exercise for the exemption working group to focus on types, groups or categories of equipment; instead, its efforts should focus on developing specific objective criteria to judge the reasonableness of a request or application for an exemption. This approach also seems more in line with FERC's statement in Order No. 743 at paragraph 115:

NERC should develop an exemption process that includes clear, objective, transparent, and uniformly applicable criteria for exemption of facilities that are not necessary for operating the grid. The ERO also should determine any related changes to its Rules of Procedures that may be required to implement the exemption process, and file the proposed exemption process and rule changes with the Commission. The challenges of developing an exemption process also include ensuring that any applicant is afforded due process and balanced decision-making, as required by section 215 of the Federal Power Act. Thus, the exemption process must address legal, regulatory and technical issues.

Accordingly, NextEra requests that NERC assemble a working group (perhaps via the Standards Committee) to develop the exemption process that is comprised of stakeholders

with legal, regulatory and technical experience. Without this balance of disciplines, NextEra is concerned that a technical-heavy working group will attempt to develop a “fix,” instead of a process whereby applicants may request an exemption, and have that exemption judged by specific criteria and pursuant to a process that affords due process and balanced decision-making.

It is not clear whether an exemption working group has already been assembled. If it has, NextEra requests that NERC consider restructuring of the group consistent with NextEra’s proposal.

In summary, NextEra requests that the BES definition drafting team adopt NextEra’s proposed definition of BES. NextEra also requests that NERC assemble a cross-functional working group to develop an exemption process based on specific criteria (rather than categories), and a process that affords applicants due process and balanced decision-making.

Phil Tatro, NERC Staff

### NERC Staff Comments on Bulk Electric System (BES) Concept Document

NERC staff appreciates the opportunity to provide comments on the concept document drafted by the Regional Bulk Electric System Definition Coordination Group (Coordination Group). We believe the concept document provides a good starting point from which discussion of the BES definition (included/excluded Facilities) and exemption process should begin.

In defining the boundaries of the BES, we believe there are some key principles that must be in place:

- The BES must be contiguous. For example, BES generation's connections and paths to Transmission need to be part of the BES.
- The BES definition must be continent-wide, with a uniform process for considering regional inclusions or exclusions.
- The BES definition cannot override any criteria already explicitly established in a standard. In other words, if a standard applies to specifically identified Elements or Facilities, then the BES definition or a regional exclusion cannot be used to modify the Elements or Facilities to which the standard is applicable (e.g., FAC-003-1, PRC-023-1).

We started with the Facilities identified in the *Statement of Compliance Registry Criteria (Revision 5.0)*<sup>18</sup> since these Facilities have been vetted by the industry. We used this starting point to develop a framework that we believe can be helpful as the industry continues to work on defining the BES. Our framework has the BES defined in three parts:

1. BES Generation
2. BES Transmission (excluding Facilities used for local distribution, such as certain radial transmission Facilities and certain transformers)
3. BES Protection and Controls

These three BES components are described in Sections 1, 2, and 3. This framework could serve as a continent-wide “base definition” to which additional inclusion and exclusion of Elements or Facilities could be applied at the regional level as described in Section 4. As Section 5 discusses, these comments do not address registration or functional model impacts resulting from the BES definition.

The details of what we think are appropriate for inclusion or exclusion in each component of the base definition is contained in each of three sections below. The rationale is described in italicized font<sup>19</sup>, as well any changes from current NERC practice. For convenience, the definitions from the *Glossary of Terms Used in NERC Reliability Standards* used herein are in the table below.

---

<sup>18</sup> [http://www.nerc.com/files/Statement\\_Compliance\\_Registry\\_Criteria-V5-0.pdf](http://www.nerc.com/files/Statement_Compliance_Registry_Criteria-V5-0.pdf)

<sup>19</sup> If an Element or Facility is included in the *Statement of Compliance Registry Criteria (Revision 5.0)*, we have not provided a rationale.

<b>Term</b>	<b>Glossary Definition</b>
Blackstart Resource	A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.
Cranking Path	A portion of the electric system that can be isolated and then energized to deliver electric power from a generation source to enable the startup of one or more other generating units.
Demand-Side Management	The term for all activities or programs undertaken by [a] Load-Serving Entity or its customers to influence the amount or timing of electricity they use.
Element	Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components
Facility	A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)
System	A combination of generation, transmission, and distribution components.
Transmission	An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems.
Transmission Line	A system of structures, wires, insulators and associated hardware that carry electric energy from one point to another in an electric power system. Lines are operated at relatively high voltages varying from 69 kV up to 765 kV, and are capable of transmitting large quantities of electricity over long distances.
Protection System	Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry.
Right-of-Way	A corridor of land on which electric lines may be located. The Transmission Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

Prior to any revised BES definition becoming effective, its impact on existing standards needs to be examined. In other words, if an existing standard was written based on the existing definition (which included the phrase “as defined by the Regional Reliability Organization”), then moving to a continent-wide bright-line definition may significantly alter the intent or implementation of the standard.

## **1. BES GENERATION**

BES Generation should include:

- a. Individual generating units greater than 20 MVA (gross nameplate rating). *All units greater than 20 MVA should be included, regardless of the interconnection voltage, because the impact on reliability of the BES associated with tripping similarly-sized units that are interconnected at different voltages is nearly identical. This is a change from current practice. We also believe that “generating unit” should be defined as “A device, whether spinning or static and whether connected synchronously, asynchronously, or electronically coupled, that produces electrical energy from another source of energy, either directly from the other energy source (such as a combustion turbine from natural gas or light distillate oil, a wind turbine from wind, or a solar*

*array from the sun) or through a storage medium (such as pumped storage hydro, a flywheel, compressed air, or battery).”*

- b. *Generating plants with aggregate generation capacity greater than 75 MVA (gross nameplate rating). All plants greater than 75 MVA should be included, regardless of the interconnection voltage, because the impact on reliability of the BES associated with tripping similarly-sized plants that are interconnected at different voltages is nearly identical. We also believe that “generating plant” should be defined as “one or more generating units that are under the common local operational control of a Generator Operator.”*
- c. *Blackstart Resources. Blackstart Resources are essential for the restoration of de-energized portions of a System.*
- d. *Any resource (supply-side or Demand-Side Management) relied on to provide Contingency Reserves to its Balancing Authority. Contingency Reserves are required by BAL-002-0 – Disturbance Control Performance. Resources that may provide such reserves are essential to ensure control of the BES.*
- e. *Any resource relied on in the determination of a System Operating Limit (SOL) or an Interconnection Reliability Operating Limit (IROL). FAC-011-2 - System Operating Limits Methodology for the Operation Horizon requires that Reliability Coordinators have a documented SOL Methodology, including a description of how to identify the subset of SOLs that qualify as IROLs. Resources included in the calculation of an SOL or an IROL should therefore be considered part of the BES since they are used to determine key BES limits that ensure reliable operation.*
- f. *Any resource that is monitored by Reliability Coordinators (RCs). IRO-003-2 – Reliability Coordination – Wide-Area View requires RCs to monitor “all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.” Any resources monitored by an RC are being monitored to ensure the reliable operation of the BES.*
- g. *Any resource fully or partially relied on to fulfill a capacity obligation. Although most capacity resources are likely captured by the other categories above, this additional category ensures that all resources that have capacity obligations are part of the BES.*
- h. *Elements or Facilities required for the control or operation of resources above, regardless of voltage, and including, but not limited to, various generator transformers (e.g., step-up, auxiliary, start-up), generator controls (including exciters and power system stabilizers), prime mover controls, and generating unit control rooms. A generating unit cannot operate reliably without properly functioning controls or a power supply to its auxiliary loads.*

We note that the current *Statement of Compliance Registry Criteria (Revision 5.0)* has language (p. 9) that excludes customer-owned/operated generation from registration if it is behind the customer’s meter, used to serve the customer’s load, has appropriate back-up services to cover service to the load when the customer’s generation is outaged, and the “net capacity provided to the bulk power system does not exceed the criteria above” (i.e., 20 MVA for an individual generating unit and 75 MVA for a generating plant.) This language does address generation adequacy for service to the customer’s load; however, it does not address the immediate-term impact on reliability (e.g., the stability of the system immediately following the loss of generation). As this exemption is

currently written, a 300 MW behind-the meter generator serving 285 MW customer load could be excluded from the BES. Therefore, we believe that behind-the-meter generation exclusions should not be part of the base BES definition. However, we are not opposed to a reliability-based exemption process that, on a case-by-case basis, would consider exemptions of specific behind-the-meter generation that would otherwise be part of the BES.

## 2. BES TRANSMISSION

BES Transmission is made up of both alternating current (ac) transmission Facilities and direct current (dc) transmission Facilities. Although the *Statement of Compliance Registry Criteria (Revision 5.0)* does not distinguish between ac and dc, we believe that this distinction is intended, and our framework uses it for clarity.

### 2.1 AC Transmission Facilities

Ac transmission Facilities should include:

- a. Transmission, Transmission Lines (including their associated Right-of-Way), and substation Facilities nominally operated at 100 kV or higher as measured phase-to-phase for a three-phase ac circuit, with the exception that radial facilities meeting the criteria described in section 2.1.1 (“Excluded Radial Transmission Facilities) are not included. Radial transmission facilities that do not meet the criteria described in section 2.1.1 (e.g., BES interconnection Facilities) are included. *We believe that the attributes of excluded radial Facilities make them Facilities that are used in the local distribution of energy. Their exclusion conforms to the Section 215 definition of Bulk-Power System which states that it “does not include facilities used in the local distribution of electric energy.”*
- b. Transformers, including autotransformers, variable frequency transformers, and phase-shifting transformers, with a high-side voltage 100 kV or higher, provided that transformers used in the local distribution of electric energy are excluded. *The exclusion of transformers used for the local distribution of energy conforms to the Section 215 definition of Bulk-Power System which states that it “does not include facilities used in the local distribution of electric energy.”*
- c. Transmission, Transmission Lines (including their associated Right-of-Way), substation Facilities, and transformers, not covered by a. or b. above, that form the principal transmission path<sup>20</sup> between BES Generation and BES ac transmission Facilities, including the Cranking Path for Blackstart Resources. *Per the “contiguous” principle described above, the principal transmission path of BES Generation that is not connected to transmission Facilities that are 100 kV or higher is part of the BES.*
- d. Transmission, Transmission Lines, and substation Facilities included in the determination of an Interconnection Reliability Operating Limit or a System Operating Limit. *See 1.e above.*
- e. Transmission, Transmission Lines, and substation Facilities monitored by Reliability Coordinators. *See 1.f above.*
- f. Elements or Facilities used in control or operation of BES ac transmission Facilities listed above, regardless of voltage and including, but not limited to, circuit breakers, in-line switches, fuses, shunt and series compensation (capacitors and reactors), power electronic control devices (e.g., static var compensators (SVCs), static synchronous compensators (STATCOMs)), wave traps, and current and potential transformers. *Ac transmission Facilities cannot operate reliably without properly functioning controls.*

---

<sup>20</sup> The term “principal transmission path” would need to be defined.

### 2.1.1 Excluded Radial Transmission Facilities

We believe that it is important to set some guidelines for the exclusion of radial transmission facilities from the BES. As such, any ac transmission Facility composed of Transmission Line(s), substation Facilities, and transformers that is connected to BES ac Transmission Facilities at only one point by automatic interruption devices (e.g., circuit breaker or fuse), and that meets the following criteria, should be considered an “excluded radial transmission Facility.”

- a. Is not capable of being switched so as to be simultaneously connected to BES ac transmission Facilities at a second point. *This criterion prevents the excluded Facility from carrying loop flow.*
- b. Has no connected BES Generation. *If the transmission Facility has any BES generation connected to it, the transmission Facility would be included in the BES per 2.1.c. above.*
- c. Connected aggregate non-BES generation, unreduced for any load, does not exceed 75 MVA. *The addition of “aggregate non-BES generation, unreduced for load, exceeding 75 MVA” captures generation that may not be captured by 1.b. above if it is distributed and not at a single generating plant. Electrically, tripping distributed generation on a radial facility has virtually an identical impact to the BES as tripping the same amount of generation aggregated at a single generating plant.*
- d. Will not cause the interruption of power flow on BES ac transmission Facilities due to a fault with Normal Clearing on any of the subject transmission Facilities described above. *If tripping a radial Facility impacts BES ac transmission Facilities, there is a direct link between BES reliability and the reliability of the radial Facility, and hence the radial Facility cannot be excluded.*

The automatic interruption device(s) and (i) Protection Systems and (ii) communications and control systems associated with the excluded radial transmission Facility should be included as part of the BES, and its owner and operator should be on the NERC Compliance Registry.

*The current registry criteria states “Radial transmission facilities serving only load with one transmission source are generally not included in this definition [of BES].” The language we have provided above more clearly defines what radial means, but does not specify that an excluded radial Transmission Facility only serves load because if a radial Facility met all the criteria above and only served load, it would be excluded. Our proposal does permit some non-BES generation (up to 75 MVA) to be considered as part of an excluded radial facility. We believe this is a reasonable upper limit and would allow some self-generation by end-use customers who are connected to the grid to be excluded from the BES. The registration criteria also includes radial Facilities that are 200 kV or greater that are explicitly covered by the vegetation management standard. We believe the 200 kV or greater inclusion in FAC-003-1 – Transmission Vegetation Management Program is not necessary for the reliable operation of the BES since “radial” has been narrowly defined above. For example, our radial criteria would not exclude as “radial” a hard tap<sup>21</sup> serving load that is part of a three-terminal line, while the present radial exclusion language could include it because the load on the hard tap could be considered as having “one transmission source.”*

### 2.2 DC Transmission Facilities

Dc transmission Facilities should include:

- a. Transmission, Transmission Lines, and substation Facilities operated at 100 kV dc or higher as measured pole-to-ground for a single dc circuit (i.e., a single pole).

---

<sup>21</sup> A “hard tap” has no automatic interruption devices at the tap.

- b. Equipment that connects ac Transmission Lines and substation Facilities to dc Transmission Lines and substation Facilities, which are operated at 100 kV (ac or dc) and above (e.g., ac/dc converter terminals).
- c. Equipment, regardless of its ac or dc voltage level, that connects normally asynchronous ac Transmission, Transmission Lines, or substation Facilities operated at 100 kV or higher (e.g., ac/dc back-to-back converters).
- d. Transmission, Transmission Lines (including their associated Right-of-Way), and substation Facilities not covered above, that interconnect BES Generation to BES ac transmission Facilities, including the Cranking Path for Blackstart Resources. *See 2.1.c above.*
- e. Transmission, Transmission Lines, and substation Facilities included in the determination of an Interconnection Reliability Operating Limit or a System Operating Limit. *See 2.1.d above.*
- f. Transmission, Transmission Lines, and substation Facilities monitored by Reliability Coordinators. *See 2.1.e above.*
- g. Elements or Facilities used in the control or operation of the BES dc transmission Facilities listed above, regardless of voltage. *See 2.1.f. above.*

### **3. BES PROTECTION AND CONTROLS**

We believe that BES Protection and Controls should not only include all Protection Systems and control and communication systems that are included in Elements or Facilities for the control and operation of BES Transmission or BES Generation, but also any Protection Systems, controls and communication systems which are used to reliably operate the BES, regardless of voltage. BES Protection and Controls would include, but are not limited to, energy management systems, supervisory control and data acquisition systems, Protection Systems, Special Protection Systems (a.k.a., Remedial Action Schemes), underfrequency load shedding programs, undervoltage load shedding programs, Demand-Side Management programs using control and/or communication systems, and Protection Systems and control and communication systems and facilities operated by or relied on by Balancing Authorities, Transmission Operators, Reliability Coordinators, or Generation Operators. *Protection and control of the BES is paramount for the reliable operation of the BES. Each of the systems, programs, or facilities delineated above is used to ensure reliability. To be sure that no protection and control systems used for reliability were inadvertently excluded, we added language that this third part of the BES definition “should not only include all Protection Systems and control and communication systems that are included in Elements or Facilities for the control and operation of BES Transmission or BES Generation, but also any Protection Systems, controls and communication systems which are used to reliably operate the BES.” Any attempts to itemize such systems into an exhaustive list would inevitably leave a key one out.*

### **4. ADDITIONAL REGIONAL INCLUSIONS AND EXCLUSIONS**

Facilities not discussed above could be included or excluded by Regional Entities, depending on whether they are used for the reliable operation of the BES. Such inclusions and exclusions would be based on a process included in a future revision to NERC’s *Rules of Procedure*. Such revision would be subject to both NERC and FERC approval.

- a. Regional exclusions should not exclude Elements or Facilities covered by a standard. Such exclusions would degrade the level of reliability provided by the standard.
- b. FERC Order 672<sup>22</sup> addressed criteria for regional differences in Paragraph 291:

As a general matter, we will accept the following two types of regional differences, provided they are otherwise just, reasonable, not unduly discriminatory or preferential, and in the public interest, as required under the statute: (1) a regional difference that is more stringent than the continent-wide Reliability Standard, including a regional difference that addresses matters that the continent-wide Reliability Standard does not; and (2) a regional Reliability Standard that is necessitated by a physical difference in the Bulk-Power System.

We agree that these criteria should be the starting point for additional regional inclusions or exclusions.

- c. Facilities that are used for the reliable operation of the BES in a particular region and which are not captured in the base definition should be included as part of the BES by that region.
- d. Facilities should only be considered for exclusion by a region if they are not used for the reliable operation of the BES, provided that such facilities are incapable of being tapped onto or directly connected to the BES.
- e. If excluded Elements or Facilities are to be connected to the BES, they should have automatic interruption devices (e.g., circuit breakers or fuses) connecting them to the BES at their point of connection. Furthermore, this device and (i) Protection Systems and (ii) communications and control systems associated with the excluded Element or Facility should be included as part of the BES, and its owner and operator should be on the NERC Compliance Registry.

## 5. REGISTRATION AND FUNCTIONAL MODEL IMPACTS

This proposed BES framework would bring conforming changes to NERC's compliance registry criteria; however, this document has not attempted to define those changes. For example, a Load-Serving Entity served by a hard radial tap that it owns (as part of a three-terminal line) would be registered as a Transmission Owner since the hard tap is not excluded from the BES. Likewise, an owner of a 50 MW generating unit interconnected at 69 kV would be registered as a Generation Owner. Once the BES definition is settled, changes in the compliance registry criteria would logically follow.

Functional model changes may also be necessitated by a new BES definition. For example, in the BES Generation section, we have included Demand-Side Management resources, and no functional model entity is currently responsible for such resources within the functional model. Again, functional model changes would need to logically follow a new BES definition.

<p><b>Industry Need</b> (Provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)</p> <p>This project supports the ERO's obligation to respond to the Commission's directives and recommendations relative to the definition of Bulk Electric System identified in FERC Order 743.</p>
<p><b>Brief Description</b> (Provide a paragraph that describes the scope of this standard action.)</p>

Revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements. Develop specific inclusions and exclusions to the core definition. Identify what evidence will be needed to support a request for an exception to the new definition of BES.

**Detailed Description** (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR.)

Revise the definition of Bulk Electric System (BES) to identify specific inclusions and exclusions to the core definition, to address the Federal Energy Regulatory Commission's (FERC) concerns as identified in FERC Order 693 issued on March 16, 2007 and directives in FERC Order 743 issued on November 18, 2010. The definition encompasses all Elements necessary for the reliable operation and planning of the interconnected transmission network.

Existing NERC Glossary of Terms Definition of Bulk Electric System:

*As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.*

The authors are proposing a revised definition of the term BES to provide for improved clarity, to reduce ambiguity, and to establish a universal "bright-line" for distinguishing between BES and non-BES Elements.

This proposed definition provides consistency across the nation's reliability regions by establishing a definition that clearly describes what constitutes BES and non-BES Elements. The BES definition references an exception process (which may include regional differences as defined by FERC Order 672) that can be used to:

- Identify radial Transmission that is excluded from the BES,
- Identify Elements operated at voltages of 100kV or higher that may be excluded from the BES; and
- Identify Elements operated at voltages less than 100kV that may be included in the BES.

The proposed continent-wide definition of Bulk Electric System that the Project 2010-17 SDT will start with is:

*Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process.*

The development, approval, and application of the BES definition exception process (including periodic review) will be governed by revisions to the NERC Rules of Procedure accomplished by another team in close coordination with the revision of the BES definition.

The Standard Drafting Team will work closely with the Rules of Procedure team developing the BES

## Standards Authorization Request Form

---

definition exception process to develop a single coordinated implementation plan. The BES Definition team will solicit stakeholder input in identifying the evidence an entity will need when submitting a request for an exception to the definition of BES. While the determination of what evidence will be needed to support a request for a BES Definition Exception will be developed using NERC's standard development process, no decision has been made on "where" the final product will reside – in the definition of BES or as an attachment (e.g., a procedure identifying what evidence to produce when applying for a BES exception) to the new BES Exception Process in the Rules of Procedure.

**Standards Authorization Request Form**

**Reliability Functions**

<b>The Standard will Apply to the Following Functions</b> <i>(Check box for each one that applies.)</i>		
<input checked="" type="checkbox"/>	Reliability Assurer	Monitors and evaluates the activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the bulk power system within a Reliability Assurer Area and adjacent areas.
<input checked="" type="checkbox"/>	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
<input checked="" type="checkbox"/>	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
<input checked="" type="checkbox"/>	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
<input checked="" type="checkbox"/>	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
<input checked="" type="checkbox"/>	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within its portion of the Planning Coordinator's Area.
<input checked="" type="checkbox"/>	Transmission Owner	Owns and maintains transmission facilities.
<input checked="" type="checkbox"/>	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
<input checked="" type="checkbox"/>	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within the Transmission Planner Area.
<input checked="" type="checkbox"/>	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
<input checked="" type="checkbox"/>	Distribution Provider	Delivers electrical energy to the End-use customer.
<input checked="" type="checkbox"/>	Generator Owner	Owns and maintains generation facilities.
<input checked="" type="checkbox"/>	Generator Operator	Operates generation unit(s) to provide real and reactive power.
<input type="checkbox"/>	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
<input checked="" type="checkbox"/>	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

***Reliability and Market Interface Principles***

<b>Applicable Reliability Principles</b> <i>(Check box for all that apply.)</i>	
<input checked="" type="checkbox"/>	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
<input checked="" type="checkbox"/>	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
<input checked="" type="checkbox"/>	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
<input checked="" type="checkbox"/>	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
<input checked="" type="checkbox"/>	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
<input checked="" type="checkbox"/>	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
<input checked="" type="checkbox"/>	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
<input checked="" type="checkbox"/>	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
<b>Does the proposed Standard comply with all of the following Market Interface Principles?</b> <i>(Select 'yes' or 'no' from the drop-down box.)</i>	
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

<p><b>Brief Description</b> (Provide a paragraph that describes the scope of this standard action.)</p>

## Standards Authorization Request Form

Revise the definition of Bulk Electric System (BES) contained in the NERC Glossary of Terms to improve clarity, to reduce ambiguity, and to establish consistency across all Regions in distinguishing between BES and non-BES Elements ~~and Facilities~~. Develop specific inclusions and exclusions to the core definition. Identify what evidence will be needed to support a request for an exception to the new definition of BES.

Formatted: Font:

**Detailed Description** (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR.)

Revise the definition of Bulk Electric System (BES) ~~and to develop~~ identify specific inclusions and exclusions to the core definition, to address the Federal Energy Regulatory Commission's (FERC) concerns as identified in FERC Order 693 issued on March 16, 2007 and directives in FERC Order 743 issued on November 18, 2010. ~~(Order 743) so that t~~ The definition encompasses all Elements ~~and Facilities~~ necessary for the reliable operation and planning of the interconnected Bulk Power System transmission network.

Existing NERC Glossary of Terms Definition of Bulk Electric System:

*As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.*

The authors are proposing a revised definition of the term BES to provide for improved clarity, to reduce ambiguity, and to establish a universal "bright-line" for distinguishing between BES and non-BES Elements ~~and Facilities~~.

This proposed definition provides consistency across the nation's reliability regions by establishing a definition that clearly describes what constitutes BES and non-BES Elements ~~and Facilities~~. The BES definition references an ~~exemption~~ exception process (which may include regional differences as defined by FERC Order 672 ~~or jurisdictional exemptions as appropriate for those entities not subject to Section 215 of the Federal Power Act~~) that can be used to:

- Identify ~~the R~~ radial Transmission ~~systems~~ that ~~are~~ is excluded from the BES,
- Identify Elements ~~and Facilities~~ operated at voltages of 100kV or higher that may be excluded from the BES; and
- ~~Identify Elements~~ ~~and Facilities~~ operated at voltages less than 100kV that may be included in the BES.

The proposed continent-wide definition of Bulk Electric System that the Project 2010-17 SDT will start with is:

*Bulk Electric System: All Transmission and Generation Elements and Facilities operated at voltages of 100 kV or higher necessary to support bulk power system reliability. Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may be excluded and Elements and Facilities operated at voltages less than 100kV may be included if approved through the BES definition exemption process.*

## Standards Authorization Request Form

The development, approval, and application of the BES definition ~~exemption-exception~~ process (including periodic review ~~of exempted facilities~~) will be governed by revisions to the NERC Rules of Procedure, ~~accomplished by another team~~ in close coordination with the revision of the BES definition.

~~However, as envisioned, the Standard Drafting Team will work closely with the Rules of Procedure team developing the BES definition exemption-exception process to develop a single coordinated implementation plan. It is also envisioned, that the Rules of Procedure The BES Definition team working to develop the BES definition exemption-exception process will solicit stakeholder input from drafting teams, stakeholders, and Regional Reliability Organizations Entities in identifying the evidence an entity will need when submitting a request for an exception to the definition of BES. physical and operational characteristics for consideration in developing the BES definition exemption-exception process. While the determination of what evidence will be needed to support a request for a BES Definition Exception will be developed using NERC's standard development process, no decision has been made on "where" the final product will reside – in the definition of BES or as an attachment (e.g., a procedure identifying what evidence to produce when applying for a BES exception) to the new BES Exception Process in the Rules of Procedure.~~

## Proposed Continent-wide Definition of Bulk Electric System:

**Bulk Electric System (BES):** All Transmission Elements operated at 100 kV or higher, Real Power resources as described below, and Reactive Power resources connected at 100 kV or higher unless such designation is modified by the list shown below.

### Inclusions:

- I1 - Transformers, other than generator step-up (GSU) transformers, including phase angle regulators, with two windings of 100 kV or higher unless excluded under Exclusions E1 and E3.
- I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.
- I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.
- I4 - Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator's restoration plan regardless of voltage.
- I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.

### Exclusions:

- E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:
  - a) Only serving Load. A normally open switching device between radial systems may operate in a 'make-before-break' fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,
  - b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,
  - c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.
- E2 - A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer's side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.
- E3 - Local distribution networks (LDNs): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the interconnected System. LDN's are connected to the Bulk Electric System (BES) at

more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:

- a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
- b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;
- c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;
- d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
- e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

## Proposed Continent-wide Definition of Bulk Electric System:

**Bulk Electric System: (BES):** All Transmission and Generation Elements and Facilities operated at ~~voltage~~ 100 kV or higher, Real Power resources as described below, and Reactive Power resources connected at 100 kV or higher unless such designation is modified by the list shown below.

### Inclusions:

- I1 - Transformers, other than generator step-up (GSU) transformers, including phase angle regulators, with two windings of 100 kV or higher ~~necessary~~ unless excluded under Exclusions E1 and E3.
- I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.
- I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.
- I4 - Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator's restoration plan regardless of voltage.
- I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to ~~support~~ a system Element at a voltage of 100 kV or above.

