3. The team should consider addressing exceptions to the typical (radial connection – single point of connection) generator connections to the BES on a case-by-case basis involving the appropriate parties, such as the GO/GOP/TO/TOP/TP and Regional Entity, rather than creating requirements that apply to all GO/GOPs.

Is the drafting team headed in the right direction?

1. We applaud the team for seeking informal direction from the industry and believe the direction that the team is taking is appropriate.

COMMENTS:

PSEG Registered Entities Comments on March 2011 White Paper on Generator Requirements at the Transmission Interface

The PSEG Registered Entities (“REs”) support the work of the *Ad Hoc Group for Generator Requirements at the Transmission Interface* subsequently placed under the aegis of the Standard Development Team (“SDT”) for Project 2010-07. We appreciate this opportunity to provide informal comments on the March 2011 White Paper on Generator Requirements at the Transmission Interface (“White Paper”).

The PSEG REs support the concepts advocated in the White Paper, principally, that:

- Subjecting Generator Owners (“GOs”) or Generation Operators (“GOPs”) to all of the standards applicable to Transmission Owners (“TOs”) or Transmission Operators (“TOPs”) would do little if anything to improve the reliability of the Bulk Electric System;
- The goals of Project 2010-07 can be accomplished by making GOs and GOPs responsible for complying with a limited number of reliability standard requirements, namely certain requirements in FAC-001 and FAC-003; and
- Creating new definitions for generator interconnection facilities and/or interfaces which would be formalized in the NERC Glossary.

The PSEG REs also agree that ability to implement the concepts advocated in the White Paper are inexorably linked to the work of the SDT assigned to Project 2010-17 (Definition of the Bulk Electric System [“BES”]). We therefore recommend the two project teams coordinate their efforts.

We are concerned by the suggestion that the requirements of FAC-001 are applicable within forty-five days of receiving an interconnection request. There are a host of regulatory and commercial activities and assessments that must be completed before the interconnection occurs. In its role as the Regional Transmission Organization, PJM acts as the Transmission Planner and coordinates and evaluates transmission interconnection requests. Furthermore, experience shows that many of these interconnection requests are subsequently withdrawn from the interconnection queues at PJM. Requiring GOs to be fully compliant with FAC-001 within 45 days of the receipt of such request for projects that may never be constructed would not improve the reliability of the BES, but could result in an inefficient use of resources. Therefore, we ask the SDT to consider alternatives to receipt of an interconnection request for triggering FAC-001 applicability to GOs.

With regard to the requirement for GOs related to FAC-003, the PSEG REs support an exemption for transmission facilities on the property of the GO. The SDT has acknowledged this concept in paragraph 4.2.4 of FAC-003-02, but it is unclear exactly which facilities are excluded by this exemption. Since PSEG believes that it is the intent of the SDT to include all

transmission lines on the generating station property as well as the some portion of the transmission line that leaves the station property, we ask the SDT to adopt the approach advocated by the Ad-Hoc Group. Under that approach, the vegetation management standards in FAC-003-02 apply to GOs owning a Generator Interconnection Facility that operates at 200 kV and above, or are otherwise deemed critical to the BES, but provides for an exclusion from FAC-003-02 for Generation Interconnection Facilities that reside within the GOs property line. We also support an exemption for generator lead lines that leave the GO's property but do not exceed two spans (generally one-half mile from the generator property).

The PSEG Companies also acknowledge the efforts of the Electric Power Supply Association ("EPSA") to provide guidance and build consensus on this effort.

Jay Seitz, U.S. Bureau of Reclamation

HSeitz@usbr.gov

COMMENTS:

As stated, the purpose of Project 2010-07 is to clearly identify the appropriate generation facilities and the standards requirements that should apply to such generation Facilities to ensure that the reliability of the Bulk electric system is maintained. In pursuit of this purpose judgment and discretion of the Registered Entities should be recognized.

The white paper proposes a role for Generator Owners well outside that of the existing NERC Reliability Functional Model. BES facilities at which an entity may logically request interconnection should be covered by a Transmission Owner and Transmission Operator. We believe many of the concerns raised should be addressed by the registration process rather than push Transmission Owner standards to the Generator Owner.

Specific comments to the white paper follow:

- How can the proposal outlined in the White Paper be improved? Is the drafting team heading in the right direction?

The drafting team can improve its approach by limiting the applicability of those standards in which the drafting team believes a reliability gap may exist for specific type of facilities. This will help to ensure that interconnection requests or vegetation management is applied only to those locations where network or integrated transmission exist.

The drafting team should spend more time on considering the comments provided to the ad hoc team when it developed its final report. Specifically, as stated in the SAR, the drafting team needs to “add particular focus on the operation of the interface point at which operating responsibility shifts from the Generator Operator to the Transmission Operator.” The drafting team appears to have sidestepped the action by what appears to be unilaterally dismissing the work of the ad hoc Team.

The drafting team proposal is not adequately addressing the interface issue in its proposal. The drafting team did recognize that while elements owned by entities who are registered as Generator Owner appear to fit the definition of elements owned by Transmission Owners, the elements need not be subject to the same level of standards applicable to Transmission Owners. The drafting team also recognized that those elements are generally non network or non integrated transmission elements. Simply put they are not used to transmit power other than from the specific Generator Owner. The proposal submitted for comment does not recognize the non network/non integrated transmission nature of the elements when it proposes to apply FAC-001 to Generator Owners. The purpose of FAC-001 is for facilities where network or integrated transmission exists. By applying FAC-001, the Generator Owner “transmission’ type elements,

would be de facto considered network transmission and would then require the Generator Owner to develop interconnection requirements at Generator facilities. Since the Generator Owner now would have a recognized network facility, it would also be subject to FERC Order 888 and be required to develop rates for the use of its facilities.

Finally, the drafting team recognized that the definition of BES would drag certain GO into a TO arena with little if any improvement in reliability of the Bulk Electric System. The drafting team should recognize that if the Generator Owners are in fact required to register as Transmission Owners, the proposed changes to the standards would open the Generator Owner to interconnection requests at other than transmission system voltage levels.

- The drafting team has chosen to use informal means of receiving industry feedback (webinars, presentations before industry stakeholder groups, etc.) prior to expending valuable industry resources to develop specific proposals for reliability standard requirements, measures, VSLs, etc. Do you have any further suggestions for seeking industry input before the project moves into a more formal development phase?

The drafting team should build upon the work of the ad hoc Team which encompasses much of the industry feedback on the subject. The suggestion to modify FAC -001 and FAC-003 do not get to the root of the concerns and do not address the interface issue addressed raised by industry.

- The Ad Hoc group originally proposed the new terms “Generator Interconnection Facility” and “Generator Interconnection Operational Interface” as part of this project. The Project 2010-07 drafting team believes that changes to the definition of Bulk Electric System under Project 2010-17 and modifications to a select group of standards can accomplish the same goal without the need for new definitions. Do you support this approach? If not, please explain.

This action is not supported. The industry spent a great deal of time responding to the white paper drafts which resulted in the recommendation for the new terms. Without defining the interface issues and where they exist, modification of the standards cannot hope to deal with the true reliability issue.

Cynthia Janka, Arizona Public Service

Cynthia.Janka@aps.com

602-250-2028

COMMENTS:

Chris Cambridge, Engineering Manager and GO GOP Subject Matter Expert submits the following comments on behalf of Arizona Public Service (AZPS).

The Standards Drafting Team (SDT) for this project is trying to address the Reliability Standards required for a Generator Owner and Operator who has interconnection facilities (referred to as a GOTO). The SDT has provided various approaches for industry comment and AZPS is providing comments on the following two approaches:

Requiring any classification that subjects Generator Owners and Generator Operators to all the standards applicable to Transmission Owners and Transmission Operators would do little, if

anything, to improve the reliability of the Bulk Electric System (see page 3).

To maintain an adequate level of reliability in the Bulk Electric System, a clear delineation of responsibilities and authority at the interface between Generator Owners/Operators and Transmission Owners/Operators is needed. This can be accomplished by properly applying selected standards or specific standard requirements to Generator Owners and Generator Operators (see page 3).

Taking this approach the SDT has done an admirable job of trying to address requirements for this special group of Generator Owners and Operators with generator interconnection facilities without requiring them to comply with all the Transmission Owner and Operator Reliability Standards. However, it does not appear that they have looked at the impact of adding the Generator Owner and Operator to select reliability standards applicable to Transmission Owner and Operator and how this will add additional compliance requirements to the rest of Generator Owners and Operators in the industry. It may be more appropriate to consider the creation of another entity as a Generator Interconnect to clarify the distinction from having full TO/TOP responsibilities. Then the specific requirements could be distinguished between the TO/TOP and GO/GOP.

The SDT has also made the following statements which although understandable do not provide the confidence this is the correct approach in extending the requirements of a Generator Owner and Operator into certain Transmission Owner and Operator standards. The second statement below, as indicated, will considerably alter the SDT previous direction and may limit this approach.

The SDT recognizes that its work alone may not eliminate all reliability gaps with respect to generator-owned Facilities like generator interconnection facilities (see page 7). As noted above, Project 2010-17—Definition of Bulk Electric System may have an enormous impact on the work of this SDT. We are confident that these changes we have proposed to a small number of standards, in coordination with changes to the Bulk Electric System definition, can achieve the necessary reliability (see page 7).

AZPS's ultimate recommendation is to consider adding a new entity to address the specific standards and requirements needed by a Generator Interconnect Facility versus adding additional requirements for a Generator Owner and Operator which are applicable to the Transmission Owner and Operator.

Sandy O'Connor, TransAlta
sandy_o'connor@transalta.com

COMMENTS:

TransAlta Centralia Generation LLC (TransAlta) appreciates the opportunity to provide comments on Project 2010-07 Generator Requirements at the Transmission Interface White Paper Proposal for Informal Comment.

TransAlta strongly encourages the continued progress on Project 2010-07. Completion of this project is important to bring resolution to the industry regarding not only the "go forward approach" but also for those generators that have already been registered as Transmission Owners and Transmission Operators.

TransAlta offers the following specific comments:

1. Overall TransAlta agrees with this more simplified approach. The white paper proposal describes the analysis undertaken by the Standard Drafting Team (STD) to arrive at the shorter list of standard which would require SARs - FAC-001 and FAC-003. We believe this approach is appropriate and logically puts some of the larger issues into forums that are already addressing those issues.

2. One of the recommendations in the white paper proposal is to follow Project 2010-17 Definition of Bulk Electric System and ensure that the responsibility for generator interconnection line leads is appropriately and clearly assigned to Generator Owners and Operators. TransAlta recognizes that Project 2010-017 is likely the more appropriate forum to deal with the definition of Bulk Electric System and the associated impact on the definition of generator interconnection line leads. TransAlta would recommend not only following Project 2010-07, but also active involvement in the project by the SDT to ensure that the responsibility for generator line leads is properly assigned.

3. Under the Section "Summary and Discussion of Other Options" the white paper proposal outlines a number of different options that are available to an entity to manage compliance responsibility. While TransAlta agrees that these options are available, what is important to note is that in many cases these options are difficult, costly and time consuming to implement, resulting in compliance risk for those generators that are registered by a regional entity and NERC for the Transmission Owner and Transmission Operator functions. The compliance risk placed on a generator after registration is one of the reasons we encourage the continued progress on Project 2010-07.

Thank you for considering our comments.

Denise Koehn, Bonneville Power Administration
dekoehn@bpa.gov
360-418-2533

COMMENTS:

Bonneville Power suggests that the following phrase be included:
“the GO shall coordinate with the TO to ensure that all interconnection facilities are included in the vegetation management plan”. This phrasing would leave it up to the GO and TO to determine how to coordinate most effectively.
We appreciate your consideration of our comment.

Andy Puztai, American Transmission Company
apuztai@atcllc.com
(262) 506-6913

COMMENTS:

American Transmission Company LLC (ATC) wishes to thank NERC for providing an opportunity to comment on the NERC Project 2010-07 “Generator Requirements at the Transmission Interface” White Paper as requested in the NERC posting dated March 4, 2011.

ATC reviewed the subject White paper using the recommended focus questions in the NERC posting and has a couple comments. They are summarized in the attached document.

Thanks again for providing an opportunity to comment.

1. How can the proposal outlined in the White Paper be improved? Is the drafting team heading in the right direction?

Improvements:

Next Step #1 - According to FERC Docket #ER10-1117, if a Generator Owner receives a request for service over their facilities; they have 60 days to file a tariff for processing the request for service. ATC believes that the proposed Requirement R4 of FAC-001 should give the Generator Owner 60 days, rather than 45 days, to provide its interconnection requirements.

Next Step #3 – NERC has not clearly defined wind farms to be generating plants. The words, “directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above”, in the latest Project 2010-17 concept paper may not be interpreted as applicable to wind farms. The generating units of wind farms are typically directly connected to sub-transmission facilities, which in turn are directly connected to Transmission Facilities operated at voltages of 100 kV or above.

ATC agrees the drafting team is heading in the right direction.

2. The drafting team has chosen to use informal means of receiving industry feedback (webinars, presentations before industry stakeholder groups, etc.) prior to expending valuable industry resources to develop specific proposals for reliability standard requirements, measures, VSLs, etc. Do you have any further suggestions for seeking industry input before the project moves into a more formal development phase?

No

3. The Ad Hoc group originally proposed the new terms “Generator Interconnection Facility” and “Generator Interconnection Operational Interface” as part of this project. The Project 2010-07 drafting team believes that changes to the definition of Bulk Electric System under Project 2010-17 and modifications to a select group of standards can accomplish the same goal without the need for new definitions. Do you support this approach? If not, please explain.

Yes, ATC supports the approach.

John Troha, SERC OC Standards Review Group
jtroha@serc1.org

COMMENTS:

SERC OC Standards Review Group

Comments on Project 2010-07: Generator Requirements at the Transmission Interface

How can the proposal be improved?

4. Make the language clearer on the concept of a GO/GOP interconnection request to an established GO/GOP that has an existing interconnection to the BES. It would be beneficial to include a diagram(s) of interconnection examples.
5. We feel that the GO/GOP should not be forced into registration as a TO/TOP based on having a radial connection (single point of connection) to the BES, provided that the loss of that radial connection is included in the set of study contingencies by the TP and TOP.
6. The team should consider addressing exceptions to the typical (radial connection – single point of connection) generator connections to the BES on a case-by-case basis involving the appropriate parties, such as the GO/GOP/TO/TOP/TP and Regional Entity, rather than creating requirements that apply to all GO/GOPs.

Is the drafting team headed in the right direction?

2. We applaud the team for seeking informal direction from the industry and believe the direction that the team is taking is appropriate.

jcashin@epsa.org
(202) 349-0155

COMMENTS:

EPSA Comments on Generation Requirements at the Transmission Interface – Project 2010-07

The Electric Power Supply Association (EPSA)¹ endorsed the initial recommendations of the *Ad Hoc Group for Generator Requirements at the Transmission Interface*, and appreciates the opportunity to offer these informal comments on the March 2011 White Paper Proposal for Project 2010-07. Since NERC's creation of the "GOTO Team" in February of 2009, EPSA has supported the efforts of Ad-Hoc Group and now the Project 2010-07 Standards Drafting Team (SDT). While EPSA members' compliance registration includes several functional entity types, the bulk of competitive suppliers' registrations are as Generator Owners (GOs) and Generator Operators (GOPs).

EPSA's comments herein will focus on the following points for the Project 2010-07 SDT to consider concerning the White Paper Proposal:

- The definitions included in the currently underway Bulk Electric System (BES) definition Standard drafting effort and Generator Requirements at the Transmission Interface need to be aware of each SDT's work. Thus, the Project 2010-07 SDT should regularly consult with the Project 2010-17 SDT so that the two projects work as coordinated efforts.
- So that the Interface between generation and transmission can be clearly demarcated, correctly defining generator interconnection facilities is crucial to the successful completion of Project 2010-07.
- EPSA largely supports the White Paper's correct assessment about how Project 2010-07 will either require slight or no modification of other Standards to maintain reliability.
- Competitive Suppliers agree that FAC-001-1 and FAC-003-2 should apply to GOs, but suggest that the SDT revisit and revise the criteria that would trigger compliance for these two Standards.

BES Definition and Exemptions – Working with Project 2010-17

¹ EPSA is the national trade association representing competitive power suppliers, including generators and marketers. These suppliers, who account for 40 percent of the installed generating capacity in the United States, provide reliable and competitively priced electricity from environmentally responsible facilities serving power markets. Each EPSA member typically operates in four or more NERC regions, and members represent over 700 registered entities in the NERC registry. EPSA seeks to bring the benefits of competition to all power customers. The comments contained in this filing represent the position of EPSA as an organization, but not necessarily the views of any particular member with respect to any issue.

Importantly, Project 2010-07 seeks to work in a coordinated way with the Definition of Bulk Electric System (BES) and Related Rules of Procedure Development Team – Project 2010-17 to appropriately designate facilities that would be included as part of the BES. The BES definition standard and associated exemption criteria need to be clear and widely understood so that BES generation and transmission facilities know their reliability responsibilities. The Project 2010-17 SDT needs to develop a crisp BES definition that can meld with the exemption criteria that will be developed. Importantly, the White Paper in stating Project 2010-07 Purpose, notes the Project's intent to have all generator BES facilities identified and integrated with other NERC Standards to ensure reliability. From the Paper:

The purpose of Project 2010-07—Generator Requirements at the Transmission Interface is to ensure that all generator-owned Facilities that are considered part of the Bulk Electric System are identified and that the level of reliability needed to operate such Facilities is appropriately covered under NERC's Reliability Standards.²

While the two efforts need to move forward in a coordinated way, neither project should impede the other's efforts or be stalled by the other's timetable.

EPSA supports the SDT's Purpose because it will eliminate the current conundrum when GO & GOPs are registered as TO & TOPs. This creates an untenable situation where GO & GOPs must comply with TO & TOP applicable standards despite not participating in the drafting of those Standards, because there was no evidence at the time that they would ever be registered as TO & TOPs. Project 2010-07 begins the process to change this situation and ensure against potential BES reliability gaps. By identifying the Standards that are appropriate for specific GO & GOPs the White Paper sets the course for the ERO to properly give GO & GOPs the due process accorded them under Section 215 of the Federal Power Act (FPA). Hence, generators can be engaged in the Project 2010-07 process so that those GO & GOPs that need additional responsibilities typically applicable to TO & TOPs will understand their full compliance obligations and ensure BES reliability. Moreover, coordination among Project 2010-07 and Project 2010-17 will ensure that the Standards will eliminate potential BES reliability gaps.

The Need for a Generator Interconnection Facilities Definition

EPSA supports the SDT assertion that generating elements and facilities should be classified as part of the BES. Moreover, a clear BES definition will only be successful if the point of interconnection and associated functional registration is properly defined. The White Paper notes the need for good definitions for appropriate classification:

While not all power plants are considered part of the Bulk Electric System, ultimately, all the plants are interconnected to the bulk power system via their generator interconnection facilities. Of concern is how to classify all such

² Project 2010-07: Generator Requirements at the Transmission Interface, White Paper Proposal for Informal Comment, March 2011, Page 2.

generating facilities, including their generator interconnection facilities, to determine what level of reliability is needed for such facilities.³

Generally, EPSA agrees with the SDT's conclusion that, "new definitions, modifying other definitions, and making changes to dozens of standards was no longer necessary." Much as the White Paper discusses (and is addressed later in these comments) many of the changes occurring through the BES revision will obviate the need for some of the definitional and standard modifications anticipated by the Ad-Hoc Group in 2009. EPSA agrees with this White Paper conclusion with the exception of generator interconnection facilities. A definition for generation interconnection facilities is necessary in Project 2010-07 Standard so that the interface between generators and transmission system can be clearly established and any ambiguities about reliability responsibilities for GOs & GOPs and TO & TOPs are eliminated.

The Ad-Hoc Group Report recommended the following definitions for incorporation into the existing standard:

Generator Interconnection Facility

Sole-use facility for the purpose of connecting the generating unit(s) to the transmission grid. In this regard, the sole-use facility only transmits power associated with the interconnecting generator, whether delivered to the grid or delivered to the generator for station service or auxiliary load, or delivered to meet cogeneration load requirements.

Generator Interconnection Operational Interface

Location at which operating responsibility for the Generator Interconnection Facility changes between the Transmission Operator and the Generator Operator.⁴

These definitions were developed with due consideration for varying configurations, outages, and generators materiality to the BES. The Facility definition defines the purpose of the facility, while the Generator Interconnection Operational Interface definition provides the functional lines of demarcation between the GO and the TO. The definitions were developed based on the purpose of generator interconnection facilities, their usage and how their usage differs from transmission facilities that comprise the interconnected grid. EPSA believes this is a sound basis for distinguishing BES facilities.

EPSA encourages the Project 2010-07 SDT to consider fitting the above definitions into the current White Paper for inclusion in the NERC Glossary. In addition, the other definitional changes proposed in the Ad-Hoc Group Report⁵ should be retained and be considered for Glossary modification.

³ *Id* at Page 1.

⁴ Generator Requirements at the Transmission Interface Final Report – Ad Hoc Group, November 16, 2009, Pages 17-18.

⁵ *Id* at Pages 16-17.

Provided that there have been several FERC appeals⁶ associated with this issue, EPSA encourages the SDT to include the above definitions so that registration can be based on a sound definition for generator interconnection facilities on which complying entities can rely. By providing the above definitions and changes to the NERC Glossary will add needed clarity. Including a generator interconnection facility definition in the Standard and in turn the NERC Glossary will appropriately set the stage for compliance registry criteria changes. EPSA believes the Project 2010-07 SDT should provide the definition changes for compliance registry amendment at the earliest date available so that any perceived registration reliability gaps can be corrected. Subsequently, as Regional Entities are considering new registrations they will have stronger criterion on which to base their decisions, which will make it so that NERC can “measure twice and cut once,” avoiding unnecessary resources expenditure on appeals.

Project 2010-07 and Other Relevant Reliability Standards

EPSA generally supports proposed next steps and recommendations provided in the White Paper. This section of the paper updates (since the Ad-Hoc Group Report) the review of Standards and their requirements that should apply to appropriate generation facilities. Competitive suppliers agree with the SDT's conclusions that the Standards list beginning on page 5 of the White Paper⁷ already apply to GO & GOPs due to changes since the Ad-Hoc Group Report and therefore do not need to be addressed further in Project 2010-07. The further White Paper discussion about how the circumstances for the EOP and PER and TOP (including considerations of PRC-001-2) Standards on pages 6 and 7 provides sound reasons that make EPSA believe that any reliability gaps perceived in 2009 that have since been closed.

Actions that Trigger Applicability of the FAC Standards

The first recommendation in the White Paper is to include GOs in the applicability section of FAC-001-0, an assertion with which EPSA agrees. Appropriate generation facilities that would be identified as needing to comply with FAC-001-0 would need to comply with the Standard to ensure the reliability of the BES. However, EPSA is concerned with the White Paper's proposal that Requirement 4 be added to the applicability section of FAC-001-1. The proposed Requirement reads:

R4. Generator Owner that receives an interconnection request for its facility shall, within 45 days of such request, be required to comply with requirements R1, R2, R3 for the facility for which it received the interconnection request.

EPSA cautions the SDT about inadvertently commingling commercial issues with reliability issues. The interconnection requests involve other tariff issues for both GOs and TOs that need to be resolved before compliance can be established. Reliability will not be degraded if the triggering event for Standard compliance is set after the completion of other commercially

⁶ New Harquahala Generating Company, LLC, 123 FERC 61,173 (“New Harquahala”), order on clarification, 123 FERC 61,311 (2008); Cedar Creek Wind Energy, LLC, RC11- 1-000, appeal, 2010; Milford Wind Corridor Phase I, LLC, RC11-2-000.

⁷ Project 2010-07: Generator Requirements at the Transmission Interface, White Paper Proposal for Informal Comment, March 2011, Page 5.

related regulatory obligations. Examples of commercial obligations that would need to be resolved include the need for an Open Access Transmission Tariff (OATT) to be filed with respect to the interconnection. During the proposed 45 day and potentially beyond, issues regarding transmission upgrades and financial responsibility for those upgrades would need to be resolved. Until upgrade issues are resolved, facility ownership and operation and maintenance responsibilities will not be specifically known. Additionally, if transmission owner and the interconnecting generator are affiliates, waivers with FERC acceptance will be required. The OATT and associated upgrade and affiliate waiver issues would need time to be sorted out prior to a registered GO being required to meet the requirements of FAC-001-0. Consequently triggering reliability compliance 45 days after the interconnection request is not feasible and does not enhance BES reliability. EPSA believes the SDT should ensure that reliability compliance should not be required before OATT changes and potential waivers are completed. Hence the criteria for triggering GO compliance with FAC-001-0 should only come into play after all commercial OATT issues are resolved.

The White Paper also proposes that the Generator Owner be added to all the requirements and measures that mention Transmission Owner for FAC-003-2. FAC-003-2 should apply to appropriate GOs, however EPSA asserts that the current proposal, which suggests applying the Standard to all generator interconnection facilities needs to have a more specific criteria to distinguish the specific GOs that need to comply with FAC-003-2. This would be consistent with the approach that was used by the Ad-Hoc Group in its Report where the “two-span test was supported for determining which GOs that FAC-003 should apply to:

In reaching this conclusion, the team considered other options that included inclusion of Generator Owners as applicable entities to FAC-003 based on a test for criticality, or to include Generator Owners as applicable entities in the existing version of FAC-003 without modification to the applicability criteria. The team, supported by a majority of industry commentators [sic] indicated the two-span test presented a simple and objective method to determine responsibilities for Generator Owners. Additionally, the “200 kV and above, or otherwise deemed critical to the Bulk Electric System” threshold is consistent with the current applicability of FAC-003 to Transmission Owners.⁸

EPSA supports the approach endorsed during the development of the Ad-Hoc Group Report and believes that FAC-003-2 need only apply to GOs with significant voltages and distances. Only Generator Owners of a Generator Interconnection Facility whose facilities operate at 200 kV and above or are otherwise deemed critical to the BES and whose Generation Interconnection Facility exceeds two spans (generally one-half mile from the generator property line) should need to comply with the vegetation management Standard. Therefore, the SDT should reexamine if FAC-003-2 should apply to all GOs only based on the generator interconnection facility. This must be done in conjunction with revising the definition of generator interconnection facilities.

⁸ Generator Requirements at the Transmission Interface Final Report – Ad Hoc Group, November 16, 2009, Pages 15.

Conclusion

In summary, EPISA endorses SDT's work and appreciates the posting of the White Paper for an informal comment period. The White Paper provides an important bridge for Stakeholders to weigh current recommendations with the 2009 Ad-Hoc Group Report. Generally, EPISA agrees with the SDT's recommendations but still feels that to ensure that there are no BES reliability gaps requires coordination with the current BES SDT Project 2010-17; a definition for generator interconnection facilities needs to be included in the Standard; the Standards that no longer require changes since the 2009 Ad-Hoc Report have been correctly assessed; and, the compliance triggers and criteria for the FAC Standards need to be revised. Therefore, EPISA respectfully requests that the SDT for Project 2010-07 consider the recommendations herein.

1. Coordination between Standard Drafting Teams. Based on the current status of the Bulk Electric System Standard Drafting Team (BESSDT) proposed BES definition, the White Paper Proposal (“Proposal”) does not provide a clear demarcation between generator interconnection facilities and the interconnected transmission facilities of the Transmission Owner/Operator.

The current BES definition makes no mention of what are or are not considered generation interconnection facilities, but merely includes “generating units greater than 20 MVA (aggregated 75 MVA at one site) from the generator terminals through the GSU which has a high side voltage of 100 KV or above.” Many registered generators own an additional interconnection line that is above 100 KV that, in turn, connects the generator to the transmission owner’s facilities and is also part of the generator interconnection. The currently proposed BES “core definition” would classify this line as a Transmission Element and could conceivably subject the GO to the full array of TO/TOP standards for this interconnection line.

According to its scope, the BESSDT is looking to the GRTISDT to define this demarcation through a definition, as proposed by the Ad Hoc group. As we interpret its scope, the BESSDT is defining what is or is not part of the BES without specifying what standards apply to different parts of the BES, or, for that matter, what standards apply to non-BES facilities.

The NSRS asks for clarity of the definition, “generation interconnection facility” and for that definition to be included in the NERC Glossary. This subcommittee has no preference as to which committee takes ownership of this definition; however, we are substantially interested in expediting the completion of the review of this definition.

2. Generation Interconnection Lines. The NSRS disagrees that generation interconnection lines are transmission lines from a functional standpoint. The function of the interconnection line is to interconnect the generator with the transmission system in a similar manner to the connectivity of a local distribution system to the transmission system (i.e., generally radial in nature). These lines only carry the output power or auxiliary power for that generation unit and are not for public use. The transmission system function is to deliver the generation to the load. That is not to say that some standards related to higher voltage lines may apply. Merely that, from a functional standpoint, the two are not the same and the reliability requirements are not the same.

The NSRS agrees with the approach the SDT is taking involving the addition of a GO function to FAC-003. In the ERCOT Protocols, the definition of “Power Generation Company” (“PGC”) states that the PGC does not own a transmission or distribution Facility in this state other than an essential interconnecting Facility...” Therefore, by definition, a PGC cannot be TO/TOP.

3. Proposed FAC-001 Revisions. The proposed FAC-001 revisions should not apply in the ERCOT region. In the ERCOT region, generation interconnection lines are private facilities that are not subject to third party interconnection requests. This revision only applies to a generation interconnection line that is considered part of the transmission network and for which the GO receives compensation for making this transmission line available.

The FAC-001 revisions should include a regional difference exempting Generation Owners in the ERCOT region.

4. Proposed FAC-003 Revisions. The NSRS agrees with the Ad Hoc Group’s Proposal 2, which provides for exclusions for short distance interconnections (i.e. - interconnection lines that do not exceed a distance that can be reasonably monitored), from the generator property line. In addition, there should be a process for demonstrating to the Regional Entity that the interconnection line has no vegetation around it to manage, i.e. in arid locations. Each entity should be allowed to develop this process based on their circumstances at their facility.

COMMENTS:

Comments of Sempra Generation on the Project 2010-07 Generator Requirements at the Transmission Interface White Paper

Sempra Generation is the parent company of several generation-owning subsidiaries in the Western Electricity Coordinating Council region, including Mesquite Power, LLC (Mesquite), which is currently registered as both a Generator Owner/Generator Operator (GO/GOP) as well as a Transmission Owner/Transmission Operator (TO/TOP) due to the ownership of generator interconnection facilities.

Sempra Generation commends the work of the Project 2010-07 Standards Drafting Team (SDT) and believes the team is heading in the right direction, as evidenced by the March 2011 White Paper currently open for comment. Sempra Generation supports the position of the SDT that generator interconnection facilities should not trigger registration as a TO or TOP simply because the GO owns and/or operates transmission elements or facilities. Having said that, Sempra Generation agrees that, in order to maintain an adequate level of reliability in the Bulk Electric System, selected standards and requirements should apply to GO/GOPs in order to establish and maintain a clear delineation of responsibilities with respect to their generator interconnection facilities.

In the brief comments below, Sempra Generation provides feedback to the SDT on specific proposals in the White Paper.

- **Applicability of FAC-001-0 to the Generator Owner**

The SDT's proposed approach to FAC-001-0, which would require a GO to fully implement the R1 – R3 requirements within 45 days in the event the GO receives an interconnection request, may pose some difficult practical hurdles for GOs. A third-party request to interconnect to the GO's facilities would most likely occur in the circumstance where an existing radial transmission facility is sufficiently sized to accommodate additional generation, as is sometimes the case for renewable generation in particular, given that these facilities are also often sited many miles from the grid.

Third-party interconnection requests notwithstanding, if a GO is not also registered as a TO/TOP, it is because, as recognized at p. 3 of the White Paper, that GO's interconnection facilities are radial in nature, rather than "integrated." Adding an interconnecting third-party generator user to the GO's radial gen-tie facility does not automatically make that facility an "integrated" transmission element. If the GO's transmission facilities are not "integrated," it is generally going to be infeasible for the GO to fully implement the R1 - R3 requirements, since those requirements are clearly designed for owner/operators of integrated transmission facilities. In all actuality, the most appropriate entity to coordinate the process from the technical standpoint of facility connection requirements would be the BAA/TSP to whom the

GO is interconnected, since the BAA/TSP would invariably be an “Affected System” under the FERC’s pro forma Large Generator Interconnection Procedures.

Some of the practical difficulties facing GOs were recently highlighted by participants and panelists at the FERC Technical Conference on participant-funded transmission (Docket No. AD11-11-000, et al., March 15, 2011), where FERC is considering how to better implement the OATT requirement for participant-funded transmission facilities (including gen-tie facilities). In light of the discussion at the Technical Conference, it is reasonable to assume that FERC may be making adjustments to its policies in the future regarding how to address third-party access to GO interconnection facilities.

In addition, the seeming impracticality of a generator complying with FAC-001-0 R1-R3 was acknowledged and documented in 2008 by NERC and WECC in the Harquahala “Compliance Protocol” document, which was recently filed at FERC in the Cedar Creek Wind/Milford Wind Corridor proceeding (FERC Docket No. RC11-1-000 et al., filed December 28, 2010). With respect to compliance with FAC-001-0 R1-R3, the Compliance Protocol provides as follows:

Because Harquahala does not know what equipment would be required for a specific interconnection to the Harquahala transmission facilities, to satisfy these Requirements, Harquahala will generally describe the factors it will consider if interconnection is requested, including any necessary coordination with SRP, and the necessity of installing certain equipment for measuring interconnection capability. Harquahala will not be required to publicly publish its facility connection requirements, but Harquahala will provide them upon request, as required in R3. If Harquahala were to receive a request for interconnection, Harquahala will work with the requesting entity to develop full interconnection requirements in a timely manner.

Instead of requiring the GO to comply with the full panoply of FAC-001-0 R1– R3 requirements (all within 45 days of the third-party interconnection request), Sempra Generation encourages the SDT to consider R4 language that recognizes the practical hurdles associated with implementing the requirements for radial facilities, and that takes an approach more akin to the Harquahala Compliance Protocol with respect to this Standard. Specifically, the SDT should consider R4 language that would require the GO receiving the interconnection request (i) to implement the requirements of R1 – R3 only to the extent those requirements are applicable to radial facilities; and (ii) to coordinate with its BAA/TSP on such implementation. In terms of timing, the SDT should consider whether the proposed 45 days is realistic, and whether a 90-day deadline would be more appropriate. The flexibility inherent in the above approach would likely avoid potential conflicts with any revised FERC policies resulting from the aforementioned Technical Conference.

- **Applicability of FAC-003-2 to the Generator Owner**

Sempra Generation supports the addition of “Generator Owner” to the Applicability section of FAC-003-2.

- **Project 2010-17—Definition of Bulk Electric System**

Sempra Generation supports the need for the coordination between the Project Teams for Project 2010-07 and Project 2010-17 (Definition of Bulk Electric System), and agrees that changes made to the BES definition will be instrumental in covering the reliability gap with respect to generator requirements at the transmission interface. However, because the Project 2010-17 BES work may take a significantly slower track than the SDT's progress, Sempra Generation encourages the SDT to weigh the risks and benefits of including of a definition of "Generator Interconnection Facility" in the NERC Glossary and associated clarifications to the standards, as proposed in the *Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface*.

- **Other Solutions**

As referenced in the White Paper, the standards outlined will likely not take effect for a year or more. In the meantime, GOs such as Mesquite will continue to be under increased risk of non-compliance due to their registration as TO/TOPs, and will need to incur substantial compliance costs for TO/TOP requirements that are clearly not an appropriate fit. Accordingly, Sempra Generation encourages consistent application of responsibilities under the Standards in all NERC regions, and urges NERC to adopt the necessary changes to the NERC Glossary, Registration Criteria, and/or Standards to ensure consistency exists throughout the regions.

- **Conclusion**

The Final Report and White Paper are obviously products of detailed analysis and thoughtful consideration of the myriad issues surrounding the reliability implications of ownership and operation of generator interconnection facilities. It is noteworthy – though hardly surprising – that, after many months of study, the GO/TO Task Force and the SDT, balanced groups comprised of members from a broad spectrum of functional categories, have concluded that only modest changes to the Reliability Standards would be required in order to ensure that no gaps exist and that generator interconnection facilities are operated reliably. When implemented, the recommendations included in the White Paper should go a long way toward providing the regulatory and compliance certainty needed by generators who own or operate generator Interconnection facilities. Accordingly, Sempra Generation encourages the continued work of the Project 2010-07 team.

Sempra Generation is not the same company as the utility, SDG&E or SoCalGas, and the California Public Utilities Commission does not regulate the terms of Sempra Generation's products and services.

COMMENTS:

Dear Drafting Team Members:

Thank you for the opportunity to offer input at this stage of the standard development. Below, please find comments from Constellation Power Generation and Constellation Commodities Group (collectively CPG):

1. How can the proposal outlines in the White Paper be improved? Is the drafting team heading in the right direction?

CPG agrees with many of the aspects discussed in the White Paper such as on page 3 “...qualifying generator interconnection facilities should be classified as transmission. That does not, however, mean that a Generator Owner or Generator Operator should be required to automatically register as a Transmission Owner or Transmission Operator simply because it owns and/or operators transmission Elements or Facilities” and that “requiring any classification that subjects Generator Owners and Generator Operators to all the standards applicable to Transmission Owners and Transmission Operators would do little, if anything, to improve the reliability of the Bulk Electric System.” CPG also agrees with the limited number of proposed reliability standard changes that this drafting team has identified in the White Paper.

However, the White Paper also states that any potential reliability gaps can be closed by “properly applying standards or specific standard requirements to Generator Owners and Generator Operators.” CPG does not agree with that statement. Applying selected requirements or standards to all GOs and GOPs when any potential reliability gaps only apply to a minority of GOs and GOPs is not the correct approach.

The proposed White Paper departs from some of the valuable concepts within the Ad Hoc Group report from November 2009, which CPG would like to see reconsidered. The drafting team should revisit the Ad Hoc report recommendation to define “Generator Interconnection Facility”. Because generator interconnection facilities are distinctly different from the traditional transmission function understood within the Bulk Electric System, generator interconnection facilities should be independently defined. Once clearly defined, the drafting team should consider the subset of transmission geared standards useful to address reliability issues at the subset of applicable GOs and GOPs.

The draft definition language in the Ad Hoc Report offers a good starting point:

Generator Interconnection Facility

Sole-use facility for the purpose of connecting the generating unit(s) to the transmission grid. In this regard, the sole-use facility only transmits power associated with the interconnecting generator, whether delivered to the grid or delivered to the generator for station service or auxiliary load, or delivered to meet cogeneration load requirements.

Generator Interconnection Operational Interface

Location at which operating responsibility for the Generator Interconnection Facility changes between the Transmission Operator and the Generator Operator.

2. The drafting team has chosen to use informal means of receiving industry feedback (webinars, presentations before industry stakeholder groups, etc) prior to expending valuable industry resources to develop specific proposals for reliability standard requirements, measures, VSLs, etc. Do you have any further suggestions for seeking industry input before the project moves into a more formal development phase?

Constellation supports use of informal feedback opportunities as part of the development process. This allows for constructive input early in the process without the response obligations of the formal steps which will take place later in the process. In addition, informal settings offer industry members the chance to better understand the issues and decision making behind the standard development and encourage greater familiarity with the proposal before it reaches formal ballot.

3. The Ad Hoc group originally proposed the new terms “Generator Interconnection Facility” and “Generator Interconnection Operational Interface” as part of this project. The Project 2010-07 drafting team believes that changes to the definition of Bulk Electric System under Project 2010-07 and modifications to a select group of standards can accomplish the same goal without the need for new definitions. Do you support this approach? If not, please explain.

CPG disagrees with this approach. The BES team is currently standardizing the definition of BES using input from the regions and NERC. Its scope does not include creating new functional models and changing standards to close any perceived gaps in reliability. The Ad Hoc team’s proposal of creating new terms such as “Generator Interconnection Facility” is a much better approach. By clearly defining that term, the small subset of GOs and GOPs that may have these facilities can be made subject to the select TO requirements or standards to address the potential reliability question.

Thank you for your consideration. Please contact me with any questions.

COMMENTS:

IESO Comments on Project 2010-07

“Generator Requirements at the Transmission Interface”

We thank the Project 2010-07 SDT for the opportunity to comment on the posted white paper and attachments. IESO supports the effort to properly determine which TO/TOP reliability standards requirements ought to apply to GO/GOPs to promote BES reliability, while at the same time not burdening GOs/GOPs with the obligation of complying with other requirements that are not relevant to their operation. We offer these comments:

The introduction to the white paper raised the question of classifying generating facilities, including their generator interconnection facilities, to determine what level of reliability is needed for such facilities. Further, on page 2, the SDT referred to “qualifying” generator interconnection facilities. However, it is not clear what are the qualifying criteria. Are the qualifying criteria for Elements and Facilities the BES definition criteria? If so, this should be stated explicitly.

We agree with the proposed changes to FAC-001-0. An alternative approach would have been to include the GO in each of requirements R1 to R3. That would however have meant that the GO would have to document, maintain and publish facility connection requirements even in cases where requests for same are unlikely. The proposed approach makes compliance with R1 to R3 mandatory only upon receipt of a request and avoids potentially unnecessary upfront work by the GO.

In FAC-001-0, we suggest that R4 be modified as follows: Start the sentence with “The” and delete “be required to”.

We agree with the proposed changes to FAC-003. The last sentence of footnote 2 of FAC-003 should also be modified to include the Generator Owner.

The proposed definition of Generator Interconnection Operational Interface was “Location at which operating responsibility for the Generator Interconnection Facility changes between the Transmission Operator and the Generator Operator.” We do not understand the SDT’s rationale for removing this definition since it does not refer to Elements and Facilities rated at 100 kV and above. It is also unclear how the original objective meant to be achieved by the proposed change to EOP-008-0 R1.3 would be met. Please clarify.

Sandra Shaffer, PacifiCorp
Sandra.Shaffer@PacifiCorp.com

COMMENTS:

PacifiCorp respectfully submits the following comments with respect to Project 2010-07: Generator

Requirements at the Transmission Interface: White Paper for Informal Comment:

PacifiCorp generally agrees with the objective and purpose of Project 2010-07, namely, to ensure that all generator-owned facilities that are considered part of the bulk electric system (“BES”) are identified and that the level of reliability needed to operate such facilities is appropriately covered under NERC’s Reliability Standards.

However, PacifiCorp believes that certain of the standard drafting team’s proposals are not consistent with this objective.

Specifically, in “Proposed Next Steps and Review of Reliability Standards,” item #3, the standards drafting team proposes to ensure that the responsibility for generator interconnecting line leads is appropriately and clearly assigned to Generator Owners and Generator Operators. PacifiCorp believes that this step is not necessary at this time and is inconsistent with the purpose of Project 2010-07. The purpose of the project is to ensure that the facilities considered part of the BES are properly identified. The definition of “BES” should define the facilities that are part of the BES; it should not define responsibility or ownership of those facilities. Although typically generator lead lines are owned and operated by the Generator Owner or Generator Operator, they may also be owned or operated by the Transmission Owner or Transmission Operator. The BES definition should remain broad enough to take this difference into account.

PacifiCorp disagrees that a requirement should be added to FAC-001-0 to require a Generator Owner that receives an interconnection request for its facility to comply with requirements R1, R2, and R3. First, it is not clear to PacifiCorp that the lack of this requirement could result in gaps. The standards drafting team provides no support for the existence of such a gap and rather simply makes an assumption that it could result in reliability gaps. PacifiCorp is not aware of many generating facilities that, given FERC’s open access requirements, receive interconnection requests. That said, PacifiCorp would admit that it is theoretically possible that a Generator Owner would receive an interconnection request. If such a thing were to occur, PacifiCorp believes that is unreasonable to require the Generator Owner to have facility connection requirements in place within 45 days of such request. The Generator Owner should only be obligated to develop such facility connection requirements if the interconnection request will be granted and new third-party facilities will actually be interconnected to the Generator Owner’s facilities. In this manner, the burden of developing such facility connection requirements will only apply when necessary to enhance reliability.

COMMENTS:

American Wind Energy Association Informal Comments on NERC Project 2010-07 Generator Requirements at the Transmission Interface

The American Wind Energy Association (AWEA) appreciates the opportunity to submit comments on the NERC Project 2010-07 white paper (White Paper), "Generator Requirements at the Transmission Interface." AWEA supports the proposed plan from the Generator Requirements at the Transmission Interface Ad Hoc Group (GOTO Ad Hoc Group), which concludes that:

1. If Generator Interconnection Facilities operate at 100 kV or greater or are deemed critical to the Bulk Electric System, it would make the Generator Interconnection Facility part of the Bulk Electric System with respect to Generator Owner and Generator Operator requirements but not for Transmission Owner or Transmission Operator requirements.
2. A Generator Owner or Generator Operator that owns and/or operates a Generator Interconnection Facility (that is, a sole-use facility that interconnects the generator to the grid) need not be registered as a Transmission Owner or Transmission Operator by virtue of owning or operating its Generator Interconnection Facility.
3. A Generator Interconnection Facility is considered as if it is part of the generating facility specifically for purposes of applying Reliability Standards to a Generator Owner or Generator Operator.¹

The NERC Standard Development Team's (SDT) White Paper appears to be generally consistent with the recommendations of the GOTO Ad Hoc Group. While the SDT explains that generator interconnection facilities should be classified as part of the Bulk Electric System (BES), it also states that "(this) does not mean, however, that a Generator Owner or Generator Operator should be required to automatically register as a Transmission Owner or Transmission Operator simply because it owns and/or operates transmission Elements or Facilities. ... [T]hese are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system."

AWEA supports the SDT's conclusion that "[w]hen the transmission Elements and Facilities owned and operated by Generator Owners and Generator Operators are nonnetwork/non-integrated transmission, applying *all* standards applicable to Transmission Owners and Transmission Operators would have little effect on the overall reliability of the Bulk Electric System."

AWEA also supports the SDT effort to rework the proposal from the GOTO Ad Hoc Group, not because of significant differences between ultimate goals, but to simplify this

modification process by limiting the number of standards that need to be changed.

¹ NERC, "Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface", November 16, 2009, Page 3.

We note, however, that the SDT does not clarify how, or under what circumstances, a Generator Owner or Operator will be exempted from registration as a Transmission Owner or Operator and the corresponding requirements. The new proposed definitions for the BES from Project 2010-17, Definition of Bulk Electric System, include the interconnection facilities along with the facilities of individual generators or generation plants. If these proposed changes are adopted, we think there needs to be clarification as to whether that would exempt GO/GOPs from the requirements that TO/TOPs. Therefore, AWEA requests greater clarification of how, by definition or through registration criteria, the SDT intends to implement the recommendation that a GO/GOP should not be registered as a TO/TOP solely due to its interconnection facilities. AWEA reads the White Paper to state there are few requirements that currently apply to TO/TOPs that the SDT believes are critical enough that they should also apply to GO/GOPs who have related interconnection facilities that qualify as part of the BES. These include requirements related to registration of facilities that receive interconnection requests, as well as vegetation management requirements that typically apply to transmission facilities. AWEA details our concerns about both of these requirements below.

FAC-001-0 – Facility Connection Requirements

Given the inconsistent understanding of which interconnection facilities are required to offer interconnection or transmission service, AWEA urges the SDT to watch how this issue unfolds at FERC,² and to ensure that the additional requirements proposed in FAC-001 apply only to generators who are required to accept interconnection requests. Our concern is that a generator owner of interconnection facilities would be required to incur costs and devote staff time to developing the facility connection requirements as stated in FAC-001, even though a submitted request might not result in another party interconnecting.

FAC-003-02- Transmission Vegetation Management

Given that this standard applies to lines 200kV and higher, it will apply only to the largest interconnection facilities. Still, AWEA believes the vegetation requirements the SDT has proposed in FAC-003 may be excessive for interconnection facilities that are of limited length. Wind generators by their very nature are intermittent and, therefore, are not relied upon in the same way as other generators with regard to the reliability of the grid. Vegetation issues that cause problems with wind generator interconnection facilities will not threaten reliability, but will only limit the ability for the generator to deliver its output to market, which is no different than the situation when the wind is not ² A recent FERC Technical Conference on Priority Rights to New Participant-Funded Transmission Projects, on March 15, addressed the question of when and how a generator owner of an interconnection facility must receive an interconnection. It is possible that additional rules may come out of this process to clarify these issues.

blowing. AWEA urges the SDT to consider limiting application of this requirement to longer interconnection facilities, such as those that of . mile or more.

John Criner, Kelson Energy, Inc.

(202) 420-4714

COMMENTS:

Comments of Kelson Energy, Inc. (“Kelson”) on White Paper Proposal for Informal Comment in Project 2010–07: Generator Requirements of the Transmission Interface (“White Paper”)

Kelson supports the proposition set forth in the White Paper that a Generator Owner (GO) or Generator Operator (GOP, collectively GO/GOP) should not be required to automatically register as a Transmission Owner (TO) or Transmission Operator (TOP) “simply because it owns and/or operates transmission Elements or Facilities.”¹ However, the White Paper does not address this important registration issue. Kelson understands that this is the result of the procedural limitations of the Project 2010–07 Standards Drafting Team (SDT), meaning that the SDT cannot propose changes to the *NERC Statement of Compliance Registry Criteria (Registry Criteria)*, but may only propose changes to Reliability Standards. However, the result is that this registration issue is still not being resolved by NERC in any public process. The SDT makes proposals to add GO requirements, yet it remains uncertain how GO/GOPs will be treated with respect to the TO/TOP requirements. Kelson believes this should be addressed as a whole. For this reason, Kelson provides comments on how the registration issue should be addressed, in addition to providing specific comments on the SDT’s proposals.

I. Registration

Kelson recommends that the SDT propose a new definition to the NERC Glossary for “Generator Interconnection Facility” (GIF), as was proposed in the *Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface (GO/TO Final Report)* as follows:

Sole-use facility for the purpose of connecting the generating unit(s) to the transmission grid. In this regard, the sole-use facility only transmits power associated with the interconnecting generator, whether delivered to the grid or delivered to the generator for station service or auxiliary load, or delivered to meet cogeneration load requirements.²

In addition, Section III of the *Registry Criteria* should be revised to exclude an entity that owns and/or operates GIF as their only transmission facilities from registration as a TO and/or TOP as follows:

¹White Paper at 3.

²GO/TO Final Report at 17.2

DSMDB-2913577v2

Section III of the *Registry Criteria* states that the entities that meet the definition of the different registration categories, including TO and TOP, should be excluded from registration if they do not meet any criteria listed in Section III. The criteria listed for TO and TOP in Section III is currently set forth as follows:

III.d.1 An entity that owns/operates an integrated transmission element associated with the bulk power system 100 kV and above, or lower voltage as defined by the Regional Entity necessary to provide for the reliable operation of the interconnected transmission grid; or

III.d.2 An entity that owns/operates a transmission element below 100 kV associated with a facility that is included on a critical facilities list that is defined by the Regional Entity.

Kelson recommends that this be changed as follows:

III.d.1 An entity that owns/operates an integrated transmission element associated with the bulk power system 100 kV and above, or lower voltage as defined by the Regional Entity necessary to provide for the reliable operation of the interconnected transmission grid, and not including a Generator Interconnection Facility; or

III.d.2 An entity that owns/operates a transmission element below 100 kV associated with a facility that is included on a critical facilities list that is defined by the Regional Entity.

These changes would prevent entities being registered as TO and/or TOP solely due to their Generator Interconnection Facilities. At the same time, the *Registry Criteria* always gives a Regional Entity the ability to register entities that do not otherwise fit within the *Registry Criteria* if it reasonably demonstrates that the entity is a bulk power system owner, or operates, or uses bulk power system assets and is material to the reliability of the bulk power system.³ Thus, if there is a unique situation that indicates a GIF must comply with all of the TO and/or TOP requirements, a mechanism is available for registration.

³*Registry Criteria*, Note 1.

3

DSMDB-2913577v2

II. FAC-001

Kelson does not object to the addition of GO to the applicability section of FAC-001, but objects to the content of R4. FERC requires that when a generator receives an interconnection request from a nonaffiliate,⁴ it must file an Open Access Transmission Tariff within 60 days of receiving that request. Kelson recommends that R4 be revised to be more consistent with FERC's policies, at least for those entities regulated by FERC. Generator Owner that receives an interconnection request for its facility from a nonaffiliated entity, as determined by FERC, shall, within 45 days of such a request after its Open Access Transmission Tariff is accepted by FERC, be required to comply with

requirements R1, R2 and R3 for the facility for which it received the interconnection request. If the Generator Owner is not subject to FERC Open Access Transmission Tariff requirements, then it shall be required to comply with the requirements R1, R2 and R3 within 45 days of such a request.

III. FAC-003

While Kelson agrees that vegetation management might need to apply to certain generator interconnection facilities, particularly those of significant length, indiscriminate application of FAC-003 to all GOs is not the appropriate solution. There are significant differences between the facilities that make up part of the integrated transmission grid and interconnection facilities—many, and sometimes all, interconnection facilities are “inside the fence,” where all vegetation will have been cleared as a matter of course. In this case, vegetation would not be an issue and application of a standard like FAC-003 would be an inappropriate and unnecessary burden on the owner of the interconnection facilities. While R4.2.4 might exclude entities with facilities inside the fence, even for facilities that extend beyond the fence, any vegetation management standard must be flexible to accommodate variations since interconnection facilities may consist of generator leads of varying lengths from a few feet to many miles. A one-size-fits-all approach like FAC-003 is not appropriate. The vegetation management standard imposed on GOs should be less prescriptive than the one applicable to TOs. Kelson proposes that a GO vegetation management standard broadly require the GO to ensure that vegetation be maintained, and allowing the GO to develop and implement an appropriate program for vegetation, depending on the extent of vegetation within its right-of-way.

4Sky River, LLC, 134 FERC ¶ 61,064, at P 13 (2011).

4

DSMDB-2913577v2

IV. Definition of Bulk Electric System (BES)

Kelson has no objection to relying on a new BES definition to ensure that the responsibility for generator interconnection leads appropriately and is clearly assigned to GO/GOPs with respect to the standards listed in the White Paper, so long as the final, approved BES definition actually achieves this end. Otherwise, there will be a need to clarify that the GO/GOP would need to include their generator interconnection facility in their compliance activities for these activities. At the same time, waiting for the final, approved BES definition to address this issue could prolong this process unnecessarily, and therefore, Kelson suggests that the SDT propose to make the needed clarifications. This could be done by changing the definition of GO to be defined as an “[e]ntity that owns and maintains generating units, *including its Generator Interconnection Facility*”, as recommended in the GO/TO Final Report.⁵ Alternatively, NERC could issue a Compliance Application Notice clarifying that when a GO and/or GOP is implementing the standards listed on pages 5-6 of the White Paper, its compliance activities should encompass the generator interconnection facilities.

Dale Fredrickson, Wisconsin Electric
Dale.Fredrickson@we-energies.com

COMMENTS:

The efforts of the SDT are appreciated in support of reliable operation at the Generator-Transmission interface. In particular, we believe that the SDT decision not to propose new definitions or to change other existing definitions, and not to make changes to dozens of standards is a good one. In this respect we fully agree with the direction of the SDT.

However, we take issue with other aspects of the white paper. First, we believe that the statement (p. 4, Para. 3) that “requiring any classification that subjects Generator Owners and Generator Operators to all the standards applicable to Transmission Owners and Transmission Operators would do little, if anything, to improve the reliability of the BES”, is not precisely true. Much greater, such a requirement would actually reduce reliability. The costs and efforts to comply with these standards would displace time and money that could have been invested in real reliability enhancements. This entire paragraph needs more clarity. The second sentence appears to say much the same as the first, but it qualifies the Generator Owner/Operators “transmission Elements and Facilities” as those which are nonnetwork/non-integrated. It is unclear just what statement is being made here, especially about whether any Generator Owner/Operators “transmission Elements and Facilities” would indeed be considered network/integrated. Our understanding is that by definition, these Elements and Facilities (generator tie lines) are not network lines in the sense that Transmission Lines are network lines.

As for the Proposal #1 to add the GO to the Applicability section of FAC-001-0, Facility Connection Requirements, we do not support this. The need for this is not apparent. We suggest that there are few, if any, situations where there would be an interconnection request directed to a Generator Owner. It is a unique characteristic of transmission systems that they are the gatekeepers which establish connections for generation and load. We suggest this is an unnecessary extension of a standard to Generator Owners, and is not required for reliability.

Proposal #2 adds the Generator Owner to the Applicability section of FAC-003-2, Transmission Vegetation Management. This is done across the board, with no criteria for circuit length or where the circuit is located. We maintain this is much too broad, and will result in inefficient allocation of resources. The FAC-003-2 standard appears to have very demanding requirements for transmission right-of-way vegetation management and substantial documentation requirements. The reliability risk of vegetation problems on tie lines at the Generator-Transmission interface is almost zero. In cases where the affected “transmission Elements and Facilities” is very short (in one case of ours, from the plant to the switchyard on the opposite side of a street), or in cases where such facilities are on the property of the Generator Owner, the requirement to comply with FAC-003 is not justified by reliability risks, and we strongly object to this proposal. For these cases, the resources required to comply with FAC-003 standard would be considerable. We propose that the SDT implement the Material Impact Test suggested in the Ad Hoc Group’s Final Report

(November 2009) Recommendation #3 (p. 10): “Modify the applicability of FAC-003-1 to apply to Generator Owners when their Generator Interconnection Facility operates at 200 kV or above and exceeds two spans (generally more than one-half mile, see p. 3, #6) from the generator property line...”

We appreciate the work of the SDT, and the opportunity to offer our comments.

NERC PROJECT 2010-07

GENERATOR REQUIREMENTS TO THE TRANSMISSION INTERFACE

Informal Comment Period – Ending April 4, 2011

Ed Davis

504-576-3029

We suggest the following changes and additions to the proposed draft changes to FAC-001.

First, the proposed R4 states “ .. interconnection request for its facility..”. It would be clearer to us if the request was stated as “to” its facility and suggest changing “for” to “to”:

R4. Generator Owner that receives an interconnection request ~~for~~to its facility shall,

Second, the proposed change to FAC-001, addition of Requirement 4, will require the generator owner to comply with FAC-001 Requirements 1-3 under certain conditions. Therefore, we suggest the following changes to R1-3 to conform to the addition of R4:

R1. The Transmission Owner and/or Generator Owner shall document, maintain, and publish facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Reliability Organization, subregional, Power Pool, and individual Transmission Owner and/or Generator Owner planning criteria and facility connection requirements. The Transmission Owner’s and/or Generator Owner’s facility connection requirements shall address connection requirements for:

R2. The Transmission Owner’s and/or Generator Owner’s facility connection requirements shall address, but are not limited to, the following items:

R3. The Transmission Owner and/or Generator Owner shall maintain and update its facility connection requirements as required. The Transmission Owner and/or Generator Owner shall make documentation of these requirements available to the users of the transmission system, the Regional Reliability Organization, and NERC on request (five business days).

COMMENTS:

BP Wind Energy North America Inc. Comments on Project 2010-07: Generator Requirements at the Transmission Interface

On Friday, March 4, 2011, the Project 2010-07 Generator Requirements at the Transmission Interface drafting team posted for a 30-day informal comment period a white paper on proposed concepts to support the modifications of various standards to clarify the reliability standard responsibilities of Generator Owners and Generator Operators at the interface to the interconnected grid.

BP Wind Energy North America Inc. (“BP Wind Energy”) submits the comments set forth below on the white paper. Various BP Wind Energy subsidiaries own and operate wind-powered generating facilities throughout the United States and are registered with NERC as Generator Owners (“GOs”) and Generator Operators (“GOPs”) in RFC, SPP, TRE, and WECC.

BP Wind Energy agrees with, and supports, the approach recommended in the white paper regarding how to address the applicability of NERC reliability standard to GOs and GOPs that own and/or operate generator interconnection facilities. While BP Wind Energy does not agree with the conclusion set forth in the white paper that generator interconnection facilities should be classified as transmission, BP Wind Energy strongly agrees with the white paper’s recommendation that a GO or a GOP that owns and/or operates generator interconnection facilities should not automatically be registered as a Transmission Owner (“TO”) or Transmission Operator (“TOP”) simply because it owns and/or operates such facilities. Generator interconnection facilities are typically not part of the integrated transmission system and, therefore, their reliable operation and maintenance should not require adherence to the same level or scope of standards that are applicable to transmission facilities that are part of the integrated transmission system. Indeed, requiring GOs and GOPs that own and/or operate generator interconnection facilities to adhere to *all* NERC reliability standards that are applicable to TOs and TOPs that own and/or operate transmission facilities that are part of the integrated grid makes little sense as such an approach is likely to do little to increase or ensure reliability of the bulk power system, fails to focus on what is needed to ensure reliable operation and maintenance of generator interconnection facilities, and results in unnecessary increased costs and burdens on GOs and GOPs.

By contrast, BP Wind Energy believes that the targeted approach recommended in the white paper – i.e., to clarify the applicability of a select number of reliability standards to GOs and GOPs by modifying the Purpose, Functional Entity section, requirements, and measures – is a better way to address reliable operation and maintenance of generator interconnection facilities and one that should go a long way toward providing clarity to the industry (and, in particular, GOs and GOPs) regarding GO and GOP reliability obligations.

However, given the targeted nature of the approach, BP Wind Energy strongly urges the drafting team to consider drafting and recommending, or recommending that NERC draft, revisions to the Statement of Compliance Registry Criteria that clarify the criteria for registration applicable to generator entities that own and/or operate generator interconnection facilities to ensure that, going forward, GOs and GOPs that own and/or operate such facilities are not improperly registered as TOs and TOPs. GOs and GOPs need to have the solution documented and applied in a consistent manner across regions.

Moreover, BP Wind Energy disagrees with the changes that the SDT is proposing be made to FAC-001-0. As BP Wind Energy reads the proposed changes, any GO that receives a request for service over a generator interconnection facility in which the GO has an ownership interest would be required to comply, within 45 days of receiving such a request, with the requirements set forth in R.1., R.2., and R.3. of FAC-001-0. Those requirements would obligate a GO to publish facility connection requirements for its generator interconnection facility and to ensure that the requirements address, among other things, procedures for coordination of joint studies of new facilities and their impacts on the interconnected transmission systems.

The Federal Energy Regulatory Commission ("Commission") is in the midst of considering issues related to priority access rights relating to participant-funded transmission projects, including those related to generator interconnection facilities (in particular, generator lead lines), as evidenced by the technical conference held by Commission staff on March 15, 2011 and the Commission's request in Docket No. AD11-11-000 for the submittal of comments by April 21, 2011 on such issues. As a result, the requirements applicable under Commission policy to a generator that receives a request for service over a generator interconnection line are likely to be revised or, at the very least, clarified by the Commission within the next year.

While it is difficult to predict what changes or clarifications the Commission might make, it is very possible that such changes or clarifications will conflict with the requirements set forth in FAC-001-0. For example, the Commission might establish a safe harbor period during which a generator would be permitted to have priority access over the use of the generator interconnection line and would be able to decline to provide service over the generation interconnection line. If the Commission were to adopt this proposal and a generator were to receive a request for service during the safe harbor period, the generator would be permitted to decline service under Commission policy but, under FAC-001-0, would be required to publish facility connection requirements for service that it will not be providing. The Commission could also establish a pro forma tariff governing service over generator interconnection lines with terms and conditions of service that differ significantly from the Commission's current pro forma open access transmission tariff. If the Commission were to adopt this proposal and a generator were to receive a request for service, the requirements of FAC-001-0 could end up requiring a generator to adopt facility connection requirements that are not required under the pro forma generator interconnection tariff and viewed to be more stringent, such as procedures for coordination of joint studies.

In BP Wind Energy's view, neither of these results makes sense from a compliance or reliability perspective. BP Wind Energy therefore urges the SDT to either to not propose to add references to GOs in FAC-001-0 or, alternatively, to ensure that any requirements imposed on a GO under FAC-001-0 are consistent with, and not more stringent or in conflict with, Commission policy. At a bare minimum, the proposed timeframe for imposing the requirements in FAC-001-0 on GOs that receive an interconnection request should be changed to 60 or more days to be consistent with current

Commission policy that requires a generator to file with the Commission an open access transmission tariff within 60 days of receiving a request for service.

COMMENTS:

Comments of the Transmission Access Policy Study Group on the White Paper Proposal in Project 2010-07: Generator Requirements at the Transmission Interface

TAPS appreciates the opportunity to comment on the GO/TO drafting team's White Paper. We generally support the approach proposed in the White Paper but have some specific suggestions.

We suggest that at minimum, this drafting team's goal should be to give guidance as to what Facilities are covered under a GO/GOP registration and therefore do not require TO/TOP registration. For example, radial generator leads, including all Elements radial to the generator, should be included in the entity's GO/GOP responsibility and should not require TO/TOP registration.

A. Framework

As the White Paper acknowledges in footnotes 1 and 2, it refers to both the "Bulk Electric System" and the "bulk power system." Although, as noted in footnote 2 to the White Paper, "bulk power system" is defined in Section 215 of the Federal Power Act, it is not a NERC Glossary defined term; furthermore, "bulk power system" and "Bulk Electric System" may or may not be synonymous terms. *See* Order 743-A, Paragraphs 61-63. While we recognize that there are existing NERC documents that refer to the bulk power system, we suggest for the sake of clarity and precision that going forward, so long as the contours of the "bulk power system" are not clearly defined, NERC documents should use only the NERC-defined term "Bulk Electric System."

One area in which the bulk *power* system is relevant is that FERC's reliability jurisdiction, and thus NERC's authority, are limited to the bulk power system. Therefore, the following statement on page 3 of the White Paper needs to be revised:

While qualifying Generator Owners and Generator Operators can be classified as owning and operating electric transmission Elements and Facilities, these are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system.

Mandatory reliability standards—even a lower level of standards—cannot apply to non-BPS elements. It would be more accurate to state that generator leads do not exhibit many of the characteristics, such as integration, that require application of the full set of TO/TOP reliability standards to most transmission.

We believe that generator leads that are needed for reliability are already considered part of the BES because they are not "radials serving only load." Under Order 743, the BES must

include whatever is “necessary for reliable operation of an interconnected transmission grid,” which likely means that those generator leads that connect BES generators will continue to be part of the BES. Therefore, the issue facing the GO/TO team is primarily one of registration, not BES definition: BES generator interconnection facilities should be considered BES Facilities as they are now, but where the generator lead is owned/operated by the GO/GOP (which is not always the case), it should be included in the GO/GOP’s registration and should not subject the GO/GOP to registration as a TO/TOP. Note that BES Definition SDT is not assigning responsibility for BES Facilities to one functional entity or another.

We note in addition that the White Paper’s statement that “[w]hile not all power plants are considered part of the Bulk Electric System, ultimately, all the plants are interconnected to the bulk power system *via their generator interconnection facilities*” (emphasis added) is incorrect due to the italicized language. In fact, some plants are connected to distribution or non-BES sub-transmission and are not connected to the bulk power system or BES through their interconnection facilities.

TAPS’ overarching concern is that a system that only owns a minor component of a generator lead should only be registered and made responsible for those requirements and measures of standards that properly apply to that component.

B. Standards

TAPS is comfortable with the White Paper’s elimination of many of the standards revisions that had been included in the GO/TO Ad Hoc Group Final Report. We believe that clarifying that (a) generator leads connecting BES generators are BES Facilities, and (b) such generator leads are included in the GO/GOP responsibilities of the owner and operator of the generator, will eliminate much if not all of any reliability gap that exists.

Furthermore, there is no need to revise FAC-003 so that it applies to generator interconnection facilities. A radial line cannot cascade, so the only effect of the radial generator lead sagging into vegetation is that the generator becomes unavailable. Because generators become unavailable for other reasons that dwarf the incidence of unavailability due to line outages, and the generator’s unscheduled unavailability is therefore planned for, no reliability purpose would be served by applying FAC-003 to generator interconnection facilities.

Michelle_DAntuono@oxy.com

COMMENTS:

Occidental Energy Ventures Corp. Comments on NERC Project 2010-07 White Paper Proposal on Generation Requirements at the Transmission Interface (GRTI)

Occidental Energy Ventures Corp. ("Oxy:") commends the GRTI Standard Drafting Team (and the previous Ad Hoc GOTO group) for its efforts to define the NERC Standards requirements that should apply to generation interconnection facilities and offers the following answers to the questions posed in the informal comments announcement:

The Ad Hoc group originally proposed the new terms "Generation Interconnection Facility" and "Generation Interconnection Operational Interface" as part of this project. The Project 2010-07 drafting team believes that the changes in the definition under Project 2010-17 and modifications to a select group of standards can accomplish the same goal without the need for new definitions. Do you support this approach? If not, please explain.

1. Coordination Between Standard Drafting Teams. Based on the current status of the Bulk Electric System Standard Drafting Team (BESSDT) proposed BES definition, the White Paper Proposal ("Proposal") does not provide a clear demarcation between generator interconnection facilities and the interconnected transmission facilities of the Transmission Owner/Operator. The current BES definition makes no mention of what is or is not generation interconnection facilities, but merely includes "generating units greater than 20 MVA (aggregated 75 MVA at one site) from the generator terminals through the GSU which has a high side voltage of 100 KV or above." Many such registered generators have an additional interconnection line that is above 100 KV that, in turn, connects the generator to the transmission owner's facilities and is part of the generator interconnection. The currently proposed BES "core definition" would classify this line as a Transmission Element and might be construed as subjecting the GO to the full array of TO/TOP standards for this interconnection line. This outcome would violate the stated purpose of the Proposal. According its scope, the BESSDT is looking to the GRTISDT to define this demarcation either through a definition, as proposed by the Ad Hoc group, or by some other means. As Oxy interprets its scope, the BESSDT is defining what is or is not part of the BES without defining what standards apply to different parts of the BES, or, for that matter, what standards apply to non-BES facilities.

2. Generation Interconnection Lines. Oxy basically disagrees that generation interconnection lines are transmission lines from a functional standpoint. The interconnection line's function is to interconnect the generator (i.e., generally radial in nature) with the transmission system. The transmission system function is to deliver the generation to the load. That is not to say that some standards related to higher voltage lines may apply. Merely that, from a functional standpoint, the two are not the same and the reliability requirements are not the same.

How can the proposal outline in the White Paper be improved. Is the drafting team headed in the right direction?

In general, the approach outlined in the White Paper needs more clarity concerning exactly what requirements will apply to the essentially radial systems connecting generation to the transmission system. This needs to be very clear. Oxy suggests that the Ad Hoc approach of defining Generation Interconnection Facilities be adopted by the drafting team (although the Ad Hoc definition is probably not adequate). The drafting team will then have to decide whether their proposed definition provides enough clarity such that there will be no doubt that most of the TO/TOP standards do not apply to these facilities. The TO/TOP standards that would apply to interconnection facilities would then be treated individually with new/revised requirements.

1. Proposed FAC-001 Revisions. The proposed addition of R4 and M4 in FAC-001 seems to be stated in reverse. Wouldn't the normal procedure be for the GO to submit an interconnection request to the TO as part of entering into an interconnection agreement? The procedure required of the TO in R1 through R3 specify what the TO's requirements are for interconnection. As an aside, as these procedures are changed or updated, there needs to be some requirement for communication of the changes. Also, Oxy questions the 45 day requirement. How could all the requirements in the interconnection procedure be accomplished in 45 days? The drafting likely has some underlying assumptions that are not apparent and need clarification.
2. Proposed FAC-003 Revisions. Oxy agrees with the Ad Hoc Group's Proposal 2 which provides for exclusions for short distance interconnections, i.e., interconnection lines that do not exceed two spans (or some reasonable distance that can be monitored visually or with cameras) from the generator's property line. In addition, there should be a process for demonstrating to the Regional Entity that the interconnection line has no vegetation around it to manage, i.e., in arid or industrial locations.

Do you have any further suggestions for seeking industry input before the project moves into a more formal development phase?

Oxy feels the comments on the Ad Hoc group report and the comments on the Proposal provide sufficient information for the drafting team to commence formal development. Although this project is extremely important, the formal process should not be shortened by classification as urgent.

Greg Rowland, Duke Energy Corporation
Greg.Rowland@duke-energy.com

COMMENTS:

Below are Duke Energy comments on the currently posted White Paper:

Questions posed on the NERC Announcement, and Duke Energy Responses

1. How can the proposal outlined in the White Paper be improved? Is the drafting team heading in the right direction?

Response: Duke Energy agrees with the approach outlined in the White Paper, which is to rely on the definition of Bulk Electric System (now being revised on Project 2010-17) to ensure that all BES facilities are appropriately identified for applicability of reliability standards. This is a much cleaner approach than the previous effort. We appreciate the work of the Standard Drafting Team to use this targeted approach to identifying the specific reliability standards which should be applied to Generator Owners and Generator Operators for their BES interconnection facilities.

2. The drafting team has chosen to use informal means of receiving industry feedback (webinars, presentations before industry stakeholder groups, etc.) prior to expending valuable industry resources to develop specific proposals for reliability standard requirements, measures, VSLs, etc. Do you have any further suggestions for seeking industry input before the project moves into a more formal development phase?

Response: No further suggestions for seeking industry input.

3. The Ad Hoc group originally proposed the new terms “Generator Interconnection Facility” and “Generator Interconnection Operational Interface” as part of this project. The Project 2010-07 drafting team believes that changes to the definition of Bulk Electric System under Project 2010-17 and modifications to a select group of standards can accomplish the same goal without the need for new definitions. Do you support this approach? If not, please explain.

Response: Duke Energy agrees that the previously proposed new defined terms are not needed. Project 2010-17 is developing a definition for Bulk Electric System (BES) that uses a bright-line criteria of 100 kV and above, and an inclusion/exclusion process to address specific facilities. This will ensure that BES interconnection facilities are appropriately identified. If Project 2010-07 then identifies any modifications to the reliability standards needed to address specific responsibilities of Generator Owners and Generator Operators to BES interconnection facilities, then no “reliability gap” will exist.

Kenneth A. Goldsmith P.E., Alliant Energy
319-786-4167
KenGoldsmith@alliantenergy.com

COMMENTS:

We have one comment concerning making a Generator Owner (GO) subject to the requirements of FAC-003 Transmission Vegetation Management. We can understand the need to have long highvoltage radial lines from a generating station to the interconnection point of the BES be included in the requirements for FAC-003. Our concern lies with the lines from a central generating station GSU, normally located just outside the generator building to the substation which may not be directly adjacent to the power block. These lines typically remain within the generating station boundaries, so we believe Article 4.2.4 of FAC-003-2 should be revised to read : “. . . located outside the fenced area of the switchyard, **generating station property** or substation and any portion of the span of the . . .”. This would clarify that only lines outside of the generating station property would be applicable.

It is missing a logistical requirement between FAC-003 and FAC-014. There is nothing in either standard where the PC is informing the TOs and GOs of the applicability of their facilities as outlined in the Facilities section 4.2.2 of FAC-003.

- On page 3 of the White Paper, the SDT referred to “qualifying” generator interconnection facilities. It is not clear what are the qualifying criteria. Are the qualifying criteria for Elements and Facilities the BES definition criteria? If so, this should be stated explicitly.
- The proposed definition of Generator Interconnection Operational Interface was “Location at which operating responsibility for the Generator Interconnection Facility changes between the Transmission Operator and the Generator Operator.” Why was this definition removed? It does not refer to Elements and Facilities rated at 100 kV and above. It is also unclear how the original objective meant to be achieved by the proposed change to EOP-008-0 R1.3 would be met. This needs clarification.
- In FAC-001-0, suggest that R4 be modified as follows: start the sentence with “The” and delete “be required to”.
- The modification in FAC-001 for a Generator Owner is not necessary. It is understood that a generator’s output connection to the transmission system must comply with the “receiver’s” requirements.
- Interconnection request needs to be defined. In R4, why does the Generator Owner receive an interconnection request?
- The last sentence of footnote 2 of FAC-003 should also be modified to include the Generator Owner.
- For FAC-003, this appears to be a standard applicability and registration issue. It may be more appropriate to define transmission in such a way that any generation owner that happens to also own BES transmission must register as such. With the coming of the new BES definition perhaps that would be the opportune time to introduce a fix for this registration issue. It is suggested that with the upcoming changes to the BES definitions this project should be on hold, with the understanding that the registration issue be examined.

John Bee, Exelon Transmission Strategy & Compliance
(630) 576-6925
john.bee@exeloncorp.com

COMMENTS:

Project 2010-07 Exelon Comments

FAC-003

1. The SDT should include a unique schedule and guidance specifically for GO implementation of this standard.
2. The standard should provide a clear provision to allow incorporating GO owned facilities within an existing TO's vegetation management program if mutually agreed on by the TO and GO.
3. Please provide more clarification regarding FAC-003 Requirement 4.2.4. The rationale explains that areas within the fenced area of a switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence are excluded; however, there is no guidance regarding transmission lines that run between a generator main power step up transformer and an onsite switchyard. Is the intent to include transmission lines on station property that run between a generator main power step-up transformer and an onsite switchyard?
4. Exelon suspects that this standard work is being done due to issues with GOs that have long generator leads running miles rather than feet. The standard should have verbiage stating that the standard is not applicable to GOs with short generator leads. The SDT should define "long leads" based on the length of the conductor and have provisions to exclude generators with "short leads"

FAC-001

1. Exelon does not agree that this standard should not be broadly applied to GO. GOs who do not own a switchyard and whose point of interconnection is a disconnect switch associated with the generator leads prior to the switchyard should be excluded from this standard. If a group of GOs share a generator tie line, then the associated Interconnect Agreement that each of the GO has with the applicable TO and/or TOP should address how these shared connections will effect the system. GOs may not have the resources or expertise to conduct the required interconnect studies to meet this standard
2. Exelon has generating stations that have the Main Power Transformer (MPT) disconnect as the point of demarcation. The station owns the short leads from the MPT disconnect back to the generator and the applicable TO owns from the MPT disconnect up to and including the switchyard. It is not practical for another entity to request to interconnect to the MPT disconnect nor should it be allowed. The SDT should consider verbiage to the standard that does not allow requests to interconnect to a MPT disconnect.
3. Exelon is having difficulty determining how this standard would apply to GOs and how GOs would implement the standard; suggest that examples be provided in an implementation document specifically showing where and how this standard would apply.

Patti Metro, National Rural Electric Cooperative Association (NRECA)

703.907.5817

patti.metro@nreca.coop

COMMENTS:

Drafting Team Members,

The National Rural Electric Cooperative Association (NRECA) thanks the team for this opportunity to provide comments to its white paper. Although, NRECA supports clarifying the responsibilities of entities that own/operate transmission and/or generation intertie/interconnection facilities, until the definition of the Bulk Electric System under Project 2010-17 is developed it is difficult to rectify these issues. The team should carefully monitor the Project 2010-17 activities to ensure that it does not adversely affect the success of the project nor develops requirements or definitions that would contradict the criteria established in Project 2010-17. At this time, NRECA does not have a specific position on these issues, but looks forward to reviewing and commenting on future documents this team posts for stakeholder comment.

Ramiro Cerecer, Equipower Resources Corporation
(860) 656 0843
rcerecerr@eqpwr.com

COMMENTS:

Re: Project 2010-07 Generator Requirements at the transmission interface. Informal comment period

EquiPower Resources Corp., its subsidiaries Dighton Power, LLC, Lake Road Generating Company, L.P., MASSPOWER, Milford Power Company, LLC and its affiliate, Empire Generating Co, LLC (collectively "EquiPower") are pleased to submit these informal comments to the Project 2010-07 Standard Drafting Team (SDT). EquiPower own and operates five (5) power plants located in Massachusetts, Connecticut and New York that are individually registered as Generator Owners (GO) and/or Generator Operators (GOP).

EquiPower generally supports the SDT's approach presented in its White Paper and believes the SDT is heading in the right direction. The recommendations appear to be reasonable. In particular, we support the following concepts and recommendations:

- Neither a GO or GOP should be required to automatically register as a Transmission Owner (TO) or Transmission Operator (TOP) simply because it owns and/or operates generator interconnection facilities. Clarification of the fact that generator interconnection facilities are not part of the integrated transmission system or grid is crucial to resolving the treatment of GO/GOP interconnection facilities.
- Subjecting a GO/GOP to all requirements in the TO/TOP standards is impractical and an inefficient use of resources and will not have the desired effect of improving the reliability of the Bulk Electric System (BES).
- We support the recommended plan to modify a selected group of standards to make them applicable to GO/GOP's as they relate to their generator interconnection facilities. Subject to the considerations described below, EquiPower supports the modification of both FAC-001-0 *Facility Connection Requirements* and FAC-003-2 *Transmission Vegetation Management Program*.
- EquiPower agrees that GO/GOP personnel training should be addressed in a future project.

EquiPower has two concerns that it asks the SDT to consider.

- First, as proposed in the GOTO Ad Hoc Group's Final Report, EquiPower feels strongly that including a defined span criteria at FAC-003-2 is important. Many generating plants have a nominal length of overhead tie line extending from the generator step-up (GSU) transformer substation to the interconnection point with the integrated transmission system. Requiring a GO to have a vegetation management plan for such a nominal length of conductor is not practical or efficient, nor does it provide any discernible benefit in terms of improving the reliability of the BES.
- Second, we are concerned about the regulatory implications associated with the identification of generator interconnection facilities as transmission facilities or elements. The proposed addition of Generator Owner to FAC-003-2 is similar to the applicability language found in PRC-023-1 *Transmission Relay Loadability*. Yet in Order 733 FERC concluded that, in the majority of cases, a GO would not be subject to the standard since the GO would also need to be registered as a TO, which FERC acknowledged is uncommon. The reasoning applied in Order 733 seems to focus on the term "transmission lines" and that a transmission line owner, irrespective of integrated versus non-integrated status, would need to register as a TO. EquiPower would encourage the SDT to fully consider the implications of Order 733 as it applies to GOs and clarify the application of the term "transmission lines." It is fundamentally important that the use of the term "transmission lines" clearly distinguish between integrated and non-integrated applications.

EquiPower appreciates the opportunity to submit these comments. The use of informal means of communicating such as stakeholder webinars, meetings and comment submission are effective and efficient tools for communication and standard development.

Eric Salsbury, Consumer's Energy
(517) 788-7076
etsalsbury@cmsenergy.com

COMMENTS:

Following are the comments for Consumers Energy (NCR00740) regarding Project 2010-07. Problems are created with the interchangeable use of "BES" and "transmission." NERC should maintain consistency with the use of BES, Transmission, transmission, distribution, etc. When a capitalized term is used it should be consistent with the NERC Glossary. Maybe a note should also be provided to denote that the use of the term transmission and distribution specifically do not refer to any defined system and are only used as part of the English language. When a term is used in a standard maybe it should be used consistently throughout the standard to avoid confusion. If it changes, even slightly, say to Bulk Power System (BPS) it should be accompanied with an explanation why the term being used is different. Transmission is defined by the FERC Seven Factors and by what has been authorized by the regulating State body and the FERC as being Transmission. The term Transmission defined for rate making purposes and Transmission systems vary significantly across the country to voltage levels much less than 120kV. Therefore, the use of the term Transmission and the word transmission should not be used to define facilities covered under NERC Reliability Standards. Adding Registered Entities (GO/GOP/DP) to standards involving BES facilities should be allowed to ensure the full coverage of BES facilities for the NERC Reliability Standards.

Joseph DePoorter, Madison Gas and Electric Company

jdepooter@mge.com

COMMENTS:

Within the Project 2010-07's White Paper, it should be noted that many GO's has established and detailed Interface agreement concerning their Transmission Interfaces. This White Paper did not clearly address those in place agreements. Recommend that this fact be highlighted going forward in any such White Paper, Guideline, Rational box, etc.

Carol Gerou, Midwest Reliability Organization
(651) 855 - 1735
ca.gerou@midwestreliability.org

COMMENTS:

The Midwest Reliability Organization's NERC Standards Review Subcommittee submits the following comments on the white paper titled "Project 2010-07: Generator Requirements at the Transmission interface":

SDT Question #1a: How can the proposal outlined in the White Paper be improved?

NSRS Responses:

Next Step #1 - According to FERC Docket #ER10-1117, if a Generator Owner receives a request for service over their facilities; they have 60 days to file a tariff for processing the request for service. So, we think that the proposed Requirement R4 of FAC-001 should give the Generator Owner 60 days, rather than 45 days, to provide its interconnection requirements.

Next Step #3 – NERC has not clearly defined wind farms to be generating plants. So, the words, "directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above", in the latest Project 2010-17 concept paper may not be interpreted as applicable to wind farms. The generating units of wind farms are typically directly connected to subtransmission facilities, which in turn are directly connected to Transmission Facilities operated at voltages of 100 kV or above.

Other proposed changes – in the paragraph about EOP-003-1 on page 6 we agree that Generator Operators should not be added to EOP-003-01, but for a different reason. When the proposed EOP-003-2 is approved and becomes effective, all of the requirements associated with the UFLS programs will be removed. We don't agree that PRC-001 already properly addresses the coordination of the generator UF protection with the UFLS program. However, we understand that the proposed PRC-024-1 will be the standard that contains the requirements for the Generator Owners to coordinate generator UF with UFLS program.

SDT Question #1b: Is the drafting team heading in the right direction?

NSRS Response: Yes, the drafting team is heading in the right direction.

SDT Question #2: The drafting team has chosen to use informal means of receiving industry feedback (webinars, presentations before industry stakeholder groups, etc.) prior to expending valuable industry resources to develop specific proposals for reliability standard requirements, measures, VSLs, etc. Do you have any further suggestions for seeking industry input before the project moves into a more formal development phase?

NSRS Response: No

SDT Question #3: The Ad Hoc group originally proposed the new terms "Generator Interconnection Facility" and "Generator Interconnection Operational Interface" as part of this project. The Project 2010-07 drafting team believes that changes to the definition of Bulk Electric System under Project 2010-17 and modifications to a select group of standards can accomplish the

same goal without the need for new definitions. Do you support this approach? If not, please explain.

NSRS Response: Yes

Louis C. Guidry, P.E., Cleco Support Group LLC
318-484-7495
louis.guidry@cleco.com

COMMENTS:

FAC-003 should not be applicable to Generator Owners / Operators. The intent of all of the standards is to avoid an Adverse Reliability Impact, or as the FPA Section 215(a)(4) defines "reliable operations" as: "operating the elements of the bulk-power system within equipment and electric system thermal, voltage and stability limits so that instability, uncontrolled separation, or cascading failures of such systems will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements." Radial Facilities serving only generating plants when tripped will not threaten an Adverse Reliability Impact or we would be hard pressed to run that generation in the first place. FMPA believes the intent of the standard is to prevent a cascading event where, if a line trips, another line loads heavily increasing the sag of that line, which may sag into un-cleared vegetation, causing the second line to trip, which may in turn cause heavily loading on a third line, etc. If a line trips in the transmission network, radial Facilities from generating plants will not have their loading changed much at all (since they are radial) and will not participate in this sort of "thermal" cascading event. Hence, there is no cause to regulate vegetation management of radial Facilities to generating plants since the system is always planned and operated to that potential contingency anyway and there is no danger of an Adverse Reliability Impact. Regulating vegetation management on radial Facilities is beyond the scope of the Federal Power Act Section 215. Generator Owners / Operators are still incited to perform adequate vegetation management without the need for regulation because any outage of the plant results in lost opportunity costs to the plant.

FAC-001: What gaps have been identified? Since Generator Owners do not have a tariff how would a GO determine what a valid interconnection request would be? The generator Owner wouldn't have the jurisdiction to accept an interconnection request any more than a land owner would. What is the basis for making the Generator Owner the valid entity for accepting a request.

FAC-001 R4: This states that the Generator Owner must post within 45 days for an interconnection request but the request should be a valid request. Generation Owners would not be a valid entity to accept a generation interconnection request all requests should be submitted through the TSP. Shouldn't the TSP then provide notification to the GO when interconnection request are received to interconnect with GO's generation facilities? There are processes in place currently that handle valid interconnection requests and this requirement seems to violate those processes. Could the Generator Owner deny the request for interconnection on his behalf? Since interconnection service only provides interconnection to the Bulk Electric System and not transmission service how then will they acquire transmission service? This requirement seems to conflict with current processes already in place.

FAC-003: Would like an expansion in the rationale behind why FAC003-2 should apply to ties outside of the fence. It is in the best interest of the Generator Owner to take care of vegetation from his facility to the BES in order to sell power.

BES Team: Would ask that the SDT would coordinate with the 2010-17's SDT and keep these tied together.

COMMENTS:

Mallory, please accept the below comments from Southern Company regarding Project 2010-07 White Paper: **Generator Requirements at the Transmission Interface:**

SoCo Gen Comments to Project 2010-07 White Paper:

Generator Requirements at the Transmission Interface

23 Mar 2011

General

We commend the effort directed towards the clarification of the application of NERC standards to generation interconnection circuits ("extension cords").

We agree completely with the following observations made on pages 2 and 3 of the White Paper Proposal:

Power plants come in many sizes and configurations.

The (GOTO Ad Hoc Group) plan of proposing new definitions, modifying other definitions, and making changes to dozens of standards is not necessary.

GOs and GOPs owning and operating electric transmission Elements and Facilities are most often not part of the integrated bulk power system, and as such should not be subjected to the same level of standards applicable to TOs and TOPs. [integrated implies networked, "extension cord" implies radial]

Requiring any classification that subjects GOs and GOPs to all the standards applicable to TOs and TOPs would do little to improve the reliability of the BES.

Applying all standards applicable to TOs and TOPs to non-networked/non-integrated transmission circuits would have little effect on the overall reliability of the BES.

Changes to the definition of the BES and modifications to a select group of standards can accomplish the goal without the need for new definitions.

FAC-001 R4

Please make it clear that the interconnection request is meant to be addressing a new connection to the high voltage (>100kV) "extension cord" circuit owned by the Generator Owner.

The connection of additional generation or load to the "extension cord" generation interconnection facility (circuit) changes the face of the non-radial nature of these circuits. It is not clear that only FAC-001 and FAC-003 should be applicable to the GO/GOP with this interconnect. Would the GO/GOP with networked transmission facilities be subjected to additional (traditional) TO/TOP standard requirements? If so, this project should include a review of those standards in the project scope.

Is the TO subject to completing R1, R2, and R3 within 45 days of receiving the interconnection request? If not, should the GO be subject to that time constraint?

Project 2010-07 Purpose

One of the two purposes of the Project 2010-07 is stated as “identify all generator-owned facilities that are considered part of the BES” and “clearly identify the appropriate generation Facilities.”

Please focus on this identification process. This effort should ensure clarity in the scope of application to GOs to avoid confusion and additional work load on GOs that do not contribute to the reliability of the BES. We are concerned that the modified BES definition may make the GO/GOP entities responsible for additional existing standards. A very clear description is needed to identify which GO/GOP owned “extension cord” circuits are included. Also, there is a need for itemizing any additional GO/GOP requirements resulting from a redefinition of the BES or from changes to existing standards. These clear descriptions will help eliminate uncertainty regarding the scope of equipment that is in the scope of NERC reliability standards.

Was any consideration given to creating a comprehensive listing of all NERC reliability standard requirements for owners of these “extension cord” circuits? A document of this type would provide GO/GOP owners of these circuits the ability to determine precisely which standards apply to that equipment.

FAC-003-2

FAC-003-1 R1 should not include GO as generation interconnection facility (“extension cord”) because they are never an IROL circuit.

Thomas E. Foltz, American Electric Power

Reliability Standards Compliance
tefoltz@aep.com

COMMENTS:

American Electric Power (AEP) appreciates the opportunity to provide input to the draft of "Project 2010-07: Generator Requirements at the Transmission Interface", and offers the following response for consideration.

AEP endorses the collective prior work of this group, however this effort needs to be done in coordination with concurrent efforts already underway within NERC, in defining and re-defining definitions that fall within the scope of the Bulk Electric System. It is unclear if lines are being drawn to somehow delineate between what might be considered as the transmission portion of the bulk electric system and what might be termed the generation bulk electric system.

We believe the group is heading in the right direction, however, in its implied desire to streamline the required changes recommended by the GOTO Ad Hoc Group (by eliminating the definition of Generation Interconnection Facility), it is now less clear where the planning and operational responsibilities reside for the high voltage generator lead from the GSU to the transmission point of interconnection. For example, page 3 of the White Paper states that the SDT believes it is appropriate to classify various generating Facilities and Elements (including generator interconnection facilities) as part of the Bulk Electric System. We agree. The SDT also states that it believes that qualifying generator interconnection facilities should be classified as transmission. We do not agree with leaping to classify the qualifying generator interconnection facilities as transmission absent further clarification, particularly with respect to the definition of Generation plants that is the subject of Project 2010-07 as explained in section 3 of the White Paper. Item 3 of section 3 states the following:

“Generating plants (including GSU transformers and the associated generator interconnection line lead(s)) with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above:”

Item 3 helps to clarify what qualifying generation interconnection facilities fit within the Bulk Electric System definition, but it is not at all clear from item 3 that the generation interconnection facility should be classified at transmission. Indeed, the foregoing generating plant definition would appear to be at odds with the SDT view.

This lack of clarity then brings into question the SDT groups conclusion that the “changes listed above mark a significant decrease in changes originally proposed by the GOTO Ad Hoc Group in its Final Report”. In particular, clarifications to the definition of Bulk Electric System eliminate the need for the GOTO Ad Hoc Group’s suggestions to include a reference to the proposed new term “Generator Interconnection Facility” in the following standards referenced in the GOTO Ad Hoc Group Final Report: BAL-005-0.1b, CIP-002-1, EOP-001-0, EOP-004-1, FAC-008-1, FAC-009-1, IRO-005-2, MOD-010-0, MOD-012-0, PRC-004-11, PRC-005-1, TOP-002-2, TOP-003-0, VAR-001-1, and VAR-002-1.

While AEP agrees in principle that it is desirable to reduce the need for modifications to existing Standards, we do not yet agree that the SDT’s White Paper brings enough clarity to reach the conclusion that modifications to one or more of the foregoing Standards are not required. The following comments are directed to the revisions the SDT team recommends to the following Standards.

FAC-001

There are substantial reliability issues, as well as additional regulatory, tariff, coordination, and

generator and interconnection facility issues, which need to be dealt with before AEP could agree to such requirements. It is not clear that a generator can receive a request for interconnection. Typically Generation Owners and/or developers make request for generation interconnection but do not have OATT requirements or processes in place to receive requests for generation interconnection. A material matter relating to the R4 requirement as defined by the SDT is whether a generator has any obligation to interconnect a new generation facility to its high voltage generation interconnection facility. This again points back to the SDT's blanket statement that the BES qualified generation interconnection facility be classified as "transmission". We are not convinced this declaratory statement comports with OATT and/or RTO generation interconnection procedures. Furthermore, it would be onerous to expect a generator to agree to R4 since generators are not in a position to comply with R1, R2 and R3.

FAC-001 R4

Regarding "Generator Owner that receives an interconnection request for its facility shall, within 45 days of such a request, be required to comply with requirements R1, R2, and R3 for the facility for which it received the interconnection request." Requirements R1, R2 and R3 refer to Transmission Owner's connection requirements. The proposed R4 as written implies the Generation Owner that receives an interconnection request for its facility (what facility?) will comply with the Transmission Owner facility connection requirements. We don't see the linkage between the Generation Owner and the Transmission Owner and how this is enforceable given the barriers to collaboration between new and existing generators and transmission owners.

If an end user facility seeks to be served on the Generation side of an interconnect, shouldn't the request be coordinated through an entity such as the regional transmission entity, or the appropriate transmission owner or transmission operator?

FAC-003-2

The SDT recommendation to add the Generation Owner requirement is acceptable.

COMMENTS:

Manitoba Hydro's Comments on
Project 2010-07 Generator Requirements at the Transmission Interface
Informal Comment Period Open
March 4 – April 4, 2011

Comments:

Question: How can the proposal outlined in the White Paper be improved? Is the drafting team heading in the right direction?

Response:

Manitoba Hydro (MH) does not agree with the SDT position that qualifying generator interconnection facilities should be classified as part of the BES, but “That does not mean, however, that a Generator Owner or Generator Operator should be required to automatically register as a Transmission Owner or Transmission Operator simply because it owns and/or operates transmission Elements or Facilities”. The premise for adding Generator Owner to the applicability section of FAC-001-0 appears to be based on the presumed need to cover the situation where a generator owner receives a request to interconnect to a line owned by the generator. MH disagrees that this is even a feasible scenario. If the Generator is not a transmission owner or a transmission provider, what is the mechanism to implement such a request? The generator would have to be a transmission provider and offer a transmission tariff. All interconnection requests should be implemented by the Transmission Owner regardless if the interconnection point is within a GO facility or end-user facility. The TO is in the best position to set unbiased connection requirements to ensure the reliability of the BES is maintained. If a mechanism is created to allow interconnection to a BES line owned by Generator, then it is essential for this Generator providing this interconnection service to be a Transmission Owner to ensure all reliability standards, including the protection standards, are met so the reliability of the BES is maintained.

MH does not understand the SDTs rationale for the statement “Requiring any classification that subjects Generator Owners and Generator Operators to all the standards applicable to Transmission Owners and Transmission Operators would do little, if anything, to improve the reliability of the Bulk Electric System”. This statement is not consistent with the first sentence of the previous paragraph where the SDT states “The SDT believes it is appropriate to classify various generating Facilities and Elements (including generator interconnection facilities) as part of the Bulk Electric System”. If reliability is not impacted, why is it appropriate to classify various Generating Facilities and Elements (including generator interconnection facilities) as part of the BES? It is not logical to allow the Generator to be a

“partial transmission owner”. If the Generator has transmission which is part of the BES, and over which tariff service is provided, the Generator must be a Transmission owner. Consequently, there is no need to change the applicability of FAC-001-0.

Question: The drafting team has chosen to use informal means of receiving industry feedback (webinars, presentations before industry stakeholder groups, etc.) prior to expending valuable industry resources to develop specific proposals for reliability standard requirements, measures, VSLs, etc. Do you have any further suggestions for seeking industry input before the project moves into a more formal development phase?

Response:

We believe that the industry resources would be better served by reviewing and responding to a specific draft of a proposed standard rather than providing comments on a direction in which the SDT should proceed. If there is uncertainty as to what needs to be included in the standard, we question the need for the standard given the numerous other standard proposals in the NERC queue.

Question: The Ad Hoc group originally proposed the new terms “Generator Interconnection Facility” and “Generator Interconnection Operational Interface” as part of this project. The Project 2010-07 drafting team believes that changes to the definition of Bulk Electric System under Project 2010-17 and modifications to a select group of standards can accomplish the same goal without the need for new definitions. Do you support this approach? If not, please explain.

RESPONSE:

MANITOBA HYDRO SUPPORTS AN APPROACH WHICH RELIES ON THE DEFINITION OF THE BES, INCLUDING ANY EXCLUSION AND INCLUSION CRITERIA, TO DETERMINE THE FACILITIES THAT SHOULD BE PART OF THE BES. GIVEN THAT MANY GENERATORS ARE RADIAL CONNECTIONS TO THE BES, SPECIFIC CRITERIA NEED TO BE DEVELOPED TO INCLUDE THESE CONNECTIONS IN THE BES.

Applicability of FAC-003-01

Comment:

Does the SDT have data to quantify the number of miles of transmission lines 100 kV and above that can be attributed to “multiple generating units spread over several thousand acres”? Are these thousands of acres within station fences where vegetation can be completely managed by the Generator? How many vegetation contacts have been experienced on these generator interconnection lines? Vegetation management is more of an issue for a Transmission Owner who has 10’s of thousands of miles of lines and may not be able to inspect/maintain it all without a proper process. MH would recommend that Generator Owner not be added to FAC-003-2. If NERC decides to go in this direction then we question if radial lines connecting Load to the BES should be in the same category. Generator Owner’s may have more underground cables than overhead lines and outages due to cable faults could be more frequent than vegetation contact.

Dan Roethemeyer, Dynegy
Dan.Roethemeyer@dynegy.com

COMMENTS:

Per the March 4, 2011 email regarding informal comments for Project 2010-07 Generator Requirements at the Transmission Interface, I am submitting the following comments on behalf of Dynegy Inc.:

· **How can the proposal outlined in the White Paper be improved?** Overall, the team has done a good job isolating the possible additional Standards/Requirements to only those which could impact reliability of the BES. However, with respect to FAC-003-2, there should be exclusion criteria based on the length of the generator tie line since short tie lines are commonly inspected as part of regular/routine inspections of generating plant and/or substation facilities. As such, we suggest generator tie lines 1 mile in length or shorter be excluded from FAC-003-2.

· **How can the proposal outlined in the White Paper be improved?** With respect to inclusion in Standard FAC-001-0, Generators typically have no experience dealing with Interconnection requests. As such, we suggest the team consider allowing the generator 45 days to first meet with an appropriate member of the BES (or other applicable expert) to then subsequently develop the applicable documentation in R1, R2, R3 within an agreed to time between the parties.

Thanks for your consideration.

dduff@libgen.com

COMMENTS:

First, let me state that the team has done an outstanding job on this White Paper. I believe the proposal will go a long way towards improving the reliability of the BES without imposing undue hardships on GO/GOP registrants.

That being said, I do object to the removal of the “two span” language from the proposal. In my particular circumstances (and I am sure I am not alone in this case) our interface is approximately 30 feet from our step-up transformer – measured horizontally, there is less than ten feet from transformer to interface. To burden us with the entire vegetation management program serves no reliability purpose, but does add a large paperwork burden. Restoring some kind of distance requirement would remove those unnecessary burdens, and increase the chances of this worthy effort being translated into an accepted standard.

Gary Tarplee, Edison Mission Energy
714.513.8112
gtarplee@edisonmission.com

COMMENTS:

Thanks for the opportunity to provide comments on the White Paper. EME is very supportive of the direction of the proposed White Paper. It is more efficient to modify the existing Standards as compared to creating new Standards specifically for GO's and GOP's. We offer the following comments;

- 1. It is imperative that the generation interconnection facilities and associated generation tie lines are not required to register as a TO and TOP regardless of voltage or line length.**
- 2. Generation interconnection tie lines should be identified as being outside the substation fence and should be exempt if less than 0.25 miles in length.**
- 3. The addition of the GO and GOP to IRO-005 may be redundant to TOP-001 R13. Please review. If the TOP has responsibility for the generation interface the GO and GOP should only have responsibility to inform the TOP when the GO's SPS or control equipment is non-automatic or the GOP is not able to implement a TOP operating procedure due to some event at the generating plant.**

COMMENTS:

PG&E as both a Transmission Owner, Transmission Operator, Generator Owner and Generator Operator supports the proposed changes in the white paper.

Jonathan Appelbaum, The United Illuminating Company
jonathan.appelbaum@uinet.com

COMMENTS:

March 24, 2011.

The following comments are submitted by the United Illuminating Company regarding Project 2010-07: Generator Requirements at the Transmission Interface White Paper Proposal .

