Pilot Evaluation	Narrative	Indicators of success	Means of verification	Assumptions
Purpose of Pilot	To determine if study procedures allow team to answer research questions	1a. Survey data is of good quality (e.g. limited missing or invalid data).	1a. Item response analysis	Utility and CDC team communicate throughout the pilot
		1b. Lab data is of good quality (e.g. limited missing or invalid data).	1b. Lab data (e.g. Positive controls are within acceptable standard deviation, negative controls are negative)	<ul> <li>Utility follows study procedures</li> <li>CDC team follows study procedures</li> </ul>
		1c. LPE exposure characteristics are available for each event.	1c. Item response analysis	- procedures
	To familiarize team members with study implementation and	2a. CDC team conducts 1-2 onsite training sessions.	2a. & 2b. Observed behavior and on-site training activities	
	procedures	2b. All team members follow study standard operating procedures.		
Low Pressure Event Outcomes	CDC team and utility select     appropriate exposed and     unexposed areas.	<ul> <li>1a. Exposed and unexposed areas are matched on census block or tract, housing type, pipe size and material, and origin of water.</li> <li>1b. CDC team receives customer contact information within 1-week of the event.</li> </ul>	1a. Census maps and utility water systems information      1b. Contact data management database used to monitor receipt of customer information from utilities and secure FTP site used for transfer of customer information	<ul> <li>Team members follow study procedures</li> <li>No technical issues with data management databases</li> <li>No external issues that would prevent timely shipment of water samples</li> </ul>
	LPE form is filled out completely at the time of repair.	2. Water sample information is available for all 6 samples, chain of custody information is complete, low pressure event information is complete.	2. LPE form (with chain of custody information on last page)	
	Water sample collection team follows standard operating procedures.	3a. Utility personnel collect water samples from the exposed area within 24 hours of the LPE, using CDC protocols, and CDC receives samples within 30 hours (EPA standard holding time for bacterial analytes).  3b. Utility personnel collect water samples from the unexposed area within 48 hours of the LPE and CDC receives	3a. & 3b. CDC lab chain of custody information received with shipments (on LPE form), lab data management database	

			samples within 30 hours after		
			collection.		
	4.	Lab team follows testing, standard	4a. CDC Environmental	4a. CDC lab chain of custody	
		operating procedures, and	Microbiology Laboratory	information on LPE form, lab	
		maintains chain of custody logs.	processes and begins analysis	data records, and lab data