### Exclusions:

- E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:  
a) Only serving Load. A normally open switching device between radial systems may operate in a 'make-before-break' fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,  
b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5.  
Or,  
c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.
- E2 - A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer's side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a

- binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.
- E3 - Local distribution networks (LDNs): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power ~~system reliability.~~ Elements and Facilities operated at voltages of 100kV or higher, including Radial Transmission systems, may across the interconnected System. LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:
    - a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be ~~excluded and~~ connected through automatic fault-interrupting devices;
    - b) Limits on connected generation: Neither the LDN, nor its underlying Elements and Facilities operated at voltages less than 100kV may be (in aggregate), includes more than 75 MVA generation;
    - c) Power flows only into the LDN: The generation within the LDN shall not exceed the electric Demand within the LDN;
    - d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
    - a)e) Not part of a Flowgate or transfer path: The LDN does not contain a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included ~~if approved through the BES definition exemption process~~ in an Interconnection Reliability Operating Limit (IROL).

## Implementation Plan for Project 2010-17: Definition of BES

### Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this project can be implemented. However, this definition relies heavily on the fact that an approved exception process exists in the NERC Rules of Procedure.

### Revision to Sections of Approved Standards and Definitions

There is one new definition associated with this project.

**Bulk Electric System (BES):** All Transmission Elements operated at 100 kV or higher, Real Power resources as described below, and Reactive Power resources connected at 100 kV or higher unless such designation is modified by the list shown below.

#### Inclusions:

- I1 - Transformers, other than Generator Step-up (GSU) transformers, including Phase Angle Regulators, with two windings of 100 kV or higher unless excluded under Exclusions E1 and E3.
- I2 - Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.
- I3 - Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.
- I4 - Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator's restoration plan regardless of voltage.
- I5 - Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.

#### Exclusions:

- E1 - Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:
  - a) Only serving Load. A normally open switching device between radial systems may operate in a 'make-before-break' fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,
  - b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,
  - c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.
- E2 - A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer's side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.
- E3 - Local Distribution Networks (LDN): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the Interconnected System. LDN's are connected to the Bulk Electric System (BES) at more than one location solely to

improve the level of service to retail customer Load. The LDN is characterized by all of the following:

- a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
- b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;
- c) Power flows only into the Local Distribution Network: The generation within the LDN shall not exceed the electric Demand within the LDN;
- d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
- e) Not part of a Flowgate or Transfer Path: The LDN does not contain a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

### **Effective Dates**

The effective date is the date entities are expected to meet the performance identified.

This definition shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

The SDT realizes that Order 743 suggested a maximum of 18 months for implementation of a revised definition of the BES. The 24 month period cited here is based on the various rehearing requests filed by entities expected to be affected by the revised definition. Thus, the SDT believes that this is a more realistic timeframe in which to effect any changes.

The SDT believes that the timeframe shown is needed to:

- Effectively produce reasonable transition plans – As shown in Order 743, part of the overall process of revising the definition of BES is for the ERO and Regional Entities to develop transition plans on a region by region basis to accommodate any changes needed in those regions due to the revised definition. The transition plans will include any actions necessary for entities to achieve compliance on any issues brought about by the revised definition.
- Submit any necessary registration changes – While Order 743 states that a revised definition should provide clarity and not necessarily require major changes to registration; it is possible that the revised definition may cause some registration changes. Entities will need time to submit their changes and for those changes to work their way through the process.
- File for exceptions – The revised definition does not exist in a vacuum. There is a corresponding process for entities to request exceptions for specific equipment or configurations. This process will be defined in the NERC Rules of Procedure and will involve individual entities or the Regional Entities having to make a technical case to justify the exception. This process will take

some time to complete and it would be expected that there will be an initial backlog of cases to process.

- Provide training – Entities will need to train their operators and personnel on changes to their operations brought about by the revised definition.

The existing definition of BES shall be retired upon the effective date of the new definition of BES.

## Comment Form for 1<sup>st</sup> Draft of Definition of BES (Project 2010-17)

---

Please **DO NOT** use this form to submit comments on the 1<sup>st</sup> draft of the Definition of the Bulk Electric System (Project 2010-17). This comment form must be completed by **May 27, 2011**.

If you have questions please contact Ed Dobrowolski at [ed.dobrowolski@nerc.net](mailto:ed.dobrowolski@nerc.net) or by telephone at 609-947-3673.

### Background Information Definition of the BES (Project 2010-17)

The SDT responded to the comments received for the posting of the SAR for this project by clarifying the core definition and expanding the definition to contain specific inclusions and exclusions to meet the concerns of the industry. The SDT has also used a variety of other inputs including work that was done by regional entities such as WECC, NPCC, RFC, and FRCC in coming up with the present definition. Another input was FERC Order No. 743 (and Order No. 743a) which provided several specific directives on clarifying the existing definition. The revised definition does not address functional entity registration or the applicability of standard requirements. Those are separate issues.

The core definition represents a true bright-line; but, it is clear that by itself, it does not cover all of the known situations and configurations that are needed for a complete definition. Therefore, the SDT developed several specific inclusions and exclusions that are proposed for addition to the core definition. At the present time, the SDT has drafted 5 specific inclusions and 3 specific exclusions.

Inclusions represent those items that are included as part of the Bulk Electric System (BES) where they would not have been included as part of the simple core definition. The reasons that the SDT has added these items are as follows:

- **Inclusion I1** – Transformers, other than Generator Step-up (GSU) transformers, including Phase Angle Regulators, with two windings of 100 kV or higher unless excluded under Exclusions E1 and E3.
  - Since transformers have windings operating at different voltages, clarification was required to explicitly identify which transformers to include in the BES. The SDT believes that the present draft provides this needed clarification.
- **Inclusion I2** – Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side voltage of 100 kV or above.
  - This item mirrors the NERC Compliance Registry Criteria for individual generating units. One of the basic tenets that the SDT is following is to avoid changes to registration due to the revised definition if such changes are not technically required for the definition to be complete.
  - In the comments received from the posting of the SAR for this project, the SDT found no technical rationale for changing from the present greater than 20 MVA threshold. To provide clarity on these conditions, the SDT has spelled out that the BES includes the generator terminal leads through the generator step-up transformer (GSU).
- **Inclusion I3** – Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) including the

## Comment Form for 1<sup>st</sup> Draft of Definition of BES (Project 2010-17)

---

generator terminals through the GSUs, connected through a common bus operated at a voltage of 100 kV or above.

- This item mirrors the NERC Compliance Registry Criteria for multiple generating units at a single site. One of the basic tenets that the SDT is following is to avoid changes to registration due to the revised definition if such changes are not technically required for the definition to be complete.
- In the comments received from the posting of the SAR for this project, the SDT has found no technical rationale for changing from the present greater than 75 MVA threshold. To provide clarity on these conditions, the SDT has spelled out that the BES includes the generator terminal leads through the generator step-up transformer (GSU).
- **Inclusion I4** – Blackstart Resources and the designated blackstart Cranking Paths identified in the Transmission Operator's restoration plan regardless of voltage.
  - Blackstart units and their respective cranking paths are considered vital to the overall operation of the BES.
  - Consequently, the SDT has included Blackstart Resources and their respective Cranking Paths in the BES regardless of voltage level.
- **Inclusion I5** – Dispersed power producing resources with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating) utilizing a collector system through a common point of interconnection to a system Element at a voltage of 100 kV or above.
  - This item was added to accommodate the effects of variable generation on the BES. The intent of this configuration is to include variable generation (e.g., wind and solar resources) with an aggregate rating greater than 75 MVA at one location and was considered different enough from what was proposed in Inclusion I3 to warrant its own inclusion statement for clarity.

In addition to inclusions, to complete the picture, specific exclusions also need to be considered. The SDT has currently drafted 3 specific exclusions:

- **Exclusion E1** – Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and:
  - a) Only serving Load. A normally open switching device between radial systems may operate in a 'make-before-break' fashion to allow for reliable system reconfiguration to maintain continuity of electrical service. Or,
  - b) Only including generation resources not identified in Inclusions I2, I3, I4 and I5. Or,
  - c) Is a combination of items (a.) and (b.) where the radial system serves Load and includes generation resources not identified in Inclusions I2, I3, I4 and I5.
    - This item was added to address the basic issue of radial systems. A radial exclusion is part of the existing definition and was supported moving forward in all of the regional work as well as Order No. 743 (and Order No. 743a). The SDT has clarified this exclusion by specifying that protection for the BES is a required element of the system to be excluded. The SDT believes that faults on radial lines without protection devices could negatively impact the BES.

## Comment Form for 1<sup>st</sup> Draft of Definition of BES (Project 2010-17)

---

- **Exclusion E2** – A generating unit or multiple generating units that serve all or part of retail Load with electric energy on the customer’s side of the retail meter if: (i) the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load pursuant to a binding obligation with a Balancing Authority or another Generator Owner/Generator Operator, or under terms approved by the applicable regulatory authority.
  - This item was added to address the situation of behind-the-meter generation. The wording is basically extracted from the NERC Compliance Registry Criteria.
- **Exclusion E3** – Local Distribution Networks (LDN): Groups of Elements operated above 100 kV that distribute power to Load rather than transfer bulk power across the Interconnected System. LDN’s are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load. The LDN is characterized by all of the following:
  - a) Separable by automatic fault interrupting devices: Wherever connected to the BES, the LDN must be connected through automatic fault-interrupting devices;
  - b) Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA generation;
  - c) Power flows only into the Local Distribution Network: The generation within the LDN shall not exceed the electric Demand within the LDN;
  - d) Not used to transfer bulk power: The LDN is not used to transfer energy originating outside the LDN for delivery through the LDN; and
  - e) Not part of a Flowgate or Transfer Path: The LDN does not contain a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Quebec Interconnection, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).
    - Local distribution networks were added to the exclusion list after considerable discussions among the SDT and various registered entities that have configurations meeting these conditions. The SDT believes that any network that simply supports distribution and is providing adequate protection should be excluded from the BES.

In parallel with the definition project, another team has been set up to develop a change to the NERC Rules of Procedure (ROP) to allow entities to technically justify excluding Elements from the BES that might otherwise be included according to the proposed definition. This same process would be used by Registered Entities to justify including Elements in the BES that might otherwise be excluded according to the proposed definition. Finally, this process would also be used for those situations where the core definition does not clearly identify whether an Element is part of the BES or not. This ROP team will develop the process for seeking an exemption from the definition but the DBES SDT will develop the criteria necessary for inclusion with a request for an exemption through the standards development process.

Yes:

## Comment Form for 1<sup>st</sup> Draft of Definition of BES (Project 2010-17)

---

No:

Comments:

10. The SDT is discussing an exclusion from the Bulk Electric System (BES) for small utilities based on statements in Order No. 743 that FERC does not believe its suggested approach to the BES definition and exemption process will have a significant economic impact on a substantial number of small entities and that small entities will not adversely impact the reliability of the Bulk Electric System. The SDT has been made aware that organizations that are not presently required to be registered by the NERC Statement of Compliance Registry Criteria would meet the requirements to be registered as Transmission Owners given the current proposed BES definition. These small utilities could use the Rules of Procedure (ROP) exception process but this may be an issue that could be handled more appropriately through the BES definition. This would alleviate the paperwork burden for these small utilities and also avoid a possibly unnecessary and significant impact on the administration of the ROP exception process during the transition period to the revised BES definition. The proposed exclusion language is:

Exclusion E4: Transmission Elements, from a single Transmission source connected at a voltage of 100 kV or greater, owned by a small utility whose connection to the BES is solely through this single Transmission source, and without interconnected generation as recognized in the BES Designation Inclusion Items I2, I3, I4, or I5. A small utility is recognized as an entity that performs a Distribution Provider or Load Serving Entity function but is not required to register as a Distribution Provider or Load Serving Entity by the ERO.

Do you agree with this approach and the proposed language? If not, please be specific in your response with a technical reason for your disagreement and, if appropriate, suggested language for such an exclusion if you agree in general but feel that alternative language would be more appropriate.

Yes:

No:

Comments:

11. In Order No. 743, the Commission addressed the need to differentiate between Transmission and distribution in the revised definition of the Bulk Electric System (BES). Specifically, the Commission stated that local distribution facilities are to be excluded from the BES. The SDT believes that it has excluded local distribution facilities through the revised bright-line core definition and specific inclusions and exclusions. Do you agree with this position? If not, please provide specific comments and suggestions on what else needs to be addressed or added.

Yes:

No:

Comments:

12. Are you aware of any conflicts between the proposed definition and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement, or jurisdictional issue? If so, please identify them here and provide suggested language changes that may clarify the issue.

## Standards Announcement

### Bulk Electric System Definition Revision Status

#### Background

On November 18, 2010 FERC issued [Order 743](#) and directed NERC to revise the definition of Bulk Electric System (BES) so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. Additional specificity will reduce ambiguity and establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

In addition, NERC was directed to develop a process for identifying any Elements or Facilities that should be excluded from the BES. NERC is working to address these directives with two activities – the definition of Bulk Electric System (BES) is being revised through the standard development process and a BES Definition Exception Process is being developed as a proposed modification to the NERC Rules of Procedure.

#### Teams

Two teams have been formed to develop the products needed to respond to Order 743. The first team is a drafting team working under the direction of the Standards Committee. This team is called the BES Definition Team (BES DT) and its work is publicly posted on the following web page with a link to toggle between the work of this team and the work of the BES Rules of Procedure Team:

[http://www.nerc.com/filez/standards/Project2010-17\\_BES.html](http://www.nerc.com/filez/standards/Project2010-17_BES.html)

The second team is working under the direction of NERC staff and is called the BES Rule of Procedure Team (BES ROP). Its work is publicly posted on the following web page with a link to toggle between the work of this team and the work of the BES Definition Team:

[http://www.nerc.com/filez/standards/Rules\\_of\\_Procedure-RF.html](http://www.nerc.com/filez/standards/Rules_of_Procedure-RF.html)

#### Deliverables

The Standards Committee and the Standards staff have received many comments concerning the division of work between these two teams. The leadership of the BES Definition SDT and Rules of Procedure team met with the leadership of the Standards Program and the Standards Committee and determined that the BES Definition SDT will assume responsibility for working with stakeholders to identify what evidence is needed to support a request for an exception to the BES definition. The BES Definition team will solicit stakeholder input to identify the evidence an entity will need to provide when submitting a request for an exception to the definition of BES.

Product	BES Definition Team	BES Rule of Procedure Team
Revised BES Definition	X	
Identification of evidence needed to support a request for an exception to the BES definition	X	
Addition to Rule of Procedure		X
Implementation Plan	X	X

While the determination of what evidence will be needed to support a request for a BES Definition Exception will be developed using NERC's standard development process, a decision on where the final product will reside - in the definition of BES, or as an attachment (e.g., a procedure identifying what evidence to produce when applying for a BES exception) to the Rules of Procedure will be made jointly by the leadership of the Standards Program and the Standards Committee at a later stage. Given the time constraints of this project, having all the technical content associated with this project developed by a single team seemed the most efficient decision.

### **Status**

The BES Definition Team has posted its consideration of the comments submitted in response to questions about the SAR, initial draft definition, and list of criteria for either inclusion or exclusion from the definition of BES. The team has also posted its next draft of the definition of BES and will be posting a comment form in mid-April to collect stakeholder feedback on the revised definition.

The BES ROP Team has been meeting and expects to post a draft of its proposed ROP in late April for stakeholder feedback.

Members of the two teams are sharing information and ideas and working cooperatively to ensure cohesion in the final products.

For more information or assistance, please contact Monica Benson,  
Standards Process Administrator, at [monica.benson@nerc.net](mailto:monica.benson@nerc.net) or at 404-446-2560.

## Standards Announcement

Project 2010-17 BES Definition

Comment Period Open April 28-May 27, 2011

Now available at: [http://www.nerc.com/filez/standards/Project2010-17\\_BES.html](http://www.nerc.com/filez/standards/Project2010-17_BES.html)

### Formal 30-day Comment Period Open through 8 p.m. on May 27, 2011

A proposed revision to the definition of “Bulk Electric System,” and an associated implementation plan have been posted for a formal comment period until **8 p.m. Eastern on May 27, 2011**.

The BES Definition Drafting Team is also working to identify what evidence is needed to support a request for an exception to the BES definition. The BES Definition team expects to post its initial Technical Justification Principles proposal describing the evidence needed to support a request for an exception to the BES definition in early May and will seek stakeholder comments on its proposal.

A separate team is working to identify the necessary changes to NERC’s Rules of Procedure to incorporate the process for requesting exceptions. The proposed changes to the Rules of Procedure will also be posted in early May. Once all three documents have been posted (draft revised BES Definition, proposed Technical Justification Principles, and proposed Rules of Procedure changes) and prior to the end of the comment periods, a webinar will be scheduled.

### Instructions

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at [monica.benson@nerc.net](mailto:monica.benson@nerc.net). An off-line, unofficial copy of the comment form is posted on the project page: [http://www.nerc.com/filez/standards/Project2010-17\\_BES.html](http://www.nerc.com/filez/standards/Project2010-17_BES.html)

### Next Steps

The drafting team will consider all comments and determine whether to make additional changes to the definition and its implementation plan. The team will post its response to comments and, if changes are made to the definition and implementation plan, submit the revised documents for quality review prior to the next posting.

### Project Background

On November 18, 2010 FERC issued [Order 743](#) and directed NERC to revise the definition of Bulk Electric System so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. Additional specificity will reduce ambiguity and establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

In addition, NERC was directed to develop a process for identifying any Elements or Facilities that should be excluded from the BES. NERC is working to address these directives with two activities – the definition of Bulk Electric System (BES) is being revised through the standard development process and a BES Definition

Exception Process is being developed as a proposed modification to the Rules of Procedure. The work of the BES Definition Exception Process has been publicly posted at:

[http://www.nerc.com/filez/standards/Rules\\_of\\_Procedure-RF.html](http://www.nerc.com/filez/standards/Rules_of_Procedure-RF.html)

### **Standards Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

I agree in principle with the changes; however the definition and direct effect on certain small entities has not been improved. Primarily there are many entities that will be included that are marginal at best. Such entities will include intermittent generation such as wind, which may, or may not fit into the designation of aggregation of up to 75 MVA. It is becoming a practice to size a farm, or phase of a farm, to under 75MVA to get around the rules. A site is not defined and could be defined very narrowly. I do not agree with the 20MVA threshold for single generators when the generators net output cannot reach the 20MVA output. Trash burning facilities have heavy station service loads and by nameplate are included when in reality they operate below the arbitrary cut off. FERC has asked for technically justified standards, and the proposed BES definition still applies an arbitrary threshold not supported by technical argument. This issue is further aggravated by location of these resources. Many of these resources are remotely located specifically so that they have no, or minimize impact on the BES. Many times they are on long lines that are over 100KV simply because of efficiency in electrical transmission.
Yes
No
In the discussion the Drafting team stated they found no technical rational to change the 20 MVA rule, however there is no technical rational to support 20 MVA either. There are arguably cases where it will be appropriate to include these generators; however there are may instances where these

generators should not be included. This should be driven by the interconnected transmission operators, not by an arbitrary threshold. In the WECC there are multiple examples of small/medium hydro, waste-to-energy, and other non-dispatchable generation that not only are located where they cannot add to the reliability of the BES, are not manned, and are bound by contractual relationships by a BA. These facilities have a tendency to have multiple forced outages, are affected by weather events, and are not considered reliable by the interconnected transmission operator for BES reliability purposes. Many of these facilities generate power as a secondary business, not primary. Wood burning, trash burning is waste disposal, irrigation projects are primarily focused on water delivery. Failure of power generation is not addressed as a primary importance during a failure, and none of these facilities were constructed to benefit the BES. In many cases the contract to construct these facilities was predicated on proving they do not impact the interconnected transmission operator or the BES.

No

Though as previously stated I do not think that the 20 MVA threshold has technical merit, I do not believe that the 75MVA limit has technical merit either. Further the impact should be measured at the buss bar not at the nameplate. The aggregate rating should be the same as the individual unit rating on a single plant, unless the plant can prove that there is not a common failure mode to lose more than 20MVA.

Yes

There continues to be confusion in the industry of blackstart by Generator Owners and Operators (especially small to medium generation), and the drafting team should clearly define what is meant by blackstart. Many small generators have the capability to blackstart their resource, but are not part of the Transmission Operator's blackstart plan on restoring the BES. In most cases they are asked to blackstart if possible and wait until lines are energized and close in as directed by Transmission Operator. This is significantly different than owning a blackstart resource designated to provide power during a blackout.

No

Though the intent is understood through the discussion, the language presented is not clear enough. The drafting team should be cautioned on how Standards are read through many different entities and audiences. The team should also understand if the issue is not clearly defined, there will continue to be ambiguity through the registration and compliance processes. As previously stated on an earlier question, I do not think that the 20 MVA threshold has technical merit, I do not believe that the 75MVA limit has technical merit either. Further the impact should be measured at the buss bar not at the nameplate. The aggregate rating should be the same as the individual unit rating on a single plant, unless the plant can prove that there is not a common failure mode to lose more than 20MVA.

No

Small radial systems that have two interconnection points at the same location or very close to the same location, but are not used for Transmission flow through should also be excluded. There are numerous examples of two interconnection points that are paralleled by much higher voltage systems and do not flow power through the system, but are redundant to increase distribution reliability. This should be left to the Transmission Operator/Transmission Owner to determine if there is flow through and impact to the BES before designating these as BES assets based on interconnection points. Radial should be defined as power flowing one direction only, not based on how it is interconnected to 100KV or higher lines.

No

This is very confusing. Understanding the Drafting Team's goal, it would better to adjust the I2 and I3 criteria to address NET generation and behind the meter generation. E2 appears to try and address the net generation versus nameplate issue, but not fully. Station service power is behind the meter and it is a commitment of the resource. Many small generators have multiple processes outside of power generation they must provide for, and these should be considered in the exceptions.

Yes

This does address some of my concerns on small radial transmission systems. I think that there will be confusion when small entities try and apply both E3 and E1 to their particular situations. The ambiguity will cause more questions than it is trying to answer.

No

This does not address the full concerns of these small entities. In on case I am familiar with the entity has a switchyard over 100KV and it was convenient for the interconnected utility to utilize the location of the switchyard to add a line for the Transmission Operators purpose, however now that there are two lines into the switchyard it has affected the small utility and they will not have exemption as described in Question 10. The financial burden is very high for these entities when not exempted. In this particular case noted above, the entity is planning to eventually decommission its system, but is caught in having to bear the cost of operating a transmission system even though it is only one substation that is immediatly stepped down to 13.8Kv and feeding a small distributed load. The proposed exemption will still not allow this entity to be exempt. The ROP process does not serve these small utilities well as an alternative and the Drafting Team should resolve these issues in the definition of the BES if possible.

No

Due to the voltage bright line of 100kV there is still a question of what makes up sub-transmission. Many rural companies with large geographic areas use the 115kV system internally as sub transmission, but because of the bright line it is considered part of the transmission system. This is not its purpose, or how it is operated. There are no commercial paths, and no transmission flow through. On the other hand there are significant generation resources (significantly over 20MVA) that are interconnected directly through the sub transmission system to the BES, and by definition, since they are not interconnected at 100kV, they are exempted from BES status. Some of these facilities do have direct impact on the BES.

No

Generation that is BES significant that is not connected at 100kV or above.

Individual

Si Truc PHAN

Hydro-Quebec TransEnergie

No

The bright line revised definition could expand significantly what is considered to be BES in the case of HQT, with no discernible impact on the reliable operation of the interconnected system, because of the nature of the Québec interconnection. Furthermore, it should be stated that there appears to be a conflict between the proposed definition and the regulatory framework applicable in Québec or at least there are some important differences between both. The non-FERC jurisdiction was acknowledged by FERC Order 743 in paragraph 95. As an example, the Québec regulatory framework considers that there are several levels of application for standards, not only one. A single BES definition cannot apply to all standards. The definition must include more latitude for non-FERC jurisdictions, as long as the reliability objective is achieved.

No

Since transformers are already part of "all transmission Elements operated at 100 kV and above" in the definition, and since inclusions 12 to 15 are commonly related to only generation, 11 should be removed and replace instead by the following Exclusion: Ex "Transformers not used as Generator Step-Up (GSU) transformers that have primary or secondary winding at less than 100 kV."

No

We believe that it is not necessary to include small generator of 20 MVA into the BES, neither the transmission path that connect them. However, a provision should be made so that some reliability standards related to generator shall apply (voltage regulation, etc.).

No

We believe that automatic inclusion of 75 MVA generation and the path to connect them to the BES should not be automatically included in the BES. However, a provision should be made so that some reliability standards related to generator shall apply (voltage regulation, etc.).

No

When we have to use Blackstart Resources, there is no more system. Therefore, reliability is not a system planning issue, the need is no more for reliability since we lost the System or part of it. It becomes a need for restoration of the system as fast as possible. The restoration plan is necessary, but the Blackstart Resources and do not contribute to the reliability of the System, which just failed,

but to limit the time of loss of service. There is no obligation to apply the same Reliability Standards on the paths and it should not be automatically included in the BES.

No

We believe that automatic inclusion of dispersed generation greater than 75 MVA and the path to connect them to the BES should not be automatically included in the BES. However, a provision should be made so that some reliability standards related to generator shall apply (voltage regulation, etc.).

No

It is too much restrictive to refuse exclusion of radial system when they have generator greater than 20 MVA, or multiple generating units of aggregate capacity greater than 75 MVA, especially when a system is able to function reliably with the loss of generation much higher than this amount. The fact that no Reliability Standards apply to generators excluded from BES is problematic. Generators should be allowed to be excluded but reliability standards should apply to them in specific. Also, the connection through only a single Transmission source is again too restrictive. Other Transmission source could be used for load continuity of service and the restriction should be limited to radial transmission paths where the power flow is greater than the first contingency lost.

No

Part b) is again very restrictive. It is not necessary to refuse exclusion when generation is above 75 MVA. However, a provision should be made so that reliability standards related to generator shall apply.

No

The case of small Utility is covered through other exclusions. However, the Facilities owned by small utility should have protection requirement applied.

No

See comments on E3 (Q.9)

Yes

There appears to be a conflict between the proposed definition and the regulatory framework applicable in Québec or at least there are some important differences between both. NERC's proposed definition of Bulk Electric System ("BES") is made in response to FERC's Order 743. FERC is looking to remove regional discretion, and in some cases to make sure BES includes the most important national load centers. As for HQT's System, the BES definition shall meet the expectations of Quebec's regulator, the Régie de l'Énergie du Québec, (Quebec Energy Board) which has the responsibility to ensure that electric power transmission in Québec is carried out according to the reliability standards it adopts. In a recent order (D-2011-068), the Régie de l'Énergie du Québec has recognized several level of application for the Reliability Standards in Québec. It stated specifically that most reliability standards in Québec shall be applied to the Main Transmission System (MTS). One other level of application recognised by this decision is the NPCC Bulk Power System (BPS) to which the standards related to the protection system (PRC-004-1 and PRC-005-1) and those related to the design of the transmission system (TPL 001-0 to TPL-004-0) will be applicable. The Main Transmission System definition is somewhat different than the Bulk Electric System definition. The Main Transmission System includes elements that impact the reliability of the grid, supply-demand balance and interchanges. It can be described as follows : The transmission system comprised of equipments and lines generally carrying large quantities of energy and of generating facilities of 50 MVA or more controlling reliability parameters: • Generation/load balancing • Frequency control • Level of operating reserves • Voltage control of the system and tie lines • Power flows within operating limits • Coordination and monitoring of interchange transactions • Monitoring of special protection systems • System restoration Therefore, it will be necessary to accommodate NERC's proposed definition of BES or the exception process with the Québec situation where Entities are under a different jurisdiction. These differences include more than one level of application for the reliability standards, the Main Transmission System definition being the main one to which most reliability standards apply.