- ◆ How can the proposal outlined in the White Paper be improved? Is the drafting team heading in the right direction?

UI does not agree with the direction and prefers the Ad hoc Group's approach to defining new terms. There are two base facts that this White Paper does not address. First, the NERC Statement of Registration Criteria establishes the criteria for identifying what entities are required to register for a particular function; and second once registered for a function all requirements for that function apply. The SDT is attempting to split the baby by stating a Generator Owner may own an integrated transmission element but is not required to register as a Transmission Owner.

On page 3 of the White Paper the SDT writes:

'The SDT believes it is appropriate to classify various generating Facilities and Elements (including generator interconnection facilities) as part of the Bulk Electric System. The SDT also believes that qualifying generator interconnection facilities should be classified as transmission. That does not mean, however, that a Generator Owner or Generator Operator should be required to automatically register as a Transmission Owner or Transmission Operator simply because it owns and/or operates transmission Elements or Facilities. While qualifying Generator Owners and Generator Operators can be classified as owning and operating electric transmission Elements and Facilities, these are most often not part of the integrated bulk power system, and as such should not be subject to the same level of standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Facilities and Elements that are part of the integrated bulk power system.'

In this paragraph the SDT states that the Generator Owner owns transmission elements. This statement alone is sufficient to require registration per the NERC Statement of Registration Criteria. But the SDT states that contrary to the Registration Statement those owners of these facilities need not register as Transmission Owners. The SDT then argues that the facility is not part of the *integrated* bulk power system without providing any technical justification for the term "integrated transmission facility". These facilities are impacting the reliability of the bulk power system and therefore are integrated into its operation. The SDT has to explain why these elements are not integrated. The SDT then states that because these transmission elements are not integrated into the bulk power system that all reliability requirements should not apply. The SDT is creating rules without reference to prior precedent and NERC activities.

The difficulty lies in the lack of a functional entity identified for these tie-lines. The creation of the functional entity would then allow the Reliability Standards to be applicable to those entities.

To demonstrate the inferiority of the White Paper and its approach let's review PRC-004. The White Paper states that PRC-004 requires no modification because it already is applicable to Generator Owners. PRC-004 utilizes the terms "transmission Protection system" and "generator Protection System" thereby differentiating between the two types of Protection Systems. R1 applies to Transmission Owners and Distribution Providers and their transmission Protection system, while R2 applies to Generator Owners and their generator Protection Systems. A Generator Owner owning and operating a transmission element will not be required to report on misoperations and corrective action plans for misoperations of the transmission Protection System even though the transmission Protection System misoperations will as effectively interrupt the generator as misoperations on the generator Protection System.

- ◆ The drafting team has chosen to use informal means of receiving industry feedback (webinars, presentations before industry stakeholder groups, etc.) prior to expending valuable industry resources to develop specific proposals for reliability standard requirements, measures, VSLs, etc. Do you have any further suggestions for seeking industry input before the project moves into a more formal development phase?

Include Regional Entity Compliance Manager's to provide opinion on this approach.

I agree that the SDT needs to communicate and obtain support for its approach prior to developing Standards. I imagine there are strong advocates for each approach, GOTO and the SDT approach.

- ◆ The Ad Hoc group originally proposed the new terms "Generator Interconnection Facility" and "Generator Interconnection Operational Interface" as part of this project. The Project 2010-07 drafting team believes that changes to the definition of Bulk Electric System under Project 2010-17 and modifications to a select group of standards can accomplish the same goal without the need for new definitions. Do you support this approach? If not, please explain.

No. Project 2010-17 will not resolve the problem. The new definition of BES will identify those generator leads that are part of the BES. It will not resolve this issue because once those lines are identified a Transmission Owner and Transmission Operator are required to be assigned. The problem is in the Functional Model, the NERC Statement of Registration Criteria and the requirement that all Reliability Requirements apply to a Registered Entity.

Steve Alexanders PE, Central Lincoln
541-574-2064
salexanderson@cencoast.com

COMMENTS:

Please see <http://www.ferc.gov/whats-new/comm-meet/2011/031711/E-4.pdf>, page 30, paragraph 47.

The FERC statement “ The Commission clarifies that it was not our intent to disrupt the NERC Rules of Procedure or the Statement of Compliance Registry Criteria” does not support the SDT’s statement “Follow the Project 2010-17—Definition of Bulk Electric System and ensure that the responsibility for generator interconnecting line leads is appropriately and clearly assigned to Generator Owners and Operators.” While I fail to see how a redefinition of the BES could not affect the registry criteria that references it, I still suggest including a revision to the registry criteria to assure that GO/GOPs with interconnection facilities are not registered as TO/TOPs.

No affect on Central Lincoln, but we support the team’s intent and thought you should be aware of yesterday’s ruling.

LARRY RODRIGUEZ, Entegra Power Services

lrodriguez@entegrapower.com

COMMENTS:

There is no question that the main focus of the Project 2010-07 SDT should be the assurance that all GIF are appropriately covered by the Reliability Standards. However, I would only ask that SDT members keep the following issues in mind to assure focusing on true reliability instead of possibly diminishing reliability in specific cases with unnecessary documentation and procedures:

1. Regarding FAC-001, many GIF are connected to the BES by very short lateral interconnections off the BES. In many cases we are talking about ¼ mile or less; sometimes only a few hundred feet. In these cases would there even be the physical possibility of an interconnection? Even an SPS or possible reactive device would surely be installed in the substation or switchyard on either side of the line. Therefore, should the SDT consider some qualifiers limiting the application of the FAC-001 requirements?
2. Regarding FAC-003, what if in the same ¼ mile or less mentioned above, the situation is one in which there are no trees, but only scrub brush under those very short interconnections. In addition, the corridor width is only 200ft. and the entire few acres are visible from the plant making for near daily inspection. And, let us not forget these entities have enormous incentives to absolutely assure no vegetation growth into their lines. Should there be the possibility of documenting with pictures such a situation while still providing a limited VMP appropriate to this situation?
3. Many of the GIF we are considering are IPPs whose purpose for existence is to provide reliable, clean, and efficient energy to the marketplace. In the cases of these generators with very short interconnections and very limited staff of operator/maintenance specialists, has the SDT considered that we might actually be “diverting” true reliability efforts like generating MW & MVAR and communication/coordination with the RC, BA, and TOP by burdening them with an unnecessary level of documentation/procedures commensurate with the actual situation?

COMMENTS:

- The Ad Hoc group originally proposed the new terms “Generator Interconnection Facility” and “Generator Interconnection Operational Interface” as part of this project. The Project 2010-07 drafting team believes that changes to the definition of Bulk Electric System under Project 2010-17 and modifications to a select group of standards can accomplish the same goal without the need for new definitions. Do you support this approach?

No let me explain.

Proposed BES definition:

Generation plants (including GSU transformers and the associated generator interconnecting line lead(s)) with aggregate capacity greater than 75 MVA (gross nameplate rating) directly connected via a step-up transformer(s) to Transmission Facilities operated at voltages of 100 kV or above.

(Looking for “Bright Lines” Leaves an unclear delineation at the GSU end and Transmission facilities end. GSU needs to be addressed as Low and High sides, Transmission Facilities does not identify a responsibility change.)

My Definition:

“Generator Interconnection Facility:

The Facilities from the high side of the Generation plant GSU operated at 100kV or above, to the point of connection to Transmission Facilities that delineates a responsibility / ownership change from Generator Owner to the Transmission Owner.”

(I see this as very bright lines for who is responsible for what)

COMMENTS:

FAC-001

Consideration should be given for FAC-001 applicability for Generator Owners (registered entity) with $\frac{1}{4}$ to $\frac{1}{2}$ mile of transmission interconnection to the BES, serving no load, and without plans to solicit interconnection requests. It serves no reliability purpose to burden those entities with FAC-001 R1, R2 and R3 requirements. Is it correct to assume R4 would only apply when an interconnection request is received?

FAC-003-2

Consideration should be given for FAC-003-2 applicability for Generator Owners (registered entity) with $\frac{1}{4}$ to $\frac{1}{2}$ mile of transmission interconnection to the BES and serving no load. For example, we have a $\frac{1}{4}$ mile interconnection that can be seen in its entirety from the facility administration building, from which visual inspections regularly take place. Does the SDT envision a simple one page TVMP when circumstances are as described here?

Mace Hunter, PE, Lakeland Electric

COMMENTS:

1. Add “Generator Owner” to the Applicability section of FAC-001-0 and add a requirement and a measure to address the responsibilities specific to the Generator Owner.

FAC-001-0—Facility Connection Requirements currently applies to Transmission Owners and addresses the need for Transmission Owners to establish facility connection and performance requirements. While the standard requires Transmission Owners to address connection requirements for “generation facilities, transmission facilities, and end-user facilities,” it does not address the requirements for a Generator Owner that has received a request for interconnection. The lack of such requirements for a Generator Owner’s Facility could result in gaps.

Therefore, the SDT proposes that “Generator Owner” be added to the Applicability section of FAC-001-0. It further proposes the addition of Requirement 4 and a corresponding measure:

R4. Generator Owner that receives an interconnection request for its facility shall, within 45 days of such a request, be required to comply with requirements R1, R2, and R3 for the facility for which it received the interconnection request.

M4. The Generator Owner that receives an interconnection request for its facility shall make available (to its Compliance Monitor) for inspection evidence that it met the requirements stated in Reliability Standard FAC-001-0 R4.

The way I read this proposal is that a GO has no obligation under FAC-001 until it receives an interconnection request then it has 45 days to provide the requestor the elements listed in R1 and R2. The GO should also have an obligation under R3 to maintain the facility connection requirements that it provided to the requestor.

In most cases the GO will be requesting an interconnection with a TO. I think FAC-001 works fine in this case. I also agree that a GO should comply with FAC-003 for longer generator leads between its step up T/F and the interconnection with its TO. The question is how long do the leads have to be before the FAC-003 standard becomes effective. Requiring a GO to have an VMP for a short line with no vegetation issues seems extreme.

I don’t think a GO would want to lose a generator (lose \$\$) due to a vegetation problem so he will have some type of program in place for a longer line. Food for thought.

END OF SUMMARY

Informal Comments on White Paper for Project 2010-07—Generator Requirements at the Transmission Interface

The Project 2010-07—Generator Requirements at the Transmission Interface standard drafting team (drafting team) thanks all who provided comments during this stage of development. The [White Paper Proposal for Informal Comment](#) was posted for a 30-day informal public comment period from March 4, 2011 through April 4, 2011. The stakeholders were asked to provide feedback via email to the NERC Project Coordinator. 51 sets of comments were submitted.

http://www.nerc.com/filez/standards/Project2010-07_GOTO_Project.html

The SDT has completed the review of the informal comments from industry for Project 2010-07—Generator Requirements at the Transmission Interface. Each comment was reviewed and considered by the drafting team as it proposed modifications to FAC-001 and FAC-003 and developed the project’s background document, and it will continue to consider this stakeholder feedback as the project progresses. If a comment is not specifically addressed, it is likely because the drafting team has addressed it elsewhere or the comment did not add clarity or otherwise improve the quality of the proposed standards.

A majority of commenters supported the concepts in the white paper, which represent a focused but comprehensive approach to including responsibility for generator interconnection Facilities in NERC’s Reliability Standards. Most commenters agreed that the approach of developing specific changes to a limited number of standards was preferable to developing new definitions or revising existing definitions.

The drafting team received many comments on the general direction of the project:

- **Some suggested that an interim solution be implemented until the modified standards are approved.** The drafting team is providing input to NERC compliance staff upon request as it works toward an interim solution.
- **Some said that Generator Owners and Generator Operators that are radial in nature should not have to comply with any additional standards.** In this phase of the project, the drafting team’s goal was to identify and modify standards necessary to eliminate any reliability gaps related to extended generation interconnection Facilities. Ultimately, this shall prevent the registration of Generator Owners and Generator Operators as Transmission Owners and Transmission Operators. After review of all of the standards, the drafting team believes that it is appropriate to apply FAC-001 and FAC-003 to Generator Owners (in certain cases). This was confirmed by stakeholder comments during the informal comment period.
- **Some were concerned with the drafting team’s use the term “transmission” to label generator interconnection Facilities.** Several commenters were concerned with the use of “transmission lines” as a label for generator interconnection Facilities. While such a label has been applied in other contexts by certain entities, the drafting team has avoided that labeling in its modifications to FAC-001 and FAC-003 and its background documents.

- **Some were concerned that the white paper did not acknowledge interface agreements.** The drafting team recognizes that interface/interconnection agreements usually have explicit language about coordination between Generator Owners and Operators and Transmission Owners and Operators, but unfortunately these agreements are not viewed by regulatory authorities as a tool that can be used for meeting reliability standards.
- **Some encouraged the SDT to revisit certain standards that already apply to Generator Owners and Generator Operators because some standards split requirements by applicable entity.** The drafting team has reviewed the standards that already include Generator Owners and Generator Operators and determined that no changes to specific requirements are necessary. The drafting team attempted to better explain its rationale in these cases in the latest version of the background document.
- **Several addressed commercial issues in their comments on the white paper.** Such comments are outside the scope of this drafting team (and NERC Reliability Standards in general) and thus have not been addressed here.
- **Some pointed out reference errors in the white paper.** The drafting team is grateful for these comments and has attempted to remedy all errors in the resource document that has evolved from the white paper.

The drafting team received no comments indicating that it should have included standards other than the two identified (FAC-001 and FAC-003), but several commenters suggested modifications to the proposed approaches to FAC-001 and FAC-003.

A number of comments stated that the “trigger” for the application of FAC-001 should not be the receipt of a request, but rather should be based upon “the intent or obligation” to interconnect a new Facility to an existing interconnecting Facility that is owned by a generator. Accordingly, the drafting team has proposed language to address this concern. The intent of this modified language is to start the compliance clock when the generator Facility owner executes an Agreement to perform the reliability assessment required in FAC-002. This step should occur whether the generator voluntarily agrees to the interconnection request or is compelled by a regulatory body to do so. In either case, we expect the Generator Owner and the requestor to execute some form of an Agreement. The drafting team intentionally excluded a specific reference to the kind of Agreement (such as a feasibility study) in deference to comments that we should avoid comingling of commercial and reliability aspects in reliability standards.

Similarly, a majority of comments supported FAC-003 applicability to the Generator Owner but suggested some exclusion for a “short length” Facility. Accordingly, we modified the language to apply only to a Facility that extends at least ½ mile beyond the fenced boundary(ies) of the switchyard, generating station, or generating substation.

In addition to the majority of comments addressing the line length issue, the drafting team received some minority comments on FAC-003:

- **Some indicated that Generator Owners should not be added to FAC-003 because they are never an IROL circuit.** FAC-003 addresses circuits other than those associated with an IROL.
- **Some stated that changing FAC-003 would do nothing to prevent adverse reliability impacts, because a radial line can't cascade.** The drafting team believes there is a reliability-related need to apply FAC-003 to GOs with extended interconnection Facilities.
- **One commenter suggested a better connection between FAC-003 and FAC-014, stating that there is nothing in either standard where the Planning Coordinator is informing the Transmission Owners and Generator Owners of the applicability of their Facilities as outlined in the Facilities section 4.2.2 of FAC-003.** FAC-014-2 R5 addresses this issue.
- **One commenter suggested that the requirement simply be that the Generator Owner coordinates with the Transmission Owner to ensure that the generator interconnection Facilities are included.** The drafting team believes there is a reliability-related need to apply FAC-003 to Generator Owners with extended interconnection Facilities. An entity always has the opportunity to enter into a JRO where appropriate.

A majority of commenters also supported the drafting team's proposal to not adopt new defined terms. But many commenters said that if the new terms were not adopted, the drafting team needed to work to address registration issues related to Generator Owners and Generator Operators, especially those with ownership/operational responsibility for the Facility that interconnects the generator(s) to the Transmission Owner's Facility. A few stated that there needed to be a clearer delineation of responsibilities between the Generator Owner and Transmission Owner and the Generator Operator and Transmission Operator where ownership and operational responsibility of an interconnection Facility wasn't clearly understood. While the drafting team agrees with some of the comments, it is not empowered to make all changes which may be necessary to alleviate the concerns expressed in the comments.

However, during this process, the drafting team has been meeting with NERC and FERC staffs, regional compliance managers, and industry organizations to discuss possible solutions to the issue of concern to most Generator Owner/Generator Operators (e.g., registration as a Transmission Owner/Transmission Operator). The drafting team believes this issue, and the related concerns, have the attention of appropriate NERC and regional staffs and has volunteered to provide assistance in their efforts to address them.

The goal of the Project 2010-07 drafting team is to work with NERC and regional compliance enforcement and compliance registration staffs to develop a comprehensive package that will address all reliability gaps, whether real or perceived, so that entities are appropriately registered and the appropriate reliability standards are applied to those entities.

****Note about comments from February and March 2010 SAR Posting****

During its review of these comments, the drafting team also returned to comments from its SAR posting in February and March of 2010, as many of the comments on the SAR posting dealt with the proposals in the original Ad Hoc Group for Generator Requirements at the Transmission Interface's Final Report. In

returning to these comments, the drafting team confirmed that it had addressed all relevant comments. Because of the narrower focus of the current Project 2010-07, many comments (such as those on the Ad Hoc Group's proposed definitions) were no longer relevant, but all others have been addressed:

- **Need to align project with compliance responsibility:** The drafting team is working with NERC and regional compliance staffs on exactly this.
- **The scope of the project is too broad:** The scope has been narrowed.
- **The project needs further clarification:** The original white paper posted for informal comment was developed to provide further clarification on the project. That white paper has been modified to be used as a background resource document.
- **The standards changes should be implemented all at once:** With only two standard changes being implemented and an interim solution being developed by NERC's compliance staff (in coordination with Regional compliance staff), the drafting team is not as concerned with implementing the changes simultaneously. If, for instance, FAC-001 changes are implemented before FAC-003 changes, the interim compliance solution will remain in effect until FAC-003 changes are also implemented to ensure that there are no gaps during the implementation periods.

The drafting team thanks all those who participated in the original SAR posting; the comments from that posting were invaluable during the transition from ad hoc group to standard drafting team.

The drafting team limited its modifications to those associated with expanding the scope to include the Generator Owner and bringing the format up to date.

A. Introduction

- 1. Title:** Facility Connection Requirements
- 2. Number:** FAC-001-1
- 3. Purpose:** To avoid adverse impacts on reliability, Transmission Owners and Generator Owners must establish Facility connection and performance requirements.
- 4. Applicability:**
 - 4.1.** Transmission Owner
 - 4.2.** Applicable Generator Owner
 - 2.4.1.** Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility
- 5. Effective Date:**
 - 5.1.** In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.
 - 5.2.** In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

- R1.** The Transmission Owner shall document, maintain, and publish Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements. The Transmission Owner's Facility connection requirements shall address connection requirements for:
 - 1.1.** Generation Facilities,
 - 1.2.** Transmission Facilities, and
 - 1.3.** End-user Facilities

[VRF – Medium]
- R2.** Each applicable Generator Owner, within 45 days of executing an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility (under FAC-002-1), shall document and publish and thereafter maintain Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.

[VRF – Medium]

R3. Each applicable Generator Owner with Facility connection requirements and each Transmission Owner shall have Facility connection requirements that address the following items:

3.1. Provide a written summary of its plans to achieve the required system performance as described in Requirements R1 and R2 throughout the planning horizon:

3.1.1. Procedures for coordinated joint studies of new Facilities and their impacts on the interconnected Transmission Systems.

3.1.2. Procedures for notification of new or modified Facilities to others (those responsible for the reliability of the interconnected Transmission Systems) as soon as feasible.

3.1.3. Voltage level and MW and MVAR capacity or demand at point of connection.

3.1.4. Breaker duty and surge protection.

3.1.5. System Protection and coordination.

3.1.6. Metering and telecommunications.

3.1.7. Grounding and safety issues.

3.1.8. Insulation and insulation coordination.

3.1.9. Voltage, Reactive Power, and power factor control.

3.1.10. Power quality impacts.

3.1.11. Equipment Ratings.

3.1.12. Synchronizing of Facilities.

3.1.13. Maintenance coordination.

3.1.14. Operational issues (abnormal frequency and voltages).

3.1.15. Inspection requirements for existing or new Facilities.

3.1.16. Communications and procedures during normal and emergency operating conditions.

[VRF – Medium]

R4. Each applicable Generator Owner with Facility connection requirements (in accordance with Requirement R2) and each Transmission Owner shall maintain Facility connection requirements and make documentation of these requirements available to the users of the Transmission System, the Regional Entity, and ERO on request (five business days).

[VRF – Medium]

C. Measures

M1. The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R1.

- M2.** Each Generator Owner that executes an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R2.
- M3.** Each applicable Generator Owner with Facility connection requirements and each Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R3.
- M4.** Each applicable Generator Owner with Facility connection requirements and each Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor: Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Transmission Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Owner shall retain evidence of Requirement R1, Measure M1, Requirement R3, Measure M3, and Requirement R4, Measure M4 from its last audit.

The Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain evidence of Requirement R2, Measure M2, Requirement R3, Measure M3, and Requirement R4, Measure M4 from its last audit.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Not Applicable.	<p>The Transmission Owner failed to do one of the following:</p> <p>Document or maintain or publish Facility connection requirements as specified in the Requirement</p> <p>OR</p> <p>Failed to include one (1) of the components and specified in R1.1, R1.2 or R1.3.</p>	<p>The Transmission Owner failed to do one of the following:</p> <p>Document or maintain or publish its Facility connection requirements as specified in the Requirement</p> <p>OR</p> <p>Failed to include (2) of the components as specified in R1.1, R1.2 or R1.3</p> <p>OR</p> <p>Failed to document or maintain or publish its Facility connection requirements as specified in the Requirement and failed to include one (1) of the components as specified in R1.1, R1.2 or R1.3.</p>	The Transmission Owner did not develop Facility connection requirements.
R2	The responsible entity failed to document and publish and thereafter maintain Facility connection requirements until more than 45 calendar days but less than or equal to 60 calendar days	The responsible entity failed to document and publish and thereafter maintain Facility connection requirements until more than 60 calendar days but less than or equal to 70 calendar days	The responsible entity failed to document and publish and thereafter maintain Facility connection requirements until more than 70 calendar days but less than or equal to 80 calendar days	The responsible entity failed to document and publish and thereafter maintain Facility connection requirements until more than 80 days after executing an Agreement to evaluate the

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	TBD	Added requirements for Generator Owner and brought overall standard format up to date	Revision under Project 2010-07

The drafting team limited its modifications to those associated with expanding the scope to include the Generator Owner and bringing the format up to date.

A. **Introduction**

1. **Title:** **Facility Connection Requirements**

2. **Number:** FAC-001-~~0-1~~

3. **Purpose:** To avoid adverse impacts on reliability, Transmission Owners and Generator Owners must establish Ffacility connection and performance requirements.

4. **Applicability:**

4.1. Transmission Owner

4.2. Applicable Generator Owner

4.1.2.4.1. Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility

5. **Effective Date:**

5.1. In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.

5.2. In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

~~5.~~ April 1, 2005

B. **Requirements**

R1. The Transmission Owner shall document, maintain, and publish Ffacility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional ~~Reliability Organization~~Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Ffacility connection requirements. The Transmission Owner's Ffacility connection requirements shall address connection requirements for:

1.1. Generation Ffacilities,

1.2. Transmission Ffacilities, and

~~R2.~~ End-user Ffacilities

1.3.

[VRF – Medium]

R2. Each applicable Generator Owner, within 45 days of executing an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility (under FAC-002-1), shall document and publish and thereafter maintain Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.

~~R3.~~ *[VRF – Medium]*

R3. Each applicable Generator Owner with Facility connection requirements and each The Transmission Owner shall have Facility connection requirements that address the following items:

- 3.1.** Provide a written summary of its plans to achieve the required system performance as described ~~above in Requirements R1 and R2~~ throughout the planning horizon:
 - 3.1.1.** Procedures for coordinated joint studies of new ~~F~~facilities and their impacts on the interconnected ~~T~~ransmission ~~S~~ystems.
 - 3.1.2.** Procedures for notification of new or modified ~~F~~facilities to others (those responsible for the reliability of the interconnected ~~€T~~ransmission ~~S~~ystems) as soon as feasible.
 - 3.1.3.** Voltage level and MW and MVAR capacity or demand at point of connection.
 - 3.1.4.** Breaker duty and surge protection.
 - 3.1.5.** System ~~p~~rotection and coordination.
 - 3.1.6.** Metering and telecommunications.
 - 3.1.7.** Grounding and safety issues.
 - 3.1.8.** Insulation and insulation coordination.
 - 3.1.9.** Voltage, Reactive Power, and power factor control.
 - 3.1.10.** Power quality impacts.
 - 3.1.11.** Equipment Ratings.
 - 3.1.12.** Synchronizing of ~~F~~facilities.
 - 3.1.13.** Maintenance coordination.
 - 3.1.14.** Operational issues (abnormal frequency and voltages).
 - 3.1.15.** Inspection requirements for existing or new ~~F~~facilities.
 - 3.1.16.** Communications and procedures during normal and emergency operating conditions.

[VRF – Medium]

R4. Each applicable Generator Owner with Facility connection requirements (in accordance with Requirement R2) and eachThe Transmission Owner shall maintain ~~and update its F~~facility connection requirements ~~as required and. The Transmission Owner shall~~ make documentation of these requirements available to the users of the ~~T~~ransmission ~~S~~ystem, the Regional ~~Reliability Organization~~Entity, and ~~NERC-ERO~~ on request (five business days).

~~R4.~~ *[VRF – Medium]*

C. Measures

M1. The Transmission Owner shall make available (to its Compliance ~~Monitor~~Enforcement Authority) ~~for inspection~~ evidence that it met all the requirements stated in Reliability Standard FAC-001-0-Requirement R1.

M2. Each Generator Owner that executes an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R2.

M2.M3. Each applicable Generator Owner with Facility connection requirements and eachThe Transmission Owner shall make available (to its Compliance ~~Monitor~~Enforcement Authority) ~~for inspection~~ evidence that it met all requirements stated in Reliability Standard FAC-001-0-Requirement R3.

M3.M4. Each applicable Generator Owner with Facility connection requirements and eachThe Transmission Owner shall make available (to its Compliance ~~Monitor~~Enforcement Authority) ~~for inspection~~ evidence that it met all the requirements stated in Reliability Standard FAC-001-0-Requirement R4.

- ~~2.1. **Level 1:** Facility connection requirements were provided for generation, transmission, and end-user facilities, per Reliability Standard FAC-001-0_R1, but the document(s) do not address all of the requirements of Reliability Standard FAC-001-0_R2.~~
- ~~2.2. **Level 2:** Facility connection requirements were not provided for all three categories (generation, transmission, or end-user) of facilities, per Reliability Standard FAC-001-0_R1, but the document(s) provided address all of the requirements of Reliability Standard FAC-001-0_R2.~~
- ~~2.3. **Level 3:** Facility connection requirements were not provided for all three categories (generation, transmission, or end-user) of facilities, per Reliability Standard FAC-001-0_R1, and the document(s) provided do not address all of the requirements of Reliability Standard FAC-001-0_R2.~~
- ~~2.4. **Level 4:** No document on facility connection requirements was provided per Reliability Standard FAC-001-0_R3.~~

E. Regional Differences

- 1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
<u>1</u>	<u>TBD</u>	<u>Added requirements for Generator Owner and brought overall standard format up to date</u>	<u>Revision under Project 2010-07</u>

Implementation Plan for FAC-001-1 – Facility Connection Requirements

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. FAC-001-0 will be retired when FAC-001-1 becomes effective.

Compliance with Standard

Since this version of the standard imposes no changes to Transmission Owners from those in the FERC-approved version of the standard, the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to the FERC-approved version of this standard only address Generator Owner applicability and requirements (add Generator Owner to section 4.2, introduce a new requirement (R2), and modify two existing requirements (now R3 and R4)). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

Effective Date

There are two effective dates associated with this standard:

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.

In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SC approved SAR for initial posting (January 11, 2007).
2. SAR posted for comment (January 15–February 14, 2007).
3. SAR posted for comment (April 10–May 9, 2007).
4. SC authorized moving the SAR forward to standard development (June 27, 2007).
5. First draft of proposed standard posted (October 27, 2008-November 25, 2008)).
6. Second draft of revised standard posted (September 10, 20–October 24, 2009).
7. Third draft of revised standard posted (March 1, 2010-March 31, 2010).
8. Forth draft of revised standard posted (June 17, 2010-July 17, 2010).

Proposed Action Plan and Description of Current Draft

This is the third posting of the proposed revisions to the standard in accordance with Results-Based Criteria and the fifth draft overall.

Future Development Plan

Anticipated Actions	Anticipated Date
Recirculation ballot of standards.	January 2011
Receive BOT approval	February 2011

Effective Dates

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Exceptions:

A line operated below 200kV, designated by the Planning Coordinator as an element of an IROL or as a Major WECC transfer path, becomes subject to this standard 12 months after the date the Planning Coordinator or WECC initially designates the line as being subject to this standard.

An existing transmission line operated at 200kV or higher that is newly acquired by an asset owner and was not previously subject to this standard, becomes subject to this standard 12 months after the acquisition date of the line.

Version History

Version	Date	Action	Change Tracking
1	TBA	<ol style="list-style-type: none"> 1. Added “Standard Development Roadmap.” 2. Changed “60” to “Sixty” in section A, 5.2. 3. Added “Proposed Effective Date: April 7, 2006” to footer. 4. Added “Draft 3: November 17, 2005” to footer. 	01/20/06
1	April 4, 2007	Regulatory Approval — Effective Date	New
3	May 16, 2011	Modified proposed definitions and Applicability to include Generator Owners of a certain length.	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary. When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

The current glossary definition of this NERC term is modified to address the issues set forth in Paragraph 734 of FERC Order 693.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

The current glossary definition of this NERC term is modified to allow both maintenance inspections and vegetation inspections to be performed concurrently.

Current definition of Vegetation Inspection:
The systematic examination of a transmission corridor to document vegetation conditions.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC's Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has develop two sets of proposed changes: one to this version, the latest draft of Version 2 as proposed by the Project 2007-07 team, and one to FAC-003-1, the current FERC-approved version of the standard.

If FAC-003-2 is approved by NERC's BOT, the Project 2010-07 drafting team will likely proceed with the modifications seen in this standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. FAC-003-2 would be retired once FAC-003-03 was approved.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with changes to FAC-003-1 to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability, the proposal of modifications to the NERC defined term Right-of-Way to include applicable Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

Introduction

- 1. Title:** Transmission Vegetation Management
- 2. Number:** FAC-003-3
- 3. Objectives:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.
- 4. Applicability**
 - 4.1. Functional Entities:**
 - 4.1.1. Applicable Transmission Owners**
 - 4.1.1.1.** Transmission Owners that own Transmission Facilities defined in 4.2
 - 4.1.2. Applicable Generator Owners**
 - 4.1.2.1.** Generator Owners that own Generation Facilities defined in 4.3

4.2. Transmission Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal¹, state, provincial, public, private, or tribal entities:

4.2.1. Overhead transmission lines operated at 200kV or higher.

4.2.2. Overhead transmission lines operated below 200kV having been identified as included in the definition of an Interconnection Reliability Operating Limit (IROL) under NERC Standard FAC-014 by the Planning Coordinator.

4.2.3. Overhead transmission lines operated below 200 kV having been identified as included in the definition of one of the *Major WECC Transfer Paths in the Bulk Electric System*.

4.2.4. This standard applies to overhead transmission lines identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.

Rationale

The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards, and stations have many inspection and maintenance activities that are necessary for reliability. Those existing process manage the threat. As such, the formal steps in this standard are not well suited for this environment. 3) Specifically addressing the areas where the standard applies or doesn't makes the standard stronger as it relates to clarity.

4.3. Generation Facilities: Defined below (referred to as “applicable lines”):

4.3.1. Overhead transmission lines that extend greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system and are:

4.3.1.1. Operated at 200kV or higher; or

4.3.1.2. Operated below 200kV having been identified as included in the definition of an Interconnection Reliability Operating Limit (IROL) under NERC Standard FAC-014 by the Planning Coordinator; or

Within the text of NERC Reliability Standard FAC-003-3, “transmission line(s)” and “applicable line(s)” can also refer to the generation Facilities as referenced in 4.3 and its subsections.

¹ EPAAct 2005 section 1211c: “Access approvals by Federal agencies”.

4.3.1.3. Operated below 200kV having been identified as included in the definition of one of the *Major WECC Transfer Paths in the Bulk Electric System*.

4.4. Enforcement: *The reliability obligations of the applicable entities and facilities are contained within the technical requirements of this standard. [Straw proposal]*

5. Background:

This NERC Vegetation Management Standard (“Standard”) uses a defense-in-depth approach to improve the reliability of the electric Transmission System by preventing those vegetation related outages that could lead to Cascading. This Standard is not intended to address non-preventable outages such as those due to vegetation fall-ins or blow-ins from outside the Right-of-Way, vandalism, human activities and acts of nature. Operating experience indicates that trees that have grown out of specification have contributed to Cascading, especially under heavy electrical loading conditions.

With a defense-in-depth strategy, this Standard utilizes three types of requirements to provide layers of protection to prevent vegetation related outages that could lead to Cascading:

- a) Performance-based — defines a particular reliability objective or outcome to be achieved.
- b) Risk-based — preventive requirements to reduce the risks of failure to acceptable tolerance levels.
- c) Competency-based — defines a minimum capability an entity needs to have to demonstrate it is able to perform its designated reliability functions.

The defense-in-depth strategy for reliability standards development recognizes that each requirement in a NERC reliability standard has a role in preventing system failures, and that these roles are complementary and reinforcing. Reliability standards should not be viewed as a body of unrelated requirements, but rather should be viewed as part of a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comport with the quality objectives of a reliability standard. For this Standard, the requirements have been developed as follows:

- Performance-based: Requirements 1 and 2
- Competency-based: Requirement 3
- Risk-based: Requirements 4, 5, 6 and 7

Thus the various requirements associated with a successful vegetation program could be viewed as using R1, R2 and R3 as first levels of defense; while R4 could be a subsequent or final level of defense. R6 depending on the particular vegetation approach may be either an initial defense barrier or a final defense barrier.

Major outages and operational problems have resulted from interference between overgrown vegetation and transmission lines located on many types of lands and ownership situations. Adherence to the Standard requirements for applicable lines on any kind of land or easement, whether they are Federal Lands, state or provincial lands, public or private lands, franchises, easements or lands owned in fee, will reduce and manage this risk. For the purpose of the Standard the term “public lands” includes municipal lands, village lands, city lands, and a host of other governmental entities.

This Standard addresses vegetation management along applicable overhead lines and does not apply to underground lines, submarine lines or to line sections inside an electric station boundary.

This Standard focuses on transmission lines to prevent those vegetation related outages that could lead to Cascading. It is not intended to prevent customer outages due to tree contact with lower voltage distribution system lines. For example, localized customer service might be disrupted if vegetation were to make contact with a 69kV transmission line supplying power to a 12kV distribution station. However, this Standard is not written to address such isolated situations which have little impact on the overall electric transmission system.

Since vegetation growth is constant and always present, unmanaged vegetation poses an increased outage risk, especially when numerous transmission lines are operating at or near their Rating. This can present a significant risk of multiple line failures and Cascading. Conversely, most other outage causes (such as trees falling into lines, lightning, animals, motor vehicles, etc.) are statistically intermittent. These events are not any more likely to occur during heavy system loads than any other time. There is no cause-effect relationship which creates the probability of simultaneous occurrence of other such events. Therefore these types of events are highly unlikely to cause large-scale grid failures. Thus, this Standard’s emphasis is on vegetation grow-ins.

Requirements and Measures

R1. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments of the types shown below, into the Minimum Vegetation Clearance Distance (MVCD) of any of its applicable line(s) identified as an element of an Interconnection Reliability Operating Limit (IROL) in the planning horizon by the Planning Coordinator; or Major Western Electricity Coordinating Council (WECC) transfer path(s); operating within its Rating and all Rated Electrical Operating Conditions.²

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage,
2. An encroachment due to a fall-in from inside the Right-of-Way (ROW) that caused a vegetation-related Sustained Outage,
3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage,
4. An encroachment due to a grow-in that caused a vegetation-related Sustained Outage. *[VRF – High] [Time Horizon – Real-time]*

M1. Each applicable Transmission Owner and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments.

If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

Rationale

The MVCD is a calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages. The distances in Table 2 were derived using a proven transmission design method. The types of failure to manage vegetation are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of an applicable Transmission Owner’s or applicable Generator Owner’s vegetation maintenance program since the encroachments listed require different and increasing levels of skills and knowledge and thus constitute a logical progression of how well, or poorly, an applicable Transmission Owner or applicable Generator Owner manages vegetation relative to this Requirement.

² This requirement does not apply to circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation. Nothing in this footnote should be construed to limit the applicable Transmission Owner’s or applicable Generator Owner’s right to exercise its full legal rights on the ROW.

Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period. (R1)

- R2.** Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments of the types shown below, into the MVCD of any of its applicable line(s) that is not an element of an IROL; or Major WECC transfer path; operating within its Rating and all Rated Electrical Operating Conditions.²
1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage,
 2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage,
 3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage,
 4. An encroachment due to a grow-in that caused a vegetation-related Sustained Outage.
[VRF – Medium] [Time Horizon – Real-time]

Rationale

The MVCD is a calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages. The distances in Table 2 were derived using a proven transmission design method. The types of failure to manage vegetation are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of an applicable Transmission Owner’s or applicable Generator Owner’s vegetation maintenance program since the encroachments listed require different and increasing levels of skills and knowledge and thus constitute a logical progression of how well, or poorly, an applicable Transmission Owner or applicable Generator Owner manages vegetation relative to this Requirement.

- M2.** Each applicable Transmission Owner and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments.

If a later confirmation of a Fault by the applicable Transmission Owner and applicable Generator Owner shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period. (R2)

R3. Each applicable Transmission Owner and applicable Generator Owner shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable transmission lines that include(s) the following:

- 3.1** Accounts for the movement of applicable transmission line conductors under their Facility Rating and all Rated Electrical Operating Conditions;
- 3.2** Accounts for the inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

Rationale

The documentation provides a basis for evaluating the competency of the applicable Transmission Owner’s or applicable Generator Owner’s ’s vegetation program. There may be many acceptable approaches to maintain clearances. Any approach must demonstrate that the applicable Transmission Owner or applicable Generator Owner avoids vegetation-to-wire conflicts under all Rated Electrical Operating Conditions. See Figure 1 for an illustration of possible conductor locations.

[VRF – Lower] [Time Horizon – Long Term Planning]

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner can prevent encroachment into the MVCD considering the factors identified in the requirement. (R3)

R4. Each applicable Transmission Owner and applicable Generator Owner, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable transmission line when the applicable Transmission Owner or applicable Generator Owner has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment.

Rationale

To ensure expeditious communication between the applicable Transmission Owner or applicable Generator Owner and the control center when a critical situation is confirmed.

[VRF – Medium] [Time Horizon – Real-time]

M4. Each applicable Transmission Owner and applicable Generator Owner that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders. (R4)

R5. When a applicable Transmission Owner or applicable Generator Owner is constrained from performing vegetation work, and the constraint may lead to a vegetation encroachment into the MVCD of its applicable transmission lines prior to the implementation of the next annual work plan then the applicable Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management to prevent encroachments.

[VRF – Medium] [Time Horizon – Operations Planning]

Rationale

Legal actions and other events may occur which result in constraints that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation maintenance work. In cases where the transmission line is put at potential risk due to constraints, the intent is for the applicable Transmission Owner or applicable Generator Owner to put interim measures in place, rather than do nothing. The corrective action process is intended to address situations where a planned work methodology cannot be performed but an alternate work methodology can be used.

M5. Each applicable Transmission Owner and applicable Generator Owner has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, and evidence that a line was de-energized. (R5)

R6. Each applicable Transmission Owner and applicable Generator Owner shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 months between inspections on the same ROW.³

[VRF – Medium] [Time Horizon – Operations Planning]

M6. Each applicable Transmission Owner and applicable Generator

Rationale

Inspections are used by applicable Transmission Owners and applicable Generator Owners to assess the condition of the entire ROW. The information from the assessment can be used to determine risk, determine future work and evaluate recently-completed work. This requirement sets a minimum Vegetation Inspection frequency of once per calendar year but with no more than 18 months between inspections on the same ROW. Based upon average growth rates across North America and on common utility practice, this minimum frequency is reasonable. Applicable Transmission Owners and applicable Generator Owners should consider local and environmental factors that could warrant more frequent inspections.

³ When the applicable Transmission Owner or applicable Generator Owner is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the applicable Transmission Owner or applicable Generator Owner is granted a time extension that is equivalent to the duration of the time the applicable Transmission Owner or applicable Generator Owner was prevented from performing the Vegetation Inspection.

Owner has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable transmission lines at least once per calendar year but with no more than 18 months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records. (R6)

R7. Each applicable Transmission Owner and applicable Generator Owner shall complete 100% of its annual vegetation work plan to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not put the transmission system at risk of a vegetation encroachment) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include:

Rationale

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. An annual vegetation work plan allows for work to be modified for changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors, provided that the changes do not violate the encroachment within the MVCD.

- Change in expected growth rate/ environmental factors
- Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner ⁴
- Rescheduling work between growing seasons
- Crew or contractor availability/ Mutual assistance agreements
- Identified unanticipated high priority work
- Weather conditions/Accessibility
- Permitting delays
- Land ownership changes/Change in land use by the landowner
- Emerging technologies

[VRF – Medium] [Time Horizon – Operations Planning]

M7. Each applicable Transmission Owner and applicable Generator Owner has evidence that it completed its annual vegetation work plan. Examples of acceptable forms of evidence may include a copy of the completed annual work plan (including modifications if any), dated work orders, dated invoices, or dated inspection records. (R7)

⁴ Circumstances that are beyond the control of a applicable Transmission Owner or applicable Generator Owner include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods; arboricultural, horticultural or agricultural activities.

Compliance

Compliance Enforcement Authority

- Regional Entity

Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints
- Periodic Data Submittals

Evidence Retention

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirements R1, R2, R3, R5, R6 and R7, Measures M1, M2, M3, M5, M6 and M7 for three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirement R4, Measure M4 for most recent 12 months of operator logs or most recent 3 months of voice recordings or transcripts of voice recordings, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable Transmission Owner or applicable Generator Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Additional Compliance Information

Periodic Data Submittal: The applicable Transmission Owner and applicable Generator Owner will submit a quarterly report to its Regional Entity, or the Regional Entity's designee, identifying all Sustained Outages of applicable transmission lines determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation, except as excluded in footnote 2, which includes as a minimum, the following:

- The name of the circuit(s), the date, time and duration of the outage; the voltage of the circuit; a description of the cause of the outage; the category associated with the Sustained Outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner .

A Sustained Outage is to be categorized as one of the following:

- Category 1A — Grow-ins: Sustained Outages caused by vegetation growing into applicable transmission lines, that are identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 1B — Grow-ins: Sustained Outages caused by vegetation growing into applicable transmission lines, but are not identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 2A — Fall-ins: Sustained Outages caused by vegetation falling into applicable transmission lines that are identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 2B — Fall-ins: Sustained Outages caused by vegetation falling into applicable transmission lines, but are not identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 3 — Fall-ins: Sustained Outages caused by vegetation falling into applicable transmission lines from outside the ROW;
- Category 4A — Blowing together: Sustained Outages caused by vegetation and applicable transmission lines that are identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.
- Category 4B — Blowing together: Sustained Outages caused by vegetation and applicable transmission lines, but are not identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.

The Regional Entity will report the outage information provided by applicable Transmission Owners and applicable Generator Owners, as per the above, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported Sustained Outages.

Time Horizons, Violation Risk Factors, and Violation Severity Levels

Table 1						
R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Real-time	High	The responsible entity had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.	The responsible entity had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.	The responsible entity had an encroachment into the MVCD due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage.	The responsible entity had an encroachment into the MVCD due to a grow-in that caused a vegetation-related Sustained Outage.
R2	Real-time	Medium	The responsible entity had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.	The responsible entity had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.	The responsible entity had an encroachment into the MVCD due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage.	The responsible entity had an encroachment into the MVCD due to a grow-in that caused a vegetation-related Sustained Outage.
R3	Long-Term Planning	Lower		The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the inter-relationships between vegetation growth rates,	The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the	The responsible entity does not have any maintenance strategies or documented procedures or processes or specifications used to prevent the encroachment of

None.

Guideline and Technical Basis

Requirements R1 and R2:

R1 and R2 are performance-based requirements. The reliability objective or outcome to be achieved is the prevention of vegetation encroachments within a minimum distance of transmission lines. Content-wise, R1 and R2 are the same requirements; however, they apply to different Facilities. Both R1 and R2 require each applicable Transmission Owner and applicable Generator Owner to manage vegetation to prevent encroachment within the Minimum Vegetation Clearance Distance (“MVCD”) of transmission lines. R1 is applicable to lines “identified as an element of an Interconnection Reliability Operating Limit (IROL) or Major Western Electricity Coordinating Council (WECC) transfer path (operating within Rating and Rated Electrical Operating Conditions) to avoid a Sustained Outage”. R2 applies to all other applicable lines that are not an element of an IROL or Major WECC Transfer Path.

The separation of applicability (between R1 and R2) recognizes that an encroachment into the MVCD of an IROL or Major WECC Transfer Path transmission line is a greater risk to the electric transmission system. Applicable lines that are not an element of an IROL or Major WECC Transfer Path are required to be clear of vegetation but these lines are comparatively less operationally significant. As a reflection of this difference in risk impact, the Violation Risk Factors (VRFs) are assigned as High for R1 and Medium for R2.

These requirements (R1 and R2) state that if vegetation encroaches within the distances in Table 1 in Appendix 1 of this supplemental Transmission Vegetation Management Standard FAC-003-2 Technical Reference document, it is in violation of the standard. Table 2 tabulates the distances necessary to prevent spark-over based on the Gallet equations as described more fully in Appendix 1 below.

These requirements assume that transmission lines and their conductors are operating within their Rating. If a line conductor is intentionally or inadvertently operated beyond its Rating (potentially in violation of other standards), the occurrence of a clearance encroachment may occur. For example, emergency actions taken by a Transmission Operator or Reliability Coordinator to protect an Interconnection may cause the transmission line to sag more and come closer to vegetation, potentially causing an outage. Such vegetation-related outages are not a violation of these requirements.

Evidence of violation of Requirement R1 and R2 include real-time observation of a vegetation encroachment into the MVCD (absent a Sustained Outage), or a vegetation-related encroachment resulting in a Sustained Outage due to a fall-in from inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to blowing together of applicable lines and vegetation located inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to a grow-in. If an investigation of a Fault by an applicable Transmission Owner or applicable Generator Owner confirms that a vegetation encroachment within the MVCD occurred, then it shall be considered the equivalent of a Real-time observation.

With this approach, the VSLs were defined such that they directly correlate to the severity of a failure of an applicable Transmission Owner and applicable Generator Owner to manage vegetation and to the corresponding performance level of the applicable Transmission Owner’s or applicable Generator Owner’s vegetation program’s ability to meet the goal of “preventing a Sustained Outage that could lead to Cascading.” Thus violation severity increases with an

applicable Transmission Owner's or applicable Generator Owner's inability to meet this goal and its potential of leading to a Cascading event. The additional benefits of such a combination are that it simplifies the standard and clearly defines performance for compliance. A performance-based requirement of this nature will promote high quality, cost effective vegetation management programs that will deliver the overall end result of improved reliability to the system.

Multiple Sustained Outages on an individual line can be caused by the same vegetation. For example, a limb may only partially break and intermittently contact a conductor. Such events are considered to be a single vegetation-related Sustained Outage under the Standard where the Sustained Outages occur within a 24 hour period.

The MVCD is a calculated minimum distance stated in feet (or meters) to prevent spark-over, for various altitudes and operating voltages that is used in the design of Facilities. Keeping vegetation from entering this space will prevent transmission outages.

Requirement R3:

Requirement R3 is a competency based requirement concerned with the maintenance strategies, procedures, processes, or specifications, an applicable Transmission Owner or applicable Generator Owner uses for vegetation management.

An adequate transmission vegetation management program formally establishes the approach the applicable Transmission Owner or applicable Generator Owner uses to plan and perform vegetation work to prevent transmission Sustained Outages and minimize risk to the Transmission System. The approach provides the basis for evaluating the intent, allocation of appropriate resources and the competency of the applicable Transmission Owner or applicable Generator Owner in managing vegetation. There are many acceptable approaches to manage vegetation and avoid Sustained Outages. However, the applicable Transmission Owner or applicable Generator Owner must be able to state what its approach is and how it conducts work to maintain clearances.

An example of one approach commonly used by industry is ANSI Standard A300, part 7. However, regardless of the approach a utility uses to manage vegetation, any approach an applicable Transmission Owner or applicable Generator Owner chooses to use will generally contain the following elements:

1. *the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation height) to ensure that MVCD clearances are never violated.*
2. *the work methods that the applicable Transmission Owner or applicable Generator Owner uses to control vegetation*
3. *a stated Vegetation Inspection frequency*
4. *an annual work plan*

The conductor's position in space at any point in time is continuously changing as a reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and wind loading. The movement of the transmission line conductor and the MVCD is illustrated in Figure 1 below.

Figure 1

Cross-section view of a single conductor at a given point along the span showing six possible conductor positions due to movement resulting from thermal and mechanical loading.

Requirement R4:

R4 is a risk-based requirement. It focuses on preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Fault risk when a vegetation threat is confirmed. R4 involves the notification of potentially threatening vegetation conditions, without any intentional delay, to the control center holding switching authority for that specific transmission line. Examples of acceptable unintentional delays may include communication system problems (for example, cellular service or two-way radio disabled), crews located in remote field locations with no communication access, delays due to severe weather, etc.

Confirmation is key that a threat actually exists due to vegetation. This confirmation could be in the form of an applicable Transmission Owner’s or applicable Generator Owner’s employee who personally identifies such a threat in the field. Confirmation could also be made by sending out an employee to evaluate a situation reported by a landowner.

Vegetation-related conditions that warrant a response include vegetation that is near or encroaching into the MVCD (a grow-in issue) or vegetation that could fall into the transmission conductor (a fall-in issue). A knowledgeable verification of the risk would include an assessment of the possible sag or movement of the conductor while operating between no-load conditions and its rating.

The applicable Transmission Owner or applicable Generator Owner has the responsibility to ensure the proper communication between field personnel and the control center to allow the control center to take the appropriate action until the vegetation threat is relieved. Appropriate actions may include a temporary reduction in the line loading, switching the line out of service, or positioning the system in recognition of the increasing risk of outage on that circuit. The notification of the threat should be communicated in terms of minutes or hours as opposed to a longer time frame for corrective action plans (see R5).

All potential grow-in or fall-in vegetation-related conditions will not necessarily cause a Fault at any moment. For example, some applicable Transmission Owners or applicable Generator Owners may have a danger tree identification program that identifies trees for removal with the potential to fall near the line. These trees would not require notification to the control center unless they pose an immediate fall-in threat.

Requirement R5:

R5 is a risk-based requirement. It focuses upon preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Sustained Outage risk when temporarily constrained from performing vegetation maintenance. The intent of this requirement is to deal with situations that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation management work and, as a result, have the potential to put the transmission line at risk. Constraints to performing vegetation maintenance work as planned could result from legal injunctions filed by property owners, the discovery of easement stipulations which limit the applicable Transmission Owner's or applicable Generator Owner's rights, or other circumstances.

This requirement is not intended to address situations where the transmission line is not at potential risk and the work event can be rescheduled or re-planned using an alternate work methodology. For example, a land owner may prevent the planned use of chemicals on non-threatening, low growth vegetation but agree to the use of mechanical clearing. In this case the applicable Transmission Owner or applicable Generator Owner is not under any immediate time constraint for achieving the management objective, can easily reschedule work using an alternate approach, and therefore does not need to take interim corrective action.

However, in situations where transmission line reliability is potentially at risk due to a constraint, the applicable Transmission Owner or applicable Generator Owner is required to take an interim corrective action to mitigate the potential risk to the transmission line. A wide range of actions can be taken to address various situations. General considerations include:

- Identifying locations where the applicable Transmission Owner or applicable Generator Owner is constrained from performing planned vegetation maintenance work which potentially leaves the transmission line at risk.
- Developing the specific action to mitigate any potential risk associated with not performing the vegetation maintenance work as planned.
- Documenting and tracking the specific action taken for each location.
- In developing the specific action to mitigate the potential risk to the transmission line the applicable Transmission Owner or applicable Generator Owner could consider location specific measures such as modifying the inspection and/or maintenance

intervals. Where a legal constraint would not allow any vegetation work, the interim corrective action could include limiting the loading on the transmission line.

- The applicable Transmission Owner or applicable Generator Owner should document and track the specific corrective action taken at each location. This location may be indicated as one span, one tree or a combination of spans on one property where the constraint is considered to be temporary.

Requirement R6:

R6 is a risk-based requirement. This requirement sets a minimum time period for completing Vegetation Inspections that fits general industry practice. In addition, the fact that Vegetation Inspections can be performed in conjunction with general line inspections further facilitates an applicable Transmission Owner's or applicable Generator Owner's ability to meet this requirement. However, the applicable Transmission Owner or applicable Generator Owner may determine that more frequent inspections are needed to maintain reliability levels, dependent upon such factors as anticipated growth rates of the local vegetation, length of the growing season for the geographical area, limited ROW width, and rainfall amounts. Therefore it is expected that some transmission lines may be designated with a higher frequency of inspections.

The VSL for Requirement R6 has VSL categories ranked by the percentage of the required ROW inspections completed. To calculate the percentage of inspection completion, the applicable Transmission Owner or applicable Generator Owner may choose units such as: line miles or kilometers, circuit miles or kilometers, pole line miles, ROW miles, etc.

For example, when an applicable Transmission Owner or applicable Generator Owner operates 2,000 miles of 230 kV transmission lines this applicable Transmission Owner or applicable Generator Owner will be responsible for inspecting all 2,000 miles of 230 kV transmission lines at least once during the calendar year. If one of the included lines was 100 miles long, and if it was not inspected during the year, then the amount failed to inspect would be $100/2000 = 0.05$ or 5%. The "Low VSL" for R6 would apply in this example.

Requirement R7:

R7 is a risk-based requirement. The applicable Transmission Owner or applicable Generator Owner is required to implement an annual work plan for vegetation management to accomplish the purpose of this standard. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made and documented provided they do not put the transmission system at risk. The annual work plan requirement is not intended to necessarily require a "span-by-span", or even a "line-by-line" detailed description of all work to be performed. It is only intended to require that the applicable Transmission Owner or applicable Generator Owner provide evidence of annual planning and execution of a vegetation management maintenance approach which successfully prevents encroachment of vegetation into the MVCD.

The ability to modify the work plan allows the applicable Transmission Owner or applicable Generator Owner to change priorities or treatment methodologies during the year as conditions or situations dictate. For example recent line inspections may identify unanticipated high priority work, weather conditions (drought) could make herbicide application ineffective during the plan year, or a major storm could require redirecting local resources away from planned

maintenance. This situation may also include complying with mutual assistance agreements by moving resources off the applicable Transmission Owner's or applicable Generator Owner's system to work on another system. Any of these examples could result in acceptable deferrals or additions to the annual work plan. Modifications to the annual work plan must always ensure the reliability of the electric Transmission system.

In general, the vegetation management maintenance approach should use the full extent of the applicable Transmission Owner's or applicable Generator Owner's easement, fee simple and other legal rights allowed. A comprehensive approach that exercises the full extent of legal rights on the ROW is superior to incremental management in the long term because it reduces the overall potential for encroachments, and it ensures that future planned work and future planned inspection cycles are sufficient.

When developing the annual work plan the applicable Transmission Owner or applicable Generator Owner should allow time for procedural requirements to obtain permits to work on federal, state, provincial, public, tribal lands. In some cases the lead time for obtaining permits may necessitate preparing work plans more than a year prior to work start dates. Applicable Transmission Owners or applicable Generator Owners may also need to consider those special landowner requirements as documented in easement instruments.

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Therefore, deferrals or relevant changes to the annual plan shall be documented. Depending on the planning and documentation format used by the applicable Transmission Owner or applicable Generator Owner, evidence of successful annual work plan execution could consist of signed-off work orders, signed contracts, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, or paid invoices. Other evidence may include photographs, and walk-through reports.

Notes:

The SDT determined that the use of IEEE 516-2003 in version 1 of FAC-003 was a misapplication. The SDT consulted specialists who advised that the Gallet Equation would be a technically justified method. The explanation of why the Gallet approach is more appropriate is explained in the paragraphs below.

The drafting team sought a method of establishing minimum clearance distances that uses realistic weather conditions and realistic maximum transient over-voltages factors for in-service transmission lines.

The SDT considered several factors when looking at changes to the minimum vegetation to conductor distances in FAC-003-1:

- avoid the problem associated with referring to tables in another standard (IEEE-516-2003)
- transmission lines operate in non-laboratory environments (wet conditions)
- transient over-voltage factors are lower for in-service transmission lines than for inadvertently re-energized transmission lines with trapped charges.

FAC-003-1 uses the minimum air insulation distance (MAID) without tools formula provided in IEEE 516-2003 to determine the minimum distance between a transmission line conductor and vegetation. The equations and methods provided in IEEE 516 were developed by an IEEE Task Force in 1968 from test data provided by thirteen independent laboratories. The distances provided in IEEE 516 Tables 5 and 7 are based on the withstand voltage of a dry rod-rod air gap, or in other words, dry laboratory conditions. Consequently, the validity of using these distances in an outside environment application has been questioned.

FAC-003-01 allowed Transmission Owners to use either Table 5 or Table 7 to establish the minimum clearance distances. Table 5 could be used if the Transmission Owner knew the maximum transient over-voltage factor for its system. Otherwise, Table 7 would have to be used. Table 7 represented minimum air insulation distances under the worst possible case for transient over-voltage factors. These worst case transient over-voltage factors were as follows: 3.5 for voltages up to 362 kV phase to phase; 3.0 for 500 - 550 kV phase to phase; and 2.5 for 765 to 800 kV phase to phase. These worst case over-voltage factors were also a cause for concern in this particular application of the distances.

In general, the worst case transient over-voltages occur on a transmission line that is inadvertently re-energized immediately after the line is de-energized and a trapped charge is still present. The intent of FAC-003 is to keep a transmission line that is *in service* from becoming de-energized (i.e. tripped out) due to spark-over from the line conductor to nearby vegetation. Thus, the worst case transient overvoltage assumptions are not appropriate for this application. Rather, the appropriate over voltage values are those that occur only while the line is energized.

Typical values of transient over-voltages of in-service lines, as such, are not readily available in the literature because they are negligible compared with the maximums. A conservative value for the maximum transient over-voltage that can occur anywhere along the length of an in-service ac line is approximately 2.0 per unit. This value is a conservative estimate of the transient over-voltage that is created at the point of application (e.g. a substation) by switching a capacitor bank without pre-insertion devices (e.g. closing resistors). At voltage levels where capacitor banks are not very common (e.g. 362 kV), the maximum transient over-voltage of an in-service ac line are created by fault initiation on adjacent ac lines and shunt reactor bank switching. These transient voltages are usually 1.5 per unit or less.

Even though these transient over-voltages will not be experienced at locations remote from the bus at which they are created, in order to be conservative, it is assumed that all nearby ac lines are subjected to this same level of over-voltage. Thus, a maximum transient over-voltage factor of 2.0 per unit for transmission lines operated at 242 kV and below is considered to be a realistic maximum in this application. Likewise, for ac transmission lines operated at 362 kV and above a transient over-voltage factor of 1.4 per unit is considered a realistic maximum.

The Gallet Equations are an accepted method for insulation coordination in tower design. These equations are used for computing the required strike distances for proper transmission line insulation coordination. They were developed for both wet and dry applications and can be used with any value of transient over-voltage factor. The Gallet Equation also can take into account various air gap geometries. This approach was used to design the first 500 kV and 765 kV lines in North America [1].

If one compares the MAID using the IEEE 516-2003 Table 7 (table D.5 for English values) with the critical spark-over distances computed using the Gallet wet equations, for each of the nominal voltage classes and identical transient over-voltage factors, the Gallet equations yield a more conservative (larger) minimum distance value.

Distances calculated from either the IEEE 516 (dry) formulas or the Gallet “wet” formulas are not vastly different when the same transient overvoltage factors are used; the “wet” equations will consistently produce slightly larger distances than the IEEE 516 equations when the same transient overvoltage is used. While the IEEE 516 equations were only developed for dry conditions the Gallet equations have provisions to calculate spark-over distances for both wet and dry conditions.

While EPRI is currently trying to establish empirical data for spark-over distances to live vegetation, there are no spark-over formulas currently derived expressly for vegetation to conductor minimum distances. Therefore the SDT chose a proven method that has been used in other EHV applications. The Gallet equations relevance to wet conditions and the selection of a Transient Overvoltage Factor that is consistent with the absence of trapped charges on an in-service transmission line make this methodology a better choice.

The following table is an example of the comparison of distances derived from IEEE 516 and the Gallet equations using various transient overvoltage values.

**Comparison of spark-over distances computed using Gallet wet equations
vs.
IEEE 516-2003 MAID distances
using various transient over-voltage factors**

(AC) Nom System Voltage (kV)	(AC) Max System Voltage (kV)	Transient Over-voltage Factor (T)	Clearance (ft.) Gallet (wet) @ Alt. 3000 feet	Table 5 IEEE 516 MAID (ft) @ Alt. 3000 feet
765	800	1.4	8.89	8.65

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SC approved SAR for initial posting (January 11, 2007).
2. SAR posted for comment (January 15–February 14, 2007).
3. SAR posted for comment (April 10–May 9, 2007).
4. SC authorized moving the SAR forward to standard development (June 27, 2007).
5. First draft of proposed standard posted (October 27, 2008-November 25, 2008)).
6. Second draft of revised standard posted (September 10, 20–October 24, 2009).
7. Third draft of revised standard posted (March 1, 2010-March 31, 2010).
8. Forth draft of revised standard posted (June 17, 2010-July 17, 2010).

Proposed Action Plan and Description of Current Draft

This is the third posting of the proposed revisions to the standard in accordance with Results-Based Criteria and the fifth draft overall.

Future Development Plan

Anticipated Actions	Anticipated Date
Recirculation ballot of standards.	January 2011
Receive BOT approval	February 2011

Effective Dates

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

~~First calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval is required.~~

Exceptions:

A line operated below 200kV, designated by the Planning Coordinator as an element of an IROL or as a Major WECC transfer path, becomes subject to this standard 12 months after the date the Planning Coordinator or WECC initially designates the line as being subject to this standard.

An existing transmission line operated at 200kV or higher that is newly acquired by an asset owner and was not previously subject to this standard, becomes subject to this standard 12 months after the acquisition date of the line.

Version History

Version	Date	Action	Change Tracking
1	TBA	<ol style="list-style-type: none"> 1. Added “Standard Development Roadmap.” 2. Changed “60” to “Sixty” in section A, 5.2. 3. Added “Proposed Effective Date: April 7, 2006” to footer. 4. Added “Draft 3: November 17, 2005” to footer. 	01/20/06
1	April 4, 2007	Regulatory Approval — Effective Date	New
23	<u>May 16, 2011</u>	<u>Modified proposed definitions and Applicability to include Generator Owners of a certain length.</u>	<u>Revision under Project 2010-07</u>

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary. When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

The current glossary definition of this NERC term is modified to address the issues set forth in Paragraph 734 of FERC Order 693.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's ~~Transmission Owner's~~ control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

The current glossary definition of this NERC term is modified to allow both maintenance inspections and vegetation inspections to be performed concurrently.

Current definition of Vegetation Inspection:
The systematic examination of a transmission corridor to document vegetation conditions.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC's Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has develop two sets of proposed changes: one to this version, the latest draft of Version 2 as proposed by the Project 2007-07 team, and one to FAC-003-1, the current FERC-approved version of the standard.

If FAC-003-2 is approved by NERC's BOT, the Project 2010-07 drafting team will likely proceed with the modifications seen in this standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. FAC-003-2 would be retired once FAC-003-03 was approved.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with changes to FAC-003-1 to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability, the proposal of modifications to the NERC defined term Right-of-Way to include applicable Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

Introduction

1. **Title:** Transmission Vegetation Management
2. **Number:** FAC-003-~~32~~
3. **Objectives:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.

4. Applicability

4.1. Functional Entities:

4.1.1. Applicable Transmission Owners

4.1.1.1. Transmission Owners that own Transmission Facilities defined in 4.2

4.1.2. Applicable Generator Owners

4.1.2.1. Generator Owners that own Generation Facilities defined in 4.3

~~4.1. Functional Entities:~~

~~Transmission Owners~~

4.2. Transmission Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal¹, state, provincial, public, private, or tribal entities:

4.2.1. Overhead transmission lines operated at 200kV or higher.

4.2.2. Overhead transmission lines operated below 200kV having been identified as included in the definition of an Interconnection Reliability Operating Limit (IROL) under NERC Standard FAC-014 by the Planning Coordinator.

4.2.3. Overhead transmission lines operated below 200 kV having been identified as included in the definition of one of the *Major WECC Transfer Paths in the Bulk Electric System*.

4.2.4. This standard applies to overhead transmission lines identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.

Rationale

—The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards, and stations have many inspection and maintenance activities that are necessary for reliability. Those existing process manage the threat. As such, the formal steps in this standard are not well suited for this environment. 3) ~~The standard was written for Transmission Owners. Rolling the excluded areas into this standard will bring GO and DP into the standard, even though NERC has an initiative in place to address this bigger registry issue.~~ 4) Specifically addressing the areas where the standard applies or doesn't makes the standard stronger as it relates to clarity.

4.3. Generation Facilities: Defined below (referred to as “applicable lines”):

4.3.1. Overhead transmission lines that extend greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system and are:

4.3.1.1. Operated at 200kV or higher; or

4.3.1.2. Operated below 200kV having been identified as included in the definition of an Interconnection Reliability Operating Limit (IROL) under NERC Standard FAC-014 by the Planning Coordinator; or

Within the text of NERC Reliability Standard FAC-003-3, “transmission line(s)” and “applicable line(s)” can also refer to the generation Facilities as referenced in 4.3 and its subsections.

¹ EPAAct 2005 section 1211c: “Access approvals by Federal agencies”.

4.3.1.3. Operated below 200kV having been identified as included in the definition of one of the Major WECC Transfer Paths in the Bulk Electric System.

~~4.3.—~~ **Enforcement:** *The reliability obligations of the applicable entities and facilities are contained within the technical requirements of this standard. [Straw proposal]*

4.4.

5. Background:

This NERC Vegetation Management Standard (“Standard”) uses a defense-in-depth approach to improve the reliability of the electric Transmission System by preventing those vegetation related outages that could lead to Cascading. This Standard is not intended to address non-preventable outages such as those due to vegetation fall-ins or blow-ins from outside the Right-of-Way, vandalism, human activities and acts of nature. Operating experience indicates that trees that have grown out of specification have contributed to Cascading, especially under heavy electrical loading conditions.

With a defense-in-depth strategy, this Standard utilizes three types of requirements to provide layers of protection to prevent vegetation related outages that could lead to Cascading:

- a) Performance-based — defines a particular reliability objective or outcome to be achieved.
- b) Risk-based — preventive requirements to reduce the risks of failure to acceptable tolerance levels.
- c) Competency-based — defines a minimum capability an entity needs to have to demonstrate it is able to perform its designated reliability functions.

The defense-in-depth strategy for reliability standards development recognizes that each requirement in a NERC reliability standard has a role in preventing system failures, and that these roles are complementary and reinforcing. Reliability standards should not be viewed as a body of unrelated requirements, but rather should be viewed as part of a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comport with the quality objectives of a reliability standard. For this Standard, the requirements have been developed as follows:

- Performance-based: Requirements 1 and 2
- Competency-based: Requirement 3
- Risk-based: Requirements 4, 5, 6 and 7

Thus the various requirements associated with a successful vegetation program could be viewed as using R1, R2 and R3 as first levels of defense; while R4 could be a subsequent or

final level of defense. R6 depending on the particular vegetation approach may be either an initial defense barrier or a final defense barrier.

Major outages and operational problems have resulted from interference between overgrown vegetation and transmission lines located on many types of lands and ownership situations. Adherence to the Standard requirements for applicable lines on any kind of land or easement, whether they are Federal Lands, state or provincial lands, public or private lands, franchises, easements or lands owned in fee, will reduce and manage this risk. For the purpose of the Standard the term “public lands” includes municipal lands, village lands, city lands, and a host of other governmental entities.

This Standard addresses vegetation management along applicable overhead lines and does not apply to underground lines, submarine lines or to line sections inside an electric station boundary.

This Standard focuses on transmission lines to prevent those vegetation related outages that could lead to Cascading. It is not intended to prevent customer outages due to tree contact with lower voltage distribution system lines. For example, localized customer service might be disrupted if vegetation were to make contact with a 69kV transmission line supplying power to a 12kV distribution station. However, this Standard is not written to address such isolated situations which have little impact on the overall electric transmission system.

Since vegetation growth is constant and always present, unmanaged vegetation poses an increased outage risk, especially when numerous transmission lines are operating at or near their Rating. This can present a significant risk of multiple line failures and Cascading. Conversely, most other outage causes (such as trees falling into lines, lightning, animals, motor vehicles, etc.) are statistically intermittent. These events are not any more likely to occur during heavy system loads than any other time. There is no cause-effect relationship which creates the probability of simultaneous occurrence of other such events. Therefore these types of events are highly unlikely to cause large-scale grid failures. Thus, this Standard’s emphasis is on vegetation grow-ins.

Requirements and Measures

R1. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall manage vegetation to prevent encroachments of the types shown below, into the Minimum Vegetation Clearance Distance (MVCD) of any of its applicable line(s) identified as an element of an Interconnection Reliability Operating Limit (IROL) in the planning horizon by the Planning Coordinator; or Major Western Electricity Coordinating Council (WECC) transfer path(s); operating within its Rating and all Rated Electrical Operating Conditions.²

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage,
2. An encroachment due to a fall-in from inside the Right-of-Way (ROW) that caused a vegetation-related Sustained Outage,
3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage,
4. An encroachment due to a grow-in that caused a vegetation-related Sustained Outage. *[VRF – High] [Time Horizon – Real-time]*

M1. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments.

If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

Rationale

The MVCD is a calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages. The distances in Table 2 were derived using a proven transmission design method. The types of failure to manage vegetation are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of an applicable Transmission Owner’s or applicable Generator Owner’s a TO’s vegetation maintenance program since the encroachments listed require different and increasing levels of skills and knowledge and thus constitute a logical progression of how well, or poorly, an applicable Transmission Owner or applicable Generator Owner a-TO manages vegetation relative to this Requirement.

² This requirement does not apply to circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation. Nothing in this footnote should be construed to limit the applicable Transmission Owner’s or applicable Generator Owner ~~Transmission Owner~~’s right to exercise its full legal rights on the ROW.

Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period. (R1)

- R2.** Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall manage vegetation to prevent encroachments of the types shown below, into the MVCD of any of its applicable line(s) that is not an element of an IROL; or Major WECC transfer path; operating within its Rating and all Rated Electrical Operating Conditions.²
1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage,
 2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage,
 3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage,
 4. An encroachment due to a grow-in that caused a vegetation-related Sustained Outage.
- [VRF – Medium] [Time Horizon – Real-time]*

Rationale

The MVCD is a calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages. The distances in Table 2 were derived using a proven transmission design method. The types of failure to manage vegetation are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of an applicable Transmission Owner’s or applicable Generator Owner’s ~~TO’s~~ vegetation maintenance program since the encroachments listed require different and increasing levels of skills and knowledge and thus constitute a logical progression of how well, or poorly, an applicable Transmission Owner or applicable Generator Owner ~~TO~~ manages vegetation relative to this Requirement.

- M2.** Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments.

If a later confirmation of a Fault by the applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period. (R2)

R3. Each applicable Transmission Owner and applicable Generator Owner Transmission Owner shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable transmission lines that include(s) the following:

- 3.1** Accounts for the movement of applicable transmission line conductors under their Facility Rating and all Rated Electrical Operating Conditions;
- 3.2** Accounts for the inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

Rationale

The documentation provides a basis for evaluating the competency of the applicable Transmission Owner's or applicable Generator Owner's Transmission Owner's vegetation program. There may be many acceptable approaches to maintain clearances. Any approach must demonstrate that the applicable Transmission Owner or applicable Generator Owner Transmission Owner avoids vegetation-to-wire conflicts under all Rated Electrical Operating Conditions. See Figure 1 for an illustration of possible conductor locations.

[VRF – Lower] [Time Horizon – Long Term Planning]

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner Transmission Owner can prevent encroachment into the MVCD considering the factors identified in the requirement. (R3)

R4. Each applicable Transmission Owner and applicable Generator Owner Transmission Owner, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable transmission line when the applicable Transmission Owner or applicable Generator Owner Transmission Owner has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment.

Rationale

To ensure expeditious communication between the applicable Transmission Owner or applicable Generator Owner Transmission Owner and the control center when a critical situation is confirmed.

[VRF – Medium] [Time Horizon – Real-time]

M4. Each applicable Transmission Owner and applicable Generator Owner Transmission Owner that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders. (R4)

R5. When a applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is constrained from performing vegetation work, and the constraint may lead to a vegetation encroachment into the MVCD of its applicable transmission lines prior to the implementation of the next annual work plan then the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ shall take corrective action to ensure continued vegetation management to prevent encroachments.

[VRF – Medium] [Time Horizon – Operations Planning]

Rationale

Legal actions and other events may occur which result in constraints that prevent the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from performing planned vegetation maintenance work.

In cases where the transmission line is put at potential risk due to constraints, the intent is for the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ to put interim measures in place, rather than do nothing.

The corrective action process is intended to address situations where a planned work methodology cannot be performed but an alternate work methodology can be used.

M5. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, and evidence that a line was de-energized. (R5)

R6. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 months between inspections on the same ROW.³

[VRF – Medium] [Time Horizon – Operations Planning]

Rationale

Inspections are used by applicable Transmission Owners and applicable Generator Owners ~~Transmission Owners~~ to assess the condition of the entire ROW. The information from the assessment can be used to determine risk, determine future work and evaluate recently-completed work. This requirement sets a minimum Vegetation Inspection frequency of once per calendar year but with no more than 18 months between inspections on the same ROW. Based upon average growth rates across North America and on common utility practice, this minimum frequency is reasonable. Applicable Transmission Owners and applicable Generator Owners ~~Transmission Owners~~ should consider local and environmental factors that could warrant more frequent inspections.

³ When the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the applicable Transmission Owner or applicable Generator Owner ~~TO~~ is granted a time extension that is equivalent to the duration of the time the applicable Transmission Owner or applicable Generator Owner ~~TO~~ was prevented from performing the Vegetation Inspection.

M6. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable transmission lines at least once per calendar year but with no more than 18 months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records. (R6)

R7. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall complete 100% of its annual vegetation work plan to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not put the transmission system at risk of a vegetation encroachment) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include:

Rationale

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. An annual vegetation work plan allows for work to be modified for changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors, provided that the changes do not violate the encroachment within the MVCD.

- Change in expected growth rate/ environmental factors
 - Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~⁴
 - Rescheduling work between growing seasons
 - Crew or contractor availability/ Mutual assistance agreements
 - Identified unanticipated high priority work
 - Weather conditions/Accessibility
 - Permitting delays
 - Land ownership changes/Change in land use by the landowner
 - Emerging technologies
- [VRF – Medium] [Time Horizon – Operations Planning]*

M7. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence that it completed its annual vegetation work plan. Examples of acceptable forms of evidence may include a copy of the completed annual work plan (including modifications if any), dated work orders, dated invoices, or dated inspection records. (R7)

⁴ Circumstances that are beyond the control of a applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner ~~TO~~ or an applicable regulatory body, ice storms, and floods; arboricultural, horticultural or agricultural activities.

Compliance

Compliance Enforcement Authority

- Regional Entity

Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints
- Periodic Data Submittals

Evidence Retention

The ~~applicable Transmission Owner and applicable Generator Owner~~ Transmission Owner retains data or evidence to show compliance with Requirements R1, R2, R3, R5, R6 and R7, Measures M1, M2, M3, M5, M6 and M7 for three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The ~~applicable Transmission Owner and applicable Generator Owner~~ Transmission Owner retains data or evidence to show compliance with Requirement R4, Measure M4 for most recent 12 months of operator logs or most recent 3 months of voice recordings or transcripts of voice recordings, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Additional Compliance Information

Periodic Data Submittal: The ~~applicable Transmission Owner and applicable Generator Owner~~ Transmission Owner will submit a quarterly report to its Regional Entity, or the Regional Entity's designee, identifying all Sustained Outages of applicable transmission lines determined by the ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner to have been caused by vegetation, except as excluded in footnote 2, which includes as a minimum, the following:

- The name of the circuit(s), the date, time and duration of the outage; the voltage of the circuit; a description of the cause of the outage; the category associated with the Sustained Outage; other pertinent comments; and any countermeasures taken by the ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner.

A Sustained Outage is to be categorized as one of the following:

- Category 1A — Grow-ins: Sustained Outages caused by vegetation growing into applicable transmission lines, that are identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 1B — Grow-ins: Sustained Outages caused by vegetation growing into applicable transmission lines, but are not identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 2A — Fall-ins: Sustained Outages caused by vegetation falling into applicable transmission lines that are identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 2B — Fall-ins: Sustained Outages caused by vegetation falling into applicable transmission lines, but are not identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 3 — Fall-ins: Sustained Outages caused by vegetation falling into applicable transmission lines from outside the ROW;
- Category 4A — Blowing together: Sustained Outages caused by vegetation and applicable transmission lines that are identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.
- Category 4B — Blowing together: Sustained Outages caused by vegetation and applicable transmission lines, but are not identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.

The Regional Entity will report the outage information provided by applicable Transmission Owners and applicable Generator Owners~~Transmission Owners~~, as per the above, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported Sustained Outages.

Time Horizons, Violation Risk Factors, and Violation Severity Levels

Table 1						
R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Real-time	High	The Transmission Owner responsible entity had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.	The Transmission Owner responsible entity had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.	The Transmission Owner responsible entity had an encroachment into the MVCD due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage.	The Transmission Owner responsible entity had an encroachment into the MVCD due to a grow-in that caused a vegetation-related Sustained Outage.
R2	Real-time	Medium	The Transmission Owner responsible entity had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.	The Transmission Owner responsible entity had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.	The Transmission Owner responsible entity had an encroachment into the MVCD due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage.	The Transmission Owner responsible entity had an encroachment into the MVCD due to a grow-in that caused a vegetation-related Sustained Outage.
R3	Long-Term	Lower		The Transmission Owner responsible	The Transmission	The Transmission

	Planning			<u>entity</u> has maintenance strategies or documented procedures or processes or specifications but has not accounted for the inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency, for the Transmission <u>Ownerresponsible entity</u> 's applicable lines.	Ownerresponsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the movement of transmission line conductors under their Rating and all Rated Electrical Operating Conditions, for the Transmission <u>Ownerresponsible entity</u> 's applicable lines. Guideline and Technical Basis

Requirements R1 and R2:

R1 and R2 are performance-based requirements. The reliability objective or outcome to be achieved is the prevention of vegetation encroachments within a minimum distance of transmission lines. Content-wise, R1 and R2 are the same requirements; however, they apply to different Facilities. Both R1 and R2 require each ~~Transmission-applicable Transmission Owner and applicable Generator Owner~~ ~~Owner~~ to manage vegetation to prevent encroachment within the Minimum Vegetation Clearance Distance (“MVCD”) of transmission lines. R1 is applicable to lines “identified as an element of an Interconnection Reliability Operating Limit (IROL) or Major Western Electricity Coordinating Council (WECC) transfer path (operating within Rating and Rated Electrical Operating Conditions) to avoid a Sustained Outage”. R2 applies to all other applicable lines that are not an element of an IROL or Major WECC Transfer Path.

The separation of applicability (between R1 and R2) recognizes that an encroachment into the MVCD of an IROL or Major WECC Transfer Path transmission line is a greater risk to the electric transmission system. Applicable lines that are not an element of an IROL or Major WECC Transfer Path are required to be clear of vegetation but these lines are comparatively less operationally significant. As a reflection of this difference in risk impact, the Violation Risk Factors (VRFs) are assigned as High for R1 and Medium for R2.

These requirements (R1 and R2) state that if vegetation encroaches within the distances in Table 1 in Appendix 1 of this supplemental Transmission Vegetation Management Standard FAC-003-2 Technical Reference document, it is in violation of the standard. Table 2 tabulates the distances necessary to prevent spark-over based on the Gallet equations as described more fully in Appendix 1 below.

These requirements assume that transmission lines and their conductors are operating within their Rating. If a line conductor is intentionally or inadvertently operated beyond its Rating (potentially in violation of other standards), the occurrence of a clearance encroachment may occur. For example, emergency actions taken by a Transmission Operator or Reliability Coordinator to protect an Interconnection may cause the transmission line to sag more and come closer to vegetation, potentially causing an outage. Such vegetation-related outages are not a violation of these requirements.

Evidence of violation of Requirement R1 and R2 include real-time observation of a vegetation encroachment into the MVCD (absent a Sustained Outage), or a vegetation-related encroachment resulting in a Sustained Outage due to a fall-in from inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to blowing together of applicable lines and vegetation located inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to a grow-in. If an investigation of a Fault by an ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ confirms that a vegetation encroachment within the MVCD occurred, then it shall be considered the equivalent of a Real-time observation.

With this approach, the VSLs were defined such that they directly correlate to the severity of a failure of an ~~an Transmission-applicable Transmission Owner and applicable Generator Owner~~ ~~Owner~~ to manage vegetation and to the corresponding performance level of the ~~Transmission applicable Transmission Owner’s or applicable Generator Owner’s~~ ~~Owner’s~~ vegetation

program's ability to meet the goal of "preventing a Sustained Outage that could lead to Cascading." Thus violation severity increases with an ~~Transmission Own applicable Transmission Owner's or applicable Generator Owner's~~ ~~er's~~ inability to meet this goal and its potential of leading to a Cascading event. The additional benefits of such a combination are that it simplifies the standard and clearly defines performance for compliance. A performance-based requirement of this nature will promote high quality, cost effective vegetation management programs that will deliver the overall end result of improved reliability to the system.

Multiple Sustained Outages on an individual line can be caused by the same vegetation. For example, a limb may only partially break and intermittently contact a conductor. Such events are considered to be a single vegetation-related Sustained Outage under the Standard where the Sustained Outages occur within a 24 hour period.

The MVCD is a calculated minimum distance stated in feet (or meters) to prevent spark-over, for various altitudes and operating voltages that is used in the design of ~~Transmission~~ Facilities. Keeping vegetation from entering this space will prevent transmission outages.

Requirement R3:

Requirement R3 is a competency based requirement concerned with the maintenance strategies, procedures, processes, or specifications, an ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ uses for vegetation management.

An adequate transmission vegetation management program formally establishes the approach the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ uses to plan and perform vegetation work to prevent transmission Sustained Outages and minimize risk to the Transmission System. The approach provides the basis for evaluating the intent, allocation of appropriate resources and the competency of the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ in managing vegetation. There are many acceptable approaches to manage vegetation and avoid Sustained Outages. However, the ~~Transmission applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ must be able to state what its approach is and how it conducts work to maintain clearances.

An example of one approach commonly used by industry is ANSI Standard A300, part 7. However, regardless of the approach a utility uses to manage vegetation, any approach an ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ chooses to use will generally contain the following elements:

1. *the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation height) to ensure that MVCD clearances are never violated.*
2. *the work methods that the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ uses to control vegetation*
3. *a stated Vegetation Inspection frequency*
4. *an annual work plan*

The conductor's position in space at any point in time is continuously changing as a reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and

wind loading. The movement of the transmission line conductor and the MVCD is illustrated in Figure 1 below.

Figure 1

Cross-section view of a single conductor at a given point along the span showing six possible conductor positions due to movement resulting from thermal and mechanical loading.

Requirement R4:

R4 is a risk-based requirement. It focuses on preventative actions to be taken by the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ Transmission-applicable Transmission Owner or applicable Generator Owner for the mitigation of Fault risk when a vegetation threat is confirmed. R4 involves the notification of potentially threatening vegetation conditions, without any intentional delay, to the control center holding switching authority for that specific transmission line. Examples of acceptable unintentional delays may include communication system problems (for example, cellular service or two-way radio disabled), crews located in remote field locations with no communication access, delays due to severe weather, etc.

Confirmation is key that a threat actually exists due to vegetation. This confirmation could be in the form of an an Transmission-applicable Transmission Owner's or applicable Generator Owner's ~~Owner's~~ employee who personally identifies such a threat in the field. Confirmation could also be made by sending out an employee to evaluate a situation reported by a landowner.

Vegetation-related conditions that warrant a response include vegetation that is near or encroaching into the MVCD (a grow-in issue) or vegetation that could fall into the transmission conductor (a fall-in issue). A knowledgeable verification of the risk would include an assessment of the possible sag or movement of the conductor while operating between no-load conditions and its rating.

The ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ has the responsibility to ensure the proper communication between field personnel and the control center to allow the control center to take the appropriate action until the vegetation threat is relieved. Appropriate actions may include a temporary reduction in the line loading, switching the line out of service, or positioning the system in recognition of the increasing risk of outage on that circuit. The notification of the threat should be communicated in terms of minutes or hours as opposed to a longer time frame for corrective action plans (see R5).

All potential grow-in or fall-in vegetation-related conditions will not necessarily cause a Fault at any moment. For example, some ~~Transmission-applicable Transmission Owners or applicable Generator Owners~~ ~~Owners~~ may have a danger tree identification program that identifies trees for removal with the potential to fall near the line. These trees would not require notification to the control center unless they pose an immediate fall-in threat.

Requirement R5:

R5 is a risk-based requirement. It focuses upon preventative actions to be taken by the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ for the mitigation of Sustained Outage risk when temporarily constrained from performing vegetation maintenance. The intent of this requirement is to deal with situations that prevent the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ from performing planned vegetation management work and, as a result, have the potential to put the transmission line at risk. Constraints to performing vegetation maintenance work as planned could result from legal injunctions filed by property owners, the discovery of easement stipulations which limit the ~~Transmission-applicable Transmission Owner's or applicable Generator Owner's~~ ~~Owner's~~ rights, or other circumstances.

This requirement is not intended to address situations where the transmission line is not at potential risk and the work event can be rescheduled or re-planned using an alternate work methodology. For example, a land owner may prevent the planned use of chemicals on non-threatening, low growth vegetation but agree to the use of mechanical clearing. In this case the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ is not under any immediate time constraint for achieving the management objective, can easily reschedule work using an alternate approach, and therefore does not need to take interim corrective action.

However, in situations where transmission line reliability is potentially at risk due to a constraint, the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ is required to take an interim corrective action to mitigate the potential risk to the transmission line. A wide range of actions can be taken to address various situations. General considerations include:

- Identifying locations where the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ ~~Owner~~ is constrained from performing planned vegetation maintenance work which potentially leaves the transmission line at risk.
- Developing the specific action to mitigate any potential risk associated with not performing the vegetation maintenance work as planned.
- Documenting and tracking the specific action taken for each location.

- In developing the specific action to mitigate the potential risk to the transmission line the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ Owner could consider location specific measures such as modifying the inspection and/or maintenance intervals. Where a legal constraint would not allow any vegetation work, the interim corrective action could include limiting the loading on the transmission line.
- The ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ Owner should document and track the specific corrective action taken at each location. This location may be indicated as one span, one tree or a combination of spans on one property where the constraint is considered to be temporary.

Requirement R6:

R6 is a risk-based requirement. This requirement sets a minimum time period for completing Vegetation Inspections that fits general industry practice. In addition, the fact that Vegetation Inspections can be performed in conjunction with general line inspections further facilitates an ~~Transmission-applicable Transmission Owner’s or applicable Generator Owner’s~~ Owner’s ability to meet this requirement. However, the ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ Owner may determine that more frequent inspections are needed to maintain reliability levels, dependent upon such factors as anticipated growth rates of the local vegetation, length of the growing season for the geographical area, limited ROW width, and rainfall amounts. Therefore it is expected that some transmission lines may be designated with a higher frequency of inspections.

The VSL for Requirement R6 has VSL categories ranked by the percentage of the required ROW inspections completed. To calculate the percentage of inspection completion, the ~~Transmission applicable Transmission Owner or applicable Generator Owner~~ Owner may choose units such as: line miles or kilometers, circuit miles or kilometers, pole line miles, ROW miles, etc.

For example, when an ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ Owner operates 2,000 miles of 230 kV transmission lines this ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ Owner will be responsible for inspecting all 2,000 miles of 230 kV transmission lines at least once during the calendar year. If one of the included lines was 100 miles long, and if it was not inspected during the year, then the amount failed to inspect would be $100/2000 = 0.05$ or 5%. The “Low VSL” for R6 would apply in this example.

Requirement R7:

R7 is a risk-based requirement. The ~~Transmission-applicable Transmission Owner or applicable Generator Owner~~ Owner is required to implement an annual work plan for vegetation management to accomplish the purpose of this standard. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made and

documented provided they do not put the transmission system at risk. The annual work plan requirement is not intended to necessarily require a “span-by-span”, or even a “line-by-line” detailed description of all work to be performed. It is only intended to require that the ~~Transmission-applicable Transmission Owner or applicable Generator Owner Owner~~ provide evidence of annual planning and execution of a vegetation management maintenance approach which successfully prevents encroachment of vegetation into the MVCD.

The ability to modify the work plan allows the ~~Transmission-applicable Transmission Owner or applicable Generator Owner Owner~~ to change priorities or treatment methodologies during the year as conditions or situations dictate. For example recent line inspections may identify unanticipated high priority work, weather conditions (drought) could make herbicide application ineffective during the plan year, or a major storm could require redirecting local resources away from planned maintenance. This situation may also include complying with mutual assistance agreements by moving resources off the ~~Transmission-applicable Transmission Owner’s or applicable Generator Owner’s Owner’s~~ system to work on another system. Any of these examples could result in acceptable deferrals or additions to the annual work plan. Modifications to the annual work plan must always ensure the reliability of the electric Transmission system.

In general, the vegetation management maintenance approach should use the full extent of the ~~Transmission-applicable Transmission Owner’s or applicable Generator Owner’s Owner’s~~ easement, fee simple and other legal rights allowed. -A comprehensive approach that exercises the full extent of legal rights on the -ROW is superior to incremental management in the long term because it reduces the overall potential for encroachments, and it ensures that future planned work and future planned inspection cycles are sufficient.

When developing the annual work plan the ~~Transmission-applicable Transmission Owner or applicable Generator Owner Owner~~ should allow time for procedural requirements to obtain permits to work on federal, state, provincial, public, tribal lands. In some cases the lead time for obtaining permits may necessitate preparing work plans more than a year prior to work start dates. ~~Transmission-Applicable Transmission Owners or applicable Generator Owners Owners~~ may also need to consider those special landowner requirements as documented in easement instruments.

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Therefore, deferrals or relevant changes to the annual plan shall be documented. Depending on the planning and documentation format used by the ~~applicable Transmission Owner or applicable Generator Owner Transmission Owner~~, evidence of successful annual work plan execution could consist of signed-off work orders, signed contracts, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, or paid invoices. Other evidence may include photographs, and walk-through reports.

Notes:

The SDT determined that the use of IEEE 516-2003 in version 1 of FAC-003 was a misapplication. The SDT consulted specialists who advised that the Gallet Equation would be a technically justified method. The explanation of why the Gallet approach is more appropriate is explained in the paragraphs below.

The drafting team sought a method of establishing minimum clearance distances that uses realistic weather conditions and realistic maximum transient over-voltages factors for in-service transmission lines.

The SDT considered several factors when looking at changes to the minimum vegetation to conductor distances in FAC-003-1:

- avoid the problem associated with referring to tables in another standard (IEEE-516-2003)
- transmission lines operate in non-laboratory environments (wet conditions)
- transient over-voltage factors are lower for in-service transmission lines than for inadvertently re-energized transmission lines with trapped charges.

FAC-003-1 uses the minimum air insulation distance (MAID) without tools formula provided in IEEE 516-2003 to determine the minimum distance between a transmission line conductor and vegetation. The equations and methods provided in IEEE 516 were developed by an IEEE Task Force in 1968 from test data provided by thirteen independent laboratories. The distances provided in IEEE 516 Tables 5 and 7 are based on the withstand voltage of a dry rod-rod air gap, or in other words, dry laboratory conditions. Consequently, the validity of using these distances in an outside environment application has been questioned.

FAC-003-01 allowed Transmission Owners to use either Table 5 or Table 7 to establish the minimum clearance distances. Table 5 could be used if the Transmission Owner knew the maximum transient over-voltage factor for its system. Otherwise, Table 7 would have to be used. Table 7 represented minimum air insulation distances under the worst possible case for transient over-voltage factors. These worst case transient over-voltage factors were as follows: 3.5 for voltages up to 362 kV phase to phase; 3.0 for 500 - 550 kV phase to phase; and 2.5 for 765 to 800 kV phase to phase. These worst case over-voltage factors were also a cause for concern in this particular application of the distances.

In general, the worst case transient over-voltages occur on a transmission line that is inadvertently re-energized immediately after the line is de-energized and a trapped charge is still present. The intent of FAC-003 is to keep a transmission line that is *in service* from becoming de-energized (i.e. tripped out) due to spark-over from the line conductor to nearby vegetation. Thus, the worst case transient overvoltage assumptions are not appropriate for this application. Rather, the appropriate over voltage values are those that occur only while the line is energized.

Typical values of transient over-voltages of in-service lines, as such, are not readily available in the literature because they are negligible compared with the maximums. A conservative value for the maximum transient over-voltage that can occur anywhere along the length of an in-service ac line is approximately 2.0 per unit. This value is a conservative estimate of the transient over-voltage that is created at the point of application (e.g. a substation) by switching a capacitor bank without pre-insertion devices (e.g. closing resistors). At voltage levels where capacitor banks are not very common (e.g. 362 kV), the maximum transient over-voltage of an in-service ac line are created by fault initiation on adjacent ac lines and shunt reactor bank switching. These transient voltages are usually 1.5 per unit or less.

Even though these transient over-voltages will not be experienced at locations remote from the bus at which they are created, in order to be conservative, it is assumed that all nearby ac lines are subjected to this same level of over-voltage. Thus, a maximum transient over-voltage factor of 2.0 per unit for transmission lines operated at 242 kV and below is considered to be a realistic maximum in this application. Likewise, for ac transmission lines operated at 362 kV and above a transient over-voltage factor of 1.4 per unit is considered a realistic maximum.

The Gallet Equations are an accepted method for insulation coordination in tower design. These equations are used for computing the required strike distances for proper transmission line insulation coordination. They were developed for both wet and dry applications and can be used with any value of transient over-voltage factor. The Gallet Equation also can take into account various air gap geometries. This approach was used to design the first 500 kV and 765 kV lines in North America [1].

If one compares the MAID using the IEEE 516-2003 Table 7 (table D.5 for English values) with the critical spark-over distances computed using the Gallet wet equations, for each of the nominal voltage classes and identical transient over-voltage factors, the Gallet equations yield a more conservative (larger) minimum distance value.

Distances calculated from either the IEEE 516 (dry) formulas or the Gallet “wet” formulas are not vastly different when the same transient overvoltage factors are used; the “wet” equations will consistently produce slightly larger distances than the IEEE 516 equations when the same transient overvoltage is used. While the IEEE 516 equations were only developed for dry conditions the Gallet equations have provisions to calculate spark-over distances for both wet and dry conditions.

While EPRI is currently trying to establish empirical data for spark-over distances to live vegetation, there are no spark-over formulas currently derived expressly for vegetation to conductor minimum distances. Therefore the SDT chose a proven method that has been used in other EHV applications. The Gallet equations relevance to wet conditions and the selection of a Transient Overvoltage Factor that is consistent with the absence of trapped charges on an in-service transmission line make this methodology a better choice.

The following table is an example of the comparison of distances derived from IEEE 516 and the Gallet equations using various transient overvoltage values.

**Comparison of spark-over distances computed using Gallet wet equations
vs.
IEEE 516-2003 MAID distances
using various transient over-voltage factors**

Implementation Plan for FAC-003-3 – Vegetation Management

Prerequisite Approvals

FAC-003-2 – Vegetation Management must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. All requirements and the two revised definitions in the proposed standard FAC-003-2 will be retired when FAC-003-3 becomes effective.

Compliance with Standard

There are no changes to the requirements applicable to Transmission Owners already proposed in FAC-003-2, and the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to Version 2 of the standard only address Generator Owner applicability and requirements (add Generator Owner to sections 4.1.2 and 4.3 and add applicable Generator Owner to all requirements). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

To reach compliance with the standard, a Generator Owner will have to perform a full review of as-built drawings and determine which generation interconnection Facilities require a Transmission Vegetation Management Plan (TVMP) and inspection as specified by NERC Reliability Standard FAC-003-3. In general, Generator Owners do not have staff that are qualified and experienced to create a TVMP, perform Right-of-Way inspections, and perform any required tree trimming (as is required by FAC-003-3 Requirement 1.3). Once a complete inventory is created, the Generator Owner will begin the process of gathering information for the TVMP. In instances where the generation interconnection Facilities are owned by a partnership, a majority or operating partner will need to obtain partnership approval to proceed with procurement of a TVMP expert, and later a tree trimming crew. Typically, a request for proposal to hire TVMP consultant is initiated which could take several weeks in order to obtain sufficient bids (and also satisfy Sarbanes Oxley requirements). Once all bids have been received, a contract with a TVMP consultant is signed. At this point, the TVMP consultant and Generator Owner staff will develop the TVMP, which needs to take into account local growth conditions, types of vegetation and other aspects required by FAC-003. Once the TVMP is developed, Generator Owner staff and the TVMP consultant will need to perform a Right-of-Way inspection (as required in FAC-003-3 Requirement 1), usually done using GPS, LIDAR and other tools by experienced and qualified staff.

Once a Right-of-Way inspection is completed and clearances are required, the Generator Owner will need to issue a request for proposal to hire a tree trimming crew that is qualified and experienced to perform required clearance trimming. Once all bids have been received, a contract with a tree trimming crew is signed. When the tree trimming crew is acquired, the crew will need to familiarize themselves with the entity's TVMP and required clearances. The Generator Owner will typically need to schedule any required outages in order for the tree

trimming crew to perform the needed clearance trimming. This action would also include the implementation of the work plan as required in FAC-003-3 Requirement 2. During scheduled outages, if required, the tree trimming crew will perform any required clearances and document the activities.

Another typical action is the Generator Owner establishing a system for maintaining TVMP-related activities, including maintenance of inspection and clearance documentation (as required in FAC-003-3 Requirement 1.2). On an ongoing basis, in addition to performing inspections and clearances as required by the entity's TVMP, the Generator Owner will need to ensure that the training and qualification requirements for the standard are met. The entity will also need to maintain documentation of all FAC-003-3 activities for compliance period of one year to meet compliance with the standard.

Again, due to a typical lack of experience and qualifications required by FAC-003-3, compliance with this standard by a Generator Owner may take as long as two years – in part because many entities will have generator interconnection Facilities in various parts of the country which may require several instances of TVMP and numerous Right-of-Way inspections.

Effective Date

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Exceptions:

A line operated below 200kV, designated by the Planning Coordinator as an element of an IROL or as a Major WECC transfer path, becomes subject to this standard 12 months after the date the Planning Coordinator or WECC initially designates the line as being subject to this standard.

An existing transmission line operated at 200kV or higher that is newly acquired by an asset owner and was not previously subject to this standard, becomes subject to this standard 12 months after the acquisition date of the line.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary. When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Right-of-Way (ROW)

A corridor of land on which electric lines may be located. The applicable Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of this NERC term was modified to include applicable Generator Owners.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC's Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has developed two sets of proposed changes: one to this version, FAC-003-1, the current FERC-approved version of the standard, and one to FAC-003-2, the latest draft of Version 2 as proposed by the Project 2007-07 team

If FAC-003-2 is approved by NERC's BOT, the Project 2010-07 drafting team will likely proceed with the modifications it has proposed in the redline to that version of the standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. FAC-003-2 would be retired once FAC-003-3 was approved.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with the changes to FAC-003-1 seen below to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability section, modifications to the NERC defined terms Right-of-Way to include Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

1. Title: Transmission Vegetation Management Program

2. Number: FAC-003-X

3. Purpose: To improve the reliability of the electric transmission systems by preventing outages from vegetation located on transmission rights-of-way (ROW) and minimizing outages from vegetation located adjacent to ROW, maintaining clearances between transmission lines and vegetation on and along transmission ROW, and reporting vegetation-related outages of the transmission systems to the respective Regional Entity (RE) and the North American Electric Reliability Council (NERC).

Within the text of NERC Reliability Standard FAC-003-X, "transmission line(s)" and "applicable line(s)" can also refer to the generation Facilities as referenced in 4.4 and its subsections.

4. Applicability:

4.1. Regional Entity.

4.2. Applicable Transmission Owner

4.2.1. Transmission Owner that owns overhead transmission lines operated at 200 kV and above and to any lower voltage lines designated by the RE as critical to the reliability of the electric system in the region.

4.3. Applicable Generator Owner

4.3.1. Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system and is operated at 200 kV and above and any lower voltage lines designated by the RE as critical to the reliability of the electric system in the region.

5. Effective Dates:

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

B. Requirements

R1. Each applicable Transmission Owner or applicable Generator Owner shall prepare, and keep current, a formal transmission vegetation management program (TVMP). The TVMP shall include the applicable Transmission Owner's or applicable Generator Owner's objectives, practices, approved procedures, and work specifications¹.

R1.1. The TVMP shall define a schedule for and the type (aerial, ground) of ROW vegetation inspections. This schedule should be flexible enough to adjust for changing conditions. The inspection schedule shall be based on the anticipated growth of vegetation and any other environmental or operational factors that could impact the relationship of vegetation to the applicable Transmission Owner's or applicable Generator Owner's transmission lines.

R1.2. Each applicable Transmission Owner or applicable Generator Owner, in the TVMP, shall identify and document clearances between vegetation and any overhead, ungrounded supply conductors, taking into consideration transmission line voltage, the effects of ambient temperature on conductor sag under maximum design loading, and the effects of wind velocities on conductor sway. Specifically, the applicable Transmission Owner or applicable Generator Owner shall establish clearances to be achieved at the time of vegetation management work identified herein as Clearance 1, and shall also establish and maintain a set of clearances identified herein as Clearance 2 to prevent flashover between vegetation and overhead ungrounded supply conductors.

