

Nonresponse Bias in the Telephone Point of Purchase Survey:

A summary of three studies

Patrick Falwell and Madeleine Saxton

August 4, 2009

I. Introduction

The Telephone Point of Purchase Survey (TPOPS) is a random digit dialed (RDD) computer-assisted-telephone-interview (CATI) survey that collects outlet and expenditure information from households. It serves as the main source for the outlet sampling frame for the U.S. Commodities and Services (C&S) Pricing Survey for the Consumer Price Index (CPI). It is a rotating panel survey with each consumer unit participating for four consecutive quarters.¹ The TPOPS is conducted by the Census Bureau for the Bureau of Labor Statistics (BLS). Since TPOPS' inception in the second quarter of 1997, the response rate has fallen from 68.2% to 47.1% in the last quarter of 2008.² Because of the decreasing response rate and because it is an Office of Management and Budget (OMB) requirement for clearance to conduct surveys, the BLS has embarked upon a non-response bias analysis of the TPOPS data.

One facet of the design of the TPOPS is that cell phone contacts are considered out-of-scope. The sample is drawn from banks of landline-only phone numbers. With the increase of cell-phone-only *households*, the BLS is assessing the potential bias associated with excluding cell-phone-only households and will take remedial action if a bias does indeed exist.

Cell-phone-only households have been the subject of several studies in the last several years. In 2004, the Current Population Survey (CPS) included questions in its supplement regarding the telephone service of households to measure how many were cell-phone-only. At that time, 6% of the households in the US used only cell-phones.³ In 2009, the National Health Statistics Reports revealed that in

¹ The BLS defines a consumer unit or CU as a person living alone or a group of two or more persons who are related by blood, marriage, or other living arrangement; or a group of two or more persons who share major living expenses.

² Response rate (see section 1) is calculated according to OMB's response rate definition:

$$\text{Unweighted Response Rate} = \frac{C}{C + R + NC + O + e(U)}$$

³ "Household Telephone Service and Usage Patterns in the United States in 2004: Implications for Telephone Samples," Clyde Tucker, J. Michael Brick, Brian Meekins, *Public Opinion Quarterly*, Vol. 71, No. 1, Spring 2007, pp. 3-22.

2007, this number had almost tripled to 17.5%. Some states (Oklahoma and Utah) had rates over 25% of cell-phone-only households.⁴

This paper summarizes three studies that BLS conducted to assess if the TPOPS exhibits non-response bias.

The first study compares the demographics reported in TPOPS against the Census Bureau's American Community Service (ACS). The ACS is a mandatory survey with a response rate of 97%. There are significant differences in the demographics between the two surveys.

The second study compares TPOPS complete responders with attritors and intermittent respondents as proxies for non-respondents. This analysis shows significant demographic and expenditure differences between age-race cohorts in the TPOPS population.

In the final study, the expenditures reported in the Consumer Expenditure (CE) Interview are reviewed to see if there is a difference between cell-phone-only households and those households that would be considered in-scope for TPOPS: cell-phone and landline households and landline only households. The category in which each household falls depends on what type of phone bills they indicated they had in the reference period.

These studies suggest that data in the TPOPS are not missing completely at random (MCAR). There are age-race cohorts that are under-represented in the TPOPS population, whereas others are over-represented. To correct for these issues, the BLS is exploring different ways of collecting and representing the data.

In the short-term, the recommendation of adjusting weights to correct for the under-representation of some cohorts is worth pursuing. In the long-term, the

⁴ "Wireless Substitution: State-level Estimates From the National Health Interview Survey, January-December 2007", Stephen J. Blumberg, Ph.D.; Julian V. Luke, Gestur Davidson Ph.D.; Michael E. Davern, Ph.D; Tzy-Chyi Yu, M.H.A., Ph.D.; Karne Soderberg, M.S., National Health Statistics Reports, Number 14, March 11, 2009

CPI will need to evaluate alternatives to the current land-line only RDD survey to provide its C&S Pricing sample frame.