Individual
Jerome Murray
Oregon Public Utility Commission Staff
No
The inclusion of individual generation units with a nameplate capacity between 20 MVA and 75 MVA is over-inclusive and unnecessary. Generation in this range generally has no impact to the reliability of the bulk transmission system. The 20 MVA threshold was pulled from the existing NERC Statement of Compliance Registry. This Registry value was adopted without the benefit of having been scrutinized through a NERC Standards Development Process, so the technical record justifying the 20 MVA threshold is unavailable. The BES Drafting Team will need to have technical justification for adopting the 20 MVA threshold beyond the fact that it was previously adopted by NERC in a different framework. Absent any technical justification, Inclusion I2 should be eliminated. This would leave the 75 MVA threshold in Inclusion I3 and Inclusion I5 as the minimum BES thresholds for generation. The proposed BES Definition does not address the BES "demarcation points" and whether the BES must be "contiguous." NERC Staff has submitted written comments to this project stating that the BES "must be contiguous." Instituting a contiguous BES with Inclusion I2 would result in an over-inclusive BES definition. The adoption of a "contiguous" BES is therefore likely to result in imposition of reliability standards on a substantial number of distribution elements that have nothing to do with improving or protecting the reliability of bulk transmission system. There is no compelling reason to adopt a "contiguous" BES down into local distribution systems. Section 215 of the FPA of 2005 gives FERC jurisdictional authority over "users" as well as "owners" and "operators" of the bulk power system. Consequently, FERC has the jurisdictional authority to require generation entities in the

Compliance Registry to comply with applicable NERC requirements. Hence, even where an entity does not own or operate BES assets, it could still be required, for example, to provide necessary information to the applicable Reliability Coordinator or Planning Coordinator and to participate in programs to prevent instability, uncontrolled separation or cascading outages to the bulk transmission system. This approach would fully achieve the goals of bulk transmission system reliability without imposing the full BES regulatory compliance burden on local distribution elements.

Yes

Exclusion I as currently proposed adequately defines radial systems; however, Inclusion I2 language should be removed per the rationale stated in the response to Question 3 above. To retain the Inclusion I2 language herein would sweep in an abundance of distribution elements that have no impact on the reliable operation of the interconnected bulk transmission system.

Yes

Exclusion E3 is absolutely necessary for excluding local distribution elements from the interconnected bulk transmission system as required by Section 215 of the FPA of 2005. This exclusion mirrors the Seven Factor Test (established in FERC Order 888), which sets sound overarching principles for differentiating local distribution elements from bulk transmission elements. Also, the conversion of radial systems to local distribution networks is generally implemented by a distribution provider to improve the level of service to local retail customers, not to accommodate bulk transfer of wholesale power. Retaining Exclusion E3 is absolutely crucial for maintaining the 100 kV brightline in the core BES definition. Without the distribution network E3 exclusion, the voltage threshold in the core BES definition would need to be changed to the 200 kV level. Otherwise, NERC and Regional Entities will have to deal with endless exception applications and evaluations associated with the removal of local distribution elements that have no impact on the reliable operation of the interconnected bulk transmission system.

No

Without BES "demarcation" and "contiguous" principles being addressed in the proposed BES definition, this question is difficult to answer. NERC Staff has submitted written comments to this project stating that the BES "must be contiguous." Instituting a contiguous BES with Inclusion I2, for example, would result in a substantially over-inclusive BES definition. The adoption of a "contiguous" BES is therefore likely to result in imposition of reliability standards on a substantial number of distribution elements that nothing to do with improving or protecting the reliability of bulk transmission system. There is no compelling reason to adopt a "contiguous" BES down into local distribution systems. Section 215 of the FPA of 2005 gives FERC jurisdictional authority over "users" as well as "owners" and "operators" of the bulk power system. Consequently, FERC has the jurisdictional authority to require generation and other entities in the Compliance Registry to comply with applicable NERC requirements. Hence, even where an entity does not own or operate BES assets, it could still be required, for example, to provide necessary information to the applicable Reliability Coordinator or Planning Coordinator and to participate in programs to prevent instability, uncontrolled separation, or cascading outages to the bulk transmission system. This approach would fully achieve the goals of bulk transmission system reliability without imposing the full BES regulatory compliance burden on local distribution elements.

Eric Lee Christensen

Public Utility District No. 1 of Snohomish County, Washington

Yes

As a general matter, Snohomish County PUD supports the approach the Standards Development Team ("SDT") has taken to defining the Bulk Electric System ("BES"). In the comments we submit

today, we identify several refinements we believe would improve the definition. We also discuss the legal framework the SDT must operate under as we understand it. But we support the SDT's conceptual approach and, if refined as we suggest, we will support the SDT's proposal so long as an acceptable process for defining exceptions accompanies the definition. As to the core definition addressed in Question 1, Snohomish believes the changes made in the revised definition are helpful and represent significant progress toward an acceptable definition. Nonetheless, we are concerned that the core definition is overly-broad and sweeps facilities into the BES that are required by the statute to be excluded, even considering the list of inclusions and exclusions. We therefore suggest two different approaches below that may achieve the SDT's aims more effectively than the proposed core definition. At a minimum, as we explain below, additional clarifications to the core definition are necessary and an acceptable exemption process is required to ensure that facilities that by statute must be excluded are excluded from the BES as defined by the SDT. At the outset, we urge the SDT to bear in mind the specific restrictions on the definition of "bulk-power system" contained in Section 215 of the Federal Power Act ("FPA") (Following FERC's guidance on the question, we treat the statutory term "bulk-power system" as equivalent to the term ordinarily used in the industry, "Bulk Electric System"). In Section 215(a)(1), Congress defined "bulk-power system" to mean "facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof)" and "electric energy from generation facilities needed to maintain transmission system reliability." 16 U.S.C. § 824o(a)(1). Congress unequivocally excluded from this definition "facilities used in the local distribution of electric energy." *Id.* The "bulk-power system" definition thus imposes a clear limit on the reach of the mandatory reliability regime. Congress reinforced that limit in Section 215(i), where it emphasized that the FPA authorizes the imposition of reliability standards "for only the bulk-power system." 16 U.S.C. § 824o(i)(1) (emph. added). Further, the SDT must bear in mind "the cardinal rule that a statute is to be read as a whole since the meaning of statutory language, plain or not, depends on context." *City of Mesa v. FERC*, 993 F.2d 888, 893 (D.C. Cir. 1993) (citation omitted). In considering how Congress used the term "bulk-power system" in the statute, as well as the limits on the reliability regime imposed in the surrounding statutory language, it is clear that Congress intended the "bulk-power system" to be defined narrowly so that it would incorporate only high-voltage, interstate facilities used to transmit power over long distances, whose failure threatens drastic reliability events such as cascading outages. These limitations are plain from, for example, the statutory definition of "reliability standard," which provides that reliability standards are to encompass only requirements to "provide for reliable operation of the bulk-power system." 16 U.S.C. § 824o(a)(3) (emph. added). Congress further refined the scope of reliability authority by specifically defining "reliable operation" to mean "operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance. . . or unanticipated failure of system elements." 16 U.S.C. § 824o(a)(4). Congress's intent to focus the national reliability regime on broad-scale threats to the interconnected, interstate high-voltage system like cascading outages is made clear, as well, by Congress's specific direction that the mandatory reliability system is prohibited from enforcing standards for adequacy of service, which were left to state and local authorities. 16 U.S.C. § 824o(i)(2). When read in the context of the statute as a whole, the definition developed by the SDT should therefore focus on that portion of the interconnected bulk transmission grid for which thermal, voltage, and stability limits must be observed in order to prevent instability, separation events, and cascading outages. Further, in order to honor the specific limits placed on the definition by Congress, the SDT's definition must exclude facilities used in the local distribution of electric power and it must exclude facilities whose operation or mis-operation affects only the level of service and does not threaten cascading outages or other widespread events on the bulk interconnected system. Snohomish is concerned that the SDT's proposed definition is overly-broad, and that it will sweep in many Elements that have little or no material impact on the reliable operation of the interconnected bulk transmission grid. For example, the definition would sweep in all generators with 20 MVA capacity even though generators this small rarely create impacts on the interconnected bulk transmission system that would threaten to violate the thermal, voltage or stability limits of the bulk transmission system and therefore do not threaten instability, separation, or cascading outages on the interconnected transmission system. Accordingly, for the BES definition to conform to the requirements of the statute, the SDT must adopt an effective mechanism to exempt facilities like these that are improperly swept in by the SDT's brightline approach to inclusions and exclusions. For this reason, the Exception process to accompany the SDT's definition is of critical concern. It constitutes the last line of defense against a SDT definition that

sweeps in facilities excluded by the statutory definition. Snohomish believes the SDT can achieve the goals of FERC's Orders No. 743 and 743-A while honoring these statutory limits by taking one of two alternative approaches to the core definition. First, perhaps the simplest way the SDT could achieve the goals of FERC Order No. 743 while avoiding overbreadth that violates statutory limits is to simply adopt the statutory definition of "bulk-power system" as the core definition. This approach is commonly used by regulatory agencies in defining key jurisdictional terms to ensure that the agency does not cross statutory boundaries when carrying out the duties assigned to it by Congress. Under this approach, the core definition would simply echo the statutory definition, substituting "Bulk Electric System" for its statutory equivalent, "bulk-power system": The term 'Bulk Electric System' means: (A) Facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and, (B) Electric energy from generation facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy. See 16 U.S.C. § 824o(a)(1). The inclusions and exclusions developed by the SDT, with the refinements we discuss below, would then be added to provide guidance in the application of this definition to specific classes of electric system facilities and Elements. A second alternative approach is to make the smallest possible adjustment to the current BES definition that suffices to address the central concern expressed by FERC in Orders No. 743 and 743-A. Those orders emphasized that FERC's concerns are with the initial phrase in the current NERC BES definition, which provides that the "Bulk Electric System" is: As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. In Order No. 743, FERC made clear that it views the initial phrase ("As defined by the Regional Reliability Organization") as creating unreviewable discretion for Regional Entities to define the BES in their region, and that this unreviewable discretion, rather than lack of uniformity per se, is the problem Order No. 743 is designed to remedy. See, e.g., Order No. 743, 133 FERC ¶ 61,150 at P 16 (2010) (FERC believes the "best way to address these concerns is to eliminate the Regional Entities' discretion to define 'bulk electric system' without ERO or Commission review"; id. at 30 (same). In Order No. 743-A, FERC clarified that the primary aim of its rulemaking was to eliminate this unreviewed regional discretion, and it was not, as FERC had originally proposed, to create a uniform national definition that does not allow for any regional variation. Order No. 743-A, 134 FERC ¶ 61,210 at P 11 ("We clarify that the specific issue the Commission directed the ERO to rectify is the discretion the Regional Entities have under the current bulk electric system definition to define the parameters of the bulk electric system in their regions without any oversight from the Commission or NERC."); id. at P 39 ("The Commission's suggested solution simply would eliminate regional discretion that is not subject to review by [NERC] or the Commission"). Accordingly, the SDT could achieve the primary aim of Order No. 743 by simply rewriting the current definition to read: Unless a different definition has been developed by the Regional Reliability Organization and approved by NERC and FERC, the Bulk Electric System is defined as the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. If the SDT uses this suggested language as its core definition, it will have addressed FERC's primary concern with a minimum of disruption to the current NERC system of definitions. The definition could then be further elaborated with the list of specific inclusions and exclusions of Elements and systems (modified as discussed below), to provide more specific guidance to the industry. In this connection, we note that a 200 kV threshold would be more appropriate for WECC than a 100-kV threshold. This is because generation in the West is generally located far from load, and power is generally transmitted from these generation sources to distant load centers on extremely high-voltage lines, usually operating in the range of 230-kV to 500-kV. Further, because loads are often dispersed across relatively broad geographic areas, especially in the rural West, 115-kV lines are frequently used in local distribution systems. See WECC Bulk Electric System Definition Task Force, Initial Proposal and Discussion, at pp. 11-16 (posted May 15, 2009) (available at: <http://www.wecc.biz/Standards/Development/BES/default.aspx>) (technical discussion showing that most transmission in the Western Interconnection operates at voltages greater than 200 kV). Accordingly, a 200-kV threshold with an "inclusion" mechanism to sweep in the relatively limited number of 115-kV lines in the West that perform a transmission function would be better suited to the typical topology of systems in the West than a 100-kV threshold with exceptions for facilities that operate as local distribution. That being said, we recognize that 200-kV may not be an appropriate threshold for other parts of the country and we are willing to support the SDT's approach as long as discretion is preserved for the WECC to develop a definition better suited to the conditions in the

Western Interconnection. If the STD elects not to adopt one of the above suggestions, the core definition proposed on April 28 requires clarification. Specifically, as drafted, the proposed definition is ambiguous in that it is not clear whether the clause “unless such designation is modified by the list shown below” modifies only the preceding clause (“Reactive Power resources connected at 100 kV or higher”) or the entire definition. To eliminate this ambiguity, we suggest that the proposed definition be reordered to read as follows: Bulk Electric System (BES): (A) Unless included or excluded in subpart B, the Bulk Electric System consists of: (1) all Transmission Elements operated at 100 kV or higher; (2) Real Power resources identified in subpart B; and, (3) Reactive Power resources connected at 100 kV or higher. (B) [the list of inclusions and exclusions, modified as discussed in our responses to questions 2 through 9]. Rearranging the definition in this way should make clear that the list of inclusions and exclusions that would be inserted as Subpart B modifies each provision of Subpart A. Thus, for example, even if a Transmission Element is otherwise included by virtue of operating at 100 kV or higher, it is nonetheless excluded if specifically addressed in the list of exclusions that would be incorporated as subpart B of the definition (if, for example, the Element qualifies as a Local Distribution Network). The rearrangement of the language eliminates any argument that the phrase “unless such designation is modified by the list shown below” does not modify “all Transmission Elements operated at 100 kV or higher” because of its placement at the end of the independent clause “Reactive Power resources connected at 100 kV or higher.” Snohomish supports the use of the phrase “Transmission Elements” as the starting point for the base definition because both “Transmission” and “Elements” are already defined in the NERC Glossary of Terms Used, and the use of the term “Transmission” makes clear that the Bulk Electric System includes only Elements used in Transmission and therefore excludes Elements used in local distribution of electric power. As discussed above, the definition must exclude facilities used in local distribution in order to comply with the limits placed on NERC authority by Congress in Section 215 of the Federal Power Act (“FPA”), 16 U.S.C. § 824o. For similar reasons, we believe the SDT has improved the proposed definition from its initial proposal by eliminating the use of terms such as “Generation” that are not specifically defined in the NERC Glossary of Terms and by eliminating terms such as “Facility” that include “Bulk Electric System” as part of their definition. Eliminating the use of such terms helps sharpen the core definition. If a key term is undefined, incorporating it into the definition only begs the question of how the incorporated term is defined. If a currently-defined term uses the phrase “Bulk Electric System” as part of its definition, incorporating that term into the BES definition creates a confusing circularity. We therefore support the SDT’s use of defined terms such as “Element,” “Real Power,” and “Reactive Power.”

Yes

In concept, we support the SDT’s attempt to provide a clear demarcation between the BES and non-BES elements. Inclusion I-1 is helpful because it at least implies that the BES ends where power is stepped down from transmission voltages to distribution voltages. We believe, however, that the SDT should undertake the effort to more clearly define the point where the BES ends and non-BES systems begin. In this regard, we note that the WECC Bulk Electric System Definition Task Force (“BESDTF”) has devoted considerable effort to this question and has developed one-line diagrams denoting the BES demarcation point for a number of different kinds of Elements that are common in the Western Interconnection. See WECC BES Definition Task Force Proposal 6, Appendix C (available at: <http://www.wecc.biz/Standards/Development/BES/default.aspx>). Similarly, the FRCC’s BES Definition Clarification Project has devoted considerable effort to developing one-line diagrams of transmission and distribution Elements, and identifying the point of demarcation between BES and non-BES Elements. See FRCC BES Definition Clarification Project Version 4, Appendices A & B (available at: <https://www.frcc.com/Standards/BESDef.aspx>). Using this work as a starting point, the SDT should be able to provide much useful guidance to the industry with relatively little additional effort. Also, the reference to “two windings of 100 kV or higher” may create some confusion because many three-phase transformer banks have 6 or 9 windings, depending on whether the transformer has a tertiary. We suggest clarifying this provision by changing the clause referencing two windings to read: “the two highest voltage transformer windings of 100 kV per phase that are connected to the Bulk Electric System.”

No

Snohomish is concerned that the inclusion of individual generation units with a nameplate capacity as small as 20 MVA is over-inclusive. Under FPA Section 215, generation resources are excluded from the “bulk-power system” unless they produce “electric energy” that is “needed to maintain

transmission system reliability." 16 U.S.C. § 824o(a)(1)(B). Smaller generators with a capacity of 20 MVA almost never produce electricity that is "needed to maintain transmission system reliability." Hence, the inclusion as drafted improperly expands the BES definition to include generators that the statute requires to be excluded. Further, the 20 MVA threshold appears to have been drawn without explanation from the existing NERC Statement of Compliance Registry. Given that the purpose of the Compliance Registry is to sweep in all generators that might be material to the operation of the BES, and not to definitively determine whether a given generator is, in fact, material to the operation of the BES, the STD has acted arbitrarily and without adequate technical justification in adopting the 20 MVA threshold. In responding to comments on its initial proposal, the SDT states that it adopted the 20 MVA threshold because "there is no technical basis to change the values contained in the Statement of Compliance Registry Criteria." Consideration of Comments on Definition of Bulk Electric System – Project 2010-17, March 30, 2011, at 30. But this gets the equation backwards. The SDT must have some technical justification for adopting the 20 MVA threshold beyond the fact that it was previously adopted by NERC in a different context. Without a technical justification demonstrating that facilities operating at capacities as low as 20 MVA are "needed to maintain transmission system reliability," the proposed definition is overly broad and fails to comply with the restrictions imposed by Congress in FPA Section 215(a)(1), 16 U.S.C. § 8240(a)(1). Further, the Statement of Compliance Registry was adopted without the benefit of having been vetted through the NERC Standards Development Process, so the technical record underlying the choice of that threshold is unavailable for review by the industry. In the same comments, the SDT also states that it has considered "the inclusion of generator step-up (GSU) transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable." *Id.* The SDT's reasons for reaching this conclusion are not well-explained, but apparently the concern is that a "non-contiguous" BES could create "reliability gaps." But this conclusion cannot be supported as an abstract proposition, but can only be demonstrated by a careful examination how application of reliability standards will change depending on how the BES is defined. In fact, we believe that if the SDT insists on a "contiguous" BES, an over-inclusive definition will result. We base these conclusions on the findings of NERC's Standards Drafting Team for Project 2010-07 and its predecessor, the "GO-TO Task Force." The Project 2010-07 Team was formed to address how the dedicated interconnection facilities linking a BES generator to high-voltage transmission facilities should be treated under the NERC standards. After reviewing these questions in considerable depth, the Team concluded that dedicated high-voltage interconnection facilities need not be treated as "Transmission" and classified as part of the BES in order to make reliability standards effective. On the contrary, the team concluded that by complying with a handful of reliability standards, primarily related to vegetation management, reliable operation of the bulk interconnected system could be protected without unduly burdening the owners of such interconnection systems. See Final Report from the NERC Ad Hoc Group for Generator Requirements at the Transmission Interface (Nov. 16, 2009) (paper written by the predecessor of the Project 2010-07 SDT). Much of the work of the Project 2010-07 SDT is applicable to the work of the BES Standards Development Team. For example, the Project 2010-07 Team observed that interconnection facilities "are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system." White Paper Proposal for Information Comment, NERC Project 2010-07: Generator Requirements at the Transmission Interface, at 3 (March 2011). Requiring Generation Owners and Operators to comply with the same standards as BES Transmission Owners and Operators "would do little, if anything, to improve the reliability of the Bulk Electric System," especially "when compared to the operation of the equipment that actually produces electricity – the generation equipment itself." *Id.* We believe the many of the questions considered by the Project 2010-07 Team are analogous to the questions under consideration by the SDT, and that, if the SDT insists upon a "contiguous" BES, the resulting definition will be substantially over-inclusive. The "contiguous" BES concept implies that every Element arguably necessary for the reliable operation of the interconnected bulk system must be included in the BES definition, even if it is interconnected with Elements that have no bearing on the operation of the BES. The adoption of a "contiguous" BES is therefore likely to result in imposition of reliability standards on a substantial number of facilities that have little or nothing to do with bulk system reliability, resulting in wasted regulatory expense and additional stress on the limited resources of reliability regulators. For example, a "contiguous" BES would require dedicated interconnection facilities that connect a BES generator to BES transmission facilities to be classified as BES. But, as the discussion above demonstrates, the

classification of dedicated interconnection facilities as “BES” facilities would, based on the findings of the Project 2010-07 SDT, result in substantial overregulation and unnecessary expense with little gain for bulk system reliability. Similarly, a “contiguous” BES suggests that, because certain system protection facilities, such as UFLS relays, are ordinarily embedded in local distribution systems, the local distribution system, along with the UFLS relays, must be classified as BES to make the BES “contiguous.” Such a result is not only plainly contrary to the local distribution exclusion embedded in Section 215 of the FPA, but would, by improperly classifying local distribution lines as BES “Transmission” facilities, result in huge regulatory compliance burdens with little or no improvement in bulk system reliability. There is no good reason for the SDT to adopt a “contiguous” BES. On the contrary, because Section 215 allows reliability standards to be applied to “users” of the bulk system as well as “owners” and “operators,” local distribution systems operating UFLS relays and other bulk system protection devices could be required to comply with standards governing those devices as a precondition for their use of transmission on the bulk system. The other alternative is to draft standards that apply to a specific type of equipment – again UFLS relays is a good example – rather than to BES facilities categorically. Either approach will fully achieve the goals of bulk system reliability without imposing an undue regulatory compliance burden on local distribution systems. For these reasons, we urge the SDT to follow the example of the Project 2010-07 Team and the GO-TO Task Force by giving careful consideration to the specific and practical results of how its definition will affect the application of particular reliability standards and whether the results are beneficial to reliability or simply result in unnecessary regulatory burdens that do not benefit bulk system reliability. We believe there is considerable danger of error if the SDT bases its conclusions on metaphysical debates about whether a “contiguous” or “non-contiguous” BES is more desirable rather than engaging in a careful analysis of whether the proposed definition achieves reliability goals in the most efficient manner possible.

No

Snohomish is concerned that the 75 MVA threshold has been chosen arbitrarily by the SDT. Like the 20 MVA threshold discussed in our response to question 3, the 75 MVA threshold appears to have been drawn from the NERC Statement of Compliance Registry without appreciation for the function of the threshold in that document and without adequate technical justification demonstrating the generators with an aggregate capacity of 75 MVA produce electric energy “needed to maintain transmission system reliability” and are therefore properly included in the BES definition.

Yes

Including “all” blackstart and blackstart cranking paths in the BES may ultimately provide an incentive to the electric industry to reduce the number of resources with blackstart capability. We therefore suggest that essential blackstart resources identified by the Regional Entity should be included in the Bulk Electric System, but non-essential blackstart resources need not be.

No

Snohomish agrees that it is important to address wind generation facilities and similar generation facilities in which a large number of generating units, each with a relatively small capacity, are clustered and fed into the grid at a single interconnection point. That being said, Snohomish is concerned that the 75 MVA threshold has been chosen arbitrarily for the reasons stated in our comments on Question 4.

Yes

FERC has made clear throughout the Order No. 743 process that the existing exclusion for radials be retained. We believe the exclusion as drafted adequately defines radials.

Yes

As noted in our response to Question 3, we believe the inclusion of the 20 MVA threshold (through reference to Inclusion I2) lacks an adequate technical justification in this context. Further, unless the generation unit is reliability-must-run or essential blackstart, the function of the unit is irrelevant to the reliable operation of the interconnected bulk transmission grid, and we therefore believe the reference to the function of the generation unit (“standby, back-up, and maintenance power...”) should be eliminated.

Yes

Snohomish strongly supports the categorical exclusion of Local Distribution Networks from the BES. In fact, for reasons discussed at length in our answer to Question 1, we believe the exclusion is necessary to ensure that the BES definition complies with the statutory requirement to exclude all

facilities used in the local distribution of electric power. LDNs are, of course, probably the most common kind of local distribution facility. Further, the conversion of radial systems to local distribution networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. But providing an exclusion for radials without providing an equivalent exclusion for LDNs will have the opposite effect, to the ultimate detriment of electric consumers. Snohomish also supports, with the reservations discussed below, the LDN exclusion as drafted by the SDT. At least conceptually, we believe the SDT has identified the key characteristics that separate LDNs from facilities that are part of the bulk transmission system and therefore should be classified as BES. Hence, LDNs can be excluded from the BES based on the characteristics identified by the SDT without compromising the reliability of the interconnected bulk transmission system. Although Snohomish supports the LDN exclusion, we believe the exclusion should be refined in the following respects:

- The SDT's draft states that: "LDN's are connected to the Bulk Electric System (BES) at more than one location SOLELY to improve the level of service to retail customer Load." (emphasis added) We are concerned that the use of the term "solely" implies the need for an examination of the motives of a local distribution utility in connecting to the BES at more than one location. This result is problematic because it defeats the purpose of the exclusion, which is to allow LDNs to be excluded from the BES without an in-depth and expensive inquiry into the exact nature of the LDN. In addition, the local utility may have a number of motives for connecting to the BES at more than one location, but the local utility's motives have nothing to do with how the LDN interacts with the interconnected bulk system, which should be the key determinant in including or excluding any Element from the BES. With these concerns in mind, we therefore recommend that the SDT revise the sentence quoted above as follows: "LDNs are connected to the Bulk Electric System (BES) at more than one location to improve the level of service to retail customer load and not to accommodate bulk transfers of power across the interconnected bulk system." By instituting this suggestion, the SDT would emphasize the key difference between an LDN, which is designed to reliably serve local, end-use retail customers, and the BES, which is designed to accommodate bulk transfer of power at wholesale over long distances.
- We believe the characteristics specified by the LDN in subsections (b) and (c) of the exclusion are redundant. Subsection b specifies that the LDN would not interconnect more than 75 MVA of generation in aggregate. Subpart c specifies that power flows only into the LDN. We believe the SDT can eliminate subpart b of the definition and simply rely on subpart c because if power only flows into the LDN even if it interconnects more than 75 MVA of generation, the interconnected generation interconnected will have no significant interaction with the interconnected bulk transmission system, only with the LDN. Further, with the advent of distributed generation, it is easy to foresee a situation in which a large number of very small distributed generators are interconnected into a LDN, so that the aggregate capacity of these generators exceeds 75 MVA. However, because the generators are small and dispersed and, under the subpart c criteria, would be wholly absorbed within the LDN rather than transmitting power onto the interconnected grid, those generators would not have a material impact on the grid. In addition, the 75 MVA criterion would make an LDN interconnecting more than 75 MVA part of the BES. For the reasons set forth by the Project 2010-07 SDT, we are concerned the result will be the local utility being improperly classified as a Transmission Owner and Transmission Operator, which would subject the local utility to a number of reliability standards that would significantly increase its compliance burden without substantially improving bulk system reliability. In fact, in the LDN situation, there is even less reason to impose these burdens on the local utility than in the situation addressed by the Project 2010-07 team, where generators are interconnected to the BES by dedicated interconnection facilities. Because the LDN is interconnected at multiple points, the generators interconnected to the LDN could continue to operate even if one or two interconnection points are out of service. On the other hand, in the situation addressed by the Project 2010-07 team, if the dedicated interconnection facility is out of service, the generation is unavailable because there is no alternative route to deliver it to load. Finally, for the reasons stated in our answers to Questions 3 and 4, we believe the SDT's wholesale adoption of the 20 MVA and 75 MVA thresholds from the NERC Statement of Compliance Registry lacks adequate technical justification. The SDT repeats that error here by incorporating those thresholds into the LDN exception.