R1.2.1. Clearance 1 — The applicable Transmission Owner or applicable Generator Owner shall determine and document appropriate clearance distances to be achieved at the time of transmission vegetation management work based upon local conditions and the expected time frame in which the applicable

¹ ANSI A300, Tree Care Operations – Tree, Shrub, and Other Woody Plant Maintenance – Standard Practices, while not a requirement of this standard, is considered to be an industry best practice.

Transmission Owner or applicable Generator Owner plans to return for future vegetation management work. Local conditions may include, but are not limited to: operating voltage, appropriate vegetation management techniques, fire risk, reasonably anticipated tree and conductor movement, species types and growth rates, species failure characteristics, local climate and rainfall patterns, line terrain and elevation, location of the vegetation within the span, and worker approach distance requirements. Clearance 1 distances shall be greater than those defined by Clearance 2 below.

R1.2.2. Clearance 2 — The applicable Transmission Owner or applicable Generator Owner shall determine and document specific radial clearances to be maintained between vegetation and conductors under all rated electrical operating conditions. These minimum clearance distances are necessary to prevent flashover between vegetation and conductors and will vary due to such factors as altitude and operating voltage. These applicable Transmission Owner-specific or applicable Generator Owner-specific minimum clearance distances shall be no less than those set forth in the Institute of Electrical and Electronics Engineers (IEEE) Standard 516-2003 (*Guide for Maintenance Methods on Energized Power Lines*) and as specified in its Section 4.2.2.3, Minimum Air Insulation Distances without Tools in the Air Gap.

R1.2.2.1 Where transmission system transient overvoltage factors are not known, clearances shall be derived from Table 5, IEEE 516-2003, phase-to-ground distances, with appropriate altitude correction factors applied.

R1.2.2.2 Where transmission system transient overvoltage factors are known, clearances shall be derived from Table 7, IEEE 516-2003, phase-to-phase voltages, with appropriate altitude correction factors applied.

R1.3. All personnel directly involved in the design and implementation of the TVMP shall hold appropriate qualifications and training, as defined by the Transmission Owner or Generator Owner, to perform their duties.

R1.4. Each applicable Transmission Owner or applicable Generator Owner shall develop mitigation measures to achieve sufficient clearances for the protection of the transmission facilities when it identifies locations on the ROW where the Transmission Owner or applicable Generator Owner is restricted from attaining the clearances specified in Requirement 1.2.1.

R1.5. Each Transmission Owner or applicable Generator Owner shall establish and document a process for the immediate communication of vegetation conditions that present an imminent threat of a transmission line outage. This is so that action (temporary reduction in line rating, switching line out of service, etc.) may be taken until the threat is relieved.

[VRF – High]

R2. Each applicable Transmission Owner or applicable Generator Owner shall create and implement an annual plan for vegetation management work to ensure the reliability of the system. The plan shall describe the methods used, such as manual clearing, mechanical clearing, herbicide treatment, or other actions. The plan should be flexible enough to adjust to changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors that may have an impact on the reliability of the transmission systems. Adjustments to the plan shall be documented as they occur. The plan should take into consideration the time required to obtain permissions or permits from landowners or

regulatory authorities. Each applicable Transmission Owner or applicable Generator Owner shall have systems and procedures for documenting and tracking the planned vegetation management work and ensuring that the vegetation management work was completed according to work specifications.

[VRF – High]

- R3.** Each applicable Transmission Owner or applicable Generator Owner shall report quarterly to its RE, or the RE's designee, sustained transmission line outages determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation.
- R3.1.** Multiple sustained outages on an individual line, if caused by the same vegetation, shall be reported as one outage regardless of the actual number of outages within a 24-hour period.
- R3.2.** The applicable Transmission Owner or applicable Generator Owner is not required to report to the RE, or the RE's designee, certain sustained transmission line outages caused by vegetation: (1) Vegetation-related outages that result from vegetation falling into lines from outside the ROW that result from natural disasters shall not be considered reportable (examples of disasters that could create non-reportable outages include, but are not limited to, earthquakes, fires, tornados, hurricanes, landslides, wind shear, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods), and (2) Vegetation-related outages due to human or animal activity shall not be considered reportable (examples of human or animal activity that could cause a non-reportable outage include, but are not limited to, logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation).
- R3.3.** The outage information provided by the applicable Transmission Owner or applicable Generator Owner to the RE, or the RE's designee, shall include at a minimum: the name of the circuit(s) outaged, the date, time and duration of the outage; a description of the cause of the outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.
- R3.4.** An outage shall be categorized as one of the following:
- R3.4.1.** Category 1 — Grow-ins: Outages caused by vegetation growing into lines from vegetation inside and/or outside of the ROW;
 - R3.4.2.** Category 2 — Fall-ins: Outages caused by vegetation falling into lines from inside the ROW;
 - R3.4.3.** Category 3 — Fall-ins: Outages caused by vegetation falling into lines from outside the ROW.

[VRF – Lower]

- R4.** The RE shall report the outage information provided to it by applicable Transmission Owners or applicable Generator Owners, as required by Requirement 3, quarterly to NERC, as well as any actions taken by the RE as a result of any of the reported outages.

[VRF – Lower]

C. Measures

- M1.** Each applicable Transmission Owner or applicable Generator Owner has a documented TVMP, as identified in Requirement 1.

- M1.1.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the applicable Transmission Owner or applicable Generator Owner performed the vegetation inspections as identified in Requirement 1.1.
- M1.2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that describes the clearances identified in Requirement 1.2.
- M1.3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the personnel directly involved in the design and implementation of the applicable Transmission Owner's or applicable Generator Owner TVMP hold the qualifications identified by the Transmission Owner or applicable Generator Owner as required in Requirement 1.3.
- M1.4.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has identified any areas not meeting the applicable Transmission Owner's or applicable Generator Owner's standard for vegetation management and any mitigating measures the Transmission Owner or applicable Generator Owner has taken to address these deficiencies as identified in Requirement 1.4.
- M1.5.** Each applicable Transmission Owner or applicable Generator Owner has a documented process for the immediate communication of imminent threats by vegetation as identified in Requirement 1.5.
- M2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the Transmission Owner implemented the work plan identified in Requirement 2.
- M3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has supplied quarterly outage reports to the RE, or the RE's designee, as identified in Requirement 3.
- M4.** The RE has documentation that it provided quarterly outage reports to NERC as identified in Requirement 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor:

- Regional Entity for the Transmission Owner and Generator Owner
- Electric Reliability Organization or another Regional Entity for the Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The applicable Transmission Owner and applicable Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance

Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The applicable Transmission Owner and applicable Generator Owner shall retain evidence of Requirement 1, Measure 1, Requirement 2, Measure 2, and Requirement 3, Measure 3 from its last audit.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC’s Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has develop two sets of proposed changes: one to this version, FAC-003-1, the current FERC-approved version of the standard, and one to FAC-003-2, the latest draft of Version 2 as proposed by the Project 2007-07 team

If FAC-003-2 is approved by NERC’s BOT, the Project 2010-07 drafting team will likely proceed with the modifications it has proposed in the redline to that version of the standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. FAC-003-2 would be retired once FAC-003-03 was approved.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with the changes to FAC-003-1 seen below to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability section, modifications to the NERC defined terms Right-of-Way to include Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

1. Title: Transmission Vegetation Management Program

2. Number: FAC-003-X4

3. Purpose: To improve the reliability of the electric transmission systems by preventing outages from vegetation located on transmission rights-of-way (ROW) and minimizing outages from vegetation located adjacent to ROW, maintaining clearances between transmission lines and vegetation on and along transmission ROW, and reporting vegetation-related outages of the transmission systems to the respective Regional ~~Reliability Organizations Entity~~ (RRØRE) and the North American Electric Reliability Council (NERC).

Within the text of NERC Reliability Standard FAC-003-X, “transmission line(s)” and “applicable line(s)” can also refer to the generation Facilities as referenced in 4.4 and its subsections.

4. Applicability:

4.1. Regional Entity.

4.2. Applicable Transmission Owner

4.2.1. Transmission Owner that owns overhead transmission lines operated at 200 kV and above and to any lower voltage lines designated by the RE as critical to the reliability of the electric system in the region.

4.3. Applicable Generator Owner

4.3.1. Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system and is operated at 200 kV and above and any lower voltage lines designated by the RE as critical to the reliability of the electric system in the region.

~~**4.1. Transmission Owner.**~~

~~**4.2. Regional Reliability Organization.**~~

~~**4.3. This standard shall apply to all transmission lines operated at 200 kV and above and to any lower voltage lines**~~

~~designated by the RRO as critical to the reliability of the electric system in the region.~~

5. Effective Dates:

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

~~5.1. One calendar year from the date of adoption by the NERC Board of Trustees for Requirements 1 and 2.~~

~~5.2. Sixty calendar days from the date of adoption by the NERC Board of Trustees for Requirements 3 and 4.~~

B. Requirements

R1. ~~The~~ Each applicable Transmission Owner or applicable Generator Owner shall prepare, and keep current, a formal transmission vegetation management program (TVMP). The TVMP shall include the applicable Transmission Owner's or applicable Generator Owner's objectives, practices, approved procedures, and work specifications¹.

R1.1. The TVMP shall define a schedule for and the type (aerial, ground) of ROW vegetation inspections. This schedule should be flexible enough to adjust for changing conditions. The inspection schedule shall be based on the anticipated growth of vegetation and any other environmental or operational factors that could impact the relationship of vegetation to the applicable Transmission Owner's or applicable Generator Owner's transmission lines.

R1.2. ~~Each applicable~~ The Transmission Owner or applicable Generator Owner, in the TVMP, shall identify and document clearances between vegetation and any overhead, ungrounded supply conductors, taking into consideration transmission line voltage, the

¹ ANSI A300, Tree Care Operations – Tree, Shrub, and Other Woody Plant Maintenance – Standard Practices, while not a requirement of this standard, is considered to be an industry best practice.

effects of ambient temperature on conductor sag under maximum design loading, and the effects of wind velocities on conductor sway. Specifically, the applicable Transmission Owner or applicable Generator Owner shall establish clearances to be achieved at the time of vegetation management work identified herein as Clearance 1, and shall also establish and maintain a set of clearances identified herein as Clearance 2 to prevent flashover between vegetation and overhead ungrounded supply conductors.

R1.2.1. Clearance 1 — The applicable Transmission Owner or applicable Generator Owner shall determine and document appropriate clearance distances to be achieved at the time of transmission vegetation management work based upon local conditions and the expected time frame in which the applicable Transmission Owner or applicable Generator Owner plans to return for future vegetation management work. Local conditions may include, but are not limited to: operating voltage, appropriate vegetation management techniques, fire risk, reasonably anticipated tree and conductor movement, species types and growth rates, species failure characteristics, local climate and rainfall patterns, line terrain and elevation, location of the vegetation within the span, and worker approach distance requirements. Clearance 1 distances shall be greater than those defined by Clearance 2 below.

R1.2.2. Clearance 2 — The applicable Transmission Owner or applicable Generator Owner shall determine and document specific radial clearances to be maintained between vegetation and conductors under all rated electrical operating conditions. These minimum clearance distances are necessary to prevent flashover between vegetation and conductors and will vary due to such factors as altitude and operating voltage. These applicable Transmission Owner-specific or applicable Generator Owner-specific minimum clearance distances shall be no less than those set forth in the Institute of Electrical and Electronics Engineers (IEEE) Standard 516-2003 (*Guide for Maintenance Methods on Energized Power Lines*) and as specified in its Section 4.2.2.3, Minimum Air Insulation Distances without Tools in the Air Gap.

R1.2.2.1 Where transmission system transient overvoltage factors are not known, clearances shall be derived from Table 5, IEEE 516-2003, phase-to-ground distances, with appropriate altitude correction factors applied.

R1.2.2.2 Where transmission system transient overvoltage factors are known, clearances shall be derived from Table 7, IEEE 516-2003, phase-to-phase voltages, with appropriate altitude correction factors applied.

R1.3. All personnel directly involved in the design and implementation of the TVMP shall hold appropriate qualifications and training, as defined by the Transmission Owner or Generator Owner, to perform their duties.

R1.4. ~~Each applicable~~ Each Transmission Owner or applicable Generator Owner shall develop mitigation measures to achieve sufficient clearances for the protection of the transmission facilities when it identifies locations on the ROW where the Transmission Owner or applicable Generator Owner is restricted from attaining the clearances specified in Requirement 1.2.1.

R1.5. Each Transmission Owner or applicable Generator Owner shall establish and document a process for the immediate communication of vegetation conditions that present an imminent threat of a transmission line outage. This is so that action

(temporary reduction in line rating, switching line out of service, etc.) may be taken until the threat is relieved.

[VRF – High]

- R2.** Each applicable ~~The~~ Transmission Owner or applicable Generator Owner shall create and implement an annual plan for vegetation management work to ensure the reliability of the system. The plan shall describe the methods used, such as manual clearing, mechanical clearing, herbicide treatment, or other actions. The plan should be flexible enough to adjust to changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors that may have an impact on the reliability of the transmission systems. Adjustments to the plan shall be documented as they occur. The plan should take into consideration the time required to obtain permissions or permits from landowners or regulatory authorities. Each applicable Transmission Owner or applicable Generator Owner shall have systems and procedures for documenting and tracking the planned vegetation management work and ensuring that the vegetation management work was completed according to work specifications.

[VRF – High]

- R3.** Each applicable~~The~~ Transmission Owner or applicable Generator Owner shall report quarterly to its ~~NERRO~~, or the ~~NERRO~~'s designee, sustained transmission line outages determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation.
- R3.1.** Multiple sustained outages on an individual line, if caused by the same vegetation, shall be reported as one outage regardless of the actual number of outages within a 24-hour period.
- R3.2.** The applicable Transmission Owner or applicable Generator Owner is not required to report to the ~~NERRO~~, or the ~~NERRO~~'s designee, certain sustained transmission line outages caused by vegetation: (1) Vegetation-related outages that result from vegetation falling into lines from outside the ROW that result from natural disasters shall not be considered reportable (examples of disasters that could create non-reportable outages include, but are not limited to, earthquakes, fires, tornados, hurricanes, landslides, wind shear, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods), and (2) Vegetation-related outages due to human or animal activity shall not be considered reportable (examples of human or animal activity that could cause a non-reportable outage include, but are not limited to, logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation).
- R3.3.** The outage information provided by the applicable Transmission Owner or applicable Generator Owner to the ~~NERRO~~, or the ~~NERRO~~'s designee, shall include at a minimum: the name of the circuit(s) outaged, the date, time and duration of the outage; a description of the cause of the outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.
- R3.4.** An outage shall be categorized as one of the following:
- R3.4.1.** Category 1 — Grow-ins: Outages caused by vegetation growing into lines from vegetation inside and/or outside of the ROW;
- R3.4.2.** Category 2 — Fall-ins: Outages caused by vegetation falling into lines from inside the ROW;

R3.4.3. Category 3 — Fall-ins: Outages caused by vegetation falling into lines from outside the ROW.

~~[VRF – Lower]~~

R4. The ~~RERRO~~ shall report the outage information provided to it by applicable Transmission Owners or applicable Generator Owners²s, as required by Requirement 3, quarterly to NERC, as well as any actions taken by the ~~RERRO~~ as a result of any of the reported outages.

~~R4.~~~~[VRF – Lower]~~

C. Measures

M1. ~~Each applicable~~The Transmission Owner or applicable Generator Owner has a documented TVMP, as identified in Requirement 1.

M1.1. ~~Each applicable~~The Transmission Owner or applicable Generator Owner has documentation that the applicable Transmission Owner or applicable Generator Owner performed the vegetation inspections as identified in Requirement 1.1.

M1.2. ~~Each applicable~~The Transmission Owner or applicable Generator Owner has documentation that describes the clearances identified in Requirement 1.2.

M1.3. ~~Each applicable~~The Transmission Owner or applicable Generator Owner has documentation that the personnel directly involved in the design and implementation of the applicable Transmission Owner's or applicable Generator Owner TVMP hold the qualifications identified by the Transmission Owner or applicable Generator Owner as required in Requirement 1.3.

M1.4. ~~Each applicable~~The Transmission Owner or applicable Generator Owner has documentation that it has identified any areas not meeting the applicable Transmission Owner's or applicable Generator Owner's standard for vegetation management and any mitigating measures the Transmission Owner or applicable Generator Owner has taken to address these deficiencies as identified in Requirement 1.4.

M1.5. ~~Each applicable~~The Transmission Owner or applicable Generator Owner has a documented process for the immediate communication of imminent threats by vegetation as identified in Requirement 1.5.

M2. ~~Each applicable~~ The Transmission Owner or applicable Generator Owner has documentation that the Transmission Owner implemented the work plan identified in Requirement 2.

M3. ~~Each applicable~~The Transmission Owner or applicable Generator Owner has documentation that it has supplied quarterly outage reports to the ~~RERRO~~, or the ~~RERRO~~'s designee, as identified in Requirement 3.

M4. The ~~RERRO~~ has documentation that it provided quarterly outage reports to NERC as identified in Requirement 4.

D. Compliance

1. Compliance Monitoring Process

~~1.1.~~ Compliance Monitoring Responsibility Enforcement Authority

~~1.2.1.1.~~

~~1.1.~~ Compliance Monitor:

- ~~1.1.~~ Regional Entity for the Transmission Owner and Generator Owner

- Electric Reliability Organization or another Regional Entity for the Regional Entity

~~1.1.~~

~~RRO~~

~~NERC~~

~~1.2.~~ **Compliance Monitoring ~~Period and Reset~~**

~~1.2.~~ One-calendar Year ~~and Enforcement Processes:~~

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

~~E.~~ **Data Retention**

~~1.3.~~

The applicable Transmission Owner and applicable Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The applicable Transmission Owner and applicable Generator Owner shall retain evidence of Requirement 1, Measure 1, Requirement 2, Measure 2, and Requirement 3, Measure 3 from its last audit.

~~Five Years~~

~~1.1.1.4.~~ **Additional Compliance Information**

~~1.4.~~ None.

~~The Transmission Owner shall demonstrate compliance through self-certification submitted to the compliance monitor (RRO) annually that it meets the requirements of NERC Reliability Standard FAC-003-1. The compliance monitor shall conduct an on-site audit every five years or more frequently as deemed appropriate by the compliance monitor to review documentation related to Reliability Standard FAC-003-1. Field audits of ROW vegetation conditions may be conducted if determined to be necessary by the compliance monitor.~~

Implementation Plan for FAC-003-X – Transmission Vegetation Management Program

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. FAC-003-1 will be retired when FAC-003-2 becomes effective.

Compliance with Standard

There are no changes to the requirements applicable to Transmission Owners already in effect in FAC-003-1, and the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to FAC-003-1 only address Generator Owner applicability and requirements (add Generator Owner to section 4.3 and add applicable Generator Owner to all requirements). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

To reach compliance with the standard, a Generator Owner will have to perform a full review of as-built drawings and determine which generation interconnection Facilities require a Transmission Vegetation Management Plan (TVMP) and inspection as specified by NERC Reliability Standard FAC-003-X. In general, Generator Owners do not have staff that are qualified and experienced to create a TVMP and implement annual plans for vegetation management. Once a complete inventory is created, the Generator Owner will begin the process of gathering information for the TVMP. In instances where the generation interconnection Facilities are owned by a partnership, a majority or operating partner will need to obtain partnership approval to proceed with procurement of a TVMP expert, and later a tree trimming crew. Typically, a request for proposal to hire TVMP consultant is initiated, which could take several weeks in order to obtain sufficient bids (and also satisfy Sarbanes Oxley requirements). Once all bids have been received, a contract with a TVMP consultant is signed. At this point, the TVMP consultant and Generator Owner staff will develop the TVMP, which needs to take into account local growth conditions, types of vegetation and other aspects required by FAC-003-X. Once the TVMP is developed, Generator Owner staff and the TVMP consultant will need to perform a Right-of-Way inspection, usually done using GPS, LIDAR and other tools by experienced and qualified staff.

Once a Right-of-Way inspection is completed and clearances are required, the Generator Owner will need to issue a request for proposal to hire a tree trimming crew that is qualified and experienced to perform required clearance trimming. Once all bids have been received, a contract with a tree trimming crew is signed. When the tree trimming

crew is acquired, the crew will need to familiarize themselves with the entity's TVMP and required clearances. The Generator Owner will typically need to schedule any required outages in order for the tree trimming crew to perform the needed clearance trimming. This action would also include the implementation of the work plan. During scheduled outages, if required, the tree trimming crew will perform any required clearances and document the activities.

Another typical action is the Generator Owner establishing a system for maintaining TVMP-related activities, including maintenance of inspection and clearance documentation. On an ongoing basis, in addition to performing inspections and clearances as required by the entity's TVMP, the Generator Owner will need to ensure that the training and qualification requirements for the standard are met. The entity will also need to maintain documentation of all FAC-003-X activities for compliance period of one year to meet compliance with the standard.

Again, due to a typical lack of experience and qualifications required by FAC-003-X, compliance with this standard by a Generator Owner may take as long as two years – in part because many entities will have generator interconnection Facilities in various parts of the country which may require several instances of TVMP and numerous Right-of-Way inspections.

Effective Date

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document

Introduction

The integrated grid consists of many parts such as power plants, Transmission, and Facilities¹, some of which are known as generator interconnection Facilities and operate like extension cords to connect generating plants to the overall interconnected grid. Some plants consist of just a single generating unit, other plants consist of multiple generating units, and still others consist of multiple generating units spread over several thousand acres. While not all power plants and their associated Facilities are considered part of the Bulk Electric System (BES)², of concern is how to classify all such generating Facilities, including their generator interconnection Facilities, to ensure that NERC's Reliability Standards provide an appropriate level of reliability for the BES.

When such generator interconnection Facilities are owned by the Generator Owner, are part of the BES, and meet the criteria in the *Statement of Compliance Registry Criteria*, the Project 2010-07—Generator Requirements at the Transmission Interface standard drafting team (drafting team) concludes that such Facilities are only to be included in the reliability standards requirements applicable to the Generator Owner or Generator Operator. To ensure that responsibility for the generator interconnection Facilities is included in all necessary standards, however, a select number of standards need to have Generator Owners added to their applicability.

Objective

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. The drafting team believes it is appropriate to classify various generating Facilities and Elements (sometimes including generator interconnection Facilities) as part of the BES. That does not mean, however, that a Generator Owner or Generator Operator should be required to automatically register as a Transmission Owner or Transmission Operator simply because it owns and/or operates BES Elements or Facilities that are considered by some entities to be Transmission. While Generator Owners and Generator Operators meeting the criteria in the *Statement of Compliance Registry Criteria* own and operate Elements and Facilities that are considered by some entities to be Transmission, these are most often not part of the integrated grid, and as such should not be subject to all of the same standards applicable to Transmission Owners and Transmission Operators who own and operate transmission Elements and Facilities that are part of the integrated grid.

¹ "Facility" is defined in [NERC's Glossary of Terms](#) as "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)."

² The current definition of "Bulk Electric System" in the [NERC's Glossary of Terms](#) reads: "As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition." The drafting team interprets "electrical generation resources" as inclusive of generator interconnection Facilities. Note that this definition is undergoing significant revision under [Project 2010-17—Definition of Bulk Electric System](#).

When the Elements and Facilities owned and operated by Generator Owners and Generator Operators are considered by some entities to be Transmission and deemed part of the integrated grid, registering the Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator is appropriate. But most often the Facilities are limited to interconnecting generation to the Transmission system and as such have little, if any, measurable effect on the overall reliability of the BES. In fact, registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator may decrease reliability by diverting the Generator Owner's or Generator Operator's attention from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. This can be accomplished by properly applying selected standards or specific standard requirements to Generator Owners and Generator Operators. The drafting team recommends a plan to modify the requirements and measures of a selected number of standards to make them applicable to appropriate Generator Owners and Generator Operators.

Proposed Next Steps and Review of Reliability Standards

Below, the drafting team outlines its recommendations to clearly identify the appropriate generation Facilities and standards requirements that should apply to such generation Facilities to ensure that the reliability of the BES is maintained:

FAC-001-0—Facility Connection Requirements currently applies to Transmission Owners and addresses the need for Transmission Owners to establish Facility connection and performance requirements for interconnection to their Facilities. Because Generator Owners may be requested to allow interconnection to their Facilities, the STD recommends the following:

- Revise FAC-001 so that it applies to a Generator Owner if, and when, it executes an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility. (See accompanying draft standard FAC-001-1.)
 - In its first posting for informal comment, the drafting team set the “trigger” for the application of FAC-001 as the receipt of a request for interconnection. Many commenters disagreed with this approach and suggested that the “trigger” be based upon “the intent or obligation” to interconnect a new Facility to an existing interconnecting Facility that is owned by a generator. Accordingly, the drafting team has proposed language to address this concern. The intent of this modified language is to start the compliance clock at such time as the Generator Owner executes an Agreement to perform the reliability assessment required in FAC-002-1. This step should occur whether the generator voluntarily agrees to the interconnection request or is compelled by a regulatory body to do so. In either case, we expect the Generator Owner and the requestor to execute some form of Agreement. We intentionally excluded a specific reference to the form of Agreement (such as a feasibility study) in deference to comments that we should avoid comingling of commercial and reliability aspects in reliability standards.

FAC-003-2—Vegetation Management currently applies to Transmission Owners and addresses the need to maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission Rights-of-Way (ROW) and minimize encroachments from vegetation located adjacent to the ROW. It has been a major concern that certain types of Facilities used to interconnect generation be required to provide the same level of vegetation management as required for the Transmission Owner operating in the BES. Numerous comments requested a specific length for the interconnecting line before considering application of the standard. The drafting team recommends:

- Revise FAC-003 so that it applies to Generator Owners that own a Facility that extends greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation (up to the point of interconnection with the Transmission system). (See accompanying draft standards FAC-003-X and FAC-003-3.)
 - The drafting team elected to use the half-mile qualifier in its latest proposed changes. The GOTO Ad Hoc Group had originally proposed something similar, but their proposed criterion was a length of “two spans (generally one half mile from the generator property line).” The drafting team elected to use only the half-mile qualifier because it has been supported by industry comment and is clearer than referencing both two spans *and* the half-mile length. This distance is within the Generator Owner’s line of sight and could be visually monitored for vegetation conditions on a routine basis. Beyond the distance of one half mile, a vegetation management program is necessary to manage the Right-of-Way.
 - The drafting team also added text boxes to each proposed standard modification to help define certain terms within the context of the standard, rather than propose defined terms.

At this stage, the drafting team is developing two versions of proposed revisions to FAC-003: one to FAC-003-1, the current FERC-approved version of the standard (labeled FAC-003-X in accompanying documents) and one to FAC-003-2, the proposed version currently under development under Project 2007-07 (the Project 2010-07 team is labeling its revisions as FAC-003-3). See the accompanying proposed redline standards for further justification and detail.

The proposed changes listed above mark a significant decrease in changes originally proposed by the GOTO Ad Hoc Group in its [Final Report](#). The drafting team has again reviewed every reliability standard included in that report, as well as MOD and TPL standards identified in comments it has received. The drafting team does not believe that changes to reliability standards other than FAC-001 and FAC-003 are necessary to close any reliability gaps associated with generator interconnection Facilities that are non-network/non-integrated in nature (typically radial and used solely for the purpose of connecting the generating unit or units to the Transmission Facilities). Below, the drafting team has included its notes about why no other standards require modification as part of this project. The standards highlighted here are those about which questions were raised by commenters or regulatory staff:

- **COM-001-1.1:** This standard applies to entities with a wide-area view. The related responsibilities for Generator Operators are already addressed in COM-002-2.
- **EOP-005-2:** There was some concern that EOP-005 did not properly account for the Generator Operator’s responsibility when it comes to system restoration plans, but EOP-005-

2, R13 (which received regulatory approval on May 23, 2011) requires Generator Operators to have written Blackstart Resource Agreements or mutually agreed upon procedures or protocols with its Transmission Operator. Requirements R14 through R18 require the Generator Operator to develop procedures, test its blackstart generators, and provide related training.

- **MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1a, MOD-030-2:** To apply these standards to Generator Operators would require them to have a wide-area view of the integrated grid and to utilize commercially sensitive information that Generator Operators are currently precluded from viewing or using. In some cases, such as with MOD-001, the standard could only apply if a Generator Operator was registered as a Transmission Service Provider due to an interconnection service request and subsequently adopted an Open Access Transmission Tariff. The drafting team does not believe this is likely, unless ordered by FERC.
- **PER-002-0:** In Order 693, FERC directed NERC to “expand the applicability of the personnel training in Reliability Standard, PER-002-0, to include (i) generator operators centrally-located at a generation control center with a direct impact on the reliable operation of the Bulk-Power System...” In Order 742, the Commission said it is “not modifying the Order No. 693 directive regarding training for certain generator operator dispatch personnel, nor are we expanding a generator operator’s responsibilities.” This issue does not deal with generator interconnection Facilities and is thus outside the scope of Project 2010-07. The directive has been included in NERC’s issues database to be addressed in a future project.
- **PRC-001-1:** Generator Operators are already appropriately accounted for in this standard in requirements 1, 2, 3, and 5.
- **TOP-003-0:** TOP-003-0 already requires the Generator Owner to provide outage information to its Transmission Operator on a daily basis. Proposed TOP-003-2 R4 continues to make this responsibility clear by requiring Generator Owners and Generator Operators to satisfy the obligations of the Transmission Owner’s and Transmission Operator’s data specification plan.
- **TOP-006-2:** TOP-006-2 deals with general issues with generator reporting. Though not explicitly stated, Requirement R2 requires reporting of scheduled outages of equipment such as voltage regulators, shunt capacitors, etc. The drafting team believes that Elements associated with a generator interconnection Facility are to be reported under this requirement
- **VAR-001-1:** This standard also requires a wide-area view that is inappropriate for a Generator Operator. Generator Operators, for instance, should never be setting voltage schedules.
- **VAR-002-1.1b:** The drafting team received some comments expressing concern about capacitors under operational control of the Generator Operator. Requirement R3.2 requires notification for status or capability change on any other Reactive Power resources under the Generator Operator’s control and the expected duration of the change in status or capability. The drafting team believes that capacitors are included in this requirement.

The drafting team also decided not to propose new defined terms in the NERC Glossary, but has met with NERC and FERC staffs, regional compliance managers and industry organizations to discuss possible solutions to the issue of concern to most Generator Owners and Generator Operators – registration as Transmission Owners and Transmission Operators. The drafting team believes this issue has the attention of appropriate NERC and regional staffs and has volunteered to provide assistance in those groups’ efforts to address them. While these changes are not within the explicit

scope of the drafting team, the goal is to work with NERC and regional compliance enforcement and compliance registration staffs to develop a comprehensive package that will address all reliability gaps – whether real or perceived – so that entities are appropriately registered and the appropriate reliability standards are applied to those entities.

The drafting team acknowledges that there may be Elements and Facilities that are not radial or used solely for the purpose of connecting the generating unit(s) to Transmission Facilities. It is outside the scope of the drafting team to address this as part of its project, but it believes that the best way to address these non-radial Facilities is through changes to the criteria in the *Statement of Compliance Registry Criteria* as they apply to Generator Owner or Generator Operator. Trying to apply simple ‘bright line’ criteria to such Facilities as a drafting team would be a daunting task, as the configuration of interconnections is not consistent continent-wide, nor are all adjacent Elements and Facilities similar. Addressing these non-radial generator interconnection Facilities will require individual evaluations to ensure that no reliability gaps exist, and this is a task best suited to compliance staffs.

The drafting team also acknowledges that, if another party interconnects to a Facility owned by a Generator Owner, there may be the need to address MOD or TPL standards. However, the drafting team believes that this, too, is best handled through specific evaluation, perhaps accompanied by changes to the compliance registry. Entities that face this kind of scenario may also meet criteria applicable to other registrations such as Transmission Service Provider or Transmission Planner.

Other Solutions

Because the efforts outlined here will likely not take effect for a year or more, Generator Owners and Generator Operators that are concerned about their registration status should explore options like those explained below and in further detail in NERC Compliance Bulletin 2010-004.

On April 20, 2010, NERC Compliance published a [Public Bulletin](#) to provide guidance for situations like this, in which entities delegate reliability tasks to a third-party entity. In this bulletin, NERC Compliance emphasizes that while a registered entity may not delegate its responsibility for ensuring that a task is completed, it may delegate the performance of a task to another entity.

As is explained in the bulletin, compliance responsibility for applicable NERC Reliability Standard requirements and accountability for violations thereof may be achieved through several means, including the following:

1. By Individual: an entity is registered on the NERC Compliance Registry and such registered entity assumes full compliance responsibility and accountability; or

2. By Written Contract: parties enter into written agreement whereby:

a. A registered entity delegates the performance of some or all functional activities to a third party that is not a registered entity, and the registered entity retains full compliance responsibility and violation accountability; or

b. A registered entity delegates the performance of some or all of the functional activities to a third party, and the third party accepts full compliance responsibility for the specific functions it performs and violation accountability. In this case, there may be individual, concurrent or joint registration of

the entities, depending on the nature of the contractual relationship and, in any event, only the registered entity would be held responsible or accountable by a Regional Entity or NERC; or

3. By Joint Registration Organization (JRO): each party is registered and is required to clearly identify and allocate compliance responsibility and violation accountability for their respective functions under applicable NERC Reliability Standard requirements.

Unofficial Comment Form for Project 2010-07—Generator Requirements at the Transmission Interface

Please **DO NOT** use this form to submit comments. Please use the electronic comment form located at the link below to submit comments on the first formal posting for Project 2010-07—Generator Requirements at the Transmission Interface. The electronic comment form must be completed by **July 17, 2011**.

[Project 2010-07—Generator Requirements at the Transmission Interface](#)

If you have questions please contact Mallory Huggins at mallory.huggins@nerc.net or 202-383-2629.

This is the first 30-day formal comment period for the standards included in Project 2010-07. A 30-day informal comment period took place earlier this year, from March 4 to April 4, 2011. The team thanks all those who provided feedback during that comment period. The team has reviewed and considered all comments submitted, and has incorporated many of them into its latest proposed standards, as explained in the [Summary Response to Informal Comment](#) posted at the Project 2010-07 project page.

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. While many Generator Owners and Generator Operators operate Elements and Facilities that are considered by some entities to be Transmission, these are most often radial Facilities that are not part of the integrated grid, and as such should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.

As part of the BES, generators affect the overall reliability of the BES. However, registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner's or Generator Operator's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. This can be accomplished by properly applying FAC-001 and FAC-003 to Generator Owners as proposed in the redline standards posted for comment.

Before reviewing the standards, the drafting team encourages all stakeholders to read the [background resource document](#) it has provided to describe its rationale and its work thus far.

Standards Announcement

Project 2010-07 Generator Requirements at the Transmission Interface Formal Comment Period Open June 17 – July 17, 2011

Now available at: http://www.nerc.com/filez/standards/Project2010-07_GOTO_Project.html

The Generator Requirements at the Transmission Interface standard drafting team has posted proposed modifications to FAC-001 and FAC-003, along with a background resource document, for a formal comment period. For FAC-003, the team has posted proposed changes to two versions of the standard: FAC-003-1, the current FERC-approved version of the standard, has been modified as FAC-003-X, and FAC-003-2, the version currently under development by the Project 2007-07 —Vegetation Management drafting team has been modified as FAC-003-3. The 30-day formal comment period will end at **8 p.m. Eastern on Sunday, July 17, 2011.**

Instructions for Commenting

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page:

http://www.nerc.com/filez/standards/Project2010-07_GOTO_Project.html

Next Steps

The drafting team will consider all comments submitted and make revisions to the draft standards to address issues identified by commenters. The team will submit its work for quality review, and following the quality review, the team's consideration of comments will be posted, along with the revised standards, associated implementation plans, and supporting documents. The standards will then be posted for a 45-day formal comment period with an initial ballot conducted during the last 10 days of the comment period.

Background

This is the first 30-day formal comment period for the standards included in Project 2010-07. A 30-day informal comment period took place earlier this year, from March 4 to April 4, 2011. The team thanks all those who provided feedback during that comment period. The team has reviewed and considered all comments submitted, and has incorporated many of them into its latest proposed standards, as explained in the [Summary Response to Informal Comment](#) posted at the Project 2010-07 project page.

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. While many Generator Owners and Generator Operators operate Elements and Facilities that are considered by some entities to be Transmission, these are most often radial Facilities that are not part of the integrated grid, and as such should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.

As part of the BES, generators affect the overall reliability of the BES. However, registering a Generator

Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner's or Generator Operator's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. This can be accomplished by properly applying FAC-001 and FAC-003 to Generator Owners as proposed in the redline standards posted for comment.

Before reviewing the standards, the drafting team encourages all stakeholders to read the [background resource document](#) it has provided to describe its rationale and its work thus far.

The qualifier should be similar to that specified in Part 4.2.4 of FAC-003-3: "This standard applies to overhead transmission lines identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is

crossing the substation fence. " Vegetation needing attention can exist within a half mile of a switchyard. Vegetation does not discriminate between Generation and Transmission Owners.
Yes
Yes
Regarding the Right-of-Way definitions, the definition in FAC-003-3 is the better of the two. Suggest adding "and maintain" to the first sentence of the definition as follows: The corridor of land under a transmission line(s) needed to operate and maintain the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria. The term Right-of-Way goes beyond Transmission Vegetation Management, and that should be considered in the definition. How does Right-of-Way affect transmission facilities that are routed over bodies of water, or over valleys, highways, etc.? Right-of-Way in relation to underground facilities? The format of FAC-003-X should be made consistent with current NERC guidelines (i.e.--Parts of Requirements should not have R's in their numbering, should be 1.1, 1.2 etc.).

We feel that an 18 month implementation plan would be more conducive for generators to meet these new requirements
Yes
Yes
While we agree, we believe that a better explanation of "the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system" should be included. One suggestion is to distinguish between a plant perimeter fence and an internal switchyard fence.

Group
EPSA
Jack Cashin
<p>Background The Electric Power Supply Association (EPSA) endorsed the initial recommendations of the Ad Hoc Group for Generator Requirements at the Transmission Interface, offered informal comments on the March 2011 White Paper Proposal for Project 2010-07 and now appreciates this opportunity to provide comments on the questions posted June 17, 2011. Since NERC’s creation of the “GOTO Team” in February of 2009, EPSA has supported the efforts of Ad-Hoc Group and now the Project 2010-07 Standards Drafting Team (SDT). While EPSA members’ compliance registration includes several functional entity types, the bulk of competitive suppliers’ registrations are as Generator Owners (GOs) and Generator Operators (GOPs). EPSA applauds the SDT’s decision to recommend the use the “intent of obligation” as the reason for application of FAC-001 rather than the receipt of request for interconnection and thereby supports the revisions to FAC-001-1. The proposed modification to FAC-001 (a new R2) would require a GO to develop “Facility connection requirements” within “45 days of executing an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility...” The use of the agreement execution is a more reasonable triggering mechanism for FAC-001 application and compliance. The SDT’s recommendation intentionally excluded specific reference to the form of agreement to avoid commingling commercial and reliability aspects in reliability standards. However, the existing language may still may mix commercial and reliability issues. The accompanying project Background Resource Document (p.2) makes it clear that the interconnection to an existing generator facility is contemplated to be the “existing interconnecting Facility that is owned by a generator” – that is, the generator’s lead. The generator’s leads are considered part of the “existing generator Facility,” however, the generator, step-up transformer and other equipment that is within the generator switchyard can also be considered part of the Facility. FERC requires all transmission facilities to be available for “open access.” A generator lead would become open access if another customer interconnected to it. Therefore FAC-001-1 could be made clearer by modifying the language regarding the 45-day trigger as follows: within “45 days of executing an Agreement to evaluate the reliability impact of interconnecting another Facility to its the Generator Owner’s existing generation interconnecting transmission Facilities...” This modification would make it clear that the requirement does not apply to an entity that wants to, for example, connect a new generator within the fenced-in site of the existing generator, but instead only applies to request to interconnect to the generator lead.</p>
Yes
Yes
<p>EPSA generally supports the SDT’s proposed redline changes to FAC-003-X and FAC-003-3 and SDT’s diligence in monitoring Project 2007-07. There is one distinction however that EPSA would like to bring to the SDT’s attention that could increase clarity. FAC-003-X and FAC-003-3 both have similar “one half mile” language, but the starting point for the one half mile can occur one of three ways. In FAC-003-X, the language in 4.3.1 reads “Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system and ...” Therefore, there are three possible starting points for the measurement of the one half mile: beyond the fenced area of (i) the switchyard, (ii) the generating station, or (iii) the generation substation. While it would appear implicit that GO’s would determine which of the three was used to make the determination that the GO determines the starting point. Another point for consideration is that a Generator Owner’s overhead Facility that is within the fence should explicitly not be applicable to the standard. EPSA believes the language that refers to the “interconnection with the Transmission system” should be changed to “interconnection with a Transmission Owner’s Facility. The reason is</p>

that the term "Transmission" which is defined in the NERC Glossary could be construed to include all of a Generator Owner's interconnection leads. Therefore, we suggest that the language in 4.3.1 be modified as follows to make all of these points clear: A Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of either the generator switchyard, generating station or generating substation (as specified by the Generation Owner) up to the point of interconnection with the Transmission Owner's Facility and is operated 200 kV and above and any lower voltage lines designated by the RE as critical to the reliability of the electric system within the region is applicable to this standard."

Yes

EPSA appreciates the SDT proposing to use the approach that provides a specific distance for determining which GO Facility lead lines that FAC-003 should apply to. EPSA agrees that the half-mile qualifier provides a discrete parameter that will limit ambiguity in the Standard.

Yes

No

Yes

EPSA can appreciate the SDT's decision that it not propose new defined terms for the NERC Glossary. The SDT bases the decision on outreach meetings with NERC, regional compliance managers and industry organizations. EPSA supports outreach but still believes that the SDT should propose definitions for the NERC Glossary. The definitions can serve as a basis for the outreach meetings while also further limiting reliability gaps – real or perceived. Much as EPSA expressed in its White Paper comments there is still a need for a definition for generator interconnection facilities. In addition, because integrated transmission facility has also played a big part in the cases that have prompted the need for Project 2010-07 the drafting team should propose a glossary change for that definition as well. A definition for generation interconnection facilities is necessary in Project 2010-07 Standard so that the interface between generators and transmission system can be clearly established and any ambiguities about reliability responsibilities for GOs & GOPs and TO & TOPs can be eliminated. EPSA recommended the definitions from the Ad-Hoc Group Report could be used for incorporating the Generator Interconnection Facility into the standard: Generator Interconnection Facility Sole-use facility for the purpose of connecting the generating unit(s) to the transmission grid. In this regard, the sole-use facility only transmits power associated with the interconnecting generator, whether delivered to the grid or delivered to the generator for station service or auxiliary load, or delivered to meet cogeneration load requirements. Generator Interconnection Operational Interface Location at which operating responsibility for the Generator Interconnection Facility changes between the Transmission Operator and the Generator Operator. These definitions were developed with due consideration for varying configurations, outages, and generators materiality to the BES. The Facility definition defines the purpose of the facility, while the Generator Interconnection Operational Interface definition provides the functional lines of demarcation between the GO and the TO. The definitions were developed based on the purpose of generator interconnection facilities, their usage and how their usage differs from transmission facilities that comprise the interconnected grid. Similar to EPSA's assertions on the White Paper competitive suppliers believe this is a sound basis for distinguishing BES facilities. EPSA also suggests that the SDT include the following proposed definition for Integrated Transmission Facilities for inclusion in the NERC Glossary: Integrated Transmission Facilities (ITF) ITF are the Facilities that are a subpart of Transmission system that are capable of carrying the flows from multiple generator plants at different points of interconnection for delivery to customers, or to other electric systems. This proposed ITF definition builds upon Commission precedent in the Open Access Transmission Tariff (OATT) area. FERC has recognized that facilities that can carry flows from multiple supply points and deliver that power to either customers or other electric systems are proper facilities to include in an OATT and define the "Transmission System" for OATT purposes. The term "Transmission System" is an OATT-defined term that means "The facilities owned, controlled or operated by the Transmission Provider that are used to provide transmission service under Part II [Point-to-Point Transmission Service] and Part III [Network Integrated Transmission Service] of the Tariff." Under Commission precedent, facilities such as generator step-up transformers and generator interconnecting transmission facilities have been excluded from the OATT; i.e., they are not facilities that provide Transmission Service because they cannot carry the

flows from multiple supply points for delivery to customers or other electric system – their only use is to the GO and perform two functions: 1. They deliver power from the GO’s generators at a site to the OATT-defined Transmission System, and 2. They deliver off-site power from the OATT-defined Transmission System to the generators at a site when the generators at a site are not operating. While building on FERC OATT precedent, the proposed definition of “Integrated Transmission Facilities” does not require an applicable Transmission Service tariff to identify those facilities. Integrated Transmission Facilities are simply defined as those that capable of carrying flows from multiple supply points for delivery to customers or to other electric systems. Using the ITF definition, the definition of Generation Owner could be modified as follows: Generation Owner The Entity that owns and maintains generating units but which does not own or maintain Integrated Transmission Facilities. EPSA encourages the Project 2010-07 SDT to consider fitting the above definitions into the current proposal for inclusion in the NERC Glossary. Therefore, EPSA respectfully requests that the SDT for Project 2010-07 consider the all the recommendations made herein to the seven questions.

Thad Ness

American Electric Power

No

There are substantial reliability issues, as well as additional regulatory, tariff, coordination, and generator and interconnection facility issues, which need to be dealt with before AEP could agree to such requirements. It is not clear that a generator can receive a request for interconnection. We recommend adding qualifier text which states the standard only applies *if* an entity plans to allow such a requested interconnection. This would allow an entity to document that they do not plan to allow such interconnections.

Yes
In one of the supporting documents for the upcoming comments, the GO/TO group included the following statement in support for the rationale on FAC-001. In its first posting for informal comment, the drafting team set the "trigger" for the application of FAC-001 as the receipt of a request for interconnection. Many commenters disagreed with this approach and suggested that the "trigger" be based upon "the intent or obligation" to interconnect a new Facility to an existing interconnecting Facility that is owned by a generator. Accordingly, the drafting team has proposed language to addresses this concern. The intent of this modified language is to start the compliance clock at such time as the Generator Owner executes an Agreement to perform the reliability assessment required in FAC-002-1. This step should occur whether the generator voluntarily agrees to the interconnection request or is compelled by a regulatory body to do so. In either case, we expect the Generator Owner and the requestor to execute some form of Agreement. We intentionally excluded a specific reference to the form of Agreement (such as a feasibility study) in deference to comments that we should avoid comingling of commercial and reliability aspects in reliability standards. I wonder about whether or not this can work timing-wise. It says the compliance clock starts with the agreement to perform the reliability assessment for FAC-002. The FAC-001 requirements outline the need for a registered entity to document, maintain, and publish facility connections requirements in order to be compliant. If the clock starts at the agreement for the assessment, does that mean that you then document, maintain, and publish the connection requirements? Don't the connection requirements usually outline the terms for the "agreement for the assessment"? I am not sure that I understand the timing sequence in order to be compliant to the standard. I would think that the agreement needs to be in place at the time of the effective date of the standard, not upon an application.

Midwest Reliability Organization's NERC Standards Review Forum (NSRF)
Carol Gerou
No
In general, the NSRF supports the changes to FAC-001-1. However the 45 days to exicute an agreement would be a significant burden on a Generator Operator that does not have an existing process in place. The NSRF believes an aggressive but realistic time frame is 120 days. This would allow sufficient time to develop the procedure and obtain the necessary technical and legal reviews. Please clarify why "Procection" is capitalized in section 3.1.5. "Protection System" is defined by NERC but "System Protection" is not. Recommend the "half mile" statement be included within the Applicability section of this Standard as it stated in FAC-003-X.
Yes
Yes
Yes
Although the NSRF agrees with the 1/2 mile criteria (see question 1); we believe the drafting team will have to develop additional justification for this criteria given FERC's recent orders, RC11-1 and RC11-2 (see question 6 for full FERC Order details). In these orders FERC "implies" that if the GO/GOP is responsible for a breaker operated at 100kV or higher the entity should be required to register as a TOP/TO. Therefore it appears FERC would not be inclined to provide any leeway based

on distance from the substation. The SDT should note that the FERC Order points to this Project to "address matters involving reliability obligations at the interface of the transmission grid", which is foot note 58.

Yes

Yes

In FERC order "Denying Appeals of Electric Reliability Organization Registration Determinations" dated June 16, 2011 (RC11-1 and RC11-2) FERC explicitly stated compliance GAPS existed with the following standards at a minimum: • FAC-011, Requirements R2, R2.1, R2.2. • PRC-001-1, Requirements R2, R2.2, R4; • PRC-004-1 Requirement R1; • TOP-004-2, Requirements R6, R6.1, R6.2, R6.3, R6.4; • PER-003-1, Requirements R1, R1.1, R1.2; • FAC-003-1, Requirements R1, R2; • TOP-001, Requirement R1 and • FAC-014-2, Requirement R2. When a GO/GOP owns transmission equipment but is not registered as a TO or TOP. The drafting team should explicitly address each of these the above requirements.

Jody Nelson

Georgia Transmission Corporation

Yes

We commend the drafting team for their efforts to address gaps in Facility Connection Requirements. We believe that the requirements under R3 should be limited to Generator owned equipment to avoid duplication of efforts. A Generator Owner receiving an interconnection request is required to submit an interconnection request to the Transmission Owner which in turn would study the impact of such a request on the Transmission System. Therefore there is no gap as far as the Integrated Transmission System that the third party is interconnecting to through the Generator Owner. However, Generator Owners are responsible for verifying that their equipment is capable of accommodating the interconnection request.

Exelom

No

Exelon does not agree that this standard should be broadly applied to a GO. GOs who do not own a switchyard and whose point of interconnection is a disconnect switch associated with the generator leads prior to the switchyard should be excluded from this standard. If a group of GOs share a generator tie line, then the associated Interconnect Agreement that each of the GO has with the applicable TO and/or TOP should address how these shared connections will effect the system. GOs may not have the resources or expertise to conduct the required interconnect studies to meet this standard

Yes

Yes

Yes

No

Yes

FAC-001 1. Exelon has generating stations that have the Main Power Transformer (MPT) disconnect as the point of demarcation. The station owns the short leads from the MPT disconnect back to the generator and the applicable TO owns from the MPT disconnect up to and including the switchyard. It is not practical for another entity to request to interconnect to the MPT disconnect nor should it be allowed. The SDT should consider verbiage to the standard that does not allow requests to interconnect to a MPT disconnect. 2. Exelon is having difficulty determining how this standard would apply to GOs and how GOs would implement the standard; suggest that examples be provided in an implementation document specifically showing where and how this standard would apply.

However, there may need to be a variance for ERCOT because the Power Generating Companies in ERCOT are not allowed to own transmission assets.
No
: As drafted, the document still refers to generation interconnection lines as transmission lines in critical places. We understand that the SDT has taken significant steps to minimize this in both FAC-001 and FAC-003 and has had discussions with NERC about not registering GOs as TOs; however, this lack of distinction between high voltage generation interconnection lines and actual transmission lines still presents a difficult situation for Generations Owners and a source of contention with Reliability Entities. This could be resolved somewhat by using the non-defined term "generation interconnection lines" in place of "transmission lines" in, for example, section 4.3.1. Since the term "transmission line" is also undefined, this would seem to be a reasonable approach.
No
Ingleside Cogeneration LP believes there should be a relaxation in the vegetation management requirements for those interconnections which only serve as a radial link to the BES. Although we fully understand the importance of keeping vegetation away from high voltage lines, the one year period is much too frequent in our generator locations. The added documentation and other expenses simply do not justify the non-existent gain in reliability when vegetation in a locale (e.g.; desert) never reaches five feet above the ground. Consider limiting this exception to units below a certain MVA rating that are not critical to the BES – perhaps coupled with evidence that vegetative intrusions are highly unlikely.
No
The SDT needs to clarify that the one-half mile distance is measured from the property line of the Generation Owner, i.e., an interconnection line that is in a ROW. In addition, the half mile qualifier makes sense only for those interconnections into critical generation facilities. See our response under Question #3.
No
The two year compliance time frame makes sense only for those GOs who own interconnections into critical generation facilities. See our response under Question #3.
No
Yes
There is a fundamental issue related to the interconnection of generation and distribution facilities into the transmission grid. There is a myriad of complex architectures which make the designation of ownership and operational responsibilities unclear in both cases. Both this team's efforts and those by the project team redefining the extent of the BES have run into this issue. Ingleside Cogeneration LP recognizes that the effort to properly assign reliability responsibilities in these gray-area connections is difficult. However, pushing the issue back to the GO/GOP by looking for them to jointly determine

responsibilities with adjacent entities will create every conceivable arrangement possible. It seems like it should be possible to address a handful of common interconnection configurations at the start. As knowledge builds, perhaps other architectures could be added. This seems to be the direction that the project team redefining the extent of the BES is heading. Lastly, we need some assurance that regulators will work with us as we go down this path. Right now, the feeling is that they will continue to use forced registrations as a hammer – which may render moot this team’s efforts anyways.

The Applicable Entities now include a Generator Owner that meets the following condition: 'Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility' A Generator Owner should not have such power. In many instances Generator Owners do not have the models or expertise to perform interconnection studies to determine if there is an impact on the Transmission Network. All interconnection requests should be implemented by the Transmission Owner (TO) regardless if the interconnection point is within a Generation Owner facility or End-User facility. The TO is in the best position to set unbiased connection requirements to ensure the reliability of the BES is maintained. If a mechanism is created to allow interconnection to a BES line owned by Generator Owner, then it is essential for this Generator Owner providing this interconnection service to be a TO to ensure all reliability standards, including the protection standards, are met so the reliability of the BES is maintained. The drafting team should demonstrate where this situation is occurring. If the redline changes are implemented, could Generator Owner #1 permit Generator Owner #2 to interconnect one of their generators within Generator Owner #1's Facility? Would Generator Owner #2 then need to have an executed Agreement to permit further generator interconnection? From a Transmission Owner viewpoint, it is tough enough to coordinate generator connection queues among adjacent TOs. Having to coordinate with Generator Owners as well would greatly increase the complexity of coordination.
No
See question #1 comments. We do not support changing the applicability of FAC-001-1 to include Generator Owners 'with an executed Agreement' or Generator Owners that own BES transmission.
No
The direction of the background resource document gives special treatment to the Generator Owner in that it allows the Generator Owner TO status for a couple of standards (FAC-001 and FAC-003), but exempts the Generator Owner from many of the standards applicable to a TO. The NERC Functional Model defines the various functional entities. If a Generator Owner wants to be a TO, all the Requirements applicable to a TO should apply. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions.
Yes
The direction of the background resource document gives special treatment to the Generator Owner in that it allows the Generator Owner TO status for a couple of standards (FAC-001 and FAC-003), but exempts the Generator Owner from many of the standards applicable to a TO. A Generator Owner that owns BES transmission should be held accountable for the specific Requirements and Reliability Standards applicable to the TO and Transmission Operator functions. If no other entity assumes accountability for these specific Requirements and Reliability Standards on the Generator Owner BES transmission (for example system operation, protection and communication), there will be a reliability gap. Improper operation, coordination and protection of the Generator Owner BES transmission could have an impact on reliability.

The language in R2 needs to be clarified with regards to the term "its existing generation Facility." The interconnection leads are considered part of the "existing generation Facility," but so are the generator, generator step-up transformer and other equipment associated with the generator. The project Background Resource Document (p.2) makes it clear that the interconnection to an existing generator facility is contemplated to be to the "existing interconnecting Facility that is owned by a generator" – i.e., the generator's interconnection leads. We propose that the term "its existing generation Facility" be replaced with "the Generator Owner's existing interconnecting transmission Facility."
Yes
No
FAC-003-X and FAC-003-3 both have similar "one half mile" language, the starting point for the one half mile is vague. In FAC-003-X, the language in 4.3.1 reads "Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system and ..." While we support the one half mile language, there are three possible starting points for the measurement of the one half mile: beyond the fenced area of (i) the switchyard, (ii) the generating station, or (iii) the generation substation. While a GO's fencing policy may differ between generation stations, the requirement to implement vegetation management should be clear. For clarity, while we believe that the language should retain flexibility with regards to "fencing" by the Generator Owner, it should be clear that the Generation Owner determines the starting point. Second, a Generator Owner's overhead Facility that is within the fence should explicitly not be applicable to the standard. Finally, we believe the language that refers to the "interconnection with the Transmission system" should be changed to "interconnection with a Transmission Owner's Facility. The reason is that the term "Transmission" which is defined in the NERC Glossary could be construed to include all of a Generator Owner's interconnection leads. (The definition is excerpted from the Glossary in our response to question 7) Therefore, we suggest that the language in 4.3.1 be modified as follows to make all of these points clear: A Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of either the generator switchyard, generating station or generating substation (as specified by the Generation Owner) up to the point of interconnection with a Transmission Owner's Facility and is operated 200 kV and above and any lower voltage lines designated by the RE as critical to the reliability of the electric system within the region is applicable to this standard."
Yes
Yes
Yes
FERC's Cedar Creek and Milford order (issued on June 16, 2011 and that is posted at http://www.nerc.com/files/Order_Denying_Appeals_RC11-1_RC11-2_20110616.pdf) listed several standards (in Paragraphs 71 and 87) that should be applicable to Cedar Creek and Milford, respectively. Because of this order, the drafting team should examine the listed standards and determine whether they are or are not applicable to Generator Owners or Generator Operators that own and are responsible for the operation of an overhead Facility. We emphasize that our

recommendation takes no position on any legal issues regarding the referenced order.
Yes
<p>While we generally agree with the drafting team's modifications to these standards, the team's approach may not directly resolve the fundamental registration issue regarding a Generation Owner that only owns non-integrated interconnection transmission facilities. The non-integrated interconnection transmission facilities owned by a GO are part of the Bulk Electric System (BES) because they are part of BES generation facilities. The ownership of these non-integrated facilities should not require a GO to also register as a Transmission Owner. The draft team has proposed modifying two FAC standards that would apply to such GO-owned interconnection transmission facilities. These GO-owned interconnection transmission facilities are not, however, "integrated" transmission facilities, as the drafting team correctly points out in its background resource document. A proposed solution to the Generation Owner registration issue is discussed below. NERC's Rules of Procedure (ROP) require entities to be registered in accordance with the definitions in the NERC Glossary of Terms Used in Reliability Standards (Glossary) and in accordance with the NERC Statement of Compliance Registry Criteria document. The Glossary has these definitions:</p> <ul style="list-style-type: none"> • Generation Owner – Entity that owns and maintains generating units. • Transmission Owner – The entity that owns and maintains transmission facilities. • Facility – A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.) • Transmission – An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems. • Transmission Service – Services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery <p>The drafting team should create a new definition for the term "integrated transmission facilities" and include this new definition in the Glossary. This definition should then be use to modify the definition of Generation Owner so that registration will be clear. While the team chose not to create any new definitions, we believe the registration issue cannot be resolved without modifying the definition of "Generation Owner</p> <p>The following definition is proposed for Integrated Transmission Facilities in the NERC Glossary:</p> <ul style="list-style-type: none"> • Integrated Transmission Facilities (ITF) – ITF are the Facilities that are a subpart of Transmission system that are capable of carrying the flows from multiple generator plants at different points of interconnection for delivery to customers or to other electric systems. This proposed ITF definition builds upon FERC precedent in the Open Access Transmission Tariff (OATT) area. FERC has recognized that facilities that can carry flows from multiple supply points and deliver that power to either customers or other electric systems are proper facilities to include in an OATT and define the "Transmission System" for OATT purposes. The term "Transmission System" is an OATT-defined term that means "The facilities owned, controlled or operated by the Transmission Provider that are used to provide transmission service under Part II [Point-to-Point Transmission Service] and Part III [Network Integrated Transmission Service] of the Tariff." Under FERC's precedent, facilities such as generator step-up transformers and generator interconnecting transmission facilities have been excluded from the OATT; i.e., they are not facilities that provide Transmission Service because they cannot carry the flows from multiple supply points for delivery to customers or other electric system – their only use is to the Generation Owner. They perform two functions for a GO: 1. They deliver power from the GO's generators at a site to the OATT-defined Transmission System, and 2. They deliver off-site power from the OATT-defined Transmission System to the generators at a site when the generators at a site are not operating. While building on FERC OATT precedent, the proposed definition of "Integrated Transmission Facilities" does not require an applicable Transmission Service tariff to identify those facilities. Integrated Transmission Facilities are simply defined as those that capable of carrying flows from multiple supply points for delivery to customers or to other electric systems. Using the ITF definition, the definition of Generation Owner could be modified as follows: • Generation Owner – Entity that owns and maintains generating units but which does not own or maintain Integrated Transmission Facilities.

We are concerned that some of the language is ambiguous. We would like to be clear that placing new requirements on Generator Owners that are already in place and have been in place under FERC

policy is inaccurate. We want to make sure that regardless of what the generator tie line is classified as, that a valid interconnection would go through the Generator Interconnection process under its applicable tariff. Format error in 2.4.1 should read 4.2.1 in applicability. We would like to see more definition in applicability section 4.2. How does the Generator Owner get involved in this process? The VRF for R4 is listed as a medium and appears to us as an administrative requirement. We would recommend that the VRF be changed to low. The moderate and high VSL for R1 seems to be duplicative. We would recommend taking a second look and would recommend that the high should be that "if you failed to do two of the following". We would recommend that the VSL on R4 read: "The responsible entity failed to make the requirements available within 30 business days after a request."

Yes

No

In both FAC003-3 and FAC003-X it lists "greater than one half mile cutoff". We would recommend that the distance cutoff be removed. We feel that overhead Facilities shouldn't be treated any differently than any other. Also we would like to see these two sections in both standard proposals reflect similar language for 4.3.1.

No

See comment above. We feel like there is no need for using a distance exclusion.

Constellation appreciates and supports the work of the standard drafting team. We recognize the significant time invested by technical experts from industry to consider the appropriate application of reliability standards to address concerns raised about coverage of transmission at the generator interface. The recent FERC Order concerning Cedar Creek and Milford wind suggested that the list of applicable standards needing revision should go beyond FAC-001 and FAC-003. We appreciate the discussion and concerns raised by FERC in the order; however, the discussion is limited by failing to consider these issues in light of the full package of existing standards. Below is a look at the FERC suggested standards and how they intersect with other standards: • PRC-001-1, Requirements R2, R2.2, R4 FERC expressed concern that certain protection system components may not be well coordinated with the RC. However, the same standard (PRC-1) addresses this issue by requiring all GOs to ensure coordination of their protection system with interconnected parties. Further, FAC-002 requires that all new facilities undergo reviews by the TOP, BA, etc. • PRC-004-1 Requirement R1

FERC expressed concern that certain protection system components may not be analyzed for misoperations. However, the same standard (PRC-4) addresses this issue by requiring all GOs to ensure that they analyze all misoperations on their protection system which would include the protection of the tie line. • TOP-004-2, Requirements R6, R6.1, R6.2, R6.3, R6.4; FERC expressed concern that coordination may be lacking between a GO and a TO with regards to the generator tie line. However, TOP standards applicable to GOs address this issue by requiring all GOs to coordinate all maintenance and emergency outages (both forced and planned) with all applicable interconnected parties. Further, all ISO procedures require the same of GOs. • PER-003-1, Requirements R1, R1.1, R1.2; FERC expressed concern that certain generator operators are responsible for the real time operation of the interconnected BES without being NERC certified operators, potentially causing a reliability gap. Generator Operators do not monitor and control the BES, they control and monitor generators that it operates and relays information to other operating entities. Therefore, NERC certification is not required. • FAC-003-1, Requirements R1, R2; FERC and the drafting team seem aligned in the need to revise this standard and the revision proposal includes such a revision. • TOP-001, Requirement R1 FERC expressed concern that certain tie lines may not be required to operate in such a way as to alleviate operational emergencies. However, IRO and TOP standards applicable to GOs address this issue by requiring all GOs to operate as directed by their TOP, BA, or RC as directed and must render emergency assistance. • FAC-014-2, Requirement R2. FERC expressed concern that certain tie lines may have a rating based on a methodology that may not be consistent with the methodology used by the RC. However, standards FAC-8 and FAC-9 address this issue by requiring all GOs to develop a methodology to rate all equipment, and that the RC has the authority to challenge the GO on that methodology. The onus is on the GO to either change their methodology and rating accordingly, or provide a technical justification as to why they cannot adopt the changes. Further, a generator will never be limited by its tie line, as a generator's profits are directly tied to its output. Therefore no generator would limit its facility to the equipment that is delivering that output.

R1 wording in this draft only requires having published Facility connection requirements, but speaks nothing of specific required content of this published document. (R1) VSLs specifically reference R1. If VSLs continue to include assessment of how many R3 (R2 in present standard) requirements are met, a TO potentially has a redundant obligation under two separate requirements. R1 and R3 do not read in a manner consistent with (R1) VSLs. Since R2 only applies to Generator Owners, the (R2) VSL should use "Generator Owner" in place of "responsible entity."
No
ATC does not support the changes for FAC-003-X, however, ATC does support FAC-003-3. FAC-003-X Concerns The VRF and VSL tables do not correlate to the original FAC-003-1 levels of non-compliance section D.2. ATC believes that section D.2 should be rewritten to align with the already approved FAC-003-1. FAC-003-X Corrections- Applicability Section 4.3.1, sentence 3 – Transmission should not be capitalized. FAC-003-3 - No Concerns
Group
Southern Company
Antonio Grayson
No
Southern does not think that the revision to FAC-001-1 is necessary. A Generator Owner (GO) cannot assess reliability impacts to the Bulk Electric System (BES) and determine acceptability without support and involvement of the applicable owner and operator of the Transmission System. A generator tie-line does not equate to a Transmission System. A GO must already adhere to a TO's Facility connection requirements whether the GO wants to connect additional facilities or a third parties facilities to its own interconnection Facilities. Stated another way, the GO does not need Facility Connection requirements to govern how multiple units are tied to a collector bus so why are they needed for a third party to connect to an existing tie-line? In either case it is the interconnected TO that has connection requirements that must be fulfilled. The GO's Interconnection Agreement would prohibit it from connecting additional facilities without a new application for Interconnection Service with its interconnected Transmission Provider. A GO should not need to develop "connection requirements" unless it is in the business of owning and operating facilities independently of its interconnected Transmission Provider. We do not believe a reliability gap exists in FAC-001-1 because the requestor for interconnecting another Facility to an existing generation Facility must coordinate with the applicable TO, TP, and PA in accordance with FAC-002-0 to ensure they meet all applicable facility connection and performance requirements. If and when there is an agreement in place for a third party to connect to a generator tie-line then the tie-line would become part of the integrated system and its purpose and the owner's function would likely warrant registration as a TO/TOP and FAC-001 would then apply. The following excerpt from the 2010-07 Background Resource Document acknowledges that this may be necessary: "The drafting team also acknowledges that, if another party interconnects to a Facility owned by a Generator Owner, there may be the need to address MOD or TPL standards. However, the drafting team believes that this, too, is best handled through specific evaluation, perhaps accompanied by changes to the compliance registry. Entities that face this kind of scenario may also meet criteria applicable to other registrations such as Transmission Service Provider or Transmission Planner." B. If the Project 2010-07 Drafting Team decides to continue revising FAC-001-1, there are jurisdictional, interconnection policy and open access transmission tariff issues that will need to be considered. (1) Because of (a) jurisdiction under Section 215, (b) FERC's interconnection policy, and (c) the requirements of the pro forma open access transmission tariff (OATT), a GO should not be required to comply with FAC-001-1 until that GO's generating Facility reaches commercial operation. (a) Jurisdiction under FPA Section 215. First, it is not clear that NERC or FERC has jurisdiction under FPA Section 215 to require generation facilities that have not actually reached commercial operation to be subject to reliability standards. Section 215(a)(2) of the FPA defines the "Electric Reliability Organization" as "the organization certified by the Commission ... the

purpose of which is to establish and enforce reliability standards for the bulk-power system, subject to Commission review." Further, (a)(3) provides that "The term 'reliability standard' means a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system. The term includes requirements for the operation of existing bulk-power system facilities ... the design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation of the bulk-power system" Thus, under Section 215 NERC can develop reliability standards that address requirements for existing bulk-power system facilities (i.e., facilities that have reached "commercial operation") and for the design of planned additions or modifications. It is logical to interpret the phrase "design of new facilities" as meaning that new facilities must be designed to comply with existing reliability standards. However, it is not clear that this provision should be interpreted as requiring that a generating facility that has not yet reached commercial operation should be subject to reliability standards (including audit and penalties). Therefore, the GO with the existing generation facilities should not be required to incorporate the proposed generation facility into its Facility connection requirements before the proposed generation facility is subject to NERC or FERC jurisdiction. (b) FERC's interconnection policy. In addition, the revised FAC-001 would appear to place restrictions on interconnection customers in contravention of Order Nos. 2003 and 2006 (Standard Large and Small Interconnection Procedures and Agreements). FERC was very concerned about the ability of interconnection customers to interconnect their generating facilities and gave them a fair amount of flexibility. However, this revised FAC-001 would appear to restrict some of this flexibility. (i) Order No. 2003 gives the interconnection customer the ability to terminate a proposed interconnection on ninety days notice. Therefore, the interconnection customer is not required to build the facility. However, this revised FAC-001 appears to assume that the interconnection customer does not have this flexibility. What if the interconnection customer (the GO building a new generator on its site or the third party building a new generation facility) decides to terminate the Large Generator Interconnection Agreement (LGIA) or not proceed with the generation facility? In such event, the GO may be required to revert to its previous Facility connection requirements in order to accommodate the original configuration. (ii) The LGIA permits modifications to the proposed interconnection. How would this affect the Facility connection requirements? How long would the GO have to revise its Facility connection requirements? In the event that there is a single modification, or perhaps multiple modifications, how does the GO stay in compliance with this standard? (iii) FAC-001-1, R4 provides that each GO with Facility connection requirements and each TO shall maintain Facility connection requirements and make documentation of these requirements available to users of the Transmission System upon request. However, Large Generator Interconnection Procedures (LGIP), Section 3.4 requires the posting of certain interconnection information but the identity of the interconnection customer is not to be disclosed (unless it is an Affiliate). Requirement R4 would appear to potentially require disclosure of information and (more importantly) of the interconnection customer's identity in contravention of the requirements in Order No. 2003 and the LGIP. (c) OATT requirements. The definition of "applicable Generator Owner" (Section 4.2.1) and Requirement R2 provide that the GO will have an executed Agreement to evaluate the impact of interconnecting a new facility to the GO's existing generation facility. This statement is ambiguous. This statement could be understood to mean that the GO of the existing generation Facility will enter into an Agreement with the GO proposing to interconnect and the existing GO will evaluate the impact of the proposed interconnection. However, requests to interconnect new generation are processed under an OATT. In that case, it would be the Transmission Provider (not the existing GO) that would evaluate the impact of interconnecting the new facility. Thus, the language in FAC-001-1 would need to be revised to clarify that the owner of the new facility will need to interconnect under the OATT of an appropriate Transmission Provider (i.e., the Transmission Provider to which the existing GO is interconnected, not with the existing GO). Therefore, the owner of the new facility will most likely be the entity with the executed Agreement (with the Transmission Provider). Another consideration is that the existing GO could be developing a merchant transmission line. In that case, the existing GO would need to evaluate whether it needs have its own OATT and OASIS. In that case, the new generator owner would be interconnecting to the existing GO. However, the existing GO's line would not be a generator tie-line. This issue is not clear from the draft standard. (2) The following are suggested changes to FAC-001-1. (a) We recommend the Purpose statement be revised to state, "To avoid adverse impacts on BES reliability..." (b) The numbering for "Applicable Generator Owner" should be 4.2.1 instead of 2.4.1. (c) It is not clear who may request to interconnect to the Generator Owners' facility. The Background Resource document states that "[b]ecause Generator Owners may be requested to allow interconnection to their Facilities"

– this would imply that a third party may request interconnection to the Generator Owner’s Facilities. However, draft FAC-001-1 discusses “interconnecting another Facility to its existing generation Facility.” This issue needs to be clarified. Is it simply when a Generator Owner proposes to add a new facility to its existing facility or does it also include a third party request to interconnect to the Generator Owner facilities? (d) R4 should be revised to delete the requirement to maintain the Facility connection requirements because this is redundant to language in R1 (and R2, which we believe is not needed). In addition, R4 should be revised to state, “...on requests within five (5) business days” since the time requirement is essential for measurement of non-compliance as indicated by the VSLs. (e) The Severe VSL for R3 should be revised to delete the second portion which states, “The responsible entity does not have Facility connection requirements.” This non-compliance would be covered by the first portion of the two-part OR requirement (...four or more...). It is also covered by the Severe VSL of R1. (3) Effect of the proposed revisions to FAC-001-1 on FAC-002-1. (a) As drafted, there are scenarios under which a new GO may attempt to interconnect to an existing GO even though, as explained above, the interconnection should actually be done to the appropriate Transmission Provider. If the appropriate Transmission Provider is not included in the evaluation of the interconnection various types of harm may occur. In such event, the TPs and PAs should be indemnified from any liability with respect to performance of the evaluations required by FAC-002. (b) FAC-001 and FAC-002 should be revised to be clear that the existing GO and any new GOs must coordinate any interconnection with the appropriate Transmission Provider, TP and PA.

Yes

However, we do not believe it is necessary to require a GO to have Facility connection requirements as we discuss in our response to Question 1.

No

(1) We question whether R1 of FAC-003-3 would ever apply to a GO who owns transmission interconnection equipment. Can the SDT provide an example or two in the Guideline and Technical Basis section of the standard? (2) We recommend rearranging the language in R5 of FAC-003-3 to state, “The applicable Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management to prevent encroachments when...” This places the “shall” at the beginning of the requirement which is clearer and consistent with the structure of the other requirements. (3) We question why there are no VSLs assigned to R4. Should there be? What are the consequences if a Regional Entity does not comply? (4) There does not appear to be any coordination with the Vegetation Management Standard Drafting Team (VMSDT) concerning proposed modifications to the standard. The VMSDT should be consulted.

No

We agree with a one-half mile line as being “within the Generator Owner’s line of sight and could be visually monitored for vegetation conditions on a routine basis.” However, we suggest that some generation interconnection Facilities greater than ½ mile in length could also fall within the GO’s line of sight or be constructed such that they should be considered for exemption. Thus, the Task Force should consider including exclusions for longer generator tie lines if the GO can provide sufficient justification. Examples of justifications could include (1) a clear line of sight, (2) pavement, gravel, or other non-vegetation covered path, or (3) routine monitoring is performed from a roadway parallel to the line, etc. Do not obviate any other transmission requirements such as the following (which are incorporated into the draft standard): i. Operated at 200kV or higher; or ii. Operated below 200kV and included in IROL; or iii. Operated below 200kV and inclusion in a Major WECC Transfer Path

Yes

Yes

Yes

Please see our Comments in response to Question 7.

Yes

(1) The SDT needs to review the June 16, 2011 FERC Order on Cedar Creek and Milford and factor this into the equation. The FERC Order concludes that the Cedar Creek and Milford entities must register as a TO and TOP. In addition to FAC-003, the Cedar Creek and Milford order lists the following standards and requirements that apply to these entities as a TO/TOP: • PER-003-1, R1, R1.1, R1.2 (requiring NERC-certified transmission operators); • PRC-001-1, R2, R2.2, R4, R6 (notification of relay or equipment failures); • PRC-004-1, R1 (analyzing protection system misoperations); • FAC-014-2, R2 (establishment of system operating limits); • TOP-001, R1

(authority to take actions to alleviate operating emergencies); • TOP-004-2, R6, R6.1, R6.2, R6.3, R6.4 (establishment of formal policies to address voltage levels, planned outages, switching, Interconnection Reliability Operating Limits, and System Operating Limits). The SDT needs to address these specific requirements in sufficient detail by either revising the Project 2010-07 Background Resource Document or proposing revisions to these standards to address any reliability gaps. For example, we recommend, as a minimum, that the Background Resource Document discussion under PRC-001-1 be revised to state (underlined text added), "Generator Operators and the scope of protection equipment for generation interconnection Facilities are already appropriately accounted for in this standard in requirements R1, R2, R3, and R5." Please note that this statement, even with our proposed revision, conflicts with the FERC Order on Cedar Creek and Milford, Paragraphs 64, 65, and 78 where FERC states that Cedar Creek and Milford must register as a TO and TOP to ensure the protection system coordination requirements in R2 and R4 of PRC-001 are met. Thus, the discussion for PRC-001-1 in the Project 2010-07 Background Resource Document needs additional language to demonstrate adequacy of the GO requirements in order to prevent GOs that own generation interconnection Facilities from having to register as a TO and TOP. (2) In addition, we believe the SDT should add supporting discussion to the Background Resource Document to explain why the following standards adequately cover GO/GOP requirements at the Transmission Interface: PRC-004-2, PRC-005-1, PRC-023-1. For example, the Background Resource Document could state that PRC-023-1 Section A.4 Applicability already includes, "4.2. Generator Owners with load-responsive phase protection systems as described in Attachment A, applied to facilities defined in 4.1.1 through 4.1.4." (3) Furthermore, FERC's analysis in the Cedar Creek and Milford order suggests that reliability gaps will occur if certain entities are not registered as TO/TOP. The GRTI SAR DT should assess why its findings are different from the Commission's findings. By way of background, the GRTI SAR DT provides that its own assessment of the GOTO Ad Hoc Group Final Report concludes with a belief that there are only two standards requiring modifications to address reliability gaps – FAC-001 and FAC-003 (Background Resource Document, page 3). FERC will most likely require that NERC clearly demonstrate and provide technical support for the position that GO's only need to comply with FAC-001 and FAC-003 and not the other standards noted by FERC. The Background Resource Document does not appear to provide adequate technical support for the GRTI SAR DT position. Therefore, the GRTI SAR DT should develop that technical support in preparation for the filing of these revised standards at FERC.

Doug Hohlbaugh

FirstEnergy Corp

Yes

FirstEnergy (FE) appreciates the drafting team's careful consideration of the comments made by FE during the most recent informal comment period. The changes made to FAC-001 alleviate FE's prior concern related to a Generator Owner needing to maintain and publish a Facility Connection requirements document regarding facilities which are not yet subject to Open Access provisions. FE supports the team's changes to FAC-001-1 and the concept that a connection requirement document would be required upon the initial or 1st time a Generator Owner executes an Agreement to perform the reliability assessment required in FAC-002-1.

Yes

The one year lead time is sufficient lead-time to notice the GOs of new expectations required under FAC-001-1.

Yes

Yes

Yes

No

Yes

The June 16, 2011 FERC Order denying the appeals of two wind generating facilities—Cedar Creek and Milford – of the NERC determinations that Cedar Creek and Milford must each be registered as a transmission owner and transmission operator on the NERC Compliance Registry complicates the GO-TO drafting team's work. However, the issues may be distinct and different in the end. The existing GO-TO team's work product defines new reliability expectations for a generator owner regardless of whether or not the same entity is also being required to have a TO-TOP "light" compliance registration. In the Order, FERC describes what it believes are an appropriate limited set of TO-TOP requirements when a TO-TOP "light" registrations is deemed warranted for a traditional generation owner. The drafting team should describe what, if any, impact the FERC June 16 Order is having on its work scope. One minor comment for the background resource document. On page one, the last sentence of the 1st paragraph which currently reads " ... appropriate level of reliability for the BES." Consider changing to read " ... Adequate Level of Reliability for the BES." And, include a footnote directing the reader to NERC's definition/paper describing ALR. The later references to "adequate level of reliability" within the document (i.e. page 2, 2nd paragraph could then be reduced to the acronym ALR.

A Generator Owner subject to the proposed standard (i.e., with an executed Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility) should only be responsible for evaluating the impact of such interconnection on its facilities. Generation Owners should have no responsibility for evaluating impacts on interconnected or adjacent Transmission Owner systems. GOs do not have staff trained or tools available to perform the studies necessary to evaluate reliability impacts of such interconnections on Transmission Owner systems which can extend geographically far beyond the POI. The SDT should clarify that Transmission Owners are solely responsible for evaluating and addressing any impacts on their systems.
No
It may take longer since very few (if any) GOs are prepared to perform this type of work.

We support the concept of modifying FAC-001-1 to include Generation Owners that own transmission lines that interconnect them to the BES for the purpose of eliminating the need to register Generation Owners as Transmission Owners. However, there are serious issues with the implementation of the FAC-001-1. The changes conflict with the tariff process of many established markets as well as the FERC pro forma tariff. Requests to interconnect are generally governed by tariffs. The request will be submitted to the transmission provider established by the tariff. The transmission provider will then perform the necessary studies such as system impact or feasibility studies to determine any necessary upgrades through its long-term planning function. After the completion of these studies or in parallel with them, the Transmission Owner (or Generation Owner that owns transmission) will perform the facility connection study. This may or may not require an additional contract as it may be governed completely under the tariff or may be covered under a blanket agreement in an organized market. The language referring to the executed Agreement in the standard should be dropped as it is confusing and may not cover many situations. Rather, the standard should apply to the Generation Owner that owns Transmission and is not registered as Transmission Owner. R2 should be modified such as the Generation Owner that owns Transmission is required to create facility connection requirements upon request from the Planning Coordinator or Transmission Planner. While the NERC Functional Model is not clear on the function that performs the interconnection study, it likely will be either the Transmission Planner or the Planning Coordinator. Interconnection studies are typically long-term planning studies. Thus, it is the Transmission Planner or Planning Coordinator that will receive the interconnection request and determine on whose equipment will be impacted. R3 is problematic and contradicts the purpose of R2. R3 requires the Generation Owner that owns Transmission to have Facility connection requirements at all times. It appears the drafting team

intended for R3 to simply define what must be included in the facility connection requirements. To do this, we suggest the drafting team remove the Generation Owner that owns Transmission from the requirement and copy the part 3.1 and its sub-parts to R2. The following language should be struck from R2: "to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements". These requirements already exist elsewhere and inclusion here creates the potential for double jeopardy. R4 should be struck. There is no need for the Generator Owner that owns transmission to maintain its facility connection requirements. They should only be required to review and update them when they get a request. Tariff processes will already require them to make the facility connection requirements available to interconnection requesters.

**American Wind Energy Association
Formal Comments on NERC Project 2010-07
Generator Requirements at the Transmission Interface
July 17, 2011**

The American Wind Energy Association (AWEA) appreciates the opportunity to submit these formal comments on the NERC Project 2010-07. AWEA supports the general direction indicated by both the Generator Requirements at the Transmission Interface Ad Hoc Group (GOTO Ad Hoc Group), and the Project 2010-07 Standards Development Team (SDT). We agree with the sentiments from both groups that a Generator Owner (GO) or Generator Operator (GOP) that also owns or operates a generator interconnection facility (GIF), should not be required to register as a Transmission Owner (TO) and/or Transmission Operator (TOP) strictly because they own or operate the GIF. We also agree that requiring these GOs or GOPs to comply with all the TO/TOP standards would have little effect on or benefits to reliability of the Bulk Electric System.

AWEA supports the aim of these groups to address any reliability gap that may exist with regard to GIFs by considering such facilities as part of the generating facility, and therefore also subject to the GO/GOP standards. AWEA also supports the approach of identifying a limited number of TO/TOP standards, such as FAC-001 and FAC-003, which should also apply to GIFs. We would be concerned, however, if additional requirements were added beyond these two, without serious consideration by the SDT and additional industry experts. The recent FERC order on the required registration as TOs and TOPs of two generator interconnection facilities may raise some question about the direction that the GO/TO and the SDT have taken so far on this topic. AWEA urges NERC and the SDT to use caution in considering any additional standards to apply to GIFs as the current approach of the GO/TO and SDT efforts have been generally supported. Consideration of any addition standards with respect to GIFs should be done on a standard-by-standard basis, reviewing the applicability of each standard as well as the impact on the reliability of the Bulk Electric System.

Comments on Approach of Project 2010-07
Generator Requirements at the Transmission Interface

The resolution of this issue regarding generator interconnection facilities should compel a certain result in determining how to classify and register generator tie-lines. Under the current standards, NERC is compelled to register owners with generator tie-lines as transmission owners. FERC has affirmed this. The changes to the standards should be such that NERC and FERC are compelled to consider the tie-lines as part of the generator facilities. The current proposal from this task force does not achieve that result. While the proposal does make very appropriate changes to certain reliability standards, it does not change the basic definition of the Bulk Electric System or change NERC's *Statement of Compliance Registry Criteria*, to determine how tie-lines are classified. Even though the relevant reliability standards would be changed so that they are also applicable to generator facilities, NERC and the regional entities will continue to apply the same definition and criteria and can continue to classify the tie-lines as Transmission.

The solution is to change the BES definition and NERC *Statement* as well as changing the applicability of the relevant reliability standards. The background resource document from this group suggests that a change in the BES definition was part of the overall solution, but the Project 2010-17 team did not address this in its proposed definition. The concept paper from the 2010-17 group does include "generator interconnection line leads," but the formal definition paper does not.

This project group should include in its formal proposal a change to the definition of BES, including generator interconnection facilities within the definition of generation.

Consideration of Comments on Generator

Requirements at the Transmission Interface – Project 2010-07

The Generator Requirements at the Transmission Interface Drafting Team thanks all commenters who submitted comments on the first formal posting for Project 2010-07—Generator Requirements at the Transmission Interface. These standards were posted for a 30-day public comment period from June 17, 2011 through July 17, 2011. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 43 sets of comments, including comments from approximately 143 different people from approximately 100 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Project2010-07_GOTO_Project.html

The SDT thanks all stakeholders who provided comments. Your feedback helped the drafting team further modify its proposed standard changes, and the team believes that the changes are clearer and more technically sound because of it.

The SDT made a few substantive changes to both FAC-001 and both versions of FAC-003. With respect to FAC-001, many commenters suggested changes to both R2 and R3 to add clarity. The “activation” language in R2 now reads “...within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the Transmission System...” R3 has been modified so that it is clearer that only Generator Owners applicable in accordance with R2 are required to comply, and the word “protection” in R3.1.5 has been made lowercase. Per stakeholder comments, the SDT also removed the Generator Owner from R4, because they agree that that inclusion was redundant to language in R2. Because Generator Owners have been removed from the requirement (and thus the requirement is no longer within the SDT’s scope), the SDT reverted back to the original requirement language in the approved version of the standard.

Some commenters were still concerned with the 45 day “activation” point, and indicated that more time could be needed for compliance. The SDT reminded these commenters that the 45 day timeframe is 45 days from the time the entity has a study Agreement, not 45 days to execute the Agreement altogether. Any commenters who were concerned that their Facilities could never receive an interconnection request were reminded that if that’s the case, this standard would never apply to them. And those commenters who insisted that Generator Owners could never receive a request for interconnection were reminded that in the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities. Thus, the SDT thinks it is important to clarify the responsibilities related to such a request in NERC’s Reliability Standards.

With respect to FAC-003, many commenters focused on the half-mile qualifier in both versions of the standard. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: "...that extends greater than one mile beyond the fenced area of the generating station switchyard..." The SDT believes that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, the team maintains that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.

The majority of commenters did not suggest the addition of any standards or requirements to the team's scope of work, and a few commenters cautioned strongly against any additions. Some commenters suggested that the team consider including those standards and requirements listed in the June 2011 Cedar Creek and Milford FERC orders. The drafting team has considered the inclusion of the requirements listed in the Cedar Creek and Milford orders in the past, and we have been revisiting them throughout our process. We continue to conclude, with stakeholder support, that no additional substantive standard or requirement changes are necessary to achieve the goal of this project. With this posting, the drafting team has revisited those standards yet again and developed a comprehensive document and spreadsheet tracing our rationale (at every stage of the process) for not including additional standards or requirements. The team has elected to propose a slight clarifying change in PRC-004-2, but no changes to the applicability of that or any other standard.

While the drafting team will not be adding standards at this time because they do not believe such additions are technically justified or justified by stakeholder comments, the SDT will be seeking some additional informal feedback from industry groups to ensure that their technical justifications are sound and supported by others outside of the drafting team. The current draft documents showing the team's rationale and technical justification for including/excluding standards for revision under this project have been posted for information on the project page with this posting. If you have any specific feedback on these documents, you are welcome to email mallory.huggins@nerc.net.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

¹ The appeals process is in the Standard Processes Manual:
http://www.nerc.com/docs/standards/sc/Standard_Processes_Manual_Approved_May_2010.pdf.

Index to Questions, Comments, and Responses

1. Do you support the proposed redline changes to FAC-001-1? 11
2. Do you support the one year compliance timeframe for Generator Owners as proposed in the Implementation Plan for FAC-001-1?..... 28
3. Taking into consideration that only one of the versions of FAC-003 will actually be implemented, a decision that will be made as the Project 2010-07 drafting team learns more about the status of Project 2007-07—Vegetation Management, do you support the proposed redline changes to FAC-003-X and FAC-003-3? 33
4. The drafting team has added Generator Owners to the Applicability sections of FAC-003-X and FAC-003-3 with the qualifier that the included lines “extend greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system.” The team received many comments about the need to define a distance rather than other measures for exclusion, and decided on the one half mile as a reasonable distance. Do you agree with this half-mile qualifier?..... 43
5. Do you support the two year compliance timeframe for Generator Owners as included and explained in the Implementation Plans for FAC-003-X and FAC-003-3?..... 53
6. In its background resource document, the drafting team lists the standards that it has not modified, and offers rationale for its decisions. Are there any reliability standards or requirements that you believe should apply to Generator Owners or Generator Operators that own and are responsible for the operation of an overhead Facility, that are not already applicable or have been proposed to be applicable (FAC-001 and FAC-003) by the Project 2010-07 drafting team? If so, please list them and offer an explanation as to why they should be applicable to that entity. 57
7. Do you have any other questions or concerns with the proposed standards or with the background resource document that have not been addressed? If yes, please explain.63

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs

1. Do you support the proposed redline changes to FAC-001-1?

Summary Consideration: The SDT thanks all individuals and groups who provided feedback. The majority of comments indicated support for the SDT's changes to FAC-001, and the team has made additional changes, based on commenter feedback, where they believe those changes add clarity.

Commenters suggested changes to both R2 and R3 to add clarity. The "activation" language in R2 now reads "...within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System..." R3 has been modified so that it is clearer that only Generator Owners applicable in accordance with R2 are required to comply, and the word "protection" in R3.1.5 has been made lowercase. Per stakeholder comments, the SDT also removed the maintenance requirements for the Generator Owner from R2, and the Generator Owner from R4 altogether. Because Generator Owners have been removed from the requirement (and thus the requirement is no longer within the SDT's scope), the SDT reverted back to the original requirement language in the approved version of the standard.

Some commenters were still concerned with the 45 day "activation" point, and indicated that more time could be needed for compliance. The SDT reminded these commenters that the 45 day timeframe is 45 days from the time the entity has a study Agreement, not 45 days to execute the Agreement altogether. Any commenters who were concerned that their Facilities could never receive an interconnection request were reminded that if they are correct, this standard would not apply to them. Those commenters who insisted that Generator Owners could never receive a request for interconnection were reminded that in the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities. Thus, the SDT believes it is important to clarify the responsibilities related to such a request in NERC's Reliability Standards.

Some commenters brought up tariff-related issues. While the SDT has made changes attempting to clarify what was perceived by some commenters to be ambiguous qualifying language in R2, and while the commenters are correct that a valid interconnection would likely need to go through the generator interconnection process under its applicable tariff, it would be inappropriate for any market- or tariff-related language to be included in a NERC Reliability Standard. The goal of the drafting team was simply to clarify a Generator Owner's obligations, under NERC's Reliability Standards, for handling an interconnection request and the related interconnection requirements.

Several commenters also suggested changes to VRFs and VSLs. Because the SDT did not make any substantive changes to R1 or R4, the team only made changes to the VSLs or VRFs if we were correcting a typo; anything substantive would be outside the scope of this SDT. In the case of R2 and R3, changes were made per commenter suggestions.

Finally, the formatting error in the Applicability section has been corrected.

For a more detailed explanation of the team’s rationale, please see the accompanying FAC-001-1 technical justification.

