2012 Fresh Market Vegetable Production Up 1 Percent from 2011

Fresh market vegetable and melon production for the 24 selected crops estimated in 2012 totaled 438 million hundredweight, up 1 percent from last year. Harvested area covered 1.68 million acres, up 1 percent from 2011. Value of the 2012 crop is estimated at 10.1 billion dollars, down 6 percent from a year ago. The three largest crops, in terms of production, are onions, head lettuce, and watermelons, which combined to account for 36 percent of the total production. Onions, tomatoes, and sweet corn claim the highest values, accounting for 26 percent of the total value when combined.

For the 24 selected vegetables and melons estimated in 2012, California continues to be the leading fresh market State, accounting for 44 percent of the harvested area, 48 percent of production, and 50 percent of the value.

Principal Fresh Market Vegetable Production and Value – States and United States: 2010-2012

[Only includes estimates for the selected crops in the NASS annual program. These crops are not estimated for all States that might produce them. See the 2007 Census of Agriculture for a comprehensive tally of total vegetable acres by State. Includes processing total for dual usage crops (asparagus, broccoli, and cauliflower)]

2012 Processing Production of 8 Selected Vegetables Up 7 Percent from 2011

Processing production of eight selected vegetables estimated in 2012 totaled 18.3 million tons, up 7 percent from last year. Area harvested is estimated at 1.14 million acres, up 8 percent from a year ago. Processing crop value is estimated at 2.00 billion dollars, 13 percent above 2011. The three largest crops, in terms of production, are tomatoes, sweet corn, and snap beans, which combine to account for 92 percent of the total. The top three crops in terms of value are tomatoes, sweet corn, and snap beans. These three processing vegetables account for 79 percent of the total value when combined.

For the eight processed vegetables estimated in 2012, California leads the nation with 25 percent of the harvested acreage, 70 percent of the production, and 51 percent of the value.

Leading Processing Vegetable States in 2012

Definitions

Hundredweight (cwt.) is the unit used for fresh market yield and production and is equal to one hundred pounds.

Prices are a marketing year average for all methods of sale. For a crop sold for both fresh market and processing, the **Marketing Year Average Price (MYA)** is a weighted average of the fresh and processing price.

Prices for fresh vegetables are the average prices producers receive at the point of first sale. This is commonly referred to as the **average price as sold**. Since the point of first sale is not the same for all producers, prices for the various methods of sale are weighted by the proportionate quantity sold. For example, if in a given State part of the vegetables are sold free on board (F.O.B.) packed by growers, part are sold as bulk vegetables at the packinghouse door, and some are sold retail at roadside stands, the fresh vegetable **average price as sold** is a weighted average of the average price for each method of sale.

F.O.B. packed prices are adjusted to an equivalent incoming packinghouse door price by subtracting all costs that accumulate between the incoming packinghouse door and the F.O.B. price. These costs include grading, packing, inspecting fees, selling, and other costs.

Prices for vegetables sold for processing are equivalent returns for vegetables delivered to the processing plant door.

Crop value estimates in this report cover the marketing season or crop year and should not be confused with cash receipts from these crops which are on a calendar year.

State Value of Utilized Production and MYA Price Computations

The following procedure is used to compute State Values of Utilized Production and MYA Prices:

Fresh Market Value of Production:

(Fresh Market MYA) *Times* (Fresh Market Production)

Processing Value of Production:

(Processing MYA) *Times* (Processing Production)

"All" Value of Production:

(Fresh Market Value of Production) *Plus* (Processing Value of Production)

"All" MYA:

("All" Value of Production) *Divided By* ("All" Production)

United States MYA Price Computations

The following procedure is used to compute the U.S. MYA Prices:

Fresh Market MYA:

(Fresh Market Value of Production for All States) *Divided By* (Fresh Market Production for All States)

Processing MYA:

(Processing Value of Production For All States) *Divided By* (Processing Production For All States)

"All" Sales MYA:

(Total Value of Production for All States) *Divided By* (Total Production for All States)

Weights and Measures

The following table on weights, measures, and conversion factors covers the vegetables in this report. It does not cover all containers for any one product.

The information has been assembled from State schedules of legal weights, various sources within the United States Department of Agriculture, and other Government agencies. For many vegetables, there is a considerable variation in weight per unit of volume due to differences in variety or size of commodity, condition and tightness of pack, degree to which the container is heaped, etc. Effort has been made to select the most representative and fairest average for each product. For those commodities which develop considerable shrinkage, the point of origin weight or weight at harvest has been used.

The approximate or average weights as given in this table do not necessarily have official standing as a basis for packing or as grounds for settling disputes. Not all of them are recognized as legal weight. The table was prepared chiefly for use of workers in the United States Department of Agriculture who have need of conversion factors in statistical computations.

Statistical Methodology

Survey Procedures: Acreage and production information included in this report is collected six times during the year. Acreage forecasts are obtained on a quarterly basis for fresh market and processing vegetables. For fresh market vegetables, growers are surveyed seasonally for estimates of crops such as onions and strawberries. Producers growing multiple fresh market crops are surveyed at seasonal intervals in major producing States for the remaining vegetable crops in the program. Data are collected by telephone interviews, mail out, faxed questionnaires, and personal interviews. Data accuracy and reducing respondent burden are taken into account in conducting the surveys. The most desirable survey method is to do a complete enumeration of growers. When this is not possible, a mail inquiry, sent to a sample of growers, is conducted. Due to the variable nature of the vegetable industry, mail lists are frequently updated to ensure complete coverage.

Summary and Estimation Procedures: The vegetable surveys collect data in the major producing States for each respective commodity. States with a small number of growers survey all known commercial producers of vegetable commodities. States with a large number of producers contact a sample of growers to get data. Sampling may still result in a census for some vegetables.

Revision Policy: At the end of the calendar year, all producers have the opportunity to update or provide any additional data corresponding to any of the weeks for the current and previous year. After these data are incorporated with previously reported data, revised seasonal estimates are published in the Vegetables Annual Summary.

Reliability: Survey indications are subject to sampling variability because all operations growing vegetables are not included in the sample. Survey results are also subject to non-sampling errors such as omission, duplication, imputation for missing data, and mistakes in reporting, recording, and processing the data. These errors cannot be measured directly, but are minimized through rigid quality controls in the data collection process and a careful review of all reported data for consistency and reasonableness.