Yes

Snohomish County PUD supports the SDT in its efforts to avoid unintended consequences from changes to the BES definition, especially for small entities that can ill afford the substantial costs that accompany imposition of mandatory compliance with reliability standards. Further, we agree that the small utilities covered by the exemption will have no measurable impact on the operation of the

interconnected BES. Our views are borne out by experience in the Pacific Northwest where many small entities were required to register by virtue of owning a very small portion of the region's 115-kV system. These utilities have faced substantial compliance burdens even though their operations are simply not material to the interconnected bulk grid in our region, and the investment of resources in compliance therefore will have no measurable effect in improving the reliability of the interconnected grid.

No

While Snohomish County PUD agrees that the approach adopted by the SDT -- a core definition coupled with specific inclusions and exclusions -- will be effective in removing most local distribution facilities from the BES, it will not remove all such facilities. For the reasons discussed at greater length in our answer to Question 1, Snohomish believes that the proposed definition is over-inclusive and is likely to sweep up certain facilities used in local distribution that should not be classified as BES. To give a further example, assume that a local distribution utility operates a distribution network that currently would be excluded from the SDT's definition, but that a cogeneration facility with a capacity of 30 MVA and average production of 15 MW is constructed in one of the industrial areas served by local distribution facility and the output is purchased by one of the industrial customers. Because of inclusion I2, the local utility would now be classified as owning BES facilities, even though the output of the generator rarely exceeds 20 MW in practice and the output is, as a matter of physics, absorbed by the surrounding industrial loads rather than being transmitting onto the interconnected grid. Further, the fundamental nature of the local distribution facilities has not changed. They are still used to deliver electric power to the utility's end-use customers, not to deliver power on the wholesale market across the interconnected bulk grid. Hence, the result of the SDT's definition is to include "facilities used on the local distribution of electric energy" in contravention of FPA Section 215(a)(1), 16 U.S.C. § 8240(a)(1). The practical result of the improper classification would be that the local utility would be required to register as a Transmission Owner and Transmission Operator, and would incur substantial costs to comply with requirements that are designed to ensure the reliable operation of transmission lines that are part of the interconnected grid, not local distribution facilities. For the reasons explained in the papers published by the Project 2010-07 Task Force, the result is substantially increased compliance costs that produce little or no improvement in the reliability of the interconnected bulk system. Accordingly, if viewed in isolation, the SDT's core definitions and list of inclusions/exclusions do not comply with the statute or produce optimum benefits for bulk system reliability. Whether the SDT's approach complies with the statute can only be determined by examining the Exception process now under development, in conjunction with the SDT's definition. If the Exception process results in the exclusion of facilities that are improperly swept into the BES by the bright-line thresholds included in the SDT's definition, and the Exception can be attained at a reasonable cost to the involved entities, then the SDT will have achieved a result that complies with the statute. But this conclusion can be reached only upon review of the entire package, not just the core definition and list of inclusions/exclusions. In this regard, as discussed in our answer to Question 3, Snohomish notes that exclusion of facilities from the BES does not mean that owners of those facilities are entirely exempt from reliability standards. On the contrary, the statute provides that "users" of the BES can be subject to reliability regulation. 16 U.S.C. § 8240(b). Hence, even where an entity does not own BES assets, it could be required to, for example, provide necessary information to the applicable Reliability Coordinator and to participate in the regional Under-Frequency Load Shedding program by setting the UFLS relays in its Local Distribution Network at the appropriate settings. We note that participants in the WECC BES Task Force generally agreed that appropriate information should be provided by non-BES entities, although there was considerable concern related to ensuring that the provision of information was not unduly burdensome.

Yes

As noted in our responses to Question 1 and Question 11, we believe the SDT proposal is potentially in conflict with the limitations of the Federal Power Act, and in particular the statutory exclusion for facilities used in the local distribution of electric energy. Unless the SDT adopts some approach other than a core definition with inclusions and exclusions based on brightline thresholds, the SDT's approach can meet the statutory requirements only if the Exception process currently under development results in facilities that are not properly classified as BES being exempted from regulation as BES facilities.

Snohomish County PUD has these additional concerns: • We are concerned that the proposed 24-

month delay in the effective date of the new definition will delay the potentially beneficial effects of the SDT's efforts, especially for utilities that have been inappropriately registered for BES-related functions, which is a common situation in WECC. We therefore urge the new BES definition to become effective immediately upon approval by FERC or other applicable regulatory agencies. Entities that have been improperly registered for BES functions can then immediately file for deregistration and obtain the benefits of the new definition as soon as possible. For entities that have not previously been registered for BES-related functions but that would be required to register under the new definition, we do not object to the 24-month transition period proposed by the SDT to allow the newly-registered entity to attain compliance with newly-applicable reliability standards, many of which require new training for employees, new maintenance procedures, and complex new operational protocols. However, the transition period for newly-registered entities should be structured in a way that does not prevent entities seeking deregistration from benefitting from the new definition at the earliest possible date. • The current definition provides that "Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process." Snohomish is concerned that the SDT carefully delineate which entity has the burden of proof in the exclusion process. The WECC BES Task Force approach, which we commend to the SDT, laid out these burdens in some detail. Under that approach, essentially, if a facility is excluded from the BES by virtue of the specific exclusions listed in the definition, the Regional Entity bears the burden of proving that the facility nonetheless has a material impact on the interconnected bulk transmission system and therefore should be included in the BES. On the other hand, if a facility is classified as BES by virtue of the list of inclusions set forth in the BES definition, it can still escape classification as BES, but bears the burden of demonstrating that its facility has no material impact on the interconnected transmission system. We urge the SDT to give careful consideration to these burden-of-proof questions and to follow the lead of the WECC BES Task Force. • For the reasons we have explained in our answer to Question 11, we believe the Exception process is critical both to ensure that the BES definition is effective in producing measurable gains to bulk system reliability and to ensuring that the definition will comply with the limitations Congress placed in Section 215. Hence, we believe the entire BES definition, including the Exception process and related procedures, should be vetted through the NERC Standards Development Process, including the full comment periods and a ballot approvals provided for in that process. We are concerned that important elements of the BES definition have been assigned to the Rules of Procedure Team, and that changes in the Rules of Procedure are subject to approval in a process that provides considerably less due process and industry input than the Standards Development Process. Compare NERC Rules of Procedure § 1400 (providing for changes to Rules of Procedure upon approval of the NERC board and FERC) with NERC Standards Process Manual (Sept. 3, 2010) (providing for, e.g., posting of SDT proposals for comment, successive balloting, and super-majority approval requirements). Accordingly, we urge that all elements of the BES definition, including those elements that have been assigned to the Rules of Procedure Team, be vetted through the Standards Development Process. Further, we believe that the failure to vet all material elements of the BES definition through the Standards Development Process would constitute a violation of NERC's bylaws and the requirements of the Standards Development Process.

Mikhail Falkovich

No

There is still room for misinterpretation of the BES boundaries. The BES definition has ramifications affecting many standards. NERC should provide examples of what specifically is in and what is out of BES boundaries. Example one line diagrams showing "Generation Resources" included or excluded and types of radial feeds exempted should be shown. Identify what element is in BES / what is out. Suggest showing typical interconnection facilities. Addressing typical interconnection facility configurations will assist in developing a clear and concise definition that provides a precise line of demarcation between elements of the BES.

Yes

No

See comment 1 above.

Yes
No
Black start resources and the cranking path should not be included in the BES definition unless connected at 100kV and above. There are many other existing standards that impact black start units. Routine testing and redundancy is part of them. Adding in black start units < 100kV and the associated cranking path to the BES definition may discourage entities from providing black start capability due to cost associated with cumulative testing and record keeping criteria. This may result in withdrawing the offer to provide that service and/or potentially drive up the cost of that service significantly without any related increase in BES reliability.
Yes
No
Again, in similar comments to item 1 above, where is the BES line of demarcation between BES elements (the interrupting device itself) connecting the non-BES radial system? The term "Generation resource" is not defined and open for interpretation.
Yes
Group
National Rural Electric Cooperative Association (NRECA)
Barry Lawson and Patti Metro
Yes
NRECA believes the definition should explicitly state that facilities used in local distribution are excluded from the BES.
Yes
Yes
Yes
No
This is the only part of the BES definition and inclusions/exclusions that specifically states "regardless of voltage." NRECA does not believe it is appropriate for the BES definition to include such a statement. This issue needs to be addressed in standard applicability language, not in the definition of BES.
Yes
Yes
NRECA requests that the drafting team state explicitly whether the automatic interruption device is included or excluded from the BES. Examples of automatic interruption devices should be included in a reference or FAQ document, and drawings/diagrams on typical configurations would be beneficial. Consistent language is needed in the Inclusions/Exclusions. E1 states "automatic interruption device" and E3(a) states "automatic fault interrupting devices." NRECA recommends adding the word "fault" as in E3(a) and also stating "device(s)" in E1 and E3(a) and wherever else the phrase may be used in the BES definition and inclusions/exclusions. Additional clarification is needed in explaining E1(c) to ensure industry understands the scenario.

Yes
Yes
Yes
NRECA agrees with this approach, but also believes this could be addressed in the Statement of Compliance Registry Criteria document.
No
NRECA believes the definition should explicitly state that facilities used in local distribution are excluded from the BES.

Nicholas Winsemius
Grand Haven Board of Light and Power
No
The Grand Haven Board of Light and Power (GHBLP) does not agree that the core definition for the BES use a "bright line" definition of 100kV and above. Currently, we have a 138kV/69kV transformer that connects to the BES and serves a radial, load serving system. This transformer is presently protected by a "ground switch" relay scheme. We have a project in process that is replacing this "ground switch" relay scheme with a circuit switcher. The circuit switcher, unlike the ground switch, would not affect the BES if it were to operate. By this "bright line" definition this single asset would be defined as a part of the BES. The cost that our organization would incur from being forced to register as a Transmission Owner and Transmission Operator (TO/TOP) would be extreme, and would significantly impact our budget and our customer's rates. We should not have to depend on an "exclusion" process to remove this asset from being defines as a part of the BES, and this should be addressed in the core definition.
Yes
Yes
Yes
Yes
Yes
Yes
No
Exclusion E1 addresses a radial, load serving system, but it does not address whether the automatic interrupting device should be defined as a part of the BES or not. In our case, the ONE automatic interrupting device that we own would force us to register as a TO/TOP, and as a result incur significant costs. This does not comply with FERC Order No. 743 (and No. 743a) and should be addressed in this exclusion if not in the core definition.
Yes
Yes
No
We agree with addition of Exclusion E4, except that it should apply to small load serving distribution utilities even if they are required to register as a Distribution Provider and Load Serving Entity. In our last fiscal year, July 2009 through June 2010, the Grand Haven Board of Light and Power served

262,847 MWh and peaked at 54 MW. Even though we are required to register as DP/LSE, we are still a small utility. Please revise the definition of a small entity for the purpose of this exception to use more reasonable criteria.

No

The exclusions do not properly address the exclusion of single automatic interrupting device that serves a radial, load serving system and, through its operation, does not affect the BES.

Yes

This current definition does not comply with FERC Order No. 743 (and 743a) by not addressing the exclusion of a single automatic interrupting device that serves a radial, load serving system.

I can not over emphasize how unreasonable it would be for our utility to have to register as a TO/TOP because of one asset (138kV circuit switcher) that serves a radial, load serving system. It is equally unreasonable for us to have to use a long and arduous exception process to qualify for deregistration. Please take this into consideration as you prepare the final definition.

No

I still feel that a bright-line of 200 kV would be more appropriate, with language stating that certian significant elements operated below 200 kV would be included. However, I believe the exclusion process is definitely a step in the right direction.

Yes

Yes

Yes

Yes

Yes

Yes

Yes

Yes

No

I agree with the approach, but not the language. I believe the small utility clause should be taken out and this Exlusion should be applicable to any transmission elements whose connection to the BES is soley through a single transmission source and without interconnected generation, regardless of the size of the utility.

Yes

I do believe that the language in its plain sense does exclude local distribution systems, but I do see the possibility of differeing interpretations of the language across the regions again. Perhaps adding some example system diagrams showing what would and would not be included in the BES would help alleviate any possible ambiguity and increase consistency across the regions.

Individual
Kim Moulton
Vermont Transco
Yes
It appears that the SDT has made progress in addressing comments made to date. Concerned that facilities below 100 kV will fall into the current definition of BES. If changes in the wording better identified key areas the new definition would be easier to interpret, apply, and it would better align with the concerns of the members
Yes
This inclusion's wording allows an entity to easily identify which of its transformers will be included as BES and also adheres directly to the FERC identified 100kV or higher equipment. Question: if a transformer does not have two windings of 100 kV or higher but does have protection devices that could open the BES system, e.g. due to a low-voltage failed breaker scenario, would the protective devices be part of the BES even though the transformer itself is not?
Yes
How will generating owners currently registered as a GO/GOP and have units tied to the BES system through a radial transmission line, that they own, and connects them to the grid be affected by the

new definition? Will they need to become TO and TOP registered also? Should a GO/GOP have to adhere to all TO/TOP standards and requirements or only a sub-set of requirements?
No
What is the definition of "common bus"? Would this only apply to generating facilities with a direct GSU tie to the 100 kV, and up, system? Or would it apply to those units tied to the low side of a transformer at a voltage below 100 kV that has a step up high side voltage greater than 100 KV? Example: units are tied through to a single 46 kV substation (GSU high side connected to this substation) with a tie from this substation to the BES through a step up transformer.
No
: The phrase "regardless of voltage" is a concern. The goal of the FERC order is to provide a more reliable "bulk power system". Many blackstart resources are at voltages well below the 100 kV voltage and are not material to the restoration of the bulk electric system during a blackout. The wording of this inclusion would require many units that are used only for local area support to now be listed as a BES facility. The wording of this inclusion should be something to the order of "Blackstart Resources and the designated blackstart cranking paths identified in the transmission operators restoration plan that are necessary to restore the BES system", this should not include cranking paths on distribution feeds that are used primarily for local area support. The purpose of this inclusion should be to make certain all units necessary to energize the BES grid after a blackout are maintained and operated appropriately
No Comment
No
Does "a single transmission source" mean a single "substation" at 100 kV or above? The wording of this exclusion appears to allow distribution (<100 kV) level generating units to be excluded from the definition of BES. If so then this generation exclusion is appropriate to the FERC order. However, the definition of "automatic interruption device" should be defined fully. Specifically what types of equipment are considered an AID? If a transformer has a high side voltage of 115 kV and a low side voltage of 34.5 kV it would not be part of the BES definition, however depending on how one interprets the exclusion for a radial feed, if the transformers automatic interruption device were on the low side of this transformer, it appears that this transformer would then need to be "included" as BES. In addition, would the protection schemes associated with the breaker failure on the low side of a transformer (voltage <100 kV) designed to send a signal to the high side (which is greater than 100KV) for a breaker failure scenario fall into the "included" facilities even though the transformer would not be "included"?

The exclusion wording is difficult to understand and apply. Are their voltage levels where this would not apply (ex. 230 kV) or load levels that would be seen as too high? Cannot agree or disagree due to the wording
No
The inclusion of all black start units "regardless of voltage", the unclear definition of "automatic interruption device" and "common bus" could lead to local distribution company facilities being included in the definition of BES.

The core definition should be revised to read: Bulk Electric System (BES): All Transmission Elements operated at 100 KV or higher, unless such designation is modified by the list shown below. The resulting modified BES shall comprise all Elements deemed necessary for operating an interconnected electric energy transmission network, but shall exclude any Elements used in the local distribution of electric energy. The inclusion and exclusion requirements are restrictive. For example, radial

characteristics should not be limited by the amount of installed generation or single transmission source and/or require an interrupting device. Instead, one or more transmission sources could feed the radial load to provide redundancy as long as there is adequate protection and isolation for improved customer-supply continuity and reliability. This would be considered radial as long as the loss of any transmission source would not affect, and is not necessary for the operation of the interconnected transmission network. This retains the incentive to build transmission. The revised definition will have a direct impact on entities across North America and may conflict with regulatory requirements, Codes, and Licenses. FERC in its Order 743 and 743A has directed NERC to address these concerns. Include provisions in both the NERC exception criteria and exception process for federal, state and provincial jurisdictions. These provisions should provide clear guidance so that, if and when there are deviations from the exception criteria, they are properly identified with technical and regulatory justifications ensuring there is no adverse impact on the interconnected transmission network. This burden of proof should be left to the entity seeking exception because it may be difficult to define the exception criteria. Further, if such an explicit criteria could be defined, it could become another bright-line BES.

Yes

No

I2 should pertain to individual generating units, but the entire path should not be labeled as BES. Oftentimes there are cases when neither the path nor a 20 MVA unit itself will have any impact on the reliability of the interconnected transmission network, nor is it necessary for its operation. The path to generating facilities does not need to be BES contiguous. Generating units can be required to be planned, designed, and operated in accordance with a subset of NERC Standards, but should not require a contiguous path unless the unit is identified essential for the operation of transmission network.

No

I3 should pertain to multiple generating units located at a single site, but the entire contiguous path should not be labeled as BES. Oftentimes there are cases when neither the path of a 75 MVA plant or aggregated generation will have any impact on the reliability of the interconnected transmission network nor be necessary for its operation. As stated earlier, under various green energy, smart grid and dispersed renewable energy plans advocated by both Canadian and US policy makers, the gross nameplate rating of 75 MVA may undermine and deter the future potential of integrating Distributed Generations (DG's) that will be implemented to ensure the reliable operation of the interconnected transmission network BES, and, at the same time, providing the most effective and economical solutions for rate payers. Local generation can cost-effectively enhance the reliability of load pocket by avoiding transmission, but such restrictions would deter the adoption of good planning decisions. Path to generating facilities need not be BES contiguous. Generating units can be required to be planned, designed, and operated in accordance with a subset of NERC Standards, but should not require contiguous BES paths.

No

Blackstart resources and transmission facilities on the cranking path should not be classified as BES regardless of size and voltage level. From a regulatory perspective, such an inclusion would be in conflict with the current regulatory requirements in many jurisdictions. More importantly, designating these facilities as BES Elements or Facilities beyond the 100 kV bright line, the 20 MVA/unit or 75 MVA/plant criteria, without a regard to their impact on the BES (under conditions other than system restoration) will impose unnecessary requirements for these facilities, which do not contribute to reliability under interconnected operation conditions. For a restoration condition, this inclusion is extraneous. There is already a designation specific for system restoration covered by an existing standard to recognize their reliability impacts and to ensure their expected performance. NERC Standards EOP-005-2 stipulates the requirements for testing blackstart resource and cranking paths. This testing requirement suffices to ensure that the facilities critical to system restoration are functional when needed, which meets the intent of identifying their criticality to reliability. The BES definition should cover those facilities that are needed for operation under both normal and emergency conditions, which includes situations related to blackstart and system restoration. The directives should not specifically ask for inclusion of blackstart resources and facilities on the cranking path in the BES definition. The requirements in EOP-005-2 suffice to address the SDT's interpretation

and concern regarding recognition of the reliability impacts and requirements for blackstart resources and facilities used for system restoration. Generating units of any size and transmission facilities of any voltage level may be used for black start and restoration. Conceivably, a generator of 10 MW and transmission or distribution facilities of 44 kV or 69 kV may be a part of the cranking path. A BES inclusion will then subject these generators and facilities, which are essentially "local" facilities but called upon to begin restoring its bulk interconnected counterparts, to comply with the reliability standards intended for maintaining BES reliability. Included in the BES definition will thus discourage smaller generators from providing black start capability, and the transmission facilities from being a part of the cranking path. This may also discourage Transmission Owners and Operators from identifying multiple black start resources and cranking paths to provide restoration flexibility. Such an inclusion will ultimately undermine reliability. If indeed any of these facilities are deemed necessary to support bulk power system reliability at times other than system restoration, they would/should have been identified through the basic BES definition and inclusion list or can be addressed through the exception procedure. 14 should be removed based upon:

- The availability and performance expectations of blackstart resources and facilities on the cranking path are already specifically addressed in an existing standard; and
- Unless they meet the BES definition and the other inclusion criteria, they do not have any perceived reliability impact on everyday operation of the BES.

• 14 may include very small generators and distribution facilities as it is written. Is it necessary from a reliability point of view to include "cranking paths" below 100kV?

No

The entire contiguous path does not have to be BES. The path or aggregate generation will rarely have any impact on the reliability on the interconnected transmission network, nor is it necessary for its operation. These are generally referred to as connection facilities.

No

The concept is consistent with the statements in the FERC Order. However, it is imperative to understand that the limitations of E1 will have a direct impact on many entities (big and small) along with distribution companies across North America. The exclusion requirements are restrictive and these restrictions may have an adverse affect on future transmission investment, for example the addition of a second line removing the radial status exclusion. Consideration should be given to allowing entities to build additional transmission and not automatically compromise the exclusion status of any given facilities. For example, a redundant double circuit designed to supply the load with adequate protection and isolation beyond the radial tap could be significantly better for load supply-continuity and reliability. If more than one transmission source feed radial load to ensure customer supply continuity and reliability, then this should be either part of the bright-line definition E1 exclusion as long as there is adequate protection and, the loss of any single transmission source does not affect the interconnected transmission network. The SDT should:

- Carefully craft the exception criteria and procedure that is flexible and technically sound to adequately allow entities to present their case to the ERO for exclusion
- Exception criteria should be at a high-level with items of assessment that can be followed continent-wide by entities to put forward their exception for element(s) mentioned in exclusions or inclusions based on technical assessment, evidence and justification for its unique characteristics, configuration, and utilization
- Acknowledge and provide provisions in both NERC exception criteria and exception process for federal, state and provincial jurisdictions.

Yes

No

Regarding E3.a.--If the supply to a LDN is tapped off a Bulk Electric System facility, and the step down transformer is protected on its high side by a fault magnitude supervised automatic interrupting device (such as a circuit switcher), how does that affect the exclusion? The circuit switcher will only interrupt faults up to a certain magnitude. Above that threshold, depending on the system configuration, fault clearing might have to be done at the Bulk Electric System facility. Regarding E3.d.--The LDN cannot be used to transfer real or reactive power under all operating conditions. Suggest combining E3.c and E3.d to read as follows: Power is intended to flow only into the LDN. The generation within the LDN shall not exceed the electric real or reactive power demand within the LDN. The LDN only delivers real or reactive power to load, and is not to be used to transfer real or reactive power between different locations in the BES. Under no system condition is BES reliability to be

dependent on LDN flow.

No

Small utility or distribution provider is a relative term. A distribution provider may have an impact on the transmission network based on its design, configuration, connection point, and protection. Such an exception should apply regardless of the size of an entity. The concept discussed here is to define a radial system and not a small utility, as mentioned in the FERC Order. We do not believe that the SDT had sufficient discussions while crafting the proposed exclusion in regards to small utilities. The language used in the proposed clause is only appropriate to establish a bright-line definition for a radial system. Many small utilities (and individual load customers or generation connections) have more than a single transmission source with a solid tap and, at the same time, be adequately protected and effectively isolated without any adverse impact on the transmission network. Such a practice and design is widely used across North America. Hence, we do not agree that this exclusion is an attempt to address the issue of small utilities. The definition and inclusions will force many small entities, load customers and generation unit owners to act and register as Transmission Owners. This may be in conflict with state or provincial regulatory act, Codes and Licenses. Consistent with the FERC Order, the ERO and the SDT should be aware of these conflicts and should not ignore them. The ERO and the SDT address this by providing explicit but simple provisions in the exception procedure by considering sound technical exception criteria that is flexible based on demonstration of evidence to justify the element's necessity for operation. Regulatory Acts and Rules will always overrule NERC requirements and the only evidence that should be required of small utilities/entities is: • Regulatory evidence • Evidence demonstrating that NO adverse reliability impact is afflicted on the interconnected BES because of their connection.

No

The current definition drafted by the SDT has not differentiated between Transmission and Distribution, nor excluded distribution facilities from the BES, nor addressed the issue of local distribution facilities above 100kV. It is important for the ERO and the SDT to understand and be consistent with the FERC Order for these important but complex issues. Many parts of the continent could be in conflict with state or provincial regulatory act, Codes, and Licenses. The ERO and SDT and RoP teams be aware of these conflicts and not disregard them, as they will pose many implementation complexities and confusion within the industry. Regulatory Acts and Rules will always supersede NERC requirements and hence it is important that ERO should neither be caught in regulatory conflict nor put entities in these situations. As responded to in Question 10, the ERO and SDT can address this by providing explicit but simple provisions in the exception criteria (to be used by exception procedure) by putting forward required technical assessments , which are based on a demonstration of evidence to justify the element's necessity for operation. For example, suggest that for local distribution, the evidence that should be required is: • Regulatory evidence • Evidence demonstrating that NO adverse reliability impact is afflicted on the interconnected BES because of their connection Some of the other key attributes of such an exception criteria should be: • Elements are not to be part of interconnection between two balancing authority or contribute to IROs • Entire system cannot be classified as contiguous • Entity to justify whether or not the elements are necessary for the operation of the interconnected transmission network • Distinguish if the element in question supplies load centers, major cities, serves the national interest and/or possibly impact national commerce or national security, or is identified by the relevant regulatory authority Accordingly, the exception criteria should ONLY list a menu of items and a prescribed report template that should be assessed and presented by an entity as their evidence and justification for exception to a RE, the ERO and any relevant regulatory authority. This evidence and justification would be used by the ERO as part of its decision making process.

Yes

The proposed definition will have a direct impact on entities not under FERC jurisdiction, and may be in conflict with regulatory requirements with which those entities must comply.

Currently, the posted exception criterion is only a concept with many gaps and TBD, as posted details are later to follow. The exception criteria should be a menu of technical items (load flows, stability analysis etc) and non technical items (type of loads such as distribution companies versus major city center, national security, etc). Entities should be required to assess and provide their own justification under each category with a conclusion that takes into account all of the relevant items for element(s) under exception, in a consistent template and table of contents. Suggest the SDT to avoid specification of any parameters as they would differ under different desian concepts. system

configurations, system characteristics and regulatory requirements. The comments herein reflect thoughts on the document posted. An "all encompassing" comment is that the definition is too lengthy. The importance of the BES definition is recognized throughout the industry for its importance, and as such it should be simple, clear, and straightforward. The first draft definition posted was more along this line. I2, I3, and I5, being very similar, can they be combined into an encompassing generator inclusion criteria?

Individual

Yes

There is general confusion as to whether or not the "BES" is synonymous with the "BPS". If this is so, then it should be expressly stated as such. If not, clarification should be provided to industry.

Yes

Yes

Yes

Yes

Yes

No

I agree with everything up to "...but is not required to register...by the ERO". There are many small utilities that fit into the scope and spirit of the exclusion BUT were required to register as DP and/or LSE by their ERO. This has generally been on the interpretation of "better safe". Please remove the language which gives this discretion to the ERO and insert language allowing already registered small utilities with have their registrations revoked or surrendered.

Yes

I agree, but believe that those distribution companies that were forced to register as LSEs under FERC interpretation should be excluded as well.

No

Tri-State Generation and Transmission Association, Inc.

Bill Middaugh

No

The Northeast Power Coordinating Council stated that "Step-down transformers with the low-side terminals serving non-BES facilities, which are serving a distribution function, should not be part of the definition of BES." The drafting team stated that it agrees with the comment, but the implementation uses the term local distribution network, which is different than a step-down transformer. Transformers are addressed in the answer to the NPCC comment 2, but uses the ambiguous "single Transmission source" phrase as a requirement to determine BES status. Other specific comments are below.