Organization	Yes or No	Question 1 Comment
Midwest Reliability Organization's NERC Standards Review Forum (NSRF)	No	<p>In general, the NSRF supports the changes to FAC-001-1. However the 45 days to execute an agreement would be a significant burden on a Generator Operator that does not have an existing process in place. The NSRF believes an aggressive but realistic time frame is 120 days. This would allow sufficient time to develop the procedure and obtain the necessary technical and legal reviews.</p> <p>Please clarify why "Protection" is capitalized in section 3.1.5. "Protection System" is defined by NERC but "System Protection" is not.</p> <p>Recommend the "half mile" statement be included within the Applicability section of this Standard as it stated in FAC-003-X.</p>
<p>Response: Thank you for your comment. The team proposed 45 days from the time the entity has a study Agreement, not 45 days to execute the Agreement altogether. Please see the SDT’s accompanying FAC-001-1 technical justification for a more detailed explanation of the team’s rationale for using that time frame. No change made.</p> <p>“Protection” in 3.1.5 has been made lowercase.</p> <p>With respect to the “half mile” comment, an entity could receive an interconnection request for its interconnection Facility at any point along that Facility. An exemption or exclusion based on the length of the Facility is not justified because doing so would create a reliability gap. No change made.</p>		
Public Service Enterprise Group	No	<p>The language in R2 needs to be clarified with regards to the term “its existing generation Facility.” The interconnection leads are considered part of the “existing generation Facility,” but so are the generator, generator step-up transformer and other equipment associated with the generator. The project Background Resource Document (p.2) makes it clear that the interconnection to an existing generator facility is contemplated to be to the “existing interconnecting Facility that is owned by a generator” - i.e., the generator’s interconnection leads. We propose that the term “its existing generation Facility” be replaced with “the Generator Owner’s existing interconnecting transmission Facility.”</p>
<p>Response: Thank you for your comment. We agree that some additional specification could be useful, and we have used the suggested</p>		

Organization	Yes or No	Question 1 Comment
clarifying language.		
SPP Reliability Standards Development Team	No	<p>We are concerned that some of the language is ambiguous. We would like to be clear that placing new requirements on Generator Owners that are already in place and have been in place under FERC policy is inaccurate. We want to make sure that regardless of what the generator tie line is classified as, that a valid interconnection would go through the Generator Interconnection process under its applicable tariff.</p> <p>Format error in 2.4.1 should read 4.2.1 in applicability.</p> <p>We would like to see more definition in applicability section 4.2. How does the Generator Owner get involved in this process?</p> <p>The VRF for R4 is listed as a medium and appears to us as an administrative requirement. We would recommend that the VRF be changed to low.</p> <p>The moderate and high VSL for R1 seems to be duplicative. We would recommend taking a second look and would recommend that the high should be that “if you failed to do two of the following”.</p> <p>We would recommend that the VSL on R4 read: “The responsible entity failed to make the requirements available within 30 business days after a request.”</p>
<p>Response: Thank you for your comment. We have attempted to clarify what was perceived by some commenters to be ambiguous qualifying language. You are correct that a valid interconnection would likely need to go through the generator interconnection process under its applicable tariff, but it would be inappropriate for any market- or tariff-related language to be included in a NERC Reliability Standard. The goal of the drafting team was simply to clarify a Generator Owner’s obligations, under NERC’s Reliability Standards, for handling an interconnection request and the related interconnection requirements.</p> <p>The format error in the applicability section has been corrected.</p> <p>A Generator Owner can get involved in the process by receiving a request for interconnection on their Facility and executing an Agreement to evaluate the reliability impact of that request. The team has attempted to clarify to qualifying language in the applicability section with its latest proposed changes. Please see the SDT’s accompanying FAC-001-1 technical justification for a more detailed explanation of the team’s rationale.</p> <p>With respect to the VRF for R4, we agree that “low” might be more appropriate, but that change is outside the scope of this drafting team. Your suggestion will be submitted in a Suggestion Form and added to NERC’s Issues Database to be addressed in a future project.</p>		

Organization	Yes or No	Question 1 Comment
<p>With respect to the moderate and high VSLs for R1, we agree that they are duplicative and believe this was a typo. Change made.</p> <p>With respect to the proposed language change in the VSL for R4, while we agree that the VSL should be written in the negative rather than the positive that change would be outside the scope of this drafting team. Your suggestion will be submitted in a Suggestion Form and added to NERC's Issues Database to be addressed in a future project.</p>		
PPL Supply Group	No	<p>A Generator Owner subject to the proposed standard (i.e., with an executed Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility) should only be responsible for evaluating the impact of such interconnection on its facilities. Generation Owners should have no responsibility for evaluating impacts on interconnected or adjacent Transmission Owner systems. GOs do not have staff trained or tools available to perform the studies necessary to evaluate reliability impacts of such interconnections on Transmission Owner systems which can extend geographically far beyond the POI. The SDT should clarify that Transmission Owners are solely responsible for evaluating and addressing any impacts on their systems.</p>
<p>Response: Thank you for your comment. In the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the drafting team thinks it is important to clarify the responsibilities related to such a request in NERC's Reliability Standards. The drafting team does not believe the standard as written requires the Generator Owner to be responsible for any interconnection Facility past the point of interconnection with the Transmission Owner's Facility. Please see the SDT's accompanying FAC-001-1 technical justification for a more detailed explanation of the team's rationale. No change made.</p>		
ACES Power Members	No	<p>We support the concept of modifying FAC-001-1 to include Generation Owners that own transmission lines that interconnect them to the BES for the purpose of eliminating the need to register Generation Owners as Transmission Owners. However, there are serious issues with the implementation of the FAC-001-1. The changes conflict with the tariff process of many established markets as well as the FERC pro forma tariff. Requests to interconnect are generally governed by tariffs. The request will be submitted to the transmission provider established by the tariff. The transmission provider will then perform the necessary studies such as system impact or feasibility studies to determine any necessary upgrades through its long-term planning function. After the completion of these studies or in parallel with them, the Transmission Owner (or Generation Owner that owns transmission) will perform the facility connection study. This may or may not require an additional contract as it may be governed completely under the tariff or may be covered under a blanket agreement in an organized</p>

Organization	Yes or No	Question 1 Comment
		<p>market. The language referring to the executed Agreement in the standard should be dropped as it is confusing and may not cover many situations. Rather, the standard should apply to the Generation Owner that owns Transmission and is not registered as Transmission Owner.</p> <p>R2 should be modified such as the Generation Owner that owns Transmission is required to create facility connection requirements upon request from the Planning Coordinator or Transmission Planner. While the NERC Functional Model is not clear on the function that performs the interconnection study, it likely will be either the Transmission Planner or the Planning Coordinator. Interconnection studies are typically long-term planning studies. Thus, it is the Transmission Planner or Planning Coordinator that will receive the interconnection request and determine on whose equipment will be impacted.</p> <p>R3 is problematic and contradicts the purpose of R2. R3 requires the Generation Owner that owns Transmission to have Facility connection requirements at all times. It appears the drafting team intended for R3 to simply define what must be included in the facility connection requirements. To do this, we suggest the drafting team remove the Generation Owner that owns Transmission from the requirement and copy the part 3.1 and its sub-parts to R2. The following language should be struck from R2: "to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements". These requirements already exist elsewhere and inclusion here creates the potential for double jeopardy. R4 should be struck. There is no need for the Generator Owner that owns transmission to maintain its facility connection requirements. They should only be required to review and update them when they get a request. Tariff processes will already require them to make the facility connection requirements available to interconnection requesters.</p>
<p>Response: Thank you for your comment. The drafting team believes that the execution of an Agreement to evaluate the reliability impact of interconnecting a third party Facility is the appropriate "activation" point for this standard for applicable Generator Owners. We have changed the language in the requirement to accommodate situations where it was not the Generator Owner itself that executed the Agreement. Please see the SDT's accompanying FAC-001-1 technical justification for a more detailed explanation of the team's rationale.</p> <p>R3 has been modified to more clearly apply only to Generator Owners in accordance with R2. Per your suggestion about maintenance, the drafting team has removed the maintenance obligation for Generator Owners. For more information on our rationale with respect to this, please see the accompanying FAC-001-1 technical justification document.</p>		
Westar Energy	No	We suggest the VRF for R4 be changed from medium to low, as it is administrative in nature. We recommend the high VSL for R1 read, "The Transmission Owner failed to do two of the

Organization	Yes or No	Question 1 Comment
		following.”
<p>Response: Thank you for your comment. We agree that “low” might be more appropriate, but that change is outside the scope of this drafting team. Similarly, any change to the VSLs for R1 is outside the scope of this drafting team as that requirement does not include any reference to Generator Owners; we only made changes if the previous text appeared to have a typo. Your suggestions will be submitted in a Suggestion Form and added to NERC’s Issues Database to be addressed in a future project.</p>		
Southern Company	No	<p>A. Southern does not think that the revision to FAC-001-1 is necessary. A Generator Owner (GO) cannot assess reliability impacts to the Bulk Electric System (BES) and determine acceptability without support and involvement of the applicable owner and operator of the Transmission System. A generator tie-line does not equate to a Transmission System. A GO must already adhere to a TO’s Facility connection requirements whether the GO wants to connect additional facilities or a third parties facilities to its own interconnection Facilities. Stated another way, the GO does not need Facility Connection requirements to govern how multiple units are tied to a collector bus so why are they needed for a third party to connect to an existing tie-line? In either case it is the interconnected TO that has connection requirements that must be fulfilled. The GO’s Interconnection Agreement would prohibit it from connecting additional facilities without a new application for Interconnection Service with its interconnected Transmission Provider. A GO should not need to develop “connection requirements” unless it is in the business of owning and operating facilities independently of its interconnected Transmission Provider.</p> <p>We do not believe a reliability gap exists in FAC-001-1 because the requestor for interconnecting another Facility to an existing generation Facility must coordinate with the applicable TO, TP, and PA in accordance with FAC-002-0 to ensure they meet all applicable facility connection and performance requirements. If and when there is an agreement in place for a third party to connect to a generator tie-line then the tie-line would become part of the integrated system and its purpose and the owner’s function would likely warrant registration as a TO/TOP and FAC-001 would then apply. The following excerpt from the 2010-07 Background Resource Document acknowledges that this may be necessary: “The drafting team also acknowledges that, if another party interconnects to a Facility owned by a Generator Owner, there may be the need to address MOD or TPL standards. However, the drafting team believes that this, too, is best handled through specific evaluation, perhaps accompanied by changes to the compliance registry. Entities that face this kind of scenario may also meet criteria applicable to other registrations such as Transmission Service Provider or Transmission Planner.”</p>

Organization	Yes or No	Question 1 Comment
		<p>B. If the Project 2010-07 Drafting Team decides to continue revising FAC-001-1, there are jurisdictional, interconnection policy and open access transmission tariff issues that will need to be considered.</p> <p>(1) Because of (a) jurisdiction under Section 215, (b) FERC’s interconnection policy, and (c) the requirements of the pro forma open access transmission tariff (OATT), a GO should not be required to comply with FAC-001-1 until that GO’s generating Facility reaches commercial operation.</p> <p>(a) Jurisdiction under FPA Section 215. First, it is not clear that NERC or FERC has jurisdiction under FPA Section 215 to require generation facilities that have not actually reached commercial operation to be subject to reliability standards. Section 215(a)(2) of the FPA defines the “Electric Reliability Organization” as “the organization certified by the Commission ... the purpose of which is to establish and enforce reliability standards for the bulk-power system, subject to Commission review.” Further, (a)(3) provides that “The term ‘reliability standard’ means a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system. The term includes requirements for the operation of existing bulk-power system facilities ... the design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation of the bulk-power system” Thus, under Section 215 NERC can develop reliability standards that address requirements for existing bulk-power system facilities (i.e., facilities that have reached “commercial operation”) and for the design of planned additions or modifications. It is logical to interpret the phrase “design of new facilities” as meaning that new facilities must be designed to comply with existing reliability standards. However, it is not clear that this provision should be interpreted as requiring that a generating facility that has not yet reached commercial operation should be subject to reliability standards (including audit and penalties). Therefore, the GO with the existing generation facilities should not be required to incorporate the proposed generation facility into its Facility connection requirements before the proposed generation facility is subject to NERC or FERC jurisdiction.</p> <p>(b) FERC’s interconnection policy. In addition, the revised FAC-001 would appear to place restrictions on interconnection customers in contravention of Order Nos. 2003 and 2006 (Standard Large and Small Interconnection Procedures and Agreements). FERC was very concerned about the ability of interconnection customers to interconnect their generating facilities and gave them a fair amount of flexibility. However, this revised</p>

Organization	Yes or No	Question 1 Comment
		<p>FAC-001 would appear to restrict some of this flexibility.</p> <p>(i) Order No. 2003 gives the interconnection customer the ability to terminate a proposed interconnection on ninety days notice. Therefore, the interconnection customer is not required to build the facility. However, this revised FAC-001 appears to assume that the interconnection customer does not have this flexibility. What if the interconnection customer (the GO building a new generator on its site or the third party building a new generation facility) decides to terminate the Large Generator Interconnection Agreement (LGIA) or not proceed with the generation facility? In such event, the GO may be required to revert to its previous Facility connection requirements in order to accommodate the original configuration.</p> <p>(ii) The LGIA permits modifications to the proposed interconnection. How would this affect the Facility connection requirements? How long would the GO have to revise its Facility connection requirements? In the event that there is a single modification, or perhaps multiple modifications, how does the GO stay in compliance with this standard?</p> <p>(iii) FAC-001-1, R4 provides that each GO with Facility connection requirements and each TO shall maintain Facility connection requirements and make documentation of these requirements available to users of the Transmission System upon request. However, Large Generator Interconnection Procedures (LGIP), Section 3.4 requires the posting of certain interconnection information but the identity of the interconnection customer is not to be disclosed (unless it is an Affiliate). Requirement R4 would appear to potentially require disclosure of information and (more importantly) of the interconnection customer's identity in contravention of the requirements in Order No. 2003 and the LGIP.</p> <p>(c) OATT requirements. The definition of "applicable Generator Owner" (Section 4.2.1) and Requirement R2 provide that the GO will have an executed Agreement to evaluate the impact of interconnecting a new facility to the GO's existing generation facility. This statement is ambiguous. This statement could be understood to mean that the GO of the existing generation Facility will enter into an Agreement with the GO proposing to interconnect and the existing GO will evaluate the impact of the proposed interconnection. However, requests to interconnect new generation are processed under an OATT. In that case, it would be the Transmission Provider (not the existing GO) that would evaluate the impact of interconnecting the new facility. Thus, the language in FAC-001-1 would need</p>

Organization	Yes or No	Question 1 Comment
		<p>to be revised to clarify that the owner of the new facility will need to interconnect under the OATT of an appropriate Transmission Provider (i.e., the Transmission Provider to which the existing GO is interconnected, not with the existing GO). Therefore, the owner of the new facility will most likely be the entity with the executed Agreement (with the Transmission Provider). Another consideration is that the existing GO could be developing a merchant transmission line. In that case, the existing GO would need to evaluate whether it needs have its own OATT and OASIS. In that case, the new generator owner would be interconnecting to the existing GO. However, the existing GO's line would not be a generator tie-line. This issue is not clear from the draft standard.</p> <p>(2) The following are suggested changes to FAC-001-1.</p> <p>(a) We recommend the Purpose statement be revised to state, "To avoid adverse impacts on BES reliability..."</p> <p>(b) The numbering for "Applicable Generator Owner" should be 4.2.1 instead of 2.4.1.</p> <p>(c) It is not clear who may request to interconnect to the Generator Owners' facility. The Background Resource document states that "[b]ecause Generator Owners may be requested to allow interconnection to their Facilities" - this would imply that a third party may request interconnection to the Generator Owner's Facilities. However, draft FAC-001-1 discusses "interconnecting another Facility to its existing generation Facility." This issue needs to be clarified. Is it simply when a Generator Owner proposes to add a new facility to its existing facility or does it also include a third party request to interconnect to the Generator Owner facilities?</p> <p>(d) R4 should be revised to delete the requirement to maintain the Facility connection requirements because this is redundant to language in R1 (and R2, which we believe is not needed). In addition, R4 should be revised to state, "...on requests within five (5) business days" since the time requirement is essential for measurement of non-compliance as indicated by the VSLs.</p> <p>(e) The Severe VSL for R3 should be revised to delete the second portion which states, "The responsible entity does not have Facility connection requirements." This non-compliance would be covered by the first portion of the two-part OR requirement (...four or more...). It is also covered by the Severe VSL of R1.</p> <p>(3) Effect of the proposed revisions to FAC-001-1 on FAC-002-1.</p>

Organization	Yes or No	Question 1 Comment
		<p>(a) As drafted, there are scenarios under which a new GO may attempt to interconnect to an existing GO even though, as explained above, the interconnection should actually be done to the appropriate Transmission Provider. If the appropriate Transmission Provider is not included in the evaluation of the interconnection various types of harm may occur. In such event, the TPs and PAs should be indemnified from any liability with respect to performance of the evaluations required by FAC-002.</p> <p>(b) FAC-001 and FAC-002 should be revised to be clear that the existing GO and any new GOs must coordinate any interconnection with the appropriate Transmission Provider, TP and PA.</p>
<p>Response: Thank you for your comment. The drafting team has considered the jurisdictional, interconnection policy and open access transmission issues that you raise. But in the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the drafting team thinks it is important to clarify the responsibilities related to such a request in NERC’s Reliability Standards. You are correct that a jurisdictional, interconnection policy, and open access transmission tariff issues maybe have an impact, but it would be inappropriate for any market- or tariff-related language to be included in a NERC Reliability Standard. The goal of the drafting team was simply to clarify a Generator Owner’s obligations, under NERC’s Reliability Standards, for handling an interconnection request and the related interconnection requirements. Please see the SDT’s accompanying FAC-001-1 technical justification for a more detailed explanation of the team’s rationale.</p> <p>With respect to your suggested changes in section 2:</p> <ol style="list-style-type: none"> Any change to the purpose statement would be outside the scope of this team. Please submit a Suggestion Form to NERC if you continue to feel that this change is necessary. That formatting change has been made. The drafting team has worked to clarify who may request to interconnect to the Generator Owner’s Facility. The maintenance requirements in R2 and R4 are no longer applicable to Generator Owners. For more information on our rationale on this issue, please see the accompanying FAC-001-1 technical justification document. The drafting team agrees that the second portion of the Severe VSL for R3 is redundant. While other changes to VSLs and VRFs have been outside the scope of the team, because the SDT has made changes to R3, we feel comfortable making this change. <p>For a more detailed justification of our changes to FAC-001 with respect to your comments in the third section, please see the FAC-001 justification document that is posted with these standard changes.</p>		
American Electric Power	No	There are substantial reliability issues, as well as additional regulatory, tariff, coordination, and generator and interconnection facility issues, which need to be dealt with before AEP could agree to such requirements. It is not clear that a generator can receive a request for

Organization	Yes or No	Question 1 Comment
		interconnection. We recommend adding qualifier text which states the standard only applies *if* an entity plans to allow such a requested interconnection. This would allow an entity to document that they do not plan to allow such interconnections.
<p>Response: Thank you for your comment. In the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the drafting team thinks it is important to clarify the responsibilities related to such a request in NERC’s Reliability Standards. No change made.</p>		
APS	No	Do not agree with adding GO to FAC-001-1
<p>Response: Thank you for your comment. The vast majority of stakeholder commenters and the drafting team continue to support the addition of the Generator Owner to the applicability of FAC-001-1. No change made.</p>		
Exelon	No	Exelon does not agree that this standard should be broadly applied to a GO. GOs who do not own a switchyard and whose point of interconnection is a disconnect switch associated with the generator leads prior to the switchyard should be excluded from this standard. If a group of GOs share a generator tie line, then the associated Interconnect Agreement that each of the GO has with the applicable TO and/or TOP should address how these shared connections will effect the system. GOs may not have the resources or expertise to conduct the required interconnect studies to meet this standard
<p>Response: Thank you for your comment. The standard does not automatically apply to all Generator Owners; rather, it applies only to those Generator Owners with an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the Transmission System. The drafting team believes that it has built the appropriate amount of time into the standard to allow an applicable Generator Owner to evaluate the impact of an Interconnect Agreement and obtain or contract for the necessary resources and expertise. Please see the SDT’s accompanying FAC-001-1 technical justification for a more detailed explanation of the team’s rationale. No change made.</p>		
Manitoba Hydro	No	The Applicable Entities now include a Generator Owner that meets the following condition: ‘Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility.’ A Generator Owner should not have such power. In many instances Generator Owners do not have the models or expertise to perform interconnection studies to determine if there is an impact on the Transmission Network. All interconnection requests should be implemented by the Transmission Owner (TO) regardless if the interconnection point is within a Generation Owner

Organization	Yes or No	Question 1 Comment
		<p>facility or End-User facility. The TO is in the best position to set unbiased connection requirements to ensure the reliability of the BES is maintained. If a mechanism is created to allow interconnection to a BES line owned by Generator Owner, then it is essential for this Generator Owner providing this interconnection service to be a TO to ensure all reliability standards, including the protection standards, are met so the reliability of the BES is maintained. The drafting team should demonstrate where this situation is occurring. If the redline changes are implemented, could Generator Owner #1 permit Generator Owner #2 to interconnect one of their generators within Generator Owner #1's Facility? Would Generator Owner #2 then need to have an executed Agreement to permit further generator interconnection? From a Transmission Owner viewpoint, it is tough enough to coordinate generator connection queues among adjacent TOs. Having to coordinate with Generator Owners as well would greatly increase the complexity of coordination.</p>
<p>Response: Thank you for your comment. In the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the drafting team thinks it is important to clarify the responsibilities related to such a request in NERC's Reliability Standards. No change made.</p>		
American Transmission Company	No	<p>R1 wording in this draft only requires having published Facility connection requirements, but speaks nothing of specific required content of this published document. (R1) VSLs specifically reference R1. If VSLs continue to include assessment of how many R3 (R2 in present standard) requirements are met, a TO potentially has a redundant obligation under two separate requirements. R1 and R3 do not read in a manner consistent with (R1) VSLs. Since R2 only applies to Generator Owners, the (R2) VSL should use "Generator Owner" in place of "responsible entity."</p>
<p>Response: Thank you for your comment. The drafting team has removed the second portion of the Severe VSL for R3 to eliminate potential redundancy with the VSLs for R1 and R2. The VSL for R2 now refers to "Generator Owner" rather than "responsible entity."</p>		
Xcel Energy	Yes	<p>We believe it would be helpful to put explanatory wording in that if an entity is already registered as a Transmission Owner and Generator Owner, the Generator Owner portion of that entity would not have to have a separate set of interconnection requirements.</p>
<p>Response: Thank you for your comment. The Facility in question in the standard would either be owned by the Generator Owner or the Transmission Owner. The owner must meet the requirement. The SDT does not determine how an entity complies, though we could expect that if an entity is already an Transmission Owner, it could easily simply apply its already existing set of interconnection requirements to any</p>		

Organization	Yes or No	Question 1 Comment
new Facilities that are applicable under this standard.		
Ingleside Cogeneration LP	Yes	However, there may need to be a variance for ERCOT because the Power Generating Companies in ERCOT are not allowed to own transmission assets.
<p>Response: Thank you for your comment. If companies in ERCOT are not allowed to own transmission assets, the drafting team assumes that they would also never be in a position to have an Agreement to execute the reliability impact of an interconnection request. No change made.</p>		
Georgia Transmission Corporation	Yes	We commend the drafting team for their efforts to address gaps in Facility Connection Requirements. We believe that the requirements under R3 should be limited to Generator owned equipment to avoid duplication of efforts. A Generator Owner receiving an interconnection request is required to submit an interconnection request to the Transmission Owner which in turn would study the impact of such a request on the Transmission System. Therefore there is no gap as far as the Integrated Transmission System that the third party is interconnecting to through the Generator Owner. However, Generator Owners are responsible for verifying that their equipment is capable of accommodating the interconnection request.
<p>Response: Thank you for your comment. The SDT does not believe that R3 is duplicative; there is no reason to assume that the Transmission Owner or the applicable Generator Owner would be addressing anything but the equipment that it owns. No change made.</p>		
BGE	Yes	This change closes the gap in areas not already covered under FAC-003-1 in a continuous improvement effort to ensure vegetation-related transmission reliability for applicable lines.
<p>Response: Thank you for your comment.</p>		
FirstEnergy Corp	Yes	FirstEnergy (FE) appreciates the drafting team's careful consideration of the comments made by FE during the most recent informal comment period. The changes made to FAC-001 alleviate FE's prior concern related to a Generator Owner needing to maintain and publish a Facility Connection requirements document regarding facilities which are not yet subject to Open Access provisions. FE supports the team's changes to FAC-001-1 and the concept that a connection requirement document would be required upon the initial or 1st time a Generator Owner executes an Agreement to perform the reliability assessment required in FAC-002-1.
<p>Response: Thank you for your comment.</p>		

Organization	Yes or No	Question 1 Comment
Sempra Generation	Yes	Sempra Generation supports the proposal for the compliance obligations under R2 associated with an interconnection request not to be triggered until an interconnection study agreement has been executed.
Response: Thank you for your comment.		
Arizona Public Service Company	Yes	These comments supersede the previous comments submitted by Arizona Public Service Company on July 7, 2011.
Response: Thank you for your comment.		
SERC OC Standards Review Group	Yes	Consider a better definition of what constitutes an “applicable” generator owner or point to the document that explains the definition.
Response: Thank you for your comment. The drafting team attempted to clarify the description of an “applicable” Generator Owner in the latest standards changes.

EPSA		<p>Background: The Electric Power Supply Association (EPSA) endorsed the initial recommendations of the Ad Hoc Group for Generator Requirements at the Transmission Interface, offered informal comments on the March 2011 White Paper Proposal for Project 2010-07 and now appreciates this opportunity to provide comments on the questions posted June 17, 2011. Since NERC's creation of the "GOTO Team" in February of 2009, EPSA has supported the efforts of Ad-Hoc Group and now the Project 2010-07 Standards Drafting Team (SDT). While EPSA members' compliance registration includes several functional entity types, the bulk of competitive suppliers' registrations are as Generator Owners (GOs) and Generator</p>

Organization	Yes or No	Question 1 Comment
		<p>Operators (GOPs).</p> <p>EPSA applauds the SDT’s decision to recommend the use the “intent of obligation” as the reason for application of FAC-001 rather than the receipt of request for interconnection and thereby supports the revisions to FAC-001-1. The proposed modification to FAC-001 (a new R2) would require a GO to develop “Facility connection requirements” within “45 days of executing an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility...” The use of the agreement execution is a more reasonable triggering mechanism for FAC-001 application and compliance. The SDT’s recommendation intentionally excluded specific reference to the form of agreement to avoid commingling commercial and reliability aspects in reliability standards.</p> <p>However, the existing language may still may mix commercial and reliability issues. The accompanying project Background Resource Document (p.2) makes it clear that the interconnection to an existing generator facility is contemplated to be the “existing interconnecting Facility that is owned by a generator” - that is, the generator’s lead. The generator’s leads are considered part of the “existing generator Facility,” however, the generator, step-up transformer and other equipment that is within the generator switchyard can also be considered part of the Facility. FERC requires all transmission facilities to be available for “open access.” A generator lead would become open access if another customer interconnected to it. Therefore FAC-001-1 could be made clearer by modifying the language regarding the 45-day trigger as follows: within “45 days of executing an Agreement to evaluate the reliability impact of interconnecting another Facility to its the Generator Owner’s existing generation interconnecting transmission Facilities...” This modification would make it clear that the requirement does not apply to an entity that wants to, for example, connect a new generator within the fenced-in site of the existing generator, but instead only applies to request to interconnect to the generator lead.</p>
<p>Response: Thank you for your comment. The drafting team has attempted to make this clarification regarding the “activation” of the applicability of this standard with respect to Generator Owners.</p>

2. Do you support the one year compliance timeframe for Generator Owners as proposed in the Implementation Plan for FAC-001-1?

Summary Consideration: Most commenters supported the one year compliance timeframe for Generator Owners as proposed in the Implementation Plan for FAC-001-1. A few suggested a longer timeframe, but the drafting team believes it has built in the appropriate amount of time by giving a year in the implementation plan and then waiting to “activate” the standard until a Generator Owner has an executed Agreement to evaluate the reliability impact of the interconnection request.

Organization	Yes or No	Question 2 Comment
Manitoba Hydro	No	See question #1 comments. We do not support changing the applicability of FAC-001-1 to include Generator Owners ‘with an executed Agreement’ or Generator Owners that own BES transmission.
Response: Thank you for your comment. Please see our response to your Question 1 comments above.		
Ingleside Cogeneration LP	No	As drafted, the document still refers to generation interconnection lines as transmission lines in critical places. We understand that the SDT has taken significant steps to minimize this in both FAC-001 and FAC-003 and has had discussions with NERC about not registering GOs as TOs; however, this lack of distinction between high voltage generation interconnection lines and actual transmission lines still presents a difficult situation for Generations Owners and a source of contention with Reliability Entities. This could be resolved somewhat by using the non-defined term “generation interconnection lines” in place of “transmission lines” in, for example, section 4.3.1. Since the term “transmission line” is also undefined, this would seem to be a reasonable approach.
Response: Thank you for your comment. We have provided a disclaimer about the use of the term “transmission lines” in FAC-003, and have avoided use of the term elsewhere.		
APS	No	Leave the GO out of the standard.
Response: Thank you for your comment. In the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the drafting

3. Taking into consideration that only one of the versions of FAC-003 will actually be implemented, a decision that will be made as the Project 2010-07 drafting team learns more about the status of Project 2007-07—Vegetation Management, do you support the proposed redline changes to FAC-003-X and FAC-003-3?

Summary Consideration: The SDT thanks all individuals and groups who provided feedback. The majority of comments indicated support for the SDT’s changes to FAC-003-X and FAC-003-3, and the drafting team made additional changes, based on commenter feedback, where the team believes those changes add clarity.

Many commenters focused on the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: “...that extends greater than one mile beyond the fenced area of the generating station switchyard...” The drafting team believes that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, the team maintains that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.

One commenter caught typos in the Effective Dates sections of the standards, and those typos have been corrected.

Single commenters brought up minority issues, but the SDT found no justification for these issues. We address those minority issues in our responses to the specific comments below.

Organization	Yes or No	Question 3 Comment
American Transmission Company	No	<p>ATC does not support the changes for FAC-003-X, however, ATC does support FAC-003-3.</p> <p>FAC-003-X Concerns. The VRF and VSL tables do not correlate to the original FAC-003-1 levels of non-compliance section D.2. ATC believes that section D.2 should be rewritten to align with the already approved FAC-003-1.</p> <p>FAC-003-X Corrections- Applicability Section 4.3.1, sentence 3 - Transmission should not be capitalized.</p>

Organization	Yes or No	Question 3 Comment
		FAC-003-3 - No Concerns
<p>Response: Thank you for your comment. The VSLs and VRFs in FAC-003-X were taken from already approved NERC projects to update all early versions of standards with VSLs and VRFs instead of levels of non-compliance. Any additional changes to those VSLs and VRFs would be beyond the scope of this drafting team. No change made.</p> <p>Applicability Section 4.3.1 no longer includes a capitalized version of Transmission (just a reference to the "Transmission Owner's Facility").</p>		
Public Service Enterprise Group	No	<p>FAC-003-X and FAC-003-3 both have similar "one half mile" language, the starting point for the one half mile is vague. In FAC-003-X, the language in 4.3.1 reads "Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system and ...". While we support the one half mile language, there are three possible starting points for the measurement of the one half mile: beyond the fenced area of (i) the switchyard, (ii) the generating station, or (iii) the generation substation. While a GO's fencing policy may differ between generation stations, the requirement to implement vegetation management should be clear. For clarity, while we believe that the language should retain flexibility with regards to "fencing" by the Generator Owner, it should be clear that the Generation Owner determines the starting point.</p> <p>Second, a Generator Owner's overhead Facility that is within the fence should explicitly not be applicable to the standard. Finally, we believe the language that refers to the "interconnection with the Transmission system" should be changed to "interconnection with a Transmission Owner's Facility. The reason is that the term "Transmission" which is defined in the NERC Glossary could be construed to include all of a Generator Owner's interconnection leads. (The definition is excerpted from the Glossary in our response to question 7) Therefore, we suggest that the language in 4.3.1 be modified as follows to make all of these points clear: A Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of either the generator switchyard, generating station or generating substation (as specified by the Generation Owner) up to the point of interconnection with</p>

Organization	Yes or No	Question 3 Comment
		<p>a Transmission Owner’s Facility and is operated 200 kV and above and any lower voltage lines designated by the RE as critical to the reliability of the electric system within the region is applicable to this standard.”</p>
<p>Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: “...that extends greater than one mile beyond the fenced area of the generating station switchyard...” We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.</p> <p>The drafting team agrees that “interconnection with a Transmission Owner’s Facility” adds clarity. That change has been made.</p>		
<p>SPP Reliability Standards Development Team</p>	<p>No</p>	<p>In both FAC-003-3 and FAC-003-X it lists “greater than one half mile cutoff”. We would recommend that the distance cutoff be removed. We feel that overhead Facilities shouldn’t be treated any differently than any other. Also we would like to see these two sections in both standard proposals reflect similar language for 4.3.1.</p>
<p>Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: “...that extends greater than one mile beyond the fenced area of the generating station switchyard...” We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.</p>		

Organization	Yes or No	Question 3 Comment
PPL Supply Group	No	<p>Version 3 (based on V2): Third Effective date appears to contain a typographical error.</p> <p>Version X (based on V1): Same as Version 3 comments.</p> <p>Please consider streamlining the section Background (Version 3).</p>
<p>Response: Thank you for your comment. The typographical errors were corrected in both versions of the standard. Streamlining the Background section in Version 3 is not within the scope of this drafting team. No change made.</p>		
Westar Energy	No	<p>The language in the applicability section 4.3.1 in both FAC-003-3 and FAC-003-X states "extends greater than one half mile beyond..." We propose that the SDT consider removing the distance exclusion to be consistent with language for Transmission Owner Facilities and treat all overhead facilities the same.</p>
<p>Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: "...that extends greater than one mile beyond the fenced area of the generating station switchyard..." We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.</p>		
Southern Company	No	<p>(1) We question whether R1 of FAC-003-3 would ever apply to a GO who owns transmission interconnection equipment. Can the SDT provide an example or two in the Guideline and Technical Basis section of the standard?</p> <p>(2) We recommend rearranging the language in R5 of FAC-003-3 to state, "The applicable Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management to prevent encroachments when..." This places the "shall" at the beginning of the</p>

Organization	Yes or No	Question 3 Comment
		<p>requirement which is clearer and consistent with the structure of the other requirements.</p> <p>(3) We question why there are no VSLs assigned to R4. Should there be? What are the consequences if a Regional Entity does not comply?</p> <p>(4) There does not appear to be any coordination with the Vegetation Management Standard Drafting Team (VMSDT) concerning proposed modifications to the standard. The VMSDT should be consulted.</p>
<p>Response: Thank you for your comment.</p> <p>(1) The SDT is not currently aware of specific examples where R1 would apply, but we do not see any reason to remove that reference, as it could apply in the future. If we removed it now, we'd create a reliability gap, but if we leave it in, no Generator Owner has to take action unless it has an IROL or WECC transfer path.</p> <p>(2) This change is beyond the scope of our drafting team. It is an issue that should have been addressed under Project 2007-07. We will submit the issue in a Suggestion Form to be added to NERC's Issues Database.</p> <p>(3) Because the Regional Entity is not a Functional Entity, it cannot be assigned penalties under NERC's Reliability Standards.</p> <p>(4) The Project 2007-07 Vegetation Management drafting team's latest draft standard has already passed ballot, so coordination with that team was no longer a possibility.</p>		
APS	No	Leave the GO out of both Standards proposed.
<p>Response: Thank you for your comment. The drafting team and the majority of stakeholder commenters support making both FAC-001 and FAC-003 applicable to Generator Owners to ensure that all Generator Owner responsibilities at the generator interconnection Facility are covered under NERC Reliability Standards. No change made.</p>		
Indeck Energy Services	No	4.3.1.3 is a regional variation. The ROP doesn't permit members of one region to vote on regional requirements for another region. A separate regional standard will be required.
<p>Response: Thank you for your comment. It is our understanding that any stakeholder can vote on regional requirements as long as they're in the body of the standard. This does not require a separate regional standard.</p>		

Organization	Yes or No	Question 3 Comment
Ingleside Cogeneration LP	No	Ingleside Cogeneration LP believes there should be a relaxation in the vegetation management requirements for those interconnections which only serve as a radial link to the BES. Although we fully understand the importance of keeping vegetation away from high voltage lines, the one year period is much too frequent in our generator locations. The added documentation and other expenses simply do not justify the non-existent gain in reliability when vegetation in a locale (e.g.; desert) never reaches five feet above the ground. Consider limiting this exception to units below a certain MVA rating that are not critical to the BES - perhaps coupled with evidence that vegetative intrusions are highly unlikely.
<p>Response: Thank you for your comment. We have attempted to set up a reasonable qualifier/balance with the new one mile designation and “stake in the ground” at the fenced line of the switchyard. Because of a perceived reliability gap at the interconnection between Generator Owner Facilities and Transmission Owner Facilities, we are doing our best to apply the same Transmission Owner vegetation management requirements to the Generator Owner. This issue you raise (with respect to the vegetation in certain locales) could possibly be applied to other entities besides the Generator Owner if it was technically justified, so the drafting team encourages you to submit a SAR suggesting this.</p>		
Notheast Power Coordinating Council	No	See comments in the following questions.
EPSA	Yes	<p>EPSA generally supports the SDT’s proposed redline changes to FAC-003-X and FAC-003-3 and SDT’s diligence in monitoring Project 2007-07. There is one distinction however that EPSA would like to bring to the SDT’s attention that could increase clarity. FAC-003-X and FAC-003-3 both have similar “one half mile” language, but the starting point for the one half mile can occur one of three ways.</p> <p>In FAC-003-X, the language in 4.3.1 reads “Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system and ...” Therefore, there are three possible starting points for the measurement of the one half mile: beyond the fenced area of (i) the switchyard, (ii) the generating station,</p>

Organization	Yes or No	Question 3 Comment
		<p>or (iii) the generation substation. While it would appear implicit that GO's would determine which of the three was used to make the determination that the GO determines the starting point.</p> <p>Another point for consideration is that a Generator Owner's overhead Facility that is within the fence should explicitly not be applicable to the standard. EPSA believes the language that refers to the "interconnection with the Transmission system" should be changed to "interconnection with a Transmission Owner's Facility. The reason is that the term "Transmission" which is defined in the NERC Glossary could be construed to include all of a Generator Owner's interconnection leads. Therefore, we suggest that the language in 4.3.1 be modified as follows to make all of these points clear: A Generator Owner that owns an overhead Facility that extends greater than one half mile beyond the fenced area of either the generator switchyard, generating station or generating substation (as specified by the Generation Owner) up to the point of interconnection with the Transmission Owner's Facility and is operated 200 kV and above and any lower voltage lines designated by the RE as critical to the reliability of the electric system within the region is applicable to this standard."</p>
<p>Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: "...that extends greater than one mile beyond the fenced area of the generating station switchyard..." We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.</p> <p>The drafting team agrees that "interconnection with a Transmission Owner's Facility" adds clarity. That change has been made.</p>

4. The drafting team has added Generator Owners to the Applicability sections of FAC-003-X and FAC-003-3 with the qualifier that the included lines “extend greater than one half mile beyond the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system.” The team received many comments about the need to define a distance rather than other measures for exclusion, and decided on the one half mile as a reasonable distance. Do you agree with this half-mile qualifier?

Summary Consideration: The SDT thanks all individuals and groups who provided feedback. The majority of comments indicated support for the SDT’s changes to FAC-003-X and FAC-003-3, and the drafting team has made additional changes, based on commenter feedback, where they think those changes add clarity.

The drafting team received many comments about the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: “...that extends greater than one mile beyond the fenced area of the generating station switchyard...” The SDT believes that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, the team maintains that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.

One commenter suggesting including the equivalent kilometer length in the qualifying language in the standard, and we have made that change.

Organization	Yes or No	Question 4 Comment
Northeast Power Coordinating Council	No	The qualifier should be similar to that specified in Part 4.2.4 of FAC-003-3: “This standard applies to overhead transmission lines identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence. “ Vegetation needing attention can exist within a half mile of a switchyard. Vegetation does not discriminate between Generation and Transmission Owners.

Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-003-

Organization	Yes or No	Question 4 Comment

Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.</p>
Bonneville Power Administration	No	BPA believes that there needs to be a clear demarcation where Transmission Owner and Generator Owner responsibilities begin and end.
		<p>Response: Thank you for your comment. The drafting team is operating under the assumption the Generator Owner’s responsibilities to its interconnection Facility up to the point of interconnection with the Transmission Owner’s Facility, and we have attempted to make that clear in our draft standards. We are considering changes to the definitions of Generator Owner and Generator Operator, or creation of new terms to provide additional clarity in the next steps of our project plan, pending Standards Committee approval.</p>
Arizona Public Service Company	No	The generator should be responsible no matter the length from fence area to the point of interconnection.
		<p>Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: “...that extends greater than one mile beyond the fenced area of the generating station switchyard...” We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.</p>
Southern Company	No	We agree with a one-half mile line as being “within the Generator Owner’s line of sight and could be visually monitored for vegetation conditions on a routine basis.” However, we suggest that some generation interconnection Facilities greater than ½ mile in length could also fall within the GO’s line of sight or be constructed such that they should be considered for exemption. Thus, the Task Force should consider including exclusions for longer generator tie lines if

Organization	Yes or No	Question 4 Comment
		<p>the GO can provide sufficient justification. Examples of justifications could include (1) a clear line of sight, (2) pavement, gravel, or other non-vegetation covered path, or (3) routine monitoring is performed from a roadway parallel to the line, etc. Do not obviate any other transmission requirements such as the following (which are incorporate into the draft standard): i. Operated at 200kV or higher; or ii. Operated below 200kV and included in IROL; or iii. Operated below 200kV and inclusion in a Major WECC Transfer Path</p>
<p>Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.</p> <p>The drafting team is considering proposing a formal definition of the term "point of interconnection," or other definitional changes to make the use of that term clearer.</p>		
Westar Energy	No	
Midwest Reliability Organization's NERC Standards Review Forum (NSRF)	Yes	<p>Although the NSRF agrees with the 1/2 mile criteria (see question 1); we believe the drafting team will have to develop additional justification for this criteria given FERC's recent orders, RC11-1 and RC11-2 (see question 6 for full FERC Order details). In these orders FERC "implies" that if the GO/GOP is responsible for a breaker operated at 100kV or higher the entity should be required to register as a TOP/TO. Therefore it appears FERC would not be inclined to provide any leeway based on distance from the substation. The SDT should note that the FERC Order points to this Project to "address matters involving reliability obligations at the interface of the transmission grid", which is foot note 58.</p>
<p>Response: Thank you for your comment.</p>		
SERC Planning Standards Subcommittee	Yes	<p>However, we are concerned that there may be a reliability gap for locations where there is not a half-mile line-of-sight from the generation switchyard.</p>
<p>Response: Thank you for your comment. The SDT believes these cases are limited enough that an exclusion within the standard is not necessary. If you believe it is, we encourage you submit to a Suggestion Form.</p>		
EPSA	Yes	<p>EPSA appreciates the SDT proposing to use the approach that provides a</p>

Organization	Yes or No	Question 4 Comment
		specific distance for determining which GO Facility lead lines that FAC-003 should apply to. EPSA agrees that the half-mile qualifier provides a discrete parameter that will limit ambiguity in the Standard.
Response: Thank you for your comment.		
LG&E and KU Energy	Yes	Although the "one half mile" is much clearer than "two spans", what is the rationale for choosing ½ mile as opposed to another length such as 1 or 2 miles?
Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: "...that extends greater than one mile beyond the fenced area of the generating station switchyard..." We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.		
Independent Electricity System Operator	Yes	We generally agree with the proposed distance. However, we suggest that in Applicability Section 4.3.1 of the two draft standards, an equivalent kilometer value be inserted after the "one half mile".
Response: Thank you for your comment. We have added the equivalent kilometer value.		
SERC OC Standards Review Group	Yes	While we agree, we believe that a better explanation of "the fenced area of the switchyard, generating station or generating substation up to the point of interconnection with the Transmission system" should be included. One suggestion is to distinguish between a plant perimeter fence and an internal switchyard fence.
Response: Thank you for your comment. The drafting team received many comments about the half-mile qualifier in FAC-		

Organization	Yes or No	Question 4 Comment
<p>003-X and FAC-003-3. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: "...that extends greater than one mile beyond the fenced area of the generating station switchyard..." We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.</p>		
BGE	Yes	1/2 mile is a distance that can generally be viewed from one location, e.g. the switchyard, and can be construed to present minimal risk since switchyards have a reasonably frequent personnel presence that could be expected to notice vegetation issues in the <1/2 mile area.

5. Do you support the two year compliance timeframe for Generator Owners as included and explained in the Implementation Plans for FAC-003-X and FAC-003-3?

Summary Consideration: The SDT thanks all individuals and groups who provided feedback. The vast majority of commenters supported the two-year compliance timeframe for Generator Owners as included and explained in the Implementation Plan. One commenter suggested that one year would be sufficient because most lines will be short, but the SDT pointed out that the distances of the lines can vary, and Generator Owners that have not been practicing any sort of vegetation management will need to hire new staff and develop a full vegetation management plan, which could take longer than the year given to Transmission Owners for implementation of FAC-003-1. No changes were made to the two-year compliance timeframe, although the team has modified FAC-003-3's implementation plan to account for a few different scenarios that could occur with respect to the filing of FAC-003-2 and FAC-003-3

Organization	Yes or No	Question 5 Comment
Ingleside Cogeneration LP	No	The two year compliance time frame makes sense only for those GOs who own interconnections into critical generation facilities. See our response under Question #3.
<p>Response: Thank you for your comment. It is unclear whether you find the two year timeframe too long or too short, or if you believe that the standard should only apply to Generator Owners who own interconnections into critical generation facilities. No change made.</p> <p>Please see our response to your comments under Question 3 above.</p>		
APS	No	Leave GOs out of the standards.
<p>Response: Thank you for your comment. 6. In its background resource document, the drafting team lists the standards that it has not modified, and offers rationale for its decisions. Are there any reliability standards or requirements that you believe should apply to Generator Owners or Generator Operators that own and are responsible for the operation of an overhead Facility, that are not already applicable or have been proposed to be applicable (FAC-001 and FAC-003) by the Project 2010-07 drafting team? If so, please list them and offer an explanation as to why they should be applicable to that entity.

Summary Consideration: The SDT thanks all stakeholders for their feedback. The majority of commenters did not suggest the addition of any standards or requirements to the team’s scope of work, and a few commenters cautioned strongly against any additions. Some commenters suggested that the team consider including those standards and requirements listed in the June 2011 Cedar Creek and Milford FERC orders. The drafting team has considered the inclusion of the requirements listed in the Cedar Creek and Milford orders in the past, and has been revisiting them throughout our process. They have continued to conclude, with stakeholder support, that no additional substantive standard or requirement changes are necessary to achieve the goal of this project. With this posting, the drafting team has revisited those standards yet again and developed a comprehensive document and spreadsheet tracing their rationale (at every stage of the process) for not including additional standards or requirements. The team has elected to propose a slight clarifying change in PRC-004-2, but no changes to the applicability of that or any other standard.

While the SDT will not be adding standards at this time because they do not believe such additions are technically justified or justified by stakeholder comments, the team will be seeking some additional informal feedback from industry groups to ensure that their technical justifications are sound and supported by others outside of the drafting team. The team has posted their current draft rationale and technical justification documents on the project webpage with this posting. If you have any specific feedback on these documents, you are welcome to email mallory.huggins@nerc.net.

Organization	Yes or No	Question 6 Comment
Manitoba Hydro	No	The direction of the background resource document gives special treatment to the Generator Owner in that it allows the Generator Owner TO status for a couple of standards (FAC-001 and FAC-003), but exempts the Generator Owner from many of the standards applicable to a TO. The NERC Functional Model defines the various functional entities. If a Generator Owner wants to be a TO, all the Requirements applicable to a TO should apply. There is no need to change specific Reliability Standards to allow the

Organization	Yes or No	Question 6 Comment
		Generator Owner to perform only selected TO functions.
<p>Response: Thank you for your comment. The purpose of the drafting team is “To propose a set of changes to existing requirements and definitions, as well as additional requirements and definitions, that collectively adds significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. This global strategy is proposed to expedite the closing of the reliability gap.” The SDT is applying select Transmission Owner standards to Generator Owners, not attempting to give them TO status.</p>		
Sempra Generation	No	No, Sempra Generation believes the Project 2010-07 Team has effectively indentified the Standards and Requirements that should apply to Generator Owners or Generator Operators that own, and are responsible for, the operation of an overhead Facility, that are not already applicable or have been proposed to be applicable.
<p>Response: Thank you for your comment.</p>		
APS	No	Leave GOs and GOPs out of the FAC-001 and FAC-003 standards.
<p>Response: Thank you for your comment. The drafting team and the majority of stakeholder commenters support making both FAC-001 and FAC-003 applicable to Generator Owners to ensure that all Generator Owner responsibilities at the generator interconnection Facility are covered under NERC Reliability Standards. Because of this order, the drafting team should examine the listed standards and determine whether they are or are not applicable to Generator Owners or Generator Operators that own and are responsible for the operation of an overhead Facility. We emphasize that our recommendation takes no position on any legal issues regarding the referenced order.</p>
<p>Response: Thank you for your comment. The drafting team has considered the inclusion of the requirements listed in the Cedar</p>		

Organization	Yes or No	Question 6 Comment
		<p>Creek and Milford orders in the past, and we have been revisiting them throughout our process. We continue to conclude, with stakeholder support, that no additional substantive standard or requirement changes are necessary to achieve the goal of this project. With this posting, the drafting team has revisited those standards yet again and developed a comprehensive document and spreadsheet tracing our rationale (at every stage of the process) for not including additional standards or requirements. We have elected to propose a slight clarifying change in PRC-004-2, but no changes to the applicability of that or any other standard. Please see the accompanying resource documents for more information.</p>
<p>Midwest Reliability Organization's NERC Standards Review Forum (NSRF)</p>	<p>Yes</p>	<p>In FERC order "Denying Appeals of Electric Reliability Organization Registration Determinations" dated June 16, 2011 (RC11-1 and RC11-2) FERC explicitly stated compliance GAPS existed with the following standards at a minimum: o FAC-011, Requirements R2, R2.1, R2.2. o PRC-001-1, Requirements R2, R2.2, R4; o PRC-004-1 Requirement R1; o TOP-004-2, Requirements R6, R6.1, R6.2, R6.3, R6.4; o PER-003-1, Requirements R1, R1.1, R1.2; o FAC-003-1, Requirements R1, R2; o TOP-001, Requirement R1 and o FAC-014-2, Requirement R2. When a GO/GOP owns transmission equipment but is not registered as a TO or TOP. The drafting team should explicitly address each of these the above requirements.</p>
		<p>Response: Thank you for your comment. <p>additional standards or requirements. We have elected to propose a slight clarifying change in PRC-004-2, but no changes to the applicability of that or any other standard. Please see the accompanying resource documents for more information. The SDT does not agree that VAR-001 should be applied to a GOP as VAR-002 @R2 already requires the GOP to “maintain the generator voltage or Reactive Power output (within applicable Facility Ratings) as directed by the Transmission Operator.” We believe this is sufficient in meeting the purpose of VAR-001.</p>

7. Do you have any other questions or concerns with the proposed standards or with the background resource document that have not been addressed? If yes, please explain.

Summary Consideration: The SDT thanks all stakeholders who offered additional feedback in this section. Some comments revisited issues that had been addressed in other questions, and other comments introduced new minority concerns.

A few commenters suggested, again, the inclusion of definitions or additional standards within the scope of this project, and the SDT appreciates those comments, especially those which included detailed suggestions. While the team is not proposing any definition changes with this round of updated standard changes, they do plan to consider some definition changes or possibly new definitions to prevent future unnecessary registration of GOs and GOPs as TOs and TOPs and ensure that there are no possible reliability gaps. In the next steps of our project, we will consider putting forward definition-related changes for comment separately, following the procedure approved by the Standards Committee after its July 2011 meeting.

The SDT has also considered the inclusion of additional standards and requirements throughout our process and continues to conclude, with stakeholder support, that no additional substantive standard or requirement changes are necessary to achieve the goal of this project. With this posting, the drafting team has revisited those standards yet again and developed a comprehensive document and spreadsheet tracing our rationale (at every stage of the process) for not including additional standards or requirements. The team has elected to propose a slight clarifying change in PRC-004-2, but no changes to the applicability of that or any other standard. They have attempted to make our technical justifications much more robust and comprehensive than they were in the past, as suggested by stakeholders. Please see the accompanying resource documents (posted on the project webpage) for more information.

One commenter expressed concern about whether the SDT's work would be approved by regulators. The drafting team is doing everything we can to work with regulating entities to ensure that forced registrations no longer occur.

For most of the comments, the team made no changes and explained why:

One commenter suggested modifying the definition of Right-of-Way in the currently approved FAC-003-1 (our FAC-003-X). The team could not make any change because the definition proposed in FAC-003-3 has not been formally approved and, in general, modifications to the definition of ROW are outside the scope of our team.

One commenter suggested modifications to the format of the requirements in FAC-003-X, which the SDT determined to be outside its scope.

One commenter expressed concern about a Transmission Owner or Generator Owner having to comply with FAC-003 for a Facility that it did not own. The drafting team does not know why a Transmission Owner or Generator Owner would ever be required to provide evidence, documentation, notification, or inspection of vegetation management for Facilities not owned by that registered entity, except where explicitly agreed upon in a contract. In the absence of additional information to clarify this commenters concern, the SDT does not believe this needs to be addressed within the standard.

One commenter focused on FAC-001 and expressed concern about the “activation” point of the standard and the feasibility of any interconnection. The SDT reminded the commenter that “activation only occurs with an executed Agreement, and that in the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities.

One commenter wondered why only a select set of TO/TOP requirements were being applied to GOs/GOPs. The SDT directed this commenter to the goal of the team, which is to apply select Transmission Owner standards to Generator Owners, not to give them TO status.

Organization	Yes or No	Question 7 Comment
TransAlta Centralia Generation LLC	No	TransAlta Centralia Generation LLC (TransAlta) supports the recommendations put forward by the Project 2010-07 drafting team. The implementation of these recommendations will provide for much needed certainty for owners and operators of generation facilities.
Response: Thank you for your comment.		
SERC Planning Standards Subcommittee	No	The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

Northeast Power Coordinating Council	Yes	<p>Regarding the Right-of-Way definitions, the definition in FAC-003-3 is the better of the two. Suggest adding "and maintain" to the first sentence of the definition as follows: The corridor of land under a transmission line(s) needed to operate and maintain the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria. The term Right-of-Way goes beyond Transmission Vegetation Management, and that should be considered in the definition. How does Right-of-Way affect transmission facilities that are routed over bodies of water, or over valleys, highways, etc.? Right-of-Way in relation to underground facilities? The format of FAC-003-X should be made consistent with current NERC guidelines (i.e.--Parts of Requirements should not have R's in their numbering, should be 1.1, 1.2 etc.).</p>
<p>Response: Thank you for your comment. It would be outside the scope of this team to modify the definition of Right-of-Way in the currently approved FAC-003-1 (our FAC-003-X), because the definition proposed in FAC-003-3 has not been formally approved and, in general, modifications to the definition of ROW are outside the scope of our team. No change made.</p>		

Organization	Yes or No	Question 7 Comment
		<p>With respect to the changes to the format of the requirements in FAC-003-X, while our drafting team is making changes to update the format of the standard where possible, we do not think it is appropriate to change the listing of the sub-requirements to parts. In earlier versions of standards, the sub-requirements were written as requirements (for instance, they have their own VSLs), and we do not believe it is appropriate within our scope to make that format and labeling change.</p>
<p>Public Service Enterprise Group</p>	<p>Yes</p>	<p>While we generally agree with the drafting team’s modifications to these standards, the team’s approach may not directly resolve the fundamental registration issue regarding a Generation Owner that only owns non-integrated interconnection transmission facilities. The non-integrated interconnection transmission facilities owned by a GO are part of the Bulk Electric System (BES) because they are part of BES generation facilities. The ownership of these non-integrated facilities should not require a GO to also register as a Transmission Owner. The draft team has proposed modifying two FAC standards that would apply to such GO-owned interconnection transmission facilities. These GO-owned interconnection transmission facilities are not, however, “integrated” transmission facilities, as the drafting team correctly points out in its background resource document. A proposed solution to the Generation Owner registration issue is discussed below.</p> <p>NERC’s Rules of Procedure (ROP) require entities to be registered in accordance with the definitions in the NERC Glossary of Terms Used in Reliability Standards (Glossary) and in accordance with the NERC Statement of Compliance Registry Criteria document. The Glossary has these definitions:</p> <ul style="list-style-type: none"> o Generation Owner - Entity that owns and maintains generating units. o Transmission Owner - The entity that owns and maintains transmission facilities. o Facility - A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.) o Transmission - An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems.

Organization	Yes or No	Question 7 Comment
		<p>o Transmission Service - Services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery</p> <p>The drafting team should create a new definition for the term “integrated transmission facilities” and include this new definition in the Glossary. This definition should then be use to modify the definition of Generation Owner so that registration will be clear. While the team chose not to create any new definitions, we believe the registration issue cannot be resolved without modifying the definition of “Generation Owner.”</p> <p>The following definition is proposed for Integrated Transmission Facilities in the NERC Glossary:</p> <p>o Integrated Transmission Facilities (ITF) - ITF are the Facilities that are a subpart of Transmission system that are capable of carrying the flows from multiple generator plants at different points of interconnection for delivery to customers or to other electric systems</p> <p>This proposed ITF definition builds upon FERC precedent in the Open Access Transmission Tariff (OATT) area. FERC has recognized that facilities that can carry flows from multiple supply points and deliver that power to either customers or other electric systems are proper facilities to include in an OATT and define the “Transmission System” for OATT purposes. The term “Transmission System” is an OATT-defined term that means “The facilities owned, controlled or operated by the Transmission Provider that are used to provide transmission service under Part II [Point-to-Point Transmission Service] and Part III [Network Integrated Transmission Service] of the Tariff.” Under FERC’s precedent, facilities such as generator step-up transformers and generator interconnecting transmission facilities have been excluded from the OATT; i.e., they are not facilities that provide Transmission Service because they cannot carry the flows from multiple supply points for delivery to customers or other electric system - their only use is to the Generation Owner. They perform two functions for a GO:</p> <ol style="list-style-type: none"> 1. They deliver power from the GO’s generators at a site to the OATT-defined Transmission System, and 2. They deliver off-site power from the OATT-defined Transmission System to the generators at a site when the generators at a site are not operating.

Organization	Yes or No	Question 7 Comment
		<p>While building on FERC OATT precedent, the proposed definition of “Integrated Transmission Facilities” does not require an applicable Transmission Service tariff to identify those facilities. Integrated Transmission Facilities are simply defined as those that capable of carrying flows from multiple supply points for delivery to customers or to other electric systems. Using the ITF definition, the definition of Generation Owner could be modified as follows:</p> <ul style="list-style-type: none"> o Generation Owner - Entity that owns and maintains generating units but which does not own or maintain Integrated Transmission Facilities.
<p>Response: Thank you for your comment. We appreciate the detailed suggestions. While we are not proposing any definition changes with this round of updated standard changes, we do plan to consider some definition changes or possibly new definitions to prevent future registration and ensure that there are no possible gaps. In the next steps of our project, we will consider putting forward definition-related changes for comment separately, as is now allowed by the Standards Committee after its July 2011 meeting.</p>		
EPSA	Yes	<p>EPSA can appreciate the SDT’s decision that it not propose new defined terms for the NERC Glossary. The SDT bases the decision on outreach meetings with NERC, regional compliance managers and industry organizations. EPSA supports outreach but still believes that the SDT should propose definitions for the NERC Glossary. The definitions can serve as a basis for the outreach meetings while also further limiting reliability gaps - real or perceived. Much as EPSA expressed in its White Paper comments there is still a need for a definition for generator interconnection facilities. In addition, because integrated transmission facility has also played a big part in the cases that have prompted the need for Project 2010-07 the drafting team should propose a glossary change for that definition as well. A definition for generation interconnection facilities is necessary in Project 2010-07 Standard so that the interface between generators and transmission system can be clearly established and any ambiguities about reliability responsibilities for GOs & GOPs and TO & TOPs can be eliminated.</p> <p>EPSA recommended the definitions from the Ad-Hoc Group Report could be used for incorporating the Generator Interconnection Facility into the standard:</p> <ul style="list-style-type: none"> Generator Interconnection Facility - Sole-use facility for the purpose of connecting the generating unit(s) to the transmission grid. In this regard, the sole-use facility

Organization	Yes or No	Question 7 Comment
		<p>only transmits power associated with the interconnecting generator, whether delivered to the grid or delivered to the generator for station service or auxiliary load, or delivered to meet cogeneration load requirements.</p> <p>Generator Interconnection Operational Interface - Location at which operating responsibility for the Generator Interconnection Facility changes between the Transmission Operator and the Generator Operator.</p> <p>These definitions were developed with due consideration for varying configurations, outages, and generators materiality to the BES. The Facility definition defines the purpose of the facility, while the Generator Interconnection Operational Interface definition provides the functional lines of demarcation between the GO and the TO. The definitions were developed based on the purpose of generator interconnection facilities, their usage and how their usage differs from transmission facilities that comprise the interconnected grid. Similar to EPSA's assertions on the White Paper competitive suppliers believe this is a sound basis for distinguishing BES facilities. EPSA also suggests that the SDT include the following proposed definition for Integrated Transmission Facilities for inclusion in the NERC Glossary:</p> <p style="padding-left: 40px;">Integrated Transmission Facilities (ITF) - ITF are the Facilities that are a subpart of Transmission system that are capable of carrying the flows from multiple generator plants at different points of interconnection for delivery to customers, or to other electric systems.</p> <p>This proposed ITF definition builds upon Commission precedent in the Open Access Transmission Tariff (OATT) area. FERC has recognized that facilities that can carry flows from multiple supply points and deliver that power to either customers or other electric systems are proper facilities to include in an OATT and define the "Transmission System" for OATT purposes. The term "Transmission System" is an OATT-defined term that means "The facilities owned, controlled or operated by the Transmission Provider that are used to provide transmission service under Part II [Point-to-Point Transmission Service] and Part III [Network Integrated Transmission Service] of the Tariff." Under Commission precedent, facilities such as generator step-up transformers and generator interconnecting transmission facilities have been excluded from the OATT; i.e., they are not facilities that provide Transmission Service because they cannot carry the flows from multiple supply points for delivery to customers or other electric system - their</p>

Organization	Yes or No	Question 7 Comment
		<p>only use is to the GO and perform two functions:</p> <ol style="list-style-type: none"> 1. They deliver power from the GO's generators at a site to the OATT-defined Transmission System, and 2. They deliver off-site power from the OATT-defined Transmission System to the generators at a site when the generators at a site are not operating. <p>While building on FERC OATT precedent, the proposed definition of "Integrated Transmission Facilities" does not require an applicable Transmission Service tariff to identify those facilities. Integrated Transmission Facilities are simply defined as those that capable of carrying flows from multiple supply points for delivery to customers or to other electric systems. Using the ITF definition, the definition of Generation Owner could be modified as follows:</p> <p style="padding-left: 40px;">Generation Owner - The Entity that owns and maintains generating units but which does not own or maintain Integrated Transmission Facilities.</p> <p>EPSA encourages the Project 2010-07 SDT to consider fitting the above definitions into the current proposal for inclusion in the NERC Glossary. Therefore, EPSA respectfully requests that the SDT for Project 2010-07 consider the all the recommendations made herein to the seven questions.</p>
<p>Response: Thank you for your comment. We appreciate the detailed suggestions. While we are not proposing any definition changes with this round of updated standard changes, we do plan to propose some definition changes or possibly new definitions to prevent registration and ensure that there are no possible gaps. In the next steps of our project, we will consider putting forward definition-related changes for comment separately, as is now allowed by the Standards Committee after its July 2011 meeting</p>		
PacifiCorp	Yes	<p>PacifiCorp believes the Standards Drafting Team should clarify the Transmission Owner and/or the Generator Owner are not required to provide evidence, documentation, notification, or inspection of vegetation management for facilities not owned by the Transmission Owner and/or the Generator Owner.</p>
<p>Response: Thank you for your comment. The drafting team does not know why a Transmission Owner or Generator Owner would ever be required to provide evidence, documentation, notification, or inspection of vegetation management for Facilities not owned by that registered entity, except where explicitly agreed upon in a contract. We do not believe this needs to be addressed within the</p>		

Organization	Yes or No	Question 7 Comment
standard. No change made.		
Southern Company	Yes	<p>(1) The SDT needs to review the June 16, 2011 FERC Order on Cedar Creek and Milford and factor this into the equation. The FERC Order concludes that the Cedar Creek and Milford entities must register as a TO and TOP. In addition to FAC-003, the Cedar Creek and Milford order lists the following standards and requirements that apply to these entities as a TO/TOP:</p> <ul style="list-style-type: none"> o PER-003-1, R1, R1.1, R1.2 (requiring NERC-certified transmission operators); o PRC-001-1, R2, R2.2, R4, R6 (notification of relay or equipment failures); o PRC-004-1, R1 (analyzing protection system misoperations); o FAC-014-2, R2 (establishment of system operating limits); o TOP-001, R1 (authority to take actions to alleviate operating emergencies); o TOP-004-2, R6, R6.1, R6.2, R6.3, R6.4 (establishment of formal policies to address voltage levels, planned outages, switching, Interconnection Reliability Operating Limits, and System Operating Limits). <p>The SDT needs to address these specific requirements in sufficient detail by either revising the Project 2010-07 Background Resource Document or proposing revisions to these standards to address any reliability gaps. For example, we recommend, as a minimum, that the Background Resource Document discussion under PRC-001-1 be revised to state (underlined text added), “Generator Operators and the scope of protection equipment for generation interconnection Facilities are already appropriately accounted for in this standard in requirements R1, R2, R3, and R5.” Please note that this statement, even with our proposed revision, conflicts with the FERC Order on Cedar Creek and Milford, Paragraphs 64, 65, and 78 where FERC states that Cedar Creek and Milford must register as a TO and TOP to ensure the protection system coordination requirements in R2 and R4 of PRC-001 are met. Thus, the discussion for PRC-001-1 in the Project 2010-07 Background Resource Document needs additional language to demonstrate adequacy of the GO requirements in order to prevent GOs that own generation interconnection Facilities from having to register as a TO and TOP.</p> <p>(2) In addition, we believe the SDT should add supporting discussion to the</p>

Organization	Yes or No	Question 7 Comment
		<p>Background Resource Document to explain why the following standards adequately cover GO/GOP requirements at the Transmission Interface: PRC-004-2, PRC-005-1, PRC-023-1. For example, the Background Resource Document could state that PRC-023-1 Section A.4 Applicability already includes, "4.2. Generator Owners with load-responsive phase protection systems as described in Attachment A, applied to facilities defined in 4.1.1 through 4.1.4."</p> <p>(3) Furthermore, FERC's analysis in the Cedar Creek and Milford order suggests that reliability gaps will occur if certain entities are not registered as TO/TOP. The GRTI SAR DT should assess why its findings are different from the Commission's findings. By way of background, the GRTI SAR DT provides that its own assessment of the GOTO Ad Hoc Group Final Report concludes with a belief that there are only two standards requiring modifications to address reliability gaps - FAC-001 and FAC-003 (Background Resource Document, page 3). FERC will most likely require that NERC clearly demonstrate and provide technical support for the position that GO's only need to comply with FAC-001 and FAC-003 and not the other standards noted by FERC. The Background Resource Document does not appear to provide adequate technical support for the GRTI SAR DT position. Therefore, the GRTI SAR DT should develop that technical support in preparation for the filing of these revised standards at FERC.</p>
<p>Response: Thank you for your comment. We have considered the inclusion of additional standards and requirements throughout our process and we continue to conclude, with stakeholder support, that no additional substantive standard or requirement changes are necessary to achieve the goal of this project. With this posting, the drafting team has revisited those standards yet again and developed a comprehensive document and spreadsheet tracing our rationale (at every stage of the process) for not including additional standards or requirements. We have elected to propose a slight clarifying change in PRC-004-2, but no changes to the applicability of that or any other standard. We have attempted to make our technical justifications much more robust and comprehensive than they were in the past, as you suggest. Please see the accompanying resource documents for more information.</p>		
APS	Yes	Leave GOs out of the standards, because it just adds more regulation and reporting requirements not needed.
<p>Response: Thank you for your comment. The drafting team and the majority of stakeholder commenters support making both FAC-001 and FAC-003 applicable to Generator Owners to ensure that all Generator Owner responsibilities at the generator interconnection Facility are covered under NERC Reliability Standards. No change made.</p>		

Organization	Yes or No	Question 7 Comment
Sempra Generation	Yes	When implemented, the recommendations of the Project 2010-07 Team go a long way toward providing the regulatory and compliance certainty needed by generators who own or operate Generator Interconnection Facilities. NERC is encouraged to provide these industry-supported amendments to the NERC Board of Trustees in the near future. Sempra Generation also supports the comments, being concurrently filed, of the Electric Power Supply Association (EPSA).
Response: Thank you for your comment.		
Exelon	Yes	FAC-001-1. Exelon has generating stations that have the Main Power Transformer (MPT) disconnect as the point of demarcation. The station owns the short leads from the MPT disconnect back to the generator and the applicable TO owns from the MPT disconnect up to and including the switchyard. It is not practical for another entity to request to interconnect to the MPT disconnect nor should it be allowed. The SDT should consider verbiage to the standard that does not allow requests to interconnect to a MPT disconnect. 2. Exelon is having difficulty determining how this standard would apply to GOs and how GOs would implement the standard; suggest that examples be provided in an implementation document specifically showing where and how this standard would apply.
Response: Thank you for your comment. (1) FAC-001-1 would not be “activated” simply with another entity’s request to interconnect. The standard is “activated” only with an executed Agreement to evaluate the reliability impact of interconnection. If another entity cannot interconnect to the MPT, the process should not get to the point of an executed Agreement and thus this standard would never apply. (2) In the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the drafting team thinks it is important to clarify the responsibilities related to such a request in NERC’s Reliability Standards by including applicable Generator Owners in FAC-001-1. We have documented our technical justification in an accompanying resource document and encourage you to review it.		
Ingleside Cogeneration LP	Yes	There is a fundamental issue related to the interconnection of generation and distribution facilities into the transmission grid. There is a myriad of complex architectures which make the designation of ownership and operational responsibilities

Organization	Yes or No	Question 7 Comment
		<p>unclear in both cases. Both this team’s efforts and those by the project team redefining the extent of the BES have run into this issue.</p> <p>Ingleside Cogeneration LP recognizes that the effort to properly assign reliability responsibilities in these gray-area connections is difficult. However, pushing the issue back to the GO/GOP by looking for them to jointly determine responsibilities with adjacent entities will create every conceivable arrangement possible.</p> <p>It seems like it should be possible to address a handful of common interconnection configurations at the start. As knowledge builds, perhaps other architectures could be added. This seems to be the direction that the project team redefining the extent of the BES is heading.</p> <p>Lastly, we need some assurance that regulators will work with us as we go down this path. Right now, the feeling is that they will continue to use forced registrations as a hammer - which may render moot this team’s efforts anyways.</p>
<p>Response: Thank you for your comment.</p> <p>The drafting team is doing its best to coordinate with regulators to ensure that forced registrations no longer occur. While we can never be sure exactly what decision the regulators will make, our intent is to make changes through this project that prevent any future forced registrations. We have encouraged regulators to provide formal comments if they believe our changes are not going to close the gap. While there can be similarities, the SDT believes that each interconnection agreement is different. The SDT believes that each party to such agreement should have identified its ownership and operational responsibilities. If there is uncertainty as to ownership of operational responsibility of a Facility used to interconnect a generator, the respective GO/GOPs and TO/TOPs should be addressing these. Resolving these uncertainties can only occur between the affected parties.</p>		
Manitoba Hydro	Yes	<p>The direction of the background resource document gives special treatment to the Generator Owner in that it allows the Generator Owner TO status for a couple of standards (FAC-001 and FAC-003), but exempts the Generator Owner from many of the standards applicable to a TO. A Generator Owner that owns BES transmission should be held accountable for the specific Requirements and Reliability Standards applicable to the TO and Transmission Operator functions. If no other entity assumes accountability for these specific Requirements and Reliability Standards on the</p>

Organization	Yes or No	Question 7 Comment
		<p>Generator Owner BES transmission (for example system operation, protection and communication), there will be a reliability gap. Improper operation, coordination and protection of the Generator Owner BES transmission could have an impact on reliability.</p>
<p>Response: Thank you for your comment. The purpose of the drafting team is “To propose a set of changes to existing requirements and definitions, as well as additional requirements and definitions, that collectively adds significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. This global strategy is proposed to expedite the closing of the reliability gap.” The SDT is applying select Transmission Owner standards to Generator Owners, not attempting to give them TO status. The SDT believes that each interconnection agreement is different. The SDT believes that each party to such agreement should have identified its ownership and operational responsibilities. If there is uncertainty as to ownership of operational responsibility of a Facility used to interconnect a generator, the respective GO/GOPs and TO/TOPs should be addressing these. Resolving these uncertainties can only occur between the affected parties.</p>		
<p>Constellation Power Generation</p>	<p>Yes</p>	<p>Constellation appreciates and supports the work of the standard drafting team. We recognize the significant time invested by technical experts from industry to consider the appropriate application of reliability standards to address concerns raised about coverage of transmission at the generator interface. The recent FERC Order concerning Cedar Creek and Milford wind suggested that the list of applicable standards needing revision should go beyond FAC-001 and FAC-003.</p> <p>We appreciate the discussion and concerns raised by FERC in the order; however, the discussion is limited by failing to consider these issues in light of the full package of existing standards. Below is a look at the FERC suggested standards and how they intersect with other standards:</p> <ul style="list-style-type: none"> o PRC-001-1, Requirements R2, R2.2, R4; FERC expressed concern that certain protection system components may not be well coordinated with the RC. However, the same standard (PRC-1) addresses this issue by requiring all GOs to ensure coordination of their protection system with interconnected parties. Further, FAC-002 requires that all new facilities undergo reviews by the TOP, BA, etc. o PRC-004-1 Requirement R1; FERC expressed concern that certain protection system components may not be analyzed for misoperations. However, the same standard (PRC-4) addresses this issue by requiring all GOs to ensure that they

Organization	Yes or No	Question 7 Comment
		<p>analyze all misoperations on their protection system which would include the protection of the tie line.</p> <ul style="list-style-type: none"> o TOP-004-2, Requirements R6, R6.1, R6.2, R6.3, R6.4; FERC expressed concern that coordination may be lacking between a GO and a TO with regards to the generator tie line. However, TOP standards applicable to GOs address this issue by requiring all GOs to coordinate all maintenance and emergency outages (both forced and planned) with all applicable interconnected parties. Further, all ISO procedures require the same of GOs. o PER-003-1, Requirements R1, R1.1, R1.2; FERC expressed concern that certain generator operators are responsible for the real time operation of the interconnected BES without being NERC certified operators, potentially causing a reliability gap. Generator Operators do not monitor and control the BES, they control and monitor generators that it operates and relays information to other operating entities. Therefore, NERC certification is not required. o FAC-003-1, Requirements R1, R2; FERC and the drafting team seem aligned in the need to revise this standard and the revision proposal includes such a revision. o TOP-001, Requirement R1; FERC expressed concern that certain tie lines may not be required to operate in such a way as to alleviate operational emergencies. However, IRO and TOP standards applicable to GOs address this issue by requiring all GOs to operate as directed by their TOP, BA, or RC as directed and must render emergency assistance. o FAC-014-2, Requirement R2; FERC expressed concern that certain tie lines may have a rating based on a methodology that may not be consistent with the methodology used by the RC. However, standards FAC-8 and FAC-9 address this issue by requiring all GOs to develop a methodology to rate all equipment, and that the RC has the authority to challenge the GO on that methodology. The onus is on the GO to either change their methodology and rating accordingly, or provide a technical justification as to why they cannot adopt the changes. Further, a generator will never be limited by its tie line, as a generator's profits are directly tied to its output. Therefore no generator would limit its facility to the

Organization	Yes or No	Question 7 Comment
		equipment that is delivering that output.
<p>Response: Thank you for your comment. The drafting team has considered the inclusion of the requirements listed in the Cedar Creek and Milford orders in the past, and we have been revisiting them throughout our process. We continue to conclude, with stakeholder support, that no additional substantive standard or requirement changes are necessary to achieve the goal of this project. With this posting, the drafting team has revisited those standards yet again and developed a comprehensive document and spreadsheet tracing our rationale (at every stage of the process) for not including additional standards or requirements. We appreciate the rationale you have included within your comment, and where we agree, we have incorporated it into our own.</p> <p>We have elected to propose a slight clarifying change in PRC-004-2, but no changes to the applicability of that or any other standard. Please see the accompanying resource documents for more information.</p>		
Utility Services, Inc.	Yes	<p>In one of the supporting documents for the upcoming comments, the GO/TO group included the following statement in support for the rationale on FAC-001. In its first posting for informal comment, the drafting team set the “trigger” for the application of FAC-001 as the receipt of a request for interconnection. Many commenters disagreed with this approach and suggested that the “trigger” be based upon “the intent or obligation” to interconnect a new Facility to an existing interconnecting Facility that is owned by a generator. Accordingly, the drafting team has proposed language to address this concern. The intent of this modified language is to start the compliance clock at such time as the Generator Owner executes an Agreement to perform the reliability assessment required in FAC-002-1. This step should occur whether the generator voluntarily agrees to the interconnection request or is compelled by a regulatory body to do so. In either case, we expect the Generator Owner and the requestor to execute some form of Agreement. We intentionally excluded a specific reference to the form of Agreement (such as a feasibility study) in deference to comments that we should avoid comingling of commercial and reliability aspects in reliability standards.</p> <p>I wonder about whether or not this can work timing-wise. It says the compliance clock starts with the agreement to perform the reliability assessment for FAC-002. The FAC-001 requirements outline the need for a registered entity to document, maintain, and publish facility connections requirements in order to be compliant. If the clock starts at the agreement for the assessment, does that mean that you then document, maintain, and publish the connection requirements? Don’t the connection requirements usually</p>

Organization	Yes or No	Question 7 Comment
		<p>outline the terms for the “agreement for the assessment”? I am not sure that I understand the timing sequence in order to be compliant to the standard. I would think that the agreement needs to be in place at the time of the effective date of the standard, not upon an application.</p>
<p>Response: Thank you for your comment. We have provided a detailed explanation of how this process might look in the accompanying FAC-001-1 technical justification. Please refer to that for more information.</p>		
<p>FirstEnergy Corp</p>	<p>Yes</p>	<p>The June 16, 2011 FERC Order denying the appeals of two wind generating facilities- Cedar Creek and Milford - of the NERC determinations that Cedar Creek and Milford must each be registered as a transmission owner and transmission operator on the NERC Compliance Registry complicates the GO-TO drafting team’s work. However, the issues may be distinct and different in the end. The existing GO-TO team’s work product defines new reliability expectations for a generator owner regardless of whether or not the same entity is also being required to have a TO-TOP “light” compliance registration. In the Order, FERC describes what it believes are an appropriate limited set of TO-TOP requirements when a TO-TOP “light” registrations is deemed warranted for a traditional generation owner. The drafting team should describe what, if any, impact the FERC June 16 Order is having on its work scope.</p> <p>One minor comment for the background resource document. On page one, the last sentence of the 1st paragraph which currently reads “ ... appropriate level of reliability for the BES.” Consider changing to read “ ... Adequate Level of Reliability for the BES.” And, include a footnote directing the reader to NERC’s definition/paper describing ALR. The later references to “adequate level of reliability” within the document (i.e. page 2, 2nd paragraph could then be reduced to the acronym ALR.</p>
<p>Response: Thank you for your comment. The drafting team has considered the inclusion of the requirements listed in the Cedar Creek and Milford orders in the past, and we have been revisiting them throughout our process. We continue to conclude, with stakeholder support, that no additional substantive standard or requirement changes are necessary to achieve the goal of this project. With this posting, the drafting team has revisited those standards yet again and developed a comprehensive document and spreadsheet tracing our rationale (at every stage of the process) for not including additional standards or requirements.</p> <p>Thank you for pointing out the opportunity to use the term “Adequate Level of Reliability.” Because NERC has appointed a task force to explore whether that definition of Adequate Level of Reliability needs to be changed, we are avoiding references to it in our latest</p>

resource document.		
PPL Supply Group	Yes	
American Wind Energy Association		<p>The American Wind Energy Association (AWEA) appreciates the opportunity to submit these formal comments on the NERC Project 2010-07. AWEA supports the general direction indicated by both the Generator Requirements at the Transmission Interface Ad Hoc Group (GOTO Ad Hoc Group), and the Project 2010-07 Standards Development Team (SDT). We agree with the sentiments from both groups that a Generator Owner (GO) or Generator Operator (GOP) that also owns or operates a generator interconnection facility (GIF), should not be required to register as a Transmission Owner (TO) and/or Transmission Operator (TOP) strictly because they own or operate the GIF. We also agree that requiring these GOs or GOPs to comply with all the TO/TOP standards would have little effect on or benefits to reliability of the Bulk Electric System.</p> <p>AWEA supports the aim of these groups to address any reliability gap that may exist with regard to GIFs by considering such facilities as part of the generating facility, and therefore also subject to the GO/GOP standards. AWEA also supports the approach of identifying a limited number of TO/TOP standards, such as FAC-001 and FAC-003, which should also apply to GIFs. We would be concerned, however, if additional requirements were added beyond these two, without serious consideration by the SDT and additional industry experts. The recent FERC order on the required registration as TOs and TOPs of two generator interconnection facilities may raise some question about the direction that the GO/TO and the SDT have taken so far on this topic. AWEA urges NERC and the SDT to use caution in considering any additional standards to apply to GIFs as the current approach of the GO/TO and SDT efforts have been generally supported. Consideration of any addition standards with respect to GIFs should be done on a standard-by-standard basis, reviewing the applicability of each standard as well as the impact on the reliability of the Bulk Electric System.</p>
<p>Response: Thank you for your comment. The drafting team has considered the inclusion of additional standards and requirements in the past, and we have been revisiting them throughout our process. We continue to conclude, with stakeholder support, that no</p>		

Organization	Yes or No	Question 7 Comment
<p>additional substantive standard or requirement changes are necessary to achieve the goal of this project. With this posting, the drafting team has revisited those standards yet again and developed a comprehensive document and spreadsheet tracing our rationale (at every stage of the process) for not including additional standards or requirements.</p>		
<p>Cogeneration Association of California</p>		<p>The resolution of this issue regarding generator interconnection facilities should compel a certain result in determining how to classify and register generator tie-lines. Under the current standards, NERC is compelled to register owners with generator tie-lines as transmission owners. FERC has affirmed this. The changes to the standards should be such that NERC and FERC are compelled to consider the tie-lines as part of the generator facilities. The current proposal from this task force does not achieve that result. While the proposal does make very appropriate changes to certain reliability standards, it does not change the basic definition of the Bulk Electric System or change NERC's <i>Statement of Compliance Registry Criteria</i>, to determine how tie-lines are classified. Even though the relevant reliability standards would be changed so that they are also applicable to generator facilities, NERC and the regional entities will continue to apply the same definition and criteria and can continue to classify the tie-lines as Transmission.</p> <p>The solution is to change the BES definition and NERC <i>Statement</i> as well as changing the applicability of the relevant reliability standards. The background resource document from this group suggests that a change in the BES definition was part of the overall solution, but the Project 2010-17 team did not address this in its proposed definition. The concept paper from the 2010-17 group does include "generator interconnection line leads," but the formal definition paper does not.</p> <p>This project group should include in its formal proposal a change to the definition of BES, including generator interconnection facilities within the definition of generation.</p>
<p>Response: Thank you for your comment. While we are not proposing any definition changes with this round of updated standard changes, we do plan to propose some definition changes or possibly new definitions to prevent registration and ensure that there are no possible gaps. In the next steps of our project, we will consider putting forward definition-related changes for comment separately, as is now allowed by the Standards Committee after its July 2011 meeting. Although this drafting team cannot itself make changes to the Statement of Compliance Registry Criteria, our hope is that modifications to definitions would provide the language and the impetus to make those Registry Criteria changes.</p>		

Organization	Yes or No	Question 7 Comment
<p>While the Project 2010-07 SDT coordinated with the Project 2010-17 BES SDT very early on, the Project 2010-17 SDT elected not to include any reference to generator interconnection Facilities within the definition of generation. We will consider making further suggestions during future comment periods, and you should do the same.</p>

END OF REPORT

A. Introduction

1. **Title:** **Facility Connection Requirements**
2. **Number:** FAC-001-1
3. **Purpose:** To avoid adverse impacts on reliability, Transmission Owners and Generator Owners must establish Facility connection and performance requirements.
4. **Applicability:**
 - 4.1. Transmission Owner
 - 4.2. Applicable Generator Owner
 - 4.2.1 Generator Owner within an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System.
5. **Effective Date:**
 - 5.1. In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.
 - 5.2. In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

- R1. The Transmission Owner shall document, maintain, and publish Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements. The Transmission Owner's Facility connection requirements shall address connection requirements for:
 - 1.1. Generation Facilities,
 - 1.2. Transmission Facilities, and
 - 1.3. End-user Facilities

[VRF – Medium]
- R2. Each applicable Generator Owner shall, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System (under FAC-002-1), document and publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.

[VRF – Medium]

- R3.** Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall address the following items in its Facility connection requirements:
- 3.1.** Provide a written summary of its plans to achieve the required system performance as described in Requirements R1 or R2 throughout the planning horizon:
 - 3.1.1.** Procedures for coordinated joint studies of new Facilities and their impacts on the interconnected Transmission Systems.
 - 3.1.2.** Procedures for notification of new or modified Facilities to others (those responsible for the reliability of the interconnected Transmission Systems) as soon as feasible.
 - 3.1.3.** Voltage level and MW and MVAR capacity or demand at point of connection.
 - 3.1.4.** Breaker duty and surge protection.
 - 3.1.5.** System protection and coordination.
 - 3.1.6.** Metering and telecommunications.
 - 3.1.7.** Grounding and safety issues.
 - 3.1.8.** Insulation and insulation coordination.
 - 3.1.9.** Voltage, Reactive Power, and power factor control.
 - 3.1.10.** Power quality impacts.
 - 3.1.11.** Equipment Ratings.
 - 3.1.12.** Synchronizing of Facilities.
 - 3.1.13.** Maintenance coordination.
 - 3.1.14.** Operational issues (abnormal frequency and voltages).
 - 3.1.15.** Inspection requirements for existing or new Facilities.
 - 3.1.16.** Communications and procedures during normal and emergency operating conditions.

[VRF – Medium]

- R4.** The Transmission Owner shall maintain and update its Facility connection requirements as required. The Transmission Owner shall make documentation of these requirements available to the users of the transmission system, the Regional Entity, and ERO on request (five business days).

[VRF – Medium]

C. Measures

- M1.** The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R1.
- M2.** Each Generator Owner that has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R2.
- M3.** Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R3.
- M4.** The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor: Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Transmission Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Owner shall retain evidence of Requirement R1, Measure M1, Requirement R3, Measure M3, and Requirement R4, Measure M4 from its last audit.

The Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain evidence of Requirement R2, Measure M2, and Requirement R3, Measure M3 from its last audit.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Not Applicable.	<p>The Transmission Owner failed to do one of the following:</p> <p>Document or maintain or publish Facility connection requirements as specified in the Requirement</p> <p>OR</p> <p>Failed to include one (1) of the components as specified in R1.1, R1.2 or R1.3.</p>	<p>The Transmission Owner failed to do one of the following:</p> <p>Failed to include (2) of the components as specified in R1.1, R1.2 or R1.3</p> <p>OR</p> <p>Failed to document or maintain or publish its Facility connection requirements as specified in the Requirement and failed to include one (1) of the components as specified in R1.1, R1.2 or R1.3.</p>	The Transmission Owner did not develop Facility connection requirements.
R2	The Generator Owner failed to document and publish Facility connection requirements until more than 45 calendar days but less than or equal to 60 calendar days after having an Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System.	The Generator Owner failed to document and publish Facility connection requirements until more than 60 calendar days but less than or equal to 70 calendar days after having an Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System.	The Generator Owner failed to document and publish Facility connection requirements until more than 70 calendar days but less than or equal to 80 calendar days after having an Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System.	The Generator Owner failed to document and publish Facility connection requirements until more than 80 days after having an Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System.
R3	The responsible entity's Facility	The responsible entity's Facility	The responsible entity's Facility	The responsible entity's Facility

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	TBD	Added requirements for Generator Owner and brought overall standard format up to date	Revision under Project 2010-07

The drafting team limited its modifications to those associated with expanding the scope to include the Generator Owner and bringing the format up to date.

A. Introduction

1. **Title:** **Facility Connection Requirements**
2. **Number:** FAC-001-1
3. **Purpose:** To avoid adverse impacts on reliability, Transmission Owners and Generator Owners must establish Facility connection and performance requirements.
4. **Applicability:**
 - 4.1. Transmission Owner
 - 4.2. Applicable Generator Owner
 - 4.2.1 Generator Owner within an executed Agreement to evaluate the reliability impact of interconnecting ~~another Facility to its existing generation Facility~~ a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System.
5. **Effective Date:**
 - 5.1. In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.
 - 5.2. In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

- R1. The Transmission Owner shall document, maintain, and publish Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements. The Transmission Owner's Facility connection requirements shall address connection requirements for:
 - 1.1. Generation Facilities,
 - 1.2. Transmission Facilities, and
 - 1.3. End-user Facilities

[VRF – Medium]
- R2. Each applicable Generator Owner shall, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System ~~of executing an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility~~ (under FAC-002-1), ~~shall~~ document and publish its and thereafter maintain Facility connection requirements to ensure compliance with NERC Reliability

Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.

[VRF – Medium]

R3. Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) with Facility connection requirements and each Transmission Owner shall have Facility connection requirements that address the following items in its Facility connection requirements:

- 3.1.** Provide a written summary of its plans to achieve the required system performance as described in Requirements R1 ~~and or~~ R2 throughout the planning horizon:
 - 3.1.1.** Procedures for coordinated joint studies of new Facilities and their impacts on the interconnected Transmission Systems.
 - 3.1.2.** Procedures for notification of new or modified Facilities to others (those responsible for the reliability of the interconnected Transmission Systems) as soon as feasible.
 - 3.1.3.** Voltage level and MW and MVAR capacity or demand at point of connection.
 - 3.1.4.** Breaker duty and surge protection.
 - 3.1.5.** System ~~p~~Protection and coordination.
 - 3.1.6.** Metering and telecommunications.
 - 3.1.7.** Grounding and safety issues.
 - 3.1.8.** Insulation and insulation coordination.
 - 3.1.9.** Voltage, Reactive Power, and power factor control.
 - 3.1.10.** Power quality impacts.
 - 3.1.11.** Equipment Ratings.
 - 3.1.12.** Synchronizing of Facilities.
 - 3.1.13.** Maintenance coordination.
 - 3.1.14.** Operational issues (abnormal frequency and voltages).
 - 3.1.15.** Inspection requirements for existing or new Facilities.
 - 3.1.16.** Communications and procedures during normal and emergency operating conditions.

[VRF – Medium]

R4. The Transmission Owner shall~~Each applicable Generator Owner with Facility connection requirements (in accordance with Requirement R2) and each Transmission Owner shall maintain Facility connection requirements and~~ maintain and update its Facility connection

requirements as required. The Transmission Owner shall make documentation of these requirements available to the users of the ~~t~~Transmission ~~s~~System, the Regional Entity, and ERO on request (five business days).

[VRF – Medium]

C. Measures

M1. The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R1.

M2. Each Generator Owner that has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System ~~that executes an Agreement to evaluate the reliability impact of interconnecting another Facility to its existing generation Facility~~ shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R2.

M3. Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) ~~Each applicable Generator Owner with Facility connection requirements and each Transmission Owner~~ shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R3.

M4. ~~Each applicable Generator Owner with Facility connection requirements and each~~The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor: Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Transmission Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Owner shall retain evidence of Requirement R1, Measure M1, Requirement R3, Measure M3, and Requirement R4, Measure M4 from its last audit.

The Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain evidence of Requirement R2, Measure M2, and Requirement R3, Measure M3, ~~and Requirement R4, Measure M4~~ from its last audit.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Not Applicable.	<p>The Transmission Owner failed to do one of the following:</p> <p>Document or maintain or publish Facility connection requirements as specified in the Requirement</p> <p>OR</p> <p>Failed to include one (1) of the components and as specified in R1.1, R1.2 or R1.3.</p>	<p>The Transmission Owner failed to do one of the following:</p> <p>Document or maintain or publish its Facility connection requirements as specified in the Requirement</p> <p>OR</p> <p>Failed to include (2) of the components as specified in R1.1, R1.2 or R1.3</p> <p>OR</p> <p>Failed to document or maintain or publish its Facility connection requirements as specified in the Requirement and failed to include one (1) of the components as specified in R1.1, R1.2 or R1.3.</p>	<p>The Transmission Owner did not develop Facility connection requirements.</p>

 - 4.1. Transmission Owner
 - 4.2. Applicable Generator Owner
 - 4.2.1 Generator Owner within an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System.
5. **Effective Date:** ~~April 1, 2005~~
 - 5.1. In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.
 - 5.2. In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

R1. The Transmission Owner shall document, maintain, and publish Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional ~~Reliability Organization~~Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements. The Transmission Owner's Facility connection requirements shall address connection requirements for:

- 1.1. Generation Facilities,
- 1.2. Transmission Facilities, and
- 1.3. End-user Facilities

[VRF – Medium]

R2. Each applicable Generator Owner shall, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission Owner's System (under FAC-002-1), document and publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional,

Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.

[VRF – Medium]

R3. Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall address, but are not limited to, the following items: in its Facility connection requirements:

- 3.1.** Provide a written summary of its plans to achieve the required system performance as described ~~above~~ in Requirements R1 or R2 throughout the planning horizon:
 - 3.1.1.** Procedures for coordinated joint studies of new Facilities and their impacts on the interconnected Transmission Systems.
 - 3.1.2.** Procedures for notification of new or modified Facilities to others (those responsible for the reliability of the interconnected Transmission Systems) as soon as feasible.
 - 3.1.3.** Voltage level and MW and MVAR capacity or demand at point of connection.
 - 3.1.4.** Breaker duty and surge protection.
 - 3.1.5.** System protection and coordination.
 - 3.1.6.** Metering and telecommunications.
 - 3.1.7.** Grounding and safety issues.
 - 3.1.8.** Insulation and insulation coordination.
 - 3.1.9.** Voltage, Reactive Power, and power factor control.
 - 3.1.10.** Power quality impacts.
 - 3.1.11.** Equipment Ratings.
 - 3.1.12.** Synchronizing of Facilities.
 - 3.1.13.** Maintenance coordination.
 - 3.1.14.** Operational issues (abnormal frequency and voltages).
 - 3.1.15.** Inspection requirements for existing or new Facilities.
 - 3.1.16.** Communications and procedures during normal and emergency operating conditions.

[VRF – Medium]

R4. The Transmission Owner shall maintain and update its Facility connection requirements as required. The Transmission Owner shall make documentation of these requirements available

to the users of the transmission system, the Regional ~~Reliability Organization Entity~~, and ~~NERCERO~~ on request (five business days).

[VRF – Medium]

C. Measures

- M1.** The Transmission Owner shall make available (to its Compliance ~~Monitor~~) ~~for inspection~~ Enforcement Authority) evidence that it met all the requirements stated in ~~Reliability Standard FAC-001-0-Requirement~~ R1.
- M2.** ~~Each Generator Owner that has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to~~ the Transmission ~~Owner~~ System shall make available (to its Compliance ~~Monitor~~) ~~for inspection~~ Enforcement Authority) evidence that it met all requirements stated in ~~Reliability Standard FAC-001-0-Requirement~~ R2.
- M3.** ~~The~~ Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall make available (to its Compliance ~~Monitor~~) ~~for inspection~~ Enforcement Authority) evidence that it met all ~~the~~ requirements stated in ~~Reliability Standard FAC-001-0-R3~~ Requirement R3.
- M3.M4.** ~~The~~ Transmission Owner shall make available (to its Compliance ~~Enforcement Authority~~) evidence that it met all the requirements stated in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

- 1.1. Compliance ~~Monitoring Responsibility~~ Enforcement Authority**
Compliance Monitor: Regional ~~Reliability Organization Entity~~
- 1.2. Compliance Monitoring ~~Period~~ and ~~Reset Timeframe~~ Enforcement Processes:**
~~On request (five business days):~~
Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints
- 1.3. Data Retention**
~~None specified.~~
The Transmission Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Owner shall retain evidence of Requirement R1, Measure M1, Requirement R3, Measure M3, and Requirement R4, Measure M4 from its last audit.

The Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain evidence of Requirement R2, Measure M2, and Requirement R3, Measure M3 from its last audit.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. ~~Violation Severity Levels of Non-Compliance~~

~~2.1. **Level 1:** Facility connection requirements were provided for generation, transmission, and end-user facilities, per Reliability Standard FAC-001-0-R1, but the document(s) do not address all of the requirements of Reliability Standard FAC-001-0-R2.~~

~~2.2. **Level 2:** Facility connection requirements were not provided for all three categories (generation, transmission, or end-user) of facilities, per Reliability Standard FAC-001-0-R1, but the document(s) provided address all of the requirements of Reliability Standard FAC-001-0-R2.~~

~~2.3. **Level 3:** Facility connection requirements were not provided for all three categories (generation, transmission, or end-user) of facilities, per Reliability Standard FAC-001-0-R1, and the document(s) provided do not address all of the requirements of Reliability Standard FAC-001-0-R2.~~

~~2.4. **Level 4:** No document on facility connection requirements was provided per Reliability Standard FAC-001-0-R3.~~

E. **Regional Differences**

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
<u>1</u>	<u>TBD</u>	<u>Added requirements for Generator Owner and brought overall standard format up to date</u>	<u>Revision under Project 2010-07</u>

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary. When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Right-of-Way (ROW)

A corridor of land on which electric lines may be located. The applicable Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of this NERC term was modified to include applicable Generator Owners.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC's Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has developed two sets of proposed changes: one to this version, FAC-003-1, the current FERC-approved version of the standard, and one to FAC-003-2, the latest draft of Version 2 as proposed by the Project 2007-07 team

If FAC-003-2 is approved by NERC's BOT, the Project 2010-07 drafting team will likely proceed with the modifications it has proposed in the redline to that version of the standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. FAC-003-2 would be retired once FAC-003-3 was approved.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with the changes to FAC-003-1 seen below to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability section, modifications to the NERC defined terms Right-of-Way to include Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

1. Title: **Transmission Vegetation Management Program**

2. Number: FAC-003-X

3. Purpose: To improve the reliability of the electric transmission systems by preventing outages from vegetation located on transmission rights-of-way (ROW) and minimizing outages from vegetation located adjacent to ROW, maintaining clearances between transmission lines and vegetation on and along transmission ROW, and reporting vegetation-related outages of the transmission systems to the respective Regional Entity (RE) and the North American Electric Reliability Council (NERC).

Within the text of NERC Reliability Standard FAC-003-X, "transmission line(s)" and "applicable line(s)" can also refer to the generation Facilities as referenced in 4.4 and its subsections.

4. Applicability:

4.1. Regional Entity.

4.2. Applicable Transmission Owner

4.2.1. Transmission Owner that owns overhead transmission lines operated at 200 kV and above and to any lower voltage lines designated by the RE as critical to the reliability of the electric system in the region.

4.3. Applicable Generator Owner

4.3.1. Generator Owner that owns an overhead transmission line(s) that extends greater than one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard up to the point of interconnection with a Transmission Owner's Facility and is operated at 200 kV and above and any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region.

5. Effective Dates:

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

B. Requirements

R1. Each applicable Transmission Owner or applicable Generator Owner shall prepare, and keep current, a formal transmission vegetation management program (TVMP). The TVMP shall include the applicable Transmission Owner's or applicable Generator Owner's objectives, practices, approved procedures, and work specifications¹.

R1.1. The TVMP shall define a schedule for and the type (aerial, ground) of ROW vegetation inspections. This schedule should be flexible enough to adjust for changing conditions. The inspection schedule shall be based on the anticipated growth of vegetation and any other environmental or operational factors that could impact the relationship of vegetation to the applicable Transmission Owner's or applicable Generator Owner's transmission lines.

R1.2. Each applicable Transmission Owner or applicable Generator Owner, in the TVMP, shall identify and document clearances between vegetation and any overhead, ungrounded supply conductors, taking into consideration transmission line voltage, the effects of ambient temperature on conductor sag under maximum design loading, and the effects of wind velocities on conductor sway. Specifically, the applicable Transmission Owner or applicable Generator Owner shall establish clearances to be achieved at the time of vegetation management work identified herein as Clearance 1, and shall also establish and maintain a set of clearances identified herein as Clearance 2 to prevent flashover between vegetation and overhead ungrounded supply conductors.

R1.2.1. Clearance 1 — The applicable Transmission Owner or applicable Generator Owner shall determine and document appropriate clearance distances to be achieved at the time of transmission vegetation management work based upon local conditions and the expected time frame in which the applicable

¹ ANSI A300, Tree Care Operations – Tree, Shrub, and Other Woody Plant Maintenance – Standard Practices, while not a requirement of this standard, is considered to be an industry best practice.

Transmission Owner or applicable Generator Owner plans to return for future vegetation management work. Local conditions may include, but are not limited to: operating voltage, appropriate vegetation management techniques, fire risk, reasonably anticipated tree and conductor movement, species types and growth rates, species failure characteristics, local climate and rainfall patterns, line terrain and elevation, location of the vegetation within the span, and worker approach distance requirements. Clearance 1 distances shall be greater than those defined by Clearance 2 below.

R1.2.2. Clearance 2 — The applicable Transmission Owner or applicable Generator Owner shall determine and document specific radial clearances to be maintained between vegetation and conductors under all rated electrical operating conditions. These minimum clearance distances are necessary to prevent flashover between vegetation and conductors and will vary due to such factors as altitude and operating voltage. These applicable Transmission Owner-specific or applicable Generator Owner-specific minimum clearance distances shall be no less than those set forth in the Institute of Electrical and Electronics Engineers (IEEE) Standard 516-2003 (*Guide for Maintenance Methods on Energized Power Lines*) and as specified in its Section 4.2.2.3, Minimum Air Insulation Distances without Tools in the Air Gap.

R1.2.2.1 Where transmission system transient overvoltage factors are not known, clearances shall be derived from Table 5, IEEE 516-2003, phase-to-ground distances, with appropriate altitude correction factors applied.

R1.2.2.2 Where transmission system transient overvoltage factors are known, clearances shall be derived from Table 7, IEEE 516-2003, phase-to-phase voltages, with appropriate altitude correction factors applied.

R1.3. All personnel directly involved in the design and implementation of the TVMP shall hold appropriate qualifications and training, as defined by the Transmission Owner or Generator Owner, to perform their duties.

R1.4. Each applicable Transmission Owner or applicable Generator Owner shall develop mitigation measures to achieve sufficient clearances for the protection of the transmission facilities when it identifies locations on the ROW where the Transmission Owner or applicable Generator Owner is restricted from attaining the clearances specified in Requirement 1.2.1.

R1.5. Each Transmission Owner or applicable Generator Owner shall establish and document a process for the immediate communication of vegetation conditions that present an imminent threat of a transmission line outage. This is so that action (temporary reduction in line rating, switching line out of service, etc.) may be taken until the threat is relieved.

[VRF – High]

R2. Each applicable Transmission Owner or applicable Generator Owner shall create and implement an annual plan for vegetation management work to ensure the reliability of the system. The plan shall describe the methods used, such as manual clearing, mechanical clearing, herbicide treatment, or other actions. The plan should be flexible enough to adjust to changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors that may have an impact on the reliability of the transmission systems. Adjustments to the plan shall be documented as they occur. The plan should take into consideration the time required to obtain permissions or permits from landowners or

regulatory authorities. Each applicable Transmission Owner or applicable Generator Owner shall have systems and procedures for documenting and tracking the planned vegetation management work and ensuring that the vegetation management work was completed according to work specifications.

[VRF – High]

- R3.** Each applicable Transmission Owner or applicable Generator Owner shall report quarterly to its Regional Entity, or the Regional Entity’s designee, sustained transmission line outages determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation.
- R3.1.** Multiple sustained outages on an individual line, if caused by the same vegetation, shall be reported as one outage regardless of the actual number of outages within a 24-hour period.
- R3.2.** The applicable Transmission Owner or applicable Generator Owner is not required to report to the Regional Entity, or the Regional Entity’s designee, certain sustained transmission line outages caused by vegetation: (1) Vegetation-related outages that result from vegetation falling into lines from outside the ROW that result from natural disasters shall not be considered reportable (examples of disasters that could create non-reportable outages include, but are not limited to, earthquakes, fires, tornados, hurricanes, landslides, wind shear, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods), and (2) Vegetation-related outages due to human or animal activity shall not be considered reportable (examples of human or animal activity that could cause a non-reportable outage include, but are not limited to, logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation).
- R3.3.** The outage information provided by the applicable Transmission Owner or applicable Generator Owner to the Regional Entity, or the Regional Entity’s designee, shall include at a minimum: the name of the circuit(s) outaged, the date, time and duration of the outage; a description of the cause of the outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.
- R3.4.** An outage shall be categorized as one of the following:
- R3.4.1.** Category 1 — Grow-ins: Outages caused by vegetation growing into lines from vegetation inside and/or outside of the ROW;
 - R3.4.2.** Category 2 — Fall-ins: Outages caused by vegetation falling into lines from inside the ROW;
 - R3.4.3.** Category 3 — Fall-ins: Outages caused by vegetation falling into lines from outside the ROW.

[VRF – Lower]

- R4.** The Regional Entity shall report the outage information provided to it by applicable Transmission Owners or applicable Generator Owners, as required by Requirement 3, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported outages.

[VRF – Lower]

C. Measures

- M1.** Each applicable Transmission Owner or applicable Generator Owner has a documented TVMP, as identified in Requirement 1.
 - M1.1.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the applicable Transmission Owner or applicable Generator Owner performed the vegetation inspections as identified in Requirement 1.1.
 - M1.2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that describes the clearances identified in Requirement 1.2.
 - M1.3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the personnel directly involved in the design and implementation of the applicable Transmission Owner's or applicable Generator Owner TVMP hold the qualifications identified by the Transmission Owner or applicable Generator Owner as required in Requirement 1.3.
 - M1.4.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has identified any areas not meeting the applicable Transmission Owner's or applicable Generator Owner's standard for vegetation management and any mitigating measures the Transmission Owner or applicable Generator Owner has taken to address these deficiencies as identified in Requirement 1.4.
 - M1.5.** Each applicable Transmission Owner or applicable Generator Owner has a documented process for the immediate communication of imminent threats by vegetation as identified in Requirement 1.5.
- M2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the Transmission Owner implemented the work plan identified in Requirement 2.
- M3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has supplied quarterly outage reports to the Regional Entity, or the Regional Entity's designee, as identified in Requirement 3.
- M4.** The Regional Entity has documentation that it provided quarterly outage reports to NERC as identified in Requirement 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor:

- Regional Entity for the Transmission Owner and Generator Owner
- Electric Reliability Organization or another Regional Entity approved by the ERO and FERC or other applicable government authorities

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The applicable Transmission Owner and applicable Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The applicable Transmission Owner and applicable Generator Owner shall retain evidence of Requirement 1, Measure 1, Requirement 2, Measure 2, and Requirement 3, Measure 3 from its last audit.

1.4. Additional Compliance Information

None.

Right-of-Way (ROW)

A corridor of land on which electric lines may be located. The applicable Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of this NERC term was modified to include applicable Generator Owners.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC's Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has developed two sets of proposed changes: one to this version, FAC-003-1, the current FERC-approved version of the standard, and one to FAC-003-2, the latest draft of Version 2 as proposed by the Project 2007-07 team

If FAC-003-2 is approved by NERC's BOT, the Project 2010-07 drafting team will likely proceed with the modifications it has proposed in the redline to that version of the standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. FAC-003-2 would be retired once FAC-003-3 was approved.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with the changes to FAC-003-1 seen below to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability section, modifications to the NERC defined terms Right-of-Way to include Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

1. **Title:** **Transmission Vegetation Management Program**

2. **Number:** FAC-003-X

3. **Purpose:** To improve the reliability of the electric transmission systems by preventing outages from vegetation located on transmission rights-of-way (ROW) and minimizing outages from vegetation located adjacent to ROW, maintaining clearances between transmission lines and vegetation on and along transmission ROW, and reporting vegetation-related outages of the transmission systems to the respective Regional Entity (RE) and the North American Electric Reliability Council (NERC).

Within the text of NERC Reliability Standard FAC-003-X, "transmission line(s)" and "applicable line(s)" can also refer to the generation Facilities as referenced in 4.4 and its subsections.

4. Applicability:

4.1. Regional Entity.

4.2. Applicable Transmission Owner

4.2.1. Transmission Owner that owns overhead transmission lines operated at 200 kV and above and to any lower voltage lines designated by the RE as critical to the reliability of the electric system in the region.

4.3. Applicable Generator Owner

4.3.1. Generator Owner that owns an overhead ~~Facility~~ transmission line(s) that extends greater than one ~~half~~ mile or 1.609 kilometers beyond the fenced area of the ~~switchyard, generating station or generating substation~~ generating station switchyard up to the point of interconnection with ~~the Transmission system~~ Transmission Owner's Facility and is operated at 200 kV and above and any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region.

5. Effective Dates:

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

B. Requirements

R1. Each applicable Transmission Owner or applicable Generator Owner shall prepare, and keep current, a formal transmission vegetation management program (TVMP). The TVMP shall include the applicable Transmission Owner's or applicable Generator Owner's objectives, practices, approved procedures, and work specifications¹.

R1.1. The TVMP shall define a schedule for and the type (aerial, ground) of ROW vegetation inspections. This schedule should be flexible enough to adjust for changing conditions. The inspection schedule shall be based on the anticipated growth of vegetation and any other environmental or operational factors that could impact the relationship of vegetation to the applicable Transmission Owner's or applicable Generator Owner's transmission lines.

R1.2. Each applicable Transmission Owner or applicable Generator Owner, in the TVMP, shall identify and document clearances between vegetation and any overhead, ungrounded supply conductors, taking into consideration transmission line voltage, the effects of ambient temperature on conductor sag under maximum design loading, and the effects of wind velocities on conductor sway. Specifically, the applicable Transmission Owner or applicable Generator Owner shall establish clearances to be achieved at the time of vegetation management work identified herein as Clearance 1, and shall also establish and maintain a set of clearances identified herein as Clearance 2 to prevent flashover between vegetation and overhead ungrounded supply conductors.

R1.2.1. Clearance 1 — The applicable Transmission Owner or applicable Generator Owner shall determine and document appropriate clearance distances to be achieved at the time of transmission vegetation management work based upon

¹ ANSI A300, Tree Care Operations – Tree, Shrub, and Other Woody Plant Maintenance – Standard Practices, while not a requirement of this standard, is considered to be an industry best practice.

local conditions and the expected time frame in which the applicable Transmission Owner or applicable Generator Owner plans to return for future vegetation management work. Local conditions may include, but are not limited to: operating voltage, appropriate vegetation management techniques, fire risk, reasonably anticipated tree and conductor movement, species types and growth rates, species failure characteristics, local climate and rainfall patterns, line terrain and elevation, location of the vegetation within the span, and worker approach distance requirements. Clearance 1 distances shall be greater than those defined by Clearance 2 below.

R1.2.2. Clearance 2 — The applicable Transmission Owner or applicable Generator Owner shall determine and document specific radial clearances to be maintained between vegetation and conductors under all rated electrical operating conditions. These minimum clearance distances are necessary to prevent flashover between vegetation and conductors and will vary due to such factors as altitude and operating voltage. These applicable Transmission Owner-specific or applicable Generator Owner-specific minimum clearance distances shall be no less than those set forth in the Institute of Electrical and Electronics Engineers (IEEE) Standard 516-2003 (*Guide for Maintenance Methods on Energized Power Lines*) and as specified in its Section 4.2.2.3, Minimum Air Insulation Distances without Tools in the Air Gap.

R1.2.2.1 Where transmission system transient overvoltage factors are not known, clearances shall be derived from Table 5, IEEE 516-2003, phase-to-ground distances, with appropriate altitude correction factors applied.

R1.2.2.2 Where transmission system transient overvoltage factors are known, clearances shall be derived from Table 7, IEEE 516-2003, phase-to-phase voltages, with appropriate altitude correction factors applied.

R1.3. All personnel directly involved in the design and implementation of the TVMP shall hold appropriate qualifications and training, as defined by the Transmission Owner or Generator Owner, to perform their duties.

R1.4. Each applicable Transmission Owner or applicable Generator Owner shall develop mitigation measures to achieve sufficient clearances for the protection of the transmission facilities when it identifies locations on the ROW where the Transmission Owner or applicable Generator Owner is restricted from attaining the clearances specified in Requirement 1.2.1.