1. TPOPS Response Rates

TPOPS response rates show a decreasing trend since BLS switched to an RDD/CATI survey in 1997. The tables below show the response rate from the 1st quarter in 2005 to the 4th quarter in 2008. The tables show the response rate steadily decreasing. Response rates are calculated according to OMB's response rate definition

Unweighted Response Rate

$$\text{Unweighted Response Rate} = \frac{C}{C + R + NC + O + e(U)}$$

C = number of completed interviews or sufficient partially completed interviews

R = number of refusals

NC = number of noncontacted sample units known to be eligible

O = number of eligible sample units not responding for reasons other than refusal

U = number of sample units of unknown eligibility, not completed

e = estimated proportion of sample units of unknown eligibility that are eligible,
(set to 0.27)

Response Rate by Quarter⁵

Quarter	Interviews	Non Contacts	Refusals	Estimate of Unknown Population	Total	Response Rate
Q971	3453	429	1008	174.96	5,065.0	68.2%
Q972	6330	940	1736	357.21	9,363.2	67.6%

Q083	47.8%	24.9%	22.7%	4.7%		52.1%	47.4%
Q084	47.1%	22.7%	25.5%	4.7%		48.3%	54.2%

- The two response rates by quarter tables suggest that TPOPS has experienced an abrupt decline in response rate. The average annual response rate from 2005 to 2008 was 54.8%, 49.9%, 46.5%, and 46.8%, respectively.
- The cause of this decline can be attributed to a higher number of non-contacts and refusals. The combined average annual response rate of non-contacts and refusals from 2005 to 2008 was 40.5%, 45.5%, 48.7%, and 48.5%, respectively.

Y - Panel 1	3,689	2,124	1,479	426.06	7,718.06	47.8%
Y - Panel 2	3,465	1,860	1,179	184.68	6,688.68	51.8%
Y - Panel 3	3,293	1,070	1,063	170.91	5,596.91	58.8%
Y - Panel 4	3,025	986	952	157.14	5,120.14	59.1%

- The response rate of the Midwest was clearly higher than the response rates of the other three regions for all four panels of interviews.
- The Midwest's A-sized (self-representing) PSUs also had higher response rates than other regions' PSUs and have not experienced the abrupt declines in response rate as have other PSUs. The Midwest's A-sized PSUs had an average response rate of 55.2%, while the East, the South, and the West had average response rates of 43.8%, 43.2%, and 45.3%, respectively. The average decline in response rate from 2005 to 2008 for the Midwest was 4.8%, while East, the South, and the West had average declines of 6.1%, 7.0%, and 9.0%.
- New York City (A109) had the lowest response rate in 2008, and was continually among the lowest responding PSUs from 2005 to 2008.
- The X-sized PSUs (metropolitan non-self-representing) and the Y-sized PSUs (nonmetropolitan non-self-representing) (53.2% and 57.4% respectively) had higher average response rates than A-sized PSUs.

2. Comparison of TPOPS Demographic Data to American Community Survey Data

A comparison of TPOPS socio-demographic data to the Census Bureau's American Community Survey's (ACS) socio-demographic data is necessary to analyze potential non-response bias in TPOPS.

TPOPS only collects demographic data from the respondent and not the other members of the consumer unit. This analysis assumes that the demographics of the TPOPS respondent represent the demographics of the entire consumer unit. The demographics of the consumer units are then compared against the demographic data of ACS householders. ACS reports the percentages of total householders that fall into various demographic groups, and these percentages are assumed to be the urban population's demographic percentages. These percentages are used to calculate the expected number of TPOPS consumer units, against which the observed number of TPOPS consumer units could be compared using Chi-Square tests.

Additional adjustments are made for respondents who did not answer demographic questions. The rate of non-response for race questions averages 16.6% between 2005 and 2008, and the rate of non-response for age questions averaged 14.6% between 2005 and 2008. The weight of non-response consumer units was reallocated, however, using the frequency distribution of those responding to race and age questions for each quarter and each population sampling unit (PSU). For example, if the weight of non-response equals 100 for a given PSU, and the distribution of those responding to race questions was 30% white, 30% black, 30% Hispanic, and 10% Asian, then the reallocated weight equals 30, 30, 30, and 10 for each group, respectively. After the weight of non-responders is reallocated, the quarterly distributions of each race and age group were averaged by year.