No

We recommend changing I1 to the following: "Only transformers, including phase angle regulators, with two or more windings of 100 kV or higher that are connected through automatic fault-

interrupting devices, unless excluded under Exclusions E1 and E3." "Only" is required to prevent a regional interpretation that includes distribution transformers since they are never specifically excluded. The phrase regarding GSUs is removed since they are covered in I2 and I3.
Yes
Yes
Yes
Yes
No
A "single Transmission source" is unclear and may be interpreted differently by different Regional Entities. A circuit switcher-protected transformer serving only distribution load may be tapped to a single transmission line but the transmission line has two or more sources. Is the system then connected to a single Transmission source, thus making it radial and being excluded? Or will the Regional Entity declare that, since the transmission line has two sources that the radial system also has two sources? We suggest changing the opening sentence of Exclusion E1 to "Any radial system that is connected to a Transmission source through an automatic interrupting device or devices and:"
No
This Exclusion should also include "wholesale" meters for the instance where an electric distribution cooperative has some small generation connected to its distribution system that meets the same criteria.
No
We believe that element c. needs to be changed to : "Power flows only into the Local Distribution Network, even under all contingency conditions that are considered under any TPL standard requirement dealing with transmission system performance: The generation within the LDN shall not exceed the electric Demand within the LDN;"
No
We disagree with adding E4. This issue should be resolved by enhancing the NERC Statement of Compliance Registry Criteria, not by integrating registration exemptions in NERC definitions.
No
See the comments to Question 7.
No
We believe that this definition is not consistent with the response from the SPCS in Project 2009-17, "Interpretation of PRC-004-1 and PRC-005-1 for Y-W Electric and Tri-State" and could change its intent. Existing tapped distribution transformers are clearly not BES Elements at this time. Under the proposed definition that clarity is lost. There are instances where "automatic interruption device" or "automatic interrupting device" is used. Each should be changed to include "fault" after "automatic."
Individual

Portland General Electric Company
The bright-line definition of 100kV should specify that this is a three-phase line-to-line voltage.
Yes
The reference to "two windings" will cause confusion. Presumably the Standard Drafting Team means two three-phase windings, which would mean that both the high sides and the low sides of a typical transformer bank would have to be operating at 100kV and above in order to be part of the BES. In other words, a 230kV/57kV transformer would not be included, despite the fact that all three windings that make up the high side are individually rated at over 100kV. The inclusion needs to make clear that it's talking about two or more sets of windings, each set consisting of three phases.
No

The 20 MVA gross nameplate rating threshold for an individual unit is too low and will result in the inclusion in the BES of generating units that have no potential to impact the reliability of the BES. The 20 MVA threshold was taken from the registration criteria, and no technical justification has been provided for its use. PGE recommends that this inclusion be removed entirely.

The 75 MVA aggregate capacity rating threshold could result in the inclusion in the BES of generating units that have no potential to impact the reliability of the BES. The 75 MVA threshold was taken from the registration criteria, and no technical justification has been provided for its use. In addition, the meaning of the phrase "located at a single site" is unclear and subject to multiple interpretations. The phrase "connected through a common bus" accomplishes the same goal, and therefore the phrase "located at a single site" should be removed.

Yes

It is not clear what the SDT is attempting to capture with this inclusion that is not already captured in I3. In addition, the term "collector system" needs to be defined.

Yes

Yes

While PGE appreciates the SDT's efforts to exclude distribution systems, as required by the statute, PGE believes that this Exclusion needs further clarification to be workable. PGE has specific concerns with the following aspects of the Exclusion: (b) The phrase "nor its underlying Elements (in aggregate)" is ambiguous. It does not make it clear how a utility could differentiate between the multiple Local Distribution Networks within its service territory. (c) The phrase "Power flows only into the Local Distribution Network" does not make clear that under certain abnormal circumstances power may flow out of a Local Distribution Network. Wording such as "the predominant direction of flow is into the Local Distribution Network during normal (non-outage) conditions" could account for such abnormal circumstances. (d) The phrase "Not used to transfer bulk power" should similarly be modified to indicate that it is meant to describe normal rather than abnormal conditions. In addition, this aspect of the Exclusion should account for the fact that two utilities may have multiple interchange points at the distribution level, but the fact that energy is transferred at these points does not inherently make them transmission paths. A phrase such as "none of the LDN facilities are identified as belonging to or having direct rating impact on a regionally-recognized constrained transmission path used to deliver energy to points outside of the LDN" could address this concern.

As stated above, PGE believes that the Exclusion for Local Distribution Network needs to be more explicit.

There are many small utilities that fit into the scope and spirit of the exclusion BUT are currently registered as a DP and/or LSE. Will this exclusion remove them from registration OR should language be inserted that automatically revokes the NERC registrations of "already registered" small utilities. I recommend that any such revocation be handled by NERC and NOT by the various EROs for the sake of consistency.
Yes
I agree, but believe that those local distribution companies operating below the bright-line that were forced to register as LSEs under FERC Order on Compliance Filing (October 16, 2008) should be excluded as well. For example, BAL-005-0.1b, CIP-001-1a, EOP-002-3 and others do not apply to DPs but affect small local utilities as LSEs. If, according to FERC Order 743 a small local distribution utility would be rightly excluded from DP standards, then, by the same logic and as a distribution-level LSE, they should be excluded from LSE standards as well. If an operating system voltage below 100kV is too low to affect the BES/BPS, then it stands to reason that their connected load is too small as well. If not – then another bright-line should be established in the spirit of FERC Order 743 to differentiate between power flow across the BES/BPS and power flow to end-use consumers.
No
no.

The specific identification of global inclusions and exclusions is a very good way to approach this complex issue. We believe there are further items to be added to the list related to generator interconnections, a task that was passed to this project from Project 2010-07. Just as is the case with complex distribution systems, there are a variety of generator-transmission interconnection architectures which are driving the Regions to inappropriately register Generator Owner/Operators as Transmission Owners.
Yes
Transmission system transformers are not part of our existing or anticipated base of facilities.
No
The threshold for individual generation units is consistent with the NERC functional registry criterion. We believe that it is important to maintain this uniformity. However, we believe there are further items to be added to the list related to generator interconnections, a task that was passed to this project from Project 2010-07. Just as is the case with complex distribution systems, there are a variety of generator-transmission interconnection architectures which are driving the Regions to inappropriately register Generator Owner/Operators as Transmission Owners.
No
The threshold for multiple generation units aggregated at a single location is consistent with the NERC functional registry criterion. We believes that it is important to maintain this uniformity. However, we believe there are further items to be added to the list related to generator interconnections, a task that was passed to this project from Project 2010-07. Just as is the case with complex distribution systems, there are a variety of generator-transmission interconnection architectures which are driving the Regions to inappropriately register Generator Owner/Operators as Transmission Owners.
We do not operate any Blackstarts

Yes
The threshold for widely distributed and aggregated generation units (wind farms) is consistent with the NERC functional registry criterion.
Yes
We agree that all radial connections serving a single load, small generator, or combination should be excluded
No
Generators which serve local retail load (cogeneration) should be excluded if the net capacity available to the BES does not exceed 20 MW Single Unit/75 MW Multiple Units thresholds. We believe there are further items to be added to the list related to generator interconnections, a task that was passed to this project from Project 2010-07. Just as is the case with complex distribution systems, there are a variety of generator-transmission interconnection architectures which are driving the Regions to inappropriately register Generator Owner/Operators as Transmission Owners.

American Municipal Power and Members
Kevin Koloini
Yes
AMP and its members appreciate the opportunity to comment on the draft BES definition. We generally support the direction taken by the SDT, with some minor changes. We agree with some other entities' comments and suggest a few clarifying edits to the core definition. First, the definition should refer to "non-generator Reactive Power resources," to make clear that although all generators provide some reactive power, those that do not meet the criteria of I2-I5 are not included in the BES. There is ambiguity concerning whether a transformer stepping down from >100 kV to <100 kV is included or not, though we believe that the SDT intends to exclude such transformers. It is clear that transformers with two windings >100 kV are included and GSUs for registered generators are included, but it is somewhat unclear in the current draft whether a 138 kV to 69 kV transformer is included or excluded. We suggests making it clear that the intent of the SDT is to include (a) GSUs associated with BES generators and (b) transformers with 2 or more windingwindings >100 kV, and that other transformers are excluded. We also believe the drafting team intended to exclude all elements that are not included either under the BES definition and designations or through the exception process. For the sake of clarity, we suggest that a sentence to that effect be added to the core definition. Finally, we note that the definition does not currently refer to the existence of the exception process. We suggest that such a reference be added either to the core definition or to the lists of Inclusions and Exclusions. The following is the core definition incorporating the changes: All Transmission Elements (except transformers) operated at 100 kV or higher, transformers as described below, Real Power resources as described below, and non-generator Reactive Power resources connected at 100 kV or higher unless such designation is modified by the list shown below. The NERC Rules of Procedure provide an Exception Process through which Elements not included in the BES under this definition and designations may be included in the BES, and Elements included in the BES under this definition and designations may be excluded from the BES. Elements not included in the BES either by application of this definition and designations, or through the BES exception process, are not BES Elements.
Yes
We support I2, but propose clarifying edits. To minimize possible confusion as to the category of transformers being addressed in I1, and the sufficiency of a single applicable Exclusion, we suggest the following rewording: "Transformers, including phase angle regulators, and not including generator

step-up (GSU) transformers, with two windings of 100 kV or higher unless excluded under Exclusion E1 or E3."
Yes
We support I2 but propose clarifying edits. We understand that the intent is to define the BES component of qualifying generators as that equipment from the generator terminals through the GSU. To convey clearly this point, as well as that only generators that are both over 20 MVA and connected through a GSU with a high side voltage of at least 100 kV are included in the BES, I2 should be reworded as follows: "Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals, connected through a GSU that has a high-side voltage of 100 kV or above. A BES generator includes the equipment from the generator terminals through the GSU."
Yes
I3 contains language similar to I2, and should be similarly reworded, as follows: "Multiple generating units located at a single site with aggregate capacity greater than 75 MVA (gross aggregate nameplate rating), connected through a common bus operated at a voltage of 100 kV or above. A BES generating plant includes the equipment from the generator terminals through the respective GSUs."
No
We recommend that the SDT exclude Blackstart Units under 20MW and Blackstart Units that are connected via their GSU to Non-BES Facilities (under 100kV). We believe this would be a minimal impact on the existing Restoration Plans while increasing the reliability and viability of these Restoration Plans since the industry would be forced to use only BES facilities as defined by NERC BES definition. This would force all Blackstart Units to be compliance with all Reliability Standards if this change is implemented.
No
There is concern over inadvertently including small distribution that has behind-the-meter generation on a 69 kV loop. We somewhat agree with the concept of Inclusion I5 but suggest a language change to clarify what we understand to be the drafting team's intent, that the inclusion is intended to apply to dispersed wind and solar generating plants, and not, for example, to a radially-connected city with an aggregate of 75 MW of small generators behind-the-meter. This distinction is appropriate because such a city cannot have the same impact on the grid as a 75 MW wind farm; loss of the radial connecting the city to the grid would result in loss of its load as well as its generation, so that the supply-demand mismatch would be far less significant. We suggest that I5 be revised.
No
The words "described as" should be deleted from the exclusion to avoid confusion. What matters is how the system is actually connected, not how someone describes it. In addition, "a single Transmission source" could be defined, and should be generic enough to encompass the various bus configurations. It is not the case, for example, that each individual breaker position in a ring bus is a separate Transmission source; in that case, a bus at one voltage level at one substation should be considered "a single transmission source." Some examples of configurations that should be considered a single transmission source for this purpose are at <a href="https://www.frc.com/Standards/StandardDocs/BES/BESAppendixA_V4_clean.pdf">https://www.frc.com/Standards/StandardDocs/BES/BESAppendixA_V4_clean.pdf</a> , Examples 1-6. The phrase "automatic interrupting device" should be replaced with the phrase "switching device." Many radials are connected to ring buses or breaker-and-a-half schemes where the breakers (automatic interrupting devices) are within the bus arrangement where the appropriate division between BES and non-BES is at the disconnect switch as the radial "takes off" from the bus arrangement.
Yes
We understand that E2 is intended to apply only to retail customers' generation. The exclusion should therefore be revised to make that limitation clear. Specifically, the first sentence should read: "A generating unit or multiple generating units that serve all or part of retail customer Load with electric energy on the retail customer's side of the retail meter." In addition, the first condition of exclusion, (i), "the net capacity provided to the BES does not exceed the criteria identified in Inclusions I2 or I3," as written is vague and could be subjectively applied. I2 limits capacity supplied to the BES to 20MVA while I3 limits that capacity to 75MVA. A better way to state the exclusion would be as follows: (i), "the net capacity provided to the BES does not exceed the retail customer's total nameplate generation, or 75MVA, whichever is greater,".

Yes
The exclusion refers to groups of Elements that “distribute power to Load rather than transfer bulk power across the interconnected system.” The use of the term “bulk power” is vague and could be read incorrectly as a reference to the “bulk-power system,” which is defined in the Federal Power Act but is not a NERC defined term. If the LDN is connected to the BES at more than one location, there will by definition be some loop flow. We recommend below that Exclusion 3(d) be revised to quantify the amount of loop flow that is permissible in an excluded LDN. In the context of the first sentence of Exclusion E3, less specificity is needed, and the sentence should only be revised for the sake of accuracy to state: “Groups of Elements operated above 100 kV that are primarily intended to distribute power to load rather than to transfer power across the interconnected System.” The exclusion’s reference to connection “at more than one location” is vague. The sentence should be revised to read “connected to the Bulk Electric System (BES) from more than one Transmission source solely to improve the level of service to retail customer Load,” and “Transmission source” should have the same meaning that it does in E1. E3(a) should require that there be switching devices between the LDN and the BES, not specifically automatic fault-interrupting devices. The term “separable by” in “Separable by automatic fault interrupting devices” is unclear and should be reworded. E3(b) To avoid pulling an LDN into the BES based on very small customer-owned generation (such as rooftop photovoltaics and hospital backup diesel generators) that the utility does not consider or rely on, or necessarily even know about, the item should be reworded: “Limits on connected generation: Neither the LDN, nor its underlying Elements (in aggregate), includes more than 75 MVA of generation used to meet the resource adequacy requirements of electric utilities.” E3(d) states “Not used to transfer bulk power.” As noted above, “bulk power” is a vague term. There will necessarily be some loop flow on a system that is connected to the BES at more than one location. The amount of permissible loop flow for this purpose needs to be determined and stated in this item.
Yes
For the sake of clarity, the final sentence should be revised to read as follows: “For purposes of this exclusion, a “small utility” is an entity that benefits from the utility of the BES, but does not meet the registry criteria to perform functions in the BES.”
No
No
In Ohio, 50 MW is the threshold for siting. Although 20 MW has recently been the criteria for the BES, if there is no technical justification (a study of some kind) then we highly recommend raising the threshold for generators to 50 MVA for a single unit. In our experience, registered generators, even those that have had severe violations, have been routinely classified as not having an impact on the BES in the enforcement process. Due to this truth, we can not understand the justification for keeping such a low threshold. We suggest raising the threshold to 50 MVA for single units, unless a technical study justifies inclusion.
Individual

National Grid
No
The core definition should be revised to read: Bulk Electric System (BES): All Transmission Elements operated at 100 KV or higher, unless such designation is modified by the list shown below. The resulting modified BES shall comprise all Elements deemed necessary for operating an interconnected electric energy transmission network, but shall exclude any Elements used in the local distribution of electric energy.
Yes
We would like some clarification regarding three-winding transformers, for example a 345/115/23 kV transformer. Was the intention to include the 23kV in the new definition of BES? If so, it seems likely that other 23 kV components on the buswork could be pulled into the definition of BES if it is in the zone of protection of the transformer.
Yes

Yes
No
<p>We do not feel that blackstart resources and cranking paths should be classified as BES. In several instances, cranking paths direct the operator to pick up distribution load before moving on to the next step for stability purposes. These are non-jurisdictional distribution facilities and should not be considered BES, since they are not necessary to support the reliability of the bulk power system during normal conditions. The BES definition should cover those facilities that are within FERC's jurisdiction and that are needed for operation under both normal and emergency conditions, which may include some facilities related to black-start and system restoration, but not all. The directives should not broadly include blackstart resources and facilities on the cranking path in the BES definition. This is over inclusive. The requirements in NERC standard EOP-005-2 address the SDT's interpretation and concern regarding recognition of the reliability impacts and requirements for blackstart resources and facilities used for system restoration. For example, there could also be small generators (less than 20 MVA/unit or 75 MVA/plant) or transmission and distribution facilities of 69 kV or less, which are considered "local", that are used for system restoration in the cranking path. A BES inclusion will then subject these generators and facilities, which are "local", non-jurisdictional facilities that may be called upon to begin restoring its bulk interconnected counterparts, to comply with the reliability standards intended for maintaining BES reliability. Including these facilities in the BES definition will thus discourage smaller generators from providing blackstart capability, and the transmission facilities from being a part of the cranking path. This may also discourage Transmission Owners and Operators from identifying multiple blackstart resources and cranking paths to provide restoration flexibility. This will ultimately undermine reliability. Also, including these types of facilities in the BES definitions could lead to jurisdictional challenges that could cause uncertainty and delay the implementation of the new BES definition and divert important industry and regulatory resources. Because of these reasons, I4 should be removed from the inclusions list.</p>
Yes
No
<p>We feel that there might be some confusion between I1 and E1 because while I1 only includes transformers with 2 windings greater than 100kV, E1 specifically says a tap must have an automatic interruption device to be excluded. So, we are concerned that radial tapped lines with a transformer whose low-side voltage is less than 100kV, but do not have an automatic interruption device are not excluded. We would like to see some additional clarity in this exclusion to address this situation Does automatic interruption device only include breakers/circuit switchers? Would a device such as a motorized loadbreak be considered an automatic interruption device? If motorized loadbreaks are also considered as an automatic interruption device, then there would be less confusion between E1 and I1. We also request that this issue be addressed by adding clarity to the exclusion. Another concern is that this exclusion requirement is restrictive and may have an adverse affect on future transmission investment for redundant radial supply to improve local load service, for example the addition of a second line removing the radial status exclusion. Consideration should be given to allowing entities to build additional transmission without automatically compromising the exclusion status of any given facilities.</p>
Yes
No
<p>E3.c and E3.d – These two points can be combined into one: Power is intended to flow only into the LDN. The generation within the LDN shall not exceed the electric real or reactive power demand within the LDN. The LDN only delivers real or reactive power to load, and is not to be used to transfer real or reactive power between different locations in the BES. Under no system condition is BES reliability to be dependent on LDN flow. E3.e - We would like more clarification on flowgates and what they are. We are interpreting flowgate as the lines that make up defined operational interface, as defined by the Operations group not the Planning group. Is this the correct interpretation of flowgate?</p>
No

This exclusion is not necessary. Many small utilities (and individual load customers or generation connections) have more than a single transmission source with a solid tap and, at the same time, be adequately protected and effectively isolated without any adverse impact on the transmission network. Such a practice and design is widely used across North America. Hence, we do not agree that this exclusion is an attempt to address the issue of small utilities. The definition and inclusions will force many small entities, load customers and generation unit owners to act and register as Transmission Owners. This may be in conflict with state or provincial regulatory act, Codes and Licenses, and may lead to jurisdictional challenges that could cause uncertainty and delay in implementing the new BES definition. Consistent with the FERC Order, the ERO and the SDT should be aware of these conflicts and should not ignore them. The ERO and the SDT address this by providing explicit but simple provisions in the exception procedure by considering sound technical exception criteria that is flexible based on demonstration of evidence to justify the element's necessity for operation. The only evidence that should be required of small utilities/entities is:

- Regulatory evidence.
- Evidence demonstrating that NO adverse reliability impact is afflicted on the interconnected BES because of their connection.

No

We don't believe the bright-line core definition and specific inclusions and exclusions prevent distribution from being considered as BES. Actually, it seems like a lot of distribution will be considered BES according to the inclusions and exclusions. (E1 may be interpreted to include step downs if they don't have automatic interruption devices and possibly the tied through distribution system to the other step-down transformer that doesn't have an automatic interruption device from the same Transmission source) If the definition is not revised to exclude more distribution, we are concerned about how the distribution elements that will be considered BES under the new definition will be classified. The BES definition should not be used to differentiate between transmission and distribution. It is important for the ERO and the SDT to understand and be consistent with the FERC Order for these important but complex issues. There could be conflicts with state or provincial jurisdictions. The ERO and SDT and RoP teams should be aware of these conflicts and not disregard them, as they will pose many implementation complexities and confusion within the industry, and may lead to jurisdictional challenges that could cause uncertainty and delay in implementation of the new BES definition. It is important for the ERO to not put entities in situations where there is some confusion or conflict. Removing I4, the inclusion regarding blackstart resources and cranking paths, will prevent distribution from being considered as BES. Also, clarification that step downs which have one winding which is less than 100 kV but are tapped off of the BES system without an automatic interruption device are not BES could also prevent distribution from being considered as BES.

Yes

There could be some conflicts with the ISO-NE Pool Transmission Facility (PTF) definition. If something is considered non-PTF, but is considered BES with this new definition, it could lead to confusion about which criteria should be applied to these entities and potentially which tariff (non-PTF or PTF) is truly the correct tariff. We believe adding more clarity as previously mentioned in the other questions to the definition and excluding I4 and clarifying E1 will minimize these issues.

We are concerned that the proposed definition of BES and specified inclusions reaches farther into the electric system than the Bulk Power System (BPS) definition. The statutory framework of the Federal Power and section 215 specifically must govern the definition of BES. It is clear in FERC's Order No. 743 that BES should not extend further than BPS, therefore the statutory definition of BPS must be the guide for the SDT's efforts, particularly with regard to the treatment of local distribution facilities. The BPS definition includes (1) facilities and control systems necessary for operating an interconnected electric energy transmission network; and (2) electric energy from generation facilities needed to maintain transmission system reliability. It does not include facilities used in the local distribution of electric energy. The definition of BES must comply with the statutory definition. First, the facilities and control systems to be included within the BPS/BES must be necessary for operating an interconnected electric transmission network. Therefore, one question to consider for each of the proposed inclusions and exclusions is "are they necessary?" A particular facility or element should not be included in the BES definition just because it would be desirable to have the facility considered BES or covered by a particular standard. Imposing a requirement that all contiguous elements be included is too broad and may sweep in facilities to the BES definition that are statutorily excluded because they are not necessary. Second, both the transmission and the generation facilities included within the BPS/BES must be tied to maintaining the reliable operation of the BPS. Section 215 defines the term

“reliable operation” as “operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure”. The statute does not require that there be no loss of load. The statute is aimed at avoiding uncontrolled separation or cascading failures. Therefore, the definition of BES should only include elements that are necessary to prevent these occurrences.

No

EEl believes that the entire designated cranking path should not be included in the BES definition if it would include facilities that are less than 100 kV on the path. Including such facilities may inappropriately include some facilities that are local distribution facilities, which are under state jurisdiction. These facilities might be swept into the definition of BES without an inquiry as to whether or not the facilities are “facilities used in local distribution of electric energy,” which is an explicit exclusion under the Federal Power Act definition of “Bulk-Power System.” This issue is more fully discussed in EEl’s response to Question 13.

Yes

EEl suggests that the following language more clearly expresses the intent of the SDT: Dispersed power producing resources with aggregate capacity greater than 75 MVA gross aggregate nameplate rating) utilizing a collector system from the point where the aggregate rating exceeds 75 MVA through a common point of interconnection to a system Element at a voltage o 100 kV or above.

No

EEl suggests the following change to E1: Any radial system which is described as connected from a single Transmission source [Delete “originating with an automatic interruption device”] and:

See comments to Question 13.

See comments to Question 13.

Comments: EEl appreciates the efforts of the SDT and offers these comments to help guide its efforts. EEl believes that the statutory framework of the Federal Power Act and Section 215 specifically must govern the definition of BES. While FERC has declined to further define the term “Bulk-Power System” (“BPS”) and suggested in Order No. 743 that the BPS “reaches farther than those facilities that are included” in the BES, it is clear that the BES cannot extend further than the BPS, and therefore the statutory definition of BPS must be the guide for the SDT’s efforts, particularly with regard to the treatment of local distribution facilities. The BPS definition in Section 215 includes: (1) facilities and control systems necessary for operating an interconnected electric energy transmission network; and (2) electric energy from generation facilities needed to maintain transmission system reliability. But the term BPS does not include facilities used in the local distribution of electric energy. The definition of BES must comply with the statutory definition. EEl points to several issues to which it believes the SDT should pay particular attention. First, the facilities and control systems to be included within the BPS/BES must be necessary for operating an interconnected electric transmission network. Therefore, each of the proposed inclusions and exclusions must be measured against this requirement – are they necessary? It is insufficient to include a particular facility or element within the BES definition merely because it would be desirable to have such a facility covered under the BES or a particular standard. In addition, EEl believes that imposing a requirement that all contiguous elements be included is too broad and may sweep in facilities to the BES definition that are statutorily excluded because they are not necessary. For example, while blackstart resources may be “necessary,” including all facilities that are contiguous

between a particular blackstart resource and the transmission system is likely to include elements that are not “necessary” to the operation of the interstate transmission network and therefore not within the statutory definition. As a general rule, EEI believes it is appropriate to include contiguous elements or facilities above 100kV necessary for operating the interconnected transmission network, but not any below 100 kV unless the element is necessary to operate the interconnected transmission network. There is no reason to require a “contiguous” BES down to the local distribution facility level. Section 215 gives NERC and FERC jurisdiction over “users, owners and operators” of the BPS. Therefore, FERC has authority to require an entity that is not a BES facility to comply with applicable NERC requirements where necessary for BPS reliability. This approach would achieve the goals of BPS reliability without extending the full reach of BES applicability to facilities that may be local distribution facilities that are excluded from Section 215. Second, both the transmission and the generation facilities included within the BPS/BES must be tied to maintaining the reliable operation of the BPS. Section 215 defines the term “reliable operation” as “operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure. The statute does not require that there be no loss of load. The statute is aimed at avoiding uncontrolled separation or cascading failures. Therefore, consistent with the statute, the definition of BES should only include elements that are necessary to prevent these occurrences. Third, the statute contains a specific exclusion for facilities used in the local distribution of electric energy (“local distribution facilities”). FERC has agreed in Orders No. 743 and 743-A that local distribution facilities are not subject to Section 215. FERC, as the agency implementing Section 215, has the authority to interpret what that means. In Order 743-A, FERC left it to NERC, and therefore to the SDT, to determine in the first instance which facilities are local distribution and therefore excluded and whether or not to use tests such as the Seven Factor Test from Order No. 888. Order No. 888 set out seven indicators, a combination of functional and technical tests, to assist companies and state commissions with separating local distribution facilities from FERC jurisdictional transmission facilities on a case by case basis. The seven factors are: (1) Local distribution facilities are normally in close proximity to retail customers; (2) Local distribution facilities are primarily radial in character; (3) Power flows into local distribution systems; it rarely, if ever, flows out; (4) When power enters into a local distribution system, it is not reconsigned or transported on to some other market; (5) Power entering a local distribution system is consumer in a comparatively restricted geographical area; (6) Meters are based at the transmission/local distribution interface to measure flows into the local distribution facilities; and (7) Local distribution systems will be of reduced voltage. EEI acknowledges that the Seven Factor test does not draw a bright line between facilities used in local distribution and transmission facilities and may not be a perfect fit for applying to specific pieces of equipment as the SDT has tried to do. However, many state commissions have made determination of what are local distribution facilities and FERC has concurred with these determinations. Therefore, EEI proposes that if NERC or FERC seek to include facilities (or class of facilities) in the BES that have been previously determined by a state commission to be local distribution through application of the Seven Factor Test, that there is a rebuttable presumption that these are facilities used in local distribution for purposes of the BES definition. In order to overcome this presumption, NERC/FERC must make a showing demonstrating that these facilities “necessary” for the reliable operation of the BPS. EEI will address this and a procedure for seeking exclusion of facilities that previously have been determined to be local distribution in its comments to be submitted on the exceptions process. In applying the statutory exclusion for local distribution facilities, the SDT should ensure that the inclusions do not include local distribution facilities and that the exclusions are sufficient to exclude local distribution facilities. Similarly, it is not sufficient to include an element that would otherwise be a local distribution facility merely to support a facility clearly within the BES. For example, the SDT should consider the how the proposed criteria would classify types of equipment such as distribution voltage equipment – some, such as cap banks in a generation switchyard do support the transmission system versus a regulator on a distribution feeder – the former may be part of the BES and the latter unlikely or not at all.