R1.5. Each Transmission Owner or applicable Generator Owner shall establish and document a process for the immediate communication of vegetation conditions that present an imminent threat of a transmission line outage. This is so that action (temporary reduction in line rating, switching line out of service, etc.) may be taken until the threat is relieved.

[VRF – High]

R2. Each applicable Transmission Owner or applicable Generator Owner shall create and implement an annual plan for vegetation management work to ensure the reliability of the system. The plan shall describe the methods used, such as manual clearing, mechanical clearing, herbicide treatment, or other actions. The plan should be flexible enough to adjust to changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors that may have an impact on the reliability of the transmission systems. Adjustments to the plan shall be documented as they occur. The plan should take into

consideration the time required to obtain permissions or permits from landowners or regulatory authorities. Each applicable Transmission Owner or applicable Generator Owner shall have systems and procedures for documenting and tracking the planned vegetation management work and ensuring that the vegetation management work was completed according to work specifications.

[VRF – High]

R3. Each applicable Transmission Owner or applicable Generator Owner shall report quarterly to its Regional Entity, or the Regional Entity's designee, sustained transmission line outages determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation.

R3.1. Multiple sustained outages on an individual line, if caused by the same vegetation, shall be reported as one outage regardless of the actual number of outages within a 24-hour period.

R3.2. The applicable Transmission Owner or applicable Generator Owner is not required to report to the Regional Entity, or the Regional Entity's designee, certain sustained transmission line outages caused by vegetation: (1) Vegetation-related outages that result from vegetation falling into lines from outside the ROW that result from natural disasters shall not be considered reportable (examples of disasters that could create non-reportable outages include, but are not limited to, earthquakes, fires, tornados, hurricanes, landslides, wind shear, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods), and (2) Vegetation-related outages due to human or animal activity shall not be considered reportable (examples of human or animal activity that could cause a non-reportable outage include, but are not limited to, logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation).

R3.3. The outage information provided by the applicable Transmission Owner or applicable Generator Owner to the Regional Entity, or the Regional Entity's designee, shall include at a minimum: the name of the circuit(s) outaged, the date, time and duration of the outage; a description of the cause of the outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.

R3.4. An outage shall be categorized as one of the following:

R3.4.1. Category 1 — Grow-ins: Outages caused by vegetation growing into lines from vegetation inside and/or outside of the ROW;

R3.4.2. Category 2 — Fall-ins: Outages caused by vegetation falling into lines from inside the ROW;

R3.4.3. Category 3 — Fall-ins: Outages caused by vegetation falling into lines from outside the ROW.

[VRF – Lower]

R4. The Regional Entity shall report the outage information provided to it by applicable Transmission Owners or applicable Generator Owners, as required by Requirement 3, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported outages.

[VRF – Lower]

C. Measures

- M1.** Each applicable Transmission Owner or applicable Generator Owner has a documented TVMP, as identified in Requirement 1.
- M1.1.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the applicable Transmission Owner or applicable Generator Owner performed the vegetation inspections as identified in Requirement 1.1.
- M1.2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that describes the clearances identified in Requirement 1.2.
- M1.3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the personnel directly involved in the design and implementation of the applicable Transmission Owner's or applicable Generator Owner TVMP hold the qualifications identified by the Transmission Owner or applicable Generator Owner as required in Requirement 1.3.
- M1.4.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has identified any areas not meeting the applicable Transmission Owner's or applicable Generator Owner's standard for vegetation management and any mitigating measures the Transmission Owner or applicable Generator Owner has taken to address these deficiencies as identified in Requirement 1.4.
- M1.5.** Each applicable Transmission Owner or applicable Generator Owner has a documented process for the immediate communication of imminent threats by vegetation as identified in Requirement 1.5.
- M2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the Transmission Owner implemented the work plan identified in Requirement 2.
- M3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has supplied quarterly outage reports to the Regional Entity, or the Regional Entity's designee, as identified in Requirement 3.
- M4.** The Regional Entity has documentation that it provided quarterly outage reports to NERC as identified in Requirement 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor:

- Regional Entity for the Transmission Owner and Generator Owner
- Electric Reliability Organization or another Regional Entity for the Regional Entity approved by the ERO and FERC or other applicable government authorities

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The applicable Transmission Owner and applicable Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The applicable Transmission Owner and applicable Generator Owner shall retain evidence of Requirement 1, Measure 1, Requirement 2, Measure 2, and Requirement 3, Measure 3 from its last audit.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Version History

Version	Date	Action	Change Tracking
1	TBA	<ol style="list-style-type: none"> Added “Standard Development Roadmap.” Changed “60” to “Sixty” in section A, 5.2. Added “Proposed Effective Date: April 7, 2006” to footer. 	01/20/06

Standard FAC-003-X — Transmission Vegetation Management Program

		4. Added “Draft 3: November 17, 2005” to footer.	
X	May 16, 2011	Added <u>Made standard applicable to certain qualifying requirements for</u> Generator Owners and brought overall standard format up to date	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary. When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Right-of-Way (ROW)

A corridor of land on which electric lines may be located. The applicable Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of this NERC term was modified to include applicable Generator Owners.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC’s Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has develop two sets of proposed changes: one to this version, FAC-003-1, the current FERC-approved version of the standard, and one to FAC-003-2, the latest draft of Version 2 as proposed by the Project 2007-07 team

If FAC-003-2 is approved by NERC’s BOT, the Project 2010-07 drafting team will likely proceed with the modifications it has proposed in the redline to that version of the standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. FAC-003-2 would be retired once FAC-003-03 was approved.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with the changes to FAC-003-1 seen below to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability section, modifications to the NERC defined terms Right-of-Way to include Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

1. Title: Transmission Vegetation Management Program

2. Number: FAC-003-~~1X~~

3. Purpose: To improve the reliability of the electric transmission systems by preventing outages from vegetation located on transmission rights-of-way (ROW) and minimizing outages from vegetation located adjacent to ROW, maintaining clearances between transmission lines and vegetation on and along transmission ROW, and reporting vegetation-related outages of the transmission systems to the respective Regional ~~Reliability Organizations (RRO)~~Entity (RE) and the North American Electric Reliability Council (NERC).

Within the text of NERC Reliability Standard FAC-003-X, “transmission line(s)” and “applicable line(s)” can also refer to the generation Facilities as referenced in 4.4 and its subsections.

4. Applicability:

4.1. Regional Entity.

~~**4.1.4.2. Applicable Transmission Owner-**~~

~~**4.2. Regional Reliability Organization-**~~

~~**4.2.1. This standard shall apply to all**~~**Transmission Owner that owns overhead** transmission lines operated at 200 kV and above and to any lower voltage lines designated by the ~~RRORE~~Entity as critical to the reliability of the electric system in the region.

4.3. Applicable Generator Owner

4.3.1. Generator Owner that owns an overhead transmission line(s) that extends greater than one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard up to the point of interconnection with the a Transmission Owner’s Facility and is operated at 200 kV and above and any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region.

5. Effective Dates:

~~5.1. One calendar year from the date of adoption by the NERC Board of Trustees for Requirements 1 and 2.~~

~~5.2. Sixty calendar days from the date of adoption by the NERC Board of Trustees for Requirements 3 and 4.~~

B. Requirements

~~The Transmission~~ There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

B. Requirements

R1. Each applicable Transmission Owner or applicable Generator Owner shall prepare, and keep current, a formal transmission vegetation management program (TVMP). The TVMP shall include the applicable Transmission Owner's or applicable Generator Owner's objectives, practices, approved procedures, and work specifications¹.

R1.1. The TVMP shall define a schedule for and the type (aerial, ground) of ROW vegetation inspections. This schedule should be flexible enough to adjust for changing conditions. The inspection schedule shall be based on the anticipated growth of vegetation and any other environmental or operational factors that could impact the relationship of vegetation to the applicable Transmission Owner's or applicable Generator Owner's transmission lines.

R1.2. ~~The~~Each applicable Transmission Owner or applicable Generator Owner, in the TVMP, shall identify and document clearances between vegetation and any overhead, ungrounded supply conductors, taking into consideration transmission line voltage, the

¹ ANSI A300, Tree Care Operations – Tree, Shrub, and Other Woody Plant Maintenance – Standard Practices, while not a requirement of this standard, is considered to be an industry best practice.

effects of ambient temperature on conductor sag under maximum design loading, and the effects of wind velocities on conductor sway. Specifically, the applicable Transmission Owner or applicable Generator Owner shall establish clearances to be achieved at the time of vegetation management work identified herein as Clearance 1, and shall also establish and maintain a set of clearances identified herein as Clearance 2 to prevent flashover between vegetation and overhead ungrounded supply conductors.

R1.2.1. Clearance 1 — The applicable Transmission Owner or applicable Generator Owner shall determine and document appropriate clearance distances to be achieved at the time of transmission vegetation management work based upon local conditions and the expected time frame in which the applicable Transmission Owner or applicable Generator Owner plans to return for future vegetation management work. Local conditions may include, but are not limited to: operating voltage, appropriate vegetation management techniques, fire risk, reasonably anticipated tree and conductor movement, species types and growth rates, species failure characteristics, local climate and rainfall patterns, line terrain and elevation, location of the vegetation within the span, and worker approach distance requirements. Clearance 1 distances shall be greater than those defined by Clearance 2 below.

R1.2.2. Clearance 2 — The applicable Transmission Owner or applicable Generator Owner shall determine and document specific radial clearances to be maintained between vegetation and conductors under all rated electrical operating conditions. These minimum clearance distances are necessary to prevent flashover between vegetation and conductors and will vary due to such factors as altitude and operating voltage. These applicable Transmission Owner-specific or applicable Generator Owner-specific minimum clearance distances shall be no less than those set forth in the Institute of Electrical and Electronics Engineers (IEEE) Standard 516-2003 (*Guide for Maintenance Methods on Energized Power Lines*) and as specified in its Section 4.2.2.3, Minimum Air Insulation Distances without Tools in the Air Gap.

R1.2.2.1 Where transmission system transient overvoltage factors are not known, clearances shall be derived from Table 5, IEEE 516-2003, phase-to-ground distances, with appropriate altitude correction factors applied.

R1.2.2.2 Where transmission system transient overvoltage factors are known, clearances shall be derived from Table 7, IEEE 516-2003, phase-to-phase voltages, with appropriate altitude correction factors applied.

R1.3. All personnel directly involved in the design and implementation of the TVMP shall hold appropriate qualifications and training, as defined by the Transmission Owner or Generator Owner, to perform their duties.

R1.4. Each applicable Transmission Owner or applicable Generator Owner shall develop mitigation measures to achieve sufficient clearances for the protection of the transmission facilities when it identifies locations on the ROW where the Transmission Owner or applicable Generator Owner is restricted from attaining the clearances specified in Requirement 1.2.1.

R1.5. Each Transmission Owner or applicable Generator Owner shall establish and document a process for the immediate communication of vegetation conditions that present an imminent threat of a transmission line outage. This is so that action

(temporary reduction in line rating, switching line out of service, etc.) may be taken until the threat is relieved.

~~The~~[VRF – High]

- R2.** Each applicable Transmission Owner or applicable Generator Owner shall create and implement an annual plan for vegetation management work to ensure the reliability of the system. The plan shall describe the methods used, such as manual clearing, mechanical clearing, herbicide treatment, or other actions. The plan should be flexible enough to adjust to changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors that may have an impact on the reliability of the transmission systems. Adjustments to the plan shall be documented as they occur. The plan should take into consideration the time required to obtain permissions or permits from landowners or regulatory authorities. Each applicable Transmission Owner or applicable Generator Owner shall have systems and procedures for documenting and tracking the planned vegetation management work and ensuring that the vegetation management work was completed according to work specifications.

~~The~~[VRF – High]

- R3.** Each applicable Transmission Owner or applicable Generator Owner shall report quarterly to its ~~RRO~~Regional Entity, or the ~~RRO's~~Regional Entity's designee, sustained transmission line outages determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation.
- R3.1.** Multiple sustained outages on an individual line, if caused by the same vegetation, shall be reported as one outage regardless of the actual number of outages within a 24-hour period.
- R3.2.** The applicable Transmission Owner or applicable Generator Owner is not required to report to the ~~RRO~~Regional Entity, or the ~~RRO's~~Regional Entity's designee, certain sustained transmission line outages caused by vegetation: (1) Vegetation-related outages that result from vegetation falling into lines from outside the ROW that result from natural disasters shall not be considered reportable (examples of disasters that could create non-reportable outages include, but are not limited to, earthquakes, fires, tornados, hurricanes, landslides, wind shear, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods), and (2) Vegetation-related outages due to human or animal activity shall not be considered reportable (examples of human or animal activity that could cause a non-reportable outage include, but are not limited to, logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation).
- R3.3.** The outage information provided by the applicable Transmission Owner or applicable Generator Owner to the ~~RRO~~Regional Entity, or the ~~RRO's~~Regional Entity's designee, shall include at a minimum: the name of the circuit(s) outaged, the date, time and duration of the outage; a description of the cause of the outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.
- R3.4.** An outage shall be categorized as one of the following:
- R3.4.1.** Category 1 — Grow-ins: Outages caused by vegetation growing into lines from vegetation inside and/or outside of the ROW;

R3.4.2. Category 2 — Fall-ins: Outages caused by vegetation falling into lines from inside the ROW;

R3.4.3. Category 3 — Fall-ins: Outages caused by vegetation falling into lines from outside the ROW.

[VRF – Lower]

R4. The ~~RRO~~Regional Entity shall report the outage information provided to it by applicable Transmission ~~Owner's~~Owners or applicable Generator Owners, as required by Requirement 3, quarterly to NERC, as well as any actions taken by the ~~RRO~~Regional Entity as a result of any of the reported outages.

[VRF – Lower]

C. Measures

M1. ~~The~~Each applicable Transmission Owner or applicable Generator Owner has a documented TVMP, as identified in Requirement 1.

M1.1. ~~The~~Each applicable Transmission Owner or applicable Generator Owner has documentation that the applicable Transmission Owner or applicable Generator Owner performed the vegetation inspections as identified in Requirement 1.1.

M1.2. ~~The~~Each applicable Transmission Owner or applicable Generator Owner has documentation that describes the clearances identified in Requirement 1.2.

M1.3. ~~The~~Each applicable Transmission Owner or applicable Generator Owner has documentation that the personnel directly involved in the design and implementation of the applicable Transmission Owner's or applicable Generator Owner TVMP hold the qualifications identified by the Transmission Owner or applicable Generator Owner as required in Requirement 1.3.

M1.4. ~~The~~Each applicable Transmission Owner or applicable Generator Owner has documentation that it has identified any areas not meeting the applicable Transmission Owner's or applicable Generator Owner's standard for vegetation management and any mitigating measures the Transmission Owner or applicable Generator Owner has taken to address these deficiencies as identified in Requirement 1.4.

M1.5. ~~The~~Each applicable Transmission Owner or applicable Generator Owner has a documented process for the immediate communication of imminent threats by vegetation as identified in Requirement 1.5.

M2. ~~The~~Each applicable Transmission Owner or applicable Generator Owner has documentation that the Transmission Owner implemented the work plan identified in Requirement 2.

M3. ~~The~~Each applicable Transmission Owner or applicable Generator Owner has documentation that it has supplied quarterly outage reports to the ~~RRO~~Regional Entity, or the ~~RRO's~~Regional Entity's designee, as identified in Requirement 3.

M4. The ~~RRO~~Regional Entity has documentation that it provided quarterly outage reports to NERC as identified in Requirement 4.

D. Compliance

1. Compliance Monitoring Process

1.1. ~~Compliance~~ ~~Monitoring Responsibility~~ ~~Enforcement Authority~~

~~RRO~~

~~NERC~~

~~6 of 13~~ ~~Adopted by NERC Board of Trustees: February 7, 2006~~

~~Effective Date: April 7, 2006~~

~~Draft 2: August 31, 2011~~

~~of~~

Compliance Monitor:

- Regional Entity for the Transmission Owner and Generator Owner
- Electric Reliability Organization or another Regional Entity approved by the ERO and FERC or other applicable government authorities

1.2. Compliance Monitoring ~~Period~~ and ~~Reset~~ Enforcement Processes:

~~One calendar Year~~

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

~~Five Years~~

The applicable Transmission Owner and applicable Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The applicable Transmission Owner and applicable Generator Owner shall retain evidence of Requirement 1, Measure 1, Requirement 2, Measure 2, and Requirement 3, Measure 3 from its last audit.

1.4. Additional Compliance Information

~~The Transmission Owner shall demonstrate compliance through self-certification submitted to the compliance monitor (RRO) annually that it meets the requirements of NERC Reliability Standard FAC-003-1. The compliance monitor shall conduct an on-site audit every five years or more frequently as deemed appropriate by the compliance monitor to review documentation related to Reliability Standard FAC-003-1. Field audits of ROW vegetation conditions may be conducted if determined to be necessary by the compliance monitor.~~

None.

2. Violation Severity Levels of Non-Compliance

~~**2.1. Level 1:**~~

~~**2.1.1.** The TVMP was incomplete in one of the requirements specified in any subpart of Requirement 1, or;~~

~~**2.1.2.** Documentation of the annual work plan, as specified in Requirement 2, was incomplete when presented to the Compliance Monitor during an on-site audit, or;~~

~~**2.1.3.** The RRO provided an outage report to NERC that was incomplete and did not contain the information required in Requirement 4.~~

~~**2.2. Level 2:**~~ _____

~~2.2.1. The TVMP was incomplete in two of the requirements specified in any subpart of Requirement 1, or;~~

~~2.2.2. The Transmission Owner was unable to certify during its annual self-certification that it fully implemented its annual work plan, or documented deviations from, as specified in Requirement 2.~~

~~2.2.3. The Transmission Owner reported one Category 2 transmission vegetation-related outage in a calendar year.~~

~~2.3. Level 3: ———~~

~~2.3.1. The Transmission Owner reported one Category 1 or multiple Category 2 transmission vegetation related outages in a calendar year, or;~~

~~2.3.2. The Transmission Owner did not maintain a set of clearances (Clearance 2), as defined in Requirement 1.2.2, to prevent flashover between vegetation and overhead ungrounded supply conductors, or;~~

~~2.3.3. The TVMP was incomplete in three of the requirements specified in any subpart of Requirement 1.~~

~~2.4. Level 4: —~~

~~2.4.1. The Transmission Owner reported more than one Category 1 transmission vegetation related outage in a calendar year, or;~~

~~2.4.2. The TVMP was incomplete in four or more of the requirements specified in any subpart of Requirement 1.~~

Version History

Version	Date	Action	Change Tracking
1	TBA	<ol style="list-style-type: none"> 1. Added “Standard Development Roadmap.” 2. Changed “60” to “Sixty” in section A, 5.2. 3. Added “Proposed Effective Date: April 7, 2006” to footer. 4. Added “Draft 3: November 17, 2005” to footer. 	01/20/06
<u>X</u>	<u>May 16, 2011</u>	<u>Made standard applicable to certain qualifying Generator Owners and brought overall standard format up to date</u>	<u>Revision under Project 2010-07</u>

Effective Dates

There are two effective dates associated with this standard.

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.
2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.
3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.

4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Version History

Version	Date	Action	Change Tracking
3	September 29, 2011	Using the latest draft of FAC-003-2 from the Project 2007-07 SDT, modified proposed definitions and Applicability to include Generator Owners of a certain length.	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

The current glossary definition of this NERC term is modified to address the issues set forth in Paragraph 734 of FERC Order 693.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

The current glossary definition of this NERC term is modified to allow both maintenance inspections and vegetation inspections to be performed concurrently.

Current definition of Vegetation Inspection:
The systematic examination of a transmission corridor to document vegetation conditions.

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC's Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has developed two sets of proposed changes: one to this version, the latest draft of Version 2 as proposed by the Project 2007-07 team, and one to FAC-003-1, the current FERC-approved version of the standard.

If FAC-003-2 is approved by NERC's BOT, the Project 2010-07 drafting team will likely proceed with the modifications seen in this standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. Several scenarios that could play out based on the order of the approval of these versions of the standards are addressed in the FAC-003-3 implementation plan.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with changes to FAC-003-1 to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability, the proposal of modifications to the NERC defined term Right-of-Way to include applicable Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

- 1. Title:** Transmission Vegetation Management
- 2. Number:** FAC-003-3
- 3. Purpose:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.
- 4. Applicability**
 - 4.1. Functional Entities:**
 - 4.1.1. Applicable Transmission Owners**
 - 4.1.1.1. Transmission Owners that own Transmission Facilities defined in 4.2.**
 - 4.1.2. Applicable Generator Owners**

4.1.2.1. Generator Owners that own generation Facilities defined in 4.3

4.2. Transmission Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal¹, state, provincial, public, private, or tribal entities:

4.2.1. Each overhead transmission line operated at 200kV or higher.

4.2.2. Each overhead transmission line operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

4.2.3. Each overhead transmission line operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

4.2.4. Each overhead transmission line identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.

4.3. Generation Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal², state, provincial, public, private, or tribal entities:

4.3.1. Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generating switchyard and are:

4.3.1.1. Operated at 200kV or higher; or

4.3.1.2. Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

4.3.1.3. Operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

Rationale: The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards, and stations have many inspection and maintenance activities that are necessary for reliability. Those existing process manage the threat. As such, the formal steps in this standard are not well suited for this environment. 3) Specifically addressing the areas where the standard does and does not apply makes the standard clearer.

Within the text of NERC Reliability Standard FAC-003-3, “transmission line(s) and “applicable line(s) can also refer to the generation Facilities as referenced in 4.3 and its subsections.

Enforcement:

¹ EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

² EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

The Requirements within a Reliability Standard govern and will be enforced. The Requirements within a Reliability Standard define what an entity must do to be compliant and binds an entity to certain obligations of performance under Section 215 of the Federal Power Act. Compliance will in all cases be measured by determining whether a party met or failed to meet the Reliability Standard Requirement given the specific facts and circumstances of its use, ownership or operation of the bulk power system.

Measures provide guidance on assessing non-compliance with the Requirements. Measures are the evidence that could be presented to demonstrate compliance with a Reliability Standard Requirement and are not intended to contain the quantitative metrics for determining satisfactory performance nor to limit how an entity may demonstrate compliance if valid alternatives to demonstrating compliance are available in a specific case. A Reliability Standard may be enforced in the absence of specified Measures.

Entities must comply with the “Compliance” section in its entirety, including the Administrative Procedure that sets forth, among other things, reporting requirements.

The “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” are provided for informational purposes. They are designed to convey guidance from NERC’s various activities. The “Guideline and Technical Basis” section and text boxes with “Examples” and “Rationale” are not intended to establish new Requirements under NERC’s Reliability Standards or to modify the Requirements in any existing NERC Reliability Standard. Implementation of the “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” is not a substitute for compliance with Requirements in NERC’s Reliability Standards.”

5. Background:

- 5.1.1.** This standard uses three types of requirements to provide layers of protection to prevent vegetation related outages that could lead to Cascading:
- 5.1.2.** a) Performance-based — defines a particular reliability objective or outcome to be achieved. In its simplest form, a results-based requirement has four components: *who, under what conditions (if any), shall perform what action, to achieve what particular bulk power system performance result or outcome?*
- 5.1.3.** b) Risk-based — preventive requirements to reduce the risks of failure to acceptable tolerance levels. A risk-based reliability requirement should be framed as: *who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?*
- 5.1.4.** c) Competency-based — defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions. A competency-based reliability requirement should

be framed as: *who, under what conditions (if any), shall have what capability, to achieve what particular result or outcome to perform an action to achieve a result or outcome or to reduce a risk to the reliability of the bulk power system?*

- 5.1.5.** The defense-in-depth strategy for reliability standards development recognizes that each requirement in a NERC reliability standard has a role in preventing system failures, and that these roles are complementary and reinforcing. Reliability standards should not be viewed as a body of unrelated requirements, but rather should be viewed as part of a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comport with the quality objectives of a reliability standard.

This standard uses a defense-in-depth approach to improve the reliability of the electric Transmission system by:

- Requiring that vegetation be managed to prevent vegetation encroachment inside the flash-over clearance (R1 and R2);
- Requiring documentation of the maintenance strategies, procedures, processes and specifications used to manage vegetation to prevent potential flash-over conditions including consideration of 1) conductor dynamics and 2) the interrelationships between vegetation growth rates, control methods and the inspection frequency (R3);
- Requiring timely notification to the appropriate control center of vegetation conditions that could cause a flash-over at any moment (R4);
- Requiring corrective actions to ensure that flash-over distances will not be violated due to work constrains such as legal injunctions (R5);
- Requiring inspections of vegetation conditions to be performed annually (R6); and
- Requiring that the annual work needed to prevent flash-over is completed (R7).

5.1.6. For this standard, the requirements have been developed as follows:

5.1.7. Performance-based: Requirements 1 and 2

5.1.8. Competency-based: Requirement 3

5.1.9. Risk-based: Requirements 4, 5, 6 and 7

5.1.10. R3 serves as the first line of defense by ensuring that entities understand the problem they are trying to manage and have fully developed strategies and plans to manage the problem. R1, R2, and R7 serve as the second line of defense by requiring that entities carry out their plans and manage vegetation. R6, which requires inspections, may be either a part of the first line of defense (as input into the strategies and plans) or as a third line of defense (as a check of the first and second lines of defense). R4 serves as the final line of defense, as it addresses cases in which all the other lines of defense have failed.

- 5.1.11.** Major outages and operational problems have resulted from interference between overgrown vegetation and transmission lines located on many types of lands and ownership situations. Adherence to the standard requirements for applicable lines on any kind of land or easement, whether they are Federal Lands, state or provincial lands, public or private lands, franchises, easements or lands owned in fee, will reduce and manage this risk. For the purpose of the standard the term “public lands” includes municipal lands, village lands, city lands, and a host of other governmental entities.
- 5.1.12.** This standard addresses vegetation management along applicable overhead lines and does not apply to underground lines, submarine lines or to line sections inside an electric station boundary.
- 5.1.13.** This standard focuses on transmission lines to prevent those vegetation related outages that could lead to Cascading. It is not intended to prevent customer outages due to tree contact with lower voltage distribution system lines. For example, localized customer service might be disrupted if vegetation were to make contact with a 69kV transmission line supplying power to a 12kV distribution station. However, this standard is not written to address such isolated situations which have little impact on the overall electric transmission system.
- 5.1.14.** Since vegetation growth is constant and always present, unmanaged vegetation poses an increased outage risk, especially when numerous transmission lines are operating at or near their Rating. This can present a significant risk of consecutive line failures when lines are experiencing large sags thereby leading to Cascading. Once the first line fails the shift of the current to the other lines and/or the increasing system loads will lead to the second and subsequent line failures as contact to the vegetation under those lines occurs. Conversely, most other outage causes (such as trees falling into lines, lightning, animals, motor vehicles, etc.) are not an interrelated function of the shift of currents or the increasing system loading. These events are not any more likely to occur during heavy system loads than any other time. There is no cause-effect relationship which creates the probability of simultaneous occurrence of other such events. Therefore these types of events are highly unlikely to cause large-scale grid failures. Thus, this standard places the highest priority on the management of vegetation to prevent vegetation grow-ins.

B. Requirements and Measures

R1. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path; operating within their Rating and all Rated Electrical Operating Conditions of the types shown below³ [*Violation Risk Factor: High*] [*Time Horizon: Real-time*]:

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage⁴,
2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁵,
3. An encroachment due to the blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
4. An encroachment due to vegetation growth into the MVCD that caused a vegetation-related Sustained Outage⁴.

M1. Each applicable Transmission Owner

Rationale for R1 and R2:

Lines with the highest significance to reliability are covered in R1; all other lines are covered in R2.

Rationale for the types of failure to manage vegetation which are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of an applicable Transmission Owner's or applicable Generator Owner's vegetation maintenance program:

1. This management failure is found by routine inspection or Fault event investigation, and is normally symptomatic of unusual conditions in an otherwise sound program.
2. This management failure occurs when the height and location of a side tree within the ROW is not adequately addressed by the program.
3. This management failure occurs when side growth is not adequately addressed and may be indicative of an unsound program.
4. This management failure is usually indicative of a program that is not addressing the most fundamental dynamic of vegetation management, (i.e. a grow-in under the line). If this type of failure is pervasive on multiple lines, it provides a mechanism for a Cascade.

³ This requirement does not apply to circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, or installation, removal, or digging of vegetation. Nothing in this footnote should be construed to limit the Transmission Owner's right to exercise its full legal rights on the ROW.

⁴ If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

⁵ Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period.

and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R1)

- R2.** Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path; operating within its Rating and all Rated Electrical Operating Conditions of the types shown below² [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time*]:
1. An encroachment into the MVCD, observed in Real-time, absent a Sustained Outage³,
 2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁴,
 3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
 4. An encroachment due to vegetation growth into the line MVCD that caused a vegetation-related Sustained Outage⁴
- M2.** Each applicable Transmission Owner and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R2)

R3. Each applicable Transmission Owner and applicable Generator Owner shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines that accounts for the following:

3.1 Movement of applicable line conductors under their Rating and all Rated Electrical Operating Conditions;

3.2 Inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]:

Rationale

The documentation provides a basis for evaluating the competency of the applicable Transmission Owner’s or applicable Generator Owner’s vegetation program. There may be many acceptable approaches to maintain clearances. Any approach must demonstrate that the applicable Transmission Owner or applicable Generator Owner avoids vegetation-to-wire conflicts under all Ratings and all Rated Electrical Operating Conditions. See Figure

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner can prevent encroachment into the MVCD considering the factors identified in the requirement. (R3)

R4. Each applicable Transmission Owner and applicable Generator Owner, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable line when the applicable Transmission Owner and applicable Generator Owner has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment *[Violation Risk Factor: Medium] [Time Horizon: Real-time]*.

Rationale

This is to ensure expeditious communication between the applicable Transmission Owner or applicable Generator Owner and the control center when a critical situation is confirmed.

M4. Each applicable Transmission Owner and applicable Generator Owner that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders. (R4)

R5. When a applicable Transmission Owner and applicable Generator Owner is constrained from performing vegetation work on an applicable line operating within its Rating and all Rated Electrical Operating Conditions, and the constraint may lead to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan, then the applicable Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management to prevent encroachments [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Legal actions and other events may occur which result in constraints that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation maintenance work. In cases where the transmission line is put at potential risk due to constraints, the intent is for the applicable Transmission Owner and applicable Generator Owner to put interim measures in place, rather than do nothing. The corrective action process is not intended to address situations where a planned work methodology cannot be performed but an alternate work methodology can be used.

M5. Each applicable Transmission Owner and applicable Generator Owner has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, or evidence that the line was de-energized. (R5)

R6. Each applicable Transmission Owner and applicable Generator Owner shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 calendar months between inspections on the same ROW⁶ [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Inspections are used by applicable Transmission Owners and applicable Generator Owners to assess the condition of the entire ROW. The information from the assessment can be used to determine risk, determine future work and evaluate recently-completed work. This requirement sets a minimum Vegetation Inspection frequency of once per calendar year but with no more than 18 months between inspections on the same ROW. Based upon average growth rates across North America and on common utility practice, this minimum frequency is reasonable. Transmission Owners should consider local and environmental factors that could

⁶ When the applicable Transmission Owner or applicable Generator Owner is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the TO or GO is granted a time extension that is equivalent to the duration of the time the TO or GO was prevented from performing the Vegetation Inspection.

M6. Each applicable Transmission Owner and applicable Generator Owner has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable lines at least once per calendar year but with no more than 18 calendar months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records. (R6)

R7. Each applicable Transmission Owner and applicable Generator Owner shall complete 100% of its annual vegetation work plan of applicable lines to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not allow encroachment of vegetation into the MVCD) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan

Rationale

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. It allows modifications to the planned work for changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors, provided that those modifications do not put the transmission system at risk of a vegetation encroachment.

(measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]:

- Change in expected growth rate/ environmental factors
- Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner⁷
- Rescheduling work between growing seasons
- Crew or contractor availability/ Mutual assistance agreements
- Identified unanticipated high priority work
- Weather conditions/Accessibility
- Permitting delays
- Land ownership changes/Change in land use by the landowner
- Emerging technologies

M7. Each applicable Transmission Owner and applicable Generator Owner has evidence that it completed its annual vegetation work plan for its applicable lines. Examples of

⁷ Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, ice storms, floods, or major storms as defined either by the TO or GO or an applicable regulatory body.

acceptable forms of evidence may include a copy of the completed annual work plan (as finally modified), dated work orders, dated invoices, or dated inspection records.
(R7)

C. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

1.2 Regional Entity Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirements R1, R2, R3, R5, R6 and R7, Measures M1, M2, M3, M5, M6 and M7 for three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirement R4, Measure M4 for most recent 12 months of operator logs or most recent 3 months of voice recordings or transcripts of voice recordings, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a applicable Transmission Owner or applicable Generator Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3 Compliance Monitoring and Enforcement Processes:

5.1.15. Compliance Audit

5.1.16. Self-Certification

5.1.17. Spot Checking

5.1.18. Compliance Violation Investigation

5.1.19. Self-Reporting

Complaint

Periodic Data Submittal

1.4 Additional Compliance Information

Periodic Data Submittal: The applicable Transmission Owner and applicable Generator Owner will submit a quarterly report to its Regional Entity, or the Regional Entity's designee, identifying all Sustained Outages of applicable lines operated within their Rating and all Rated Electrical Operating Conditions as determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation, except as excluded in footnote 2, and including as a minimum the following:

- The name of the circuit(s), the date, time and duration of the outage; the voltage of the circuit; a description of the cause of the outage; the category associated with the Sustained Outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.

A Sustained Outage is to be categorized as one of the following:

- Category 1A — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, that are identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 1B — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 2A — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 2B — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 3 — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines from outside the ROW;
- Category 4A — Blowing together: Sustained Outages caused by vegetation and applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.
- Category 4B — Blowing together: Sustained Outages caused by vegetation and applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.

The Regional Entity will report the outage information provided by applicable Transmission Owners and applicable Generator Owners, as per the above, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported Sustained Outages.

Table of Compliance Elements

R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Real-time	High	The responsible entity failed to manage vegetation in a manner such that the responsible entity had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.	The responsible entity failed to manage vegetation in a manner such that the responsible entity had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.	The responsible entity failed to manage vegetation in a manner such that the responsible entity had an encroachment into the MVCD due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage.	The responsible entity failed to manage vegetation in a manner such that the responsible entity had an encroachment into the MVCD due to a grow-in that caused a vegetation-related Sustained Outage.
R2	Real-time	Medium	The responsible entity failed to manage vegetation in a manner such that the responsible entity had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.	The responsible entity failed to manage vegetation in a manner such that the responsible entity had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.	The responsible entity failed to manage vegetation in a manner such that the responsible entity had an encroachment into the MVCD due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage.	The responsible entity failed to manage vegetation in a manner such that the responsible entity had an encroachment into the MVCD due to a grow-in that caused a vegetation-related Sustained Outage.
R3	Long-Term Planning	Lower		The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency, for the responsible entity’s applicable lines. (Requirement R3, Part 3.2)	The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the movement of transmission line conductors under their Rating and all Rated Electrical Operating Conditions, for the responsible entity’s applicable lines. Requirement R3, Part 3.1)	The responsible entity does not have any maintenance strategies or documented procedures or processes or specifications used to prevent the encroachment of vegetation into the MVCD, for the responsible entity’s applicable lines.

R4	Real-time	Medium			The responsible entity experienced a confirmed vegetation threat and notified the control center holding switching authority for that applicable line, but there was intentional delay in that notification.	The responsible entity experienced a confirmed vegetation threat and did not notify the control center holding switching authority for that applicable line.
R5	Operations Planning	Medium				The responsible entity did not take corrective action when it was constrained from performing planned vegetation work where an applicable line was put at potential risk.
R6	Operations Planning	Medium	The responsible entity failed to inspect 5% or less of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.)	The responsible entity failed to inspect more than 5% up to and including 10% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).	The responsible entity failed to inspect more than 10% up to and including 15% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).	The responsible entity failed to inspect more than 15% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).
R7	Operations Planning	Medium	The responsible entity failed to complete 5% or less of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 5% and up to and including 10% of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 10% and up to and including 15% of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 15% of its annual vegetation work plan for its applicable lines (as finally modified).

D. Regional Differences

F. Associated Documents

Guideline and Technical Basis (attached).

Guideline and Technical Basis

Effective dates:

The first two sentences of the Effective Dates section is standard language used in most NERC standards to cover the general effective date and is sufficient to cover the vast majority of situations. Five special cases are needed to cover effective dates for individual lines which undergo transitions after the general effective date. These special cases cover the effective dates for those lines which are initially becoming subject to the standard, those lines which are changing their applicability within the standard, and those lines which are changing in a manner that removes their applicability to the standard.

Case 1 is needed because the Planning Coordinators may designate lines below 200 kV to become elements of an IROL or Major WECC Transfer Path in a future Planning Year (PY). For example, studies by the Planning Coordinator in 2011 may identify a line to have that designation beginning in PY 2021, ten years after the planning study is performed. It is not intended for the Standard to be immediately applicable to, or in effect for, that line until that future PY begins. The effective date provision for such lines ensures that the line will become subject to the standard on January 1 of the PY specified with an allowance of at least 12 months for the applicable Transmission Owner or applicable Generator Owner to make the necessary preparations to achieve compliance on that line. The table below has some explanatory examples of the application.

<u>Date that Planning Study is completed</u>	<u>PY the line will become an IROL element</u>	<u>Date 1</u>	<u>Date 2</u>	<u>Effective Date The latter of Date 1 or Date 2</u>
05/15/2011	2012	05/15/2012	01/01/2012	05/15/2012
05/15/2011	2013	05/15/2012	01/01/2013	01/01/2013
05/15/2011	2014	05/15/2012	01/01/2014	01/01/2014
05/15/2011	2021	05/15/2012	01/01/2021	01/01/2021

Case 2 is needed because a line operating below 200kV designated as an element of an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network.

Case 3 is needed because a line operating at 200 kV or above that once was designated as an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network. Such changes result in the need to apply R1 to that line until that date is reached and then to apply R2 to that line thereafter.

Case 4 is needed because an existing line that is to be operated at 200 kV or above can be acquired by an applicable Transmission Owner or applicable Generator Owner from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network which will thereafter make the line subject to the standard.

Case 5 is needed because an existing line that is operated below 200 kV can be acquired by an applicable Transmission Owner or applicable Generator Owner from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network. In this special case the line upon acquisition was designated as an element of an Interconnection Reliability Operating Limit (IROL) or an element of a Major WECC Transfer Path.

Defined Terms:

Explanation for revising the definition of ROW:

The current NERC glossary definition of Right of Way has been modified to address the matter set forth in Paragraph 734 of FERC Order 693. The Order pointed out that Transmission Owners may in some cases own more property or rights than are needed to reliably operate transmission lines. This modified definition represents a slight but significant departure from the strict legal definition of “right of way” in that this definition is based on engineering and construction considerations that establish the width of a corridor from a technical basis. The pre-2007 maintenance records are included in the revised definition to allow the use of such vegetation widths if there were no engineering or construction standards that referenced the width of right of way to be maintained for vegetation on a particular line but the evidence exists in maintenance records for a width that was in fact maintained prior to this standard becoming mandatory. Such widths may be the only information available for lines that had limited or no vegetation easement rights and were typically maintained primarily to ensure public safety. This standard does not require additional easement rights to be purchased to satisfy a minimum right of way width that did not exist prior to this standard becoming mandatory.

Explanation for revising the definition of Vegetation Inspections:

The current glossary definition of this NERC term is being modified to allow both maintenance inspections and vegetation inspections to be performed concurrently. This allows potential efficiencies, especially for those lines with minimal vegetation and/or slow vegetation growth rates.

Explanation of the definition of the MVCD:

The MVCD is a calculated minimum distance that is derived from the Gallet Equations. This is a method of calculating a flash over distance that has been used in the design of high voltage transmission lines. Keeping vegetation away from high voltage conductors by this distance will prevent voltage flash-over to the vegetation. See the explanatory text below for Requirement R3 and associated Figure 1. Table 2 below provides MVCD values for various voltages and altitudes. Details of the equations and an example calculation are provided in Appendix 1 of the Technical Reference Document.

Requirements R1 and R2:

R1 and R2 are performance-based requirements. The reliability objective or outcome to be achieved is the management of vegetation such that there are no vegetation encroachments within a minimum distance of transmission lines. Content-wise, R1 and R2 are the same requirements; however, they apply to different Facilities. Both R1 and R2 require each applicable Transmission Owner or applicable Generator Owner to manage vegetation to prevent encroachment within the MVCD of transmission lines. R1 is applicable to lines that are identified as an element of an IROL or Major WECC Transfer Path. R2 is applicable to all other lines that are not elements of IROLs, and not elements of Major WECC Transfer Paths.

The separation of applicability (between R1 and R2) recognizes that inadequate vegetation management for an applicable line that is an element of an IROL or a Major WECC Transfer Path is a greater risk to the interconnected electric transmission system than applicable lines that are not elements of IROLs or Major WECC Transfer Paths. Applicable lines that are not elements of IROLs or Major WECC Transfer Paths do require effective vegetation management, but these lines are comparatively less operationally significant. As a reflection of this difference in risk impact, the Violation Risk Factors (VRFs) are assigned as High for R1 and Medium for R2.

Requirements R1 and R2 state that if inadequate vegetation management allows vegetation to encroach within the MVCD distance as shown in Table 2, it is a violation of the standard. Table 2 distances are the minimum clearances that will prevent spark-over based on the Gallet equations as described more fully in the Technical Reference document.

These requirements assume that transmission lines and their conductors are operating within their Rating. If a line conductor is intentionally or inadvertently operated beyond its Rating and Rated Electrical Operating Condition (potentially in violation of other standards), the occurrence of a clearance encroachment may occur solely due to that condition. For example, emergency actions taken by an applicable Transmission Owner or applicable Generator Owner or Reliability Coordinator to protect an Interconnection may cause excessive sagging and an outage. Another example would be ice loading beyond the line's Rating and Rated Electrical Operating Condition. Such vegetation-related encroachments and outages are not violations of this standard.

Evidence of failures to adequately manage vegetation include real-time observation of a vegetation encroachment into the MVCD (absent a Sustained Outage), or a vegetation-related encroachment resulting in a Sustained Outage due to a fall-in from inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to the blowing together of the lines and vegetation located inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to a grow-in. Faults which do not cause a Sustained outage and which are confirmed to have been caused by vegetation encroachment within the MVCD are considered the equivalent of a Real-time observation for violation severity levels.

With this approach, the VSLs for R1 and R2 are structured such that they directly correlate to the severity of a failure of an applicable Transmission Owner or applicable Generator Owner to manage vegetation and to the corresponding performance level of the Transmission Owner's vegetation program's ability to meet the objective of "preventing the risk of those vegetation related outages that could lead to Cascading." Thus violation severity increases with an applicable Transmission Owner's or applicable Generator Owner's inability to meet this goal and its potential of leading to a Cascading event. The additional benefits of such a combination are that it simplifies the standard and clearly defines performance for compliance. A performance-based requirement of this nature will promote high quality, cost effective vegetation management programs that will deliver the overall end result of improved reliability to the system.

Multiple Sustained Outages on an individual line can be caused by the same vegetation. For example initial investigations and corrective actions may not identify and remove the actual outage cause then another outage occurs after the line is re-energized and previous high conductor temperatures return. Such events are considered to be a single vegetation-related Sustained Outage under the standard where the Sustained Outages occur within a 24 hour period.

The MVCD is a calculated minimum distance stated in feet (or meters) to prevent spark-over, for various altitudes and operating voltages that is used in the design of Transmission Facilities. Keeping vegetation from entering this space will prevent transmission outages.

If the applicable Transmission Owner or applicable Generator Owner has applicable lines operated at nominal voltage levels not listed in Table 2, then the applicable TO or applicable GO should use the next largest clearance distance based on the next highest nominal voltage in the table to determine an acceptable distance.

Requirement R3: R3 is a competency based requirement concerned with the maintenance strategies, procedures, processes, or specifications, an applicable Transmission Owner or applicable Generator Owner uses for vegetation management.

An adequate transmission vegetation management program formally establishes the approach the applicable Transmission Owner or applicable Generator Owner uses to plan and perform vegetation work to prevent transmission Sustained Outages and minimize risk to the transmission system. The approach provides the basis for evaluating the intent, allocation of appropriate resources, and the competency of the applicable Transmission Owner or applicable Generator Owner in managing vegetation. There are many acceptable approaches to manage vegetation and avoid Sustained Outages. However, the applicable Transmission Owner or applicable Generator Owner must be able to show the documentation of its approach and how it conducts work to maintain clearances.

An example of one approach commonly used by industry is ANSI Standard A300, part 7. However, regardless of the approach a utility uses to manage vegetation, any approach an applicable Transmission Owner or applicable Generator Owner chooses to use will generally contain the following elements:

1. *the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation height) to ensure that MVCD clearances are never violated.*
2. *the work methods that the applicable Transmission Owner or applicable Generator Owner uses to control vegetation*
3. *a stated Vegetation Inspection frequency*
4. *an annual work plan*

The conductor's position in space at any point in time is continuously changing in reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and wind loading. The movement of the transmission line conductor and the MVCD is illustrated in Figure 1 below. In the Technical Reference document more figures and explanations of conductor dynamics are provided.

Figure 1

A cross-section view of a single conductor at a given point along the span is shown with six possible conductor positions due to movement resulting from thermal and mechanical loading.

Requirement R4:

R4 is a risk-based requirement. It focuses on preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Fault risk when a vegetation threat is confirmed. R4 involves the notification of potentially threatening vegetation conditions, without any intentional delay, to the control center holding switching authority for that specific transmission line. Examples of acceptable unintentional delays may include communication system problems (for example, cellular service or two-way radio disabled), crews located in remote field locations with no communication access, delays due to severe weather, etc.

Confirmation is key that a threat actually exists due to vegetation. This confirmation could be in the form of an applicable Transmission Owner or applicable Generator Owner employee who personally identifies such a threat in the field. Confirmation could also be made by sending out an employee to evaluate a situation reported by a landowner.

Vegetation-related conditions that warrant a response include vegetation that is near or encroaching into the MVCD (a grow-in issue) or vegetation that could fall into the transmission conductor (a fall-in issue). A knowledgeable verification of the risk would include an assessment of the possible sag or movement of the conductor while operating between no-load conditions and its rating.

The applicable Transmission Owner or applicable Generator Owner has the responsibility to ensure the proper communication between field personnel and the control center to allow the control center to take the appropriate action until or as the vegetation threat is relieved. Appropriate actions may include a temporary reduction in the line loading, switching the line out of service, or other preparatory actions in recognition of the increased risk of outage on that circuit. The notification of the threat should be communicated in terms of minutes or hours as opposed to a longer time frame for corrective action plans (see R5).

All potential grow-in or fall-in vegetation-related conditions will not necessarily cause a Fault at any moment. For example, some applicable Transmission Owners or applicable Generator Owners may have a danger tree identification program that identifies trees for removal with the potential to fall near the line. These trees would not require notification to the control center unless they pose an immediate fall-in threat.

Requirement R5:

R5 is a risk-based requirement. It focuses upon preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Sustained Outage risk when temporarily constrained from performing vegetation maintenance. The intent of this requirement is to deal with situations that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation management work and, as a result, have the potential to put the transmission line at risk. Constraints to performing vegetation maintenance work as planned could result from legal injunctions filed by property owners, the discovery of easement stipulations which limit the applicable Transmission Owner's or applicable Generator Owner's rights, or other circumstances.

This requirement is not intended to address situations where the transmission line is not at potential risk and the work event can be rescheduled or re-planned using an alternate work methodology. For example, a land owner may prevent the planned use of chemicals on non-threatening, low growth vegetation but agree to the use of mechanical clearing. In this case the applicable Transmission Owner or applicable Generator Owner is not under any immediate time constraint for achieving the management objective, can easily reschedule work using an alternate approach, and therefore does not need to take interim corrective action.

However, in situations where transmission line reliability is potentially at risk due to a constraint, the applicable Transmission Owner or applicable Generator Owner is required to take an interim corrective action to mitigate the potential risk to the transmission line. A wide range of actions can be taken to address various situations. General considerations include:

- Identifying locations where the applicable Transmission Owner or applicable Generator Owner is constrained from performing planned vegetation maintenance work which potentially leaves the transmission line at risk.
- Developing the specific action to mitigate any potential risk associated with not performing the vegetation maintenance work as planned.
- Documenting and tracking the specific action taken for the location.
- In developing the specific action to mitigate the potential risk to the transmission line the applicable Transmission Owner or applicable Generator Owner could consider location specific measures such as modifying the inspection and/or maintenance intervals. Where a legal constraint would not allow any vegetation work, the interim corrective action could include limiting the loading on the transmission line.
- The applicable Transmission Owner or applicable Generator Owner should document and track the specific corrective action taken at each location. This location may be indicated as one span, one tree or a combination of spans on one property where the constraint is considered to be temporary.

Requirement R6:

R6 is a risk-based requirement. This requirement sets a minimum time period for completing Vegetation Inspections. The provision that Vegetation Inspections can be performed in conjunction with general line inspections facilitates a Transmission Owner’s ability to meet this requirement. However, the applicable Transmission Owner or applicable Generator Owner may determine that more frequent vegetation specific inspections are needed to maintain reliability levels, based on factors such as anticipated growth rates of the local vegetation, length of the local growing season, limited ROW width, and local rainfall. Therefore it is expected that some transmission lines may be designated with a higher frequency of inspections.

The VSLs for Requirement R6 have levels ranked by the failure to inspect a percentage of the applicable lines to be inspected. To calculate the appropriate VSL the applicable Transmission Owner or applicable Generator Owner may choose units such as: circuit, pole line, line miles or kilometers, etc.

For example, when an applicable Transmission Owner or applicable Generator Owner operates 2,000 miles of applicable transmission lines this applicable Transmission Owner or applicable Generator Owner will be responsible for inspecting all the 2,000 miles of lines at least once during the calendar year. If one of the included lines was 100 miles long, and if it was not inspected during the year, then the amount failed to inspect would be $100/2000 = 0.05$ or 5%. The “Low VSL” for R6 would apply in this example.

Requirement R7:

R7 is a risk-based requirement. The applicable Transmission Owner or applicable Generator Owner is required to complete its annual work plan for vegetation management to accomplish the purpose of this standard. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made and documented provided they do not put the transmission system at risk. The annual work plan requirement is not intended to necessarily require a “span-by-span”, or even a “line-by-line” detailed description of all work to be performed. It is only intended to require that the applicable Transmission Owner or applicable Generator Owner provide evidence of annual planning and execution of a vegetation management maintenance approach which successfully prevents encroachment of vegetation into the MVCD.

For example, when an applicable Transmission Owner or applicable Generator Owner identifies 1,000 miles of applicable transmission lines to be completed in the applicable Transmission Owner’s or applicable Generator Owner’s annual plan, the applicable Transmission Owner or applicable Generator Owner will be responsible completing those identified miles. If a applicable Transmission Owner or applicable Generator Owner makes a modification to the annual plan that does not put the transmission system at risk of an encroachment the annual plan may be modified. If 100 miles of the annual plan is deferred until next year the calculation to determine what percentage was completed for the current year would be: $1000 - 100$ (deferred miles) = 900 modified annual plan, or $900 / 900 = 100\%$ completed annual miles. If an applicable Transmission Owner or applicable Generator Owner only completed 875 of the total 1000 miles with no acceptable documentation for modification of the annual plan the calculation for failure to complete the annual plan would be: $1000 - 875 = 125$ miles failed to complete then, 125 miles (not completed) / 1000 total annual plan miles = 12.5% failed to complete.

The ability to modify the work plan allows the applicable Transmission Owner or applicable Generator Owner to change priorities or treatment methodologies during the year as conditions or situations dictate. For example recent line inspections may identify unanticipated high priority work, weather conditions (drought) could make herbicide application ineffective during the plan year, or a major storm could require redirecting local resources away from planned maintenance. This situation may also include complying with mutual assistance agreements by moving resources off the applicable Transmission Owner’s or applicable Generator Owner’s system to work on another system. Any of these examples could result in acceptable deferrals or additions to the annual work plan provided that they do not put the transmission system at risk of a vegetation encroachment.

In general, the vegetation management maintenance approach should use the full extent of the applicable Transmission Owner’s or applicable Generator Owner’s easement, fee simple and other legal rights allowed. A comprehensive approach that exercises the full extent of legal rights on the ROW is superior to incremental management because in the long term it reduces the overall potential for encroachments, and it ensures that future planned work and future planned inspection cycles are sufficient.

When developing the annual work plan the applicable Transmission Owner or applicable Generator Owner should allow time for procedural requirements to obtain permits to work on federal, state, provincial, public, tribal lands. In some cases the lead time for obtaining permits may necessitate preparing work plans more than a year prior to work start dates. Applicable Transmission Owners or applicable Generator Owners may also need to consider those special landowner requirements as documented in easement instruments.

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Therefore, deferrals or relevant changes to the annual plan shall be documented. Depending on the planning and documentation format used by the applicable Transmission Owner or applicable Generator Owner, evidence of successful annual work plan execution could consist of signed-off work orders, signed contracts, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, or paid invoices. Other evidence may include photographs, and walk-through reports.

* Such lines are applicable to this standard only if PC has determined such per FAC-014 (refer to the Applicability Section above)

⁸ The distances in this Table are the minimums required to prevent Flash-over; however prudent vegetation maintenance practices dictate that substantially greater distances will be achieved at time of vegetation maintenance.

⁹ Where applicable lines are operated at nominal voltages other than those listed, the applicable Transmission Owner or applicable Generator Owner should use the maximum system voltage to determine the appropriate clearance for that line.

Notes:

The SDT determined that the use of IEEE 516-2003 in version 1 of FAC-003 was a misapplication. The SDT consulted specialists who advised that the Gallet Equation would be a technically justified method. The explanation of why the Gallet approach is more appropriate is explained in the paragraphs below.

The drafting team sought a method of establishing minimum clearance distances that uses realistic weather conditions and realistic maximum transient over-voltages factors for in-service transmission lines.

The SDT considered several factors when looking at changes to the minimum vegetation to conductor distances in FAC-003-1:

- avoid the problem associated with referring to tables in another standard (IEEE-516-2003)
- transmission lines operate in non-laboratory environments (wet conditions)
- transient over-voltage factors are lower for in-service transmission lines than for inadvertently re-energized transmission lines with trapped charges.

FAC-003-1 uses the minimum air insulation distance (MAID) without tools formula provided in IEEE 516-2003 to determine the minimum distance between a transmission line conductor and vegetation. The equations and methods provided in IEEE 516 were developed by an IEEE Task Force in 1968 from test data provided by thirteen independent laboratories. The distances provided in IEEE 516 Tables 5 and 7 are based on the withstand voltage of a dry rod-rod air gap, or in other words, dry laboratory conditions. Consequently, the validity of using these distances in an outside environment application has been questioned.

FAC-003-01 allowed Transmission Owners to use either Table 5 or Table 7 to establish the minimum clearance distances. Table 7 could be used if the Transmission Owner knew the maximum transient over-voltage factor for its system. Otherwise, Table 5 would have to be used. Table 5 represented minimum air insulation distances under the worst possible case for transient over-voltage factors. These worst case transient over-voltage factors were as follows: 3.5 for voltages up to 362 kV phase to phase; 3.0 for 500 - 550 kV phase to phase; and 2.5 for 765 to 800 kV phase to phase. These worst case over-voltage factors were also a cause for concern in this particular application of the distances.

In general, the worst case transient over-voltages occur on a transmission line that is inadvertently re-energized immediately after the line is de-energized and a trapped charge is still present. The intent of FAC-003 is to keep a transmission line that is *in service* from becoming de-energized (i.e. tripped out) due to spark-over from the line conductor to nearby vegetation. Thus, the worst case transient overvoltage assumptions are not appropriate for this application. Rather, the appropriate over voltage values are those that occur only while the line is energized.

Typical values of transient over-voltages of in-service lines, as such, are not readily available in the literature because they are negligible compared with the maximums. A conservative value for the maximum transient over-voltage that can occur anywhere along the length of an in-service ac line is approximately 2.0 per unit. This value is a conservative estimate of the transient over-voltage that is created at the point of application (e.g. a substation) by switching a capacitor bank without pre-insertion devices (e.g. closing resistors). At voltage levels where capacitor banks are not very common (e.g. Maximum System Voltage of 362 kV), the

maximum transient over-voltage of an in-service ac line are created by fault initiation on adjacent ac lines and shunt reactor bank switching. These transient voltages are usually 1.5 per unit or less.

Even though these transient over-voltages will not be experienced at locations remote from the bus at which they are created, in order to be conservative, it is assumed that all nearby ac lines are subjected to this same level of over-voltage. Thus, a maximum transient over-voltage factor of 2.0 per unit for transmission lines operated at 302 kV and below is considered to be a realistic maximum in this application. Likewise, for ac transmission lines operated at Maximum System Voltages of 362 kV and above a transient over-voltage factor of 1.4 per unit is considered a realistic maximum.

The Gallet Equations are an accepted method for insulation coordination in tower design. These equations are used for computing the required strike distances for proper transmission line insulation coordination. They were developed for both wet and dry applications and can be used with any value of transient over-voltage factor. The Gallet Equation also can take into account various air gap geometries. This approach was used to design the first 500 kV and 765 kV lines in North America.

If one compares the MAID using the IEEE 516-2003 Table 7 (table D.5 for English values) with the critical spark-over distances computed using the Gallet wet equations, for each of the nominal voltage classes and identical transient over-voltage factors, the Gallet equations yield a more conservative (larger) minimum distance value.

Distances calculated from either the IEEE 516 (dry) formulas or the Gallet “wet” formulas are not vastly different when the same transient overvoltage factors are used; the “wet” equations will consistently produce slightly larger distances than the IEEE 516 equations when the same transient overvoltage is used. While the IEEE 516 equations were only developed for dry conditions the Gallet equations have provisions to calculate spark-over distances for both wet and dry conditions.

While EPRI is currently trying to establish empirical data for spark-over distances to live vegetation, there are no spark-over formulas currently derived expressly for vegetation to conductor minimum distances. Therefore the SDT chose a proven method that has been used in other EHV applications. The Gallet equations relevance to wet conditions and the selection of a Transient Overvoltage Factor that is consistent with the absence of trapped charges on an in-service transmission line make this methodology a better choice. The following table is an example of the comparison of distances derived from IEEE 516 and the Gallet equations.

**Comparison of spark-over distances computed using Gallet wet equations vs.
IEEE 516-2003 MAID distances**

(AC) Nom System Voltage (kV)	(AC) Max System Voltage (kV)	Transient Over-voltage Factor (T)	Clearance (ft.) Gallet (wet) @ Alt. 3000 feet	Table 7 (Table D.5 for feet) IEEE 516-2003 MAID (ft) @ Alt. 3000 feet

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

- ~~1. SC approved SAR for initial posting (January 11, 2007).~~
- ~~2. SAR posted for comment (January 15–February 14, 2007).~~
- ~~3. SAR posted for comment (April 10–May 9, 2007).~~
- ~~4. SC authorized moving the SAR forward to standard development (June 27, 2007).~~
- ~~5. First draft of proposed standard posted (October 27, 2008–November 25, 2008).~~
- ~~6. Second draft of revised standard posted (September 10, 20–October 24, 2009).~~
- ~~7. Third draft of revised standard posted (March 1, 2010–March 31, 2010).~~
- ~~8. Fourth draft of revised standard posted (June 17, 2010–July 17, 2010).~~
- ~~9. Fifth draft of revised standard posted (February 18, 2011–February 28, 2011)~~
10. Sixth draft of revised standard posted (September xx–2011)

Proposed Action Plan and Description of Current Draft

This is the fourth posting of the proposed revisions to the standard in accordance with Results-Based Criteria and the sixth draft overall.

Future Development Plan

Anticipated Actions	Anticipated Date
Recirculation ballot of standards.	September 2011
Receive BOT approval	November 2011

Effective Dates

There are two effective dates associated with this standard.

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

~~This standard becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval is required. Where no regulatory approval is required, the standard becomes effective on the first calendar day of the first calendar quarter one year after Board of Trustees adoption.~~

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.
2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.

3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.
4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Version History

Version	Date	Action	Change Tracking
1	TBA	1. Added “Standard Development Roadmap.” 2. Changed “60” to “Sixty” in section A, 5.2. 3. Added “Proposed Effective Date: April 7, 2006” to footer. 4. Added “Draft 3: November 17, 2005” to footer.	01/20/06
1	April 4, 2007	Regulatory Approval — Effective Date	New
23	September 29, 2011	Using the latest draft of FAC-003-2 from the Project 2007-07 SDT, modified proposed definitions and Applicability to include Generator Owners of a certain length.	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

The current glossary definition of this NERC term is modified to address the issues set forth in Paragraph 734 of FERC Order 693.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

The current glossary definition of this NERC term is modified to allow both maintenance inspections and vegetation inspections to be performed concurrently.

Current definition of Vegetation Inspection:
The systematic examination of a transmission corridor to document vegetation conditions.

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC's Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has developed two sets of proposed changes: one to this version, the latest draft of Version 2 as proposed by the Project 2007-07 team, and one to FAC-003-1, the current FERC-approved version of the standard.

If FAC-003-2 is approved by NERC's BOT, the Project 2010-07 drafting team will likely proceed with the modifications seen in this standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. Several scenarios that could play out based on the order of the approval of these versions of the standards are addressed in the FAC-003-3 implementation plan.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with changes to FAC-003-1 to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability, the proposal of modifications to the NERC defined term Right-of-Way to include applicable Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

1. **Title:** Transmission Vegetation Management
2. **Number:** FAC-003-~~3~~2
3. **Purpose:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.

4. Applicability

4.1. Functional Entities:

4.1.1. Applicable Transmission Owners

4.1.1.1. Transmission Owners that own Transmission Facilities defined in 4.2.

4.1.2. Applicable Generator Owners

4.1.2.1. Generator Owners that own generation Facilities defined in 4.3

~~4.1.—~~

~~4.1.1—Transmission Owners~~

4.2. Transmission Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal¹, state, provincial, public, private, or tribal entities:

~~4.2.1. 4.2.1.—~~Each overhead transmission line operated at 200kV or higher.

~~4.2.2. 4.2.2.—~~Each overhead transmission line operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

~~4.2.3. 4.2.3.—~~Each overhead transmission line operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

4.2.4. 4.2.4.—Each overhead transmission line identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.

4.3. Generation Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal², state, provincial, public, private, or tribal entities:

4.3.1. Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generating switchyard and are:

4.3.1.1. Operated at 200kV or higher; or

4.3.1.2. Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

4.3.1.3. Operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

Rationale: The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards, and stations have many inspection and maintenance activities that are necessary for reliability. Those existing process manage the threat. As such, the formal steps in this standard are not well suited for this environment. ~~3) NERC has a project in place to address at a later date the applicability of this standard to Generation Owners.~~ 3) NERC has a project in place to address at a later date the applicability of this standard to Generation Owners. ~~3) NERC has a project in place to address at a later date the applicability of this standard to Generation Owners.~~ 3) NERC has a project in place to address at a later date the applicability of this standard to Generation Owners. 4) Specifically

~~Rationale:~~ The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards,

Enforcement:

The Requirements within a Reliability Standard govern and will be enforced. The Requirements within a Reliability Standard define what an entity must do to be compliant and binds an entity to certain obligations of performance under Section 215 of the Federal Power Act. Compliance will in all cases be measured by determining whether a party met or failed to meet the Reliability Standard Requirement given the specific facts and circumstances of its use, ownership or operation of the bulk power system.

Measures provide guidance on assessing non-compliance with the Requirements. Measures are the evidence that could be presented to demonstrate compliance with a Reliability Standard Requirement and are not intended to contain the quantitative metrics for determining satisfactory performance nor to limit how an entity may demonstrate compliance if valid alternatives to demonstrating compliance are available in a specific case. A Reliability Standard may be enforced in the absence of specified Measures.

Entities must comply with the “Compliance” section in its entirety, including the Administrative Procedure that sets forth, among other things, reporting requirements.

The “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” are provided for informational purposes. They are designed to convey guidance from NERC’s various activities. The “Guideline and Technical Basis” section and text boxes with “Examples” and “Rationale” are not intended to establish new Requirements under NERC’s Reliability Standards or to modify the Requirements in any existing NERC Reliability Standard. Implementation of the “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” is not a substitute for compliance with Requirements in NERC’s Reliability Standards.”

5. Background:

- 5.1.1.** This standard uses three types of requirements to provide layers of protection to prevent vegetation related outages that could lead to Cascading:
- 5.1.2.** a) Performance-based — defines a particular reliability objective or outcome to be achieved. In its simplest form, a results-based requirement has four components: *who, under what conditions (if any), shall perform what action, to achieve what particular bulk power system performance result or outcome?*
- 5.1.3.** b) Risk-based — preventive requirements to reduce the risks of failure to acceptable tolerance levels. A risk-based reliability requirement should be framed as: *who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?*

5.1.4. c) Competency-based — defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions. A competency-based reliability requirement should be framed as: *who, under what conditions (if any), shall have what capability, to achieve what particular result or outcome to perform an action to achieve a result or outcome or to reduce a risk to the reliability of the bulk power system?*

5.1.5. The defense-in-depth strategy for reliability standards development recognizes that each requirement in a NERC reliability standard has a role in preventing system failures, and that these roles are complementary and reinforcing. Reliability standards should not be viewed as a body of unrelated requirements, but rather should be viewed as part of a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comport with the quality objectives of a reliability standard.

This standard uses a defense-in-depth approach to improve the reliability of the electric Transmission system by:

- Requiring that vegetation be managed to prevent vegetation encroachment inside the flash-over clearance (R1 and R2);
- Requiring documentation of the maintenance strategies, procedures, processes and specifications used to manage vegetation to prevent potential flash-over conditions including consideration of 1) conductor dynamics and 2) the interrelationships between vegetation growth rates, control methods and the inspection frequency (R3);
- Requiring timely notification to the appropriate control center of vegetation conditions that could cause a flash-over at any moment (R4);
- Requiring corrective actions to ensure that flash-over distances will not be violated due to work constrains such as legal injunctions (R5);
- Requiring inspections of vegetation conditions to be performed annually (R6); and
- Requiring that the annual work needed to prevent flash-over is completed (R7).

5.1.6. For this standard, the requirements have been developed as follows:

5.1.7. Performance-based: Requirements 1 and 2

5.1.8. Competency-based: Requirement 3

5.1.9. Risk-based: Requirements 4, 5, 6 and 7

5.1.10. R3 serves as the first line of defense by ensuring that entities understand the problem they are trying to manage and have fully developed strategies and plans to manage the problem. R1, R2, and R7 serve as the second line of defense by requiring that entities carry out their plans and manage vegetation. R6, which requires inspections, may be either a part of the first line of defense (as input into the strategies and plans) or as a third line of defense (as a check of the first and second lines of defense). R4 serves

as the final line of defense, as it addresses cases in which all the other lines of defense have failed.

- 5.1.11.** Major outages and operational problems have resulted from interference between overgrown vegetation and transmission lines located on many types of lands and ownership situations. Adherence to the standard requirements for applicable lines on any kind of land or easement, whether they are Federal Lands, state or provincial lands, public or private lands, franchises, easements or lands owned in fee, will reduce and manage this risk. For the purpose of the standard the term “public lands” includes municipal lands, village lands, city lands, and a host of other governmental entities.
- 5.1.12.** This standard addresses vegetation management along applicable overhead lines and does not apply to underground lines, submarine lines or to line sections inside an electric station boundary.
- 5.1.13.** This standard focuses on transmission lines to prevent those vegetation related outages that could lead to Cascading. It is not intended to prevent customer outages due to tree contact with lower voltage distribution system lines. For example, localized customer service might be disrupted if vegetation were to make contact with a 69kV transmission line supplying power to a 12kV distribution station. However, this standard is not written to address such isolated situations which have little impact on the overall electric transmission system.
- 5.1.14.** Since vegetation growth is constant and always present, unmanaged vegetation poses an increased outage risk, especially when numerous transmission lines are operating at or near their Rating. This can present a significant risk of consecutive line failures when lines are experiencing large sags thereby leading to Cascading. Once the first line fails the shift of the current to the other lines and/or the increasing system loads will lead to the second and subsequent line failures as contact to the vegetation under those lines occurs. Conversely, most other outage causes (such as trees falling into lines, lightning, animals, motor vehicles, etc.) are not an interrelated function of the shift of currents or the increasing system loading. These events are not any more likely to occur during heavy system loads than any other time. There is no cause-effect relationship which creates the probability of simultaneous occurrence of other such events. Therefore these types of events are highly unlikely to cause large-scale grid failures. Thus, this standard places the highest priority on the management of vegetation to prevent vegetation grow-ins.

B. Requirements and Measures

R1. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path; operating within their Rating and all Rated Electrical Operating Conditions of the types shown below³ [*Violation Risk Factor: High*] [*Time Horizon: Real-time*]:

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage⁴,
2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁵,
3. An encroachment due to the blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
4. An encroachment due to vegetation growth into the MVCD that caused a vegetation-related Sustained Outage⁴.

M1. Each applicable Transmission Owner

Rationale for R1 and R2:

Lines with the highest significance to reliability are covered in R1; all other lines are covered in R2.

Rationale for the types of failure to manage vegetation which are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of ~~a~~an applicable Transmission Owner's or applicable Generator Owner's vegetation maintenance program:

1. This management failure is found by routine inspection or Fault event investigation, and is normally symptomatic of unusual conditions in an otherwise sound program.
2. This management failure occurs when the height and location of a side tree within the ROW is not adequately addressed by the program.
3. This management failure occurs when side growth is not adequately addressed and may be indicative of an unsound program.
4. This management failure is usually indicative of a program that is not addressing the most fundamental dynamic of vegetation management, (i.e. a grow-in under the line). If this type of failure is pervasive on multiple lines, it provides a mechanism for a Cascade.

³ This requirement does not apply to circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner ~~a Transmission Owner~~ subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, or installation, removal, or digging of vegetation. Nothing in this footnote should be construed to limit the Transmission Owner's right to exercise its full legal rights on the ROW.

⁴ If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

⁵ Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period.

~~and applicable Generator Owner Transmission Owner~~ has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R1)

- R2.** Each ~~applicable Transmission Owner and applicable Generator Owner Transmission Owner~~ shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path; operating within its Rating and all Rated Electrical Operating Conditions of the types shown below² [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time*]:
1. An encroachment into the MVCD, observed in Real-time, absent a Sustained Outage³,
 2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁴,
 3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
 4. An encroachment due to vegetation growth into the line MVCD that caused a vegetation-related Sustained Outage⁴

- M2.** Each ~~applicable Transmission Owner and applicable Generator Owner Transmission Owner~~ has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R2)

R3. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines that accounts for the following:

- 3.1** Movement of applicable line conductors under their Rating and all Rated Electrical Operating Conditions;
- 3.2** Inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]:

Rationale

The documentation provides a basis for evaluating the competency of the applicable Transmission Owner’s or applicable Generator Owner’s vegetation program. There may be many acceptable approaches to maintain clearances. Any approach must demonstrate that the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ avoids vegetation-to-wire conflicts under all Ratings and all Rated Electrical Operating

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ can prevent encroachment into the MVCD considering the factors identified in the requirement. (R3)

R4. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable line when the applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment *[Violation Risk Factor: Medium] [Time Horizon: Real-time].*

Rationale

This is to ensure expeditious communication between the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ and the control center when a critical situation is confirmed.

M4. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders. (R4)

R5. When a applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ is constrained from performing vegetation work on an applicable line operating within its Rating and all Rated Electrical Operating Conditions, and the constraint may lead to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan, then the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ shall take corrective action to ensure continued vegetation management to prevent encroachments [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Legal actions and other events may occur which result in constraints that prevent the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from performing planned vegetation maintenance work.

In cases where the transmission line is put at potential risk due to constraints, the intent is for the applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ to put interim measures in place, rather than do nothing.

The corrective action process is not intended to address situations where a planned work methodology cannot be performed but an alternate work methodology can be used.

M5. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, or evidence that the line was de-energized. (R5)

Rationale

Inspections are used by applicable Transmission Owners and applicable Generator Owners ~~Transmission Owners~~ to assess the condition of the entire ROW. The information from the assessment can be used to determine risk, determine future work and evaluate recently-completed work. This requirement sets a minimum Vegetation Inspection frequency of once per calendar year but with no more than 18 months between inspections on the same ROW. Based upon average growth rates across North America and on common utility practice, this minimum frequency is reasonable. Transmission Owners should consider local and environmental factors

R6. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 calendar months between inspections on the same ROW⁶ [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

⁶ When the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the TO or GO is granted a

M6. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable lines at least once per calendar year but with no more than 18 calendar months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records. (R6)

R7. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall complete 100% of its annual vegetation work plan of applicable lines to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not allow encroachment of vegetation into the MVCD) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]:

Rationale

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. It allows modifications to the planned work for changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors, provided that those modifications do not put the transmission system at risk of a vegetation encroachment.

- Change in expected growth rate/ environmental factors
- Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner⁷
- Rescheduling work between growing seasons
- Crew or contractor availability/ Mutual assistance agreements
- Identified unanticipated high priority work
- Weather conditions/Accessibility
- Permitting delays
- Land ownership changes/Change in land use by the landowner
- Emerging technologies

time extension that is equivalent to the duration of the time the TO or GO was prevented from performing the Vegetation Inspection.

⁷ Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, ice storms, floods, or major storms as defined either by the TO or GO or an applicable regulatory body.

- M7.** Each ~~applicable Transmission Owner and applicable Generator Owner~~ Transmission Owner has evidence that it completed its annual vegetation work plan for its applicable lines. Examples of acceptable forms of evidence may include a copy of the completed annual work plan (as finally modified), dated work orders, dated invoices, or dated inspection records. (R7)

C. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

1.2 Regional Entity Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ retains data or evidence to show compliance with Requirements R1, R2, R3, R5, R6 and R7, Measures M1, M2, M3, M5, M6 and M7 for three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ retains data or evidence to show compliance with Requirement R4, Measure M4 for most recent 12 months of operator logs or most recent 3 months of voice recordings or transcripts of voice recordings, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3 Compliance Monitoring and Enforcement Processes:

- 5.1.15. Compliance Audit
- 5.1.16. Self-Certification
- 5.1.17. Spot Checking
- 5.1.18. Compliance Violation Investigation
- 5.1.19. Self-Reporting
 - Complaint
 - Periodic Data Submittal

1.4 Additional Compliance Information

Periodic Data Submittal: The applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ will submit a quarterly report to its Regional Entity, or the Regional Entity's designee, identifying all Sustained Outages of applicable lines operated within their Rating and all Rated Electrical Operating Conditions as determined by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ to have been caused by vegetation, except as excluded in footnote 2, and including as a minimum the following:

- The name of the circuit(s), the date, time and duration of the outage; the voltage of the circuit; a description of the cause of the outage; the category associated with the Sustained Outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~.

A Sustained Outage is to be categorized as one of the following:

- Category 1A — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, that are identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 1B — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 2A — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 2B — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 3 — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines from outside the ROW;
- Category 4A — Blowing together: Sustained Outages caused by vegetation and applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.
- Category 4B — Blowing together: Sustained Outages caused by vegetation and applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.

The Regional Entity will report the outage information provided by applicable Transmission Owners and applicable Generator Owners~~Transmission Owners~~, as per the above, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported Sustained Outages.

Table of Compliance Elements

R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Real-time	High	The Transmission Owner <u>responsible entity</u> failed to manage vegetation in a manner such that the <u>responsible entity</u> Transmission Owner had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.	The <u>responsible entity</u> Transmission Owner failed to manage vegetation in a manner such that the <u>responsible entity</u> Transmission Owner had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.	The <u>responsible entity</u> Transmission Owner failed to manage vegetation in a manner such that the <u>responsible entity</u> Transmission Owner had an encroachment into the MVCD due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage.	The <u>responsible entity</u> Transmission Owner failed to manage vegetation in a manner such that the <u>responsible entity</u> Transmission Owner had an encroachment into the MVCD due to a grow-in that caused a vegetation-related Sustained Outage.
R2	Real-time	Medium	The <u>responsible entity</u> Transmission Owner failed to manage vegetation in a manner such that the <u>responsible entity</u> Transmission Owner had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.	The <u>responsible entity</u> Transmission Owner failed to manage vegetation in a manner such that the <u>responsible entity</u> Transmission Owner had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.	The <u>responsible entity</u> Transmission Owner failed to manage vegetation in a manner such that the <u>responsible entity</u> Transmission Owner had an encroachment into the MVCD due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage.	The <u>responsible entity</u> Transmission Owner failed to manage vegetation in a manner such that the <u>responsible entity</u> Transmission Owner had an encroachment into the MVCD due to a grow-in that caused a vegetation-related Sustained Outage.
R3	Long-Term Planning	Lower		The <u>responsible entity</u> Transmission Owner has maintenance strategies or documented procedures or processes or specifications but has not accounted for the inter-relationships between vegetation growth rates,	The <u>responsible entity</u> Transmission Owner has maintenance strategies or documented procedures or processes or specifications but has not accounted for the movement of transmission line conductors under their Rating	The <u>responsible entity</u> Transmission Owner does not have any maintenance strategies or documented procedures or processes or specifications used to prevent the encroachment of vegetation into the MVCD, for the

				vegetation control methods, and inspection frequency, for the responsible entity's Transmission Owner's applicable lines. (Requirement R3, Part 3.2)	and all Rated Electrical Operating Conditions, for the responsible entity's Transmission Owner's applicable lines. Requirement R3, Part 3.1)	responsible entity's Transmission Owner's applicable lines.
R4	Real-time	Medium			The responsible entity Transmission Owner experienced a confirmed vegetation threat and notified the control center holding switching authority for that applicable line, but there was intentional delay in that notification.	The responsible entity Transmission Owner experienced a confirmed vegetation threat and did not notify the control center holding switching authority for that applicable line.
R5	Operations Planning	Medium				The responsible entity Transmission Owner did not take corrective action when it was constrained from performing planned vegetation work where an applicable line was put at potential risk.
R6	Operations Planning	Medium	The responsible entity Transmission Owner failed to inspect 5% or less of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.)	The responsible entity Transmission Owner failed to inspect more than 5% up to and including 10% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.). Guideline and Technical Basis (attached).

Guideline and Technical Basis

Effective dates:

The first two sentences of the Effective Dates section is standard language used in most NERC standards to cover the general effective date and is sufficient to cover the vast majority of situations. Five special cases are needed to cover effective dates for individual lines which undergo transitions after the general effective date. These special cases cover the effective dates for those lines which are initially becoming subject to the standard, those lines which are changing their applicability within the standard, and those lines which are changing in a manner that removes their applicability to the standard.

Case 1 is needed because the Planning Coordinators may designate lines below 200 kV to become elements of an IROL or Major WECC Transfer Path in a future Planning Year (PY). For example, studies by the Planning Coordinator in 2011 may identify a line to have that designation beginning in PY 2021, ten years after the planning study is performed. It is not intended for the Standard to be immediately applicable to, or in effect for, that line until that future PY begins. The effective date provision for such lines ensures that the line will become subject to the standard on January 1 of the PY specified with an allowance of at least 12 months for the applicable Transmission Owner or applicable Generator Owner to make the necessary preparations to achieve compliance on that line. The table below has some explanatory examples of the application.

<u>Date that Planning Study is completed</u>	<u>PY the line will become an IROL element</u>	<u>Date 1</u>	<u>Date 2</u>	<u>Effective Date The latter of Date 1 or Date 2</u>
05/15/2011	2012	05/15/2012	01/01/2012	05/15/2012
05/15/2011	2013	05/15/2012	01/01/2013	01/01/2013
05/15/2011	2014	05/15/2012	01/01/2014	01/01/2014
05/15/2011	2021	05/15/2012	01/01/2021	01/01/2021

Case 2 is needed because a line operating below 200kV designated as an element of an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network.

Case 3 is needed because a line operating at 200 kV or above that once was designated as an element of an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network. Such changes result in the need to apply R1 to that line until that date is reached and then to apply R2 to that line thereafter.

Case 4 is needed because an existing line that is to be operated at 200 kV or above can be acquired by an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator ~~Owner~~ ~~Transmission Owner~~, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network which will thereafter make the line subject to the standard.

Case 5 is needed because an existing line that is operated below 200 kV can be acquired by an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner ~~Transmission owner~~, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network. In this special case the line upon acquisition was designated as an element of an Interconnection Reliability Operating Limit (IROL) or an element of a Major WECC Transfer Path.

Defined Terms:

Explanation for revising the definition of ROW:

The current NERC glossary definition of Right of Way has been modified to address the matter set forth in Paragraph 734 of FERC Order 693. The Order pointed out that Transmission Owners may in some cases own more property or rights than are needed to reliably operate transmission lines. This modified definition represents a slight but significant departure from the strict legal definition of “right of way” in that this definition is based on engineering and construction considerations that establish the width of a corridor from a technical basis. The pre-2007 maintenance records are included in the revised definition to allow the use of such vegetation widths if there were no engineering or construction standards that referenced the width of right of way to be maintained for vegetation on a particular line but the evidence exists in maintenance records for a width that was in fact maintained prior to this standard becoming mandatory. Such widths may be the only information available for lines that had limited or no vegetation easement rights and were typically maintained primarily to ensure public safety. This standard does not require additional easement rights to be purchased to satisfy a minimum right of way width that did not exist prior to this standard becoming mandatory.

Explanation for revising the definition of Vegetation Inspections:

The current glossary definition of this NERC term is being modified to allow both maintenance inspections and vegetation inspections to be performed concurrently. This allows potential efficiencies, especially for those lines with minimal vegetation and/or slow vegetation growth rates.

Explanation of the definition of the MVCD:

The MVCD is a calculated minimum distance that is derived from the Gallet Equations. This is a method of calculating a flash over distance that has been used in the design of high voltage transmission lines. Keeping vegetation away from high voltage conductors by this distance will prevent voltage flash-over to the vegetation. See the explanatory text below for Requirement R3 and associated Figure 1. Table 2 below provides MVCD values for various voltages and altitudes. Details of the equations and an example calculation are provided in Appendix 1 of the Technical Reference Document.

Requirements R1 and R2:

R1 and R2 are performance-based requirements. The reliability objective or outcome to be achieved is the management of vegetation such that there are no vegetation encroachments within a minimum distance of transmission lines. Content-wise, R1 and R2 are the same requirements; however, they apply to different Facilities. Both R1 and R2 require each applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ to manage vegetation to prevent encroachment within the MVCD of transmission lines. R1 is applicable to lines that are identified as an element of an IROL or Major WECC Transfer Path. R2 is applicable to all other lines that are not elements of IROLs, and not elements of Major WECC Transfer Paths.

The separation of applicability (between R1 and R2) recognizes that inadequate vegetation management for an applicable line that is an element of an IROL or a Major WECC Transfer Path is a greater risk to the interconnected electric transmission system than applicable lines that are not elements of IROLs or Major WECC Transfer Paths. Applicable lines that are not elements of IROLs or Major WECC Transfer Paths do require effective vegetation management, but these lines are comparatively less operationally significant. As a reflection of this difference in risk impact, the Violation Risk Factors (VRFs) are assigned as High for R1 and Medium for R2.

Requirements R1 and R2 state that if inadequate vegetation management allows vegetation to encroach within the MVCD distance as shown in Table 2, it is a violation of the standard. Table 2 distances are the minimum clearances that will prevent spark-over based on the Gallet equations as described more fully in the Technical Reference document.

These requirements assume that transmission lines and their conductors are operating within their Rating. If a line conductor is intentionally or inadvertently operated beyond its Rating and Rated Electrical Operating Condition (potentially in violation of other standards), the occurrence of a clearance encroachment may occur solely due to that condition. For example, emergency actions taken by an applicable Transmission Owner or applicable Generator Owner ~~Transmission Operator~~ or Reliability Coordinator to protect an Interconnection may cause excessive sagging and an outage. Another example would be ice loading beyond the line's Rating and Rated Electrical Operating Condition. Such vegetation-related encroachments and outages are not violations of this standard.

Evidence of failures to adequately manage vegetation include real-time observation of a vegetation encroachment into the MVCD (absent a Sustained Outage), or a vegetation-related encroachment resulting in a Sustained Outage due to a fall-in from inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to the blowing together of the lines and vegetation located inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to a grow-in. Faults which do not cause a Sustained outage and which are confirmed to have been caused by vegetation encroachment within the MVCD are considered the equivalent of a Real-time observation for violation severity levels.

With this approach, the VSLs for R1 and R2 are structured such that they directly correlate to the severity of a failure of an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ to manage vegetation and to the corresponding performance level of the Transmission Owner's vegetation program's ability to meet the objective of "preventing the risk of those vegetation related outages that could lead to Cascading." Thus violation severity increases with an applicable Transmission Owner's or applicable Generator Owner's ~~Transmission Owner's~~ inability to meet this goal and its potential of leading to a Cascading event. The additional benefits of such a combination are that it simplifies the standard and clearly defines performance for compliance. A performance-based requirement of this nature will promote high quality, cost effective vegetation management programs that will deliver the overall end result of improved reliability to the system.

Multiple Sustained Outages on an individual line can be caused by the same vegetation. For example initial investigations and corrective actions may not identify and remove the actual outage cause then another outage occurs after the line is re-energized and previous high conductor temperatures return. Such events are considered to be a single vegetation-related Sustained Outage under the standard where the Sustained Outages occur within a 24 hour period.

The MVCD is a calculated minimum distance stated in feet (or meters) to prevent spark-over, for various altitudes and operating voltages that is used in the design of Transmission Facilities. Keeping vegetation from entering this space will prevent transmission outages.

If the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ has applicable lines operated at nominal voltage levels not listed in Table 2, then the applicable TO or applicable GO should use the next largest clearance distance based on the next highest nominal voltage in the table to determine an acceptable distance.

Requirement R3: R3 is a competency based requirement concerned with the maintenance strategies, procedures, processes, or specifications, an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ uses for vegetation management.

An adequate transmission vegetation management program formally establishes the approach the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ uses to plan and perform vegetation work to prevent transmission Sustained Outages and minimize risk to the transmission system. The approach provides the basis for evaluating the intent, allocation of appropriate resources, and the competency of the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ in managing vegetation. There are many acceptable approaches to manage vegetation and avoid Sustained Outages. However, the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ must be able to show the documentation of its approach and how it conducts work to maintain clearances.

An example of one approach commonly used by industry is ANSI Standard A300, part 7. However, regardless of the approach a utility uses to manage vegetation, any approach an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ chooses to use will generally contain the following elements:

1. *the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation height) to ensure that MVCD clearances are never violated.*
2. *the work methods that the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ uses to control vegetation*
3. *a stated Vegetation Inspection frequency*
4. *an annual work plan*

The conductor's position in space at any point in time is continuously changing in reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and wind loading. The movement of the transmission line conductor and the MVCD is illustrated in Figure 1 below. In the Technical Reference document more figures and explanations of conductor dynamics are provided.

Figure 1

A cross-section view of a single conductor at a given point along the span is shown with six possible conductor positions due to movement resulting from thermal and mechanical loading.

Requirement R4:

R4 is a risk-based requirement. It focuses on preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ for the mitigation of Fault risk when a vegetation threat is confirmed. R4 involves the notification of potentially threatening vegetation conditions, without any intentional delay, to the control center holding switching authority for that specific transmission line. Examples of acceptable unintentional delays may include communication system problems (for example, cellular service or two-way radio disabled), crews located in remote field locations with no communication access, delays due to severe weather, etc.

Confirmation is key that a threat actually exists due to vegetation. This confirmation could be in the form of an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner's~~ employee who personally identifies such a threat in the field. Confirmation could also be made by sending out an employee to evaluate a situation reported by a landowner.

Vegetation-related conditions that warrant a response include vegetation that is near or encroaching into the MVCD (a grow-in issue) or vegetation that could fall into the transmission conductor (a fall-in issue). A knowledgeable verification of the risk would include an assessment of the possible sag or movement of the conductor while operating between no-load conditions and its rating.

The applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ has the responsibility to ensure the proper communication between field personnel and the control center to allow the control center to take the appropriate action until or as the vegetation threat is relieved. Appropriate actions may include a temporary reduction in the line loading, switching the line out of service, or other preparatory actions in recognition of the increased risk of outage on that circuit. The notification of the threat should be communicated in terms of minutes or hours as opposed to a longer time frame for corrective action plans (see R5).

All potential grow-in or fall-in vegetation-related conditions will not necessarily cause a Fault at any moment. For example, some applicable Transmission Owners or applicable Generator Owners ~~Transmission Owners~~ may have a danger tree identification program that identifies trees for removal with the potential to fall near the line. These trees would not require notification to the control center unless they pose an immediate fall-in threat.

Requirement R5:

R5 is a risk-based requirement. It focuses upon preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ for the mitigation of Sustained Outage risk when temporarily constrained from performing vegetation maintenance. The intent of this requirement is to deal with situations that prevent the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from performing planned vegetation management work and, as a result, have the potential to put the transmission line at risk. Constraints to performing vegetation maintenance work as planned could result from legal injunctions filed by property owners, the discovery of easement stipulations which limit the applicable Transmission Owner's or applicable Generator Owner's ~~Transmission Owner's~~ rights, or other circumstances.

This requirement is not intended to address situations where the transmission line is not at potential risk and the work event can be rescheduled or re-planned using an alternate work methodology. For example, a land owner may prevent the planned use of chemicals on non-threatening, low growth vegetation but agree to the use of mechanical clearing. In this case the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is not under any immediate time constraint for achieving the management objective, can easily reschedule work using an alternate approach, and therefore does not need to take interim corrective action.

However, in situations where transmission line reliability is potentially at risk due to a constraint, the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is required to take an interim corrective action to mitigate the potential risk to the transmission line. A wide range of actions can be taken to address various situations. General considerations include:

- Identifying locations where the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is constrained from performing planned vegetation maintenance work which potentially leaves the transmission line at risk.
- Developing the specific action to mitigate any potential risk associated with not performing the vegetation maintenance work as planned.
- Documenting and tracking the specific action taken for the location.
- In developing the specific action to mitigate the potential risk to the transmission line the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ could consider location specific measures such as modifying the inspection and/or maintenance intervals. Where a legal constraint would not allow any vegetation work, the interim corrective action could include limiting the loading on the transmission line.
- The applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ should document and track the specific corrective action taken at each location. This location may be indicated as one span, one tree or a combination of spans on one property where the constraint is considered to be temporary.

Requirement R6:

R6 is a risk-based requirement. This requirement sets a minimum time period for completing Vegetation Inspections. The provision that Vegetation Inspections can be performed in conjunction with general line inspections facilitates a Transmission Owner's ability to meet this requirement. However, the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ may determine that more frequent vegetation specific inspections are needed to maintain reliability levels, based on factors such as anticipated growth rates of the local vegetation, length of the local growing season, limited ROW width, and local rainfall. Therefore it is expected that some transmission lines may be designated with a higher frequency of inspections.

The VSLs for Requirement R6 have levels ranked by the failure to inspect a percentage of the applicable lines to be inspected. To calculate the appropriate VSL the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ may choose units such as: circuit, pole line, line miles or kilometers, etc.

For example, when an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ operates 2,000 miles of applicable transmission lines this applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ will be responsible for inspecting all the 2,000 miles of lines at least once during the calendar year. If one of the included lines was 100 miles long, and if it was not inspected during the year, then the amount failed to inspect would be $100/2000 = 0.05$ or 5%. The "Low VSL" for R6 would apply in this example.

Requirement R7:

R7 is a risk-based requirement. The ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner is required to complete its an annual work plan for vegetation management to accomplish the purpose of this standard. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made and documented provided they do not put the transmission system at risk. The annual work plan requirement is not intended to necessarily require a “span-by-span”, or even a “line-by-line” detailed description of all work to be performed. It is only intended to require that the ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner provide evidence of annual planning and execution of a vegetation management maintenance approach which successfully prevents encroachment of vegetation into the MVCD.

For example, when an ~~an applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner identifies 1,000 miles of applicable transmission lines to be completed in the ~~applicable Transmission Owner’s or applicable Generator Owner’s~~ Transmission Owner’s annual plan, the ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner will be responsible completing those identified miles. If a ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner makes a modification to the annual plan that does not put the transmission system at risk of an encroachment the annual plan may be modified. If 100 miles of the annual plan is deferred until next year the calculation to determine what percentage was completed for the current year would be: $1000 - 100$ (deferred miles) = 900 modified annual plan, or $900 / 900 = 100\%$ completed annual miles. If an ~~an applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner only completed 875 of the total 1000 miles with no acceptable documentation for modification of the annual plan the calculation for failure to complete the annual plan would be: $1000 - 875 = 125$ miles failed to complete then, 125 miles (not completed) / 1000 total annual plan miles = 12.5% failed to complete.

The ability to modify the work plan allows the ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner to change priorities or treatment methodologies during the year as conditions or situations dictate. For example recent line inspections may identify unanticipated high priority work, weather conditions (drought) could make herbicide application ineffective during the plan year, or a major storm could require redirecting local resources away from planned maintenance. This situation may also include complying with mutual assistance agreements by moving resources off the ~~applicable Transmission Owner’s or applicable Generator Owner’s~~ Transmission Owner’s system to work on another system. Any of these examples could result in acceptable deferrals or additions to the annual work plan provided that they do not put the transmission system at risk of a vegetation encroachment.

In general, the vegetation management maintenance approach should use the full extent of the ~~applicable Transmission Owner’s or applicable Generator Owner’s~~ Transmission Owner’s easement, fee simple and other legal rights allowed. A comprehensive approach that exercises the full extent of legal rights on the ROW is superior to incremental management because in the long term it reduces the overall potential for encroachments, and it ensures that future planned work and future planned inspection cycles are sufficient.

When developing the annual work plan the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ should allow time for procedural requirements to obtain permits to work on federal, state, provincial, public, tribal lands. In some cases the lead time for obtaining permits may necessitate preparing work plans more than a year prior to work start dates. Applicable Transmission Owners or applicable Generator Owners ~~Transmission Owners~~ may also need to consider those special landowner requirements as documented in easement instruments.

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Therefore, deferrals or relevant changes to the annual plan shall be documented. Depending on the planning and documentation format used by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~, evidence of successful annual work plan execution could consist of signed-off work orders, signed contracts, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, or paid invoices. Other evidence may include photographs, and walk-through reports.

FAC-003 — TABLE 2 — Minimum Vegetation Clearance Distances (MVCD)⁸
For Alternating Current Voltages (feet)

* Such lines are applicable to this standard only if PC has determined such per FAC-014 (refer to the Applicability Section above)

⁸ The distances in this Table are the minimums required to prevent Flash-over; however prudent vegetation maintenance practices dictate that substantially greater distances will be achieved at time of vegetation maintenance.

⁹ Where applicable lines are operated at nominal voltages other than those listed, ~~the~~ the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ should use the maximum system voltage to determine the appropriate clearance for that line.

Notes:

The SDT determined that the use of IEEE 516-2003 in version 1 of FAC-003 was a misapplication. The SDT consulted specialists who advised that the Gallet Equation would be a technically justified method. The explanation of why the Gallet approach is more appropriate is explained in the paragraphs below.

The drafting team sought a method of establishing minimum clearance distances that uses realistic weather conditions and realistic maximum transient over-voltages factors for in-service transmission lines.

The SDT considered several factors when looking at changes to the minimum vegetation to conductor distances in FAC-003-1:

- avoid the problem associated with referring to tables in another standard (IEEE-516-2003)
- transmission lines operate in non-laboratory environments (wet conditions)
- transient over-voltage factors are lower for in-service transmission lines than for inadvertently re-energized transmission lines with trapped charges.

FAC-003-1 uses the minimum air insulation distance (MAID) without tools formula provided in IEEE 516-2003 to determine the minimum distance between a transmission line conductor and vegetation. The equations and methods provided in IEEE 516 were developed by an IEEE Task Force in 1968 from test data provided by thirteen independent laboratories. The distances provided in IEEE 516 Tables 5 and 7 are based on the withstand voltage of a dry rod-rod air gap, or in other words, dry laboratory conditions. Consequently, the validity of using these distances in an outside environment application has been questioned.

FAC-003-01 allowed Transmission Owners to use either Table 5 or Table 7 to establish the minimum clearance distances. Table 7 could be used if the Transmission Owner knew the maximum transient over-voltage factor for its system. Otherwise, Table 5 would have to be used. Table 5 represented minimum air insulation distances under the worst possible case for transient over-voltage factors. These worst case transient over-voltage factors were as follows: 3.5 for voltages up to 362 kV phase to phase; 3.0 for 500 - 550 kV phase to phase; and 2.5 for 765 to 800 kV phase to phase. These worst case over-voltage factors were also a cause for concern in this particular application of the distances.

In general, the worst case transient over-voltages occur on a transmission line that is inadvertently re-energized immediately after the line is de-energized and a trapped charge is still present. The intent of FAC-003 is to keep a transmission line that is *in service* from becoming de-energized (i.e. tripped out) due to spark-over from the line conductor to nearby vegetation. Thus, the worst case transient overvoltage assumptions are not appropriate for this application. Rather, the appropriate over voltage values are those that occur only while the line is energized.

Typical values of transient over-voltages of in-service lines, as such, are not readily available in the literature because they are negligible compared with the maximums. A conservative value for the maximum transient over-voltage that can occur anywhere along the length of an in-service ac line is approximately 2.0 per unit. This value is a conservative estimate of the transient over-voltage that is created at the point of application (e.g. a substation) by switching a capacitor bank without pre-insertion devices (e.g. closing resistors). At voltage levels where capacitor banks are not very common (e.g. Maximum System Voltage of 362 kV), the

maximum transient over-voltage of an in-service ac line are created by fault initiation on adjacent ac lines and shunt reactor bank switching. These transient voltages are usually 1.5 per unit or less.

Even though these transient over-voltages will not be experienced at locations remote from the bus at which they are created, in order to be conservative, it is assumed that all nearby ac lines are subjected to this same level of over-voltage. Thus, a maximum transient over-voltage factor of 2.0 per unit for transmission lines operated at 302 kV and below is considered to be a realistic maximum in this application. Likewise, for ac transmission lines operated at Maximum System Voltages of 362 kV and above a transient over-voltage factor of 1.4 per unit is considered a realistic maximum.

The Gallet Equations are an accepted method for insulation coordination in tower design. These equations are used for computing the required strike distances for proper transmission line insulation coordination. They were developed for both wet and dry applications and can be used with any value of transient over-voltage factor. The Gallet Equation also can take into account various air gap geometries. This approach was used to design the first 500 kV and 765 kV lines in North America.

If one compares the MAID using the IEEE 516-2003 Table 7 (table D.5 for English values) with the critical spark-over distances computed using the Gallet wet equations, for each of the nominal voltage classes and identical transient over-voltage factors, the Gallet equations yield a more conservative (larger) minimum distance value.

Distances calculated from either the IEEE 516 (dry) formulas or the Gallet “wet” formulas are not vastly different when the same transient overvoltage factors are used; the “wet” equations will consistently produce slightly larger distances than the IEEE 516 equations when the same transient overvoltage is used. While the IEEE 516 equations were only developed for dry conditions the Gallet equations have provisions to calculate spark-over distances for both wet and dry conditions.

While EPRI is currently trying to establish empirical data for spark-over distances to live vegetation, there are no spark-over formulas currently derived expressly for vegetation to conductor minimum distances. Therefore the SDT chose a proven method that has been used in other EHV applications. The Gallet equations relevance to wet conditions and the selection of a Transient Overvoltage Factor that is consistent with the absence of trapped charges on an in-service transmission line make this methodology a better choice. The following table is an example of the comparison of distances derived from IEEE 516 and the Gallet equations.

**Comparison of spark-over distances computed using Gallet wet equations vs.
IEEE 516-2003 MAID distances**

(AC) Nom System Voltage (kV)	(AC) Max System Voltage (kV)	Transient Over-voltage Factor (T)	Clearance (ft.) Gallet (wet) @ Alt. 3000 feet	Table 7 (Table D.5 for feet) IEEE 516-2003 MAID (ft) @ Alt. 3000 feet
765	800	2.0	14.36	13.95
500	550	2.4	11.0	10.07
345	362	3.0	8.55	7.47
230	242	3.0	5.28	4.2
115	121	3.0	2.46	2.1

Effective Dates

There are two effective dates associated with this standard.

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.
2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.
3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.

4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Version History

Version	Date	Action	Change Tracking
3	September 29, 2011	Using the latest draft of FAC-003-2 from the Project 2007-07 SDT, modified proposed definitions and Applicability to include Generator Owners of a certain length.	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

The current glossary definition of this NERC term is modified to address the issues set forth in Paragraph 734 of FERC Order 693.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

The current glossary definition of this NERC term is modified to allow both maintenance inspections and vegetation inspections to be performed concurrently.

Current definition of Vegetation Inspection:
The systematic examination of a transmission corridor to document vegetation conditions.

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC’s Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has developed two sets of proposed changes: one to this version, the latest draft of Version 2 as proposed by the Project 2007-07 team, and one to FAC-003-1, the current FERC-approved version of the standard.

If FAC-003-2 is approved by NERC’s BOT, the Project 2010-07 drafting team will likely proceed with the modifications seen in this standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. Several scenarios that could play out based on the order of the approval of these versions of the standards are addressed in the FAC-003-3 implementation plan.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with changes to FAC-003-1 to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability, the proposal of modifications to the NERC defined term Right-of-Way to include applicable Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

1. **Title:** Transmission Vegetation Management
2. **Number:** FAC-003-3
3. **Purpose:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.
4. **Applicability**
 - 4.1. **Functional Entities:**
 - 4.1.1. Applicable Transmission Owners
 - 4.1.1.1. Transmission Owners that own Transmission Facilities defined in 4.2.
 - 4.1.2. Applicable Generator Owners

4.1.2.1. Generator Owners that own generation Facilities defined in 4.3

4.2. Transmission Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal¹, state, provincial, public, private, or tribal entities:

4.2.1. Each overhead transmission line operated at 200kV or higher.

4.2.2. Each overhead transmission line operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

4.2.3. Each overhead transmission line operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

4.2.4. Each overhead transmission line identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.

4.3. Generation Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal², state, provincial, public, private, or tribal entities:

4.3.1. Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generating switchyard and are:

4.3.1.1. Operated at 200kV or higher; or

4.3.1.2. Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

4.3.1.3. Operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

Rationale: The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards, and stations have many inspection and maintenance activities that are necessary for reliability. Those existing process manage the threat. As such, the formal steps in this standard are not well suited for this environment. 3) Specifically addressing the areas where the standard does and does not apply makes the standard clearer.

Within the text of NERC Reliability Standard FAC-003-3, “transmission line(s) and “applicable line(s) can also refer to the generation Facilities as referenced in 4.3 and its subsections.

