SECTION VI - FUNCTIONAL LOSS AND ADDITIONAL LIMITATION OF ROM

NOTE: The VA defines functional loss as the inability, due to damage or infection in parts of the system, to perform normal working movements of the body with normal excursion, strength, speed, coordination and/or endurance. As regards the joints, factors of disability reside in reductions of their normal excursion of movements in different planes.
Using information from the history and physical exam, select the factors below that contribute to functional loss or impairment (regardless of repetitive use) or to additional limitation of ROM after repetitive use for the joint or extremity being evaluated on this DBQ:

6A. CONTRIBUTING FACTORS OF DISABILITY *(check all that apply and indicate side affected)*:

☐ No functional loss for right lower extremity attributable to claimed condition

☐ Less movement than normal *(due to ankylosis, limitation or blocking, adhesions, tendon-tie-ups, contracted scars, etc.)*	☐ Right	☐ Left	☐ Both
☐ More movement than normal *(from flail joints, resections, nonunion of fractures, relaxation of ligaments, etc..)*	☐ Right	☐ Left	☐ Both

☐ Interference with sitting	☐ Right	☐ Left	☐ Both
☐ Interference with standing	☐ Right	☐ Left	☐ Both
☐ Other, describe:			

NOTE: If any of the above factors is/are associated with limitation of motion, the examiner must give an opinion on whether pain, weakness, fatigability, or incoordination could significantly limit functional ability during flare-ups or when the joint is ***used repeatedly over a period of time*** and that opinion, if feasible, should be expressed in terms of the degree of additional ROM loss due to pain on use or during flare-ups. The following section will assist you in providing this required opinion.

The question simply asks whether the functional loss is to the same degree as if there were an amputation of the affected limb.