First, thank you for the opportunity to comment on the draft Proposed Continent-wide Definition of

the Bulk Electric System (BES). We appreciate the work that the Standards Development Team (SDT) has put into a new definition so far and believe the draft is a step in the right direction. We also understand the relatively short timeframe that NERC is working under in order to create a new BES definition to submit to FERC for approval before the imposed deadline. That said, we believe that the draft definition needs significant revision before NERC files it with FERC for approval. In response to question #1, we recommend that NERC revise the draft BES definition so that the first paragraph reads as follows: "Bulk Electric System (BES): Includes anything that meets each of the following three (3) criteria: (1) (a) Is a facility or control system necessary for operating an interconnected electric energy transmission network (or any portion thereof), or (b) Is electric energy from generation facilities needed to maintain transmission system reliability; AND (2) Is not a facility used in the local distribution of electric energy as determined by the Seven Factor Test set out in FERC Order 888; AND (3) (a) Unless included or excluded in subpart (b), is i. A Transmission Element operated at 100kV or higher; or ii. A Real Power Resource identified in subpart (b); or iii. A Reactive Power resource connected at 100kV or higher; (b) [the list of inclusions of exclusions in the draft, as modified by our comments below]" Criteria (1) and (2) of these revisions would capture the limitations on what may be included in the BES due to the jurisdictional limits that Congress placed on FERC, NERC, and the Regional Entities in developing and enforcing mandatory reliability standards. Specifically, Section 215(i) of the Federal Power Act provides that the Electric Reliability Organization (ERO) "shall have authority to develop and enforce compliance with reliability standards for only the Bulk-Power System." Section 215(b)(1) of the FPA, 16 U.S.C. § 824o(a)(1) (emphasis added). Section 215(a)(1) of the statute defines the term "Bulk-Power System" or "BPS" as: (A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy." Id. With this language, Congress expressly limited FERC, NERC, and the Regional Entities' jurisdiction with regard to local distribution facilities as well as those facilities not necessary for operating a transmission network. Given that these facilities are statutorily excluded from the definition of the BPS, reliability standards may not be developed or enforced for facilities used in local distribution, and therefore the definition of the BES may not include such facilities. In Order No. 672, FERC adopted the statutory definition of the BPS. See Order No. 672, FERC Stats. & Regs. ¶ 31,204 (2006). In Order No. 743-A, issued earlier this year, the Commission acknowledged that "Congress has specifically exempted 'facilities used in the local distribution of electric energy'" from the BPS definition. See Order 743-A, 134 FERC ¶ 61,210 at P. 25 (2011). FERC also held that to the extent any facility is a facility used in the local distribution of electric energy, it is exempted from the requirements of Section 215. Id. at P.54. In Order No. 743-A, FERC delegated to NERC the task of proposing for FERC approval criteria and a process to identify the facilities used in local distribution that will be excluded from NERC and FERC regulation. Id. at P 76. The critical first step in this process is for NERC to propose criteria for approval by FERC to determine which facilities are not BPS facilities and therefore not BES facilities. Accordingly, it is critical that NERC create a definition of the BES that first excludes facilities used in local distribution. In Order No. 743-A, the Commission confirmed this, stating: "once a facility is classified as local distribution, the facility will be excluded from the [BES] unless changes to the system warrant a review of the determination." Order No. 743-A, at P 71 (emphasis added). We believe that the Seven Factor is the appropriate means to determine whether a facility is used in the local distribution of electricity and therefore should be referenced in the definition of the BES. This is the test that applies elsewhere to determine whether facilities qualify as local distribution, and therefore there is strong and clear precedent for using it in the BES definition. See 334 F.3d 48. In fact, the statutory language in Section 201 of the FPA that led to the Seven Factor Test for other purposes is identical to the statutory language in Section 215 of the FPA at issue here. Well established rules of statutory construction call for interpreting identical language to produce similar meanings, therefore applying the Seven Factor Test under both sections of the statute is appropriate. And, without the Seven Factor Test as a means of determining what qualifies as local distribution facilities, there could be significant uncertainty and confusion as to whether certain facilities are part of the BES. Further, the Commission stated in Order 743-A that, "the Seven Factor Test could be relevant and possibly is a logical starting point for determining which facilities are local distribution for reliability purposes, while also allowing NERC flexibility in applying the test or developing an alternative approach as it deems necessary." Id. at P 69. The Seven Factor Test includes the following factors: 1) Local distribution facilities are normally in close proximity to retail customers; 2) local distribution facilities are primarily radial in character; 3) power flows into local

distribution systems, it rarely, if ever, flows out; 4) when power enters a local distribution system, it is not re-consigned or transported on to some other market; 5) power entering a local distribution system is consumed in a comparatively restricted geographical area; 6) meters are based at the transmission/local distribution interface to measure flows into the local distribution system; and 7) local distribution systems will be of reduced voltage. Order No. 888 at 31,771. FERC precedent indicates that a utility does not have to meet every factor of the seven-factor test in order for their facilities to qualify as local distribution. California Pacific Edison Co., Order Granting in Part and Denying in Part Petition for Declaratory Order, 133 FERC ¶ 61,018, 61,075 (Oct. 7, 2010). NERC must also limit the BES to facilities or control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof) or electric energy from generation facilities needed to maintain transmission system reliability, as directed by the FPA. Similar to the local distribution exclusion, facilities not falling into either of these categories are not part of the BPS and therefore must be expressly excluded from the BES. In order to establish a process that is consistent with the FPA and NERC's delegated authority from FERC, the proper sequence of steps must be applied in the correct order to determine which facilities are subject to NERC and FERC jurisdiction in the first instance, and only then, from among the jurisdictional facilities, to determine which facilities and control systems must comply with the electric reliability standards. Our revisions to the BES definition would create such a process within the definition of the BES. It would ensure that entities would begin any analysis of whether a particular item qualifies as BES by asking, first, whether that facility is "necessary for operating an interconnected electric energy transmission network (or any portion thereof)" or is "electric energy from generation facilities needed to maintain transmission system reliability," and second, whether that facility is "used in the local distribution of electric energy." Only after addressing these questions might further analysis be appropriate. We understand, but disagree with, the argument that, because the FPA clearly excludes local distribution facilities and facilities necessary for operating an interconnected electric transmission network from FERC, NERC, and Regional Entity jurisdiction, it is not necessary to expressly exclude these facilities again in the definition of the BES. This approach might be legally accurate, but could lead to significant confusion for entities attempting to implement the new BES definition. There are numerous examples of Regional Entities, particularly WECC, attempting to include such facilities in the BES under the current BES definition, and regulated entities are not certain as to which facilities they should consider part of the BES. Clarifying FERC, NERC, and Regional Entity in the BES definition, even if such clarification is already provided in the FPA, would avoid such problems under the new definition. Criterion (3) of these revisions is necessary to resolve the ambiguity in the proposed definition as to whether the clause "unless such designation is modified by the list shown below" modifies only the preceding clause ("Reactive Power resources connected at 100 kV or higher") or the entire definition. Rearranging the definition in this way should make clear that the list of inclusions and exclusions that would be inserted as Subpart (b) modifies each provision of Subpart (a). Thus, for example, even if a Transmission Element is otherwise included by virtue of operating at 100 kV or higher, it is nonetheless excluded if specifically addressed in the list of exclusions that would be incorporated as subpart (b) of the definition (if, for example, the Element qualifies as a Local Distribution Network). The rearrangement of the language eliminates any argument that the phrase "unless such designation is modified by the list shown below" does not modify "all Transmission Elements operated at 100 kV or higher" because of its placement at the end of the independent clause "Reactive Power resources connected at 100 kV or higher." Further, we support the use of the phrase "Transmission Elements" as the starting point for the base definition because both "Transmission" and "Elements" are already defined in the NERC Glossary of Terms Used, and the use of the term "Transmission" makes clear that the Bulk Electric System includes only Elements used in Transmission and therefore excludes Elements used in local distribution of electric power. As discussed above, the definition must exclude facilities used in local distribution in order to comply with the limits placed on NERC authority by Congress in Section 215 of the FPA. For similar reasons, we believe the SDT has improved the proposed definition from its initial proposal by eliminating the use of terms such as "Generation" that are not specifically defined in the NERC Glossary of Terms and by eliminating terms such as "Facility" that include "Bulk Electric System" as part of their definition. Eliminating the use of such terms helps sharpen the core definition. If a key term is undefined, incorporating it into the definition only begs the question of how the incorporated term is defined. If a currently-defined term uses the phrase "Bulk Electric System" as part of its definition, incorporating that term into the BES definition creates a confusing circularity. We therefore support the SDT's use of defined terms such as "Element," "Real Power," and "Reactive Power."

Yes

We support the SDT's attempt to provide a clear demarcation between the BES and non-BES elements. Inclusion I-1 is helpful because it at least implies that the BES ends where power is stepped down from transmission voltages to distribution voltages. We believe, however, that the SDT should undertake the effort to more clearly define the point where the BES ends and non-BES systems begin. We note that the WECC Bulk Electric System Definition Task Force ("BESDTF") has devoted considerable effort to this question and has developed one-line diagrams denoting the BES demarcation point for a number of different kinds of Elements that are common in the Western Interconnection. See WECC BES Definition Task Force Proposal 6, Appendix C (available at: <http://www.wecc.biz/Standards/Development/BES/default.aspx>). Similarly, the FRCC's BES Definition Clarification Project has devoted considerable effort to developing one-line diagrams of transmission and distribution Elements, and identifying the point of demarcation between BES and non-BES Elements. See FRCC BES Definition Clarification Project Version 4, Appendices A & B (available at: <https://www.frcc.com/Standards/BESDef.aspx>). Using this work as a starting point, the SDT should be able to provide much useful guidance to the industry with relatively little additional effort.

No

The inclusion of individual generation units with a nameplate capacity as small as 20 MVA is over-inclusive. Under FPA Section 215, generation resources are excluded from the "bulk-power system" unless they produce "electric energy" that is "needed to maintain transmission system reliability." 16 U.S.C. § 824o(a)(1)(B). Smaller generators with a capacity of 20 MVA almost never produce electricity that is "needed to maintain transmission system reliability." Hence, the inclusion as drafted would improperly expand the BES definition to include generators that the statute requires to be excluded. Further, the 20 MVA threshold appears to have been drawn without explanation from the existing NERC Statement of Compliance Registry. Given that the purpose of the Compliance Registry is to sweep in all generators that might be material to the operation of the BES, and not to definitively determine whether a given generator is, in fact, material to the operation of the BES, the STD has acted arbitrarily and without adequate technical justification in adopting the 20 MVA threshold. The 100 MVA threshold seems more in alignment with technical standards such as Power System Stabilizer requirements. In responding to comments on its initial proposal, the SDT states that it adopted the 20 MVA threshold because "there is no technical basis to change the values contained in the Statement of Compliance Registry Criteria." Consideration of Comments on Definition of Bulk Electric System – Project 2010-17, March 30, 2011, at 30. But this gets the equation backwards. The SDT must have some technical justification for adopting the 20 MVA threshold beyond the fact that it was previously adopted by NERC in a different context. Without a technical justification demonstrating that facilities operating at capacities as low as 20 MVA are "needed to maintain transmission system reliability," the proposed definition is overly broad and fails to comply with the restrictions imposed by Congress in FPA Section 215(a)(1), 16 U.S.C. § 824o(a)(1). Further, the Statement of Compliance Registry was adopted without the benefit of having been vetted through the NERC Standards Development Process, so the technical record underlying the choice of that threshold is unavailable for review by the industry. In the same comments, the SDT also states that it has considered "the inclusion of generator step-up (GSU) transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable." Id. The SDT's reasons for reaching this conclusion are not well-explained, but apparently the concern is that a "non-contiguous" BES could create "reliability gaps." This conclusion cannot be supported as an abstract proposition, but can only be demonstrated by a careful examination how application of reliability standards will change depending on how the BES is defined. We believe that if the SDT insists on a "contiguous" BES, an over-inclusive definition will result. We base these conclusions on the findings of NERC's Standards Drafting Team for Project 2010-07 and its predecessor, the "GO-TO Task Force." The Project 2010-07 Team was formed to address how the dedicated interconnection facilities linking a BES generator to high-voltage transmission facilities should be treated under the NERC standards. After reviewing these questions in considerable depth, the Team concluded that dedicated high-voltage interconnection facilities need not be treated as "Transmission" and classified as part of the BES in order to make reliability standards effective. On the contrary, the team concluded that by complying with a handful of reliability standards, primarily related to vegetation management, reliable operation of the bulk interconnected system could be protected without unduly burdening the owners of such interconnection systems. See Final Report from the NERC Ad Hoc Group for Generator Requirements at the Transmission Interface (Nov. 16, 2009) (paper written by the predecessor of the

Project 2010-07 SDT). Much of the work of the Project 2010-07 SDT is applicable to the work of the BES Standards Development Team. For example, the Project 2010-07 Team observed that interconnection facilities “are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system.” White Paper Proposal for Information Comment, NERC Project 2010-07: Generator Requirements at the Transmission Interface, at 3 (March 2011). Requiring Generation Owners and Operators to comply with the same standards as BES Transmission Owners and Operators “would do little, if anything, to improve the reliability of the Bulk Electric System,” especially “when compared to the operation of the equipment that actually produces electricity – the generation equipment itself.” Id. We believe the many of the questions considered by the Project 2010-07 Team are analogous to the questions under consideration by the SDT, and that, if the SDT insists upon a “contiguous” BES, the resulting definition will be substantially over-inclusive. The “contiguous” BES concept implies that every Element arguably necessary for the reliable operation of the interconnected bulk system must be included in the BES definition, even if it is interconnected with Elements that have no bearing on the operation of the BES. The adoption of a “contiguous” BES is therefore likely to result in imposition of reliability standards on a substantial number of facilities that have little or nothing to do with bulk system reliability, resulting in wasted regulatory expense and additional stress on the limited resources of reliability regulators. For example, a “contiguous” BES would require dedicated interconnection facilities that connect a BES generator to BES transmission facilities to be classified as BES. But, as the discussion above demonstrates, the classification of dedicated interconnection facilities as “BES” facilities would, based on the findings of the Project 2010-07 SDT, result in substantial overregulation and unnecessary expense with little gain for bulk system reliability. Similarly, a “contiguous” BES suggests that, because certain system protection facilities, such as UFLS relays, are ordinarily embedded in local distribution systems, the local distribution system, along with the UFLS relays, must be classified as BES to make the BES “contiguous.” Such a result is not only plainly contrary to the local distribution exclusion embedded in Section 215 of the FPA, but would, by improperly classifying local distribution lines as BES “Transmission” facilities, result in huge regulatory compliance burdens with little or no improvement in bulk system reliability. There is no good reason for the SDT to adopt a “contiguous” BES. On the contrary, because Section 215 allows reliability standards to be applied to “users” of the bulk system as well as “owners” and “operators,” local distribution systems operating UFLS relays and other bulk system protection devices could be required to comply with standards governing those devices as a precondition for their use of transmission on the bulk system. For these reasons, we urge the SDT to follow the example of the Project 2010-07 Team and the GO-TO Task Force by giving careful consideration to the specific and practical results of how its definition will affect the application of particular reliability standards and whether the results are beneficial to reliability or simply result in unnecessary regulatory burdens that do not benefit bulk system reliability. We believe there is considerable danger of error if the SDT bases its conclusions on metaphysical debates about whether a “contiguous” or “non-contiguous” BES is more desirable rather than engaging in a careful analysis of whether the proposed definition achieves reliability goals in the most efficient manner possible.

No

We are concerned that the 75 MVA threshold has been chosen arbitrarily by the SDT. Like the 20 MVA threshold discussed in our response to question 3, the 75 MVA threshold appears to have been drawn from the NERC Statement of Compliance Registry without appreciation for the function of the threshold in that document and without adequate technical justification demonstrating the generators with an aggregate capacity of 75 MVA produce electric energy “needed to maintain transmission system reliability” and are therefore properly included in the BES definition. The 100 MVA threshold seems more in alignment with technical standards such as Power System Stabilizer requirements.

No

We are concerned that the 75 MVA threshold has been chosen arbitrarily for the reasons stated in our comments on Question 4.

Yes

FERC has made clear throughout the Order No. 743 process that the existing exclusion for radials be retained.

As noted in our response to Question 3, we believe the inclusion of the 20 MVA threshold lacks an adequate technical justification. Further, unless the generation unit is reliability-must-run or essential blackstart, the function of the unit is irrelevant to the reliable operation of the interconnected bulk transmission grid, and we therefore believe the reference to the function of the generation unit should be eliminated.

Yes

We strongly support the categorical exclusion of Local Distribution Networks from the BES. For reasons discussed at length in our answer to Question 1, we believe the exclusion is necessary to ensure that the BES definition complies with the statutory requirement to exclude all facilities used in the local distribution of electric power. LDNs are likely the most common kind of local distribution facility. Further, the conversion of radial systems to local distribution networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. We also support, with the reservations discussed below, the LDN exclusion as drafted by the SDT. We believe the SDT has identified the key characteristics that separate LDNs from facilities that are part of the bulk transmission system and therefore should be classified as BES. Hence, LDNs can be excluded from the BES based on the characteristics identified by the SDT without compromising the reliability of the interconnected bulk transmission system. However, for the reasons stated in our answers to Questions 3 and 4, we believe the SDT's wholesale adoption of the 20 MVA and 75 MVA thresholds from the NERC Statement of Compliance Registry lacks adequate technical justification. The SDT repeats that error here by incorporating those thresholds into the LDN exception. The 100 MVA threshold seems more in alignment with technical standards such as Power System Stabilizer requirements.

Yes

We strongly support the SDT in its efforts to avoid unintended consequences from changes to the BES definition, especially for small entities that cannot afford the substantial costs that accompany imposition of mandatory reliability standards. We agree that the small utilities covered by the proposed exemption would have no measurable impact on the operation of the interconnected BES. Our views are borne out by experience in the Pacific Northwest where many small entities were required to register by virtue of owning a very small portion of the region's 115-kV system. These utilities have faced substantial compliance burdens even though their operations are simply not material to the interconnected bulk grid in our region, and the investment of resources in compliance therefore will have no measurable effect in improving the reliability of the interconnected grid.

No

We agree that the approach adopted by the SDT -- a core definition coupled with specific inclusions and exclusions -- will be effective in removing some local distribution facilities from the BES, it will not remove all such facilities. For the reasons discussed in our answer to Question 1, the proposed definition is over-inclusive and is likely to sweep up certain facilities used in local distribution that should not be classified as BES.

As discussed in our answers to Question 1 and Question 11, the SDT proposal does not reflect the jurisdictional limitations of the FPA.

Individual

Paul Titus

Northern Wasco County PUD

No

As a general matter, Northern Wasco County PUD supports the approach the Standards Development Team ("SDT") has taken to defining the Bulk Electric System ("BES"). The changes made in the revised core definition are helpful and represent significant progress toward an acceptable definition. With an effective and efficient exclusion process, the draft will better define the BES as a whole. We urge the SDT to bear in mind the restrictions contained in Section 215 of the Federal Power Act ("FPA") The "bulk-power system" (As per FERC, we treat the statutory term "bulk-power system" as equivalent to the term ordinarily used in the industry, "Bulk Electric System") definition imposes a clear limit on the reach of the mandatory reliability regime. The BES is made up of only those "facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof)" and "electric energy from generation facilities needed to maintain

transmission system reliability." Congress reinforced that limit in Section 215(i), where it emphasized that the FPA authorizes the imposition of reliability standards "for only the bulk-power system." Northern Wasco County PUD is concerned that the SDT's proposed definition is overly-broad, and that it will sweep in many Elements that have little or no material impact on the reliable operation of the interconnected bulk transmission grid. For example, the definition uses the arbitrary 20 MVA threshold from the NERC Statement of Registry Criteria for inclusion of generators. Accordingly, for the BES definition to conform to the requirements of the statute, the SDT must adopt an effective mechanism to exempt facilities like these that are improperly swept in by the SDT's brightline approach to inclusions and exclusions. For this reason, the Exception process to accompany the SDT's definition is of critical concern. If the SDT incorporates this statutory language as its core definition, it will have addressed FERC's primary concern with a minimum of disruption to the current NERC system of definitions. The definition could then be further elaborated to show specific points of demarcation for each inclusion and exclusion similar to that Proposal 6 from the WECC Bulk Electric System Definition Task Force ("BESDTF") team to further delineate BES and non-BES facilities.

No

In concept, we support the SDT's attempt to provide a clear demarcation between the BES and non-BES elements. Inclusion I-1 is helpful because it at least implies that the BES ends where power is stepped down from transmission voltages to distribution voltages. We believe, however, that the SDT should undertake the effort to more clearly define the point where the BES ends and non-BES systems begin. In this regard, we note that the WECC Bulk Electric System Definition Task Force ("BESDTF") has devoted considerable effort to this question and has developed one-line diagrams noting the BES demarcation point for a number of different kinds of Elements that are common in the Western Interconnection. Using this work as a starting point, the SDT should be able to provide much useful guidance to the industry with relatively little additional effort. Also, the reference to "two windings of 100 kV or higher" may create some confusion because many three-phase transformer banks have 6 or 9 windings, depending on whether the transformer has a tertiary. We suggest clarifying this provision by changing the clause reference two windings to read: "the two highest voltage transformer windings of 100 kV per phase that are connected to the Bulk Electric System." We again urge the SDT to consider further delineation of points of demarcation similar to WECC BESDTF Proposal 6.

No

Northern Wasco County PUD is concerned that I2 inclusion criteria that includes the arbitrary 20 MVA threshold from the NERC Statement of Registry Criteria for inclusion of generators is over-inclusive. Under FPA Section 215, generation resources are excluded from the "bulk-power system" unless they produce "electric energy" that is "needed to maintain transmission system reliability." Hence, the inclusion as drafted improperly expands the BES definition to include generators that the statute requires to be excluded. In the same comments, the SDT also states that it has considered "the inclusion of generator step-up (GSU) transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable." Unfortunately, the SDT appears to have concluded that any interconnection facility operating above 100-kV should be classified as BES. The result will be to require Generation Owners to register as Transmission Owners/Operators, as well, producing substantial additional compliance costs for those Generation Owners but resulting in little or no improvement in the reliability of the BES. We recommend that the SDT, like the Project 2010-07 SDT (commonly referred to as the GO/TO Team), give careful consideration to the practical results of its recommendations rather than relying on abstract conclusions about whether a "contiguous" or "non-contiguous" BES is more desirable. We are concerned that the SDT's pursuit of a "contiguous" BES will result in a substantially over-inclusive BES definition. The "contiguous" BES concept implies that every Element arguably necessary for the reliable operation of the interconnected bulk system must be included in the BES definition, even if it is interconnected with Elements that have no bearing on the operation of the BES. NERC's Standards Drafting Team for Project 2010-07, has already considered this question and, based on an in-depth review of potentially applicable reliability standards, has concluded that generation interconnection facilities, even if operated above 100-kV, need to comply only with a limited set of reliability standards in order to achieve the reliability goals. Much of the work of the Project 2010-07 SDT is applicable to the work of the BES Standards Development Team. For example, the Project 2010-07 Team observed that interconnection facilities "are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission

Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system.” Similarly, a “contiguous” BES suggests that, because certain system protection facilities, such as UFLS relays, are ordinarily embedded in local distribution systems, the local distribution system, along with the UFLS relays, must be classified as BES to make the BES “contiguous.” Such a result is not only plainly contrary to the local distribution exclusion embedded in Section 215 of the FPA, but would, by improperly classifying local distribution lines as BES “Transmission” facilities, result in huge regulatory compliance burdens with little or no improvement in bulk system reliability.

No

Northern Wasco County PUD is concerned that the 75 MVA threshold has been chosen arbitrarily by the SDT. Like the 20 MVA threshold discussed in our response to question 3, the 75 MVA threshold appears to have been drawn from the NERC Statement of Compliance Registry without appreciation for the function of the threshold in that document and without adequate technical justification demonstrating the generators with an aggregate capacity of 75 MVA produce electric energy “needed to maintain transmission system reliability” and are therefore properly included in the BES definition.

Yes

Including “all” blackstart and blackstart cranking paths in the BES may ultimately provide an incentive to the electric industry to reduce the number of resources with blackstart capability. We therefore suggest that essential blackstart resources identified by the Regional Entity should be included in the Bulk Electric System, but non-essential blackstart resources need not be.

No

Northern Wasco County PUD agrees that it is important to address wind generation facilities and similar generation facilities in which a large number of generating units, each with a relatively small capacity, are clustered and fed into the grid at a single interconnection point. That being said, Northern Wasco County PUD is concerned that the 75 MVA threshold has been chosen arbitrarily for the reasons stated in our comments on Question 4.

Yes

FERC has made clear throughout the Order No. 743 process that the existing exclusion for radials be retained. We believe the exclusion as drafted adequately defines radials.

No

As noted in our response to Question 3, we believe the inclusion of the 20 MVA threshold (through reference to Inclusion I2) lacks an adequate technical justification in this context. Further, unless the generation unit is reliability-must-run or essential blackstart, the function of the unit is irrelevant to the reliable operation of the interconnected bulk transmission grid, and we therefore believe the reference to the function of the generation unit (“standby, back-up, and maintenance power...”) should be eliminated.

Yes

Northern Wasco County PUD strongly supports the categorical exclusion of Local Distribution Networks from the BES. In fact, for reasons discussed at length in our answer to Question 1, we believe the exclusion is necessary to ensure that the BES definition complies with the statutory requirement to exclude all facilities used in the local distribution of electric power. LDNs are, of course, probably the most common kind of local distribution facility. Further, the conversion of radial systems to local distribution networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. Northern Wasco County PUD supports the LDN exclusion, but we believe the exclusion should be refined in the following respects: • The SDT’s draft states that: “LDN’s are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load.” (emphasis added) We recommend that the SDT revise the sentence quoted above as follows: “LDN’s are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load and not to accommodate bulk transfers of power across the interconnected bulk system.” By instituting this suggestion, the SDT would emphasize the key difference between an LDN, which is designed to reliably serve local, end-use retail customers, and the BES, which is designed to accommodate bulk transfer of power at wholesale over long distances.

Yes

Northern Wasco County PUD supports the SDT in its efforts to avoid unintended consequences from changes to the BES definition, especially for small entities that can ill afford the substantial costs that accompany imposition of mandatory compliance with reliability standards. Further, we agree that the small utilities covered by the exemption will have no measurable impact on the operation of the interconnected BES. In the Pacific Northwest, many small entities were required to register by virtue of owning a very small portion of the region's 115-kV system. These utilities have faced substantial compliance burdens even though their operations are simply not material to the interconnected bulk grid in our region, and the investment of resources in compliance therefore will have no measurable effect in improving the reliability of the interconnected grid.

No

While Northern Wasco County PUD agrees that the approach adopted by the SDT -- a core definition coupled with specific inclusions and exclusions -- will be effective in removing most local distribution facilities from the BES, it will not remove all such facilities. For the reasons discussed at greater length in our answer to Question 1, Northern Wasco County PUD believes that the proposed definition is over-inclusive and is likely to sweep up certain facilities used in local distribution that should not be classified as BES. As discussed in our answer to Question 3, Northern Wasco County PUD notes that exclusion of facilities from the BES does not mean that owners of those facilities are entirely exempt from reliability standards. On the contrary, the statute provides that "users" of the BES can be subject to reliability regulation. Hence, even where an entity does not own BES assets, it could be required to, for example, provide necessary information to the applicable Reliability Coordinator and to participate in the regional Under-Frequency Load Shedding program by setting the UFLS relays in its Local Distribution Network at the appropriate settings. We note that participants in the WECC BESDTF Task Force generally agreed that appropriate information should be provided by non-BES entities, although there was considerable concern related to ensuring that the provision of information was not unduly burdensome.