Enforcement:

¹ EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

² EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

The Requirements within a Reliability Standard govern and will be enforced. The Requirements within a Reliability Standard define what an entity must do to be compliant and binds an entity to certain obligations of performance under Section 215 of the Federal Power Act. Compliance will in all cases be measured by determining whether a party met or failed to meet the Reliability Standard Requirement given the specific facts and circumstances of its use, ownership or operation of the bulk power system.

Measures provide guidance on assessing non-compliance with the Requirements. Measures are the evidence that could be presented to demonstrate compliance with a Reliability Standard Requirement and are not intended to contain the quantitative metrics for determining satisfactory performance nor to limit how an entity may demonstrate compliance if valid alternatives to demonstrating compliance are available in a specific case. A Reliability Standard may be enforced in the absence of specified Measures.

Entities must comply with the “Compliance” section in its entirety, including the Administrative Procedure that sets forth, among other things, reporting requirements.

The “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” are provided for informational purposes. They are designed to convey guidance from NERC’s various activities. The “Guideline and Technical Basis” section and text boxes with “Examples” and “Rationale” are not intended to establish new Requirements under NERC’s Reliability Standards or to modify the Requirements in any existing NERC Reliability Standard. Implementation of the “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” is not a substitute for compliance with Requirements in NERC’s Reliability Standards.”

5. Background:

- 5.1.1.** This standard uses three types of requirements to provide layers of protection to prevent vegetation related outages that could lead to Cascading:
- 5.1.2.** a) Performance-based — defines a particular reliability objective or outcome to be achieved. In its simplest form, a results-based requirement has four components: *who, under what conditions (if any), shall perform what action, to achieve what particular bulk power system performance result or outcome?*
- 5.1.3.** b) Risk-based — preventive requirements to reduce the risks of failure to acceptable tolerance levels. A risk-based reliability requirement should be framed as: *who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?*
- 5.1.4.** c) Competency-based — defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions. A competency-based reliability requirement should

be framed as: *who, under what conditions (if any), shall have what capability, to achieve what particular result or outcome to perform an action to achieve a result or outcome or to reduce a risk to the reliability of the bulk power system?*

- 5.1.5.** The defense-in-depth strategy for reliability standards development recognizes that each requirement in a NERC reliability standard has a role in preventing system failures, and that these roles are complementary and reinforcing. Reliability standards should not be viewed as a body of unrelated requirements, but rather should be viewed as part of a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comport with the quality objectives of a reliability standard.

This standard uses a defense-in-depth approach to improve the reliability of the electric Transmission system by:

- Requiring that vegetation be managed to prevent vegetation encroachment inside the flash-over clearance (R1 and R2);
- Requiring documentation of the maintenance strategies, procedures, processes and specifications used to manage vegetation to prevent potential flash-over conditions including consideration of 1) conductor dynamics and 2) the interrelationships between vegetation growth rates, control methods and the inspection frequency (R3);
- Requiring timely notification to the appropriate control center of vegetation conditions that could cause a flash-over at any moment (R4);
- Requiring corrective actions to ensure that flash-over distances will not be violated due to work constrains such as legal injunctions (R5);
- Requiring inspections of vegetation conditions to be performed annually (R6); and
- Requiring that the annual work needed to prevent flash-over is completed (R7).

5.1.6. For this standard, the requirements have been developed as follows:

5.1.7. Performance-based: Requirements 1 and 2

5.1.8. Competency-based: Requirement 3

5.1.9. Risk-based: Requirements 4, 5, 6 and 7

5.1.10. R3 serves as the first line of defense by ensuring that entities understand the problem they are trying to manage and have fully developed strategies and plans to manage the problem. R1, R2, and R7 serve as the second line of defense by requiring that entities carry out their plans and manage vegetation. R6, which requires inspections, may be either a part of the first line of defense (as input into the strategies and plans) or as a third line of defense (as a check of the first and second lines of defense). R4 serves as the final line of defense, as it addresses cases in which all the other lines of defense have failed.

- 5.1.11.** Major outages and operational problems have resulted from interference between overgrown vegetation and transmission lines located on many types of lands and ownership situations. Adherence to the standard requirements for applicable lines on any kind of land or easement, whether they are Federal Lands, state or provincial lands, public or private lands, franchises, easements or lands owned in fee, will reduce and manage this risk. For the purpose of the standard the term “public lands” includes municipal lands, village lands, city lands, and a host of other governmental entities.
- 5.1.12.** This standard addresses vegetation management along applicable overhead lines and does not apply to underground lines, submarine lines or to line sections inside an electric station boundary.
- 5.1.13.** This standard focuses on transmission lines to prevent those vegetation related outages that could lead to Cascading. It is not intended to prevent customer outages due to tree contact with lower voltage distribution system lines. For example, localized customer service might be disrupted if vegetation were to make contact with a 69kV transmission line supplying power to a 12kV distribution station. However, this standard is not written to address such isolated situations which have little impact on the overall electric transmission system.
- 5.1.14.** Since vegetation growth is constant and always present, unmanaged vegetation poses an increased outage risk, especially when numerous transmission lines are operating at or near their Rating. This can present a significant risk of consecutive line failures when lines are experiencing large sags thereby leading to Cascading. Once the first line fails the shift of the current to the other lines and/or the increasing system loads will lead to the second and subsequent line failures as contact to the vegetation under those lines occurs. Conversely, most other outage causes (such as trees falling into lines, lightning, animals, motor vehicles, etc.) are not an interrelated function of the shift of currents or the increasing system loading. These events are not any more likely to occur during heavy system loads than any other time. There is no cause-effect relationship which creates the probability of simultaneous occurrence of other such events. Therefore these types of events are highly unlikely to cause large-scale grid failures. Thus, this standard places the highest priority on the management of vegetation to prevent vegetation grow-ins.

B. Requirements and Measures

R1. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path; operating within their Rating and all Rated Electrical Operating Conditions of the types shown below³ [*Violation Risk Factor: High*] [*Time Horizon: Real-time*]:

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage⁴,
2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁵,
3. An encroachment due to the blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
4. An encroachment due to vegetation growth into the MVCD that caused a vegetation-related Sustained Outage⁴.

M1. Each applicable Transmission Owner

Rationale for R1 and R2:

Lines with the highest significance to reliability are covered in R1; all other lines are covered in R2.

Rationale for the types of failure to manage vegetation which are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of an applicable Transmission Owner's or applicable Generator Owner's vegetation maintenance program:

1. This management failure is found by routine inspection or Fault event investigation, and is normally symptomatic of unusual conditions in an otherwise sound program.
2. This management failure occurs when the height and location of a side tree within the ROW is not adequately addressed by the program.
3. This management failure occurs when side growth is not adequately addressed and may be indicative of an unsound program.
4. This management failure is usually indicative of a program that is not addressing the most fundamental dynamic of vegetation management, (i.e. a grow-in under the line). If this type of failure is pervasive on multiple lines, it provides a mechanism for a Cascade.

³ This requirement does not apply to circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, or installation, removal, or digging of vegetation. Nothing in this footnote should be construed to limit the Transmission Owner's right to exercise its full legal rights on the ROW.

⁴ If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

⁵ Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period.

and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R1)

- R2.** Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path; operating within its Rating and all Rated Electrical Operating Conditions of the types shown below² [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time*]:
1. An encroachment into the MVCD, observed in Real-time, absent a Sustained Outage³,
 2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁴,
 3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
 4. An encroachment due to vegetation growth into the line MVCD that caused a vegetation-related Sustained Outage⁴
- M2.** Each applicable Transmission Owner and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R2)

R3. Each applicable Transmission Owner and applicable Generator Owner shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines that accounts for the following:

3.1 Movement of applicable line conductors under their Rating and all Rated Electrical Operating Conditions;

3.2 Inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]:

Rationale

The documentation provides a basis for evaluating the competency of the applicable Transmission Owner’s or applicable Generator Owner’s vegetation program. There may be many acceptable approaches to maintain clearances. Any approach must demonstrate that the applicable Transmission Owner or applicable Generator Owner avoids vegetation-to-wire conflicts under all Ratings and all Rated Electrical Operating Conditions. See Figure

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner can prevent encroachment into the MVCD considering the factors identified in the requirement. (R3)

R4. Each applicable Transmission Owner and applicable Generator Owner, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable line when the applicable Transmission Owner and applicable Generator Owner has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment [Violation Risk Factor: Medium] [Time Horizon: Real-time].

Rationale

This is to ensure expeditious communication between the applicable Transmission Owner or applicable Generator Owner and the control center when a critical situation is confirmed.

M4. Each applicable Transmission Owner and applicable Generator Owner that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders. (R4)

R5. When a applicable Transmission Owner and applicable Generator Owner is constrained from performing vegetation work on an applicable line operating within its Rating and all Rated Electrical Operating Conditions, and the constraint may lead to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan, then the applicable Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management to prevent encroachments [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Legal actions and other events may occur which result in constraints that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation maintenance work.

In cases where the transmission line is put at potential risk due to constraints, the intent is for the applicable Transmission Owner and applicable Generator Owner to put interim measures in place, rather than do nothing.

The corrective action process is not intended to address situations where a planned work methodology cannot be performed but an alternate work methodology can be used.

M5. Each applicable Transmission Owner and applicable Generator Owner has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, or evidence that the line was de-energized. (R5)

R6. Each applicable Transmission Owner and applicable Generator Owner shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 calendar months between inspections on the same ROW⁶ [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Inspections are used by applicable Transmission Owners and applicable Generator Owners to assess the condition of the entire ROW. The information from the assessment can be used to determine risk, determine future work and evaluate recently-completed work. This requirement sets a minimum Vegetation Inspection frequency of once per calendar year but with no more than 18 months between inspections on the same ROW. Based upon average growth rates across North America and on common utility practice, this minimum frequency is reasonable. Transmission Owners should consider local and environmental factors that could

⁶ When the applicable Transmission Owner or applicable Generator Owner is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the TO or GO is granted a time extension that is equivalent to the duration of the time the TO or GO was prevented from performing the Vegetation Inspection.

M6. Each applicable Transmission Owner and applicable Generator Owner has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable lines at least once per calendar year but with no more than 18 calendar months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records. (R6)

R7. Each applicable Transmission Owner and applicable Generator Owner shall complete 100% of its annual vegetation work plan of applicable lines to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not allow encroachment of vegetation into the MVCD) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan

Rationale

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. It allows modifications to the planned work for changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors, provided that those modifications do not put the transmission system at risk of a vegetation encroachment.

(measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]:

- Change in expected growth rate/ environmental factors
- Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner⁷
- Rescheduling work between growing seasons
- Crew or contractor availability/ Mutual assistance agreements
- Identified unanticipated high priority work
- Weather conditions/Accessibility
- Permitting delays
- Land ownership changes/Change in land use by the landowner
- Emerging technologies

M7. Each applicable Transmission Owner and applicable Generator Owner has evidence that it completed its annual vegetation work plan for its applicable lines. Examples of

⁷ Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, ice storms, floods, or major storms as defined either by the TO or GO or an applicable regulatory body.

acceptable forms of evidence may include a copy of the completed annual work plan (as finally modified), dated work orders, dated invoices, or dated inspection records.
(R7)

C. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

1.2 Regional Entity Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirements R1, R2, R3, R5, R6 and R7, Measures M1, M2, M3, M5, M6 and M7 for three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirement R4, Measure M4 for most recent 12 months of operator logs or most recent 3 months of voice recordings or transcripts of voice recordings, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a applicable Transmission Owner or applicable Generator Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3 Compliance Monitoring and Enforcement Processes:

- 5.1.15. Compliance Audit
- 5.1.16. Self-Certification
- 5.1.17. Spot Checking
- 5.1.18. Compliance Violation Investigation
- 5.1.19. Self-Reporting
 - Complaint
 - Periodic Data Submittal

1.4 Additional Compliance Information

Periodic Data Submittal: The applicable Transmission Owner and applicable Generator Owner will submit a quarterly report to its Regional Entity, or the Regional Entity's designee, identifying all Sustained Outages of applicable lines operated within their Rating and all Rated Electrical Operating Conditions as determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation, except as excluded in footnote 2, and including as a minimum the following:

- The name of the circuit(s), the date, time and duration of the outage; the voltage of the circuit; a description of the cause of the outage; the category associated with the Sustained Outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.

A Sustained Outage is to be categorized as one of the following:

- Category 1A — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, that are identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 1B — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 2A — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 2B — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 3 — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines from outside the ROW;
- Category 4A — Blowing together: Sustained Outages caused by vegetation and applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.
- Category 4B — Blowing together: Sustained Outages caused by vegetation and applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.

The Regional Entity will report the outage information provided by applicable Transmission Owners and applicable Generator Owners, as per the above, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported Sustained Outages.

Table of Compliance Elements

On November 3, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management with NERC staff-proposed changes to the VSLs for R1 and R2 in lieu of the Project 2007-07 SDT’s original proposed VSLs. The table below now reflects the VSLs for R1 and R2 that were approved by NERC’s Board of Trustees. The only additional change made by the Project 2010-07 SDT was to change “Transmission Owner” to “responsible entity.”

R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Real-time	High			The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line identified as an element of an IROL or Major WECC transfer path and encroachment into the MVCD as identified in FAC-003-Table 2 was observed in real time absent a Sustained Outage.	The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line identified as an element of an IROL or Major WECC transfer path and a vegetation-related Sustained Outage was caused by one of the following: <ul style="list-style-type: none"> • A fall-in from inside the active transmission line ROW • Blowing together of applicable lines and vegetation located inside the active transmission line ROW • A grow-in
R2	Real-time	Medium			The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line not identified as an element of an IROL or Major WECC transfer path and	The Transmission Owner failed to manage vegetation to prevent encroachment into the MVCD of a line not identified as an element of an IROL or Major WECC transfer path and

					encroachment into the MVCD as identified in FAC-003-Table 2 was observed in real time absent a Sustained Outage.	a vegetation-related Sustained Outage was caused by one of the following: <ul style="list-style-type: none"> • A fall-in from inside the active transmission line ROW • Blowing together of applicable lines and vegetation located inside the active transmission line ROW • A grow-in
R3	Long-Term Planning	Lower		The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency, for the responsible entity's applicable lines. (Requirement R3, Part 3.2)	The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the movement of transmission line conductors under their Rating and all Rated Electrical Operating Conditions, for the responsible entity's applicable lines. Requirement R3, Part 3.1)	The responsible entity does not have any maintenance strategies or documented procedures or processes or specifications used to prevent the encroachment of vegetation into the MVCD, for the responsible entity's applicable lines.
R4	Real-time	Medium			The responsible entity experienced a confirmed vegetation threat and notified the control center holding switching authority for that applicable line, but there was intentional delay in that notification.	The responsible entity experienced a confirmed vegetation threat and did not notify the control center holding switching authority for that applicable line.
R5	Operations Planning	Medium				The responsible entity did not take corrective action when it

						was constrained from performing planned vegetation work where an applicable line was put at potential risk.
R6	Operations Planning	Medium	The responsible entity failed to inspect 5% or less of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.)	The responsible entity failed to inspect more than 5% up to and including 10% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).	The responsible entity failed to inspect more than 10% up to and including 15% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).	The responsible entity failed to inspect more than 15% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).
R7	Operations Planning	Medium	The responsible entity failed to complete 5% or less of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 5% and up to and including 10% of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 10% and up to and including 15% of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 15% of its annual vegetation work plan for its applicable lines (as finally modified).

D. Regional Differences

F. Associated Documents

Guideline and Technical Basis (attached).

Guideline and Technical Basis

Effective dates:

The first two sentences of the Effective Dates section is standard language used in most NERC standards to cover the general effective date and is sufficient to cover the vast majority of situations. Five special cases are needed to cover effective dates for individual lines which undergo transitions after the general effective date. These special cases cover the effective dates for those lines which are initially becoming subject to the standard, those lines which are changing their applicability within the standard, and those lines which are changing in a manner that removes their applicability to the standard.

Case 1 is needed because the Planning Coordinators may designate lines below 200 kV to become elements of an IROL or Major WECC Transfer Path in a future Planning Year (PY). For example, studies by the Planning Coordinator in 2011 may identify a line to have that designation beginning in PY 2021, ten years after the planning study is performed. It is not intended for the Standard to be immediately applicable to, or in effect for, that line until that future PY begins. The effective date provision for such lines ensures that the line will become subject to the standard on January 1 of the PY specified with an allowance of at least 12 months for the applicable Transmission Owner or applicable Generator Owner to make the necessary preparations to achieve compliance on that line. The table below has some explanatory examples of the application.

<u>Date that Planning Study is completed</u>	<u>PY the line will become an IROL element</u>	<u>Date 1</u>	<u>Date 2</u>	<u>Effective Date The latter of Date 1 or Date 2</u>
05/15/2011	2012	05/15/2012	01/01/2012	05/15/2012
05/15/2011	2013	05/15/2012	01/01/2013	01/01/2013
05/15/2011	2014	05/15/2012	01/01/2014	01/01/2014
05/15/2011	2021	05/15/2012	01/01/2021	01/01/2021

Case 2 is needed because a line operating below 200kV designated as an element of an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network.

Case 3 is needed because a line operating at 200 kV or above that once was designated as an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network. Such changes result in the need to apply R1 to that line until that date is reached and then to apply R2 to that line thereafter.

Case 4 is needed because an existing line that is to be operated at 200 kV or above can be acquired by an applicable Transmission Owner or applicable Generator Owner from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network which will thereafter make the line subject to the standard.

Case 5 is needed because an existing line that is operated below 200 kV can be acquired by an applicable Transmission Owner or applicable Generator Owner from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network. In this special case the line upon acquisition was designated as an element of an Interconnection Reliability Operating Limit (IROL) or an element of a Major WECC Transfer Path.

Defined Terms:

Explanation for revising the definition of ROW:

The current NERC glossary definition of Right of Way has been modified to address the matter set forth in Paragraph 734 of FERC Order 693. The Order pointed out that Transmission Owners may in some cases own more property or rights than are needed to reliably operate transmission lines. This modified definition represents a slight but significant departure from the strict legal definition of “right of way” in that this definition is based on engineering and construction considerations that establish the width of a corridor from a technical basis. The pre-2007 maintenance records are included in the revised definition to allow the use of such vegetation widths if there were no engineering or construction standards that referenced the width of right of way to be maintained for vegetation on a particular line but the evidence exists in maintenance records for a width that was in fact maintained prior to this standard becoming mandatory. Such widths may be the only information available for lines that had limited or no vegetation easement rights and were typically maintained primarily to ensure public safety. This standard does not require additional easement rights to be purchased to satisfy a minimum right of way width that did not exist prior to this standard becoming mandatory.

Explanation for revising the definition of Vegetation Inspections:

The current glossary definition of this NERC term is being modified to allow both maintenance inspections and vegetation inspections to be performed concurrently. This allows potential efficiencies, especially for those lines with minimal vegetation and/or slow vegetation growth rates.

Explanation of the definition of the MVCD:

The MVCD is a calculated minimum distance that is derived from the Gallet Equations. This is a method of calculating a flash over distance that has been used in the design of high voltage transmission lines. Keeping vegetation away from high voltage conductors by this distance will prevent voltage flash-over to the vegetation. See the explanatory text below for Requirement R3 and associated Figure 1. Table 2 below provides MVCD values for various voltages and altitudes. Details of the equations and an example calculation are provided in Appendix 1 of the Technical Reference Document.

Requirements R1 and R2:

R1 and R2 are performance-based requirements. The reliability objective or outcome to be achieved is the management of vegetation such that there are no vegetation encroachments within a minimum distance of transmission lines. Content-wise, R1 and R2 are the same requirements; however, they apply to different Facilities. Both R1 and R2 require each applicable Transmission Owner or applicable Generator Owner to manage vegetation to prevent encroachment within the MVCD of transmission lines. R1 is applicable to lines that are identified as an element of an IROL or Major WECC Transfer Path. R2 is applicable to all other lines that are not elements of IROLs, and not elements of Major WECC Transfer Paths.

The separation of applicability (between R1 and R2) recognizes that inadequate vegetation management for an applicable line that is an element of an IROL or a Major WECC Transfer Path is a greater risk to the interconnected electric transmission system than applicable lines that are not elements of IROLs or Major WECC Transfer Paths. Applicable lines that are not elements of IROLs or Major WECC Transfer Paths do require effective vegetation management, but these lines are comparatively less operationally significant. As a reflection of this difference in risk impact, the Violation Risk Factors (VRFs) are assigned as High for R1 and Medium for R2.

Requirements R1 and R2 state that if inadequate vegetation management allows vegetation to encroach within the MVCD distance as shown in Table 2, it is a violation of the standard. Table 2 distances are the minimum clearances that will prevent spark-over based on the Gallet equations as described more fully in the Technical Reference document.

These requirements assume that transmission lines and their conductors are operating within their Rating. If a line conductor is intentionally or inadvertently operated beyond its Rating and Rated Electrical Operating Condition (potentially in violation of other standards), the occurrence of a clearance encroachment may occur solely due to that condition. For example, emergency actions taken by an applicable Transmission Owner or applicable Generator Owner or Reliability Coordinator to protect an Interconnection may cause excessive sagging and an outage. Another example would be ice loading beyond the line's Rating and Rated Electrical Operating Condition. Such vegetation-related encroachments and outages are not violations of this standard.

Evidence of failures to adequately manage vegetation include real-time observation of a vegetation encroachment into the MVCD (absent a Sustained Outage), or a vegetation-related encroachment resulting in a Sustained Outage due to a fall-in from inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to the blowing together of the lines and vegetation located inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to a grow-in. Faults which do not cause a Sustained outage and which are confirmed to have been caused by vegetation encroachment within the MVCD are considered the equivalent of a Real-time observation for violation severity levels.

With this approach, the VSLs for R1 and R2 are structured such that they directly correlate to the severity of a failure of an applicable Transmission Owner or applicable Generator Owner to manage vegetation and to the corresponding performance level of the Transmission Owner's vegetation program's ability to meet the objective of "preventing the risk of those vegetation related outages that could lead to Cascading." Thus violation severity increases with an applicable Transmission Owner's or applicable Generator Owner's inability to meet this goal and its potential of leading to a Cascading event. The additional benefits of such a combination are that it simplifies the standard and clearly defines performance for compliance. A performance-based requirement of this nature will promote high quality, cost effective vegetation management programs that will deliver the overall end result of improved reliability to the system.

Multiple Sustained Outages on an individual line can be caused by the same vegetation. For example initial investigations and corrective actions may not identify and remove the actual outage cause then another outage occurs after the line is re-energized and previous high conductor temperatures return. Such events are considered to be a single vegetation-related Sustained Outage under the standard where the Sustained Outages occur within a 24 hour period.

The MVCD is a calculated minimum distance stated in feet (or meters) to prevent spark-over, for various altitudes and operating voltages that is used in the design of Transmission Facilities. Keeping vegetation from entering this space will prevent transmission outages.

If the applicable Transmission Owner or applicable Generator Owner has applicable lines operated at nominal voltage levels not listed in Table 2, then the applicable TO or applicable GO should use the next largest clearance distance based on the next highest nominal voltage in the table to determine an acceptable distance.

Requirement R3: R3 is a competency based requirement concerned with the maintenance strategies, procedures, processes, or specifications, an applicable Transmission Owner or applicable Generator Owner uses for vegetation management.

An adequate transmission vegetation management program formally establishes the approach the applicable Transmission Owner or applicable Generator Owner uses to plan and perform vegetation work to prevent transmission Sustained Outages and minimize risk to the transmission system. The approach provides the basis for evaluating the intent, allocation of appropriate resources, and the competency of the applicable Transmission Owner or applicable Generator Owner in managing vegetation. There are many acceptable approaches to manage vegetation and avoid Sustained Outages. However, the applicable Transmission Owner or applicable Generator Owner must be able to show the documentation of its approach and how it conducts work to maintain clearances.

An example of one approach commonly used by industry is ANSI Standard A300, part 7. However, regardless of the approach a utility uses to manage vegetation, any approach an applicable Transmission Owner or applicable Generator Owner chooses to use will generally contain the following elements:

1. *the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation height) to ensure that MVCD clearances are never violated.*
2. *the work methods that the applicable Transmission Owner or applicable Generator Owner uses to control vegetation*
3. *a stated Vegetation Inspection frequency*
4. *an annual work plan*

The conductor's position in space at any point in time is continuously changing in reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and wind loading. The movement of the transmission line conductor and the MVCD is illustrated in Figure 1 below. In the Technical Reference document more figures and explanations of conductor dynamics are provided.

Figure 1

A cross-section view of a single conductor at a given point along the span is shown with six possible conductor positions due to movement resulting from thermal and mechanical loading.

Requirement R4:

R4 is a risk-based requirement. It focuses on preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Fault risk when a vegetation threat is confirmed. R4 involves the notification of potentially threatening vegetation conditions, without any intentional delay, to the control center holding switching authority for that specific transmission line. Examples of acceptable unintentional delays may include communication system problems (for example, cellular service or two-way radio disabled), crews located in remote field locations with no communication access, delays due to severe weather, etc.

Confirmation is key that a threat actually exists due to vegetation. This confirmation could be in the form of an applicable Transmission Owner or applicable Generator Owner employee who personally identifies such a threat in the field. Confirmation could also be made by sending out an employee to evaluate a situation reported by a landowner.

Vegetation-related conditions that warrant a response include vegetation that is near or encroaching into the MVCD (a grow-in issue) or vegetation that could fall into the transmission conductor (a fall-in issue). A knowledgeable verification of the risk would include an assessment of the possible sag or movement of the conductor while operating between no-load conditions and its rating.

The applicable Transmission Owner or applicable Generator Owner has the responsibility to ensure the proper communication between field personnel and the control center to allow the control center to take the appropriate action until or as the vegetation threat is relieved. Appropriate actions may include a temporary reduction in the line loading, switching the line out of service, or other preparatory actions in recognition of the increased risk of outage on that circuit. The notification of the threat should be communicated in terms of minutes or hours as opposed to a longer time frame for corrective action plans (see R5).

All potential grow-in or fall-in vegetation-related conditions will not necessarily cause a Fault at any moment. For example, some applicable Transmission Owners or applicable Generator Owners may have a danger tree identification program that identifies trees for removal with the potential to fall near the line. These trees would not require notification to the control center unless they pose an immediate fall-in threat.

Requirement R5:

R5 is a risk-based requirement. It focuses upon preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Sustained Outage risk when temporarily constrained from performing vegetation maintenance. The intent of this requirement is to deal with situations that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation management work and, as a result, have the potential to put the transmission line at risk. Constraints to performing vegetation maintenance work as planned could result from legal injunctions filed by property owners, the discovery of easement stipulations which limit the applicable Transmission Owner's or applicable Generator Owner's rights, or other circumstances.

This requirement is not intended to address situations where the transmission line is not at potential risk and the work event can be rescheduled or re-planned using an alternate work methodology. For example, a land owner may prevent the planned use of chemicals on non-threatening, low growth vegetation but agree to the use of mechanical clearing. In this case the applicable Transmission Owner or applicable Generator Owner is not under any immediate time constraint for achieving the management objective, can easily reschedule work using an alternate approach, and therefore does not need to take interim corrective action.

However, in situations where transmission line reliability is potentially at risk due to a constraint, the applicable Transmission Owner or applicable Generator Owner is required to take an interim corrective action to mitigate the potential risk to the transmission line. A wide range of actions can be taken to address various situations. General considerations include:

- Identifying locations where the applicable Transmission Owner or applicable Generator Owner is constrained from performing planned vegetation maintenance work which potentially leaves the transmission line at risk.
- Developing the specific action to mitigate any potential risk associated with not performing the vegetation maintenance work as planned.
- Documenting and tracking the specific action taken for the location.
- In developing the specific action to mitigate the potential risk to the transmission line the applicable Transmission Owner or applicable Generator Owner could consider location specific measures such as modifying the inspection and/or maintenance intervals. Where a legal constraint would not allow any vegetation work, the interim corrective action could include limiting the loading on the transmission line.
- The applicable Transmission Owner or applicable Generator Owner should document and track the specific corrective action taken at each location. This location may be indicated as one span, one tree or a combination of spans on one property where the constraint is considered to be temporary.

Requirement R6:

R6 is a risk-based requirement. This requirement sets a minimum time period for completing Vegetation Inspections. The provision that Vegetation Inspections can be performed in conjunction with general line inspections facilitates a Transmission Owner’s ability to meet this requirement. However, the applicable Transmission Owner or applicable Generator Owner may determine that more frequent vegetation specific inspections are needed to maintain reliability levels, based on factors such as anticipated growth rates of the local vegetation, length of the local growing season, limited ROW width, and local rainfall. Therefore it is expected that some transmission lines may be designated with a higher frequency of inspections.

The VSLs for Requirement R6 have levels ranked by the failure to inspect a percentage of the applicable lines to be inspected. To calculate the appropriate VSL the applicable Transmission Owner or applicable Generator Owner may choose units such as: circuit, pole line, line miles or kilometers, etc.

For example, when an applicable Transmission Owner or applicable Generator Owner operates 2,000 miles of applicable transmission lines this applicable Transmission Owner or applicable Generator Owner will be responsible for inspecting all the 2,000 miles of lines at least once during the calendar year. If one of the included lines was 100 miles long, and if it was not inspected during the year, then the amount failed to inspect would be $100/2000 = 0.05$ or 5%. The “Low VSL” for R6 would apply in this example.

Requirement R7:

R7 is a risk-based requirement. The applicable Transmission Owner or applicable Generator Owner is required to complete its annual work plan for vegetation management to accomplish the purpose of this standard. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made and documented provided they do not put the transmission system at risk. The annual work plan requirement is not intended to necessarily require a “span-by-span”, or even a “line-by-line” detailed description of all work to be performed. It is only intended to require that the applicable Transmission Owner or applicable Generator Owner provide evidence of annual planning and execution of a vegetation management maintenance approach which successfully prevents encroachment of vegetation into the MVCD.

For example, when an applicable Transmission Owner or applicable Generator Owner identifies 1,000 miles of applicable transmission lines to be completed in the applicable Transmission Owner’s or applicable Generator Owner’s annual plan, the applicable Transmission Owner or applicable Generator Owner will be responsible completing those identified miles. If a applicable Transmission Owner or applicable Generator Owner makes a modification to the annual plan that does not put the transmission system at risk of an encroachment the annual plan may be modified. If 100 miles of the annual plan is deferred until next year the calculation to determine what percentage was completed for the current year would be: $1000 - 100$ (deferred miles) = 900 modified annual plan, or $900 / 900 = 100\%$ completed annual miles. If an applicable Transmission Owner or applicable Generator Owner only completed 875 of the total 1000 miles with no acceptable documentation for modification of the annual plan the calculation for failure to complete the annual plan would be: $1000 - 875 = 125$ miles failed to complete then, 125 miles (not completed) / 1000 total annual plan miles = 12.5% failed to complete.

The ability to modify the work plan allows the applicable Transmission Owner or applicable Generator Owner to change priorities or treatment methodologies during the year as conditions or situations dictate. For example recent line inspections may identify unanticipated high priority work, weather conditions (drought) could make herbicide application ineffective during the plan year, or a major storm could require redirecting local resources away from planned maintenance. This situation may also include complying with mutual assistance agreements by moving resources off the applicable Transmission Owner’s or applicable Generator Owner’s system to work on another system. Any of these examples could result in acceptable deferrals or additions to the annual work plan provided that they do not put the transmission system at risk of a vegetation encroachment.

In general, the vegetation management maintenance approach should use the full extent of the applicable Transmission Owner’s or applicable Generator Owner’s easement, fee simple and other legal rights allowed. A comprehensive approach that exercises the full extent of legal rights on the ROW is superior to incremental management because in the long term it reduces the overall potential for encroachments, and it ensures that future planned work and future planned inspection cycles are sufficient.

When developing the annual work plan the applicable Transmission Owner or applicable Generator Owner should allow time for procedural requirements to obtain permits to work on federal, state, provincial, public, tribal lands. In some cases the lead time for obtaining permits may necessitate preparing work plans more than a year prior to work start dates. Applicable Transmission Owners or applicable Generator Owners may also need to consider those special landowner requirements as documented in easement instruments.

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Therefore, deferrals or relevant changes to the annual plan shall be documented. Depending on the planning and documentation format used by the applicable Transmission Owner or applicable Generator Owner, evidence of successful annual work plan execution could consist of signed-off work orders, signed contracts, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, or paid invoices. Other evidence may include photographs, and walk-through reports.

* Such lines are applicable to this standard only if PC has determined such per FAC-014 (refer to the Applicability Section above)

⁸ The distances in this Table are the minimums required to prevent Flash-over; however prudent vegetation maintenance practices dictate that substantially greater distances will be achieved at time of vegetation maintenance.

⁹ Where applicable lines are operated at nominal voltages other than those listed, the applicable Transmission Owner or applicable Generator Owner should use the maximum system voltage to determine the appropriate clearance for that line.

Notes:

The SDT determined that the use of IEEE 516-2003 in version 1 of FAC-003 was a misapplication. The SDT consulted specialists who advised that the Gallet Equation would be a technically justified method. The explanation of why the Gallet approach is more appropriate is explained in the paragraphs below.

The drafting team sought a method of establishing minimum clearance distances that uses realistic weather conditions and realistic maximum transient over-voltages factors for in-service transmission lines.

The SDT considered several factors when looking at changes to the minimum vegetation to conductor distances in FAC-003-1:

- avoid the problem associated with referring to tables in another standard (IEEE-516-2003)
- transmission lines operate in non-laboratory environments (wet conditions)
- transient over-voltage factors are lower for in-service transmission lines than for inadvertently re-energized transmission lines with trapped charges.

FAC-003-1 uses the minimum air insulation distance (MAID) without tools formula provided in IEEE 516-2003 to determine the minimum distance between a transmission line conductor and vegetation. The equations and methods provided in IEEE 516 were developed by an IEEE Task Force in 1968 from test data provided by thirteen independent laboratories. The distances provided in IEEE 516 Tables 5 and 7 are based on the withstand voltage of a dry rod-rod air gap, or in other words, dry laboratory conditions. Consequently, the validity of using these distances in an outside environment application has been questioned.

FAC-003-01 allowed Transmission Owners to use either Table 5 or Table 7 to establish the minimum clearance distances. Table 7 could be used if the Transmission Owner knew the maximum transient over-voltage factor for its system. Otherwise, Table 5 would have to be used. Table 5 represented minimum air insulation distances under the worst possible case for transient over-voltage factors. These worst case transient over-voltage factors were as follows: 3.5 for voltages up to 362 kV phase to phase; 3.0 for 500 - 550 kV phase to phase; and 2.5 for 765 to 800 kV phase to phase. These worst case over-voltage factors were also a cause for concern in this particular application of the distances.

In general, the worst case transient over-voltages occur on a transmission line that is inadvertently re-energized immediately after the line is de-energized and a trapped charge is still present. The intent of FAC-003 is to keep a transmission line that is *in service* from becoming de-energized (i.e. tripped out) due to spark-over from the line conductor to nearby vegetation. Thus, the worst case transient overvoltage assumptions are not appropriate for this application. Rather, the appropriate over voltage values are those that occur only while the line is energized.

Typical values of transient over-voltages of in-service lines, as such, are not readily available in the literature because they are negligible compared with the maximums. A conservative value for the maximum transient over-voltage that can occur anywhere along the length of an in-service ac line is approximately 2.0 per unit. This value is a conservative estimate of the transient over-voltage that is created at the point of application (e.g. a substation) by switching a capacitor bank without pre-insertion devices (e.g. closing resistors). At voltage levels where capacitor banks are not very common (e.g. Maximum System Voltage of 362 kV), the

maximum transient over-voltage of an in-service ac line are created by fault initiation on adjacent ac lines and shunt reactor bank switching. These transient voltages are usually 1.5 per unit or less.

Even though these transient over-voltages will not be experienced at locations remote from the bus at which they are created, in order to be conservative, it is assumed that all nearby ac lines are subjected to this same level of over-voltage. Thus, a maximum transient over-voltage factor of 2.0 per unit for transmission lines operated at 302 kV and below is considered to be a realistic maximum in this application. Likewise, for ac transmission lines operated at Maximum System Voltages of 362 kV and above a transient over-voltage factor of 1.4 per unit is considered a realistic maximum.

The Gallet Equations are an accepted method for insulation coordination in tower design. These equations are used for computing the required strike distances for proper transmission line insulation coordination. They were developed for both wet and dry applications and can be used with any value of transient over-voltage factor. The Gallet Equation also can take into account various air gap geometries. This approach was used to design the first 500 kV and 765 kV lines in North America.

If one compares the MAID using the IEEE 516-2003 Table 7 (table D.5 for English values) with the critical spark-over distances computed using the Gallet wet equations, for each of the nominal voltage classes and identical transient over-voltage factors, the Gallet equations yield a more conservative (larger) minimum distance value.

Distances calculated from either the IEEE 516 (dry) formulas or the Gallet “wet” formulas are not vastly different when the same transient overvoltage factors are used; the “wet” equations will consistently produce slightly larger distances than the IEEE 516 equations when the same transient overvoltage is used. While the IEEE 516 equations were only developed for dry conditions the Gallet equations have provisions to calculate spark-over distances for both wet and dry conditions.

While EPRI is currently trying to establish empirical data for spark-over distances to live vegetation, there are no spark-over formulas currently derived expressly for vegetation to conductor minimum distances. Therefore the SDT chose a proven method that has been used in other EHV applications. The Gallet equations relevance to wet conditions and the selection of a Transient Overvoltage Factor that is consistent with the absence of trapped charges on an in-service transmission line make this methodology a better choice. The following table is an example of the comparison of distances derived from IEEE 516 and the Gallet equations.

**Comparison of spark-over distances computed using Gallet wet equations vs.
IEEE 516-2003 MAID distances**

(AC) Nom System Voltage (kV)	(AC) Max System Voltage (kV)	Transient Over-voltage Factor (T)	Clearance (ft.) Gallet (wet) @ Alt. 3000 feet	Table 7 (Table D.5 for feet) IEEE 516-2003 MAID (ft) @ Alt. 3000 feet

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

- ~~1. SC approved SAR for initial posting (January 11, 2007).~~
- ~~2. SAR posted for comment (January 15–February 14, 2007).~~
- ~~3. SAR posted for comment (April 10–May 9, 2007).~~
- ~~4. SC authorized moving the SAR forward to standard development (June 27, 2007).~~
- ~~5. First draft of proposed standard posted (October 27, 2008–November 25, 2008).~~
- ~~6. Second draft of revised standard posted (September 10, 20–October 24, 2009).~~
- ~~7. Third draft of revised standard posted (March 1, 2010–March 31, 2010).~~
- ~~8. Fourth draft of revised standard posted (June 17, 2010–July 17, 2010).~~
- ~~9. Fifth draft of revised standard posted (February 18, 2011–February 28, 2011)~~
10. Sixth draft of revised standard posted (September xx–2011)

Proposed Action Plan and Description of Current Draft

This is the fourth posting of the proposed revisions to the standard in accordance with Results-Based Criteria and the sixth draft overall.

Future Development Plan

Anticipated Actions	Anticipated Date
Recirculation ballot of standards.	September 2011
Receive BOT approval	November 2011

Effective Dates

There are two effective dates associated with this standard.

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

~~This standard becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval is required. Where no regulatory approval is required, the standard becomes effective on the first calendar day of the first calendar quarter one year after Board of Trustees adoption.~~

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.
2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.

3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.
4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Version History

Version	Date	Action	Change Tracking
1	TBA	1. Added “Standard Development Roadmap.” 2. Changed “60” to “Sixty” in section A, 5.2. 3. Added “Proposed Effective Date: April 7, 2006” to footer. 4. Added “Draft 3: November 17, 2005” to footer.	01/20/06
1	April 4, 2007	Regulatory Approval — Effective Date	New
23	September 29, 2011	Using the latest draft of FAC-003-2 from the Project 2007-07 SDT, modified proposed definitions and Applicability to include Generator Owners of a certain length.	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

The current glossary definition of this NERC term is modified to address the issues set forth in Paragraph 734 of FERC Order 693.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

The current glossary definition of this NERC term is modified to allow both maintenance inspections and vegetation inspections to be performed concurrently.

Current definition of Vegetation Inspection:
The systematic examination of a transmission corridor to document vegetation conditions.

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

FAC-003-2 is currently under development under Project 2007-07. The project is nearing its final stages, but the Project 2010-07 drafting team does not want to assume that the project will be approved by NERC's Board or Trustees (BOT) or FERC. Thus, the Project 2010-07 drafting team has developed two sets of proposed changes: one to this version, the latest draft of Version 2 as proposed by the Project 2007-07 team, and one to FAC-003-1, the current FERC-approved version of the standard.

If FAC-003-2 is approved by NERC's BOT, the Project 2010-07 drafting team will likely proceed with the modifications seen in this standard. These changes would be submitted for stakeholder approval and balloted as FAC-003-3. Several scenarios that could play out based on the order of the approval of these versions of the standards are addressed in the FAC-003-3 implementation plan.

If, however, FAC-003-2 remains under development, the Project 2010-07 drafting team will proceed with changes to FAC-003-1 to avoid further delay of its project goals. Changes to FAC-003-1 would address the addition of Generator Owners to the applicability, the proposal of modifications to the NERC defined term Right-of-Way to include applicable Generator Owners, and some formatting changes to bring the standard up to date. These changes would not be comprehensive; rather, they would aim to include the generator interconnection Facility in the standard with as few other changes as possible.

A. Introduction

1. **Title:** Transmission Vegetation Management
2. **Number:** FAC-003-~~3~~2
3. **Purpose:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.

4. Applicability

4.1. Functional Entities:

4.1.1. Applicable Transmission Owners

4.1.1.1. Transmission Owners that own Transmission Facilities defined in 4.2.

4.1.2. Applicable Generator Owners

4.1.2.1. Generator Owners that own generation Facilities defined in 4.3

~~4.1.—~~

~~4.1.1—Transmission Owners~~

4.2. Transmission Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal¹, state, provincial, public, private, or tribal entities:

~~4.2.1. 4.2.1.—~~Each overhead transmission line operated at 200kV or higher.

~~4.2.2. 4.2.2.—~~Each overhead transmission line operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

~~4.2.3. 4.2.3.—~~Each overhead transmission line operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

4.2.4. ~~4.2.4.—~~Each overhead transmission line identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.

Rationale: The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards, and stations have many inspection and maintenance activities that are necessary for reliability. Those existing process manage the threat. As such, the formal steps in this standard are not well suited for this environment. ~~3) NERC has a project in place to address at a later date the applicability of this standard to Generation Owners.~~ 3) Specifically

4.3. Generation Facilities: Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal², state, provincial, public, private, or tribal entities:

4.3.1. Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generating switchyard and are:

4.3.1.1. Operated at 200kV or higher; or

4.3.1.2. Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.

4.3.1.3. Operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

~~Rationale: The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards,~~

¹ EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

² EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

Enforcement:

The Requirements within a Reliability Standard govern and will be enforced. The Requirements within a Reliability Standard define what an entity must do to be compliant and binds an entity to certain obligations of performance under Section 215 of the Federal Power Act. Compliance will in all cases be measured by determining whether a party met or failed to meet the Reliability Standard Requirement given the specific facts and circumstances of its use, ownership or operation of the bulk power system.

Measures provide guidance on assessing non-compliance with the Requirements. Measures are the evidence that could be presented to demonstrate compliance with a Reliability Standard Requirement and are not intended to contain the quantitative metrics for determining satisfactory performance nor to limit how an entity may demonstrate compliance if valid alternatives to demonstrating compliance are available in a specific case. A Reliability Standard may be enforced in the absence of specified Measures.

Entities must comply with the “Compliance” section in its entirety, including the Administrative Procedure that sets forth, among other things, reporting requirements.

The “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” are provided for informational purposes. They are designed to convey guidance from NERC’s various activities. The “Guideline and Technical Basis” section and text boxes with “Examples” and “Rationale” are not intended to establish new Requirements under NERC’s Reliability Standards or to modify the Requirements in any existing NERC Reliability Standard. Implementation of the “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” is not a substitute for compliance with Requirements in NERC’s Reliability Standards.”

5. Background:

- 5.1.1.** This standard uses three types of requirements to provide layers of protection to prevent vegetation related outages that could lead to Cascading:
- 5.1.2.** a) Performance-based — defines a particular reliability objective or outcome to be achieved. In its simplest form, a results-based requirement has four components: *who, under what conditions (if any), shall perform what action, to achieve what particular bulk power system performance result or outcome?*
- 5.1.3.** b) Risk-based — preventive requirements to reduce the risks of failure to acceptable tolerance levels. A risk-based reliability requirement should be framed as: *who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?*

5.1.4. c) Competency-based — defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions. A competency-based reliability requirement should be framed as: *who, under what conditions (if any), shall have what capability, to achieve what particular result or outcome to perform an action to achieve a result or outcome or to reduce a risk to the reliability of the bulk power system?*

5.1.5. The defense-in-depth strategy for reliability standards development recognizes that each requirement in a NERC reliability standard has a role in preventing system failures, and that these roles are complementary and reinforcing. Reliability standards should not be viewed as a body of unrelated requirements, but rather should be viewed as part of a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comport with the quality objectives of a reliability standard.

This standard uses a defense-in-depth approach to improve the reliability of the electric Transmission system by:

- Requiring that vegetation be managed to prevent vegetation encroachment inside the flash-over clearance (R1 and R2);
- Requiring documentation of the maintenance strategies, procedures, processes and specifications used to manage vegetation to prevent potential flash-over conditions including consideration of 1) conductor dynamics and 2) the interrelationships between vegetation growth rates, control methods and the inspection frequency (R3);
- Requiring timely notification to the appropriate control center of vegetation conditions that could cause a flash-over at any moment (R4);
- Requiring corrective actions to ensure that flash-over distances will not be violated due to work constrains such as legal injunctions (R5);
- Requiring inspections of vegetation conditions to be performed annually (R6); and
- Requiring that the annual work needed to prevent flash-over is completed (R7).

5.1.6. For this standard, the requirements have been developed as follows:

***5.1.7.** Performance-based: Requirements 1 and 2

***5.1.8.** Competency-based: Requirement 3

***5.1.9.** Risk-based: Requirements 4, 5, 6 and 7

5.1.10. R3 serves as the first line of defense by ensuring that entities understand the problem they are trying to manage and have fully developed strategies and plans to manage the problem. R1, R2, and R7 serve as the second line of defense by requiring that entities carry out their plans and manage vegetation. R6, which requires inspections, may be either a part of the first line of defense (as input into the strategies and plans) or as a third line of defense (as a check of the first and second lines of defense). R4 serves

as the final line of defense, as it addresses cases in which all the other lines of defense have failed.

- 5.1.11.** Major outages and operational problems have resulted from interference between overgrown vegetation and transmission lines located on many types of lands and ownership situations. Adherence to the standard requirements for applicable lines on any kind of land or easement, whether they are Federal Lands, state or provincial lands, public or private lands, franchises, easements or lands owned in fee, will reduce and manage this risk. For the purpose of the standard the term “public lands” includes municipal lands, village lands, city lands, and a host of other governmental entities.
- 5.1.12.** This standard addresses vegetation management along applicable overhead lines and does not apply to underground lines, submarine lines or to line sections inside an electric station boundary.
- 5.1.13.** This standard focuses on transmission lines to prevent those vegetation related outages that could lead to Cascading. It is not intended to prevent customer outages due to tree contact with lower voltage distribution system lines. For example, localized customer service might be disrupted if vegetation were to make contact with a 69kV transmission line supplying power to a 12kV distribution station. However, this standard is not written to address such isolated situations which have little impact on the overall electric transmission system.
- 5.1.14.** Since vegetation growth is constant and always present, unmanaged vegetation poses an increased outage risk, especially when numerous transmission lines are operating at or near their Rating. This can present a significant risk of consecutive line failures when lines are experiencing large sags thereby leading to Cascading. Once the first line fails the shift of the current to the other lines and/or the increasing system loads will lead to the second and subsequent line failures as contact to the vegetation under those lines occurs. Conversely, most other outage causes (such as trees falling into lines, lightning, animals, motor vehicles, etc.) are not an interrelated function of the shift of currents or the increasing system loading. These events are not any more likely to occur during heavy system loads than any other time. There is no cause-effect relationship which creates the probability of simultaneous occurrence of other such events. Therefore these types of events are highly unlikely to cause large-scale grid failures. Thus, this standard places the highest priority on the management of vegetation to prevent vegetation grow-ins.

B. Requirements and Measures

R1. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path; operating within their Rating and all Rated Electrical Operating Conditions of the types shown below³ [*Violation Risk Factor: High*] [*Time Horizon: Real-time*]:

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage⁴,
2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁵,
3. An encroachment due to the blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
4. An encroachment due to vegetation growth into the MVCD that caused a vegetation-related Sustained Outage⁴.

M1. Each applicable Transmission Owner

Rationale for R1 and R2:

Lines with the highest significance to reliability are covered in R1; all other lines are covered in R2.

Rationale for the types of failure to manage vegetation which are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of ~~a~~an applicable Transmission Owner's or applicable Generator Owner's vegetation maintenance program:

1. This management failure is found by routine inspection or Fault event investigation, and is normally symptomatic of unusual conditions in an otherwise sound program.
2. This management failure occurs when the height and location of a side tree within the ROW is not adequately addressed by the program.
3. This management failure occurs when side growth is not adequately addressed and may be indicative of an unsound program.
4. This management failure is usually indicative of a program that is not addressing the most fundamental dynamic of vegetation management, (i.e. a grow-in under the line). If this type of failure is pervasive on multiple lines, it provides a mechanism for a Cascade.

³ This requirement does not apply to circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner ~~a Transmission Owner~~ subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, or installation, removal, or digging of vegetation. Nothing in this footnote should be construed to limit the Transmission Owner's right to exercise its full legal rights on the ROW.

⁴ If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

⁵ Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period.

~~and applicable Generator Owner Transmission Owner~~ has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R1)

- R2.** Each ~~applicable Transmission Owner and applicable Generator Owner Transmission Owner~~ shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path; operating within its Rating and all Rated Electrical Operating Conditions of the types shown below² [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time*]:
1. An encroachment into the MVCD, observed in Real-time, absent a Sustained Outage³,
 2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁴,
 3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
 4. An encroachment due to vegetation growth into the line MVCD that caused a vegetation-related Sustained Outage⁴

- M2.** Each ~~applicable Transmission Owner and applicable Generator Owner Transmission Owner~~ has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R2)

R3. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines that accounts for the following:

- 3.1** Movement of applicable line conductors under their Rating and all Rated Electrical Operating Conditions;
- 3.2** Inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning];

Rationale

The documentation provides a basis for evaluating the competency of the applicable Transmission Owner’s or applicable Generator Owner’s vegetation program. There may be many acceptable approaches to maintain clearances. Any approach must demonstrate that the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ avoids vegetation-to-wire conflicts under all Ratings and all Rated Electrical Operating

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ can prevent encroachment into the MVCD considering the factors identified in the requirement. (R3)

R4. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable line when the applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment *[Violation Risk Factor: Medium] [Time Horizon: Real-time].*

Rationale

This is to ensure expeditious communication between the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ and the control center when a critical situation is confirmed.

M4. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders. (R4)

R5. When a applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ is constrained from performing vegetation work on an applicable line operating within its Rating and all Rated Electrical Operating Conditions, and the constraint may lead to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan, then the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ shall take corrective action to ensure continued vegetation management to prevent encroachments [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Legal actions and other events may occur which result in constraints that prevent the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from performing planned vegetation maintenance work.

In cases where the transmission line is put at potential risk due to constraints, the intent is for the applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ to put interim measures in place, rather than do nothing.

The corrective action process is not intended to address situations where a planned work methodology cannot be performed but an alternate work methodology can be used.

M5. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, or evidence that the line was de-energized. (R5)

Rationale

Inspections are used by applicable Transmission Owners and applicable Generator Owners ~~Transmission Owners~~ to assess the condition of the entire ROW. The information from the assessment can be used to determine risk, determine future work and evaluate recently-completed work. This requirement sets a minimum Vegetation Inspection frequency of once per calendar year but with no more than 18 months between inspections on the same ROW. Based upon average growth rates across North America and on common utility practice, this minimum frequency is reasonable. Transmission Owners should consider local and environmental factors

R6. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 calendar months between inspections on the same ROW⁶ [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

⁶ When the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the TO or GO is granted a

M6. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable lines at least once per calendar year but with no more than 18 calendar months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records. (R6)

R7. Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ shall complete 100% of its annual vegetation work plan of applicable lines to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not allow encroachment of vegetation into the MVCD) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]:

Rationale

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. It allows modifications to the planned work for changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors, provided that those modifications do not put the transmission system at risk of a vegetation encroachment.

- Change in expected growth rate/ environmental factors
- Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner⁷
- Rescheduling work between growing seasons
- Crew or contractor availability/ Mutual assistance agreements
- Identified unanticipated high priority work
- Weather conditions/Accessibility
- Permitting delays
- Land ownership changes/Change in land use by the landowner
- Emerging technologies

time extension that is equivalent to the duration of the time the TO or GO was prevented from performing the Vegetation Inspection.

⁷ Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, ice storms, floods, or major storms as defined either by the TO or GO or an applicable regulatory body.

- M7.** Each applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ has evidence that it completed its annual vegetation work plan for its applicable lines. Examples of acceptable forms of evidence may include a copy of the completed annual work plan (as finally modified), dated work orders, dated invoices, or dated inspection records. (R7)

C. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

1.2 Regional Entity Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ retains data or evidence to show compliance with Requirements R1, R2, R3, R5, R6 and R7, Measures M1, M2, M3, M5, M6 and M7 for three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ retains data or evidence to show compliance with Requirement R4, Measure M4 for most recent 12 months of operator logs or most recent 3 months of voice recordings or transcripts of voice recordings, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3 Compliance Monitoring and Enforcement Processes:

- 5.1.15. Compliance Audit
- 5.1.16. Self-Certification
- 5.1.17. Spot Checking
- 5.1.18. Compliance Violation Investigation
- 5.1.19. Self-Reporting
 - Complaint
 - Periodic Data Submittal

1.4 Additional Compliance Information

Periodic Data Submittal: The applicable Transmission Owner and applicable Generator Owner ~~Transmission Owner~~ will submit a quarterly report to its Regional Entity, or the Regional Entity's designee, identifying all Sustained Outages of applicable lines operated within their Rating and all Rated Electrical Operating Conditions as determined by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ to have been caused by vegetation, except as excluded in footnote 2, and including as a minimum the following:

- The name of the circuit(s), the date, time and duration of the outage; the voltage of the circuit; a description of the cause of the outage; the category associated with the Sustained Outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~.

A Sustained Outage is to be categorized as one of the following:

- Category 1A — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, that are identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 1B — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 2A — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 2B — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 3 — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines from outside the ROW;
- Category 4A — Blowing together: Sustained Outages caused by vegetation and applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.
- Category 4B — Blowing together: Sustained Outages caused by vegetation and applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.

The Regional Entity will report the outage information provided by applicable Transmission Owners and applicable Generator Owners~~Transmission Owners~~, as per the above, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported Sustained Outages.

Table of Compliance Elements

On November 3, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management with NERC staff-proposed changes to the VSLs for R1 and R2 in lieu of the Project 2007-07 SDT’s original proposed VSLs. Those latest changes are reflected here. The only additional change made by the Project 2010-07 SDT was to change “Transmission Owner” to “responsible entity” in both sets of VSLs.

R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Real-time	High	<p>The Transmission Owner responsible entity failed to manage vegetation in a manner such that the responsible entity Transmission Owner had an encroachment into the MVCD observed in Real-time, absent a Sustained Outage.</p>	<p>The responsible entity Transmission Owner failed to manage vegetation in a manner such that the responsible entity Transmission Owner had an encroachment into the MVCD due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage.</p>	<p>The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line identified as an element of an IROL or Major WECC transfer path and encroachment into the MVCD as identified in FAC-003-Table 2 was observed in real time absent a Sustained Outage. F. Associated Documents

Guideline and Technical Basis (attached).

Guideline and Technical Basis

Effective dates:

The first two sentences of the Effective Dates section is standard language used in most NERC standards to cover the general effective date and is sufficient to cover the vast majority of situations. Five special cases are needed to cover effective dates for individual lines which undergo transitions after the general effective date. These special cases cover the effective dates for those lines which are initially becoming subject to the standard, those lines which are changing their applicability within the standard, and those lines which are changing in a manner that removes their applicability to the standard.

Case 1 is needed because the Planning Coordinators may designate lines below 200 kV to become elements of an IROL or Major WECC Transfer Path in a future Planning Year (PY). For example, studies by the Planning Coordinator in 2011 may identify a line to have that designation beginning in PY 2021, ten years after the planning study is performed. It is not intended for the Standard to be immediately applicable to, or in effect for, that line until that future PY begins. The effective date provision for such lines ensures that the line will become subject to the standard on January 1 of the PY specified with an allowance of at least 12 months for the applicable Transmission Owner or applicable Generator Owner to make the necessary preparations to achieve compliance on that line. The table below has some explanatory examples of the application.

<u>Date that Planning Study is completed</u>	<u>PY the line will become an IROL element</u>	<u>Date 1</u>	<u>Date 2</u>	<u>Effective Date The latter of Date 1 or Date 2</u>
05/15/2011	2012	05/15/2012	01/01/2012	05/15/2012
05/15/2011	2013	05/15/2012	01/01/2013	01/01/2013
05/15/2011	2014	05/15/2012	01/01/2014	01/01/2014
05/15/2011	2021	05/15/2012	01/01/2021	01/01/2021

Case 2 is needed because a line operating below 200kV designated as an element of an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network.

Case 3 is needed because a line operating at 200 kV or above that once was designated as an element of an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network. Such changes result in the need to apply R1 to that line until that date is reached and then to apply R2 to that line thereafter.

Case 4 is needed because an existing line that is to be operated at 200 kV or above can be acquired by an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator ~~Owner~~ ~~Transmission Owner~~, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network which will thereafter make the line subject to the standard.

Case 5 is needed because an existing line that is operated below 200 kV can be acquired by an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner ~~Transmission owner~~, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network. In this special case the line upon acquisition was designated as an element of an Interconnection Reliability Operating Limit (IROL) or an element of a Major WECC Transfer Path.

Defined Terms:

Explanation for revising the definition of ROW:

The current NERC glossary definition of Right of Way has been modified to address the matter set forth in Paragraph 734 of FERC Order 693. The Order pointed out that Transmission Owners may in some cases own more property or rights than are needed to reliably operate transmission lines. This modified definition represents a slight but significant departure from the strict legal definition of “right of way” in that this definition is based on engineering and construction considerations that establish the width of a corridor from a technical basis. The pre-2007 maintenance records are included in the revised definition to allow the use of such vegetation widths if there were no engineering or construction standards that referenced the width of right of way to be maintained for vegetation on a particular line but the evidence exists in maintenance records for a width that was in fact maintained prior to this standard becoming mandatory. Such widths may be the only information available for lines that had limited or no vegetation easement rights and were typically maintained primarily to ensure public safety. This standard does not require additional easement rights to be purchased to satisfy a minimum right of way width that did not exist prior to this standard becoming mandatory.

Explanation for revising the definition of Vegetation Inspections:

The current glossary definition of this NERC term is being modified to allow both maintenance inspections and vegetation inspections to be performed concurrently. This allows potential efficiencies, especially for those lines with minimal vegetation and/or slow vegetation growth rates.

Explanation of the definition of the MVCD:

The MVCD is a calculated minimum distance that is derived from the Gallet Equations. This is a method of calculating a flash over distance that has been used in the design of high voltage transmission lines. Keeping vegetation away from high voltage conductors by this distance will prevent voltage flash-over to the vegetation. See the explanatory text below for Requirement R3 and associated Figure 1. Table 2 below provides MVCD values for various voltages and altitudes. Details of the equations and an example calculation are provided in Appendix 1 of the Technical Reference Document.

Requirements R1 and R2:

R1 and R2 are performance-based requirements. The reliability objective or outcome to be achieved is the management of vegetation such that there are no vegetation encroachments within a minimum distance of transmission lines. Content-wise, R1 and R2 are the same requirements; however, they apply to different Facilities. Both R1 and R2 require each applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ to manage vegetation to prevent encroachment within the MVCD of transmission lines. R1 is applicable to lines that are identified as an element of an IROL or Major WECC Transfer Path. R2 is applicable to all other lines that are not elements of IROLs, and not elements of Major WECC Transfer Paths.

The separation of applicability (between R1 and R2) recognizes that inadequate vegetation management for an applicable line that is an element of an IROL or a Major WECC Transfer Path is a greater risk to the interconnected electric transmission system than applicable lines that are not elements of IROLs or Major WECC Transfer Paths. Applicable lines that are not elements of IROLs or Major WECC Transfer Paths do require effective vegetation management, but these lines are comparatively less operationally significant. As a reflection of this difference in risk impact, the Violation Risk Factors (VRFs) are assigned as High for R1 and Medium for R2.

Requirements R1 and R2 state that if inadequate vegetation management allows vegetation to encroach within the MVCD distance as shown in Table 2, it is a violation of the standard. Table 2 distances are the minimum clearances that will prevent spark-over based on the Gallet equations as described more fully in the Technical Reference document.

These requirements assume that transmission lines and their conductors are operating within their Rating. If a line conductor is intentionally or inadvertently operated beyond its Rating and Rated Electrical Operating Condition (potentially in violation of other standards), the occurrence of a clearance encroachment may occur solely due to that condition. For example, emergency actions taken by an applicable Transmission Owner or applicable Generator Owner ~~Transmission Operator~~ or Reliability Coordinator to protect an Interconnection may cause excessive sagging and an outage. Another example would be ice loading beyond the line's Rating and Rated Electrical Operating Condition. Such vegetation-related encroachments and outages are not violations of this standard.

Evidence of failures to adequately manage vegetation include real-time observation of a vegetation encroachment into the MVCD (absent a Sustained Outage), or a vegetation-related encroachment resulting in a Sustained Outage due to a fall-in from inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to the blowing together of the lines and vegetation located inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to a grow-in. Faults which do not cause a Sustained outage and which are confirmed to have been caused by vegetation encroachment within the MVCD are considered the equivalent of a Real-time observation for violation severity levels.

With this approach, the VSLs for R1 and R2 are structured such that they directly correlate to the severity of a failure of an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ to manage vegetation and to the corresponding performance level of the Transmission Owner's vegetation program's ability to meet the objective of "preventing the risk of those vegetation related outages that could lead to Cascading." Thus violation severity increases with an applicable Transmission Owner's or applicable Generator Owner's ~~Transmission Owner's~~ inability to meet this goal and its potential of leading to a Cascading event. The additional benefits of such a combination are that it simplifies the standard and clearly defines performance for compliance. A performance-based requirement of this nature will promote high quality, cost effective vegetation management programs that will deliver the overall end result of improved reliability to the system.

Multiple Sustained Outages on an individual line can be caused by the same vegetation. For example initial investigations and corrective actions may not identify and remove the actual outage cause then another outage occurs after the line is re-energized and previous high conductor temperatures return. Such events are considered to be a single vegetation-related Sustained Outage under the standard where the Sustained Outages occur within a 24 hour period.

The MVCD is a calculated minimum distance stated in feet (or meters) to prevent spark-over, for various altitudes and operating voltages that is used in the design of Transmission Facilities. Keeping vegetation from entering this space will prevent transmission outages.

If the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ has applicable lines operated at nominal voltage levels not listed in Table 2, then the applicable TO or applicable GO should use the next largest clearance distance based on the next highest nominal voltage in the table to determine an acceptable distance.

Requirement R3: R3 is a competency based requirement concerned with the maintenance strategies, procedures, processes, or specifications, an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ uses for vegetation management.

An adequate transmission vegetation management program formally establishes the approach the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ uses to plan and perform vegetation work to prevent transmission Sustained Outages and minimize risk to the transmission system. The approach provides the basis for evaluating the intent, allocation of appropriate resources, and the competency of the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ in managing vegetation. There are many acceptable approaches to manage vegetation and avoid Sustained Outages. However, the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ must be able to show the documentation of its approach and how it conducts work to maintain clearances.

An example of one approach commonly used by industry is ANSI Standard A300, part 7. However, regardless of the approach a utility uses to manage vegetation, any approach an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ chooses to use will generally contain the following elements:

1. *the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation height) to ensure that MVCD clearances are never violated.*
2. *the work methods that the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ uses to control vegetation*
3. *a stated Vegetation Inspection frequency*
4. *an annual work plan*

The conductor's position in space at any point in time is continuously changing in reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and wind loading. The movement of the transmission line conductor and the MVCD is illustrated in Figure 1 below. In the Technical Reference document more figures and explanations of conductor dynamics are provided.

Figure 1

A cross-section view of a single conductor at a given point along the span is shown with six possible conductor positions due to movement resulting from thermal and mechanical loading.

Requirement R4:

R4 is a risk-based requirement. It focuses on preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ for the mitigation of Fault risk when a vegetation threat is confirmed. R4 involves the notification of potentially threatening vegetation conditions, without any intentional delay, to the control center holding switching authority for that specific transmission line. Examples of acceptable unintentional delays may include communication system problems (for example, cellular service or two-way radio disabled), crews located in remote field locations with no communication access, delays due to severe weather, etc.

Confirmation is key that a threat actually exists due to vegetation. This confirmation could be in the form of an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner's~~ employee who personally identifies such a threat in the field. Confirmation could also be made by sending out an employee to evaluate a situation reported by a landowner.

Vegetation-related conditions that warrant a response include vegetation that is near or encroaching into the MVCD (a grow-in issue) or vegetation that could fall into the transmission conductor (a fall-in issue). A knowledgeable verification of the risk would include an assessment of the possible sag or movement of the conductor while operating between no-load conditions and its rating.

The applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ has the responsibility to ensure the proper communication between field personnel and the control center to allow the control center to take the appropriate action until or as the vegetation threat is relieved. Appropriate actions may include a temporary reduction in the line loading, switching the line out of service, or other preparatory actions in recognition of the increased risk of outage on that circuit. The notification of the threat should be communicated in terms of minutes or hours as opposed to a longer time frame for corrective action plans (see R5).

All potential grow-in or fall-in vegetation-related conditions will not necessarily cause a Fault at any moment. For example, some applicable Transmission Owners or applicable Generator Owners ~~Transmission Owners~~ may have a danger tree identification program that identifies trees for removal with the potential to fall near the line. These trees would not require notification to the control center unless they pose an immediate fall-in threat.

Requirement R5:

R5 is a risk-based requirement. It focuses upon preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ for the mitigation of Sustained Outage risk when temporarily constrained from performing vegetation maintenance. The intent of this requirement is to deal with situations that prevent the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ from performing planned vegetation management work and, as a result, have the potential to put the transmission line at risk. Constraints to performing vegetation maintenance work as planned could result from legal injunctions filed by property owners, the discovery of easement stipulations which limit the applicable Transmission Owner's or applicable Generator Owner's ~~Transmission Owner's~~ rights, or other circumstances.

This requirement is not intended to address situations where the transmission line is not at potential risk and the work event can be rescheduled or re-planned using an alternate work methodology. For example, a land owner may prevent the planned use of chemicals on non-threatening, low growth vegetation but agree to the use of mechanical clearing. In this case the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is not under any immediate time constraint for achieving the management objective, can easily reschedule work using an alternate approach, and therefore does not need to take interim corrective action.

However, in situations where transmission line reliability is potentially at risk due to a constraint, the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is required to take an interim corrective action to mitigate the potential risk to the transmission line. A wide range of actions can be taken to address various situations. General considerations include:

- Identifying locations where the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ is constrained from performing planned vegetation maintenance work which potentially leaves the transmission line at risk.
- Developing the specific action to mitigate any potential risk associated with not performing the vegetation maintenance work as planned.
- Documenting and tracking the specific action taken for the location.
- In developing the specific action to mitigate the potential risk to the transmission line the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ could consider location specific measures such as modifying the inspection and/or maintenance intervals. Where a legal constraint would not allow any vegetation work, the interim corrective action could include limiting the loading on the transmission line.
- The applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ should document and track the specific corrective action taken at each location. This location may be indicated as one span, one tree or a combination of spans on one property where the constraint is considered to be temporary.

Requirement R6:

R6 is a risk-based requirement. This requirement sets a minimum time period for completing Vegetation Inspections. The provision that Vegetation Inspections can be performed in conjunction with general line inspections facilitates a Transmission Owner's ability to meet this requirement. However, the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ may determine that more frequent vegetation specific inspections are needed to maintain reliability levels, based on factors such as anticipated growth rates of the local vegetation, length of the local growing season, limited ROW width, and local rainfall. Therefore it is expected that some transmission lines may be designated with a higher frequency of inspections.

The VSLs for Requirement R6 have levels ranked by the failure to inspect a percentage of the applicable lines to be inspected. To calculate the appropriate VSL the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ may choose units such as: circuit, pole line, line miles or kilometers, etc.

For example, when an applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ operates 2,000 miles of applicable transmission lines this applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ will be responsible for inspecting all the 2,000 miles of lines at least once during the calendar year. If one of the included lines was 100 miles long, and if it was not inspected during the year, then the amount failed to inspect would be $100/2000 = 0.05$ or 5%. The "Low VSL" for R6 would apply in this example.

Requirement R7:

R7 is a risk-based requirement. The ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner is required to complete its an annual work plan for vegetation management to accomplish the purpose of this standard. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made and documented provided they do not put the transmission system at risk. The annual work plan requirement is not intended to necessarily require a “span-by-span”, or even a “line-by-line” detailed description of all work to be performed. It is only intended to require that the ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner provide evidence of annual planning and execution of a vegetation management maintenance approach which successfully prevents encroachment of vegetation into the MVCD.

For example, when an ~~an applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner identifies 1,000 miles of applicable transmission lines to be completed in the ~~applicable Transmission Owner’s or applicable Generator Owner’s~~ Transmission Owner’s annual plan, the ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner will be responsible completing those identified miles. If a ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner makes a modification to the annual plan that does not put the transmission system at risk of an encroachment the annual plan may be modified. If 100 miles of the annual plan is deferred until next year the calculation to determine what percentage was completed for the current year would be: $1000 - 100$ (deferred miles) = 900 modified annual plan, or $900 / 900 = 100\%$ completed annual miles. If an ~~an applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner only completed 875 of the total 1000 miles with no acceptable documentation for modification of the annual plan the calculation for failure to complete the annual plan would be: $1000 - 875 = 125$ miles failed to complete then, 125 miles (not completed) / 1000 total annual plan miles = 12.5% failed to complete.

The ability to modify the work plan allows the ~~applicable Transmission Owner or applicable Generator Owner~~ Transmission Owner to change priorities or treatment methodologies during the year as conditions or situations dictate. For example recent line inspections may identify unanticipated high priority work, weather conditions (drought) could make herbicide application ineffective during the plan year, or a major storm could require redirecting local resources away from planned maintenance. This situation may also include complying with mutual assistance agreements by moving resources off the ~~applicable Transmission Owner’s or applicable Generator Owner’s~~ Transmission Owner’s system to work on another system. Any of these examples could result in acceptable deferrals or additions to the annual work plan provided that they do not put the transmission system at risk of a vegetation encroachment.

In general, the vegetation management maintenance approach should use the full extent of the ~~applicable Transmission Owner’s or applicable Generator Owner’s~~ Transmission Owner’s easement, fee simple and other legal rights allowed. A comprehensive approach that exercises the full extent of legal rights on the ROW is superior to incremental management because in the long term it reduces the overall potential for encroachments, and it ensures that future planned work and future planned inspection cycles are sufficient.

When developing the annual work plan the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ should allow time for procedural requirements to obtain permits to work on federal, state, provincial, public, tribal lands. In some cases the lead time for obtaining permits may necessitate preparing work plans more than a year prior to work start dates. Applicable Transmission Owners or applicable Generator Owners ~~Transmission Owners~~ may also need to consider those special landowner requirements as documented in easement instruments.

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Therefore, deferrals or relevant changes to the annual plan shall be documented. Depending on the planning and documentation format used by the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~, evidence of successful annual work plan execution could consist of signed-off work orders, signed contracts, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, or paid invoices. Other evidence may include photographs, and walk-through reports.

FAC-003 — TABLE 2 — Minimum Vegetation Clearance Distances (MVCD)⁸

* Such lines are applicable to this standard only if PC has determined such per FAC-014 (refer to the Applicability Section above)

⁸ The distances in this Table are the minimums required to prevent Flash-over; however prudent vegetation maintenance practices dictate that substantially greater distances will be achieved at time of vegetation maintenance.

⁹ Where applicable lines are operated at nominal voltages other than those listed, ~~the~~ the applicable Transmission Owner or applicable Generator Owner ~~Transmission Owner~~ should use the maximum system voltage to determine the appropriate clearance for that line.

Notes:

The SDT determined that the use of IEEE 516-2003 in version 1 of FAC-003 was a misapplication. The SDT consulted specialists who advised that the Gallet Equation would be a technically justified method. The explanation of why the Gallet approach is more appropriate is explained in the paragraphs below.

The drafting team sought a method of establishing minimum clearance distances that uses realistic weather conditions and realistic maximum transient over-voltages factors for in-service transmission lines.

The SDT considered several factors when looking at changes to the minimum vegetation to conductor distances in FAC-003-1:

- avoid the problem associated with referring to tables in another standard (IEEE-516-2003)
- transmission lines operate in non-laboratory environments (wet conditions)
- transient over-voltage factors are lower for in-service transmission lines than for inadvertently re-energized transmission lines with trapped charges.

FAC-003-1 uses the minimum air insulation distance (MAID) without tools formula provided in IEEE 516-2003 to determine the minimum distance between a transmission line conductor and vegetation. The equations and methods provided in IEEE 516 were developed by an IEEE Task Force in 1968 from test data provided by thirteen independent laboratories. The distances provided in IEEE 516 Tables 5 and 7 are based on the withstand voltage of a dry rod-rod air gap, or in other words, dry laboratory conditions. Consequently, the validity of using these distances in an outside environment application has been questioned.

FAC-003-01 allowed Transmission Owners to use either Table 5 or Table 7 to establish the minimum clearance distances. Table 7 could be used if the Transmission Owner knew the maximum transient over-voltage factor for its system. Otherwise, Table 5 would have to be used. Table 5 represented minimum air insulation distances under the worst possible case for transient over-voltage factors. These worst case transient over-voltage factors were as follows: 3.5 for voltages up to 362 kV phase to phase; 3.0 for 500 - 550 kV phase to phase; and 2.5 for 765 to 800 kV phase to phase. These worst case over-voltage factors were also a cause for concern in this particular application of the distances.

In general, the worst case transient over-voltages occur on a transmission line that is inadvertently re-energized immediately after the line is de-energized and a trapped charge is still present. The intent of FAC-003 is to keep a transmission line that is *in service* from becoming de-energized (i.e. tripped out) due to spark-over from the line conductor to nearby vegetation. Thus, the worst case transient overvoltage assumptions are not appropriate for this application. Rather, the appropriate over voltage values are those that occur only while the line is energized.

Typical values of transient over-voltages of in-service lines, as such, are not readily available in the literature because they are negligible compared with the maximums. A conservative value for the maximum transient over-voltage that can occur anywhere along the length of an in-service ac line is approximately 2.0 per unit. This value is a conservative estimate of the transient over-voltage that is created at the point of application (e.g. a substation) by switching a capacitor bank without pre-insertion devices (e.g. closing resistors). At voltage levels where capacitor banks are not very common (e.g. Maximum System Voltage of 362 kV), the

maximum transient over-voltage of an in-service ac line are created by fault initiation on adjacent ac lines and shunt reactor bank switching. These transient voltages are usually 1.5 per unit or less.

Even though these transient over-voltages will not be experienced at locations remote from the bus at which they are created, in order to be conservative, it is assumed that all nearby ac lines are subjected to this same level of over-voltage. Thus, a maximum transient over-voltage factor of 2.0 per unit for transmission lines operated at 302 kV and below is considered to be a realistic maximum in this application. Likewise, for ac transmission lines operated at Maximum System Voltages of 362 kV and above a transient over-voltage factor of 1.4 per unit is considered a realistic maximum.

The Gallet Equations are an accepted method for insulation coordination in tower design. These equations are used for computing the required strike distances for proper transmission line insulation coordination. They were developed for both wet and dry applications and can be used with any value of transient over-voltage factor. The Gallet Equation also can take into account various air gap geometries. This approach was used to design the first 500 kV and 765 kV lines in North America.

If one compares the MAID using the IEEE 516-2003 Table 7 (table D.5 for English values) with the critical spark-over distances computed using the Gallet wet equations, for each of the nominal voltage classes and identical transient over-voltage factors, the Gallet equations yield a more conservative (larger) minimum distance value.

Distances calculated from either the IEEE 516 (dry) formulas or the Gallet “wet” formulas are not vastly different when the same transient overvoltage factors are used; the “wet” equations will consistently produce slightly larger distances than the IEEE 516 equations when the same transient overvoltage is used. While the IEEE 516 equations were only developed for dry conditions the Gallet equations have provisions to calculate spark-over distances for both wet and dry conditions.

While EPRI is currently trying to establish empirical data for spark-over distances to live vegetation, there are no spark-over formulas currently derived expressly for vegetation to conductor minimum distances. Therefore the SDT chose a proven method that has been used in other EHV applications. The Gallet equations relevance to wet conditions and the selection of a Transient Overvoltage Factor that is consistent with the absence of trapped charges on an in-service transmission line make this methodology a better choice. The following table is an example of the comparison of distances derived from IEEE 516 and the Gallet equations.

**Comparison of spark-over distances computed using Gallet wet equations vs.
IEEE 516-2003 MAID distances**

(AC) Nom System Voltage (kV)	(AC) Max System Voltage (kV)	Transient Over-voltage Factor (T)	Clearance (ft.) Gallet (wet) @ Alt. 3000 feet	Table 7 (Table D.5 for feet) IEEE 516-2003 MAID (ft) @ Alt. 3000 feet

Standard PRC-004-2.1 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

A. Introduction

1. **Title:** Analysis and Mitigation of Transmission and Generation Protection System Misoperations
2. **Number:** PRC-004-2.1
3. **Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.
4. **Applicability**
 - 4.1. Transmission Owner.
 - 4.2. Distribution Provider that owns a transmission Protection System.
 - 4.3. Generator Owner.
5. **(Proposed) Effective Date:** In those jurisdictions where regulatory approval is required, all requirements become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements become effective upon Board of Trustees' adoption.

B. Requirements

- R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.
- R2. The Generator Owner shall analyze its generator and generator interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.
- R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.

C. Measures

- M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.
- M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.
- M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Entity's procedures.

D. Compliance

1. **Compliance Monitoring Process**
 - 1.1. **Compliance Enforcement Authority**
Regional Entity.

Standard PRC-004-2.1 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.5. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Violation Severity Levels (no changes)

E. Regional Differences

None identified.

		<u>generator interconnection Facility...”</u>	<u>2010-07</u>
--	--	---	----------------

Implementation Plan for FAC-001-1—Facility Connection Requirements

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. FAC-001-0 – Facility Connection Requirements will be retired at midnight the day before FAC-001-1 becomes effective.

Compliance with Standard

Since this version of the standard imposes no changes to Transmission Owners from those in the FERC-approved version of the standard, the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to the FERC-approved version of this standard only address Generator Owner applicability and requirements (add Generator Owner to section 4.2, introduce a new requirement (R2), and modify one existing requirement (now R3)). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

Effective Date

There are two effective dates associated with this standard:

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.

In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

Implementation Plan for FAC-001-1 Facility Connection Requirements

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. FAC-001-0 Facility Connection Requirements will be retired ~~when~~ at midnight the day before FAC-001-1 becomes effective.

Compliance with Standard

Since this version of the standard imposes no changes to Transmission Owners from those in the FERC-approved version of the standard, the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to the FERC-approved version of this standard only address Generator Owner applicability and requirements (add Generator Owner to section 4.2, introduce a new requirement (R2), and modify ~~two~~ one existing ~~requirements~~ requirement (now R3 ~~and~~ R4)). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

Effective Date

There are two effective dates associated with this standard:

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.

In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

Implementation Plan for FAC-003-3— Transmission Vegetation Management

Prerequisite Approvals

There are a number of scenarios that could occur regarding the approval of FAC-003-2 that would affect the implementation of FAC-003-3.

If FAC-003-2 is filed with applicable regulatory authorities and approved before FAC-003-3 is filed with applicable regulatory authorities, then when and if FAC-003-3 is approved by applicable regulatory authorities, the implementation plan and effective dates for Transmission Owners in FAC-003-2 will be transferred into this implementation plan. The “clock” for calculating effective dates for Transmission Owners will still have started at the time specified in FAC-003-2 (based on the approval date of that standard). Generator Owners will be required to comply with the implementation plan as outlined below.

If applicable regulatory authorities elect to approve only FAC-003-3 and not FAC-003-2, the original implementation plan for Transmission Owners as outlined in FAC-003-2 will be transferred into this implementation plan. Generator Owners will be required to comply with the implementation plan as outlined below. The “clocks” for calculating the effective dates for both Transmission Owners and Generator Owners will begin at the same time.

If applicable regulatory authorities approve FAC-003-2 and FAC-003-3 at the same time, the implementation plan and effective dates for Transmission Owners in FAC-003-2 will be transferred into this implementation plan and FAC-003-2 will be immediately retired. Generator Owners will be required to comply with the implementation plan as outlined below. The “clocks” for calculating the effective dates for both Transmission Owners and Generator Owners will begin at the same time.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. All requirements and the two revised definitions in the proposed standard FAC-003-2 will be retired at midnight the day before FAC-003-3 becomes effective.

There are two revised definitions in the proposed standard:

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either

construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

There is one new definition in the proposed standard:

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

The current glossary definitions of Right-of-Way and Vegetation Inspection, or the glossary definitions of Right-of-Way and Vegetation Inspection in FAC-003-2, if that standard has been approved, will be retired at midnight the day before FAC-003-3 (and with it, the above definitions of Right-of-Way and Vegetation Inspection) becomes effective. The above definition of Minimum Vegetation Clearance Distance will be added to the NERC glossary upon approval of FAC-003-3, or the above definition of Minimum Vegetation Clearance Distance will replace (and thus force the retirement, at midnight the day before FAC-003-3 is approved) of the same definition in FAC-003-2, if FAC-003-2 has been approved.

Compliance with Standard

As outlined above under "Prerequisite Approvals," the inclusion of Transmission Owners in this implementation plan will depend on order in which regulatory authorities approved FAC-003-2 and FAC-003-3. Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

To reach compliance with the standard, a Generator Owner will have to perform a full review of as-built drawings and determine which generation interconnection Facilities require a Transmission Vegetation Management Plan (TVMP) and inspection as specified by NERC Reliability Standard FAC-003-3. In general, Generator Owners do not have staff that are qualified and experienced to create a TVMP, perform Right-of-Way inspections, and perform any required tree trimming (as is required by FAC-003-3 Requirement 1.3). Once a complete inventory is created, the Generator Owner will begin the process of gathering information for the TVMP. In instances where the generation interconnection Facilities are owned by a partnership, a majority or operating partner will need to obtain partnership

approval to proceed with procurement of a TVMP expert, and later a tree trimming crew. Typically, a request for proposal to hire TVMP consultant is initiated which could take several weeks in order to obtain sufficient bids (and also satisfy Sarbanes Oxley requirements). Once all bids have been received, a contract with a TVMP consultant is signed. At this point, the TVMP consultant and Generator Owner staff will develop the TVMP, which needs to take into account local growth conditions, types of vegetation and other aspects required by FAC-003. Once the TVMP is developed, Generator Owner staff and the TVMP consultant will need to perform a Right-of-Way inspection (as required in FAC-003-3 Requirement 1), usually done using GPS, LIDAR and other tools by experienced and qualified staff.

Once a Right-of-Way inspection is completed and clearances are required, the Generator Owner will need to issue a request for proposal to hire a tree trimming crew that is qualified and experienced to perform required clearance trimming. Once all bids have been received, a contract with a tree trimming crew is signed. When the tree trimming crew is acquired, the crew will need to familiarize themselves with the entity's TVMP and required clearances. The Generator Owner will typically need to schedule any required outages in order for the tree trimming crew to perform the needed clearance trimming. This action would also include the implementation of the work plan as required in FAC-003-3 Requirement 2. During scheduled outages, if required, the tree trimming crew will perform any required clearances and document the activities.

Another typical action is the Generator Owner establishing a system for maintaining TVMP-related activities, including maintenance of inspection and clearance documentation (as required in FAC-003-3 Requirement 1.2). On an ongoing basis, in addition to performing inspections and clearances as required by the entity's TVMP, the Generator Owner will need to ensure that the training and qualification requirements for the standard are met. The entity will also need to maintain documentation of all FAC-003-3 activities for compliance period of one year to meet compliance with the standard.

Again, due to a typical lack of experience and qualifications required by FAC-003-3, compliance with this standard by a Generator Owner may take as long as two years – in part because many entities will have generator interconnection Facilities in various parts of the country which may require several instances of TVMP and numerous Right-of-Way inspections.

Effective Date

There are two effective dates associated with this implementation plan:

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one

year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.
2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.
3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.
4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12

months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Implementation Plan for FAC-003-3 — Transmission Vegetation Management

Prerequisite Approvals

There are a number of scenarios that could occur regarding the approval of FAC-003-2 —Vegetation Management must be implemented that would affect the implementation of FAC-003-3.

If FAC-003-2 is filed with applicable regulatory authorities and approved before FAC-003-3 is filed with applicable regulatory authorities, then when and if FAC-003-3 is approved by applicable regulatory authorities, the implementation plan and effective dates for Transmission Owners in FAC-003-2 will be transferred into this implementation plan. The “clock” for calculating effective dates for Transmission Owners will still have started at the time specified in FAC-003-2 (based on the approval date of that standard ~~can~~). Generator Owners will be implemented required to comply with the implementation plan as outlined below.

If applicable regulatory authorities elect to approve only FAC-003-3 and not FAC-003-2, the original implementation plan for Transmission Owners as outlined in FAC-003-2 will be transferred into this implementation plan. Generator Owners will be required to comply with the implementation plan as outlined below. The “clocks” for calculating the effective dates for both Transmission Owners and Generator Owners will begin at the same time.

If applicable regulatory authorities approve FAC-003-2 and FAC-003-3 at the same time, the implementation plan and effective dates for Transmission Owners in FAC-003-2 will be transferred into this implementation plan and FAC-003-2 will be immediately retired. Generator Owners will be required to comply with the implementation plan as outlined below. The “clocks” for calculating the effective dates for both Transmission Owners and Generator Owners will begin at the same time.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. All requirements and the two revised definitions in the proposed standard FAC-003-2 will be retired when at midnight the day before FAC-003-3 becomes effective.

There are two revised definitions in the proposed standard:

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either

construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

There is one new definition in the proposed standard:

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

The current glossary definitions of Right-of-Way and Vegetation Inspection, or the glossary definitions of Right-of-Way and Vegetation Inspection in FAC-003-2, if that standard has been approved, will be retired at midnight the day before FAC-003-3 (and with it, the above definitions of Right-of-Way and Vegetation Inspection) becomes effective. The above definition of Minimum Vegetation Clearance Distance will be added to the NERC glossary upon approval of FAC-003-3, or the above definition of Minimum Vegetation Clearance Distance will replace (and thus force the retirement, at midnight the day before FAC-003-3 is approved) of the same definition in FAC-003-2, if FAC-003-2 has been approved.

Compliance with Standard

~~There are no changes to~~ As outlined above under "Prerequisite Approvals," the requirements applicable to inclusion of Transmission Owners already proposed in this implementation plan will depend on order in which regulatory authorities approved FAC-003-2, and the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

~~The proposed changes to Version 2 of the standard only address Generator Owner applicability and requirements (add Generator Owner to sections 4.1.2 and 4.FAC-003-3 and add applicable Generator Owner to all requirements).~~ Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

To reach compliance with the standard, a Generator Owner will have to perform a full review of as-built drawings and determine which generation interconnection Facilities require a Transmission

Vegetation Management Plan (TVMP) and inspection as specified by NERC Reliability Standard FAC-003-3. In general, Generator Owners do not have staff that are qualified and experienced to create a TVMP, perform Right-of-Way inspections, and perform any required tree trimming (as is required by FAC-003-3 Requirement 1.3). Once a complete inventory is created, the Generator Owner will begin the process of gathering information for the TVMP. In instances where the generation interconnection Facilities are owned by a partnership, a majority or operating partner will need to obtain partnership approval to proceed with procurement of a TVMP expert, and later a tree trimming crew. Typically, a request for proposal to hire TVMP consultant is initiated which could take several weeks in order to obtain sufficient bids (and also satisfy Sarbanes Oxley requirements). Once all bids have been received, a contract with a TVMP consultant is signed. At this point, the TVMP consultant and Generator Owner staff will develop the TVMP, which needs to take into account local growth conditions, types of vegetation and other aspects required by FAC-003. Once the TVMP is developed, Generator Owner staff and the TVMP consultant will need to perform a Right-of-Way inspection (as required in FAC-003-3 Requirement 1), usually done using GPS, LIDAR and other tools by experienced and qualified staff.

Once a Right-of-Way inspection is completed and clearances are required, the Generator Owner will need to issue a request for proposal to hire a tree trimming crew that is qualified and experienced to perform required clearance trimming. Once all bids have been received, a contract with a tree trimming crew is signed. When the tree trimming crew is acquired, the crew will need to familiarize themselves with the entity's TVMP and required clearances. The Generator Owner will typically need to schedule any required outages in order for the tree trimming crew to perform the needed clearance trimming. This action would also include the implementation of the work plan as required in FAC-003-3 Requirement 2. During scheduled outages, if required, the tree trimming crew will perform any required clearances and document the activities.

Another typical action is the Generator Owner establishing a system for maintaining TVMP-related activities, including maintenance of inspection and clearance documentation (as required in FAC-003-3 Requirement 1.2). On an ongoing basis, in addition to performing inspections and clearances as required by the entity's TVMP, the Generator Owner will need to ensure that the training and qualification requirements for the standard are met. The entity will also need to maintain documentation of all FAC-003-3 activities for compliance period of one year to meet compliance with the standard.

Again, due to a typical lack of experience and qualifications required by FAC-003-3, compliance with this standard by a Generator Owner may take as long as two years – in part because many entities will have generator interconnection Facilities in various parts of the country which may require several instances of TVMP and numerous Right-of-Way inspections.

Effective Date

There are ~~three~~two effective dates associated with this implementation plan:

~~116-390 Village Blvd.
Princeton, NJ 08540~~

~~609.452.8060~~ | ~~www.nerc.com~~ **Implementation Plan for FAC-003-3**

The first ~~effective date applies to Transmission Owners.~~

~~In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.~~

The ~~second~~ effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The ~~third~~ second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Exceptions:

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or as designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being ~~subject~~ an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to ~~this~~ become an element of an IROL or an element of a Major WECC Transfer Path.

2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.
3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.
4. An existing transmission line operated at 200kV or higher ~~that~~which is newly acquired by an asset owner and which was not previously subject to this standard; becomes subject to this standard 12 months after the acquisition date ~~of the line.~~
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Implementation Plan for FAC-003-X – Transmission Vegetation Management Program

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. FAC-003-1 will be retired at midnight the day before FAC-003-X becomes effective.

There is one revised definition in the proposed standard:

Right-of-Way: A corridor of land on which electric lines may be located. The Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of Right-of-Way will be retired at midnight the day before FAC-003-X (and with it, the above definition of Right-of-Way) becomes effective.

Compliance with Standard

There are no changes to the requirements applicable to Transmission Owners already in effect in FAC-003-1, and the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to FAC-003-1 only address Generator Owner applicability and requirements (add Generator Owner to section 4.3 and add applicable Generator Owner to all requirements). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

To reach compliance with the standard, a Generator Owner will have to perform a full review of as-built drawings and determine which generation interconnection Facilities require a Transmission Vegetation Management Plan (TVMP) and inspection as specified by NERC Reliability Standard FAC-003-X. In general, Generator Owners do not have staff that are qualified and experienced to create a TVMP and implement annual plans for vegetation management. Once a complete inventory is created, the Generator Owner will begin the process of gathering information for the TVMP. In instances where the generation interconnection Facilities are owned by a partnership, a majority or operating partner will need to obtain partnership approval to proceed with procurement of a TVMP expert, and later a tree trimming crew. Typically, a request for proposal to hire TVMP consultant is initiated, which could take several weeks in order to obtain sufficient bids (and also satisfy Sarbanes Oxley requirements). Once all bids have been received, a contract with a TVMP consultant is signed. At this point, the TVMP consultant and

Generator Owner staff will develop the TVMP, which needs to take into account local growth conditions, types of vegetation and other aspects required by FAC-003-X. Once the TVMP is developed, Generator Owner staff and the TVMP consultant will need to perform a Right-of-Way inspection, usually done using GPS, LIDAR and other tools by experienced and qualified staff.

Once a Right-of-Way inspection is completed and clearances are required, the Generator Owner will need to issue a request for proposal to hire a tree trimming crew that is qualified and experienced to perform required clearance trimming. Once all bids have been received, a contract with a tree trimming crew is signed. When the tree trimming crew is acquired, the crew will need to familiarize themselves with the entity's TVMP and required clearances. The Generator Owner will typically need to schedule any required outages in order for the tree trimming crew to perform the needed clearance trimming. This action would also include the implementation of the work plan. During scheduled outages, if required, the tree trimming crew will perform any required clearances and document the activities.

Another typical action is the Generator Owner establishing a system for maintaining TVMP-related activities, including maintenance of inspection and clearance documentation. On an ongoing basis, in addition to performing inspections and clearances as required by the entity's TVMP, the Generator Owner will need to ensure that the training and qualification requirements for the standard are met. The entity will also need to maintain documentation of all FAC-003-X activities for compliance period of one year to meet compliance with the standard.

Again, due to a typical lack of experience and qualifications required by FAC-003-X, compliance with this standard by a Generator Owner may take as long as two years – in part because many entities will have generator interconnection Facilities in various parts of the country which may require several instances of TVMP and numerous Right-of-Way inspections.

Effective Date

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Implementation Plan for FAC-003-X – Transmission Vegetation Management Program

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards.

FAC-003-1 will be retired ~~when~~ at midnight the day before FAC-003-~~2~~X becomes effective.

There is one revised definition in the proposed standard:

Right-of-Way: A corridor of land on which electric lines may be located. The Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of Right-of-Way will be retired at midnight the day before FAC-003-X (and with it, the above definition of Right-of-Way) becomes effective.

Compliance with Standard

There are no changes to the requirements applicable to Transmission Owners already in effect in FAC-003-1, and the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to FAC-003-1 only address Generator Owner applicability and requirements (add Generator Owner to section 4.3 and add applicable Generator Owner to all requirements). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

To reach compliance with the standard, a Generator Owner will have to perform a full review of as-built drawings and determine which generation interconnection Facilities require a Transmission Vegetation Management Plan (TVMP) and inspection as specified by NERC Reliability Standard FAC-003-X. In general, Generator Owners do not have staff that are qualified and experienced to create a TVMP and implement annual plans for vegetation management. Once a complete inventory is created, the Generator Owner will begin the process of gathering information for the TVMP. In instances where the generation interconnection Facilities are owned by a partnership, a majority or operating partner will need to obtain partnership approval to proceed with procurement of a TVMP expert, and later a tree trimming crew. Typically, a request for proposal to hire TVMP consultant is initiated, which could take several weeks in order to obtain sufficient bids (and also satisfy Sarbanes Oxley requirements). Once all bids have been received, a

contract with a TVMP consultant is signed. At this point, the TVMP consultant and Generator Owner staff will develop the TVMP, which needs to take into account local growth conditions, types of vegetation and other aspects required by FAC-003-X. Once the TVMP is developed, Generator Owner staff and the TVMP consultant will need to perform a Right-of-Way inspection, usually done using GPS, LIDAR and other tools by experienced and qualified staff.

Once a Right-of-Way inspection is completed and clearances are required, the Generator Owner will need to issue a request for proposal to hire a tree trimming crew that is qualified and experienced to perform required clearance trimming. Once all bids have been received, a contract with a tree trimming crew is signed. When the tree trimming crew is acquired, the crew will need to familiarize themselves with the entity's TVMP and required clearances. The Generator Owner will typically need to schedule any required outages in order for the tree trimming crew to perform the needed clearance trimming. This action would also include the implementation of the work plan. During scheduled outages, if required, the tree trimming crew will perform any required clearances and document the activities.

Another typical action is the Generator Owner establishing a system for maintaining TVMP-related activities, including maintenance of inspection and clearance documentation. On an ongoing basis, in addition to performing inspections and clearances as required by the entity's TVMP, the Generator Owner will need to ensure that the training and qualification requirements for the standard are met. The entity will also need to maintain documentation of all FAC-003-X activities for compliance period of one year to meet compliance with the standard.

Again, due to a typical lack of experience and qualifications required by FAC-003-X, compliance with this standard by a Generator Owner may take as long as two years – in part because many entities will have generator interconnection Facilities in various parts of the country which may require several instances of TVMP and numerous Right-of-Way inspections.

Effective Date

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Implementation Plan for PRC-004-2.1— Analysis of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. PRC-004-2 will be retired when PRC-004-2.1 becomes effective.

Compliance with Standard

The proposed change to Requirement R2 is a clarifying change. While there was no reliability gap in the previous version of the standard, if applied literally, there was the possibility for the misperception that the Generator Owner was only responsible for analyzing its generator Protection System Misoperations, exclusive of its generator interconnection Facility. The errata change to R2 makes clear that generator interconnection Facilities are also part of Generator Owners' responsibility in the context of this standard.

Because the change is merely a clarifying change, no additional time for compliance is needed.

Effective Date

In those jurisdictions where regulatory approval is required, all requirements become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements become effective upon Board of Trustees' adoption.

Technical Justification

Project 2010-07 Generator Requirements at the Transmission Interface

Background

As part of its work on Project 2010-07—Generator Requirements at the Transmission Interface, the standard drafting team (SDT) reviewed 34 reliability standards and 102 requirements to determine what changes are necessary to close a reliability gap with respect to what is commonly known as the generator interconnection Facility. The majority of these standards and requirements had been addressed in the [Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface](#) (Ad Hoc Report), and additional standards have been reviewed, and will continue to be reviewed, as a result of informal discussions with NERC and FERC staffs.

The basis for standard modifications recommended by the Ad Hoc Group for Generator Requirements at the Transmission Interface (Ad Hoc Group) was a few fundamental clarifications to the definitions of Generator Owner, Generator Operator, and Transmission, along with the creation of new definitions: one for Generator Interconnection Facility and one for Generator Interconnection Operational Interface. The Ad Hoc Group proposed the addition of these two new definitions to 26 standards encompassing 29 requirements (new and old), along with some modifications to FAC-003 to make it applicable to Generator Owners under certain circumstances.

Since the publication of the Ad Hoc Report, various entities have challenged these modifications and the recommended creation of the new definitions. The SDT has developed a more focused approach than that of the Ad Hoc Group: to propose recommendations whereby radial interconnection Facilities (at or above 100 kV) that are owned and operated by generating entities will be included in a small set of standards and requirements previously only applicable to Transmission Owners. The SDT agrees completely with the Ad Hoc Group's conclusion that Generator Owners and Operators of these radial generator tie-line Facilities (at voltages equal to or greater than 100 kV) should not be registered as Transmission Owners and Transmission Operators in order to maintain reliability on the Bulk Electric System (BES).

The SDT's justification for this strategy is rooted in the very title of its standards project: "Generator Requirements at the Transmission Interface." That is, the goal and scope of the project has always been to determine the responsibilities of those Generator Owners and Generator Operators that own or operate an interconnection Facility (in some cases labeled a "transmission Facility") between the generator and the interface with the portion of the BES where Transmission Owners and Transmission Operators take over ownership and operating responsibility. These kinds of Generator Owners and Generator Operators do not own or operate Facilities that are part of the interconnected system; rather, they own and operate radial Facilities that are connected to the boundary of the

interconnected system and as such have a limited role in providing reliability compared to those that operate in a networked fashion beyond the point of interconnection.

While some argue that these interconnecting portions of a Generator Owner's Facilities could be defined as Transmission and thus require the Generator Owner and Generator Operator for the Facility to be classified and registered as a Transmission Owner and Transmission Operator, the SDT does not believe this is necessary to provide an appropriate level of reliability for the BES. Just as important, such classification and registration could actually cause a reduction in reliability. Generator Owners and Generator Operators do not need, and in some cases may be prohibited from having, a wide-area view and responsibility for the integrated transmission system. Requiring Generator Owners and Generator Operators to have such responsibilities would require significant training, would require substantially more data and modeling responsibilities, and would detract from the entities' primary functions: to own and operate their generation equipment – including any Facilities owned and operated at voltages of 100 kV or greater that connect to the interconnected system – in a reliable manner.

Additionally, the SDT believes that the industry is much more aware today of the need to include all elements (owned and operated at 100 kV or higher) of a generator Facility in the procedures and compliance program of the registered entity that owns or has operational responsibility of those elements. Industry awareness was raised substantially at the time the [October 17, 2010 Facility Ratings Recommendation to Industry](#) was issued (which included Generator Owners and specifically addressed interconnection Facilities in [the Q&A document](#)). While this applies to a specific NERC Recommendation, the SDT considers this compelling evidence that the paradigm for thinking about generator interconnection Facilities is shifting.

All of this has led the SDT to its current conclusions to modify FAC-001, FAC-003, and PRC-004. The SDT does not believe any further modifications to standards are necessary to maintain an appropriate level of reliability based on the revised assumption that while generator Facilities (at 100 kV and above) will be considered by some to be transmission, Generator Owners and Generator Operators should not be registered as Transmission Owners and Transmission Operators simply as a result of the ownership and operation of such Facilities. Because the majority of commenters support the SDT's current recommendation to not adopt new terms, the SDT has elected to focus on its standard changes and to postpone discussions on revisions to existing, or creation of new, definitions until the standards have been successfully balloted.

Below, the SDT discusses the changes it has proposed for FAC-001, FAC-003, and PRC-004 and then provides justification for not modifying any additional standards that had been proposed for substantive modification in the Ad Hoc Report.

Review of SDT's Proposed Standard Changes

FAC-001-1—Facility Connection Requirements

While some stakeholders have questioned the modifications in the proposed FAC-001-1, the SDT remains convinced that there is the potential for a reliability gap if this standard is not modified so that it applies to a Generator Owner if and when it executes an Agreement to evaluate the reliability impact of interconnecting a third party Facility to its existing generation interconnection Facility. The intent of this modified language is to start the compliance clock when the Generator Owner executes an Agreement to perform the reliability assessment required in FAC-002-1. This step is expected to occur if a Generator Owner is compelled by a regulatory body to allow such interconnection. Assuming that a regulatory body would require a Generator Owner to evaluate such an interconnection request, the SDT expects the Generator Owner and the third party to execute some form of an Agreement. The SDT intentionally excluded a specific reference to the form of Agreement (such as a feasibility study) in deference to stakeholder suggestions to avoid comingling of commercial and reliability issues in reliability standards.