2005

2005					
RACE OF HOUSEHOLDER	ACS Percentage	Expected Number of Consumer Units	TPOPS Percentage	Observed Number of Consumer Units	X^2
American Indian and Alaska Native	0.6%	558,600	0.6%	587,531	1,498
Asian	4.5%	4,189,497	2.9%	2,732,643	506,606

Total		75,820,202		75,820,202	8,722,760

The differences between the TPOPS and ACS samples are statistically significant for race and age, for all years between 2005 and 2007. The differences in age of ACS householder percentages and TPOPS respondent percentages are particularly of interest in terms of TPOPS failing to collect enough from certain cohorts. The older age strata for TPOPS respondents represent a much larger percentage than the younger age strata when compared to ACS householders for all three years. From 2005 to 2007, the combined percentage of the two youngest strata fell from 36.4% to 28.4%. As with the TPOPS response rates for individual PSUs, the response rates may vary considerably among individual cohorts

In comparison to the age demographics, the TPOPS race demographics, while statistically significant, do not seem to be as problematic. The individual race cohorts fluctuate considerably between years, with some cohorts being closer to the ACS percentages in one year, then being considerably different in the next. The white cohort was always overrepresented, however, whereas other cohorts were underrepresented by as much as 6% to 7%. The black cohort was underrepresented by around 6% in 2005 and 2007, but was actually overrepresented by 3% in 2006. The Hispanic cohort was underrepresented by 3%, 5%, and 6% in the three years, respectively. The Asian cohort was underrepresented by between 2% to 3%. Other cohorts composing around 5%

of TPOPS respondents were more in line with the percentages reported by ACS householders.

3. Comparison of Respondents Completing Four TPOPS Interviews and Dropout Respondents

In an attempt to analyze the characteristics of TPOPS non-responders, the expenditure means per TPOPS Category, or POPSCAT, and demographic data were compared for TPOPS respondents who completed four quarters of interviews (complete respondents) and respondents who dropped out of the survey after completing one or two interviews (attritors). The TPOPS attritors served as proxies for non-responders under the assumption that non-participation in TPOPS after one or two interviews indicates similarity to those who refuse to participate or are non-contacts. The time period of 2005 to 2008 was again used in this analysis; however, only respondents who had a chance to complete four interviews within that time period were included. Therefore, a respondent who completed his or her fourth interview in the first quarter of 2005 or began the survey in the second quarter of 2008 was not considered. Overall, there were 21,256 consumer units that completed four quarters of interviews and 22,446 attritor consumer units that completed one or two interviews.

The expenditure means of each POPSCAT were calculated for both the complete responders and the attritors and tested for significant differences using two-sample t-tests. There is a statistically significant difference in expenditure means for 33% of the POPSCATs, and the breakdown of significance by major groups is listed in the table below. The differences in expenditure mean are statistically insignificant for the majority of each major group's POPSCATs. Only the apparel major group had more POPSCATs with statistically significant differences in mean expenditure than POPSCATs with statistically insignificant differences in mean expenditure.

Major Group	Number of Stat. Insig. POPSCAT means	Number of Stat. Sig. POPSCAT means
Apparel	7	16
Education/Communication	12	5
Food	36	25
General Items	10	6
Household Items	28	11
Medical	9	0
Recreation	26	6
Transportation	16	3

The large percentage of statistically insignificant differences in POPSCAT expenditure means hopefully suggest that there are not large differences in overall expenditure behavior between complete responders and attriters.

The demographic data for the always participating consumer units and the dropout consumer units was also calculated. Unfortunately, the dropout consumer units did not respond to demographic questions a considerable percentage of the time (Race – 16.4%, Age – 17.6%, Gender – 15.4%). In order to make a side by side comparison of the demographics of the always-participating consumer units and the dropout consumer units, the weight of the non-responding consumer units had to be redistributed to the demographic categories. The four year population mean was calculated for each PSU and the rates of non-response were calculated for each PSU and quarter. The final weights of consumer units responding to demographic questions were then adjusted to account for non-response and to equal the four-year population mean of each PSU.