Yes

The Exceptions process is a necessary part of making this proposal compliant with the Federal Power Act. As noted in our responses to Question 1 and Question 11, we believe the basic SDT proposal is potentially in conflict with the limitations of the Federal Power Act, and in particular the statutory exclusion for facilities used in the local distribution of electric energy. The SDT's approach can meet the statutory requirements only if the Exception process currently under development results in facilities that are not properly classified as BES being exempted from regulation as BES facilities.

Northern Wasco County PUD has these additional concerns:

- The current definition provides that "Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process." Northern Wasco County PUD is concerned that the SDT carefully delineate which entity has the burden of proof in the exclusion process. The WECC BESDTF approach, which we commend to the SDT, laid out these burdens in some detail. Under that approach, essentially, if a facility is excluded from the BES by virtue of the specific exclusions listed in the definition, the Regional Entity bears the burden of proving that the facility nonetheless has a material impact on the interconnected bulk transmission system and therefore should be included in the BES. On the other hand, if a facility is classified as BES by virtue of the list of inclusions set forth in the BES definition, it can still escape classification as BES, but bears the burden of demonstrating that its facility has no material impact on the interconnected transmission system. We urge the SDT to give careful consideration to these burden-of-proof questions and to follow the lead of the WECC BES Task Force.
- For the reasons we have explained in our answer to Question 11, we believe the Exception process is critical both to ensure that the BES definition is effective in producing measurable gains to bulk system reliability and to ensuring that the definition will comply with the limitations Congress placed in Section 215. Hence, we believe the entire BES definition, including the Exception process and related procedures, should be vetted through the NERC Standards Development Process, including the full comment periods and a ballot approvals provided for in that process. We are concerned that important elements of the BES definition have been assigned to the Rules of Procedure Team, and that changes in the Rules of Procedure are subject to approval in a process that provides considerably less due process and industry input than the Standards Development Process. Accordingly, we urge that all elements of the BES definition, including those elements that have been assigned to the Rules of Procedure Team, be vetted through the Standards Development Process.

Individual

Bill Dearing

PUD No. 2 of Grant County, Washington
Yes
Grant supports the approach the Standards Development Team (“SDT”) has taken to defining the Bulk Electric System (“BES”). The changes made in the revised core definition are helpful and represent significant progress toward an acceptable definition. With an effective and efficient exclusion process, the draft will better define the BES as a whole. The definition could then be further elaborated to show specific points of demarcation for each inclusion and exclusion similar to that Proposal 6 from the WECC Bulk Electric System Definition Task Force (“BESDTF”) team to further delineate BES and non-BES facilities.
Yes
Grant supports the SDT’s attempt to provide a clear demarcation between the BES and non-BES elements. In I1 the transformer inclusion specifies “two windings greater than 100 kV or”. This appears to leave auto transformers out of the definition entirely. If the intent is to include these transformers, then more clarity might be available if it was revised to “at least two sets of bushings rated higher than 100 kV unless...” Inclusion I-1 is helpful because it implies that the BES ends where power is stepped down from transmission voltages to distribution voltages. We believe, however, that the SDT should undertake the effort to more clearly define the point where the BES ends and non-BES systems begin. In this regard, we note again that the WECC BESDTF has devoted considerable effort to this question and has developed one-line diagrams noting the BES demarcation point for a number of different kinds of Elements that are common in the Western Interconnection. Using this work as a starting point, the SDT should be able to provide much useful guidance to the industry with relatively little additional effort.
No
In the same comments, the SDT also states that it has considered “the inclusion of generator step-up (GSU) transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable.” Unfortunately, the SDT appears to have concluded that any interconnection facility operating above 100-kV should be classified as BES. The result will be to require Generation Owners to register as Transmission Owners/Operators, as well, producing substantial additional compliance costs for those Generation Owners but resulting in little or no improvement in the reliability of the BES. We recommend that the SDT, like the Project 2010-07 SDT (commonly referred to as the GO/TO Team), give careful consideration to the practical results of its recommendations rather than relying on abstract conclusions about whether a “contiguous” or “non-contiguous” BES is more desirable. We are concerned that the SDT’s pursuit of a “contiguous” BES will result in a substantially over-inclusive BES definition. The “contiguous” BES concept implies that every Element arguably necessary for the reliable operation of the interconnected bulk system must be included in the BES definition, even if it is interconnected with Elements that have no bearing on the operation of the BES. A “contiguous” BES suggests that, because certain system protection facilities, such as UFLS relays, are ordinarily embedded in local distribution systems, the local distribution system, along with the UFLS relays, must be classified as BES to make the BES “contiguous.” The improper classification of local distribution lines as BES “Transmission” facilities results in huge regulatory compliance burdens with little or no improvement in bulk system reliability.
Yes
Grant supports this proposed inclusion.
Yes
Grant supports this proposed inclusion with the caveat that the BES should be allowed to be non-contiguous, especially in this case, if the unit is low voltage.
Yes
Grant agrees that it is important to address wind generation facilities and similar generation facilities in which a large number of generating units, each with a relatively small capacity, are clustered and fed into the grid at a single interconnection point.
Yes
E1 specifically states “Any radial system which is described as connected from a single transmission source originating with an automatic disconnection device and...”. The example of concern is a radial tap to a single distribution power transformer that is connected to a ring bus or breaker and a half bus. In this case the transformer would have 2 automatic disconnection devices from what is

essentially a single source. Typically ring bus and breaker and a half bus are used to improve reliability, limiting the exclusion to a single disconnecting device appears to bring a hypothetical radial tap fed from a ring bus or breaker and a half bus into the BES definition. Although the LDN exclusion might apply there is the potential for many situations where it might not. A possible remedy is to revise the exclusion as follows: "Any radial system which is described as connected from a single transmission source that originates with automatic disconnection device(s) and..." In addition, a definition for "a single transmission source" should be provided to clarify the intent. Suggestion: "A single transmission source would be any transmission source located within a single facility, yard or fenced area and electrically continuous at a single voltage level".

Yes

Unless the generation unit is reliability-must-run or essential blackstart, the function of the unit is irrelevant to the reliable operation of the interconnected bulk transmission grid, and we therefore believe the reference to the function of the generation unit ("standby, back-up, and maintenance power...") should be eliminated.

Yes

Grant supports the categorical exclusion of Local Distribution Networks from the BES. We believe the exclusion is necessary to ensure that the BES definition complies with the statutory requirement to exclude all facilities used in the local distribution of electric power. LDNs are, of course, probably the most common kind of local distribution facility. Further, the conversion of radial systems to local distribution networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. Grant supports the LDN exclusion, but we believe the exclusion should be refined in the following respects: • The SDT's draft states that: "LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load." (emphasis added) We recommend that the SDT revise the sentence quoted above as follows: "LDN's are connected to the Bulk Electric System (BES) at more than one location solely to improve the level of service to retail customer Load and not to accommodate bulk transfers of power across the interconnected bulk system." By instituting this suggestion, the SDT would emphasize the key difference between an LDN, which is designed to reliably serve local, end-use retail customers, and the BES, which is designed to accommodate bulk transfer of power at wholesale over long distances. Two more suggestions: Bullet d, starts with "bulk power" and ends with generic "energy" transferred through and out of the LDN. This is inconsistent and will likely lead to confusion. In addition, "paper only" contract path transfers that result in no physical flow across the LDN should be specifically excluded.

Grant supports the SDT in its efforts to avoid unintended consequences from changes to the BES definition, especially for small entities that can ill afford the substantial costs that accompany imposition of mandatory compliance with reliability standards. Further, we agree that the small utilities covered by the exemption will have no measurable impact on the operation of the interconnected BES. In the Pacific Northwest, many small entities were required to register by virtue of owning a very small portion of the region's 115-kV transmission. These utilities have faced substantial compliance burdens even though their operations are simply not material to the interconnected bulk grid in our region, and the investment of resources in compliance therefore will have no measurable effect in improving the reliability of the interconnected grid.

Yes

Grant supports the concepts as presented in the draft. Exclusion of facilities from the BES does not mean that owners of those facilities are entirely exempt from reliability standards. The statutes provide that "users" of the BES can be subject to reliability regulation. Hence, even where an entity does not own BES assets, it could be required to, for example, provide necessary information to the applicable Reliability Coordinator and to participate in the regional Under-Frequency Load Shedding program by setting the UFLS relays in its Local Distribution Network at the appropriate settings. We note that participants in the WECC BESDTF Task Force generally agreed that appropriate information should be provided by non-BES entities, although there was considerable concern related to ensuring that the provision of information was not unduly burdensome.

Yes

The Exceptions process is a necessary part of making this proposal compliant with the Federal Power Act. The SDT's approach can meet the statutory requirements only if the Exception process currently under development results in facilities that are not properly classified as BES being exempted from

regulation as BES facilities.
Grant has these additional concerns: • We are concerned that the proposed 24-month delay in the effective date of the new definition will delay the potentially beneficial effects of the SDT's efforts, especially for utilities that have been inappropriately required to meet BES reliability standards, which is a common situation in WECC. We therefore urge the new BES definition become effective immediately upon approval by FERC or other applicable regulatory agencies. Entities that have been improperly required to meet standards can then immediately redirect resources to where they are truly needed. For entities that have not previously been registered for BES-related functions but that would be required to register under the new definition, we agree that 24 months is an appropriate transition period to allow the newly-registered entity to attain compliance with newly-applicable reliability standards, many of which require new training for employees, new maintenance procedures, and complex new operational protocols. However, the transition period for newly-registered entities should be structured in a way that does not prevent entities seeking deregistration from benefitting from the new definition at the earliest possible date. • The current definition provides that "Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process." Grant is concerned that the SDT carefully delineate which entity has the burden of proof in the exclusion process. The WECC BESDTF approach, which we commend to the SDT, laid out these burdens in some detail. Under that approach, essentially, if a facility is excluded from the BES by virtue of the specific exclusions listed in the definition, the Regional Entity bears the burden of proving that the facility nonetheless has a material impact on the interconnected bulk transmission system and therefore should be included in the BES. On the other hand, if a facility is classified as BES by virtue of the list of inclusions set forth in the BES definition, it can still escape classification as BES, but bears the burden of demonstrating that its facility has no material impact on the interconnected transmission system. We urge the SDT to give careful consideration to these burden-of-proof questions and to follow the lead of the WECC BES Task Force.
Group
Small Entity Working Group (SEWG)
Scott Berry
Yes
The Small Entity Working Group (SEWG) appreciates the opportunity to comment on the draft BES definition. The group generally supports the direction taken by the SDT, with some minor changes. The BES definition should refer to "non-generator Reactive Power resources," to clarify that although all generators provide some reactive power, the generators that do not meet the criteria of I2 through I5 are not included in the BES. The BES definition should include a reference to the existence of the exception process.
No comment.
Yes
Yes, with a minor clarification. Individual generating units greater than 20 MVA (gross nameplate rating) including the generator terminals through the GSU which has a high side connection voltage of 100 kV or above. This should help state that only generators that are both over 20 MVA and connected through a GSU with a high side voltage of at least 100kV are included in the BES.
No comment.
No
The SEWG proposes a minor change to Inclusion I4. The SEWG recommends that the SDT exclude Blackstart Units under 20MW and Blackstart Units that are connected via their GSU to Non-BES Facilities (under 100kV). We believe this would be a minimal impact on the existing Restoration Plans while increasing the reliability and viability of these Restoration Plans since the industry would be forced to use only BES facilities as defined by NERC BES definition. In addition, a clarification is needed under the first bullet under I4 in the posted word comment form for this BES draft (posted in the first column under Implementation Plan for Definition). It should be changed to read "Blackstart units that have been included in the Transmission Operator's restoration plan and their respective cranking paths..." We do not believe it was the intent of the SDT to include all blackstart units in the BES definition regardless if they are not part of a Transmission Operator's restoration plan.
No Comment
Yes

Yes, with some minor changes. Delete the words "described as" in the sentence: Any radial system which is described as connected from a single Transmission source originating with an automatic interruption device and. How the radial system is actually connected is important not the description. The SEWG believes that "a single Transmission source" should be defined in such a way to ensure all the various bus configurations are captured. The SEWG recommends modifying the language in E1 to allow for the use of a "switching device" rather than an "automatic reclosing device" for two specific situations as follows: 1) When a radial transmission line is feed from a ring bus, but only serve load and/or non-registered generation: 2) When a radial transmission line is feed from a breaker and half bus and it only serves load and/or non-registered generation. In both cases, faults on the radial transmission line will not interrupt network transmission flows and therefore has minimal impact on the BES. For direct connection of radial transmission lines to a networked transmission line, the SEWG agrees that an automatic interrupting device is required to protect the BES.

No Comments

Yes

Yes, with some clarifying edits. The first sentence of Exclusion 3 should be revised for accuracy as follows: ""Local Distribution Networks (LDN): Groups of Elements operated above 100 kV that are primarily intended to distribute power to Load rather than to transfer bulk power across the Interconnected System." The second sentence should be revised for clarity as follows: "LDN's are connected to the Bulk Electric System (BES) from more than one Transmission source solely to improve the level of service to retail customer Load." Exclusion E3 a) should be revised as we note in our comments in Question#7 to allow for the use of switching devices in specific situations

Yes

Yes, with some clarifying edits. The final sentence should be revised as follows: "For purposes of this exclusion, a 'small utility' is an entity that performs a distribution provider or load serving entity function but is not required to register as a Distribution Provider or Load Serving Entity by the ERO."

Idaho Falls Power

Richard Malloy

No

We believe that inclusions or exclusions tied to brightline registration criteria (such as the 20MVA single generation source or 75 MVA facility) does not fulfill the effort the NERC BES definition project was tasked to undertake. The current draft's language will draw in many small municipal and other like entities with small generation assets, which have no material impact upon the BES. Further, should these generation assets not be excluded, this draft implies that all assets downstream to the point of interconnection are BES as well regardless of point of connection. We believe it was the original intent of this definition project to remove such immaterial assets and the undue burden placed upon such entities and subsequently their rate payers, who have no impact to the BES.

Yes

It seems reasonable to conclude that such transformers would belong in a classification that comprises the BES.

No

We feel the bright line criteria 20 MVA for generation is equally as arbitrary as the 100KV threshold for transmission, which was the impetus for the NERC BES definition effort. There should be more defining criteria to establish what generation resources should be included in the BES. Possible criteria to consider would be generation serving load other than local load connected to an LDN or generation that is dispatchable. Surely, just as not all 100 kV is material to the BES, neither is all 20MVA or greater generation. If this draft's language is allowed to stand at the brightline of 20MVA, without additional defining criteria, will have the likely result of an inordinate number of entities having to resolve the issue of material impact through the Rules of Procedure exemption process. We urge NERC to take this opportunity now to more clearly define material generation assets beyond a simple brightline criteria. In addition to our concern of this draft following bright line registry criteria for

generation assets, it is our concern that there is no distinction made as to where the generation is connected. Our belief is that generation on an LDN wherein the net flow of power is into the LDN should be exempt as the likelihood of that generation being material to the larger BES is exceedingly small.

No

Again, following our statement in question 3, we feel an arbitrary brightline threshold requires additional defining criteria for inclusion. Adopting the registry's brightline criteria is us skirting the purpose of the BES definition effort, and lends no more clarity to what is in fact the BES.

Yes

It is reasonable to conclude that Blackstart generation resources are material to the BES.

No

This inclusion seems redundant to the registry criteria for GO/GOP of a facility generation of 75MVA or greater. We do not see how this definition adds or removes any assets already defined by the registry criteria.

No

This exclusion speaks to radial systems with generation resources not identified in 12, 13, 14, or 15, thus seemingly only to apply to generation resources smaller than 20MVA. We wonder why this exclusion then exists as these resources are already excluded by not being large enough to fall under the registry criteria, and thus need not comply with the reliability standards.

No

We do not agree with E2(i). If the generation assets listed in the inclusions of 12 and 13 are not permitted to be excluded in E2, then what is the point of E2? The generation assets would already be in or out based upon the registry's MVA nameplate capacity. We would support E2 if provision (i) were struck. If generation assets are behind the meter on a local distribution network (fitting the criteria E3 for exemption) then too the generation should be exempted regardless of MVA rating. Moreover, we do not agree that there is a brightline MVA threshold of materiality to the BES. We would hope that the drafting team could demonstrate how the 20MVA brightline is a valid threshold for generation while the 100kV for transmission is not. We are concerned that relatively small generation on a local distribution network wherein generation is always serving local retail load behind the meter will be labelled a BES asset. As such, then is the LDN to the point of interconnection a BES asset as well, and therefore subject to the suite of TO/TOP standards? We feel such an outcome is unreasonable. It seems to us, as is stated under section 215 of the FPA, that the term BES "does not include facilities used in the local distribution of electric energy." To a logical conclusion, the generation attached to local distribution was considered and is intended to be one of the "facilities" and should therefore be exempted from inclusion in the BES. However, should the drafting team deem that all generation above 20MVA are a BES assets, we would hope that the exclusion for Local Distribution Networks could still stand and that the generation on the LDN would be divorced and defined separately. Our opinion is the BES is not one large contiguous system, but is rather comprised of assets across the region, which due to their size or location are vital to a sound BES but are not necessarily connected to each other. This principle would allow the generation to be regulated yet remove the burden of transmission standards from small entities.

No

We support this exclusion, however generation assets on a Local Distribution Network should be excluded regardless of MVA rating if all other defining criteria in E3 are met. Additionally, it is unclear as written whether a single generation asset greater than 20MVA would be excluded as E3(b) states 75 MVA, but is inconsistent with E2(i). Some clarification of intent is needed to resolve the ambiguities between these two exclusions.

No

Just as 100kv is an arbitrary number, so is 20MVA. We appreciate the NERC efforts made to define transmission material to the BES, and likewise feel the same efforts should be applied to small generation resources. There exists a large number of utilities with small generation serving local load on an LDN that will be possibly drawn into TO/TOP standard's compliance by the language in this draft. We hope the drafting team will define BES generation beyond a brightline criteria, as 20MVA lends no more clarity as to what is a BES asset than does 100kV. We believe it should be demonstrated as to why 20MVA is deemed a generation threshold of materiality to the BES. The

opportunity now exists to address thresholds, not just the 100kV.
No
In the exclusions, we feel there has not been given enough clarification of generation assets on a LDN, specifically, is a single generation resource >20MVA but <75 MVA excluded? This does not seem clear because of the seeming inconsistencies of E2(i) and E3(b). Further, we believe generation on an LDN serving local load wherein the net flow is into the LDN should be excluded.
Yes
It is unclear how the reliability standards will be applied to registered entities should some assets be deemed not to be a part of the BES. As an example; will an LSE with >25MW of load connected at 161kv be responsible for relay maintenance under PRC-005-1 if the 161 kv is exempted as a local distribution network? Clarification of this issue may be beyond the scope of the BES definition effort, however guidance in this area should accompany this effort.

No
<p>First, thank you for the opportunity to comment on the draft Proposed Continent-wide Definition of the Bulk Electric System (BES). We appreciate the work that the Standards Development Team (SDT) has put into a new definition so far and believe the draft is a step in the right direction. We also understand the relatively short timeframe that NERC is working under in order to create a new BES definition to submit to FERC for approval before the imposed deadline. That said, we believe that the draft definition needs significant revision before NERC files it with FERC for approval. In response to question #1, we recommend that NERC revise the draft BES definition so that the first paragraph reads as follows: "Bulk Electric System (BES): Includes anything that meets each of the following three (3) criteria: (1) (a) Is a facility or control system necessary for operating an interconnected electric energy transmission network (or any portion thereof), or (b) Is electric energy from generation facilities needed to maintain transmission system reliability; AND (2) Is not a facility used in the local distribution of electric energy as determined by the Seven Factor Test set out in FERC Order 888; AND (3) (a) Unless included or excluded in subpart (b), is i. A Transmission Element operated at 100kV or higher; or ii. A Real Power Resource identified in subpart (b); or iii. A Reactive Power resource connected at 100kV or higher; (b) [the list of inclusions of exclusions in the draft, as modified by our comments below]" Criteria (1) and (2) of these revisions would capture the limitations on what may be included in the BES due to the jurisdictional limits that Congress placed on FERC, NERC, and the Regional Entities in developing and enforcing mandatory reliability standards. Specifically, Section 215(i) of the Federal Power Act provides that the Electric Reliability Organization (ERO) "shall have authority to develop and enforce compliance with reliability standards for only the Bulk-Power System." Section 215(b)(1) of the FPA, 16 U.S.C. § 824o(a)(1) (emphasis added). Section 215(a)(1) of the statute defines the term "Bulk-Power System" or "BPS" as: (A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy." Id. With this language, Congress expressly limited FERC, NERC, and the Regional Entities' jurisdiction with regard to local distribution facilities as well as those facilities not necessary for operating a transmission network. Given that these facilities are statutorily excluded from the definition of the BPS, reliability standards may not be developed or enforced for facilities used in local distribution, and therefore the definition of the BES may not include such facilities. In Order No. 672, FERC adopted the statutory definition of the BPS. See Order No. 672, FERC Stats. &amp; Regs. ¶ 31,204 (2006). In Order No. 743-A, issued earlier this year, the Commission acknowledged that "Congress has specifically exempted 'facilities used in the local distribution of electric energy'" from the BPS definition. See Order 743-A, 134 FERC ¶ 61,210 at P. 25 (2011). FERC also held that to the extent any facility is a facility used in the local distribution of electric energy, it is exempted from the requirements of Section 215. Id. at P.54. In Order No. 743-A, FERC delegated to NERC the task of proposing for FERC approval criteria and a process to identify the facilities used in local distribution that will be excluded from NERC and FERC regulation. Id. at P 76. The critical first step in this process is for NERC to propose criteria for approval by FERC to determine which facilities are not BPS facilities</p>

and therefore not BES facilities. Accordingly, it is critical that NERC create a definition of the BES that first excludes facilities used in local distribution. In Order No. 743-A, the Commission confirmed this, stating: "once a facility is classified as local distribution, the facility will be excluded from the [BES] unless changes to the system warrant a review of the determination." Order No. 743-A, at P 71 (emphasis added). We believe that the Seven Factor is the appropriate means to determine whether a facility is used in the local distribution of electricity and therefore should be referenced in the definition of the BES. This is the test that applies elsewhere to determine whether facilities qualify as local distribution, and therefore there is strong and clear precedent for using it in the BES definition. See 334 F.3d 48. In fact, the statutory language in Section 201 of the FPA that led to the Seven Factor Test for other purposes is identical to the statutory language in Section 215 of the FPA at issue here. Well established rules of statutory construction call for interpreting identical language to produce similar meanings, therefore applying the Seven Factor Test under both sections of the statute is appropriate. And, without the Seven Factor Test as a means of determining what qualifies as local distribution facilities, there could be significant uncertainty and confusion as to whether certain facilities are part of the BES. Further, the Commission stated in Order 743-A that, "the Seven Factor Test could be relevant and possibly is a logical starting point for determining which facilities are local distribution for reliability purposes, while also allowing NERC flexibility in applying the test or developing an alternative approach as it deems necessary." Id. at P 69. The Seven Factor Test includes the following factors: 1) Local distribution facilities are normally in close proximity to retail customers; 2) local distribution facilities are primarily radial in character; 3) power flows into local distribution systems, it rarely, if ever, flows out; 4) when power enters a local distribution system, it is not re-consigned or transported on to some other market; 5) power entering a local distribution system is consumed in a comparatively restricted geographical area; 6) meters are based at the transmission/local distribution interface to measure flows into the local distribution system; and 7) local distribution systems will be of reduced voltage. Order No. 888 at 31,771. FERC precedent indicates that a utility does not have to meet every factor of the seven-factor test in order for their facilities to qualify as local distribution. California Pacific Edison Co., Order Granting in Part and Denying in Part Petition for Declaratory Order, 133 FERC ¶ 61,018, 61,075 (Oct. 7, 2010). NERC must also limit the BES to facilities or control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof) or electric energy from generation facilities needed to maintain transmission system reliability, as directed by the FPA. Similar to the local distribution exclusion, facilities not falling into either of these categories are not part of the BPS and therefore must be expressly excluded from the BES. In order to establish a process that is consistent with the FPA and NERC's delegated authority from FERC, the proper sequence of steps must be applied in the correct order to determine which facilities are subject to NERC and FERC jurisdiction in the first instance, and only then, from among the jurisdictional facilities, to determine which facilities and control systems must comply with the electric reliability standards. Our revisions to the BES definition would create such a process within the definition of the BES. It would ensure that entities would begin any analysis of whether a particular item qualifies as BES by asking, first, whether that facility is "necessary for operating an interconnected electric energy transmission network (or any portion thereof)" or is "electric energy from generation facilities needed to maintain transmission system reliability," and second, whether that facility is "used in the local distribution of electric energy." Only after addressing these questions might further analysis be appropriate. We understand, but disagree with, the argument that, because the FPA clearly excludes local distribution facilities and facilities necessary for operating an interconnected electric transmission network from FERC, NERC, and Regional Entity jurisdiction, it is not necessary to expressly exclude these facilities again in the definition of the BES. This approach might be legally accurate, but could lead to significant confusion for entities attempting to implement the new BES definition. There are numerous examples of Regional Entities, particularly WECC, attempting to include such facilities in the BES under the current BES definition, and regulated entities are not certain as to which facilities they should consider part of the BES. Clarifying FERC, NERC, and Regional Entity in the BES definition, even if such clarification is already provided in the FPA, would avoid such problems under the new definition. Criterion (3) of these revisions is necessary to resolve the ambiguity in the proposed definition as to whether the clause "unless such designation is modified by the list shown below" modifies only the preceding clause ("Reactive Power resources connected at 100 kV or higher") or the entire definition. Rearranging the definition in this way should make clear that the list of inclusions and exclusions that would be inserted as Subpart (b) modifies each provision of Subpart (a). Thus, for example, even if a Transmission Element is otherwise included by virtue of operating at 100 kV or higher, it is

nonetheless excluded if specifically addressed in the list of exclusions that would be incorporated as subpart (b) of the definition (if, for example, the Element qualifies as a Local Distribution Network). The rearrangement of the language eliminates any argument that the phrase “unless such designation is modified by the list shown below” does not modify “all Transmission Elements operated at 100 kV or higher” because of its placement at the end of the independent clause “Reactive Power resources connected at 100 kV or higher.” Further, we support the use of the phrase “Transmission Elements” as the starting point for the base definition because both “Transmission” and “Elements” are already defined in the NERC Glossary of Terms Used, and the use of the term “Transmission” makes clear that the Bulk Electric System includes only Elements used in Transmission and therefore excludes Elements used in local distribution of electric power. As discussed above, the definition must exclude facilities used in local distribution in order to comply with the limits placed on NERC authority by Congress in Section 215 of the FPA. For similar reasons, we believe the SDT has improved the proposed definition from its initial proposal by eliminating the use of terms such as “Generation” that are not specifically defined in the NERC Glossary of Terms and by eliminating terms such as “Facility” that include “Bulk Electric System” as part of their definition. Eliminating the use of such terms helps sharpen the core definition. If a key term is undefined, incorporating it into the definition only begs the question of how the incorporated term is defined. If a currently-defined term uses the phrase “Bulk Electric System” as part of its definition, incorporating that term into the BES definition creates a confusing circularity. We therefore support the SDT’s use of defined terms such as “Element,” “Real Power,” and “Reactive Power.”