The SDT acknowledges that the scenario described in the proposed FAC-001-1 may be rare, but in the past (for instance, FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the SDT thinks it is important to clarify the responsibilities related to such a request in NERC's Reliability Standards. And, while the SDT acknowledges that such regulatory action might also result in the Generator Owner being registered for other functions, such as Transmission Owner, Transmission Planner, and/or Transmission Service Provider, it decided the proposed revision provides appropriate reliability coverage until any additional registration is required and does not impact any Generator Owner that never executes an Agreement as described in the standard.

FAC-003-X and FAC-003-3—Vegetation Management

The SDT and most stakeholders agree with the Ad Hoc Group recommendation that FAC-003 be applicable to Generator Owners that own a generation interconnection if that Facility contains overhead conductors. The Ad Hoc Group originally excluded such a Facility from this requirement if its length is less than two spans (generally one half mile from the generator property line). After reviewing formal comments, the SDT agreed to revise the exclusion so that it applies to a Facility if its length is "one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard" to approximate line of sign from a fixed point. Other than revising this exclusion, the SDT applied the same criteria to the Generator Owner as applies to the Transmission Owner in the current FERC approved version of this standard as well as one approved by stakeholders (under Project 2007-07) in February 2011. The SDT is communicating with NERC staff and the Project 2007-07 SDT to ensure that changes to this standard will be coordinated before submitting to NERC's Board of Trustees, but feels compelled to continue to posting both versions until the outcome of Project 2007-07 efforts is clearer.

PRC-004-2.1—Analysis and Mitigation of Transmission and Generation Protection System Misoperations

After examining all standards it had previously reviewed, the SDT elected to propose a slight change to PRC-004-2.1. While the SDT rejected other opportunities to “drop” the phrase “generator interconnection Facility” into requirements because it is not typically the best way to add clarity, in the case of PRC-004-2, the SDT fears that the phrasing of R2 (“The Generator Owner shall analyze its generator Protection System Misoperations...”) could lead to some confusion about whether an interconnection Facility is included. Thus, the SDT proposes adding “and generator interconnection Facility” as redlined in the draft standard. Because there is no change in applicability, and because the SDT believes that most Generator Owners already interpret the standard in this manner, we consider this to be a minor and not substantive change employed only to add clarity.

Review of Other Substantive Standard Modifications from the Ad Hoc Report

To ensure that no reliability gaps were left when the SDT shifted its strategy from the original strategy of the Ad Hoc Group, the SDT reviewed all standards for which the Ad Hoc Group had proposed changes, and again discussed whether making these standards applicable to Generator Owners or Generator Operators would increase reliability with respect to generator requirements at the transmission interface. Below, the SDT provides its reasons for not proposing the substantive changes that were included in the Ad Hoc Report (that is, a change in applicability or new requirement, beyond simply adding the text “including its Generator Interconnection Facility” to an existing requirement). As Project 2010-07 continues, the SDT will work with FERC staff, NERC staff, and industry groups to determine if its list of proposed standards is supported industry-wide, and whether other standards need to be considered.

EOP-003-1—Load Shedding Plans

For **EOP-003-1**, the Ad Hoc Group originally proposed that Generator Operators be added to the requirement that requires Transmission Operators and Balancing Authorities to coordinate automatic load-shedding throughout their areas. The SDT determined that this addition was unnecessary because PRC-001 already includes the requirement that Transmission Operators coordinate their underfrequency load shedding programs with underfrequency isolation of generating units, which infers that Generator Operators need to provide their underfrequency settings to their respective Transmission Operator. Further, Generator Operators typically do not have the technical expertise or access to the data necessary for the high-level coordination that this standard requires.

IRO-005-2—Reliability Coordination – Current Day Operations

The SDT chose not to adopt the revision to **IRO-005-2** proposed by the Ad Hoc Group. This revision would have added a new requirement that would read, “The Generator Operator shall immediately inform the Transmission Operator of the status of the Special Protection System, including any degradation or potential failure to operate as expected for SPS relay or control equipment under its control.” The SDT initially arrived at this decision because of the planned retirement of IRO-005-2. In subsequent meetings, the SDT also reached the conclusion that there is no reliability gap as PRC-001-1 R2 already requires the Generator Operator to notify reliability entities of relay or equipment failures.

The SDT believes that a Special Protection System is a form of protection system and therefore any degradation or potential failure to operate as expected would be required to be reported by the Generator Operator to reliability entities (Balancing Authorities, Transmission Operators, and Reliability Coordinators).

Personnel Performance, Training, and Qualifications (PER) Standards

The SDT also chose not to propose the revisions to **PER-001-0—Operating Personnel Responsibility and Authority** or **PER-002-0—Operating Personnel Training** that were proposed by the Ad Hoc Group. For PER-001-0, the Ad Hoc Group had proposed adding a new R2 that would read “Each Generator Operator shall provide operating personnel with the responsibility and authority to implement real-time actions to ensure the stable and reliable operation of the Generation Facility and Generation Interconnection Facility, and the responsibility and authority to follow the directives of reliability authorities including the Transmission Operator and Balancing Authority.” To PER-002-0, the Ad Hoc Group proposed adding the Generator Operator to R1 (“Each Transmission Operator, Generator Operator, and Balancing Authority shall be staffed with adequately trained operating personnel”) and adding a new R3 that would read: “Each Generator Operator shall implement an initial and continuing training program for all operating personnel that are responsible for operating the Generator Interconnection Facility that verifies the personnel’s ability and understanding to operate the equipment in a reliable manner.”

These proposed changes to the PER standards have little to do with responsibilities that relate specifically to a generator interconnection Facility. Issues related to the training of Generator Operators existed separately from the work of Project 2010-07, and the SDT agrees that its scope limits its efforts to standards that are directly related to generator requirements at the transmission interface. The SDT also cites past FERC Orders as proof that this issue is not within the scope of Project 2010-07. In Order 693, FERC directed NERC to "expand the applicability of the personnel training Reliability Standard, PER-002-0, to include (i) generator operators centrally-located at a generation control center with a direct impact on the reliable operation of the Bulk-Power System..." In Order 742, FERC reaffirmed this, stating that it is "not modifying the Order No. 693 directive regarding training for certain generator operator dispatch personnel, nor are we expanding a generator operator’s responsibilities."

Centrally-located generator operators working at a generation control center typically dispatch the output from multiple generating units. As such, they can be called upon to comply with orders from their Balancing Authority that may have a significant impact on the reliable operation of the BES. Their training would be covered by proposed change to PER-002-0 and Order 742. Generator Operators who deal with interconnection facilities at individual generating plants, on the other hand, typically do not receive reliability-based orders specific to the interconnection Facilities and are therefore not covered by Order 742. Further, the SDT believes there is no reliability gap as Generator Operators are, under

currently approved reliability standards, required to follow directives issued by a Balancing Authority, Reliability Coordinator or Transmission Operator.

These items are clearly important ones for the Commission, but the SDT does not think it is appropriate to fold modifications to these PER standards into the scope of its work until it is specifically directed to do so. For now, modifications to PER-002-0 based on Order 693 directives are already included in [NERC's Issue Database](#) (P. 52-53) to be addressed by a future project. PER-001-0 is not addressed in the Issues Database, but the [Project 2007-03 drafting team has proposed](#) that the standard be retired.

Transmission Operations (TOP) Standards

For TOP standards, the Ad Hoc Group proposed a number of new requirements that the SDT does not see as supportive of reliability. This set of standards was somewhat difficult to analyze, as the Project 2007-03—Real-time Transmission Operations drafting team has made significant changes to TOP-001 through TOP-008, resulting in three proposed TOP standards where there are currently eight (see the project's [Implementation Plan](#)). The Project 2010-07 reviewed both the FERC-approved TOP standards and the fifth draft of the modified standards in Project 2007-03 to determine whether it needed to propose any additional changes to cover radial generator interconnection Facilities. In addition, the Project 2010-07 SDT contacted the Project 2010-07 to get its opinion as to whether there might be any reliability gaps related to generator interconnection facilities. No such changes will be proposed for the reasons outlined below.

The Ad Hoc Group proposed adding two new requirements to **TOP-001-1—Reliability Responsibilities and Authority**. The first was proposed as R9 and read: "The Generator Operator shall coordinate the operation of its Generator Interconnection Facility with the Transmission Operator to whom it interconnects in order to preserve Interconnection reliability..." The SDT does not agree that this change is necessary. TOP-002-2 R3 (proposed to be covered in the future by TOP-003-2, as outlined in Project 2007-03's Implementation Plan) already requires the Generator Operator to coordinate its current-day, next-day, and seasonal operations with its Host Balancing Authority and Transmission Service Provider. These entities are, in turn, required to coordinate with their respective Transmission Operator. Additionally, TOP-002-2 R4 (proposed to be covered in the future by TOP-003-2, as outlined in Project 2007-03's Implementation Plan) requires each Balancing Authority and Transmission Operator to coordinate with neighboring Balancing Authorities and Transmission Operators and with its Reliability Coordinator. With these requirements, Generator Operators are already required to provide necessary operations information to Transmission Operators. To require the same thing in TOP-001-1 would be redundant.

The second new requirement proposed by the Ad Hoc Group for TOP-001-1 was R10, which was to read: "The Transmission Operator shall have decision-making authority over operation of the Generator Interconnection Operational Interface at all times in order to preserve Interconnection reliability." As cited above, TOP-002-2 R3 (proposed to be covered in the future by TOP-003-2, as

outlined in Project 2007-03's Implementation Plan) already requires the Generator Operator to coordinate with its interconnecting Transmission Operator. Further, TOP-001-1 R3 (proposed to be covered in the future in the proposed IRO-001-2 R2 and R3) already requires the Generator Operator to comply with reliability directives issued by the Transmission Operator. These requirements effectively give the Transmission Operator decision-making authority over operation of all generator Facilities up to the point of interconnection. To require the same thing in TOP-001-1 would be redundant.

The Ad Hoc Group also proposed a new requirement, R7, for **TOP-004-2—Transmission Operations** that would read: "The Generator Operator shall operate its Generator Interconnection Facility within its applicable ratings." The SDT does not agree that a reliability gap exists, because an operator has a fiduciary obligation to protect a Facility for which it is operationally responsible. FAC-008-1—Facility Ratings Methodology and FAC-009-1—Establish and Communicate Facility Ratings already infer that the reason for establishing a ratings methodology and communicating facility ratings to the Reliability Coordinator, Planning Authority, Transmission Planner, and Transmission Operator is "...for use in reliable planning and operation of the Bulk Electric System." Further, TOP-004-2 is proposed to be retired under the work of the Project 2007-03 drafting team. Its requirements will either be deleted or assigned elsewhere.

The Ad Hoc team proposed to add a new requirement, R5, to **TOP-008-1—Response to Transmission Limit Violations** that would read "The Generator Operator shall disconnect the Generator Interconnection Facility when safety is jeopardized or the overload or abnormal voltage or reactive condition persists and generating equipment or the Generator Interconnection Facility is endangered. In doing so, the Generator Operator shall notify its Transmission Operator and Balancing Authority impacted by the disconnection prior to switching, if time permits, otherwise, immediately thereafter." The SDT sees no reliability benefit to adding this requirement. TOP-001-1 R7 ("Each Transmission Operator and Generator Operator shall not remove Bulk Electric System facilities from service if removing those facilities would burden neighboring systems unless...") and its parts give the Generator Operator authority over its Facilities, which would include the generator interconnection Facility. If there is an outage, R7.1 requires the Generator Operator to notify and coordinate with its Transmission Operator, which is required to notify the Reliability Coordinator and other affected Transmission Operators. And as with TOP-004-2, the Project 2007-03 drafting team has proposed to deleting all of TOP-008-1's requirements and retiring the standard.

Conclusion

The Project 2010-07 SDT is confident that the changes it has proposed address the reliability gap that exists with respect to the responsibilities of Generator Owners and Generator Operations that own radial interconnection Facilities. The changes to FAC-001 and FAC-003 (and now PRC-004) have been supported by stakeholders during comment periods, and there has been no strong support for bringing other standards into the scope of this project.

That said, the SDT recognizes the success of its work depends on stakeholders, NERC, and FERC agreeing that generator requirements at the transmission interface are covered under NERC Reliability Standards, both for the sake of reliability and to prevent further unwarranted registration of Generator Owners and Generator Operators as Transmission Owners and Transmission Operators. If the SDT's work does not close the gap in the eyes of all parties, that work will have been unsuccessful, so the SDT is considering all feedback it receives with request to this project. While it is posting changes to only FAC-001, FAC-003, and PRC-004, and stands by that decision, it will continue to consider whether glossary term additions/modifications and modifications to other standards could enhance the reliability impact of this project. Based on conversations with NERC and FERC staff, and review of FERC's Order Denying Compliance Registry Appeals of Cedar Creek Wind Energy and Milford Wind Corridor Phase I (135 FERC ¶ 61,241), the SDT is discussing whether it should consider the following requirements for further review: EOP-005-1 R1, R2, R6, R7; FAC-014-2 R2; PER-003-1 R1, R1.1, R1.2; PRC-001-1 R2, R2.2, R4, R6; PRC-004-1 R1; TOP-001 R1; TOP-004-2 R6, R6.1, R6.2, R6.3, R6.4; and TOP-006-1 R3. The SDT is actively seeking stakeholder feedback as to whether, in light of these orders, it should consider additional standards and or new or modifications to existing definitions as it proceeds with its work.

Technical Justification: FAC-001-1

Project 2010-07 Generator Requirements at the Transmission Interface

In response to the June 17-July 17, 2011 formal posting of the proposed standard changes in Project 2010-07, the standard drafting team (SDT) received stakeholder comments on FAC-001-1 expressing concern about the feasibility of a Generator Owner receiving and executing an interconnection request on one of its interconnection Facilities, as well as concern about the market-related processes that would go along with such an interconnection request. In this technical justification document, the SDT seeks to further clarify its rationale for making the proposed FAC-001-1 applicable to qualifying Generator Owners.

While the SDT understands that interconnection requests for Generator Owner Facilities are still relatively rare, in the past (for instance, 134 FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities. The SDT acknowledges that FERC does not have jurisdiction over all Generator Owners, but realizes that the potential exists for a third party to request to interconnect its planned generator with an existing generator interconnection Facility (whose use at the time of the request is solely to transmit capacity, energy, and ancillary services from the existing generator).

The SDT discussed the various ways such an interconnection could occur and agrees that if the third party interconnection could be accomplished without the need for the existing Generator Owner to develop its own connection requirements and system performance requirements and determine impacts on the interconnected transmission systems, this standard need not apply to the Generator Owner. And the SDT agrees that in many cases, these connection requirements, system performance requirements, and determined impacts on the interconnected transmission systems are currently determined by entities registered as either a Transmission Owner, Transmission Planner, and/or Transmission Service Provider. However, the SDT remains convinced (based on the orders cited above) that there may be occasions where FERC or another regulatory agency compels the Generator Owner to allow a third party to interconnect its planned generator with an existing generator interconnection Facility. Where this occurs, the SDT feels it is necessary for the existing owner of that generator interconnection Facility to provide connection requirements to the third party that requests interconnection. The SDT also believes, and many comments seem to support, that performance requirements and a determination of impact to the interconnected transmission systems need to be evaluated by some entity. The question becomes which entity.

The SDT can only work within the standards development process. We cannot address other regulatory issues such as FERC-mandated open transmission access (Order 888 and subsequent) or state or provincial jurisdiction over generation or transmission assets. While we acknowledge these

mechanisms exists and may come into play in the scenarios described in the proposed FAC-001-1, we as the SDT can only deal within the context of reliability standards. For this reason, R2 indicates that FAC-001-1 applies only when a Generator Owner has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility. The SDT's reasoning here is that if the owner of the existing generator interconnection Facility agrees, or is compelled, to allow a third party to interconnect, and can do so using existing agreements, contracts, and/or tariffs (and thereby avoid having an executed Agreement to evaluate the reliability impact of interconnecting third party Facility to the Generator Owner's existing Facility), and thus avoid having to develop its own connection requirements or perform impact studies, it will. In this example, it is likely that the existing Transmission Owner, Transmission Planner, and/or Transmission Service Provider processes and Agreements will be utilized and the purpose of FAC-001-1 will be met without applying this standard to the Generator Owner.

If, on the other hand, the owner of the existing generator interconnection Facility agrees, or is compelled, to allow a third party to interconnect, but cannot do so without having to develop its own connection requirements or perform impact studies, the SDT believes that the potential for a reliability gap exists. This might occur, for instance, if the owner of an existing generator interconnection Facility was compelled to allow interconnection and to implement open transmission access. In this example, (under FERC Order 888 and subsequent orders), the existing interconnection owner becomes a Transmission Service Provider and is required to have an Open Access Transmission Tariff (OATT). FERC's pro forma OATT requires the Transmission Service Provider to, among other things, perform system impact and feasibility studies. In order to do so, such studies must be coordinated with other Transmission Service Providers and Transmission Planners. And, to further complicate the issue, the SDT has been informed that in Texas, a Generator Owner is not allowed to own transmission.

Clearly, these issues are complex and not all are within the jurisdiction of federal or provincial regulators. For these reasons, the SDT took the only approach it found workable. If, and only if, the existing owner of a generator interconnection Facility has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to its existing generation Facility would the proposed FAC-001-1 apply. The SDT believes that this is most likely to occur if the owner of an existing generator interconnection Facility is compelled to allow a third party to interconnect and adopt open transmission access. However, the SDT cannot be certain this is the only example and it therefore proposes to add this new requirement to FAC-001-1. In doing so, the SDT acknowledges that the Generator Owner may not, at the time it agrees or is compelled to allow a third party to interconnect, have the necessary expertise to conduct the required interconnect studies to meet this standard. However, the SDT believes that, upon executing such Agreement, the Generator Owner will have to acquire such expertise. How the Generator Owner chooses to do so is not for the SDT to determine. The SDT is tasked with identifying potential reliability gaps and addressing such gaps through the standards development process.

The SDT does agree with many comments asking that the Generator Owner not be required to maintain its connection requirements, and there was robust discussion among the team and observers. Some were concerned that, without an obligation to maintain, there would not be a review to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria. Others were concerned that the third party requesting interconnection might not actually interconnect, but the owner of the existing generator interconnection Facility would, having executed an evaluation agreement, be forever obligated to maintain connection requirements. In the end, the SDT agreed that if the owner of the existing generator interconnection Facility adopted open access or was determined to be providing “transmission service” it was likely that its existing registration would be re-evaluated and that the issue would be more appropriately addressed at that time. The SDT has therefore agreed to remove maintenance requirements for Generator Owners from both Requirement R2 and Requirement R4 in the proposed FAC-001-1.

We hope that you have found this explanation of our rationale helpful, but if you have further suggestions for improvement or clarity, please submit them in your comments on this latest posting.

Unofficial Comment Form

Generator Requirements at the Transmission Interface (Project 2010-07)

Please **DO NOT** use this form to submit comments. Please use the [electronic comment form](#) to submit comments on the first formal posting for Project 2010-07—Generator Requirements at the Transmission Interface. The electronic comment form must be completed by **November 18, 2011**.

[2010-07 Project Page](#)

If you have questions please contact Mallory Huggins at mallory.huggins@nerc.net or 202-383-2629.

Background

With the exception of the errata change to PRC-004-2.1, which is being posted for the first time, this is the second formal comment period and first ballot period for the standards included in Project 2010-07. The standards will be posted for formal comment for 45-days, with a ballot during the final 10 days of the comment period. Ballot pool formation will take place during the first 30 days of the comment period, and [the SDT is hosting an interactive webinar on October 6](#).

A 30-day formal comment period took place earlier this year, from June 17-July 17, 2011. The SDT thanks all those who provided feedback during that comment period. The SDT has reviewed and considered all comments submitted, and has incorporated many of them into its latest proposed standards, as explained in the Consideration of Comments form posted at the Project 2010-07 project page.

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. While many Generator Owners and Generator Operators operate Elements and Facilities that are considered by some entities to be Transmission, these are most often radial Facilities that are not part of the integrated grid, and as such should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.

As part of the BES, generators affect the overall reliability of the BES. However, registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner's or Generator Operator's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. The SDT believes this can be accomplished by properly applying FAC-001, FAC-003, and PRC-004-2.1 to Generator Owners as proposed in the redline standards posted for comment.

NOTE: The Project 2007-07 Vegetation Management team will likely be posting a sixth draft of FAC-003-2 for recirculation ballot during the Project 2010-07's comment period. Both teams acknowledge this overlap, and have been in contact to discuss best strategies moving forward. The

changes proposed by the Project 2010-07 SDT in FAC-003-3 are minimal, and serve only to apply the standard and its requirements to qualifying Generator Owners. The SDT recognizes that a number of scenarios may occur with respect to the filing and approval of Versions 2 and 3 of FAC-003 and has attempted to account for those in the FAC-003-3 implementation plan.

You do not have to answer all questions. Enter all comments in Simple Text Format.

1. Based on stakeholder comment, the SDT clarified the applicability language of FAC-001-1 and removed the Generator Owner from R4. Do you support the proposed redline changes to FAC-001-1? (Please refer to the posted FAC-001-1 technical justification document for more information about the SDT's rationale for its changes.)

Yes

No

Comments:

2. Do you support the one year compliance timeframe for Generator Owners as proposed in the Implementation Plan for FAC-001-1?

Yes

No

Comments:

3. With respect to FAC-003, many commenters focused on the half-mile qualifier in FAC-003. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: "...that extends greater than one mile beyond the fenced area of the generating station switchyard..." We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.

Taking into consideration that only one of the versions of FAC-003 will actually be implemented, a decision that will be made as Project 2007-07—Vegetation Management moves forward, do you support the proposed redline changes to FAC-003-X and FAC-003-3?

Yes

No

Comments:

4. Do you support compliance timeframe for Generator Owners as included and explained in the Implementation Plans for FAC-003-X?

Yes

No

Comments:

5. In the FAC-003-3 implementation plan, the SDT has attempted to account for a number of different scenarios that could play out with respect to the filing and approvals of FAC-003-2 and FAC-003-3. Do you support this approach? If there are other scenarios that the SDT needs to account for, please suggest them here.

Yes

No

Comments:

6. In its technical justification document, the SDT reviews all standards that had been proposed for substantive modification in the Ad Hoc Group's original support and explains why, with the exception of FAC-003, modifying them would not provide any reliability benefit. Do you support these justifications? If you believe the SDT needs to add more information to its rationale for any of these decisions, please include suggested language here.

Yes

No

Comments:

7. The SDT is attempting to modify a set of standards so that radial generator interconnection Facilities are appropriately accounted for in NERC's Reliability Standards, both to close reliability gaps and to prevent the unnecessary registration of GOs and GOPs at TOs and TOPs. Does the set of standards currently posted achieve this goal?

Yes

No

Comments:

8. If you answered "yes" to Question 7, are the modifications the SDT has made in this posting the appropriate ones?

Yes

No

Comments:

9. If you answered "no" to Question 7, what standards need to be added or removed to achieve the SDT's goal? Please provide technical justification for your answer.

Yes

No

Comments:

10. Do you have any other comments that you have not yet addressed? If yes, please explain.

Yes

No

Comments:

Standards Announcement

Project 2010-07 Generator Requirements at the Transmission Interface
Ballot Pool Forming October 5 – November 4, 2011

Formal Comment Period October 5 – November 18, 2011

Initial Ballot Windows Open November 9 – 18, 2011

[Available Now](#)

The SDT has reviewed comments received during a 30-day formal comment period that took place earlier this year, from June 17-July 17, 2011, and thanks to all those who provided feedback during that comment period. The SDT has incorporated many of the suggested changes into its latest proposed standards, as explained in the posted Consideration of Comments.

This is the second formal comment period and initial ballot period for three standards included in Project 2010-07. Revised drafts of FAC-001-1 and two versions of FAC-003 – FAC-003-3 and FAC-003-X – along with minor modifications to PRC-004-2.1, have been posted for a formal comment period and initial ballot that will end on Friday, November 18, 2011. Note that FAC-003-X shows changes to the last approved version of the standard, while FAC-003-3 shows changes to the last version being developed by the Project 2007-07 drafting team to incorporate Requirements for Generator Owners in those standards.

PRC-004-2.1 is being posted for the first time with this posting, and is also being posted for a formal 45-day comment period with an initial ballot. Because the changes are very limited, the Standards Committee waived the initial formal comment period for this standard.

Instructions for Joining the Ballot Pool for Project 2010-07

Registered Ballot Body members may join the ballot pool to be eligible to vote in the upcoming ballots at the following page: [Join Ballot Pool](#)

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) One ballot pool list server has been set up and can be used for communication on each of the standards being balloted for this project. The list server is: bp-2010-07_FAC-001-1_in@nerc.com

Instructions for Commenting

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the [project page](#).

Next Steps

Separate ballots will be conducted for each standard. These ballot windows will begin on Wednesday, November 9, 2011 and end at 8 p.m. Eastern on Friday, November 18, 2011. NOTE: There is only one ballot pool to join for this project. There will be four separate ballots, one for each standard, and individuals who join this single ballot pool will be eligible to vote in all four ballots. This was done to make the process simpler for those who are voting. If you have any questions, please contact Monica Benson at monica.benson@nerc.net.

Background

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. While many Generator Owners and Generator Operators operate Facilities, commonly known as generator interconnection Facilities, that are considered by some entities to be transmission, these are most often radial Facilities that are not part of the integrated grid. As such, they should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.

As part of the BES, generators so affect the overall reliability of the BES. But registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner's or Generator Operator's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. This can be accomplished by properly applying FAC-001, FAC-003, and PRC-004 to Generator Owners as proposed in the redline standards posted for comment.

Before reviewing the standards, the drafting team encourages all stakeholders to read the [technical justification resource document](#) it has provided to describe its rationale and its work thus far.

Additional information is available on the [project page](#).

Standards Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Project 2010-07 Generator Requirements at the Transmission Interface

Four Ballot Windows Now Open Through 8 p.m. Eastern on Friday, November 18, 2011

Now Available

An initial ballot of each of the following standards is open through 8 p.m. Eastern on Friday, November 18, 2011. Note that the ballots are limited to the few modifications made to these standards to ensure that there is a functional entity responsible for requirements associated with the transmission line connecting the generator step up transformer to the transmission system (generator interconnection Facility).

- FAC-001-1 – Facility Connection Requirements
- Two versions of FAC-003 – Transmission Vegetation Management (FAC-003-3 and FAC-003-X). Note that FAC-003-X shows changes to FAC-003-1, while FAC-003-3 shows changes to FAC-003-2 developed by the Project 2007-07 drafting team. **FAC-003-2 was adopted by the NERC Board on November 3, and a revised version of FAC-003-3 showing the Project 2010-07 drafting team's changes against the Board's version has now been posted.**
- PRC-004-2.1 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

IMPORTANT: Updates on Posted Standards

Last week, while the Project 2010-07 standards were posted for comment, NERC's Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.

Additionally, when the NERC Board of Trustees adopted FAC-003-2 –Transmission Vegetation Management last week, it approved the standard with NERC staff-proposed VSLs rather than the Project 2007-07 SDT-developed VSLs that were originally posted with both FAC-003-2 and FAC-003-3. The posted versions of Project 2010-07's FAC-003-3 now include the FAC-003-2 VSLs proposed by NERC

staff, since they are the set that was approved by the NERC Board of Trustees. Note that the Project 2010-07 SDT made no substantive changes to any version of the FAC-003-2 VSLs; the SDT simply changed “Transmission Owner” to “responsible entity.” A text box has also been added to the VSL section of FAC-003-3 for further clarity.

Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their votes for the standards from the following page: <https://standards.nerc.net/CurrentBallots.aspx>

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Friday, November 18, 2011**. Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the [project page](#).

Special Instructions for Submitting Comments with a Ballot

Please note that comments submitted during the formal comment period and the ballots for the standards all use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments. The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.

Next Steps

The drafting team will consider all comments submitted during the formal comment period and ballots to determine whether to make additional revisions to the standards.

Background

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC’s Reliability Standards. While many Generator Owners and Generator Operators operate Facilities, commonly known as generator interconnection Facilities, that are considered by some entities to be transmission, these are most often radial Facilities that are not part of the integrated grid. As such, they should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.

As part of the BES, generators do affect the overall reliability of the BES. But registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner’s or Generator Operator’s resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. This can be accomplished by properly applying FAC-001, FAC-003, and PRC-004 to Generator Owners as proposed in the redline standards posted for comment.

Before reviewing the standards, the drafting team encourages all stakeholders to read the [technical justification resource document](#) it has provided to describe its rationale and its work thus far.

Initial Ballot Windows Open November 9 – 18, 2011

[Available Now](#)

The SDT has reviewed comments received during a 30-day formal comment period that took place earlier this year, from June 17-July 17, 2011, and thanks to all those who provided feedback during that comment period. The SDT has incorporated many of the suggested changes into its latest proposed standards, as explained in the posted Consideration of Comments.

This is the second formal comment period and initial ballot period for three standards included in Project 2010-07. Revised drafts of FAC-001-1 and two versions of FAC-003 – FAC-003-3 and FAC-003-X – along with minor modifications to PRC-004-2.1, have been posted for a formal comment period and initial ballot that will end on Friday, November 18, 2011. Note that FAC-003-X shows changes to the last approved version of the standard, while FAC-003-3 shows changes to the last version being developed by the Project 2007-07 drafting team to incorporate Requirements for Generator Owners in those standards.

PRC-004-2.1 is being posted for the first time with this posting, and is also being posted for a formal 45-day comment period with an initial ballot. Because the changes are very limited, the Standards Committee waived the initial formal comment period for this standard.

Instructions for Joining the Ballot Pool for Project 2010-07

Registered Ballot Body members may join the ballot pool to be eligible to vote in the upcoming ballots at the following page: [Join Ballot Pool](#)

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) One ballot pool list server has been set up and can be used for communication on each of the standards being balloted for this project. The list server is: [bp-2010-07 FAC-001-1 in@nerc.com](mailto:bp-2010-07_FAC-001-1_in@nerc.com)

Instructions for Commenting

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the [project page](#).

Next Steps

Separate ballots will be conducted for each standard. These ballot windows will begin on Wednesday, November 9, 2011 and end at 8 p.m. Eastern on Friday, November 18, 2011. NOTE: There is only one ballot pool to join for this project. There will be four separate ballots, one for each standard, and individuals who join this single ballot pool will be eligible to vote in all four ballots. This was done to make the process simpler for those who are voting. If you have any questions, please contact Monica Benson at monica.benson@nerc.net.

Background

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. While many Generator Owners and Generator Operators operate Facilities, commonly known as generator interconnection Facilities, that are considered by some entities to be transmission, these are most often radial Facilities that are not part of the integrated grid. As such, they should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.

As part of the BES, generators so affect the overall reliability of the BES. But registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner's or Generator Operator's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. This can be accomplished by properly applying FAC-001, FAC-003, and PRC-004 to Generator Owners as proposed in the redline standards posted for comment.

Before reviewing the standards, the drafting team encourages all stakeholders to read the [technical justification resource document](#) it has provided to describe its rationale and its work thus far.

Additional information is available on the [project page](#).

Standards Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Project 2010-07 Generator Requirements at the Transmission Interface

Initial Ballot Results

[Now Available](#)

Initial ballots for each of the following standards and their associated implementation plans closed on November 18, 2011:

- FAC-001-1 – Facility Connection Requirements
- Two versions of FAC-003 – Transmission Vegetation Management (FAC-003-3 and FAC-003-X). *Note that FAC-003-X shows changes to FAC-003-1, while FAC-003-3 shows changes to FAC-003-2 developed by the Project 2007-07 drafting team. FAC-003-2 was adopted by the NERC Board on November 3, and a revised version of FAC-003-3 showing the Project 2010-07 drafting team's changes against the Board's version was posted.*
- PRC-004-2.1 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Voting statistics for each ballot are listed in the table below, and the [Ballot Results](#) Web page provides a link to the detailed results.

Standard	Quorum	Approval
FAC-001-1	88.22%	86.94%
FAC-003-3	85.08%	85.71%
FAC-003-X	84.82%	85.31%
PRC-004-2.1	84.29%	96.09%

Next Steps

The drafting team will consider all comments received and determine whether to make additional changes to the standards. If the drafting team makes substantive changes to a standard, the standard will be posted for a parallel 30-day comment period and successive ballot. If the drafting team decides that no substantive changes are needed to a standard, a recirculation ballot will be conducted.

Background

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. While many Generator Owners and Generator Operators operate Facilities, commonly known as generator interconnection Facilities, that are considered by some entities to be transmission, these are most often radial Facilities that are not part of the integrated grid. As such, they should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.

As part of the BES, generators do affect the overall reliability of the BES. But registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner's or Generator Operator's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. This can be accomplished by properly applying FAC-001, FAC-003, and PRC-004 to Generator Owners as proposed in the redline standards posted for comment. Additional information is available on the [project page](#).

All TO requirements for FAC-001-1 would apply if and when GO executes an Agreement to evaluate the reliability impact of interconnecting a third party Facility to its existing generation interconnection Facility. The execution of the agreement is necessary to comply with FAC-002-1 and start the compliance clock with the applicable regulatory authority. Thus as the Project 2010-07 Standard Drafting Team (SDT) in its technical justification has stated, "If, and only if, the existing owner of a generator interconnection Facility has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to its existing generation Facility" then FAC-001-1 should apply. EPSA concurs with SDT's conclusion. The SDT has examined the issue regarding if future requests for transmission service on the interconnection Facility and in doing so acknowledged that when that Facility adopted open access and was providing transmission service it would necessitate re-evaluation of the need for the Facility to be maintained in accordance with FAC-001-1, Requirements 2 and 4. This service would indeed prompt the necessary agreement the SDT contemplates in its technical justification of FAC-001-1. EPSA believes this serves as the necessary trigger for evaluation of Requirements 2 and 4 under FAC-001-1 for GOs.

Based on the applicability section of FAC-001 we feel that the strike through should have been kept. It limited the requirement to just those generator owners who had agreements in place, which we feel is appropriate.
Yes
No
There is a possibility of some conflict with the Bulk Electric System Definition. This should be consistent with the Transmission Owner requirements if the lead is determined part of the BES.

No
The effective dates should be consistent with the original standard. If there is a reason for the extension we would like to know why.
Yes
Yes
Yes
No
We agree that the standards being addressed are correct. See above comments. There are some issues with the determination of which facilities are deemed BES since ownership of what may be a BES facility may not always be by a Transmission Owner. All relevant standards should apply to BES facilities regardless of ownership.

John Bee on behalf of Exelon
Exelon
Yes
Yes
No
FAC-003 - Exelon supports the one mile length qualifier, but feels that additional clarification is needed to determine the points of demarcation. There are too many differing physical configurations to use a "fence line" as a determination of applicability. Suggest that the tie line length be defined as "from the Generator Step up Transformer GSU to the point of interconnection between the GO and TO owned equipment." Also suggest that the standard define what constitutes a generation station switchyard.
Yes
Yes
Yes
Yes
Yes
PRC-004 - suggest that the Standard state that responsibility for the analysis of misoperations of protective equipment shall be the responsibility of the owner of the protective equipment.
Individual
Dennis Sismaet
Seattle City Light
Yes
Key points are that (1) an executed agreement is required before evaluations of impacts are necessary and (2) this only applies when a third party is connecting to the generating interconnection line.

Yes
The proposed changes for FAC-001-1 state a 45 day period to complete the evaluation. Not sure what the question is referring to regarding " 1 year "?
Yes
Key points are the greater than one mile with clear statement of "...beyond the fenced area of the generating switchyard."
Yes
The explanation deals with the fact that there are simultaneous revisions of FAC-003 underway by two different teams.

Unfortunately, the vital point of this requirement revolves around whether or not a Generator Owner is compelled externally to allow access to their interconnection facilities. If the GO is driving the connection for financial or other business reasons, there is no reason they should not be responsible for developing AND maintaining a facility connection requirements document. Otherwise, when the local transmission system requirements change for any reason, there will be no entity responsible to ensure that the third party will conform as well. Conversely, if the GO should be compelled to allow access to a third party, it is the responsibility of the "compeller" to handle all the related reliability studies and documents. This may include the development of a CFR which separates reliability tasks between the GO and other entities – especially if a TSP registration is required. This ensures that the Regional Entity, PUC, RTO, or other regulator must budget dollars and resources directly related to their action – not cause them to be directed to a GO.
No
Based upon similar issues addressed in Compliance Application Notices (CANs), the drafting team needs to specify how the requirements apply to an in-place "executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System." In the view of Ingleside Cogeneration LP, if the Agreement takes effect even one day before FAC-001-1 does, requirements R2 and R3 do not apply. Without this clarification, it is possible that NERC's Compliance team will apply the requirements retroactively – with minimum industry input.
No
Ingleside Cogeneration LP is very concerned that the attempt to develop "bright-line" criteria to assign applicability to either version of FAC-003 is misplaced. As seen with NERC's recent proposed directive related to Generator-Transmission interconnections, those thresholds can be arbitrarily reduced based upon regulators aversion to risk – not scientific evidence. (As it stands today, NERC has proposed any interconnection facility operating at 100 kV or higher and greater than 3 spans in length be applicable – which is even stricter than the TO thresholds in FAC-003.) This would suggest that a reliability assessment consistent with the TPL standards must be the determining factor. If the Planning Coordinator or Transmission Planner can show that the Generator-Transmission interconnection could contribute to a violation of an SOL or IROL, then a vegetation management program may be in order. Furthermore, there needs to be some level of common sense applied if a

GO-TO interconnection is located in an area where vegetation clearance is never an issue. A one-size-fits-all requirement based upon vegetation growth in the sub-tropics, should not automatically apply in the desert. In our view, every dollar spent to control vegetation in an arid climate is one less dollar available to purchase advanced telemetry, AGC systems, and other items which have a far greater impact on reliability.

No

Based upon similar issues addressed in Compliance Application Notices (CANs), the drafting team needs to specify when the first vegetation management inspection quarterly report, and any other requirement with an assigned interval in FAC-003-3 or FAC-003-X. Even if the decision is to adopt the same criteria proposed in CAN-0012, the industry is better served with a clear distinction made up front.

Yes

Ingleside Cogeneration agrees that the SDT's approach is thorough. We are far more concerned about FAC-003's applicability criteria and implementation time frame at this point – as stated in our responses to questions 3 and 4.

Yes

Ingleside Cogeneration LP believes the SDT has spent a significant amount of time and effort to demonstrate that only FAC-001, FAC-003, and PRC-004 need to be modified to address any reliability gaps that may exist related to the GO-TO interconnection. We agree that the other standards/requirements identified by the Ad Hoc Group are covered elsewhere.

Yes

Although the SDT is nearing conclusion on the closing of reliability gaps, the unnecessary registration of GOs and GOPs as TOs and TOPs is far from resolved in our view. Ingleside Cogeneration's concern is based upon NERC's recent proposal to dictate an interim GO-TO interconnection solution which completely bypasses the Standards Development Process. Frankly, it seriously brings to question the nature of the consensus-driven process – which appears to be moving in a dictatorial direction.

No

See comments to questions 1 through 4.

Ingleside Cogeneration LP believes that the set of standards proposed by the SDT is technologically accurate and defensible. The open issue is if the ERO and FERC expect more standards to be included – whether based upon sound reliability principals or not.

The intent of the draft language in FAC-001-1 is to provide guidance for addressing the alleged reliability gap that exists between GO/GOPs that own/ operate transmission facilities but are not registered as TO/TOPs. The impact of the revised language will depend on the characterization of the generator lead after the "third party " connects to the existing generator lead. IF the generator lead is owned by the TO utility after the third party connection : The proposed DRAFT FAC-001 language suggests that within 45 days of a 3rd party having an executed Agreement to evaluate the reliability impact of interconnecting, the existing generator needs to document and publish facility connection requirements. The proposed language suggests that a third party can commandeer existing generators leads and interconnect. A reclassification would be required because "third party" power would flow through the downstream portions of the existing leads. This introduces significant challenges for defining ownership / transfer of installed assets as well as real property, easements, operational jurisdiction, O&M cost responsibility, etc. The FERC approved pro-forma Attachment X Interconnection Agreement clearly states that the project Developer must meet all Applicable Reliability Standards which means that all requirements and guidelines of the Applicable Reliability Councils, and the Transmission District to which the Developer's Large Generating Facility is directly interconnected. As an example, to accommodate this NERC proposal, the FERC approved NYISO pro-

forma tariff would need to be revised to allow this "third party" use. The pro-forma interconnection tariff also states that the Developer must provide updated project information prior to the Facilities Study. The Facilities Study might not be made until several years after the Interconnection Request /Feasibility Study is made ("executed Agreement to evaluate the reliability impact of interconnecting" in this proposed draft is akin to the Interconnection Request/Feasibility Study). Placing the requirement to have the existing Generator Owner publish reliability requirements for a potential "third party user", without the generator having any knowledge of the potential reliability outcomes or asset transfer / ownership issues is not a reasonable expectation. The interconnection of a third party to an existing generator lead would force existing generators to revise their Interconnection Agreements with FERC. The "third party", would at a minimum, need to comply with the existing Generators reliability obligations as specified in the Interconnection Agreement. IF the third party connects to the GO owned generator lead, the GO will be considered a TO: A TO would not be involved, other than review of the SRIS and Facilities reports. The difficult thing for an existing GO would be to prepare, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility, a document listing the requirements. To allow for the above possibilities, the language for applicability of FAC-001 to GO's or GOP's, should be : "Each applicable Generator Owner shall, at least 60 days prior to execution of a Facilities / Class Year Study Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System, document and publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, sub regional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements."

Yes

No

Suggest in FAC-003-X; 4.3.1. that Regional Entity be changed to RE as listed in 4.2.1 for consistency. Also Regional Entity is used throughout the rest of the document, suggest using RE for consistency. In FAC-003-3; 4.3.1. add station to the following: " Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generation station switchyard and are" to show consistency as it is written in FAC-003-X 4.3.1. The technical justification characterized the exclusion (i.e., one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard) as "approximate line of sight [sic] from a fixed point" and noted that this line of sight may be limited by local terrain. Where line of sight of the radial corridor is limited on a clear day due to terrain, the one mile exemption must be limited in distance to no more than the line of sight on a clear day beyond the fenced area.

No action is required unless a GO has an executed third-party agreement. If a GO has an agreement, the standard already includes a 45-day timeframe for the GO to document and publish its facility connection requirements.
Yes
Yes
Yes
No
The Technical Justification document did not review the standards FERC identified in paragraphs 71 and 87 of 135 FERC ¶ 61,241 ORDER DENYING APPEALS OF ELECTRIC RELIABILITY ORGANIZATION REGISTRATION DETERMINATIONS. The SDT needs to review these standards to determine if changes are needed; otherwise, FERC will require registration of GOs and GOPs as TOs and TOPs to address reliability gaps. If the SDT determines no changes are needed to these FERC-identified standards, they should provide justification.
The SDT should consider the standards that FERC identified in 135 FERC ¶ 61,241.

(a) There is no technical basis for the one mile length exemption. In fact, one could argue that a very short line, 300 feet in length, that experienced a fault from a tree at "the end of the circuit", i.e near the switchyard fence, would have much more of an impact on the BES because the fault would be limited by much less impedance. (b) It is unclear in this version if a GO that owned one line that was 1.2 miles in length, and fifty other lines that did not exceed 500' in length would have to comply for all fifty-one lines or not. It would appear that they would as they owned at least one more than a mile. This ambiguity should be removed.

No
The 2 year compliance time line is far too long. There is significant industry evidence that was developed in the drafting of Version 2 that supports a one year compliance time-line for new lines. This is evidenced in Version 2. Thus there is no basis for the 2 years.
(a) There is no technical basis for the one mile length exemption. In fact, one could argue that a very short line, 300 feet in length, that experienced a fault from a tree at "the end of the circuit", i.e near the switchyard fence, would have much more of an impact on the BES because the fault would be limited by much less impedance. (b) It is also unclear in this version if a GO that owned one line that was 1.2 miles in length would have to comply for the entire length of said line, or just 0.2 miles of said line. If the GO is responsible for 1.2 miles, then that argues that the first mile is important and consequently there is no basis for ignoring the first mile on other lines. If the GO is only responsible for 0.2 miles, what is the technical basis to ignore a mile? And would it be the first mile from the switchyard that is ignored, or is the middle mile, or the last mile where it connects to the TO? Or could the GO decide? Or could the GO pick sections of the line that amount to a mile that they can ignore? This seems like something that should be addressed for compliance. (c) The 2 year compliance time line is far too long. There is significant industry evidence that was developed in the drafting of Version 2 that supports a one year compliance time-line for new lines. This is evidenced in Version 2. Thus there is no basis for the 2 years

We revised this partial sentence to the following: "Each applicable Generator Owner shall, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Transmission Facility that is used for connection to the interconnected Transmission systems (under FAC-002-1), ..." - The phrase "Generator Owner's existing Facility that is used to interconnect to the Transmission System" was changed to "Generator Owner's existing Transmission Facility that is used for connection to the interconnected Transmission systems." - "Transmission" was added before Facility to exclude connections elsewhere; "Transmission System" was changed to "Transmission systems" because while "Transmission" and "System" are defined in the NERC Glossary, "System" means "A combination of generation, transmission, and distribution components." "Transmission systems" do not have generation or distribution components, so a lower case "system" is warranted. - In addition, the suggested phrase "interconnected Transmission systems" (plural "systems") uses identical language from FAC-002-1, except that we capitalized "Transmission."
Yes
No
No
It's no longer applicable.
Yes
No
PRC-005-1 - Transmission and Generation Protection System Maintenance and Testing was recommended by the Ad Hoc Group for modification, but not addressed to the technical justification document. It should be.

No
It would be helpful if the SDT defined what it means by the term “radial generator interconnection Facilities.” Does it mean interconnection Facilities that under Normal Clearing for a fault do not interrupt flows on other BES Elements? This is also confusing because of the radial exclusion included in the BES definition work in Project 2010-17. That definition would allow part of a three-terminal circuit to be excluded from the BES, while the other parts are included in the BES.
No
Yes
We believe that the Ad Hoc Group’s suggestions regarding PRC-005-1 - Transmission and Generation Protection System Maintenance were correct and that this standard should have been modified by the SDT in a manner similar to the way the SDT modified PRC-004-2. This would require modifying R1 and R2 in PRC-005-1a (the current version) to include protection systems in the generator interconnection Facility. In addition, the SDT should evaluate modifying PER-002-0 – Operation Personnel Training. In doing so the SDT completes one of the open FERC directives in Order 693. Paragraph 1363 addresses GOP training: 1363. Further, the Commission agrees with MidAmerican, SDG&E and others that the experience and knowledge required by transmission operators about Bulk-Power System operations goes well beyond what is needed by generation operators; therefore, training for generator operators need not be as extensive as that required for transmission operators. Accordingly, the training requirements developed by the ERO should be tailored in their scope, content and duration so as to be appropriate to generation operations personnel and the objective of promoting system reliability. Thus, in addition to modifying the Reliability Standard to identify generator operators as applicable entities, we direct the ERO to develop specific Requirements addressing the scope, content and duration appropriate for generator operator personnel.
Group
MRO NSRF
Will SMith
Yes
Yes
No
The NSRF agrees with the drafting committees desire to eliminate arbitrary and capricious behavior of auditors and industry staff by precisely defining the point at which measurement starts for the length of transmission line. The concern the NSRF has with the proposed wording is that many generating station may not have a “generating station switchyard” as implied by the proposed wording. Often the generator leads (e.g. 20 kV) will exit the generator and connect to transformers located in transformer bays directly adjacent to the plant. From the transformers the now greater than 200 kV lines will be routed to the point of interconnect or a generating unit switchyard, possibly miles or yards away. By no one’s definitions would the transformer bays adjacent to the plant be considered a switchyard. The plant fence may be yards or hundreds of yards from the bays and on a multiple unit site, there may be a site fence or boundary, which could be comprise of fences, security patrols, or other barriers yards or miles from the transformer but enveloping the switchyard. The valid assumption made by the drafting team is that transmission lines within an area tightly controlled by the generator operator poses very little risk to the BES as a result of vegetation contact. This assumption is based on the valid observation that these areas are routinely occupied and observed by station personnel and as a result unexpected and unacceptable vegetation growth is highly unlikely because it is controlled by routine maintenance. It also correctly assumes that some distance past the controlled area is acceptable since this area would also be under near continuous observation. The problem comes in defining both a tightly controlled area and a line of site. We suggest the following: Controlled Area: A perimeter around a power plant, power plants, or switchyard which is prevents intrusion by the use of physical barriers, observation, or electronic monitoring and is routinely occupied such that unexpected and unacceptable vegetation growth would be observed and correct as a matter of routine maintenance. Line of Sight: NSRF recommends a two kilometer distance from the

controlled area perimeter. Our assessment is that an individual of average height would have a line of sight of approximately 4 Kilometers. Therefore, we recommended a distance of 2 kilometers from the Controlled Area of the plant to provide margin. The revised applicability statement would read as follows: "Generator Owner that owns an overhead transmission line(s) that extends greater than 2.0 kilometers beyond the Controlled Area of the generating station up to the point of interconnection with a Transmission Owner's Facility and is operated at 200 kV and above and any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region. Furthermore we applaud the committee for using the metric system to identify the acceptable distance for this standard and urge it to remove all references to English units. We strongly suggest this drafting team and all future drafting team abandon the anachronistic English measurement system. This archaic system, based on the length of an average barley corn, should be abandon in all scientific and engineering endeavors.

Yes

There may be a typographical error on the effective date. As currently drafted the standard states: In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption. Should it be worded as follows? In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 R1 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

Yes

No

The NSRF has one concern with the current justification and definitions. At some point, if enough interconnections are made to generator outlet leads in accordance with FAC-001, the original generator operator will be a Transmission Operator and a Transmission Owner. This point in time needs to be explicitly defined by the drafting team.

Yes

Yes

The NSRF agrees if the drafting team incorporates as suggested improvements

Yes
AWEA appreciates that this standard specifies that it has limited applicability. For instance, only those generators that have an executed agreement with a third party wishing to interconnect must document and publish Facility connection requirements. We believe the proposed 45-day time window is a minimum for GO/GOP owners of generator lead lines to provide this documentation following execution of such an agreement. Anything less than 45 days could result in a burdensome and hard to meet deadline for GO/GOP staff. However, AWEA believes that extending this time window for publishing Facility connection requirements to 90 days after an executed agreement would be beneficial. We believe this will allow the GO/GOP owners of generator leads more time to coordinate with their interconnecting Transmission Providers and will result in more reliable and coordinated connection requirements for the generator lead.
Yes
Yes, since there is no exigent reason why this standard needs to be put in place at once, we support the one-year compliance timeframe. We believe that it will allow generators a reasonable time to comply with the requirement.
Yes
Applying the vegetation management requirements to only generator lead lines that extend more than "one mile beyond the fenced area of the generating station switchyard" strikes a reasonable balance among the many stakeholder positions expressed on this topic. We think that as this criterion recognizes that there is little need for a vegetation management plan for shorter lines. It should explicitly state that this is true for all such facilities with lines of that length or smaller.

Yes
Yes, as with our comments to question 2, since there is no exigent reason why this standard needs to be put in place at once, we support the proposed compliance timeframe. We believe that it will allow generators a reasonable time to comply with the requirement.
Yes
Yes
The reasoning of the SDT is comprehensive and makes a strong case for why there is no need for additional standards to be applied to GO/GOP lead lines as they will not improve the reliability of the Bulk Electric System. In fact, as noted above, such additional standards may decrease reliability by diverting the GO/GOP's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.
Yes
AWEA believes that the standards modifications proposed by the SDT should address any genuine reliability gap with regard to generator lead lines, rather than just perceived but unsupported threats. To that end, we support the approach that the SDT appears to be taking of modifying a limited number of applicable standards so that they apply to GO/GOP lead lines. In particular, we fully support the fact that the SDT recognizes that GO/GOPs should not automatically be required to register as TO/TOPs simply because of their ownership of generator lead lines. The SDT correctly recognizes that such registration should be done based on a case-by-case determination. As already noted, registering a GO/GOP as a TO/TOP may actually decrease reliability.
Yes
For the most part, AWEA agrees that the SDT proposal strikes a reasonable balance and provides the requisite level of clarity and certainty necessary for GO/GOPs to understand their responsibilities and compliance requirements.
AWEA appreciates the opportunity to submit these comments on the NERC Project 2010-07. AWEA supports the general direction indicated by both the Generator Requirements at the Transmission Interface Ad Hoc Group and the Project 2010-07 Standards Development Team. We agree with the sentiments from both groups that a GO or GOP that also owns or operates a generator lead line should not be required to register as a TO or TOP strictly because they own or operate a generator lead line. We also agree that requiring these GO/GOPs to comply with all the TO/TOP standards would have little effect on or benefits to reliability of the Bulk Electric System, and could even detract from it. AWEA supports the intent and goal of the SDT to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. We also agree with the SDT that while many GO/GOPs operate Elements and Facilities that might be considered by some entities to be Transmission, these are most often radial Facilities that are not part of the integrated grid, and as such should not be subject to the same standards applicable to TO/TOPs, who own and operate Transmission Elements and Facilities that are part of the integrated grid. Therefore, we support the SDT's approach of identifying a very limited number of TO/TOP standards, such as FAC-001 and FAC-003, which should also apply to GO/GOP owners of generator lead lines. We would be concerned, however, if additional requirements were added beyond FAC-001, FAC-003, and PRC-004. Consideration of any additional standards with respect to generator lead lines should be done on a standard-by-standard basis, reviewing the applicability of each standard as well as the impact on the reliability of the Bulk Electric System.

The changes to this standard are minor, and seem to be centered around including "generator Interconnection facilities" to R2. This added phrase and the statement in 1.4 Data Retention "Generator Owner that owns a generation Protection System" seems to assume that the generator owner and generator interconnection facilities owner is always the same. This is not always the case, and will make this standard language confusing to prepare evidence for. A suggestion would be to revise the language to allow for a separate generator owner and generator interconnection facilities owner.

Anything less than 45 days could result in a burdensome and hard to meet deadline for GO/GOP staff. However, we believes that extending this time window for publishing Facility connection requirements to 90 days after an executed agreement would be beneficial. We believe this will allow the GO/GOP owners of generator leads more time to coordinate with their interconnecting Transmission Providers and will result in more reliable and coordinated connection requirements for the generator lead.
Yes
Yes, since there is no exigent reason why this standard needs to be put in place at once, we support the one-year compliance timeframe. We believe that it will allow generators a reasonable time to comply with the requirement.

Yes
Applying the vegetation management requirements to only generator lead lines that extend more than “one mile beyond the fenced area of the generating station switchyard” strikes a reasonable balance among the many stakeholder positions expressed on this topic. We think that as this criterion recognizes that there is little need for a vegetation management plan for shorter lines, it should explicitly state that this is true for all such facilities with lines of that length or smaller.
Yes
Yes, as with our comments to question 2, since there is no exigent reason why this standard needs to be put in place at once, we support the proposed compliance timeframe. We believe that it will allow generators a reasonable time to comply with the requirement.
Yes
Yes
The reasoning of the SDT is comprehensive and makes a strong case for why there is no need for additional standards to be applied to GO/GOP lead lines as they will not improve the reliability of the Bulk Electric System. In fact, as noted above, such additional standards may decrease reliability by diverting the GO/GOP's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.
Yes
We believe that the standards modifications proposed by the SDT should address any genuine reliability gap with regard to generator lead lines, rather than just perceived but unsupported threats. To that end, we support the approach that the SDT appears to be taking of modifying a limited number of applicable standards so that they apply to GO/GOP lead lines. In particular, we fully support the fact that the SDT recognizes that GO/GOPs should not automatically be required to register as TO/TOPs simply because of their ownership of generator lead lines. The SDT correctly recognizes that such registration should be done based on a case-by-case determination. As already noted, registering a GO/GOP as a TO/TOP may actually decrease reliability.
Yes
For the most, we agree that the SDT proposal strikes a reasonable balance and provides the requisite level of clarity and certainty necessary for GO/GOPs to understand their responsibilities and compliance requirements.
RES and AWEA appreciates the opportunity to submit these comments on the NERC Project 2010-07. We support the general direction indicated by both the Generator Requirements at the Transmission Interface Ad Hoc Group and the Project 2010-07 Standards Development Team. We agree with the sentiments from both groups that a GO or GOP that also owns or operates a generator lead line should not be required to register as a TO or TOP strictly because they own or operate a generator lead line. We also agree that requiring these GO/GOPs to comply with all the TO/TOP standards would have little effect on or benefits to reliability of the Bulk Electric System, and could even detract from it. RES and AWEA supports the intent and goal of the SDT to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. We also agree with the SDT that while many GO/GOPs operate Elements and Facilities that might be considered by some entities to be Transmission, these are most often radial Facilities that are not part of the integrated grid, and as such should not be subject to the same standards applicable to TO/TOPs, who own and operate Transmission Elements and Facilities that are part of the integrated grid. Therefore, we support the SDT's approach of identifying a very limited number of TO/TOP standards, such as FAC-001 and FAC-003, which should also apply to GO/GOP owners of generator lead lines. We would be concerned, however, if additional requirements were added beyond FAC-001, FAC-003, and PRC-004. Consideration of any additional standards with respect to generator lead lines should be done on a standard-by-standard basis, reviewing the applicability of each standard as well as the impact on the reliability of the Bulk Electric System.

Manitoba Hydro
No
Manitoba Hydro has the following comments: 1) The intention of the NERC SDT in revising these standards is not clear. While the Technical Justification document states that the SDT intended to focus on a Generator Owner’s radial interconnection facilities, the scope of the revised standard (s) is not confined to such facilities. The very broadly defined term “Facility” is used. Moreover, the Technical Justification document’s reference to the FERC decision in Cedar Creek as a basis for the revision of additional standards is confusing, since that decision did not specifically address the issue of radial facilities and supported NERC’s registration of GOs as TOs. 2) If the drafting team intends to limit the scope of FAC-001-1 to GO owned radial generator interconnection facilities that are not deemed BES transmission and therefore would not require the registration of the GO as a TO, Manitoba Hydro disagrees with the proposed changes to FAC-001-1 as Generator Owners may not have the models or expertise to perform interconnection studies to determine if there is an impact on the Transmission Network. This concern is echoed in the technical justification document provided by NERC: ‘the SDT acknowledges that the Generator Owner may not, at the time it agrees or is compelled to allow a third part to interconnect, have the necessary expertise to conduct the required interconnect studies to meet this standard... the Generator Owner will have to acquire such expertise. How the Generator Owner chooses to do so is not for the SDT to determine.’ Although it may not be for the SDT to determine how a GO obtains technical expertise, ensuring that such expertise is acquired before a GO conducts the required interconnection studies should be a concern to NERC as this directly affects the reliability of the BES. As a result, all interconnection requests should be implemented by the TO providing the GO with connection to the BES regardless if the interconnection point is within a Generation Owner facility or End-User facility as the TO is in the best position to set unbiased connection requirements to ensure the reliability of the BES is maintained. If the scope of FAC-001-1 also applies to GO owned BES transmission facilities, Manitoba Hydro strongly believes that the Compliance Registry should apply and the GOs should be required to register as a TO and abide by all applicable standards to that functional type. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions. Reliability gaps would be better addressed if select GOs and GOPs registered as TOs and TOPs to ensure all reliability standards, including the protection standards, are met so the reliability of the BES is maintained. At this time, this would not lead to a large number of extra registrations since, as stated in the technical justification document, ‘interconnection requests for Generator Owner Facilities are still relatively

rare. 3) If the redline changes are implemented, GOs are removed from R4, thereby removing the obligation for GOs to maintain their connection requirements. If GOs are included in FAC-001, they should be held accountable to the same level as TOs and should be required to maintain their connection requirements. Requiring a GO to maintain connection requirements would be especially beneficial to the GO themselves. In the majority of instances, any GO that is an Applicable Entity for FAC-001 would initially be inexperienced in performing interconnection studies and would benefit from regular and frequent review of their connection requirements as experience and expertise are gained. 4) The revision to FAC-001-1 R2 may be problematic, depending on what was intended. Under the revised requirement, the obligation to comply is dependent on the execution of an agreement to evaluate reliability impacts under FAC-002-1. However, FAC-002-1 does not clearly require the execution of an agreement by the Generator Owner. FAC-002-1 only requires the Generator Owner to "coordinate and cooperate on its assessments with its Transmission Planner and Planning Authority". Accordingly if a Generator Owner coordinates without executing an agreement to perform an assessment, compliance with FAC-001 R1 will not be required. 5) Manitoba Hydro would also like to point out that if the redline changes are implemented, it will greatly increase the complexity of coordination required under FAC-002-1 for Transmission Planners/Planning Authorities.

No

See question 1 comments.

No

Manitoba Hydro does not support the changes being proposed in this project. If a Generator Owner is required to register as a TO, all the Requirements applicable to a TO should apply. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions.

No

See Question 7 comments.

No

The SDT's proposed modifications gives special treatment to the Generator Owner in that it allows the Generator Owner TO status for a couple of standards (FAC-001, FAC-003 and PRC-004), but exempts the Generator Owner from many of the standards applicable to a TO. The NERC Registry Criteria defines the various functional entities. If a Generator Owner wants to own transmission facilities and it falls under the definition of a Transmission Owner under the NERC Registry Criteria, then all the Requirements applicable to a TO should apply. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions. Reliability gaps would be better closed if select GOs and GOPs simply registered as TOs and TOPs. At this time, this would not lead to a large number of extra registrations since, as stated in the technical justification document, 'interconnection requests for Generator Owner Facilities are still relatively rare.

see comment to Question 7
FMPA believes that TOP-004-2 R6.2 ought to also be addressed in the standards as applicable to GOPs. The requirements reads: R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including: R6.2. Switching transmission elements. Although planned outages are covered in other standards applicable to a GOP, switching to close / synchronize a generator back to the system is not specifically covered in the standards. Some have argued that TOP-002-2 R3 causes GOPs to coordinate its current day plans with the TOP; however, the name of the standard is "Transmission Operations Planning" and therefore implies the availability of the generator and related equipment and not necessary implies the policies and procedures for switching operations; which includes synchronization. FMPA cannot imagine a generator that would not have such switching / synchronization policies and procedures coordinated with its interconnecting TOP; as such would normally be required through a Large Generator Interconnection Agreement through a pro forma OATT; however, FMPA is not aware of any instance in the standards that covers this. As such, FMPA recommends including TOP-004-2 R6.2 as being applicable to a GOP.

Dominion suggests in FAC-003-X; 4.3.1. Regional Entity be changed to RE as listed in 4.2.1 for consistency. Also Regional Entity is used throughout the rest of the document, suggest using RE for consistency overall. Dominion suggests in FAC-003-3; 4.3.1. adding station to the following "Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generation station switchyard and are" to show consistency as it is written in FAC-003-X 4.3.1. Further, Dominion is concerned that the technical justification characterized the exclusion (i.e., one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard) as "approximate line of sign [sic] from a fixed point" and notes that this line of sight may be limited by local terrain. Where line of sight of the radial corridor is limited on a clear day due to terrain, the one mile exemption must be limited in distance to no more than the line of sight on a clear day beyond the fenced area.

The language for FAC-001 Requirement R2 should be: "This requirement shall apply to each applicable Generator Owner. Generator Owner filings must be made at least 60 days in advance of execution of the final interconnection study agreement in the Planning Coordinator's or Transmission Planner's study process. Each applicable Generation Owner must publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, sub regional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements. The evaluation of the reliability impact(s) of interconnecting a third party Facility to the Generator Owner's existing Facility utilized for interconnection to the Transmission System must be documented."

We suggest that the Vegetation Management Standards should be consistent for both the TO and GO facilities. We would also like to suggest an additional Recommendation for added clarity regarding Category 3 Outages (Off-ROW Fall-in Outages). We understand that the Category 3 Outages are not a violation of the Standard, but we feel that there should be some level of comment added within the Standard clearly stating that these Outages are "Reportable Only" during the Quarterly Outage reports to the RE's, and that there are no associated violations/sanctions for this Category Of Outage, and that an Off-ROW fall-in outage would not be considered an encroachment into the MVCD in any way. The Technical Reference Document does a good job of clearly stating this in the Introduction on Page 5 ("This standard is not intended to address outages such as those due to vegetation fall-ins or blow-ins from outside the Right-of-Way, vandalism, human activities or acts of nature.") and we feel

that this should also be stated clearly in the Standard.

In answer to the SDT request for feedback on FERC's Order concerning Cedar Creek and Milford, the District finds no technical reason to add any of the listed standard requirements, and struggles to understand why FERC would even consider this listing as applicable.

bring a uniform, fair and technically supported approach that resolves the interface issue. Thus, NextEra requests that the SDT (prior to proceeding any further or any additional comments or votes on specific draft Reliability Standards) issue a technical paper that point-by-point addresses the merits of including the Reliability Standards set forth in the FERC Orders and NERC's draft interim directive, and request stakeholder, including NERC staff, comment. For example, this technical paper would likely the merits of NERC's draft interim directive not requiring NERC-certified operators (but require training of interface operators), while FERC's orders require NERC-certified operators. While NextEra does not agree five days of training is necessary for an interface operator, as the draft interim directive appears to propose, NextEra does believe a technical case can be made why NERC-certification is not required, and that some degree of training related to the applicable Reliability Standards is reasonable. Similar, on FAC-003 (as well as several other Standards), the draft interim directive proposes a slightly different approach than the SDT. NextEra would rather these approaches reconciled than be in conflict, with the potential for continued conflict as the SDT's work product proceeds. Further, NextEra requests that the SDT's review the technical merits of NERC's proposed criteria to determine what generator transmission lead is required to comply with additional Reliability Standards. As noted, above, this technical paper should be posted for stakeholder, including NERC staff, comment. Accordingly, while NextEra would have preferred that NERC and the Regional Entities express there interim draft directive approach on the record in this proceeding, NextEra believes it is appropriate for the SDT to draft a comprehensive technical paper that, with an open approach, considers the inclusion of additional Reliability Standards, if appropriate, as a way of building lasting support for its approach.

ReliabiltyFirst

ReliabilityFist has found a number of editorial erros for the FAC-001-1 VSLs. They include the following: 1. VSL R1 – should not reference sub-requirements, should reference the sub-parts consistent with the requirement (i.e. Requirement R1, Part 1.1, 1.2 or 1.3) 2. VSL for R3 – the VSL should referenced Requirement 3, Part 3.1.1 through 3.1.16 rather than what is currently stated (Requirement R3, Part 3.1.1 R3.1.6)

Individual

Donald Jones

Texas Reliability Entity

No

In Section 5.1, the reference to Regional Entity should be removed. There are no requirements that apply to the Regional Entity. In Requirements R1 and R4, "Planning Coordinator" should be added after "Regional Entity." In the ERCOT Region it is the Planning Coordinator that maintains planning criteria and connection requirements. There is no NERC requirement or any obligation (as indicated in the technical justification document) on the part of a GO to specifically execute an Agreement to evaluate the reliability impact of interconnecting a third party Facility. Therefore, this requirement's applicability is contingent on a prerequisite that may not occur, and that is under the control of the GO. This assumption on the part of the SDT unnecessarily complicates the compliance monitoring and enforcement of this standard. For instance, if an "Agreement" is not executed, a GO is not required to comply with the requirement, even though the GO may ultimately interconnect with another entity. The requirement should be modified to include an applicability trigger similar to that of FAC-002-1, so that once a GO "seek[s] to integrate . . .," i.e., agrees to or is compelled to allow a third-party

interconnection, then the requirement becomes applicable. Otherwise, the compliance and monitoring is subject to the SDT's speculation as indicated in this language included in the technical justification document: "However, the SDT cannot be certain this is the only example and it therefore proposes to add this new requirement to FAC-001-1. In doing so, the SDT acknowledges that the Generator Owner may not, at the time it agrees or is compelled to allow a third party to interconnect, have the necessary expertise to conduct the required interconnect studies to meet this standard. Assuming that a regulatory body would require a Generator Owner to evaluate such an interconnection request, the SDT expects the Generator Owner and the third party to execute some form of an Agreement."

Yes

In the description of the "second effective date" in FAC-003-X there is an erroneous reference to "Requirement R3," which should be corrected to "Requirement R1."

No

A compliance timeframe for the applicable GOs of two years is too long and the scenario used as a basis provides no timing specifics or details. Moreover, the 12 months for an existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard is arguably the same situation as an applicable GO but the applicable GO has an additional 12 months to come into compliance.

Yes

No

Our negative votes on FAC-003 reflect our concern that this project has not considered all of the applicable standards. Why did the SDT choose to only review the Ad Hoc Group's standards when there have been multiple registration appeals in which FERC and NERC have repeatedly cited specific additional TO/TOP standards that were determined to be applicable to GO/GOPs? This SDT project would serve a tremendous value to the ERO and in particular industry if it were to address the technical aspects of the following FERC ordered applicable standards: PRC-001-1 R2, R4; PRC-004-1 R1; TOP-004-2 R6; PER-003-1 R1; FAC-003-1 R1, R2; TOP-001-1a R1 and FAC-004-2 R2. The SDT team should analyze the FERC orders, the applicable standards indicated, and the circumstances and facts involved, and technically justify why no reliability gap exists if these standards are not applied to GO interface facilities. The SDT should include more "technical" information in its technical justification document. For example, in regards to TOP-004-2 R7, the SDT technical justification states that there is no reliability gap because, ". . . because an operator has a fiduciary obligation to protect a Facility for which it is operationally responsible." An entity having a fiduciary obligation is not a technical justification of why a reliability gap does not exist. Moreover, by that logic there would be no need for many standards because every registered entity has a fiduciary obligation to protect its facilities.

Constellation supports the SDT justifications and offers additional information in our response to question 10.
Yes
Yes
Constellation appreciates and supports the work of the standard drafting team. We recognize the significant time invested by technical experts from industry to consider the appropriate application of reliability standards to address concerns raised about coverage of transmission at the generator interface. The drafting team analysis identified the standards in need of revision to appropriately address the reliability concerns raised. While the revision process focuses on specific standards, it is important to consider the reliability questions in the context of the full complement of reliability standards that apply to entities. For instance, the following standards already apply to generators and relate to the reliability considerations around transmission at the generator interface: • PRC-001-1 addresses coordination of protection system components by requiring all GOs to ensure coordination of their protection system with interconnected parties. Further, FAC-002 requires that all new facilities undergo reviews by the TOP, BA, etc. • PRC-004-1 requires all GOs to ensure that they analyze all misoperations on their protection system which would include the protection of the tie line. • TOP standards applicable to GOs aid coordination between a GO and a TO with regards to the generator tie line by requiring all GOs to coordinate all maintenance and emergency outages (both forced and planned) with all applicable interconnected parties. Further, all ISO procedures require the same of GOs. • RC, TOP and/or BA certified operators control and are responsible for overseeing that transmission. According to the NERC functional model, a Generator Operator is defined as “operat(ing) generating unit(s) and perform(ing) the functions of supplying energy and reliability related services.” Given this limited scope, the Generator Operator (GOP) cannot be considered as operating on the same level as the Reliability Coordinator, Transmission Operator or Balancing Authority when it comes to real time information on the status of the BES. The GOP does not monitor and control the BES, rather the GOP only monitors and controls the generators that it operates and relays information to other operating entities. • IRO and TOP standards applicable to GOs include tie lines in their pool of resources to alleviate operational emergencies by requiring all GOs to operate as directed by their TOP, BA, or RC as directed and must render emergency assistance. • FAC-8 and FAC-9 manage rating methodology consistency by requiring all GOs to develop a methodology to rate all equipment, and that the RC has the authority to challenge the GO on that methodology. The onus is on the GO to either change their methodology and rating accordingly, or provide a technical justification as to why they cannot adopt the changes. Further, a generator will never be limited by its tie line, as a generator’s profits are directly tied to its output. Therefore no generator would limit its facility to the equipment that is delivering that output.

No
Suggest that the overall structure of the standard be revised such that R1 – R3 are applicable to the Transmission Owner (consistent with existing FAC-001-0) and R4 (the new requirement) is applicable to the “applicable Generator Owner”. See further comments below. Support the proposed revisions to R1 and R4, but suggest R4 be returned to R3 (consistent with existing FAC-001-0). R3 in the balloted standard should be returned to R2 (consistent with existing FAC-001-0) and only be applicable to the Transmission Owner. R3.1 (or R2.1 if moved back) should be “fixed”, but it may be beyond this SDT’s charge. The use of “above” in the FAC-001-0 standard, or the proposed reference to “Requirements R1 or R2” in the proposed standard do not make sense in combination with the colon used at the end of the requirement. Suggest that R3.1 (or 2.1 if moved back) be revised as written below and all sub-

requirements of R3.1 be elevated (R3.1.1 becomes R3.2, R3.1.2 becomes R3.3, etc.). "R3.1 Performance requirements and/or planning criteria used to assess system impacts." R2 in the balloted standard should become R4 and modified to incorporate the connection requirements contained in R3 that can more reasonably be expected of an "applicable Generator Owner". For instance, an "applicable Generator Owner" might simply have a connection requirement for a third party that addresses coordination of system impact studies with the appropriate Transmission Owner(s), in lieu of R3.1, R3.1.1, and R3.1.2. Suggest that R2 (or R4 if moved below existing FAC-001-0 requirements) be revised as written below. "R2 Each applicable Generator Owner that has agreed to allow a third party Facility owner (Generation Facility, Transmission Facility, or End-user Facility) to connect to the Transmission system through use of pre-existing applicable Generator Owner Facilities shall communicate it's Facility connection requirements to the third party. The applicable Generator Owner Facility connection requirements shall address the following items: R2.1 Coordination of system impact studies with the Transmission Owner. R2.2 Voltage level and MW and MVAR capacity or demand at point of connection. R2.3 Breaker duty and surge protection. R2.4 System protection and coordination R2.5 Metering...." Etc.

Southern Company

Antonio Grayson

No

1) R4 is duplicative of R1 - either remove "maintain" from R1 or delete R4 - both instances of "maintain" are not needed. 2) The measures, as written, provide no additional indication of the evidence that could be presented to demonstrate compliance with the Reliability Standard Requirements. They provide little guidance on assessing non-compliance with the Requirements.

No

See our response to Question 9.

No

All of these comments pertain to FAC-003-3: 1) We suggest referring to the Implementation Plan in the Effective Date sub-section of Section A of the standard rather than repeating the content of the Implementation Plan in the standard. There exists unnecessary duplication with including the information in both places. 2) We suggest simplifying the purpose statement to more succinctly say the intent, for example: "To maintain a reliable transmission system by managing vegetation located on transmission rights of way to minimize vegetation encroachments and thereby minimize the risk of vegetation related outages". If this change is not acceptable, at least change the phrase "preventing the risk" to "minimizing the risk". 3) We feel that the Enforcement paragraphs between 4.3.1.3 and 5.0 seem to be out of place. Those paragraphs don't belong in this location - consider moving them to Section C. Compliance. The fourth paragraph belongs in the background section. 4) We suggest moving the background section to Section F. "Associated Documents". It gets in the way of getting to the requirements of the standard. 5) We suggest moving Table 2 of the "Guideline and Technical Basis" document into R1, since it seems to be the only part of the document that is enforceable. Further we suggest that the Guideline and Technical Basis document be removed from the standard. The inclusion of this document in the standard makes the standard unweildy. 6) We suggest reordering the words in R1 to more clearly state the requirement. Please consider this rephrasing: "For lines which are either an element of an IROL or an element of a Major WECC Transfer Path, each

applicable TO and applicable GO shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) when operating within their Rating during all Rated Electrical Operating Conditions of the types shown below: ..." (remainder is unchanged). 7) We suggest reordering the words of R2 to more clearly state the requirement. Please consider the this rephrasing: "For lines which are neither an element of an IROL nor an element of a Major WECC Transfer Path, each applicable TO and applicable GO shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) when operating within its Rating and during all Rated Electrical Operating Conditions of the types listed below: ..." (remainder is unchanged). 8) On Page 11 of the posted clean draft standard, is the reference to the previous footnote 2 correct? We recommend eliminating footnotes where possible to minimize redirections. 9) The Rationale text-box on page 13 of the clean version of FAC-003-3 overlaps some of the text of footnote #6.

Yes

The development of a working TVMP will take some time to initialize. The 1 year time frame for R3 is appropriate. The 2 year time frame for all other requirements is appropriate.

No

We believe that a standard development process should not have parallel paths where the same version is being modified by multiple teams. The uncertainty in which development path leads to confusion in the industry and ultimately proves to have wasted some resources for the path that does not come to fruition.

Yes

Additional responses are needed to justify the exclusion of the list of requirements and standards found in the recent FERC order denying the rehearing request of the Compliance Registry Appeals of Cedar Creek and Milford. (135 FERC Para. 61,241). Please see our response to Question 10 for a detailed discussion on this topic.

No

We don't believe the effort realizes the goal because 1) it is inclusive of FAC-001 that does not need any modifications and 2) the effort needs to reinforce the appropriate justification not to include the additional standards FERC has identified in their Cedar Creek and Milford Orders.

Yes

The version history table is incorrect - change version 3 to version 2.1.

Yes

Southern does not think that the revision to FAC-001-1 is necessary. A Generator Owner (GO) cannot assess reliability impacts to the Bulk Electric System (BES) and determine acceptability without support and involvement of the applicable owner and operator of the Transmission System (i.e., the "interconnected TO" or "interconnected TP"). A generator tie-line does not equate to a Transmission System. A GO must already adhere to a TO's Facility connection requirements whether the GO wants to connect additional facilities or a third parties' facilities to its own interconnection Facilities. Stated another way, the GO does not need Facility Connection requirements to govern how multiple units are tied to a collector bus so why are they needed for a third party to connect to an existing tie-line? In either case it is the interconnected TO or interconnected TP that has connection requirements that must be fulfilled. The GO's Interconnection Agreement would prohibit it from connecting additional facilities without a new application for Interconnection Service with its interconnected TO or interconnected TP. A GO should not need to develop "connection requirements" unless it is in the business of owning and operating facilities independently of its interconnected TO or interconnected TP. We do not believe a reliability gap exists in FAC-001-1 because the requestor for interconnecting another Facility to an existing generation Facility must coordinate with the applicable TO, TP, and PA in accordance with FAC-002-0 to ensure they meet all applicable facility connection and performance requirements. If and when there is an agreement in place for a third party to connect to a generator tie-line then the tie-line would become part of the integrated system and its purpose and the owner's function would likely warrant registration as a TO/TOP and FAC-001 would then apply. The following excerpt from the 2010-07 Background Resource White Paper acknowledges that this may be necessary: "The drafting team also acknowledges that, if another party interconnects to a Facility owned by a Generator Owner, there may be the need to address MOD or TPL standards. However, the drafting team believes that this, too, is best handled through specific evaluation, perhaps accompanied by changes to the compliance registry. Entities that face this kind of scenario may also meet criteria applicable to other registrations such as Transmission Service Provider or

Transmission Planner." [Arguments related to jurisdictional, interconnection policy and open access transmission tariff issues] (1) Because of (a) jurisdiction under Section 215, (b) FERC's interconnection policy, and (c) the requirements of the pro forma open access transmission tariff (OATT), a GO should not be required to comply with FAC-001-1 until that GO's generating Facility reaches commercial operation. NERC should not make facilities subject to the mandatory reliability standards before the facilities are actually part of the BES. (a) Jurisdiction under FPA Section 215. First, it is not clear that NERC or FERC has jurisdiction under FPA Section 215 to require generation facilities that have not actually reached commercial operation to be subject to reliability standards. Section 215(a)(2) of the FPA defines the "Electric Reliability Organization" as "the organization certified by the Commission ... the purpose of which is to establish and enforce reliability standards for the bulk-power system, subject to Commission review." Further, (a)(3) provides that "The term 'reliability standard' means a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system. The term includes requirements for the operation of existing bulk-power system facilities ... the design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation of the bulk-power system" Thus, under Section 215 NERC can develop reliability standards that address requirements for existing bulk-power system facilities (i.e., facilities that have reached "commercial operation") and for the design of planned additions or modifications. It is logical to interpret the phrase "design of new facilities" as meaning that new facilities must be designed to comply with existing reliability standards. However, it is not clear that this provision should be interpreted as requiring that a generating facility that has not yet reached commercial operation should be subject to reliability standards (including audit and penalties). Therefore, the GO with the existing generation facilities should not be required to incorporate the proposed generation facility into its Facility connection requirements before the proposed generation facility is subject to NERC or FERC jurisdiction. (b) FERC's interconnection policy. In addition, the revised FAC-001 would appear to place restrictions on interconnection customers in contravention of Order Nos. 2003 and 2006 (Standard Large and Small Interconnection Procedures and Agreements). FERC was very concerned about the ability of interconnection customers to interconnect their generating facilities and gave them a fair amount of flexibility. However, this revised FAC-001 would appear to restrict some of this flexibility. (i) Order No. 2003 gives the interconnection customer the ability to terminate a proposed interconnection on ninety days notice. Therefore, the interconnection customer is not required to build the facility. However, this revised FAC-001 appears to assume that the interconnection customer does not have this flexibility. What if the interconnection customer (the GO building a new generator on its site or the third party building a new generation facility) decides to terminate the Large Generator Interconnection Agreement (LGIA) or not proceed with the generation facility? In such event, the GO may be required to revert to its previous Facility connection requirements in order to accommodate the original configuration. (ii) The LGIA permits modifications to the proposed interconnection. How would this affect the Facility connection requirements? How long would the GO have to revise its Facility connection requirements? In the event that there is a single modification, or perhaps multiple modifications, how does the GO stay in compliance with this standard? (iii) FAC-001-1, R4 provides that each GO with Facility connection requirements and each TO shall maintain Facility connection requirements and make documentation of these requirements available to users of the Transmission System upon request. However, Large Generator Interconnection Procedures (LGIP), Section 3.4 requires the posting of certain interconnection information but the identity of the interconnection customer is not to be disclosed (unless it is an Affiliate). Requirement R4 would appear to potentially require disclosure of information and (more importantly) of the interconnection customer's identity in contravention of the requirements in Order No. 2003 and the LGIP. (c) OATT requirements. The definition of "applicable Generator Owner" (Section 4.2.1) and Requirement R2 provide that the GO will have an executed Agreement to evaluate the impact of interconnecting a new facility to the GO's existing generation facility. This statement is ambiguous. This statement could be understood to mean that the GO of the existing generation Facility will enter into an Agreement with the GO proposing to interconnect and the existing GO will evaluate the impact of the proposed interconnection. However, requests to interconnect new generation are processed under an OATT. In that case, it would be the Transmission Provider (not the existing GO) that would evaluate the impact of interconnecting the new facility. Thus, the language in FAC-001-1 would need to be revised to clarify that the owner of the new facility will need to interconnect under the OATT of an appropriate Transmission Provider (i.e., the Transmission Provider to which the existing GO is interconnected, not with the existing GO). Therefore, the owner of the new facility will most likely be the entity with the executed Agreement

(with the Transmission Provider). Another consideration is that the existing GO could be developing a merchant transmission line. In that case, the existing GO would need to evaluate whether it needs have its own OATT and OASIS. In that case, the new generator owner would be interconnecting to the existing GO. However, the existing GO's line would not be a generator tie-line. This issue is not clear from the draft standard. (2) The following are suggested changes to FAC-001-1. (a) We recommend the Purpose statement be revised to state, "To avoid adverse impacts on BES reliability..." (b) It is unclear in Applicability section 4.2.1 that the term "Agreement" means that the GO has an executed agreement with a TO/TSP or that the GO and the third party have an executed agreement. Without further explanation, the capitalized term "Agreement" has the effect of introducing confusion. If the SDT does not intend to propose a new addition to the NERC Glossary of Terms, it should use the lower case term, "agreement." With respect to the capitalized term, "Transmission System," the SDT should consider clarifying if it intends to propose adding this to the Glossary. (3) Effect of the proposed revisions to FAC-001-1 on FAC-002-1. (a) As drafted, there are scenarios under which a new GO may attempt to interconnect to an existing GO even though, as explained above, the interconnection should actually be done to the appropriate Transmission Provider. If the appropriate Transmission Provider is not included in the evaluation of the interconnection various types of harm may occur. In such event, the TPs and PAs should be indemnified from any liability with respect to performance of the evaluations required by FAC-002. (b) FAC-001 and FAC-002 should be revised to be clear that the existing GO and any new GOs must coordinate any interconnection with the appropriate Transmission Provider, TP and PA.

We agree with the 2010-17 Standard Drafting Team's conclusion to not modify other standards such as those mentioned on page 4 of the Technical Justification document. In addition, we wish to provide the following support for exclusion of these specific standards. Southern Company believes NERC's Project 2010-07 SDT must challenge making revisions to the standards included in the FERC order on Cedar Creek and Milford. (This order supports NERC's requirement for those entities to register as a TO/TOP due to their ownership of generator interconnection circuits > 100kV.) We believe there are clear technical and reliability-based reasons that support not adding GO and GOP requirements to these standards and not requiring the GO or GOP to register as a TO or TOP. Furthermore, we also believe there are clear distinctions between GO/GOP responsibilities and TO/TOP responsibilities that must be maintained to ensure BES reliability. Revising standards to assign TO/TOP responsibilities to a GO/GOP or requiring a GO/GOP to register as a TO/TOP because of generator interconnection circuits > 100kV will reduce the clarity of these responsibilities. We have provided specific comments on each standard below: EOP-005-1 R1, R2, R6, R7 R1 and R2 require each TOP to have and maintain a system restoration plan. R6 requires the TOP to train its operating personnel in implementing this plan. R7 requires the TOP to verify its restoration plan by actual testing or simulation. These requirements are clearly the role and responsibility of the TOP, not a GO/GOP who happens to have generator interconnection facilities in the TOP's control area. The GOP's roles and responsibilities are clearly and appropriately addressed EOP-005-2. The presence of a generator interconnection circuit > 100kV that happens to be owned by the GO instead of the TOP fundamentally does not change the roles and responsibilities of the TOP or the GOP. Thus, no changes due to EOP-005 are needed. FAC-014-2, R2 FAC-014-2 R2 states "The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology." FAC-014-2 R2 should not be revised to include GOPs. The GO is required by FAC-008-1 R1 and FAC-009-1 (FERC approved version) and pending FAC-008-3 R3 and R6 (FAC-008-3 filed with FERC for approval) to document the Facility Ratings for a GO-owned generator interconnection circuit >100kV. The established Facility Rating must respect the most limiting applicable equipment rating in the circuit and must consider operating limitations and ambient conditions. The thermal or ampere rating of this circuit would equal its ampere operating limit and should be conveyed by the GO to the GOP if they are not the same entity. The operating voltage limits for this circuit are established by the applicable TO/TOP, not the GO or GOP. Therefore, we believe adding the GO to FAC-014-2 R2 would be redundant. PER-003-1 R2, R2.1, R2.2 PER-003-1 R2 and its sub-requirements state: "R2. Each Transmission Operator shall staff its Real-time operating positions performing Transmission Operator reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining one of the following valid NERC certificates (1) : [Risk Factor: High][Time Horizon: Real-time Operations]: R2.1. Areas of Competency R2.1.1. Transmission operations R2.1.2. Emergency preparedness and operations R2.1.3. System operations R2.1.4. Protection and control R2.1.5. Voltage and reactive R2.2. Certificates • Reliability Operator • Balancing, Interchange and Transmission Operator •

Transmission Operator This requirement is specifically for TOPs. Personnel training for GOPs needs to be addressed separately and not mingled with responsibilities of the TOP. The GOPs role in supporting BES reliability needs to be clearly understood and defined prior to establishing training requirements in the standards. PRC-001-1, R2, R2.2, R4, R6 Generator Operators (GOPs) and the scope of protection equipment for generation interconnection Facilities are already appropriately accounted for in this standard in requirement R2 and sub-requirement R2.2 The language used in requirement R2 which applies to the GOP uses the general terms "relay or equipment failures" which would include not only generator relaying, but generator interconnection relaying in the GOPs scope as well. The GOP is required to notify the TOP and Host BA in R2.1 "if a protective relay or equipment failure reduces system reliability." Requirement R2.2 requires the affected TOP to notify its RC and affected TOPs and BAs. Thus, applying R2.2 to a GOP would be redundant to R2.1. Requirement R4 states, "Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities." A generator interconnection tie line does not constitute a "major tie line" or major "interconnection with neighboring GOPs, TOPs, and BAs." Thus, R4 should not be revised to include GOPs. If a GO exists within NERC that does own such interconnection facilities, the responsibility for coordination of protection systems on such a line or interconnection should be the responsibility of the TOP in that area, not the GO/GOP. This may require formal agreements between the TO/TOP and GO/GOP, since the GO may own protection equipment on his end. The same logic applies to R6. R6 states, "Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status." This is clearly the responsibility of the TOP and/or BA, not a GO/GOP who happens to have generator interconnection facilities in the area. An SPS function by definition is to maintain BES reliability. If a GO/GOP has equipment within the equipment scope of a Special Protection System (SPS), responsibility for monitoring the SPS should be conveyed in a formal agreement as appropriate. TOP-001-1 R1 Requirement R1 states, "Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies." This is clearly the responsibility of the TOP, not a GO/GOP who happens to have generator interconnection facilities in the TOP's area. Thus, R1 should not be applied to a GO/GOP who owns or operates generator interconnection facilities. Furthermore, TOP-001-1 R3 (proposed to be covered in the future in the proposed IRO-001-2 R2 and R3) appropriately requires the GOP to comply with reliability directives issued by the TO "unless such actions would violate safety, equipment, regulatory or statutory requirements." These requirements effectively give the TOP the necessary decision-making authority over operation of all generator Facilities up to the point of interconnection. They also give the GOP the necessary authority to take appropriate actions to ensure safety and protection of the GO's equipment. Thus, no changes to TOP-001-1 are necessary. TOP-004-2 R6, R6.1, R6.2, R6.3, R6.4 Requirement R6 and its sub-requirements state: "R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including: R6.1. Monitoring and controlling voltage levels and real and reactive power flows. R6.2. Switching transmission elements. R6.3. Planned outages of transmission elements. R6.4. Responding to IROL and SOL violations." These are clearly the responsibility of the TOP, not a GO/GOP who happens to have generator interconnection facilities in the TOP's area. Thus, these requirements should not be applied to a GO/GOP who owns or operates generator interconnection facilities. The same logic applies here as stated above in our discussion on TOP-001-1. We believe it is inappropriate and would be adverse to BES reliability to apply these requirements to a GOP. TOP-004-2 effectively gives the TOP the necessary decision-making authority over operation of all generator Facilities up to the point of interconnection. They also give the GOP the necessary authority to take appropriate actions to ensure safety and protection of the GO's equipment, such as opening high voltage generator output breakers when required to protect the unit. Thus, no changes to TOP-004-2 are necessary. TOP-006-2 R3 Requirement R3 states, "R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel. The intent of this requirement when applied to a GOP is already addressed in PRC-001-1 R1 which states, "Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area." Thus, no change to TOP-006-2 is necessary.

Jason Marshall
Yes
We largely agree with the changes the drafting team made but believe some additional changes are necessary. In section 4.2.1 of the Applicability Section, "within" should be "with". Because NERC's Glossary of Terms establishes that an Agreement can be verbal and not enforceable by law, section 4.2.1 should be further modified to clarify that it is a legally enforceable and fully executed Agreement. The language in R3 in parenthesis after Generation Owner should be modified to "once required by Requirement R2". This makes it clearer that R3 does not apply until the GO has an executed Agreement to evaluate a request by a third part to interconnect.
Yes
Yes
We support the changes to FAC-003 suggested by the drafting team because we believe the drafting team has provided the best solution in face of a difficult problem. However, in general, we do not support registration of GOs and GOPs as TOs and TOPs or applicability of any TO/TOP requirements to the GO/GOP simply because they have a radial interconnection greater than one mile in length. While there may be some generators that own interconnecting facilities of significant length operated at a significant voltage that could impact BES reliability, we do not believe that the number of generating facilities that fit into that category is significantly large. When one considers that the majority of generators are still owned and operator by utilities that are also registered as a TO and TOP, there is only a minority subset of generators left that could be considered. NERC has the registration for this remaining set of generators and could use the data to evaluate how many of this remaining subset have interconnections owned by the generator that are substantial enough to affect reliability. It seems that NERC could determine the boundaries of this problem before registering anymore GOs and GOPs as TOs and TOPs or before applying additional requirements through this effort on the GOs and GOPs.
Yes
Yes
With recent NERC BOT approval of the FAC-003-2 standard, the drafting team should continue to monitor the standard progress with FERC and make necessary adjustments to the implementation plan.
Yes
Yes
No
The modifications are largely the appropriate ones with the exceptions we noted in Q1 and Q10.
The modifications to PRC-004-2.1 R2 could be interpreted as requiring the GO to analyze Protection System Misoperations on the generator interconnection Facility even if it does not own the Facility. We suggest modifying the requirement as shown below to address this issue. "The Generator Owner shall analyze Protection System Misoperations on its generator and generator interconnection Facility that it owns ..."

Steve Rueckert

No
WECC casts an affirmative vote for the SDT proposal as a necessary but not sufficient step in addressing the GOTO matter. WECC, NERC, and the other Regions developed a subset of Standards and Requirements that were considered necessary to address potential gaps for transmission interconnection facilities and operations to be included in a proposed NERC Directive, which is expected to issue by year-end. The subset of requirements developed for the proposed NERC Directive were informed by the applicable FERC Orders. Consequently, it is important that the SDT address the comparative reliability risks between the proposed NERC Directive List and the SDT Proposal to assure that reliability gaps will not result from the SDT proposal. Please see NERC's proposed Directive for the rationale and technical justification.
Please see response to question #7.

See additional comments received attached.

Additional Comments Received

Generator Requirements at the Transmission Interface (Project 2010-07)

NERC Comments:

1. Based on stakeholder comment, the SDT clarified the applicability language of FAC-001-1 and removed the Generator Owner from R4. Do you support the proposed redline changes to FAC-001-1? (Please refer to the posted FAC-001-1 technical justification document for more information about the SDT's rationale for its changes.)

Yes

No

Comments:

2. Do you support the one year compliance timeframe for Generator Owners as proposed in the Implementation Plan for FAC-001-1?

Yes

No

Comments: There appears to be no rationale for allowing one year for the development of connection requirements given the Technical Justification rationale that the compliance clock starts "if and only if when it executes an Agreement to evaluate....", recognizing the time lag indicated in the Technical Justification.

3. With respect to FAC-003, many commenters focused on the half-mile qualifier in FAC-003. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: "...that extends greater than one mile beyond the fenced area of the generating station switchyard..." We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.

Taking into consideration that only one of the versions of FAC-003 will actually be implemented, a decision that will be made as Project 2007-07—Vegetation Management moves forward, do you support the proposed redline changes to FAC-003-X and FAC-003-3?

Yes

No

Comments:

4. Do you support compliance timeframe for Generator Owners as included and explained in the Implementation Plans for FAC-003-X?

Yes

No

Comments:

5. In the FAC-003-3 implementation plan, the SDT has attempted to account for a number of different scenarios that could play out with respect to the filing and approvals of FAC-003-2 and FAC-003-3. Do you support this approach? If there are other scenarios that the SDT needs to account for, please suggest them here.

Yes

No

Comments:

6. In its technical justification document, the SDT reviews all standards that had been proposed for substantive modification in the Ad Hoc Group's original support and explains why, with the exception of FAC-003, modifying them would not provide any reliability benefit. Do you support these justifications? If you believe the SDT needs to add more information to its rationale for any of these decisions, please include suggested language here.

Yes

No

Comments: Please see the comments to Question 7 for the rationale for expanding the scope of the SDT to address additional Standards.

7. The SDT is attempting to modify a set of standards so that radial generator interconnection Facilities are appropriately accounted for in NERC's Reliability Standards, both to close reliability gaps and to prevent the unnecessary registration of GOs and GOPs at TOs and TOPs. Does the set of standards currently posted achieve this goal?

Yes

No

Comments:

Regarding Project 2010-07 Generator Requirements at the Transmission Interface, NERC staff advises the SDT revisions to the following Standards must be included, for all facilities that are deemed to be 'BES Transmission Facilities more commonly described as Generator Leads':

a) EOP-005-1 R1, R2, R5, R6 and R7

Revisions to this Standard are needed to respond to:

- If GOP has blackstart resources defined by its RC, then EOP-005 applies. The GOP restoration plan would require coordination with TOP per the TOP Blackstart Restoration Plan. The GOP would start its blackstart resources to provide necessary real and reactive power to its generating resources per interconnecting TOP directives. (Note: In addition, if GOP has blackstart capability the interconnection TOP will have included this capability in its restoration planning for its area of responsibility.)

- If GOP does not have blackstart resources, GOP restoration plan is dependent upon provision of real and reactive power service from interconnecting TOP, per VAR-001 and VAR-002 requiring the GOP to follow the directives of the interconnecting TOP, compliance with this standard/requirements is not required.

b) FAC-014-2 R2

If the Transmission system has associated SOLs as directed by its RC, the applicable GOP shall establish these limits per the RC's direction

c) PER-002-0

In order that the requirements of PER-003-0 are not applied, PER-002 should be revised to require the applicable GOP should develop an appropriate training program that contains the necessary elements for the GOP operating their Transmission facility to understand fully the impacts of operation on the BES; such as a) equipment involved, including protection systems, b) the coordination aspects with the TO/TOP to which it is connected, and c) the protocols for and impacts of operating facilities associated with a Transmission facility. The objective of this training is to ensure that the GOP is completely aware of its obligations to have the ability to follow the directives of the appropriate TOP. This ability includes personnel with the skills and training to execute these obligations in the best interest of reliability concerning the reliable operational and coordination issues with the interconnecting TOP.

Therefore, for all generators that are determined to be a typical Generator Long Lead type facility, revising PER-002 would provide a method that recognizes full NERC Certification of operators at these type generators is unnecessary to bridge the reliability gap that exists until all appropriate Reliability Standards are revised to incorporate the proper wording. The basis of this conclusion is through a rudimentary technical evaluation of the topics required for full NERC Certified Operator initial certification. This review resulted in only 25% of the topics included in the certification testing requirements would generally apply to operators at a typical Generator Long Lead type facility. Consequently, revising PER-002 would provide adequate training that will meet the facts and circumstances of each specific generator and as such bridges the reliability gap.

A component of this training might be NERC Technical Reference Document '*Power Plant and Transmission System Protection Coordination*'.

(<http://www.nerc.com/docs/pc/spctf/Gen%20Prot%20Coord%20Rev1%20Final%2007-30-2010.pdf>)

- d) PRC-001 In order to avoid confusion, revise R1 to require the applicable GO to maintain, and the applicable GOP, to monitor those systems defined as BES Transmission metering and protection circuits/systems above and beyond the Generation equipment metering and protection circuits/systems; and R4 to coordinate Transmission protection systems with the interconnection TOP's protection system that apply.

- e) PRC-005 In order to avoid confusion, revise the Standard R1 to require the applicable GO to develop a program which includes those maintenance and testing intervals and a summary of procedures for those systems defined as BES Transmission metering and protection circuits/systems above and beyond the Generation metering and protection circuits/systems.
- f) TOP-001-1 R1 Applicable GOPs assigned to operate their BES Transmission facilities have clear and unambiguous authority to operate those facilities.
- g) TOP-004-2 R6 Applicable GOPs to develop formal policies and procedures that provide for coordination of activities associated with their Transmission facilities that may impact reliability with their interconnecting TOP and/or GOPs identified in FAC-001
- h) TOP-006-1 R3 Applicable GOPs provide appropriate technical information concerning Transmission metering and protection circuits/systems to their operating personnel.

8. If you answered "yes" to Question 7, are the modifications the SDT has made in this posting the appropriate ones?

Yes

No

Comments: See full comments in Question 7

9. If you answered "no" to Question 7, what standards need to be added or removed to achieve the SDT's goal? Please provide technical justification for your answer.

Yes

No

Comments: See full comments in Question 7 and also refer to question 6 and the reference to the Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface, dated Nov 16, 2009

10. Do you have any other comments that you have not yet addressed? If yes, please explain.

Yes

No

Comments:

Notwithstanding the comments in the SDT's Technical Justification paper relative to work within other existing or future Standard Development Projects, we advise this SDT to expand its scope to include the above listed necessary Standards revisions.

Consideration of Comments

Generator Requirements at the Transmission Interface Project 2010-07

The Generator Requirements at the Transmission Interface Drafting Team thanks all commenters who submitted comments for Project 2010-07—Generator Requirements at the Transmission Interface. These standards were posted for a 45-day public comment period from October 5, 2011 through November 18, 2011. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 40 sets of comments, including comments from 123 different people from approximately 86 companies representing all 10 of the Industry Segments as shown in the table on the following pages.

Based on stakeholder comments, the SDT made minor changes to FAC-001-1, FAC-003-X, FAC-003-3, and PRC-004-2.1. The standards will proceed to recirculation ballot.

In FAC-001-1, the SDT corrected a typo in the Applicability section 4.2.1 to change “within” to “with”; corrected a typo in the VSLs for R3 to ensure that parts 3.1.1 through 3.1.16 were referenced, rather than just 3.1.1 through 3.1.6; and changed references to “Transmission System” to “interconnected Transmission systems” to ensure consistency with the language elsewhere in the standard and in FAC-002-1.

In FAC-003-X and FAC-003-3, the SDT added a clarifying reference to line of sight in the GO exemption in section 4.3.1. of both versions; corrected a typo in 4.3.1.2 of FAC-003-3; and changed “RE” to “Regional Entity” in 4.3.1 of FAC-003-X.

As it discusses in the document titled “[Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface](#),” the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.

To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: “Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are...”

With this reference, the SDT simply seeks to clarify the exception language based on the intent that has been agreed upon by the stakeholder body. In its [Consideration of Comments report](#) from the last formal comment period, which ended on July 17, 2011, the SDT explained “We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor.” With the addition of an explicit line of sight reference here, the SDT believes it has clarified its original intent and appropriately considered all comments submitted.

Members of the ballot pool should note that for its recirculation ballot, the SDT will be balloting **both** FAC-003-3 and FAC-003-X, but stakeholders should **not** vote as though they are choosing one or the other. The SDT plans to present FAC-003-3 alone to NERC’s Board of Trustees, but it wants to have FAC-003-X ready to submit to the Board if, for some reason, neither FAC-003-2 nor FAC-003-3 are approved by FERC. Members of the ballot body should vote on the merits of each version of FAC-003 individually. **In other words, stakeholders who support adding GOs to the applicability of FAC-003 should vote in the affirmative for both FAC-003-3 and FAC-003-X.**

In PRC-004-2.1, the SDT added a reference to the generator interconnection Facility to the data retention section of the standard (for consistency with the language in R2) and corrected a typo in the Version History.