OVER 85	2,408,314	2.7%	OVER 85	1,446,224	1.6%

Gender Comparison

Completed 4 Interviews Q051 - Q081			Completed 4 Interviews Q051 - Q081		
	# Consumer Units	Percent		# Consumer Units	Percent
Male	32,379,932	36.7%	Male	33,797,690	37.4%
Female	55,764,117	63.3%	Female	56,524,418	62.6%

The method of redistributing the final weight of non-responders precluded formal significance testing to determine if survey participation is independent of demographic characteristics. It still appears that there are considerable differences between the samples. The percentage of whites is much higher among those who completed the survey all four quarters, while the percentage of blacks and Hispanics is lower. The age demographics of the two groups appear particularly distorted. The older age ranges make up a large percentage of those who completed all four interviews, while the younger age ranges compose a large percentage of the dropout consumer units. While the demographic differences cannot be definitively confirmed, they do suggest that the consumer units completing four quarters of TPOPS interviews and those dropping out of the survey are different.

4. Comparison of Mean POPSCAT Expenditures for Cell Phone-Only and Landline Telephone Consumer Units in the Consumer Expenditure Survey

A sample of likely cell phone-only households was established using data from the Consumer Expenditure (CE) Interview Survey. A consumer unit was identified as a cell phone-only household if no expenditure for local telephone service was reported in any quarter of data 2006-2007. Overall, 23,250 CPI-Urban consumer units participated in the CE Interview Survey from 2006-2007, and the breakdown of households per telephone status is listed in the table below.

Group	Number of Consumer Units	Percent of Total
Landline and Cell Phone	11,324	48.7%
Landline Only	7,495	32.2%
Cell Phone Only	3,067	13.2%
No Telephone Expense	1,364	5.9%

Each consumer unit's expenditures were annualized and classified by TPOPS expenditure categories, or POPSCAT. The expenditure mean of each POPSCAT was calculated for each of the groups above, and the expenditure means were compared using a two-sample t-test. Overall, the most important analysis is of the comparison between cell phone-only consumer units and the consumer units which would compose the TPOPS sample - consumer units with both landline and cell phone expenses and consumer units with landline expenses only.

It should be noted that certain POPSCATs, especially from the food major group, were not included in the analysis because they are only reported in the Consumer Expenditure Survey's Diary survey. The Diary survey asks a consumer unit to report its expenditures during a two week period every quarter. It is difficult to determine if a consumer unit is cell phone-only given that it may not have received a cellular telephone bill during that two week survey period. In

contrast, the CE Interview Survey has a three month recall period that covers an entire quarter, meaning no expenditure will be excluded due to a time gap in a consumer unit's participation in the survey.

Expenditure means were compared for 140 POPSCATs using the two-sample t-test.⁶ Using a level of significance, $\alpha = 0.025$, 94 POPSCATs, or 67.1% of all POPSCATs, had statistically significant differences in mean expenditures. The breakdown of statistical significance by POPSCAT major group is as follows:

Major Group	Number of Stat. Insig. POPSCATS	Number of Statistically Sig. POPSCATS
Apparel	12	11
Education/Communication	4	9
Food	0	1
General Items	6	8
Household Items	9	28
Recreation	9	22
Transportation	8	12

In addition to the comparison of expenditure means, analysis of the demographics of the cell phone-only sample and the TPOPS-eligible sample also implies that there are considerable differences between the two groups. The difference in age demographics seems most striking, and Chi-square tests for independence also showed that differences in gender, race, and salary were statistically significant.

⁶ A Shapiro-Wilk statistic was calculated to determine the normality of the samples of expenditures by POPSCAT for each group. Only one sample (New Cars and Trucks for the cell phone-only population) failed to pass the normality test assuming $\alpha = 0.05$.