Yes

We support the SDT’s attempt to provide a clear demarcation between the BES and non-BES elements. Inclusion I-1 is helpful because it at least implies that the BES ends where power is stepped down from transmission voltages to distribution voltages. We believe, however, that the SDT should undertake the effort to more clearly define the point where the BES ends and non-BES systems begin. We note that the WECC Bulk Electric System Definition Task Force (“BESDTF”) has devoted considerable effort to this question and has developed one-line diagrams denoting the BES demarcation point for a number of different kinds of Elements that are common in the Western Interconnection. See WECC BES Definition Task Force Proposal 6, Appendix C (available at: <http://www.wecc.biz/Standards/Development/BES/default.aspx>). Similarly, the FRCC’s BES Definition Clarification Project has devoted considerable effort to developing one-line diagrams of transmission and distribution Elements, and identifying the point of demarcation between BES and non-BES Elements. See FRCC BES Definition Clarification Project Version 4, Appendices A & B (available at: <https://www.frcc.com/Standards/BESDef.aspx>). Using this work as a starting point, the SDT should be able to provide much useful guidance to the industry with relatively little additional effort.

No

The inclusion of individual generation units with a nameplate capacity as small as 20 MVA is over-inclusive. Under FPA Section 215, generation resources are excluded from the “bulk-power system” unless they produce “electric energy” that is “needed to maintain transmission system reliability.” 16 U.S.C. § 824o(a)(1)(B). Smaller generators with a capacity of 20 MVA almost never produce electricity that is “needed to maintain transmission system reliability.” Hence, the inclusion as drafted would improperly expand the BES definition to include generators that the statute requires to be excluded. Further, the 20 MVA threshold appears to have been drawn without explanation from the existing NERC Statement of Compliance Registry. Given that the purpose of the Compliance Registry is to sweep in all generators that might be material to the operation of the BES, and not to definitively determine whether a given generator is, in fact, material to the operation of the BES, the STD has acted arbitrarily and without adequate technical justification in adopting the 20 MVA threshold. The 100 MVA threshold seems more in alignment with technical standards such as Power System Stabilizer requirements. In responding to comments on its initial proposal, the SDT states that it adopted the 20 MVA threshold because “there is no technical basis to change the values contained in the Statement of Compliance Registry Criteria.” Consideration of Comments on Definition of Bulk Electric System – Project 2010-17, March 30, 2011, at 30. But this gets the equation backwards. The SDT must have some technical justification for adopting the 20 MVA threshold beyond the fact that it was previously adopted by NERC in a different context. Without a technical justification demonstrating that facilities operating at capacities as low as 20 MVA are “needed to maintain transmission system reliability,” the proposed definition is overly broad and fails to comply with the restrictions imposed by Congress in FPA Section 215(a)(1), 16 U.S.C. § 824o(a)(1). Further, the Statement of Compliance

Registry was adopted without the benefit of having been vetted through the NERC Standards Development Process, so the technical record underlying the choice of that threshold is unavailable for review by the industry. In the same comments, the SDT also states that it has considered “the inclusion of generator step-up (GSU) transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable.” Id. The SDT’s reasons for reaching this conclusion are not well-explained, but apparently the concern is that a “non-contiguous” BES could create “reliability gaps.” This conclusion cannot be supported as an abstract proposition, but can only be demonstrated by a careful examination how application of reliability standards will change depending on how the BES is defined. We believe that if the SDT insists on a “contiguous” BES, an over-inclusive definition will result. We base these conclusions on the findings of NERC’s Standards Drafting Team for Project 2010-07 and its predecessor, the “GO-TO Task Force.” The Project 2010-07 Team was formed to address how the dedicated interconnection facilities linking a BES generator to high-voltage transmission facilities should be treated under the NERC standards. After reviewing these questions in considerable depth, the Team concluded that dedicated high-voltage interconnection facilities need not be treated as “Transmission” and classified as part of the BES in order to make reliability standards effective. On the contrary, the team concluded that by complying with a handful of reliability standards, primarily related to vegetation management, reliable operation of the bulk interconnected system could be protected without unduly burdening the owners of such interconnection systems. See Final Report from the NERC Ad Hoc Group for Generator Requirements at the Transmission Interface (Nov. 16, 2009) (paper written by the predecessor of the Project 2010-07 SDT). Much of the work of the Project 2010-07 SDT is applicable to the work of the BES Standards Development Team. For example, the Project 2010-07 Team observed that interconnection facilities “are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system.” White Paper Proposal for Information Comment, NERC Project 2010-07: Generator Requirements at the Transmission Interface, at 3 (March 2011). Requiring Generation Owners and Operators to comply with the same standards as BES Transmission Owners and Operators “would do little, if anything, to improve the reliability of the Bulk Electric System,” especially “when compared to the operation of the equipment that actually produces electricity – the generation equipment itself.” Id. We believe the many of the questions considered by the Project 2010-07 Team are analogous to the questions under consideration by the SDT, and that, if the SDT insists upon a “contiguous” BES, the resulting definition will be substantially over-inclusive. The “contiguous” BES concept implies that every Element arguably necessary for the reliable operation of the interconnected bulk system must be included in the BES definition, even if it is interconnected with Elements that have no bearing on the operation of the BES. The adoption of a “contiguous” BES is therefore likely to result in imposition of reliability standards on a substantial number of facilities that have little or nothing to do with bulk system reliability, resulting in wasted regulatory expense and additional stress on the limited resources of reliability regulators. For example, a “contiguous” BES would require dedicated interconnection facilities that connect a BES generator to BES transmission facilities to be classified as BES. But, as the discussion above demonstrates, the classification of dedicated interconnection facilities as “BES” facilities would, based on the findings of the Project 2010-07 SDT, result in substantial overregulation and unnecessary expense with little gain for bulk system reliability. Similarly, a “contiguous” BES suggests that, because certain system protection facilities, such as UFLS relays, are ordinarily embedded in local distribution systems, the local distribution system, along with the UFLS relays, must be classified as BES to make the BES “contiguous.” Such a result is not only plainly contrary to the local distribution exclusion embedded in Section 215 of the FPA, but would, by improperly classifying local distribution lines as BES “Transmission” facilities, result in huge regulatory compliance burdens with little or no improvement in bulk system reliability. There is no good reason for the SDT to adopt a “contiguous” BES. On the contrary, because Section 215 allows reliability standards to be applied to “users” of the bulk system as well as “owners” and “operators,” local distribution systems operating UFLS relays and other bulk system protection devices could be required to comply with standards governing those devices as a precondition for their use of transmission on the bulk system. For these reasons, we urge the SDT to follow the example of the Project 2010-07 Team and the GO-TO Task Force by giving careful consideration to the specific and practical results of how its definition will affect the application of particular reliability standards and whether the results are beneficial to reliability or simply result in unnecessary regulatory burdens that do not benefit bulk system reliability. We believe there is

considerable danger of error if the SDT bases its conclusions on metaphysical debates about whether a "contiguous" or "non-contiguous" BES is more desirable rather than engaging in a careful analysis of whether the proposed definition achieves reliability goals in the most efficient manner possible.

No

We are concerned that the 75 MVA threshold has been chosen arbitrarily by the SDT. Like the 20 MVA threshold discussed in our response to question 3, the 75 MVA threshold appears to have been drawn from the NERC Statement of Compliance Registry without appreciation for the function of the threshold in that document and without adequate technical justification demonstrating the generators with an aggregate capacity of 75 MVA produce electric energy "needed to maintain transmission system reliability" and are therefore properly included in the BES definition. The 100 MVA threshold seems more in alignment with technical standards such as Power System Stabilizer requirements.

No

We are concerned that the 75 MVA threshold has been chosen arbitrarily for the reasons stated in our comments on Question 4.

Yes

FERC has made clear throughout the Order No. 743 process that the existing exclusion for radials be retained.

As noted in our response to Question 3, we believe the inclusion of the 20 MVA threshold lacks an adequate technical justification. Further, unless the generation unit is reliability-must-run or essential blackstart, the function of the unit is irrelevant to the reliable operation of the interconnected bulk transmission grid, and we therefore believe the reference to the function of the generation unit should be eliminated.

Yes

We strongly support the categorical exclusion of Local Distribution Networks from the BES. For reasons discussed at length in our answer to Question 1, we believe the exclusion is necessary to ensure that the BES definition complies with the statutory requirement to exclude all facilities used in the local distribution of electric power. LDNs are likely the most common kind of local distribution facility. Further, the conversion of radial systems to local distribution networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. We also support, with the reservations discussed below, the LDN exclusion as drafted by the SDT. We believe the SDT has identified the key characteristics that separate LDNs from facilities that are part of the bulk transmission system and therefore should be classified as BES. Hence, LDNs can be excluded from the BES based on the characteristics identified by the SDT without compromising the reliability of the interconnected bulk transmission system. However, for the reasons stated in our answers to Questions 3 and 4, we believe the SDT's wholesale adoption of the 20 MVA and 75 MVA thresholds from the NERC Statement of Compliance Registry lacks adequate technical justification. The SDT repeats that error here by incorporating those thresholds into the LDN exception. The 100 MVA threshold seems more in alignment with technical standards such as Power System Stabilizer requirements.

Yes

We strongly support the SDT in its efforts to avoid unintended consequences from changes to the BES definition, especially for small entities that cannot afford the substantial costs that accompany imposition of mandatory reliability standards. We agree that the small utilities covered by the proposed exemption would have no measurable impact on the operation of the interconnected BES. Our views are borne out by experience in the Pacific Northwest where many small entities were required to register by virtue of owning a very small portion of the region's 115-kV system. These utilities have faced substantial compliance burdens even though their operations are simply not material to the interconnected bulk grid in our region, and the investment of resources in compliance therefore will have no measurable effect in improving the reliability of the interconnected grid.

No

We agree that the approach adopted by the SDT -- a core definition coupled with specific inclusions and exclusions -- will be effective in removing some local distribution facilities from the BES, it will not remove all such facilities. For the reasons discussed in our answer to Question 1, the proposed definition is over-inclusive and is likely to sweep up certain facilities used in local distribution that

should not be classified as BES.
As discussed in our answers to Question 1 and Question 11, the SDT proposal does not reflect the jurisdictional limitations of the FPA.

<p>First, thank you for the opportunity to comment on the draft Proposed Continent-wide Definition of the Bulk Electric System (BES). We appreciate the work that the Standards Development Team (SDT) has put into a new definition so far and believe the draft is a step in the right direction. We also understand the relatively short timeframe that NERC is working under in order to create a new BES definition to submit to FERC for approval before the imposed deadline. That said, we believe that the draft definition needs significant revision before NERC files it with FERC for approval. In response to question #1, we recommend that NERC revise the draft BES definition so that the first paragraph reads as follows: "Bulk Electric System (BES): Includes anything that meets each of the following three (3) criteria: (1) (a) Is a facility or control system necessary for operating an interconnected electric energy transmission network (or any portion thereof), or (b) Is electric energy from generation facilities needed to maintain transmission system reliability; AND (2) Is not a facility used in the local distribution of electric energy as determined by the Seven Factor Test set out in FERC Order 888; AND (3) (a) Unless included or excluded in subpart (b), is i. A Transmission Element operated at 100kV or higher; or ii. A Real Power Resource identified in subpart (b); or iii. A Reactive Power resource connected at 100kV or higher; (b) [the list of inclusions of exclusions in the draft, as modified by our comments below]" Criteria (1) and (2) of these revisions would capture the limitations on what may be included in the BES due to the jurisdictional limits that Congress placed on FERC, NERC, and the Regional Entities in developing and enforcing mandatory reliability standards. Specifically, Section 215(i) of the Federal Power Act provides that the Electric Reliability Organization (ERO) "shall have authority to develop and enforce compliance with reliability standards for only the Bulk-Power System." Section 215(b)(1) of the FPA, 16 U.S.C. § 824o(a)(1) (emphasis added). Section 215(a)(1) of the statute defines the term "Bulk-Power System" or "BPS" as: (A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy." Id. With this language, Congress expressly limited FERC, NERC, and the Regional Entities' jurisdiction with regard to local distribution facilities as well as those facilities not necessary for operating a transmission network. Given that these facilities are statutorily excluded from the definition of the BPS, reliability standards may not be developed or enforced for facilities used in local distribution, and therefore the definition of the BES may not include such facilities. In Order No. 672, FERC adopted the statutory definition of the BPS. See Order No. 672, FERC Stats. &amp; Regs. ¶ 31,204 (2006). In Order No. 743-A, issued earlier this year, the Commission acknowledged that "Congress has specifically exempted 'facilities used in the local distribution of electric energy'" from the BPS definition. See Order 743-A, 134 FERC ¶ 61,210 at P. 25 (2011). FERC also held that to the extent any facility is a facility used in the local distribution of electric energy, it is exempted from the requirements of Section 215. Id. at P.54. In Order No. 743-A, FERC delegated to NERC the task of proposing for FERC approval criteria and a process to identify the facilities used in local distribution that will be excluded from NERC and FERC regulation. Id. at P 76. The critical first step in this process is for NERC to propose criteria for approval by FERC to determine which facilities are not BPS facilities and therefore not BES facilities. Accordingly, it is critical that NERC create a definition of the BES that first excludes facilities used in local distribution. In Order No. 743-A, the Commission confirmed this, stating: "once a facility is classified as local distribution, the facility will be excluded from the [BES] unless changes to the system warrant a review of the determination." Order No. 743-A, at P 71 (emphasis added). We believe that the Seven Factor is the appropriate means to determine whether a facility is used in the local distribution of electricity and therefore should be referenced in the definition of the BES. This is the test that applies elsewhere to determine whether facilities qualify as local distribution, and therefore there is strong and clear precedent for using it in the BES definition. See 334 F.3d 48. In fact, the statutory language in Section 201 of the FPA that led to the Seven Factor Test for other purposes is identical to the statutory language in Section 215 of the FPA at issue</p>

here. Well established rules of statutory construction call for interpreting identical language to produce similar meanings, therefore applying the Seven Factor Test under both sections of the statute is appropriate. And, without the Seven Factor Test as a means of determining what qualifies as local distribution facilities, there could be significant uncertainty and confusion as to whether certain facilities are part of the BES. Further, the Commission stated in Order 743-A that, "the Seven Factor Test could be relevant and possibly is a logical starting point for determining which facilities are local distribution for reliability purposes, while also allowing NERC flexibility in applying the test or developing an alternative approach as it deems necessary." Id. at P 69. The Seven Factor Test includes the following factors: 1) Local distribution facilities are normally in close proximity to retail customers; 2) local distribution facilities are primarily radial in character; 3) power flows into local distribution systems, it rarely, if ever, flows out; 4) when power enters a local distribution system, it is not re-consigned or transported on to some other market; 5) power entering a local distribution system is consumed in a comparatively restricted geographical area; 6) meters are based at the transmission/local distribution interface to measure flows into the local distribution system; and 7) local distribution systems will be of reduced voltage. Order No. 888 at 31,771. FERC precedent indicates that a utility does not have to meet every factor of the seven-factor test in order for their facilities to qualify as local distribution. California Pacific Edison Co., Order Granting in Part and Denying in Part Petition for Declaratory Order, 133 FERC ¶ 61,018, 61,075 (Oct. 7, 2010). NERC must also limit the BES to facilities or control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof) or electric energy from generation facilities needed to maintain transmission system reliability, as directed by the FPA. Similar to the local distribution exclusion, facilities not falling into either of these categories are not part of the BPS and therefore must be expressly excluded from the BES. In order to establish a process that is consistent with the FPA and NERC's delegated authority from FERC, the proper sequence of steps must be applied in the correct order to determine which facilities are subject to NERC and FERC jurisdiction in the first instance, and only then, from among the jurisdictional facilities, to determine which facilities and control systems must comply with the electric reliability standards. Our revisions to the BES definition would create such a process within the definition of the BES. It would ensure that entities would begin any analysis of whether a particular item qualifies as BES by asking, first, whether that facility is "necessary for operating an interconnected electric energy transmission network (or any portion thereof)" or is "electric energy from generation facilities needed to maintain transmission system reliability," and second, whether that facility is "used in the local distribution of electric energy." Only after addressing these questions might further analysis be appropriate. We understand, but disagree with, the argument that, because the FPA clearly excludes local distribution facilities and facilities necessary for operating an interconnected electric transmission network from FERC, NERC, and Regional Entity jurisdiction, it is not necessary to expressly exclude these facilities again in the definition of the BES. This approach might be legally accurate, but could lead to significant confusion for entities attempting to implement the new BES definition. There are numerous examples of Regional Entities, particularly WECC, attempting to include such facilities in the BES under the current BES definition, and regulated entities are not certain as to which facilities they should consider part of the BES. Clarifying FERC, NERC, and Regional Entity in the BES definition, even if such clarification is already provided in the FPA, would avoid such problems under the new definition. Criterion (3) of these revisions is necessary to resolve the ambiguity in the proposed definition as to whether the clause "unless such designation is modified by the list shown below" modifies only the preceding clause ("Reactive Power resources connected at 100 kV or higher") or the entire definition. Rearranging the definition in this way should make clear that the list of inclusions and exclusions that would be inserted as Subpart (b) modifies each provision of Subpart (a). Thus, for example, even if a Transmission Element is otherwise included by virtue of operating at 100 kV or higher, it is nonetheless excluded if specifically addressed in the list of exclusions that would be incorporated as subpart (b) of the definition (if, for example, the Element qualifies as a Local Distribution Network). The rearrangement of the language eliminates any argument that the phrase "unless such designation is modified by the list shown below" does not modify "all Transmission Elements operated at 100 kV or higher" because of its placement at the end of the independent clause "Reactive Power resources connected at 100 kV or higher." Further, we support the use of the phrase "Transmission Elements" as the starting point for the base definition because both "Transmission" and "Elements" are already defined in the NERC Glossary of Terms Used, and the use of the term "Transmission" makes clear that the Bulk Electric System includes only Elements used in Transmission and therefore excludes Elements used in local distribution of electric power. As discussed above, the definition must exclude

facilities used in local distribution in order to comply with the limits placed on NERC authority by Congress in Section 215 of the FPA. For similar reasons, we believe the SDT has improved the proposed definition from its initial proposal by eliminating the use of terms such as "Generation" that are not specifically defined in the NERC Glossary of Terms and by eliminating terms such as "Facility" that include "Bulk Electric System" as part of their definition. Eliminating the use of such terms helps sharpen the core definition. If a key term is undefined, incorporating it into the definition only begs the question of how the incorporated term is defined. If a currently-defined term uses the phrase "Bulk Electric System" as part of its definition, incorporating that term into the BES definition creates a confusing circularity. We therefore support the SDT's use of defined terms such as "Element," "Real Power," and "Reactive Power."

Yes

We support the SDT's attempt to provide a clear demarcation between the BES and non-BES elements. Inclusion I-1 is helpful because it at least implies that the BES ends where power is stepped down from transmission voltages to distribution voltages. We believe, however, that the SDT should undertake the effort to more clearly define the point where the BES ends and non-BES systems begin. We note that the WECC Bulk Electric System Definition Task Force ("BESDTF") has devoted considerable effort to this question and has developed one-line diagrams denoting the BES demarcation point for a number of different kinds of Elements that are common in the Western Interconnection. See WECC BES Definition Task Force Proposal 6, Appendix C (available at: <http://www.wecc.biz/Standards/Development/BES/default.aspx>). Similarly, the FRCC's BES Definition Clarification Project has devoted considerable effort to developing one-line diagrams of transmission and distribution Elements, and identifying the point of demarcation between BES and non-BES Elements. See FRCC BES Definition Clarification Project Version 4, Appendices A & B (available at: <https://www.frcc.com/Standards/BESDef.aspx>). Using this work as a starting point, the SDT should be able to provide much useful guidance to the industry with relatively little additional effort.

No

The inclusion of individual generation units with a nameplate capacity as small as 20 MVA is over-inclusive. Under FPA Section 215, generation resources are excluded from the "bulk-power system" unless they produce "electric energy" that is "needed to maintain transmission system reliability." 16 U.S.C. § 824o(a)(1)(B). Smaller generators with a capacity of 20 MVA almost never produce electricity that is "needed to maintain transmission system reliability." Hence, the inclusion as drafted would improperly expand the BES definition to include generators that the statute requires to be excluded. Further, the 20 MVA threshold appears to have been drawn without explanation from the existing NERC Statement of Compliance Registry. Given that the purpose of the Compliance Registry is to sweep in all generators that might be material to the operation of the BES, and not to definitively determine whether a given generator is, in fact, material to the operation of the BES, the STD has acted arbitrarily and without adequate technical justification in adopting the 20 MVA threshold. The 100 MVA threshold seems more in alignment with technical standards such as Power System Stabilizer requirements. In responding to comments on its initial proposal, the SDT states that it adopted the 20 MVA threshold because "there is no technical basis to change the values contained in the Statement of Compliance Registry Criteria." Consideration of Comments on Definition of Bulk Electric System – Project 2010-17, March 30, 2011, at 30. But this gets the equation backwards. The SDT must have some technical justification for adopting the 20 MVA threshold beyond the fact that it was previously adopted by NERC in a different context. Without a technical justification demonstrating that facilities operating at capacities as low as 20 MVA are "needed to maintain transmission system reliability," the proposed definition is overly broad and fails to comply with the restrictions imposed by Congress in FPA Section 215(a)(1), 16 U.S.C. § 8240(a)(1). Further, the Statement of Compliance Registry was adopted without the benefit of having been vetted through the NERC Standards Development Process, so the technical record underlying the choice of that threshold is unavailable for review by the industry. In the same comments, the SDT also states that it has considered "the inclusion of generator step-up (GSU) transformers and associated interconnection line leads and believes the BES must be contiguous at this level in order to be reliable." Id. The SDT's reasons for reaching this conclusion are not well-explained, but apparently the concern is that a "non-contiguous" BES could create "reliability gaps." This conclusion cannot be supported as an abstract proposition, but can only be demonstrated by a careful examination how application of reliability standards will change depending on how the BES is defined. We believe that if the SDT insists on a "contiguous" BES, an over-inclusive definition will result. We base these conclusions on the findings of NERC's

Standards Drafting Team for Project 2010-07 and its predecessor, the "GO-TO Task Force." The Project 2010-07 Team was formed to address how the dedicated interconnection facilities linking a BES generator to high-voltage transmission facilities should be treated under the NERC standards. After reviewing these questions in considerable depth, the Team concluded that dedicated high-voltage interconnection facilities need not be treated as "Transmission" and classified as part of the BES in order to make reliability standards effective. On the contrary, the team concluded that by complying with a handful of reliability standards, primarily related to vegetation management, reliable operation of the bulk interconnected system could be protected without unduly burdening the owners of such interconnection systems. See Final Report from the NERC Ad Hoc Group for Generator Requirements at the Transmission Interface (Nov. 16, 2009) (paper written by the predecessor of the Project 2010-07 SDT). Much of the work of the Project 2010-07 SDT is applicable to the work of the BES Standards Development Team. For example, the Project 2010-07 Team observed that interconnection facilities "are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system." White Paper Proposal for Information Comment, NERC Project 2010-07: Generator Requirements at the Transmission Interface, at 3 (March 2011). Requiring Generation Owners and Operators to comply with the same standards as BES Transmission Owners and Operators "would do little, if anything, to improve the reliability of the Bulk Electric System," especially "when compared to the operation of the equipment that actually produces electricity – the generation equipment itself." Id. We believe the many of the questions considered by the Project 2010-07 Team are analogous to the questions under consideration by the SDT, and that, if the SDT insists upon a "contiguous" BES, the resulting definition will be substantially over-inclusive. The "contiguous" BES concept implies that every Element arguably necessary for the reliable operation of the interconnected bulk system must be included in the BES definition, even if it is interconnected with Elements that have no bearing on the operation of the BES. The adoption of a "contiguous" BES is therefore likely to result in imposition of reliability standards on a substantial number of facilities that have little or nothing to do with bulk system reliability, resulting in wasted regulatory expense and additional stress on the limited resources of reliability regulators. For example, a "contiguous" BES would require dedicated interconnection facilities that connect a BES generator to BES transmission facilities to be classified as BES. But, as the discussion above demonstrates, the classification of dedicated interconnection facilities as "BES" facilities would, based on the findings of the Project 2010-07 SDT, result in substantial overregulation and unnecessary expense with little gain for bulk system reliability. Similarly, a "contiguous" BES suggests that, because certain system protection facilities, such as UFLS relays, are ordinarily embedded in local distribution systems, the local distribution system, along with the UFLS relays, must be classified as BES to make the BES "contiguous." Such a result is not only plainly contrary to the local distribution exclusion embedded in Section 215 of the FPA, but would, by improperly classifying local distribution lines as BES "Transmission" facilities, result in huge regulatory compliance burdens with little or no improvement in bulk system reliability. There is no good reason for the SDT to adopt a "contiguous" BES. On the contrary, because Section 215 allows reliability standards to be applied to "users" of the bulk system as well as "owners" and "operators," local distribution systems operating UFLS relays and other bulk system protection devices could be required to comply with standards governing those devices as a precondition for their use of transmission on the bulk system. For these reasons, we urge the SDT to follow the example of the Project 2010-07 Team and the GO-TO Task Force by giving careful consideration to the specific and practical results of how its definition will affect the application of particular reliability standards and whether the results are beneficial to reliability or simply result in unnecessary regulatory burdens that do not benefit bulk system reliability. We believe there is considerable danger of error if the SDT bases its conclusions on metaphysical debates about whether a "contiguous" or "non-contiguous" BES is more desirable rather than engaging in a careful analysis of whether the proposed definition achieves reliability goals in the most efficient manner possible.

No

We are concerned that the 75 MVA threshold has been chosen arbitrarily by the SDT. Like the 20 MVA threshold discussed in our response to question 3, the 75 MVA threshold appears to have been drawn from the NERC Statement of Compliance Registry without appreciation for the function of the threshold in that document and without adequate technical justification demonstrating the generators with an aggregate capacity of 75 MVA produce electric energy "needed to maintain transmission system reliability" and are therefore properly included in the BES definition. The 100 MVA threshold

seems more in alignment with technical standards such as Power System Stabilizer requirements.
No
We are concerned that the 75 MVA threshold has been chosen arbitrarily for the reasons stated in our comments on Question 4.
Yes
FERC has made clear throughout the Order No. 743 process that the existing exclusion for radials be retained.
As noted in our response to Question 3, we believe the inclusion of the 20 MVA threshold lacks an adequate technical justification. Further, unless the generation unit is reliability-must-run or essential blackstart, the function of the unit is irrelevant to the reliable operation of the interconnected bulk transmission grid, and we therefore believe the reference to the function of the generation unit should be eliminated.
Yes
We strongly support the categorical exclusion of Local Distribution Networks from the BES. For reasons discussed at length in our answer to Question 1, we believe the exclusion is necessary to ensure that the BES definition complies with the statutory requirement to exclude all facilities used in the local distribution of electric power. LDNs are likely the most common kind of local distribution facility. Further, the conversion of radial systems to local distribution networks should be encouraged because networked systems generally reduce losses, increase system efficiency, and increase the level of service to retail customers. We also support, with the reservations discussed below, the LDN exclusion as drafted by the SDT. We believe the SDT has identified the key characteristics that separate LDNs from facilities that are part of the bulk transmission system and therefore should be classified as BES. Hence, LDNs can be excluded from the BES based on the characteristics identified by the SDT without compromising the reliability of the interconnected bulk transmission system. However, for the reasons stated in our answers to Questions 3 and 4, we believe the SDT's wholesale adoption of the 20 MVA and 75 MVA thresholds from the NERC Statement of Compliance Registry lacks adequate technical justification. The SDT repeats that error here by incorporating those thresholds into the LDN exception. The 100 MVA threshold seems more in alignment with technical standards such as Power System Stabilizer requirements.
Yes
