Following the initial assessment of ROM, perform repetitive use testing. For VA purposes, repetitive use testing must be included in all joint exams. The VA has determined that 3 repetitions of ROM (at a minimum) can serve as a representative test of the effect of repetitive use. After the initial measurement, reassess ROM after 3 repetitions. Report post-test measurements in question 4A.

5D. COMMENTS, IF ANY:

SECTION VI - FUNCTIONAL LOSS AND ADDITIONAL LIMITATION OF ROM

NOTE: The VA defines functional loss as the inability, due to damage or infection in parts of the system, to perform normal working movements of the body with normal excursion, strength, speed, coordination and/or endurance. As regards the joints, factors of disability reside in reductions of their normal excursion of movements in different planes.

Using information from the history and physical exam, select the factors below that contribute to functional loss or impairment (regardless of repetitive use) or to additional limitation of ROM after repetitive use for the joint or extremity being evaluated on this DBQ:

6A. CONTRIBUTING FACTORS OF DISABILITY (check all that apply and indicate side affected):

- No functional loss for left upper extremity attributable to claimed condition
- No functional loss for right upper extremity attributable to claimed condition
- Less movement than normal (*due to ankylosis, limitation or blocking, adhesions, tendon-tie-ups, contracted scars, etc.*) Right Left Both
- More movement than normal (*from flail joints, resections, nonunion of fractures, relaxation of ligaments, etc.*) Right Left Both
- Weakened movement (*due to muscle injury, disease or injury of peripheral nerves, divided or lengthened tendons, etc.*) Right Left Both
- Excess fatigability Right Left Both
- Incoordination, impaired ability to execute skilled movements smoothly Right Left Both
- Pain on movement Right Left Both
- Swelling Right Left Both
- Deformity Right Left Both
- Atrophy of disuse Right Left Both
- Instability of station Right Left Both
- Disturbance of locomotion Right Left Both
- Interference with sitting Right Left Both
- Interference with standing Right Left Both
- Other, describe:

NOTE: If any of the above factors is/are associated with limitation of motion, the examiner must give an opinion on whether pain, weakness, fatigability, or incoordination could significantly limit functional ability during flare-ups or when the joint is **used repeatedly over a period of time** and that opinion, if feasible, should be expressed in terms of the degree of additional ROM loss due to pain on use or during flare-ups. The following section will assist you in providing this required opinion.

6B. ARE ANY OF THE ABOVE FACTORS ASSOCIATED WITH LIMITATION OF MOTION?

- YES (*If yes, complete questions 6C and 6D*)
- NO (*If no, proceed to Section 6D*)

SECTION VI - FUNCTIONAL LOSS AND ADDITIONAL LIMITATION OF ROM (Continued)

6C. CONTRIBUTING FACTORS OF DISABILITY ASSOCIATED WITH LIMITATION OF MOTION

Elbow	Can pain, weakness, fatigability, or incoordination significantly limit functional ability during flare-ups or when the joint is used repeatedly over a period of time?	If yes, please estimate ROM due to pain and/or functional loss during flare-ups or when the joint is used repeatedly over a period of time:	If there is a functional loss due to pain, during flare-ups and/or when the joint is used repeatedly over a period of time but the limitation of ROM cannot be estimated, please describe the functional loss:
RIGHT ELBOW	<input type="checkbox"/> Yes <input type="checkbox"/> No	Flexion _____ <input type="checkbox"/> Est. ROM is not feasible

For example, if the functions of grasping (hand) or propulsion (foot) are as limited as if the Veteran had an amputation and prosthesis, the examiner should check "yes" and describe the diminished functioning. The question simply asks whether the functional loss is to the same degree as if there were an amputation of the affected limb.