Age Span	Landline+Cell/Landline Only	Cell Phone-Only
UNDER 35	18.0%	61.2%
BW 35-44	21.2%	17.1%
BW 45-54	21.9%	12.5%
BW 55-64	17.3%	7.02%
BW 65-74	10.8%	1.8%
BW 75-84	8.1%	0.3%
OVER 85	2.7%	0.1%

The null hypothesis that cell phone status is independent of age was rejected by a Chi-square test of independence. ($\chi^2 = 2740.53$, $df = 6$, $p\text{-value} = <.0001$).

Gender	Landline+Cell/Landline Only	Cell Phone-Only
Male	44.9%	52.9%
Female	55.1%	47.1%

The null hypothesis that cell phone status is independent of gender was rejected by a Chi-square test of independence. ($\chi^2 = 63.46$, $df = 1$, $p\text{-value} = <.0001$).

Race	Landline+Cell/Landline Only	Cell Phone-Only
White	81.1%	79.8%
Black	12.4%	12.8%
Asian	4.5%	4.9%
Hawaiian/Pac. Islander	1.2%	1.4%
Amer. Indian	0.5%	0.7%
Multiple Race	0.4%	0.4%

The null hypothesis that cell phone status is independent of race was not rejected by a Chi-square test of independence. ($\chi^2 = 5.344$, $df = 5$, $p\text{-value} = .3753$).

	Landline+Cell/Landline Only	Cell Phone-Only
Hispanic or Latino Origin	12.7%	18.0%
Other Only, No Hispanic Origin	18.4%	19.7%
White Only, No Hispanic Origin	68.9%	62.3%

The null hypothesis that cell phone status is independent of Hispanic origin was rejected by a Chi-square test of independence. ($\chi^2 = 71.96$, $df = 2$, $p\text{-value} = <.0001$).

Salary	Landline+Cell/Landline Only	Cell Phone-Only
<\$10,000	21.3%	23.0%
\$10,000 - \$30,000	21.5%	29.2%
\$30,000 - \$50,000	17.1%	22.8%

\$50,000 - \$70,000	12.5%	11.0%
\$70,000 - \$90,000	9.1%	6.8%
\$90,000 - \$125,000	9.1%	4.5%
\$125,000 - \$200,000	8.1%	2.4%
>\$250,000	1.4%	0.3%

The null hypothesis that cell phone status is independent of salary was rejected by a Chi-square test of independence. ($\chi^2 = 333.65$, $df = 7$, $p\text{-value} = <.0001$).

The statistically significant differences in overall expenditure and demographics suggest that the cell phone-only and TPOPS-eligible populations are not very similar. For TPOPS, however, the main concern is whether cell phone-only consumer units purchase goods and services at outlets, where price change behavior is different and the subsequent effect on the CPI is different. The CE Interview Survey does not collect data on outlets, and drawing conclusions from analysis of the expenditure means of individual POPSCATs or major groups is difficult. A comparison of the major groups with the highest and lowest percentage of statistically significant POPSCAT expenditure means underlies the difficulty in drawing definite conclusions.

The housing major group had the largest percentage of POPSCATs with statistically significant expenditure means. The housing major group includes a wide range of POPSCATs from lodging away from home to household appliances and services. After classifying the POPSCATs into several categories, it becomes more certain that there are general differences between the expenditure behavior of the two samples. For instance, all of the POPSCATs for household services, household decorations, and furniture are statistically significant.

	Significant	Insignificant
Household Services	Fuel Oil, Cooking Fuel, Water/Sewer Service, Garbage Collection, Home Repair, Housekeeping Services, Lawn/Garden Services, Major Appliance Repair, Reupholstery	
Household Decorations	Floor Coverings, Window Coverings, Linens, Sofas, Mattresses, Lamps/Clocks	
Furniture	Living Room Chairs/Tables, Kitchen/Dining Room Furniture, Infants' Furniture, Outdoor Furniture, Bookcases/Desks	
Major Appliances	Refrigerators/Freezers, Stoves/Ovens/Microwaves	Washers/Dryers
Small Appliances	Vacuums, Small Kitchen Appliances, Heating Equipment	Power Tools, Non-powered Tools
Miscellaneous	Lodging away from Home, Indoor Plants, Dishes, Lawn/Garden Equipment	Lawn/Garden Supplies/Insecticides, Moving/Freight Services, Paint, Kitchen Utensils/Cooking Ware

In contrast to the housing major group, the apparel major group had the lowest percentage of statistically insignificant differences in mean expenditure. It appears that similar to the housing major group, there seems to be a general difference in expenditure behavior between the cell-phone-only and TPOPS-eligible populations.

