UPDATED October 2009

<sup>1</sup> Over the course of time, the refinement of the HOS measure has resulted in changes to the definition of a "completed survey." The information table provides a presentation of how a completed survey and response rate were calculated at the time of reporting for each of the baseline and up cohorts. Given that the definition of a completed survey has evolved over time, this table should not be utilized for response rate comparison.

the cohorts. If you are interested in comparative response rate information, please contact the Medicare HOS Information and Technical Support.

2 For the baseline cohorts, the reporting units represent the individual MAOs sampled for the survey. However for the follow up cohorts, the reporting units have been adjusted to accommodate selected MAO consolidations and service area reductions at the time of performance measurement reporting (which typically occurs in the year subsequent to the collection of the follow up data).

3 For the baseline cohorts, the ineligible beneficiaries meet one of the following criteria: deceased; not enrolled in the MAO; have an incorrect address and phone number; or have a language barrier. For the follow up cohorts, the ineligible beneficiaries meet one of the following criteria: not enrolled in the MAO; have an incorrect address and phone number; or have a language barrier.

4 In general, for Cohorts 1, 2, and 3 Baseline a completed survey is defined as a survey that has at least 80% of the questions answered. However, beginning with Cohort 1 Follow Up and Cohort 4 Baseline, a completed survey is defined as a survey that can be used to calculate physical or mental health summary scores.

5 Please note, ineligible beneficiaries are removed from the denominator in the response rate calculations. In other words, Response Rate =  $\frac{\text{Number of Respondents}}{\text{Total Sample} - \text{Ineligibles}}$ .