	Significant	Insignificant
Men's Apparel	Men's Shirts	Men's Coats/Jackets, Men's Sportswear, Men's Footwear, Men's Pants, Men's Ties/Belts/Wallets, Men's Underwear/Sleepwear, Men's Suits
Women's Apparel	Women's Sportswear, Women's Footwear, Women's Tops/Skirts/Pants, Women's Underwear/Nightwear, Women's Outerwear	Women's Hoisery, Women's Dresses, Women's Suits,
Children's/Infants' Apparel	Boy's/Girl's Footwear, Boy's Clothing, Girl's Clothing, Infants' Clothing,	Infants' Underwear/Diapers,
Miscellaneous	Watches	Jewelry

Overall, the characteristics of the cell-phone-only population are considerably different from the characteristics of the TPOPS-eligible population. In comparison to the TPOPS-eligible population, the cell phone-only population is more racially diverse, younger, less wealthy, and more likely to be male. The cell phone-only population's expenditure behavior seems considerably different from the TPOPS-eligible population's expenditure behavior because 67% of POPSCATs have statistically significant differences in expenditure means.

5. Summary and recommendations

The TPOPS is used as the main source for the outlets in the CPI's C&S Pricing Survey. Because there is no comparable source against which to compare the CPI's outlet frame, the demographics and expenditures of TPOPS respondents are used as proxies and compared against similar data from the American Community Survey and the Consumer Expenditure Quarterly Interview Survey.

In the first study, we compare the demographics of the TPOPS' respondents to the demographics reported in the ACS. This comparison shows that the differences between the age cohorts in ACS and TPOPS are significantly different. TPOPS over-represents older cohorts and under-represents younger cohorts. The design of TPOPS excludes cell-phone numbers from its sample which may explain this under-representation of the younger population. This study also shows that there are statistically significant differences in the race of TPOPS respondents compared to ACS households, although the differences were less pronounced than the age differences.

The next study compares expenditures and demographics of complete and dropout respondents from the TPOPS. Around 33% of the POPS categories that are surveyed are significantly different between these two groups of respondents. Because of high item non-response, the demographic comparisons are less conclusive.

The final study focuses solely on data from the Consumer Expenditure Quarterly Interview Survey. The differences in the mean POPSCAT expenditures between cell-phone-only consumer units and land-line-only and land-line/cell-phone consumer units are statistically significant for 94 out of the 140 POPS categories compared. The differences between these two populations' expenditures may indicate that the two populations obtain goods and services from different sources.

These studies show that expenditure and demographic data in the TPOPS are likely not missing completely at random (MCAR). There are age-race cohorts that are under-represented in the TPOPS population with others being over-represented. Because expenditures and demographics are proxies for the outlets reported, it is unclear if the outlets reported in the TPOPS indicate a non-response bias. These studies do indicate a need for further analysis. To address the issues raised in this research, the BLS is exploring different ways of collecting and representing the data.

In the short-term, the recommendation of adjusting population weights to correct for the under-representation of some cohorts needs further research. In the long-term, the CPI will need to evaluate alternatives to the current design of the land-line only RDD TPOPS survey to provide its C&S Pricing sample frame.

Appendix A - Comparison of POPSCAT Expenditure Means of Respondents Completing Four TPOPS Interviews and Dropout Respondents⁷

POPSCAT	POPSCAT Title	T Statistic	Completed Consumer Unit Expenditure Reports	Completed Consumer Unit Expenditure Mean	Attritor Consumer Unit Expenditure Reports	Attritor Consumer Unit Mean Expenditure
T17	Ship Travel or Passenger Cruises	3.26	708	\$5,599.94	172	\$4,119.91