Several commenters pointed out that the wording in R1 and R2 of PRC-005-1a requires the same explicit reference to a generator interconnection Facility that was added in PRC-004-2.1 R2. The SDT agrees and is developing revisions to PRC-005-1a. These will be posted (separate from the recirculation ballot posting) soon.

Many commenters encouraged the SDT to reexamine the standards and requirements addressed in FERC’s Milford and Cedar Creek orders and NERC staff’s draft compliance directive regarding generator lead lines. The NERC [Standard Processes Manual](#) does not address the issue of how to deal with FERC Orders (that don’t include explicit directives), or draft NERC directives, within the standards process, and until this round of comments, when NERC staff submitted comments, the SDT had no formal mandate that would have made it appropriate to consider the content of the proposed directive.

The SDT reviewed all addressed standards and requirements again and continues to find clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards and not requiring the GO or GOP to register as a TO or TOP. However, to address stakeholder concern, the SDT has expanded its technical justification document (posted under “Supporting Materials”) to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive.

Other minority comments are addressed within specific questions below.

All comments submitted may be reviewed in their original format on the standard's project page:

http://www.nerc.com/filez/standards/Project2010-07_GOTO_Project.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

¹ The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_Standard_Processes_Manual_20110825.pdf.

Index to Questions, Comments, and Responses

1. Based on stakeholder comment, the SDT clarified the applicability language of FAC-001-1 and removed the Generator Owner from R4. Do you support the proposed redline changes to FAC-001-1? (Please refer to the posted FAC-001-1 technical justification document for more information about the SDT’s rationale for its changes.) 12

2. Do you support the one year compliance timeframe for Generator Owners as proposed in the Implementation Plan for FAC-001-1? 29

3. With respect to FAC-003, many commenters focused on the half-mile qualifier in FAC-003. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: “...that extends greater than one mile beyond the fenced area of the generating station switchyard...” We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.

Taking into consideration that only one of the versions of FAC-003 will actually be implemented, a decision that will be made as Project 2007-07—Vegetation Management moves forward, do you support the proposed redline changes to FAC-003-X and FAC-003-3? 34

4. Do you support compliance timeframe for Generator Owners as included and explained in the Implementation Plans for FAC-003-X? 50

5. In the FAC-003-3 implementation plan, the SDT has attempted to account for a number of different scenarios that could play out with respect to the filing and approvals of FAC-003-2 and FAC-003-3. Do you support this approach? If there are other scenarios that the SDT needs to account for, please suggest them here. 57

6. In its technical justification document, the SDT reviews all standards that had been proposed for substantive modification in the Ad Hoc Group’s original support and explains why, with the exception of FAC-003, modifying them would not provide any reliability benefit. Do you support these justifications? If you believe the SDT needs to add more information to its rationale for any of these decisions, please include suggested language here. 63

7. The SDT is attempting to modify a set of standards so that radial generator interconnection Facilities are appropriately accounted for in NERC’s Reliability Standards, both to close reliability

- gaps and to prevent the unnecessary registration of GOs and GOPs at TOs and TOPs. Does the set of standards currently posted achieve this goal? 74
- 8. If you answered “yes” to Question 7, are the modifications the SDT has made in this posting the appropriate ones? 87
- 9. If you answered “no” to Question 7, what standards need to be added or removed to achieve the SDT’s goal? Please provide technical justification for your answer. 91
- 10. Do you have any other comments that you have not yet addressed? If yes, please explain. 99

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

1. **Based on stakeholder comment, the SDT clarified the applicability language of FAC-001-1 and removed the Generator Owner from R4. Do you support the proposed redline changes to FAC-001-1? (Please refer to the posted FAC-001-1 technical justification document for more information about the SDT’s rationale for its changes.)**

Summary Consideration:

The SDT thanks all stakeholders for their comments and their 87% approval for the FAC-001-1 changes posted for ballot in November 2011. Based on stakeholder feedback, the SDT has made the following minor changes to FAC-001-1:

-Corrected a typo in Applicability section 4.2.1 to change “within” to “with.”

-Corrected a typo in the VSLs for R3 to ensure that parts 3.1.1 through 3.1.16 were referenced, rather than just 3.1.1 through 3.1.6.

-Changed references to “Transmission System” to “interconnected Transmission systems” to ensure consistency with the language elsewhere in the standard and in FAC-002-1.

Some stakeholders remain concerned about the intent of the SDT’s work on FAC-001-1. The SDT reminded them that the scope is addressed in the SAR. The intent of the SAR is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP). The SDT determined that it should first address “low-hanging fruit” and believes these to be sole-use Facilities (see posted examples under “Supporting Materials”) – that is, a Facility used to connect one or more generators to a Facility owned or operated by a transmission entity (TO/TOP). Through its deliberations, the SDT concluded that an interconnection Facility owned or operated by a GO or GOP that is more complex would likely require specific analysis and that such analysis would most likely be outside the scope of this SDT.

Concerned commenters were also referred to one of the SDT’s resource documents: [Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document](#).

Some commenters suggested changes to Requirements R1 or R4, which deal exclusively with the Transmission Operator and are outside the scope of the SDT’s work.

One commenter suggested formatting changes. The SDT agrees with the commenter that there are a number of ways to format the standard with this SDT’s revisions. However, the majority of stakeholders support the current format of the standard and no change was made.

One commenter suggested that the phrase “Generator Owner’s existing Facility” be changed to “Generator Owner’s existing Transmission Facility.” The SDT does not agree with labeling a GO’s Facility as “Transmission,” in part because in

some areas (like Texas), GOs, by statute, can't own Transmission. It was also brought to the SDT's attention that in most cases, the Facility in question is referred to as the Interconnection Facility in documents filed by the GO with FERC. Therefore, the SDT intentionally modified language so that a Facility owned by a generation entity did not contain the term "Transmission."

One commenter did not agree with the overall clarifying change to the Applicability section, but the SDT reminded this commenter that this change was made to address previous comments that indicated that there was uncertainty as to whether "another Facility to its existing generation Facility" was meant to address connecting additional generators by the same GO. The SDT intends FAC-001-1 to apply only when the GO of an existing Facility executes an agreement to evaluate the reliability impact of connecting additional generation owned by another GO. No change made with respect to this comment.

A few stakeholders were concerned with the 45-day time frame included in the standard. The SDT pointed out that majority of stakeholders and the SDT support 45 days as a sufficient time frame because in many cases, the GO would simply need to adopt (document and publish) the Facility connection requirements of its TO. No change to that time frame was made.

Organization	Yes or No	Question 1 Comment
Manitoba Hydro	Negative	The intention of the NERC SDT in revising these standards is not clear. While the Technical Justification document states that the SDT intended to focus on a Generator Owner's radial interconnection facilities, the scope of the revised standard (s) is not confined to such facilities. The very broadly defined term "Facility" is used. Moreover, the Technical Justification document's reference to the FERC decision in Cedar Creek as a basis for the revision of additional standards is confusing, since that decision did not specifically address the issue of radial facilities and supported NERC's registration of GOs as TOs.
<p>Response: Thank you for your comment. The scope of this SDT is addressed in the SAR. The intent of the SAR is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP). The SDT determined that it should first address "low-hanging fruit" and believes these to be sole-use Facilities (see posted examples under "Supporting Materials") – that is, a Facility used to connect one or more generators to a Facility owned or operated by a</p>		

Organization	Yes or No	Question 1 Comment
<p>transmission entity (TO/TOP). Through our deliberations, we came to the conclusion that an interconnection Facility owned or operated by a GO or GOP that is more complex would likely require specific analysis and that such analysis would most likely be outside the scope of this SDT.</p> <p>The SDT also refers the commenter to the document titled Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document. Specifically, see the last paragraph on page 4 and first two on page 5.</p>		
Southern Company	No	<p>1) R4 is duplicative of R1 - either remove "maintain" from R1 or delete R4 - both instances of "maintain" are not needed.â€¢ 2) The measures, as written, provide no additional indication of the evidence that could be presented to demonstrate compliance with the Reliability Standard Requirements. They provide little guidance on assessing non-compliance with the Requirements. â€¢</p>
<p>Response: Thank you for your comment. We agree with your suggestions, but both are outside the scope of this SDT. These items will be submitted to the Issues Database to be addressed in a future revision of FAC-001.</p>		
Southwest Power Pool Standards Development Team	No	<p>Based on the applicability section of FAC-001 we feel that the strike through should have been kept. It limited the requirement to just those generator owners who had agreements in place, which we feel is appropriate.</p>
<p>Response: Thank you for your comment. This change was made to address previous comments that indicated to the SDT there was uncertainty as to whether this was meant to address connecting additional generators by the same GO. The SDT intends FAC-001 to apply only when the GO of an existing Facility executes an agreement to evaluate the reliability impact of connecting additional generation owned by another GO. No change made with respect to this comment.</p>		
Texas Reliability Entity	No	<p>In Section 5.1, the reference to Regional Entity should be removed. There are no requirements that apply to the Regional Entity.</p> <p>In Requirements R1 and R4, "Planning Coordinator" should be added after "Regional Entity." In the ERCOT Region it is the Planning Coordinator that maintains planning criteria and connection requirements. There is no NERC</p>

Organization	Yes or No	Question 1 Comment
		<p>requirement or any obligation (as indicated in the technical justification document) on the part of a GO to specifically execute an Agreement to evaluate the reliability impact of interconnecting a third party Facility. Therefore, this requirement’s applicability is contingent on a prerequisite that may not occur, and that is under the control of the GO. This assumption on the part of the SDT unnecessarily complicates the compliance monitoring and enforcement of this standard. For instance, if an “Agreement” is not executed, a GO is not required to comply with the requirement, even though the GO may ultimately interconnect with another entity. The requirement should be modified to include an applicability trigger similar to that of FAC-002-1, so that once a GO “seek[s] to integrate . . .,” i.e., agrees to or is compelled to allow a third-party interconnection, then the requirement becomes applicable. Otherwise, the compliance and monitoring is subject to the SDT’s speculation as indicated in this language included in the technical justification document: “However, the SDT cannot be certain this is the only example and it therefore proposes to add this new requirement to FAC-001-1. In doing so, the SDT acknowledges that the Generator Owner may not, at the time it agrees or is compelled to allow a third party to interconnect, have the necessary expertise to conduct the required interconnect studies to meet this standard. Assuming that a regulatory body would require a Generator Owner to evaluate such an interconnection request, the SDT expects the Generator Owner and the third party to execute some form of an Agreement.”</p>
<p>Response: Thank you for your comment. All of these comments are outside the scope of the SAR and the SDT’s work because they refer specifically to the sections and requirements that apply to the TO alone. We encourage you to consider submitting a SAR that addresses your concerns.</p>		
Manitoba Hydro	No	<p>Manitoba Hydro has the following comments:</p> <ol style="list-style-type: none"> 1) The intention of the NERC SDT in revising these standards is not clear.

Organization	Yes or No	Question 1 Comment
		<p>While the Technical Justification document states that the SDT intended to focus on a Generator Owner’s radial interconnection facilities, the scope of the revised standard (s) is not confined to such facilities. The very broadly defined term “Facility” is used. Moreover, the Technical Justification document’s reference to the FERC decision in Cedar Creek as a basis for the revision of additional standards is confusing, since that decision did not specifically address the issue of radial facilities and supported NERC’s registration of GOs as TOs.</p> <p>2) If the drafting team intends to limit the scope of FAC-001-1 to GO owned radial generator interconnection facilities that are not deemed BES transmission and therefore would not require the registration of the GO as a TO, Manitoba Hydro disagrees with the proposed changes to FAC-001-1 as Generator Owners may not have the models or expertise to perform interconnection studies to determine if there is an impact on the Transmission Network. This concern is echoed in the technical justification document provided by NERC: ‘the SDT acknowledges that the Generator Owner may not, at the time it agrees or is compelled to allow a third part to interconnect, have the necessary expertise to conduct the required interconnect studies to meet this standard... the Generator Owner will have to acquire such expertise. How the Generator Owner chooses to do so is not for the SDT to determine.’ Although it may not be for the SDT to determine how a GO obtains technical expertise, ensuring that such expertise is acquired before a GO conducts the required interconnection studies should be a concern to NERC as this directly affects the reliability of the BES. As a result, all interconnection requests should be implemented by the TO providing the GO with connection to the BES regardless if the interconnection point is within a Generation Owner facility or End-User facility as the TO is in the best position to set unbiased connection requirements to ensure the reliability of the BES is maintained. If the scope of FAC-001-1 also applies to GO owned BES transmission facilities, Manitoba</p>

Organization	Yes or No	Question 1 Comment
		<p>Hydro strongly believes that the Compliance Registry should apply and the GOs should be required to register as a TO and abide by all applicable standards to that functional type. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions. Reliability gaps would be better addressed if select GOs and GOPs registered as TOs and TOPs to ensure all reliability standards, including the protection standards, are met so the reliability of the BES is maintained. At this time, this would not lead to a large number of extra registrations since, as stated in the technical justification document, ‘interconnection requests for Generator Owner Facilities are still relatively rare.</p> <p>3) If the redline changes are implemented, GOs are removed from R4, thereby removing the obligation for GOs to maintain their connection requirements. If GOs are included in FAC-001, they should be held accountable to the same level as TOs and should be required to maintain their connection requirements. Requiring a GO to maintain connection requirements would be especially beneficial to the GO themselves. In the majority of instances, any GO that is an Applicable Entity for FAC-001 would initially be inexperienced in performing interconnection studies and would benefit from regular and frequent review of their connection requirements as experience and expertise are gained.</p> <p>4) The revision to FAC-001-1 R2 may be problematic, depending on what was intended. Under the revised requirement, the obligation to comply is dependent on the execution of an agreement to evaluate reliability impacts under FAC-002-1. However, FAC-002-1 does not clearly require the execution of an agreement by the Generator Owner. FAC-002-1 only requires the Generator Owner to “coordinate and cooperate on its assessments with its Transmission Planner and Planning Authority”. Accordingly if a Generator Owner coordinates without executing an agreement to perform an assessment, compliance with FAC-001 R1 will not</p>

Organization	Yes or No	Question 1 Comment
		<p>be required.</p> <p>5) Manitoba Hydro would also like to point out that if the redline changes are implemented, it will greatly increase the complexity of coordination required under FAC-002-1 for Transmission Planners/Planning Authorities.</p>
<p>Response: Thank you for your comment. The scope of this SDT is addressed in the SAR. The intent of the SAR is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP).</p> <p>The intent of the modifications to this standard is to address the requirements of the GO prior to the interconnection of the third party to their Facilities. The reliability gap the SDT intends to close is the need for the GO to develop Facility connection requirements prior to interconnection. The SDT does agree that upon interconnection of a third party, other standards or registrations may apply as appropriate.</p> <p>The SDT also refers the commenter to the document titled Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document, which is posted on the project page. Specifically, see the last paragraph on page 4 and first two on page 5.</p>		
Tennessee Valley Authority	No	<p>Suggest that the overall structure of the standard be revised such that R1 - R3 are applicable to the Transmission Owner (consistent with existing FAC-001-0) and R4 (the new requirement) is applicable to the “applicable Generator Owner”. See further comments below. Support the proposed revisions to R1 and R4, but suggest R4 be returned to R3 (consistent with existing FAC-001-0).R3 in the balloted standard should be returned to R2 (consistent with existing FAC-001-0) and only be applicable to the Transmission Owner. R3.1 (or R2.1 if moved back) should be “fixed”, but it may be beyond this SDT’s charge. The use of “above” in the FAC-001-0 standard, or the proposed reference to “Requirements R1 or R2” in the proposed standard do not make sense in combination with the colon used at the end of the requirement. Suggest that R3.1 (or 2.1 if moved back) be revised as written below and all sub-requirements of R3.1 be elevated (R3.1.1 becomes R3.2, R3.1.2 becomes R3.3, etc.).”R3.1 Performance</p>

Organization	Yes or No	Question 1 Comment
		<p>requirements and/or planning criteria used to assess system impacts.” R2 in the balloted standard should become R4 and modified to incorporate the connection requirements contained in R3 that can more reasonably be expected of an “applicable Generator Owner”. For instance, an “applicable Generator Owner” might simply have a connection requirement for a third party that addresses coordination of system impact studies with the appropriate Transmission Owner(s), in lieu of R3.1, R3.1.1, and R3.1.2. Suggest that R2 (or R4 if moved below existing FAC-001-0 requirements) be revised as written below.”R2 Each applicable Generator Owner that has agreed to allow a third party Facility owner (Generation Facility, Transmission Facility, or End-user Facility) to connect to the Transmission system through use of pre-existing applicable Generator Owner Facilities shall communicate it’s Facility connection requirements to the third party. The applicable Generator Owner Facility connection requirements shall address the following items: R2.1 Coordination of system impact studies with the Transmission Owner. R2.2 Voltage level and MW and MVAR capacity or demand at point of connection. R2.3 Breaker duty and surge protection. R2.4 System protection and coordination R2.5 Metering....” Etc.</p>
<p>Response: Thank you for your comment. We gave the comment due consideration and agree that there are a number of ways to format the standard with this SDT’s revisions. However, the majority of stakeholders support the current format of the standard. No change made.</p>		
<p>Northeast Power Coordinating Council, Northeast Power Coordinating Council</p>	<p>No</p>	<p>The intent of the draft language in FAC-001-1 is to provide guidance for addressing the alleged reliability gap that exists between GO/GOPs that own/ operate transmission facilities but are not registered as TO/TOPs. The impact of the revised language will depend on the characterization of the generator lead after the “third party “ connects to the existing generator lead. IF the generator lead is owned by the TO utility after the third party connection : The proposed DRAFT FAC-001 language suggests that within 45 days of a 3rd party having an executed Agreement to evaluate the reliability</p>

Organization	Yes or No	Question 1 Comment
		<p>impact of interconnecting, the existing generator needs to document and publish facility connection requirements. The proposed language suggests that a third party can commandeer existing generators leads and interconnect. A reclassification would be required because “third party” power would flow through the downstream portions of the existing leads. This introduces significant challenges for defining ownership / transfer of installed assets as well as real property, easements, operational jurisdiction, O&M cost responsibility, etc. The FERC approved pro-forma Attachment X Interconnection Agreement clearly states that the project Developer must meet all Applicable Reliability Standards which means that all requirements and guidelines of the Applicable Reliability Councils, and the Transmission District to which the Developer’s Large Generating Facility is directly interconnected. As an example, to accommodate this NERC proposal, the FERC approved NYISO pro-forma tariff would need to be revised to allow this “third party” use. The pro-forma interconnection tariff also states that the Developer must provide updated project information prior to the Facilities Study. The Facilities Study might not be made until several years after the Interconnection Request /Feasibility Study is made (“executed Agreement to evaluate the reliability impact of interconnecting” in this proposed draft is akin to the Interconnection Request/Feasibility Study). Placing the requirement to have the existing Generator Owner publish reliability requirements for a potential “third party user”, without the generator having any knowledge of the potential reliability outcomes or asset transfer / ownership issues is not a reasonable expectation. The interconnection of a third party to an existing generator lead would force existing generators to revise their Interconnection Agreements with FERC. The “third party”, would at a minimum, need to comply with the existing Generators reliability obligations as specified in the Interconnection Agreement. IF the third party connects to the GO owned generator lead, the GO will be considered a TO: A TO would not be involved, other than review</p>

Organization	Yes or No	Question 1 Comment
		<p>of the SRIS and Facilities reports. The difficult thing for an existing GO would be to prepare, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility, a document listing the requirements. To allow for the above possibilities, the language for applicability of FAC-001 to GO’s or GOP’s, should be :”Each applicable Generator Owner shall, at least 60 days prior to execution of a Facilities / Class Year Study Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the Transmission System, document and publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, sub regional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.”</p>
<p>Response: Thank you for your comment. The SDT agrees with many of the comments (as indicated in the accompanying resource document titled Technical Justification: FAC-001-1), especially those concerning the complexities of this process. The majority of stakeholders and the SDT support 45 days as a sufficient time frame because in many cases, the GO would simply need to adopt (document and publish) the facility connection requirements of its TO. No change made.</p>		
Consolidated Edison Co. of NY, Inc.	No	<p>The language for FAC-001 Requirement R2 should be:”This requirement shall apply to each applicable Generator Owner. Generator Owner filings must be made at least 60 days in advance of execution of the final interconnection study agreement in the Planning Coordinator’s or Transmission Planner’s study process.Each applicable Generation Owner must publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, sub regional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.The evaluation of the reliability impact(s) of interconnecting a third party Facility to the Generator Owner’s existing Facility utilized for interconnection to the Transmission System must be</p>

		documented.”
<p>Response: Thank you for your comment. The SDT agrees with many of the comments (as indicated in the accompanying resource document titled Technical Justification: FAC-001-1), especially those concerning the complexities of this process. The majority of stakeholders and the SDT support 45 days as a sufficient time frame because in many cases, the GO would simply need to adopt (document and publish) the facility connection requirements of its TO. No change made.</p>		
<p>Ingleside Cogeneration LP (Occidental Chemical)</p>	<p>No</p>	<p>Unfortunately, the vital point of this requirement revolves around whether or not a Generator Owner is compelled externally to allow access to their interconnection facilities. If the GO is driving the connection for financial or other business reasons, there is no reason they should not be responsible for developing AND maintaining a facility connection requirements document. Otherwise, when the local transmission system requirements change for any reason, there will be no entity responsible to ensure that the third party will conform as well. Conversely, if the GO should be compelled to allow access to a third party, it is the responsibility of the “compeller” to handle all the related reliability studies and documents. This may include the development of a CFR which separates reliability tasks between the GO and other entities - especially if a TSP registration is required. This ensures that the Regional Entity, PUC, RTO, or other regulator must budget dollars and resources directly related to their action - not cause them to be directed to a GO.</p>
<p>Response: Thank you for your comment. The SDT agrees with many of the comments (as indicated in the accompanying resource document titled Technical Justification: FAC-001-1), especially those concerning the complexities of this process. However, the issues you raise are beyond the scope of the SDT and its SAR. No change made.</p>		
<p>PSEG</p>	<p>No</p>	<p>We revised this partial sentence to the following: “Each applicable Generator Owner shall, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Transmission Facility that is used for connection</p>

Organization	Yes or No	Question 1 Comment
		<p>to the interconnected Transmission systems (under FAC-002-1), ..."- The phrase "Generator Owner's existing Facility that is used to interconnect to the Transmission System" was changed to "Generator Owner's existing Transmission Facility that is used for connection to the interconnected Transmission systems." - "Transmission" was added before Facility to exclude connections elsewhere; "Transmission System" was changed to "Transmission systems" because while "Transmission" and "System" are defined in the NERC Glossary, "System" means "A combination of generation, transmission, and distribution components." "Transmission systems" do not have generation or distribution components, so a lower case "system" is warranted. - In addition, the suggested phrase "interconnected Transmission systems" (plural "systems") uses identical language from FAC-002-1, except that we capitalized "Transmission.</p>
<p>Response: Thank you for your comment. The SDT has addressed the proposed change to applicability according to your comments. The applicability section now reads: "Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission systems.</p> <p>The SDT has been informed that in some areas (like Texas), GOs, by statute, can't own Transmission. It was also brought to the SDT's attention that in most cases, the Facility in question is referred to as the Interconnection Facility in documents filed by the GO with FERC. Therefore, the SDT intentionally modified language so that a Facility owned by a generation entity did not contain the term "Transmission."</p>		
Seattle City Light	Affirmative	Key points are that (1) an executed agreement is required before evaluations of impacts are necessary and (2) this only applies when a third party is connecting to the generating interconnection line.
<p>Response: Thank you for your comment.</p>		
Electric Power Supply Association	Yes	All TO requirements for FAC-001-1 would apply if and when GO executes an Agreement to evaluate the reliability impact of interconnecting a third

Organization	Yes or No	Question 1 Comment
		<p>party Facility to its existing generation interconnection Facility. The execution of the agreement is necessary to comply with FAC-002-1 and start the compliance clock with the applicable regulatory authority. Thus as the Project 2010-07 Standard Drafting Team (SDT) in its technical justification has stated, “If, and only if, the existing owner of a generator interconnection Facility has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to its existing generation Facility” then FAC-001-1 should apply. EPSA concurs with SDT’s conclusion. The SDT has examined the issue regarding if future requests for transmission service on the interconnection Facility and in doing so acknowledged that when that Facility adopted open access and was providing transmission service it would necessitate re-evaluation of the need for the Facility to be maintained in accordance with FAC-001-1, Requirements 2 and 4. This service would indeed prompt the necessary agreement the SDT contemplates in its technical justification of FAC-001-1. EPSA believes this serves as the necessary trigger for evaluation of Requirements 2 and 4 under FAC-001-1 for GOs.</p>
<p>Response: Thank you for your comment.</p>		
<p>American Wind Energy Association</p>	<p>Yes</p>	<p>AWEA appreciates that this standard specifies that it has limited applicability. For instance, only those generators that have an executed agreement with a third party wishing to interconnect must document and publish Facility connection requirements. We believe the proposed 45-day time window is a minimum for GO/GOP owners of generator lead lines to provide this documentation following execution of such an agreement. Anything less than 45 days could result in a burdensome and hard to meet deadline for GO/GOP staff. However, AWEA believes that extending this time window for publishing Facility connection requirements to 90 days after an executed agreement would be beneficial. We believe this will allow the GO/GOP owners of generator leads more time to coordinate with their</p>

		interconnecting Transmission Providers and will result in more reliable and coordinated connection requirements for the generator lead.
<p>Response: Thank you for your comment. The majority of stakeholders and the SDT support 45 days as a sufficient time frame because in many cases, the GO would simply need to adopt (document and publish) the facility connection requirements of its TO. No change made.</p>		
SERC OC Standards Review Group	Yes	Please verify within the applicability section (4.2.1) you intended to use the word “within” rather than some other wording.
<p>Response: Thank you for your comment. The SDT intended it to read “Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the Transmission System.” This change has been made.</p>		
RES Americas Development	Yes	RES Americas and AWEA appreciate that this standard specifies that it has limited applicability. For instance, only those generators that have an executed agreement with a third party wishing to interconnect must document and publish Facility connection requirements. We believe the proposed 45-day time window is a minimum for GO/GOP owners of generator lead lines to provide this documentation following execution of such an agreement. Anything less than 45 days could result in a burdensome and hard to meet deadline for GO/GOP staff. However, we believes that extending this time window for publishing Facility connection requirements to 90 days after an executed agreement would be beneficial. We believe this will allow the GO/GOP owners of generator leads more time to coordinate with their interconnecting Transmission Providers and will result in more reliable and coordinated connection requirements for the generator lead.
<p>Response: Thank you for your comment. The majority of stakeholders and the SDT support 45 days as a sufficient time frame because in many cases, the GO would simply need to adopt (document and publish) the facility connection requirements of its TO</p>		

Organization	Yes or No	Question 1 Comment
No change made.		
ACES Power Marketing Standards Collaborators	Yes	We largely agree with the changes the drafting team made but believe some additional changes are necessary. In section 4.2.1 of the Applicability Section, “within” should be “with”. Because NERC’s Glossary of Terms establishes that an Agreement can be verbal and not enforceable by law, section 4.2.1 should be further modified to clarify that it is a legally enforceable and fully executed Agreement. The language in R3 in parenthesis after Generation Owner should be modified to “once required by Requirement R2”. This makes it clearer that R3 does not apply until the GO has an executed Agreement to evaluate a request by a third part to interconnect.
<p>Response: Thank you for your comment. We agree that “within” should be “with”. The SDT chose not to adopt the second recommendation as the requirement already contains the term “executed.” The SDT also chose not to adopt the third recommendation as the requirement already contains the parenthetical (in accordance with Requirement R2) which we feel is synonymous with the comment.</p>

2. Do you support the one year compliance timeframe for Generator Owners as proposed in the Implementation Plan for FAC-001-1?

Summary Consideration:

The vast majority of commenters supported the one year compliance time frame in the Implementation Plan. A few commenters were concerned with this time frame and associated enforcement, in part based on similar issues addressed in recent CANs. The SDT did its best to clarify its intent as follows:

The SDT’s intent is that the mandatory date (the date upon which the GO must be compliant with applicable requirements and measures) be the first calendar day of the first calendar quarter one year after FAC-001-1’s approval. The SDT believes one year is sufficient time for the GO to become compliant where it has one or more in-place (which we interpret as synonymous with legacy or grandfathered) executed Agreement(s). If an Agreement is executed after the mandatory date, then the GO has 45 days to “document and publish its Facility connection requirements” (R2) and those requirements shall address items under R3.

No changes were made to the Implementation Plan.

Organization	Yes or No	Question 2 Comment
Ingleside Cogeneration LP (Occidental Chemical)	No	Based upon similar issues addressed in Compliance Application Notices (CANs), the drafting team needs to specify how the requirements apply to an in-place “executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the Transmission System.” In the view of Ingleside Cogeneration LP, if the Agreement takes effect even one day before FAC-001-1 does, requirements R2 and R3 do not apply. Without this clarification, it is possible that NERC’s Compliance team will apply the requirements retroactively - with minimum industry input.
<p>Response: Thank you for your comment. The SDT’s intent is that the mandatory date (the date upon which the GO must be compliant with applicable requirements and measures) be the first calendar day of the first calendar quarter <u>one year after its approval</u>. The SDT believes one year is sufficient time for the GO to become compliant where it has one or more in-place (which we interpret as synonymous with legacy or grandfathered) executed Agreement(s). 3. With respect to FAC-003, many commenters focused on the half-mile qualifier in FAC-003. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: “...that extends greater than one mile beyond the fenced area of the generating station switchyard...” We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.

Taking into consideration that only one of the versions of FAC-003 will actually be implemented, a decision that will be made as Project 2007-07—Vegetation Management moves forward, do you support the proposed redline changes to FAC-003-X and FAC-003-3?

Summary Consideration:

The SDT thanks all stakeholders for their comments and their over 85% approval for the FAC-003-X and FAC-003-3 changes posted for ballot in November 2011. Based on stakeholder feedback, the SDT has made the following changes:

- Added a clarifying reference to line of sight in the GO exemption in section 4.3.1.
- Corrected a typo in 4.3.1.2 of FAC-003-3.
- Changed “RE” to “Regional Entity” in 4.3.1 of FAC-003-X.

As it discusses in the document titled “[Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface](#),” the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.

To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: “Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are...”

With this reference, the SDT simply seeks to clarify the exception language based on the intent that has been agreed upon by the stakeholder body. In its [Consideration of Comments report](#) from the last formal comment period, which ended on July 17, 2011, the SDT explained “We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor.” With the addition of an explicit line of sight reference here, the SDT believes it has clarified its original intent and appropriately considered all comments submitted.

Some stakeholders suggested changes that should have been submitted when Project 2007-07 was revising FAC-003-2, because these suggestions dealt with the standard as a whole rather than the changes made by this SDT to ensure that GOs are included in the standard’s applicability.

One commenter remains concerned about the scope of the SDT. The SDT reminded this commenter that its scope is addressed in the [SAR](#) and that its intent is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP). The SDT also refers the commenter to the document titled [Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document](#). Specifically, see the last paragraph on page 4 and first two on page 5.

Organization	Yes or No	Question 3 Comment
Ameren Services	Negative	<p>(a) There is no technical basis for the one mile length exemption. In fact, one could argue that a very short line, 300 feet in length, that experienced a fault from a tree at "the end of the circuit", i.e near the switchyard fence, would have much more of an impact on the BES because the fault would be limited by much less impedance.</p> <p>(b) It is also unclear in this version if a GO that owned one line that was 1.2 miles in length would have to comply for the entire length of said line, or just 0.2 miles of said line. If the GO is responsible for 1.2 miles, then that argues that the first mile is important and consequently there is no basis for ignoring the first mile on other lines. If the GO is only responsible for 0.2 miles, what is the technical basis to ignore a mile? And would it be the first mile from the switchyard that is ignored, or is the middle mile, or the last mile where it connects to the TO? Or could the GO decide? Or could the GO pick sections of the line that amount to a mile that they can ignore? This seems like something that should be addressed for compliance.</p>

Organization	Yes or No	Question 3 Comment
		<p>(c) The 2 year compliance time line is far too long. There is significant industry evidence that was developed in the drafting of Version 2 that supports a one year compliance time-line for new lines. This is evidenced in Version 2. Thus there is no basis for the 2 years</p>
<p>Response: Thank you for your comment. As it discusses in the document titled "Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface," the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.</p> <p>To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: "Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are..."</p> <p>With respect to your second comment, the SDT intended for the length qualifier to be just that; if the overhead portion of a Facility exceeds the distance, <u>the entire Facility</u> is subject to the requirements of the standard.</p> <p>The SDT chose the time in the implementation plan based upon reasons it documented in the accompanying implementation plan and also based upon comments of stakeholders.</p>		
<p>Wisconsin Public Service Corp Electric Cooperative</p>	<p>Negative</p>	<p>R1.2 refers to an encroachment due to a fall in. This is confusing because according to the dictionary "Webster's II" encroachment reads: "to intrude gradually", and a 'fall in' is not usually gradual.</p>
<p>Response: Thank you for your comment. This is outside the scope of the SAR. The SDT reviewed comments submitted as part of the Project 2007-07 effort and did not find this comment had been submitted.</p>		
<p>Wisconsin Public Service Corp.</p>	<p>Negative</p>	<p>The concern with the proposed wording is that many generating station may not have a "generating station switchyard" as implied by the proposed wording. Often the generator leads (e.g. 20 kV) will exit the generator and connect to transformers located in transformer bays directly adjacent to the plant. From the transformers the now greater than 200 kV lines will be routed to the point of interconnect or a</p>

Organization	Yes or No	Question 3 Comment
		<p>generating unit switchyard, possibly miles or yards away. By no one’s definitions would the transformer bays adjacent to the plant be considered a switchyard. The plant fence may be yards or hundreds of yards from the bays and on a multiple unit site, there may be a site fence or boundary, which could be comprise of fences, security patrols, or other barriers yards or miles from the transformer but enveloping the switchyard. The valid assumption made by the drafting team is that transmission lines within an area tightly controlled by the generator operator poses very little risk to the BES as a result of vegetation contact. This assumption is based on the valid observation that these areas are routinely occupied and observed by station personnel and as a result unexpected and unacceptable vegetation growth is highly unlikely because it is controlled by routine maintenance. It also correctly assumes that some distance past the controlled area is acceptable since this area would also be under near continuous observation. The problem comes in defining both a tightly controlled area and a line of site. We suggest the following: Controlled Area: A perimeter around a power plant, power plants, or switchyard which is prevents intrusion by the use of physical barriers, observation, or electronic monitoring and is routinely occupied such that unexpected and unacceptable vegetation growth would be observed and correct as a matter of routine maintenance. Line of Sight: A two kilometer distance from the controlled area perimeter.</p>
<p>Response: Thank you for your comment. As it discusses in the document titled “Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface,” the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.</p> <p>To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: "Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are..."</p>		
Southern Company	No	<p>â€¢All of these comments pertain to FAC-003-3:</p> <ol style="list-style-type: none"> 1) We suggest referring to the Implementation Plan in the Effective Date sub-section of Section A of the standard rather than repeating the content of the Implementation Plan in the standard. There exists unnecessary duplication with including the information in both places. 2) We suggest simplifying the purpose statement to more succinctly say the intent, for example: "To maintain a reliable transmission system by managing vegetation located on transmission rights of way to minimize vegetation encroachments and thereby minimize the risk of vegetation related outages". If this change is not acceptable, at least change the phrase "preventing the risk" to "minimizing the risk". 3) We feel that the Enforcement paragraphs between 4.3.1.3 and 5.0 seem to be out of place. Those paragraphs don't belong in this location - consider moving them to Section C. Compliance. The fourth paragraph belongs in the background section. 4) We suggest moving the background section to Section F. "Associated Documents". It gets in the way of getting to the requirements of the standard. 5) We suggest moving Table 2 of the "Guideline and Technical Basis" document into R1, since it seems to be the only part of the document that is enforceable. Further

Organization	Yes or No	Question 3 Comment
		<p>we suggest that the Guideline and Technical Basis document be removed from the standard. The inclusion of this document in the standard makes the standard unwieldy.</p> <p>6) We suggest reordering the words in R1 to more clearly state the requirement. Please consider this rephrasing: "For lines which are either an element of an IROL or an element of a Major WECC Transfer Path, each applicable TO and applicable GO shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) when operating within their Rating during all Rated Electrical Operating Conditions of the types shown below:..." (remainder is unchanged).</p> <p>7) We suggest reordering the words of R2 to more clearly state the requirement. Please consider the this rephrasing: "For lines which are neither an element of an IROL nor an element of a Major WECC Transfer Path, each applicable TO and applicable GO shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) when operating within its Rating and during all Rated Electrical Operating Conditions of the types listed below:..." (remainder is unchanged).</p> <p>8) On Page 11 of the posted clean draft standard, is the reference to the previous footnote 2 correct? We recommend eliminating footnotes where possible to minimize redirections.</p> <p>9) The Rationale text-box on page 13 of the clean version of FAC-003-3 overlaps some of the text of footnote #6. â€€,â€€,â€€,</p>
<p>Response: Thank you for your comment.</p> <p>With respect to your suggestion regarding the implementation plan, the SDT simply followed the NERC-mandated document guidelines. Making the change you suggest would deviate from that process and thus the SDT has not made it.</p> <p>With respect to comments 2-8, any standard changes that go beyond making a standard applicable to a GO or GOP are beyond the scope of this SDT. Any redline changes the SDT has made within standards were made to clarify or qualify the GO or GOP applicability. These comments would have been more appropriate to make during the comment period for Project 2007-07 Vegetation Management, the project that revised the version of FAC-003 from which this SDT is working.</p>		

Organization	Yes or No	Question 3 Comment
<p>We have modified the rationale box on page 13 so that it does not overlap with the text of footnote 6.</p>		
<p>Dominion</p>	<p>No</p>	<p>Dominion suggests in FAC-003-X; 4.3.1. Regional Entity be changed to RE as listed in 4.2.1 for consistency. Also Regional Entity is used throughout the rest of the document, suggest using RE for consistency overall. Dominion suggests in FAC-003-3; 4.3.1. adding station to the following “ Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generation station switchyard and are” to show consistency as it is written in FAC-003-X 4.3.1. Further, Dominion is concerned that the technical justification characterized the exclusion (i.e., one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard) as “approximate line of sign [sic] from a fixed point” and notes that this line of sight may be limited by local terrain. Where line of sight of the radial corridor is limited on a clear day due to terrain, the one mile exemption must be limited in distance to no more than the line of sight on a clear day beyond the fenced area.</p>
<p>Response: Thank you for your comment. The SDT agrees with your comment about the Regional Entity, but will instead use Regional Entity throughout.</p> <p>Thank you for your comment. As it discusses in the document titled “Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface,” the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.</p> <p>To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: “Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are...”</p>		
<p>Exelon</p>	<p>No</p>	<p>FAC-003 - Exelon supports the one mile length qualifier, but feels that additional clarification is needed to determine the points of demarcation. There are too many differing physical configurations to use a “fence line” as a determination of</p>

Organization	Yes or No	Question 3 Comment
		<p>applicability. Suggest that the tie line length be defined as “from the Generator Step up Transformer GSU to the point of interconnection between the GO and TO owned equipment.” Also suggest that the standard define what constitutes a generation station switchyard.</p>
<p>Response: Thank you for your comment. As it discusses in the document titled “Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface,” the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.</p> <p>To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: “Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are...”</p>		
<p>Ingleside Cogeneration LP (Occidental Chemical)</p>	<p>No</p>	<p>Ingleside Cogeneration LP is very concerned that the attempt to develop “bright-line” criteria to assign applicability to either version of FAC-003 is misplaced. As seen with NERC’s recent proposed directive related to Generator-Transmission interconnections, those thresholds can be arbitrarily reduced based upon regulators aversion to risk - not scientific evidence. (As it stands today, NERC has proposed any interconnection facility operating at 100 kV or higher and greater than 3 spans in length be applicable - which is even stricter than the TO thresholds in FAC-003.) This would suggest that a reliability assessment consistent with the TPL standards must be the determining factor. If the Planning Coordinator or Transmission Planner can show that the Generator-Transmission interconnection could contribute to a violation of an SOL or IROL, then a vegetation management program may be in order. Furthermore, there needs to be some level of common sense applied if a GO-TO interconnection is located in an area where vegetation clearance is never an issue. A one-size-fits-all requirement based upon vegetation growth in the sub-tropics, should not automatically apply in the desert. In our view, every dollar spent to control vegetation in an arid climate is one less dollar available to purchase</p>

Organization	Yes or No	Question 3 Comment
		advanced telemetry, AGC systems, and other items which have a far greater impact on reliability.
<p>Response: Thank you for your comment. As it discusses in the document titled “Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface,” the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.</p> <p>To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: “Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are...”</p> <p>The SDT also took into consideration the stakeholder comments submitted and believes this exemption adequately addresses the reliability impact for a majority of the Facilities, while balancing the efforts necessary to support the standard from all entities.</p>		
Manitoba Hydro	No	Manitoba Hydro does not support the changes being proposed in this project. If a Generator Owner is required to register as a TO, all the Requirements applicable to a TO should apply. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions.
<p>Response: Thank you for your comment. The scope of this SDT is addressed in the SAR. The intent of the SAR is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP). The SDT also refers the commenter to the document titled Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document. Specifically, see the last paragraph on page 4 and first two on page 5.</p>		
Northeast Power Coordinating Council, Northeast Power Coordinating Council	No	Suggest in FAC-003-X; 4.3.1. that Regional Entity be changed to RE as listed in 4.2.1 for consistency. Also Regional Entity is used throughout the rest of the document, suggest using RE for consistency. In FAC-003-3; 4.3.1. add station to the following: “Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generation station switchyard and are” to show consistency as it is written in FAC-003-X 4.3.1. The technical justification characterized the exclusion (i.e., one mile or 1.609 kilometers beyond the fenced

MRO NSRF	No	<p>The NSRF agrees with the drafting committees desire to eliminate arbitrary and capricious behavior of auditors and industry staff by precisely defining the point at which measurement starts for the length of transmission line. The concern the NSRF has with the proposed wording is that many generating station may not have a “generating station switchyard” as implied by the proposed wording. Often the generator leads (e.g. 20 kV) will exit the generator and connect to transformers located in transformer bays directly adjacent to the plant. From the transformers the now greater than 200 kV lines will be routed to the point of interconnect or a generating unit switchyard, possibly miles or yards away. By no one’s definitions would the transformer bays adjacent to the plant be considered a switchyard. The plant fence may be yards or hundreds of yards from the bays and on a multiple unit site, there may be a site fence or boundary, which could be comprise of fences, security patrols, or other barriers yards or miles from the transformer but enveloping</p>

Organization	Yes or No	Question 3 Comment
		<p>the switchyard. The valid assumption made by the drafting team is that transmission lines within an area tightly controlled by the generator operator poses very little risk to the BES as a result of vegetation contact. This assumption is based on the valid observation that these areas are routinely occupied and observed by station personnel and as a result unexpected and unacceptable vegetation growth is highly unlikely because it is controlled by routine maintenance. It also correctly assumes that some distance past the controlled area is acceptable since this area would also be under near continuous observation. The problem comes in defining both a tightly controlled area and a line of site. We suggest the following: Controlled Area: A perimeter around a power plant, power plants, or switchyard which is prevents intrusion by the use of physical barriers, observation, or electronic monitoring and is routinely occupied such that unexpected and unacceptable vegetation growth would be observed and correct as a matter of routine maintenance. Line of Sight: NSRF recommends a two kilometer distance from the controlled area perimeter. Our assessment is that an individual of average height would have a line of site of approximately 4 Kilometers. Therefore, we recommended a distance of 2 kilometers from the Controlled Area of the plant to provide margin. The revised applicability statement would read as follows: “Generator Owner that owns an overhead transmission line(s) that extends greater than 2.0 kilometers beyond the Controlled Area of the generating station up to the point of interconnection with a Transmission Owner’s Facility and is operated at 200 kV and above and any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region. Furthermore we applaud the committee for using the metric system to identify the acceptable distance for this standard and urge it to remove all references to English units. We strongly suggest this drafting team and all future drafting team abandon the anachronistic English measurement system. This archaic system, based on the length of an average barley corn, should be abandon in all scientific and engineering endeavors.</p>

Response: Thank you for your comment. As it discusses in the document titled [“Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface,”](#) the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the

PSEG	No	
Infigen Energy US	Affirmative	Infigen finds the DST supporting details regarding FAC-003-X to be appropriate. We support maintaining "reasonable and appropriate" risk prevention measures to minimize encroachment that could trigger vegetation-related outages.
<p>Response: Thank you for your comment and support.</p>		
Seattle City Light	Affirmative	Key points are the greater than one mile with clear statement of "...beyond the fenced area of the generating switchyard."
<p>Response: Thank you for your comment and support.</p>		
RES Americas Development / American Wind Energy Association	Yes	Applying the vegetation management requirements to only generator lead lines that extend more than "one mile beyond the fenced area of the generating station switchyard" strikes a reasonable balance among the many stakeholder positions expressed on this topic. We think that as this criterion recognizes that there is little need for a vegetation management plan for shorter lines, it should explicitly state that this is true for all such facilities with lines of that length or smaller.
<p>Response: Thank you for your comment and support.</p>		

Organization	Yes or No	Question 3 Comment
Texas Reliability Entity	Yes	In the description of the “second effective date” in FAC-003-X there is an erroneous reference to “Requirement R3,” which should be corrected to “Requirement R1.”
Response: Thank you for your comment and support. This conforming change was made.		
Seattle City Light	Yes	Key points are the greater than one mile with clear statement of “...beyond the fenced area of the generating switchyard.”
Response: Thank you for your comment and support.		
ACES Power Marketing Standards Collaborators	Yes	We support the changes to FAC-003 suggested by the drafting team because we believe the drafting team has provided the best solution in face of a difficult problem. However, in general, we do not support registration of GOs and GOPs as TOs and TOPs or applicability of any TO/TOP requirements to the GO/GOP simply because they have a radial interconnection greater than one mile in length. While there may be some generators that own interconnecting facilities of significant length operated at a significant voltage that could impact BES reliability, we do not believe that the number of generating facilities that fit into that category is significantly large. When one considers that the majority of generators are still owned and operator by utilities that are also registered as a TO and TOP, there is only a minority subset of generators left that could be considered. NERC has the registration for this remaining set of generators and could use the data to evaluate how many of this remaining subset have interconnections owned by the generator that are substantial enough to affect reliability. It seems that NERC could determine the boundaries of this problem before registering anymore GOs and GOPs as TOs and TOPs or before applying additional requirements through this effort on the GOs and GOPs.
Response: Thank you for your comment and support.

4. Do you support compliance timeframe for Generator Owners as included and explained in the Implementation Plans for FAC-003-X?

Summary Consideration:

The SDT thanks all stakeholders for their comments. The vast majority of stakeholders support the compliance timeframes as proposed and explained in the Implementation Plan for FAC-003-X.

One commenter found a typo in the effective dates section of FAC-003-X, where one section referenced R3 when it should have referenced R1. That has been corrected in both the standard and the Implementation Plan.

A few stakeholders thought that two years was too long for an Implementation Plan for this standard. The SDT reminded those commenters that the time frame was based on previous stakeholder comments and the fact that the Implementation Plan for Version 0 standards stated “the Version 0 Reliability Standards are generally a translation and clarification of existing operating policies and planning standards, entities that are in compliance with NERC policies and standards today are expected to be able to remain in compliance with the Version 0 Reliability Standards with their existing procedures, tools, and practices.” This process occurred over more than two years. It is therefore reasonable to assume that GOs, having never had to comply with a vegetation management standard, be afforded adequate time to do so.

Beyond the corrected typo, no changes were made.

Organization	Yes or No	Question 4 Comment
Ameren Services	Negative	The 2 year compliance time line is far too long. There is significant industry evidence that was developed in the drafting of Version 2 that supports a one year compliance time-line for new lines. This is evidenced in Version 2. Thus there is no basis for the 2 years.
<p>Response: Thank you for your comment. The SDT choose the time in the implementation plan based upon comments of stakeholders and the fact that the implementation plan for <u>Version 0 standards</u> stated “the Version 0 Reliability Standards are generally a translation and clarification of existing operating policies and planning standards, entities that are in compliance with NERC policies</p>		

Organization	Yes or No	Question 4 Comment
<p>and standards today are expected to be able to remain in compliance with the Version 0 Reliability Standards with their existing procedures, tools, and practices.” This process occurred over more than two years. It is therefore reasonable to assume that GOs, having never had to comply with a vegetation management standard, be afforded adequate time to do so.</p>		
Texas Reliability Entity	No	<p>A compliance timeframe for the applicable GOs of two years is too long and the scenario used as a basis provides no timing specifics or details. Moreover, the 12 months for an existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard is arguably the same situation as an applicable GO but the applicable GO has an additional 12 months to come into compliance.</p>
<p>Response: Thank you for your comment. The SDT choose the time in the implementation plan based upon comments of stakeholders and the fact that the implementation plan for Version 0 standards stated “the Version 0 Reliability Standards are generally a translation and clarification of existing operating policies and planning standards, entities that are in compliance with NERC policies and standards today are expected to be able to remain in compliance with the Version 0 Reliability Standards with their existing procedures, tools, and practices.” This process occurred over more than two years. It is therefore reasonable to assume that GOs, having never had to comply with a vegetation management standard, be afforded adequate time to do so. The SDT does not believe that a TO’s acquisition of a new asset is the same as applying new requirements to a GO.</p>		
Ingleside Cogeneration LP (Occidental Chemical)	No	<p>Based upon similar issues addressed in Compliance Application Notices (CANs), the drafting team needs to specify when the first vegetation management inspection quarterly report, and any other requirement with an assigned interval in FAC-003-3 or FAC-003-X. Even if the decision is to adopt the same criteria proposed in CAN-0012, the industry is better served with a clear distinction made up front.</p>
<p>Response: Thank you for your comment. This is a comment that is outside the scope of the SDT, and in fact deals with a larger body of standards than just FAC-003. No change made.</p>		
PSEG	No	It’s no longer applicable.
<p>Response: Thank you for your comment. The SDT acknowledges that in November 2011, NERC’s Board of Trustees adopted FAC-003-2</p>		

Organization	Yes or No	Question 4 Comment
<p>– Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.</p> <p>Note that for its recirculation ballot, the SDT will be balloting both FAC-003-3 and FAC-003-X, but stakeholders should not vote as though they are choosing one or the other. As stated above, the SDT plans to present FAC-003-3 alone to NERC’s Board of Trustees, but it wants to have FAC-003-X ready to submit to the Board if, for some reason, neither FAC-003-2 nor FAC-003-3 are approved by FERC. Members of the ballot body should vote on the merits of each version of FAC-003 individually. In other words, stakeholders who support adding GOs to the applicability of FAC-003 should vote in the affirmative for both FAC-003-3 and FAC-003-X.</p>		
Manitoba Hydro	No	See question 3 comments.
<p>Response: See the SDT’s response to Question 3.</p>		
Southwest Power Pool Standards Development Team	No	The effective dates should be consistent with the original standard. If there is a reason for the extension we would like to know why.
<p>Response: Thank you for your comment. The SDT choose the time in the implementation plan based upon comments of stakeholders and the fact that the implementation plan for Version 0 standards stated “the Version 0 Reliability Standards are generally a translation and clarification of existing operating policies and planning standards, entities that are in compliance with NERC policies and standards today are expected to be able to remain in compliance with the Version 0 Reliability Standards with their existing procedures, tools, and practices.” This process occurred over more than two years. It is therefore reasonable to assume that GOs, having never had to comply with a vegetation management standard, be afforded adequate time to do so.</p>		
Southern Company	Yes	The development of a working TVMP will take some time to initialize. The 1 year time frame for R3 is appropriate. The 2 year time frame for all other requirements is appropriate.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment and support.		
Seattle City Light	Yes	The explanation deals with the fact that there are simultaneous revisions of FAC-003 underway by two different teams.
Response: Thank you for your comment and support.		
MRO NSRF	Yes	There may be a typographical error on the effective date. As currently drafted the standard states: In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption. Should it be worded as follows? In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 R1 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.
Response: Thank you for your comment. The SDT agrees with you. "Requirement R3," will be corrected to "Requirement R1."		
RES Americas Development/ American Wind Energy Association	Yes	Yes, as with our comments to question 2, since there is no exigent reason why this standard needs to be put in place at once, we support the proposed compliance timeframe. We believe that it will allow generators a reasonable time to comply with the requirement.

5. In the FAC-003-3 implementation plan, the SDT has attempted to account for a number of different scenarios that could play out with respect to the filing and approvals of FAC-003-2 and FAC-003-3. Do you support this approach? If there are other scenarios that the SDT needs to account for, please suggest them here.

Summary Consideration:

The SDT thanks all stakeholders for their comments. The vast majority of stakeholders support the compliance timeframes as proposed and explained in the Implementation Plan for FAC-003-3.

One commenter thought that two years was too long for an Implementation Plan for this standard. The SDT reminded those commenters that the time frame was based on previous stakeholder comments and the fact that the Implementation Plan for Version 0 standards stated “the Version 0 Reliability Standards are generally a translation and clarification of existing operating policies and planning standards, entities that are in compliance with NERC policies and standards today are expected to be able to remain in compliance with the Version 0 Reliability Standards with their existing procedures, tools, and practices.” This process occurred over more than two years. It is therefore reasonable to assume that GOs, having never had to comply with a vegetation management standard, be afforded adequate time to do so.

Some stakeholders expressed confusion about the relationship between FAC-003-3 and the recently BOT-approved FAC-003-2. The SDT acknowledges that in November 2011, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.

All stakeholders should note that for its recirculation ballot, the SDT will be balloting **both** FAC-003-3 and FAC-003-X, but stakeholders should **not** vote as though they are choosing one or the other. As stated above, the SDT plans to present FAC-003-3 alone to NERC’s Board of Trustees, but it wants to have FAC-003-X ready to submit to the Board if, for some reason, neither FAC-003-2 nor FAC-003-3 are approved by FERC. Members of the ballot body should vote on the merits of each version of FAC-003 individually. **In other words, stakeholders who support adding GOs to the applicability of FAC-003 should vote in the affirmative for both FAC-003-3 and FAC-003-X.**

Organization	Yes or No	Question 5 Comment
Manitoba Hydro	No	See question 3 comments.
Response: See the SDT’s response to Question 3.		
Southern Company	No	We believe that a standard development process should not have parallel paths where the same version is being modified by multiple teams. The uncertainty in which development path leads to confusion in the industry and ultimately proves to have wasted some resources for the path that does not come to fruition.
<p>Response: Thank you for your comment. While the SDT agrees this is not preferable, it was necessary given the urgency of both projects. The SDT did the best it could to describe the scenarios and reasons for posting multiple versions.</p> <p>In November 2011, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.</p>		
Ingleside Cogeneration LP (Occidental Chemical)	Yes	Ingleside Cogeneration agrees that the SDT’s approach is thorough. We are far more concerned about FAC-003’s applicability criteria and implementation time frame at this point - as stated in our responses to questions 3 and 4.
Response: Thank you for your comment and support. Please refer to the SDT’s responses to Questions 3 and 4.		
ACES Power Marketing Standards Collaborators	Yes	With recent NERC BOT approval of the FAC-003-2 standard, the drafting team should continue to monitor the standard progress with FERC and make necessary adjustments to the implementation plan.
Response: Thank you for your comment. The SDT acknowledges that FAC-003-2 was recently approved by the BOT. The SDT does not		

Organization	Yes or No	Question 5 Comment
<p>see the need to revise the GO implementation plan, as it already accounts for a number of scenarios that could occur based on how FERC handles the filing of FAC-003-2.</p>		
<p>Ameren</p>		<p>(a) There is no technical basis for the one mile length exemption. In fact, one could argue that a very short line, 300 feet in length, that experienced a fault from a tree at "the end of the circuit", i.e near the switchyard fence, would have much more of an impact on the BES because the fault would be limited by much less impedance.</p> <p>(b) It is also unclear in this version if a GO that owned one line that was 1.2 miles in length would have to comply for the entire length of said line, or just 0.2 miles of said line. If the GO is responsible for 1.2 miles, then that argues that the first mile is important and consequently there is no basis for ignoring the first mile on other lines. If the GO is only responsible for 0.2 miles, what is the technical basis to ignore a mile? And would it be the first mile from the switchyard that is ignored, or is the middle mile, or the last mile where it connects to the TO? Or could the GO decide? Or could the GO pick sections of the line that amount to a mile that they can ignore? This seems like something that should be addressed for compliance.</p> <p>(c) The 2 year compliance time line is far too long. There is significant industry evidence that was developed in the drafting of Version 2 that supports a one year compliance time-line for new lines. This is evidenced in Version 2. Thus there is no basis for the 2 years</p>
<p>Response: Thank you for your comment. As it discusses in the document titled "Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface," the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.</p> <p>To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: "Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are..."</p> <p>With respect to your second comment, the SDT intended for the length qualifier to be just that; if the overhead portion of a Facility</p>		

Organization	Yes or No	Question 5 Comment
<p>exceeds the distance, the entire Facility is subject to the requirements of the standard.</p> <p>The SDT choose the time in the implementation plan based upon reasons it documented in the accompanying implementation plan and also based upon comments of stakeholders.</p>

6. In its technical justification document, the SDT reviews all standards that had been proposed for substantive modification in the Ad Hoc Group’s original support and explains why, with the exception of FAC-003, modifying them would not provide any reliability benefit. Do you support these justifications? If you believe the SDT needs to add more information to its rationale for any of these decisions, please include suggested language here.

Summary Consideration:

The SDT thanks all stakeholders for their comments.

A few commenters pointed out that the wording in R1 and R2 of PRC-005-1a requires the same explicit reference to a generator interconnection Facility that was added in PRC-004-2a R2. The SDT is developing revisions to PRC-005-1a and will post them soon.

Many commenters encouraged the SDT to reexamine the standards and requirements that FERC and NERC applied to GOs and GOPs in their Milford/Cedar Creek order and draft compliance directive regarding generator leads. The SDT pointed out that the NERC Standard Processes Manual does not address the issue of how to deal with FERC Orders (that don’t include explicit directives), or NERC directives, within the standards process, and until this round of comments, when NERC staff submitted comments, the SDT had no formal mandate that would have made it appropriate to consider the content of the proposed directive.

Based on stakeholder comments, the SDT expanded its technical justification document (posted under “Supporting Materials”) to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive. After another thorough review of these standards, the SDT continues to believe that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards.

One commenter remains concerned about the scope of the SDT. The SDT reminded this commenter that its scope is addressed in the SAR and that its intent is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP). The SDT also refers the commenter to the document titled Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document. Specifically, see the last paragraph on page 4 and first two on page 5.

Organization	Yes or No	Question 6 Comment
Manitoba Hydro	Negative	The intention of the NERC SDT in revising these standards is not clear. While the Technical Justification document states that the SDT intended to focus on a Generator

Organization	Yes or No	Question 6 Comment
		<p>Owner’s radial interconnection facilities, the scope of the revised standard (s) is not confined to such facilities. The very broadly defined term “Facility” is used. Moreover, the Technical Justification document’s reference to the FERC decision in Cedar Creek as a basis for the revision of additional standards is confusing, since that decision did not specifically address the issue of radial facilities and supported NERC’s registration of GOs as TOs.</p>
<p>Response: Thank you for your comment. The scope of this SDT is addressed in the SAR. The intent of the SAR is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP). The SDT determined that it should first address “low-hanging fruit” and believes these to be sole-use Facilities (see posted examples under “Supporting Materials”) – that is, a Facility used to connect one or more generators to a Facility owned or operated by a transmission entity (TO/TOP). Through our deliberations, we came to the conclusion that an interconnection Facility owned or operated by a GO or GOP that is more complex would likely require specific analysis and that such analysis would most likely be outside the scope of this SDT.</p> <p>The SDT also refers the commenter to the document titled Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document. Specifically, see the last paragraph on page 4 and first two on page 5.</p>		
Texas Reliability Entity	No	<p>Our negative votes on FAC-003 reflect our concern that this project has not considered all of the applicable standards. Why did the SDT choose to only review the Ad Hoc Group’s standards when there have been multiple registration appeals in which FERC and NERC have repeatedly cited specific additional TO/TOP standards that were determined to be applicable to GO/GOPs? This SDT project would serve a tremendous value to the ERO and in particular industry if it were to address the technical aspects of the following FERC ordered applicable standards: PRC-001-1 R2, R4; PRC-004-1 R1; TOP-004-2 R6; PER-003-1 R1; FAC-003-1 R1, R2; TOP-001-1a R1 and FAC-004-2 R2. The SDT team should analyze the FERC orders, the applicable standards indicated, and the circumstances and facts involved, and technically justify why no reliability gap exists if these standards are not applied to GO interface facilities. The SDT should include more “technical” information in its technical justification document. For example, in regards to TOP-004-2 R7, the SDT technical</p>

Organization	Yes or No	Question 6 Comment
		<p>justification states that there is no reliability gap because, “. . . because an operator has a fiduciary obligation to protect a Facility for which it is operationally responsible.” An entity having a fiduciary obligation is not a technical justification of why a reliability gap does not exist. Moreover, by that logic there would be no need for many standards because every registered entity has a fiduciary obligation to protect its facilities.</p>
<p>Response: Thank you for your comment. The NERC Standard Processes Manual does not address the issue of how to deal with FERC Orders (that don’t include explicit directives), or NERC directives, within the standards process, and until this round of comments, when NERC staff submitted comments, the SDT had no formal mandate that would have made it appropriate to consider the content of the directive you reference.</p> <p>We would like to clarify, in response to the comment concerning TOP-004-2 R7, that in the document titled “Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface” the SDT also stated “FAC-008-1—Facility Ratings Methodology and FAC-009-1—Establish and Communicate Facility Ratings already infer that the reason for establishing a ratings methodology and communicating facility ratings to the Reliability Coordinator, Planning Authority, Transmission Planner, and Transmission Operator is for use in reliable planning and operation of the Bulk Electric System.”</p> <p>Based on your and other comments, we have expanded our technical justification document (posted under “Supporting Materials”) to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive. After another thorough review of these standards, the SDT continues to believe that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards.</p>		
PSEG	No	<p>PRC-005-1 - Transmission and Generation Protection System Maintenance and Testing was recommended by the Ad Hoc Group for modification, but not addressed to the technical justification document. It should be.</p>
<p>Response: Thank you for your comment. We have reviewed PRC-005-1a and believe that the wording in R1 and R2 of that standard require the same explicit reference to a generator interconnection Facility that was added in PRC-004-2a R2. The SDT is developing revisions to PRC-005-1a and will post them soon.</p>		
Florida Municipal Power	No	see comment to Question 7

Agency		
Response: See the SDT’s response to Question 7.		
Manitoba Hydro	No	See Question 7 comments.
Response: See the SDT’s response to Question 7.		
MRO NSRF	No	The NSRF has one concern with the current justification and definitions. At some point, if enough interconnections are made to generator outlet leads in accordance with FAC-001, the original generator operator will be a Transmission Operator and a Transmission Owner. This point in time needs to be explicitly defined by the drafting team.
Response: The SDT cannot act on this comment. Registration is outside the scope of this SDT and resides with NERC and the Regional Entity.		
Manitoba Hydro		If the drafting team intends to limit the scope of FAC-001-1 to GO owned radial generator interconnection facilities that are not deemed BES transmission and therefore would not require the registration of the GO as a TO, Manitoba Hydro disagrees with the proposed changes to FAC-001-1 as Generator Owners may not have the models or expertise to perform interconnection studies to determine if there is an impact on the Transmission Network. This concern is echoed in the technical justification document provided by NERC: ‘the SDT acknowledges that the Generator Owner may not, at the time it agrees or is compelled to allow a third part to interconnect, have the necessary expertise to conduct the required interconnect studies to meet this standard... the Generator Owner will have to acquire such expertise. How the Generator Owner chooses to do so is not for the SDT to determine.’ Although it may not be for the SDT to determine how a GO obtains technical expertise, ensuring that such expertise is acquired before a GO conducts the required interconnection studies should be a concern to NERC as this directly affects

Organization	Yes or No	Question 6 Comment
		<p>the reliability of the BES. As a result, all interconnection requests should be implemented by the TO providing the GO with connection to the BES regardless if the interconnection point is within a Generation Owner facility or End-User facility as the TO is in the best position to set unbiased connection requirements to ensure the reliability of the BES is maintained. If the scope of FAC-001-1 also applies to GO owned BES transmission facilities, Manitoba Hydro strongly believes that the Compliance Registry should apply and the GOs should be required to register as a TO and abide by all applicable standards to that functional type. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions. Reliability gaps would be better addressed if select GOs and GOPs registered as TOs and TOPs to ensure all reliability standards, including the protection standards, are met so the reliability of the BES is maintained. At this time, this would not lead to a large number of extra registrations since, as stated in the technical justification document, ‘interconnection requests for Generator Owner Facilities are still relatively rare.</p>
<p>Response: Thank you for your comment. The SDT agrees this is a complex issue and did its best to outline how it arrived at its position in the document titled “Technical Justification: FAC-001-1.”</p> <p>The SDT points out that if the GO is part of an RTO, then the GO will be coordinating any interconnection studies either directly or indirectly with the RTO interconnection process. If the GO is not part of an RTO, then the GO will be required to follow the pro forma interconnection procedures from Order 2003. The Order 2003 procedures require the GO to coordinate any studies with an affected system which could include Facilities owned by one, or more, TO on the other side of the GO’s existing point of interconnection.</p> <p>The SDT has proposed the modification of a select set of standards so that they apply to GOs and GOPs as an alternative to registering all GOs and GOPs as TOs and TOPs. The SDT does agree that upon interconnection of a third party, other standards or registrations may apply as appropriate.</p>		
Electric Power Supply Association	Affirmative	<p>All TO requirements for FAC-001-1 would apply if and when GO executes an Agreement to evaluate the reliability impact of interconnecting a third party Facility to its existing generation interconnection Facility. The execution of the agreement is necessary to comply with FAC-002-1 and start the compliance clock with the</p>

Organization	Yes or No	Question 6 Comment
		<p>applicable regulatory authority. Thus as the Project 2010-07 Standard Drafting Team (SDT) in its technical justification has stated, “If, and only if, the existing owner of a generator interconnection Facility has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to its existing generation Facility” then FAC-001-1 should apply. EPSA concurs with SDT’s conclusion. The SDT has examined the issue regarding if future requests for transmission service on the interconnection Facility and in doing so acknowledged that when that Facility adopted open access and was providing transmission service it would necessitate re-evaluation of the need for the Facility to be maintained in accordance with FAC-001-1, Requirements 2 and 4. This service would indeed prompt the necessary agreement the SDT contemplates in its technical justification of FAC-001-1. EPSA believes this serves as the necessary trigger for evaluation of Requirements 2 and 4 under FAC-001-1 for GOs.</p>
<p>Response: Thank you for your comment and support.</p>		
<p>Infigen Energy US</p>	<p>Affirmative</p>	<p>Infigen supports the FAC-001-1 technical analysis by the Project 2010-07 SDT, which states in part that “If, and only if, the existing owner of a generator interconnection Facility has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to its existing generation Facility would the proposed FAC-001-1 apply”. We agree with the SDT’s reasoning that if the owner of the existing generator interconnection Facility agrees, or is compelled to allow a third party to interconnect, but can do so using existing agreements, contracts, and/or tariffs [to avoid requiring additional executed Agreement(s)], this is the most prudent and effective way to manage this process with continuity. In order to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility more expediently, it can avoid having to develop its own connection requirements or perform additional impact studies, to the extent possible. We find it reasonable to negotiate with the existing Transmission Owner, Transmission Planner, and/or Transmission Service Provider to manage this requirement, utilizing their</p>

7. The SDT is attempting to modify a set of standards so that radial generator interconnection Facilities are appropriately accounted for in NERC's Reliability Standards, both to close reliability gaps and to prevent the unnecessary registration of GOs and GOPs at TOs and TOPs. Does the set of standards currently posted achieve this goal?

Summary Consideration:

The SDT thanks all stakeholders for their comments. Most commenters support the SDT's work and agree that the set of standards for which the SDT has proposed modification ensure that radial generator interconnection Facilities are appropriately accounted for in NERC's Reliability Standards.

One commenter continues to express confusion about the scope of the SDT's work in general. The SDT reminded this commenter that its scope is addressed in the [SAR](#). The intent of the SAR is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP). The SDT determined that it should first address "low-hanging fruit" and believes these to be sole-use Facilities (see posted examples under "Supporting Materials") – that is, a Facility used to connect one or more generators to a Facility owned or operated by a transmission entity (TO/TOP). Through its deliberations, the SDT came to the conclusion that an interconnection Facility owned or operated by a GO or GOP that is more complex would likely require specific analysis and that such analysis would most likely be outside the scope of this SDT. The SDT also refers the commenter to the document titled [Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document](#) (specifically, the last paragraph on page 4 and first two on page 5). The SDT has proposed the modification of a select set of standards so that they apply to GOs and GOPs as an alternative to registering all GOs and GOPs as TOs and TOPs, a strategy that has been widely supported by the stakeholder body. The SDT does agree that upon interconnection of a third party, other standards or registrations may apply as appropriate.

One commenter asked the SDT to specify what it means by "radial." By "radial generator interconnection Facilities," the SDT means sole-use Facilities (see posted examples under "Supporting Materials") – that is, a Facility used to connect one or more generators to a Facility owned or operated by a transmission entity (TO/TOP).

A few commenters suggested that the SDT address those standards cited by FERC and NERC in related projects. The SDT pointed out that the NERC [Standard Processes Manual](#) does not address the issue of how to deal with FERC Orders (that don't include explicit directives), or NERC directives, within the standards process. However, based on stakeholder comments, the SDT has expanded its technical justification document (posted under "Supporting Materials") to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive. After another thorough review of these standards, the SDT continues to believe that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards.

One commenter suggested that the SDT include the GO in TOP-004-2 R6, but the SDT continues to maintain that no gap exists because TOP-002-2 R3 already requires the GO to coordinate with its host BA and TSP, who in turn are required to coordinate with their TOPs.

One commenter pointed out that the Data Retention section of the proposed PRC-004-2.1a also requires modification to include the generator interconnection Facility. The SDT agrees and made this change.

Organization	Yes or No	Question 7 Comment
Manitoba Hydro	Negative	<p>Manitoba Hydro has the following comments:</p> <p>1) The intention of the NERC SDT in revising these standards is not clear. While the Technical Justification document states that the SDT intended to focus on a Generator Owner’s radial interconnection facilities, the scope of the revised standard (s) is not confined to such facilities. The very broadly defined term “Facility” is used. Moreover, the Technical Justification document’s reference to the FERC decision in Cedar Creek as a basis for the revision of additional standards is confusing, since that decision did not specifically address the issue of radial facilities and supported NERC’s registration of GOs as TOs.</p> <p>2) Manitoba Hydro strongly disagrees with bypassing the NERC Compliance Registry and only having a limited set of standards apply to the GOs ‘interconnection facilities’ If a Generator Owner wants to own transmission facilities and it falls under the definition of a Transmission Owner under the NERC Registry Criteria, then all the Requirements applicable to a TO should apply. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions. Reliability gaps would be better closed if select GOs and GOPs simply registered as TOs and TOPs. At this time, this would not lead to a large number of extra registrations since, as stated in the technical justification document, ‘interconnection requests for Generator Owner Facilities are still relatively rare.</p>

Texas Reliability Entity	No	See comment 6.
<p>Response: See the SDT’s response to Question 6.</p>		
Manitoba Hydro	No	<p>The SDT’s proposed modifications gives special treatment to the Generator Owner in that it allows the Generator Owner TO status for a couple of standards (FAC-001, FAC-003 and PRC-004), but exempts the Generator Owner from many of the standards applicable to a TO. The NERC Registry Criteria defines the various functional entities. If a Generator Owner wants to own transmission facilities and it falls under the definition of a Transmission Owner under the NERC Registry Criteria, then all the Requirements applicable to a TO should apply. There is no need to change specific Reliability Standards to allow the Generator Owner to perform only selected TO functions. Reliability gaps would be better closed if select GOs and GOPs simply registered as TOs and TOPs. At this time, this would not lead to a large number of extra registrations since, as stated in the technical justification document, ‘interconnection requests for Generator Owner Facilities are still relatively rare.</p>
<p>Response: Thank you for your comment. The scope of this SDT is addressed in the SAR. The intent of the SAR is to address all reliability gaps associated with ownership or operation of an interconnection Facility by a generation entity (GO/GOP). The SDT determined that it should first address “low-hanging fruit” and believes these to be sole-use Facilities (see posted examples under “Supporting Materials”) – that is, a Facility used to connect one or more generators to a Facility owned or operated by a transmission entity (TO/TOP). Through our deliberations, we came to the conclusion that an interconnection Facility owned or operated by a GO or</p>		

Organization	Yes or No	Question 7 Comment
<p>GOP that is more complex would likely require specific analysis and that such analysis would most likely be outside the scope of this SDT.</p> <p>The SDT also refers the commenter to the document titled Project 2010-07: Generator Requirements at the Transmission Interface Background Resource Document. Specifically, see the last paragraph on page 4 and first two on page 5.</p> <p>The SDT has proposed the modification of a select set of standards so that they apply to GOs and GOPs as an alternative to registering all GOs and GOPs as TOs and TOPs, a strategy that has been widely supported by the stakeholder body. The SDT does agree that upon interconnection of a third party, other standards or registrations may apply as appropriate.</p>		
<p>Southwest Power Pool Regional Entity</p>	<p>No</p>	<p>The Technical Justification document did not review the standards FERC identified in paragraphs 71 and 87 of 135 FERC ¶ 61,241 ORDER DENYING APPEALS OF ELECTRIC RELIABILITY ORGANIZATION REGISTRATION DETERMINATIONS. The SDT needs to review these standards to determine if changes are needed; otherwise, FERC will require registration of GOs and GOPs as TOs and TOPs to address reliability gaps. If the SDT determines no changes are needed to these FERC-identified standards, they should provide justification.</p>
<p>Response: Thank you for your comment. The NERC Standard Processes Manual does not address the issue of how to deal with FERC Orders (that don't include explicit directives) within the standards process. However, based on your and other comments, we have expanded our technical justification document (posted under "Supporting Materials") to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive. After another thorough review of these standards, the SDT continues to believe that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards.</p>		
<p>Southern Company</p>	<p>No</p>	<p>We don't believe the effort realizes the goal because 1) it is inclusive of FAC-001 that does not need any modifications and 2) the effort needs to reinforce the appropriate justification not to include the additional standards FERC has identified in their Cedar Creek and Milford Orders.</p>
<p>Response: The SDT thanks you for your comment. The SDT believes that comment (1) is a complex issue and did its best to outline how it arrived at its position in the document titled "Technical Justification: FAC-001-1."</p>		

Organization	Yes or No	Question 7 Comment
		<p>As for comment (2), the NERC Standard Processes Manual does not address the issue of how to deal with FERC Orders (that don't include explicit directives) within the standards process. However, based on your and other comments, we have expanded our technical justification document (posted under "Supporting Materials") to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive. After another thorough review of these standards, the SDT continues to believe that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards.</p>
<p>Western Electricity Coordinating Council</p>	<p>No</p>	<p>WECC casts an affirmative vote for the SDT proposal as a necessary but not sufficient step in addressing the GOTO matter. WECC, NERC, and the other Regions developed a subset of Standards and Requirements that were considered necessary to address potential gaps for transmission interconnection facilities and operations to be included in a proposed NERC Directive, which is expected to issue by year-end. The subset of requirements developed for the proposed NERC Directive were informed by the applicable FERC Orders. Consequently, it is important that the SDT address the comparative reliability risks between the proposed NERC Directive List and the SDT Proposal to assure that reliability gaps will not result from the SDT proposal. Please see NERC's proposed Directive for the rationale and technical justification.</p>
<p>Response: Thank you for your comment. The NERC Standard Processes Manual does not address the issue of how to deal with FERC Orders (that don't include explicit directives), or NERC directives, within the standards process, and until this round of comments, when NERC staff submitted comments, the SDT had no formal mandate that would have made it appropriate to consider the content of the directive you reference.</p> <p>However, based on your and other comments, we have expanded our technical justification document (posted under "Supporting Materials") to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive. After another thorough review of these standards, the SDT continues to believe that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards.</p>		
<p>Florida Municipal Power Agency</p>		<p>FMPA believes that TOP-004-2 R6.2 ought to also be addressed in the standards as applicable to GOPs. The requirements reads:R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and</p>

Organization	Yes or No	Question 7 Comment
		<p>implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including: R6.2. Switching transmission elements. Although planned outages are covered in other standards applicable to a GOP, switching to close / synchronize a generator back to the system is not specifically covered in the standards. Some have argued that TOP-002-2 R3 causes GOPs to coordinate its current day plans with the TOP; however, the name of the standard is “Transmission Operations Planning” and therefore implies the availability of the generator and related equipment and not necessary implies the policies and procedures for switching operations; which includes synchronization. FMPA cannot imagine a generator that would not have such switching / synchronization policies and procedures coordinated with its interconnecting TOP; as such would normally be required through a Large Generator Interconnection Agreement through a pro forma OATT; however, FMPA is not aware of any instance in the standards that covers this. As such, FMPA recommends including TOP-004-2 R6.2 as being applicable to a GOP.</p>
<p>Response: Thank you for your comment. We don’t agree that the gap exists because TOP-002-2 R3 already requires the GO to coordinate with its host BA and TSP, who in turn are required to coordinate with their TOPs.</p>		
Manitoba Hydro		<p>If the redline changes are implemented, GOs are removed from R4, thereby removing the obligation for GOs to maintain their connection requirements. If GOs are included in FAC-001, they should be held accountable to the same level as TOs and should be required to maintain their connection requirements. Requiring a GO to maintain connection requirements would be especially beneficial to the GO themselves. In the majority of instances, any GO that is an Applicable Entity for FAC-001 would initially be inexperienced in performing interconnection studies and would benefit from regular and frequent review of their connection requirements as experience and expertise are gained.</p>
<p>Response: Thank you for your comment. The SDT agrees this is a complex issue and did its best to outline how it arrived at its position</p>		

Organization	Yes or No	Question 7 Comment
in the document titled " Technical Justification: FAC-001-1. "		
SERC OC Standards Review Group		Please list the set of standards are you referencing.
Response: The SDT is referring to those standards posted for comment (FAC-001-1, FAC-003-X, FAC-003-3, and PRC-004-2.1).		
Constellation Power Source Generation, Inc.	Affirmative	Constellation appreciates and supports the work of the standard drafting team. We recognize the significant time invested by technical experts from industry to consider the appropriate application of reliability standards to address concerns raised about coverage of transmission at the generator interface. The drafting team analysis identified the standards in need of revision to appropriately address the reliability concerns raised. Please see more detailed comments submitted in the Project 2010-07 comment form submitted on November 18, 2011.
Response: Thank you for your comment and support.		
Infigen Energy US	Affirmative	Infigen finds the SDT supporting measures and analysis regarding FAC-003-3 to be appropriate, and believes that it is prudent for Generation Owners and Transmission Owners to manage vegetation maintenance records/inspections accordingly. We support maintaining "reasonable and appropriate" risk prevention measures to minimize encroachment that could trigger vegetation-related outages.
Response: Thank you for your comment and support.		
PPL EnergyPlus LLC	Affirmative	PPL Generation, LLC, on behalf of its NERC-registered subsidiaries, appreciates the effort by the Standard Development Team to address the GO-TO interface issues in a manner that enhances the reliability of the BES without adding unnecessary burden on Generators. As registered GOs/GOPs, the PPL Generation registered entities agree with the changes made by the SDT to these three standards. To the extent that GOs/GOPs are required to register as TOs/TOPs, PPL Generation would have

Organization	Yes or No	Question 7 Comment
		significant concerns with meeting the compliance requirements applicable to TOs in the standards included in the scope of this Project, as well as other TO/TOP requirements throughout other NERC standards.
<p>Response: Thank you for your comment and support.</p>		
Puget Sound Energy, Inc.	Affirmative	The changes to this standard are minor, and seem to be centered around including "generator Interconnection facilities" to R2. This added phrase and the statement in 1.4 Data Retention "Generator Owner that owns a generation Protection System" seems to assume that the generator owner and generator interconnection facilities owner is always the same. This is not always the case, and will make this standard language confusing to prepare evidence for. A suggestion would be to revise the language to allow for a separate generator owner and generator interconnection facilities owner.
<p>Response: Thank you for your comment. The SDT believes that the language makes clear that an entity need only be concerned with the Elements or Facilities that it owns.</p> <p>The SDT agrees with your comment regarding the language in the Data Retention section and has modified that section as follows: "The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation or generator interconnection Protection System..."</p>		
Southwest Transmission Cooperative, Inc. / ACES Power Marketing	Affirmative	We largely support the changes made by drafting team because we believe the drafting team has provided the best solution in face of a difficult problem. However, in general, we do not support registration of GOs and GOPs as TOs and TOPs or applicability of any TO/TOP requirements to the GO/GOP simply because they have a radial interconnection greater than one mile in length. While there may be some generators that own interconnecting facilities of significant length operated at a significant voltage that could impact BES reliability, we do not believe that the number of generating facilities that fit into that category is significantly large. When one considers that the majority of generators are still owned and operator by utilities that are also registered as a TO and TOP, there is only a minority subset of generators

Organization	Yes or No	Question 7 Comment
		<p>left that could be considered. NERC has the registration for this remaining set of generators and could use the data to evaluate how many of this remaining subset have interconnections owned by the generator that are substantial enough to affect reliability. It seems that NERC could determine the boundaries of this problem before registering anymore GOs and GOPs as TOs and TOPs or before applying additional requirements through this effort on the GOs and GOPs. Subjecting a GO/GOP to any TO/TOP standards requirements should require a clear demonstration of the reliability gap in each instance. Some additional changes are necessary to FAC-001.</p>
<p>Response: Thank you for your comment and support. We are unsure as to what changes to FAC-001 you feel are necessary unless you are referring to comments stated previously.</p>		
<p>Ingleside Cogeneration LP (Occidental Chemical)</p>	<p>Yes</p>	<p>Although the SDT is nearing conclusion on the closing of reliability gaps, the unnecessary registration of GOs and GOPs as TOs and TOPs is far from resolved in our view. Ingleside Cogeneration’s concern is based upon NERC’s recent proposal to dictate an interim GO-TO interconnection solution which completely bypasses the Standards Development Process. Frankly, it seriously brings to question the nature of the consensus-driven process - which appears to be moving in a dictatorial direction.</p>
<p>Response: Thank you for your comment and support.</p>		
<p>American Wind Energy Association</p>	<p>Yes</p>	<p>AWEA believes that the standards modifications proposed by the SDT should address any genuine reliability gap with regard to generator lead lines, rather than just perceived but unsupported threats. To that end, we support the approach that the SDT appears to be taking of modifying a limited number of applicable standards so that they apply to GO/GOP lead lines. In particular, we fully support the fact that the SDT recognizes that GO/GOPs should not automatically be required to register as TO/TOPs simply because of their ownership of generator lead lines. The SDT correctly recognizes that such registration should be done based on a case-by-case determination. As already noted, registering a GO/GOP as a TO/TOP may actually decrease reliability.</p>

9. If you answered “no” to Question 7, what standards need to be added or removed to achieve the SDT’s goal? Please provide technical justification for your answer.

Summary Consideration:

The SDT thanks all stakeholders who submitted comments. Few stakeholders suggested that standards need to be added or removed to achieve the SDT’s goal.

One commenter pointed out that PRC-005-1a required the same kind of change made in the proposed PRC-004-2.1a to ensure that generator interconnection Facility Protection Systems are included within that standard. The SDT agrees with this suggestion and has initiated a process to modify R1 and R2 in PRC-005-1a.

A few commenters returned to FAC-001-1 and stated their concern about the feasibility of adding FAC-001-1 to the applicability section of this standard. The SDT agrees with commenters that the issues surrounding the interconnection of a third party Facility to a GO’s existing Facilities are complex ones, and reminded commenters that it did its best to address these complexities in the resource document titled “[Technical Justification: FAC-001-1](#).” The SDT also points out that if the GO is part of an RTO, then the GO will be coordinating any interconnection studies either directly or indirectly with the RTO interconnection process. If the GO is not part of an RTO, then the GO will be required to follow the pro forma interconnection procedures from Order 2003. The Order 2003 procedures require the GO to coordinate any studies with an affected system which could include Facilities owned by one, or more, TO on the other side of the GO’s existing point of interconnection. The SDT acknowledges that upon interconnection of a third party, other standards or registrations may apply as appropriate.

Some commenters suggested that the SDT reexamine the standards cited in the Milford and Cedar Creek FERC orders. The SDT continues to find clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards and not requiring the GO or GOP to register as a TO or TOP. However, to address stakeholder concern, the SDT has expanded its technical justification document (posted under “Supporting Materials”) to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive.

Organization	Yes or No	Question 9 Comment
Cowlitz County PUD	No	N/A
Manitoba Hydro	No	See question 7 comments.

Organization	Yes or No	Question 9 Comment
<p>Response: See the SDT’s response to Question 7.</p>		
<p>Southern Company</p>	<p>Yes</p>	<p>Southern does not think that the revision to FAC-001-1 is necessary. A Generator Owner (GO) cannot assess reliability impacts to the Bulk Electric System (BES) and determine acceptability without support and involvement of the applicable owner and operator of the Transmission System (i.e., the “interconnected TO” or “interconnected TP”). A generator tie-line does not equate to a Transmission System. A GO must already adhere to a TO’s Facility connection requirements whether the GO wants to connect additional facilities or a third parties’ facilities to its own interconnection Facilities. Stated another way, the GO does not need Facility Connection requirements to govern how multiple units are tied to a collector bus so why are they needed for a third party to connect to an existing tie-line? In either case it is the interconnected TO or interconnected TP that has connection requirements that must be fulfilled. The GO’s Interconnection Agreement would prohibit it from connecting additional facilities without a new application for Interconnection Service with its interconnected TO or interconnected TP. A GO should not need to develop “connection requirements” unless it is in the business of owning and operating facilities independently of its interconnected TO or interconnected TP. We do not believe a reliability gap exists in FAC-001-1 because the requestor for interconnecting another Facility to an existing generation Facility must coordinate with the applicable TO, TP, and PA in accordance with FAC-002-0 to ensure they meet all applicable facility connection and performance requirements. If and when there is an agreement in place for a third party to connect to a generator tie-line then the tie-line would become part of the integrated system and its purpose and the owner’s function would likely warrant registration as a TO/TOP and FAC-001 would then apply. The following excerpt from the 2010-07 Background Resource White Paper acknowledges that this may be necessary: “The drafting team also acknowledges that, if another party interconnects to a Facility owned by a Generator Owner, there may be the need to address MOD or TPL standards. However, the drafting team believes that this, too, is best handled through specific evaluation, perhaps accompanied by changes to the</p>

Organization	Yes or No	Question 9 Comment
		<p>compliance registry. Entities that face this kind of scenario may also meet criteria applicable to other registrations such as Transmission Service Provider or Transmission Planner.” [Arguments related to jurisdictional, interconnection policy and open access transmission tariff issues](1) Because of (a) jurisdiction under Section 215, (b) FERC’s interconnection policy, and (c) the requirements of the pro forma open access transmission tariff (OATT), a GO should not be required to comply with FAC-001-1 until that GO’s generating Facility reaches commercial operation. NERC should not make facilities subject to the mandatory reliability standards before the facilities are actually part of the BES.(a) Jurisdiction under FPA Section 215. First, it is not clear that NERC or FERC has jurisdiction under FPA Section 215 to require generation facilities that have not actually reached commercial operation to be subject to reliability standards. Section 215(a)(2) of the FPA defines the “Electric Reliability Organization” as “the organization certified by the Commission ... the purpose of which is to establish and enforce reliability standards for the bulk-power system, subject to Commission review.” Further, (a)(3) provides that “The term ‘reliability standard’ means a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system. The term includes requirements for the operation of existing bulk-power system facilities ... the design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation of the bulk-power system” Thus, under Section 215 NERC can develop reliability standards that address requirements for existing bulk-power system facilities (i.e., facilities that have reached “commercial operation”) and for the design of planned additions or modifications. It is logical to interpret the phrase “design of new facilities” as meaning that new facilities must be designed to comply with existing reliability standards. However, it is not clear that this provision should be interpreted as requiring that a generating facility that has not yet reached commercial operation should be subject to reliability standards (including audit and penalties). Therefore, the GO with the existing generation facilities should not be required to incorporate the proposed generation facility into its Facility connection requirements before the proposed generation facility is subject to NERC or FERC jurisdiction. (b) FERC’s</p>

Organization	Yes or No	Question 9 Comment
		<p>interconnection policy. In addition, the revised FAC-001 would appear to place restrictions on interconnection customers in contravention of Order Nos. 2003 and 2006 (Standard Large and Small Interconnection Procedures and Agreements). FERC was very concerned about the ability of interconnection customers to interconnect their generating facilities and gave them a fair amount of flexibility. However, this revised FAC-001 would appear to restrict some of this flexibility.(i) Order No. 2003 gives the interconnection customer the ability to terminate a proposed interconnection on ninety days notice. Therefore, the interconnection customer is not required to build the facility. However, this revised FAC-001 appears to assume that the interconnection customer does not have this flexibility. What if the interconnection customer (the GO building a new generator on its site or the third party building a new generation facility) decides to terminate the Large Generator Interconnection Agreement (LGIA) or not proceed with the generation facility? In such event, the GO may be required to revert to its previous Facility connection requirements in order to accommodate the original configuration. (ii) The LGIA permits modifications to the proposed interconnection. How would this affect the Facility connection requirements? How long would the GO have to revise its Facility connection requirements? In the event that there is a single modification, or perhaps multiple modifications, how does the GO stay in compliance with this standard? (iii) FAC-001-1, R4 provides that each GO with Facility connection requirements and each TO shall maintain Facility connection requirements and make documentation of these requirements available to users of the Transmission System upon request. However, Large Generator Interconnection Procedures (LGIP), Section 3.4 requires the posting of certain interconnection information but the identity of the interconnection customer is not to be disclosed (unless it is an Affiliate). Requirement R4 would appear to potentially require disclosure of information and (more importantly) of the interconnection customer's identity in contravention of the requirements in Order No. 2003 and the LGIP.(c) OATT requirements. The definition of “applicable Generator Owner” (Section 4.2.1) and Requirement R2 provide that the GO will have an executed Agreement to evaluate the impact of interconnecting a new facility to the GO’s</p>

Organization	Yes or No	Question 9 Comment
		<p>existing generation facility. This statement is ambiguous. This statement could be understood to mean that the GO of the existing generation Facility will enter into an Agreement with the GO proposing to interconnect and the existing GO will evaluate the impact of the proposed interconnection. However, requests to interconnect new generation are processed under an OATT. In that case, it would be the Transmission Provider (not the existing GO) that would evaluate the impact of interconnecting the new facility. Thus, the language in FAC-001-1 would need to be revised to clarify that the owner of the new facility will need to interconnect under the OATT of an appropriate Transmission Provider (i.e., the Transmission Provider to which the existing GO is interconnected, not with the existing GO). Therefore, the owner of the new facility will most likely be the entity with the executed Agreement (with the Transmission Provider). Another consideration is that the existing GO could be developing a merchant transmission line. In that case, the existing GO would need to evaluate whether it needs have its own OATT and OASIS. In that case, the new generator owner would be interconnecting to the existing GO. However, the existing GO's line would not be a generator tie-line. This issue is not clear from the draft standard. (2) The following are suggested changes to FAC-001-1. (a) We recommend the Purpose statement be revised to state, "To avoid adverse impacts on BES reliability..." (b) It is unclear in Applicability section 4.2.1 that the term "Agreement" means that the GO has an executed agreement with a TO/TSP or that the GO and the third party have an executed agreement. Without further explanation, the capitalized term "Agreement" has the effect of introducing confusion. If the SDT does not intend to propose a new addition to the NERC Glossary of Terms, it should use the lower case term, "agreement." With respect to the capitalized term, "Transmission System," the SDT should consider clarifying if it intends to propose adding this to the Glossary. (3) Effect of the proposed revisions to FAC-001-1 on FAC-002-1.(a) As drafted, there are scenarios under which a new GO may attempt to interconnect to an existing GO even though, as explained above, the interconnection should actually be done to the appropriate Transmission Provider. If the appropriate Transmission Provider is not included in the evaluation of the interconnection various types of harm may occur. In</p>

Organization	Yes or No	Question 9 Comment
		<p>such event, the TPs and PAs should be indemnified from any liability with respect to performance of the evaluations required by FAC-002. (b) FAC-001 and FAC-002 should be revised to be clear that the existing GO and any new GOs must coordinate any interconnection with the appropriate Transmission Provider, TP and PA.</p>
<p>Response: Thank you for your comment. The SDT agrees this is a complex issue and did its best to outline how it arrived at its position in the document titled "Technical Justification: FAC-001-1."</p> <p>The SDT points out that if the GO is part of an RTO, then the GO will be coordinating any interconnection studies either directly or indirectly with the RTO interconnection process. If the GO is not part of an RTO, then the GO will be required to follow the pro forma interconnection procedures from Order 2003. The Order 2003 procedures require the GO to coordinate any studies with an affected system which could include Facilities owned by one, or more, TO on the other side of the GO's existing point of interconnection.</p> <p>The SDT does agree that upon interconnection of a third party, other standards or registrations may apply as appropriate.</p>		
PSEG	Yes	<p>We believe that the Ad Hoc Group's suggestions regarding PRC-005-1 - Transmission and Generation Protection System Maintenance were correct and that this standard should have been modified by the SDT in a manner similar to the way the SDT modified PRC-004-2. This would require modifying R1 and R2 in PRC-005-1a (the current version) to include protection systems in the generator interconnection Facility. In addition, the SDT should evaluate modifying PER-002-0 - Operation Personnel Training. In doing so the SDT completes one of the open FERC directives in Order 693. Paragraph 1363 addresses GOP training:1363. Further, the Commission agrees with MidAmerican, SDG&E and others that the experience and knowledge required by transmission operators about Bulk-Power System operations goes well beyond what is needed by generation operators; therefore, training for generator operators need not be as extensive as that required for transmission operators. Accordingly, the training requirements developed by the ERO should be tailored in their scope, content and duration so as to be appropriate to generation operations personnel and the objective of promoting system reliability. Thus, in addition to modifying the Reliability Standard to identify generator operators as applicable entities, we direct the ERO to develop specific Requirements addressing the scope,</p>

Organization	Yes or No	Question 9 Comment
		content and duration appropriate for generator operator personnel.
<p>Response: Thank you for your comment. The SDT agrees with the comment concerning PRC-005-1a and will be initiating a process to make that change.</p> <p>With respect to PER-002-0, the SDT continues to find that there are no clear and technical reliability reasons that support adding GOP requirements to any PER standard <i>based on the fact that the GOP operates a generator interconnection Facility</i>. While the SDT does not necessarily disagree that some training requirements for GOPs may be necessary, it does not see how these changes fall within its scope.</p>		
Ingleside Cogeneration LP (Occidental Chemical)		Ingleside Cogeneration LP believes that the set of standards proposed by the SDT is technologically accurate and defensible. The open issue is if the ERO and FERC expect more standards to be included - whether based upon sound reliability principals or not.
<p>Response: Thank you for your comment and support.</p>

Agency		
<p>Response: See the SDT’s response to Questions 7.</p>		
Manitoba Hydro		<p>The revision to FAC-001-1 R2 may be problematic, depending on what was intended. Under the revised requirement, the obligation to comply is dependent on the execution of an agreement to evaluate reliability impacts under FAC-002-1. However, FAC-002-1 does not clearly require the execution of an agreement by the Generator Owner. FAC-002-1 only requires the Generator Owner to “coordinate and cooperate on its assessments with its Transmission Planner and Planning Authority”. Accordingly if a Generator Owner coordinates without executing an agreement to perform an assessment, compliance with FAC-001 R1 will not be required.</p>
<p>Response: Thank you for your comment. The SDT agrees this is a complex issue and did its best to outline how it arrived at its position in the document titled “Technical Justification: FAC-001-1.”</p>		
Southwest Power Pool Regional Entity		<p>The SDT should consider the standards that FERC identified in 135 FERC ¶ 61,241.</p>
<p>Response: Thank you for your comment. The NERC Standard Processes Manual does not address the issue of how to deal with FERC Orders (that don’t include explicit directives). However, based on your and other comments, we have expanded our technical justification document (posted under “Supporting Materials”) to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive. After another thorough review of these standards, the SDT continues to believe that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards.</p>		

10. Do you have any other comments that you have not yet addressed? If yes, please explain.**Summary Consideration:**

The SDT thanks all stakeholders for their comments. In this section, many stakeholders offered supportive comments. Others offered a variety of suggestions, many of which were addressed.

One commenter suggested that the word “system” should not be capitalized in “Transmission System” in FAC-001-1 because the NERC glossary term “System” does not apply within the standard. The SDT agreed with this suggestion, and changed all references to “Transmission System” to “interconnected Transmission systems” for consistency in other parts of the standard and with FAC-002. Another commenter pointed out that “within” should be “with” in Section 4.2.1, and the SDT made this change.

A few commenters repeated their concern with the exclusion in FAC-003 for GOs with specific kinds of interconnection Facilities. For these commenters, the SDT reemphasized that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.

To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: “Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are...”

Some stakeholders offered comments that were outside the scope of this SDT’s work. A few offered comments on the overall strategy of the FAC-003-2 standard, and the SDT informed them that these comments should have been submitted when the Project 2007-7 Vegetation Management posted its work for comment.

One commenter suggested changes to the VSLs for R1 and R4. Because the SDT made no changes to these requirements, modifying the VSLs for these requirements is outside the scope of this team. This item will be added to the issues database.

Several stakeholders suggested the SDT review the standards cited in the draft NERC directive regarding generator interconnection leads and in the FERC orders regarding Milford and Cedar Creek. The SDT continues to find clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards and not requiring the GO or GOP to register as a TO or TOP. However, to address stakeholder concern, the SDT has expanded its

technical justification document (posted under “Supporting Materials”) to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive.

Organization	Yes or No	Question 10 Comment
Gainesville Regional Utilities	Negative	<p>1. It would seem that the impetus for FAC003 is to eliminate vegetation related outages within the rights-of-way as defined and subject to the exclusions as stated in footnote</p> <p>2. Thus the requirement is to manage the ROW to prevent vegetation related sustained outages with the measure being no outages. With grow-ins and fall-ins from within the defined ROW being controllable factors. 2. Including encroachments leaves the door open for fines to be imposed with no actual outage(s) having occurred. This may be like being found guilty of a crime that has not yet taken place.</p> <p>3. Combine vegetation related sustained outages by “grow-ins” and “blowing together of lines and vegetation located inside the ROW” as one item as they are both consequences of the growth of vegetation either vertically and horizontally.</p> <p>4. Leave vegetation related sustained outages by “fall-in” as a standalone as this will be related to structural problems occurring from a variety of sources.</p> <p>5. Combine R3 and R7 to R1 (development and implementation of a Transmission Vegetation Management Plan which shall include documented maintenance strategies or procedures or processes or specifications, delineation of an annual work plan and completion of same). Thus this would be the competency based requirements as a program without execution is meaningless.</p> <p>6. R1 and R2 become R2 and R3.</p>
<p>Response: Thank you for your comment. This is outside the scope of the SAR for this project. This SDT did review comments submitted as part of the Project 2007-07 effort and found that a response to this comment was provided. No change made.</p>		
Northern Indiana Public Service Co.	Negative	Ballot needs work

Organization	Yes or No	Question 10 Comment
<p>Response: The SDT does not understand your specific concern.</p>		
<p>PSEG Energy Resources & Trade LLC, PSEG Fossil LLC, Public Service Electric and Gas Co.</p>	<p>Negative</p>	<p>FAC-003-X is not applicable since FAC-003-2 was approved by the BOT on November 4, 2011</p>
<p>Response: Thank you for your comment. You are correct that in November 2011, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.</p> <p>Note that for its recirculation ballot, the SDT will be balloting both FAC-003-3 and FAC-003-X, but stakeholders should not vote as though they are choosing one or the other. As stated above, the SDT plans to present FAC-003-3 alone to NERC’s Board of Trustees, but it wants to have FAC-003-X ready to submit to the Board if, for some reason, neither FAC-003-2 nor FAC-003-3 are approved by FERC. Members of the ballot body should vote on the merits of each version of FAC-003 individually. In other words, stakeholders who support adding GOs to the applicability of FAC-003 should vote in the affirmative for both FAC-003-3 and FAC-003-X.</p>		
<p>Hydro-Quebec TransEnergie</p>	<p>Negative</p>	<p>Hydro-Quebec TransEnergie is casting a negative vote again because our comment from the last posting was not considered in the current draft: The minimum frequency of Vegetation Inspection should be based upon an average growth rates of smaller regions than all North America. Example, above the latitude of 50 degrees North, the vegetation growth rates is limited. The Vegetation Inspection frequency in the territories located above 50 degrees of latitude must be relaxed to 3 years.</p>
<p>Response: Thank you for your comment. This is outside the scope of the SAR for this project. This SDT did review comments submitted as part of the Project 2007-07 effort and did not find this comment had been submitted as part of that project effort. No changes made.</p>		

Organization	Yes or No	Question 10 Comment
New Brunswick System Operator	Negative	Since NBSO voted 'affirmative' for FAC-003-3, it makes sense for us to vote 'negative' for this standard.
<p>Response: Thank you for your comment. In November 2011, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.</p> <p>Note that for its recirculation ballot, the SDT will be balloting both FAC-003-3 and FAC-003-X, but stakeholders should not vote as though they are choosing one or the other. As stated above, the SDT plans to present FAC-003-3 alone to NERC’s Board of Trustees, but it wants to have FAC-003-X ready to submit to the Board if, for some reason, neither FAC-003-2 nor FAC-003-3 are approved by FERC. Members of the ballot body should vote on the merits of each version of FAC-003 individually. In other words, stakeholders who support adding GOs to the applicability of FAC-003 should vote in the affirmative for both FAC-003-3 and FAC-003-X.</p>		
PSEG Energy Resources & Trade LLC/ Public Service Electric and Gas Co./ PSEG Fossil LLC	Negative	The phrase “generator Facility” should be “generator Transmission Facility,” and the phrase “Transmission System” should be “Transmission system.”
<p>Response: Thank you for your comment. We agree with your change to “Transmission system” but not to the addition of “Transmission” in the phrase “generator Facility.” The SDT does not agree with labeling a GO’s Facility as “Transmission,” in part because in some areas (like Texas), GOs, by statute, can’t own Transmission. It was also brought to the SDT’s attention that in most cases, the Facility in question is referred to as the Interconnection Facility in documents filed by the GO with FERC. Therefore, the SDT intentionally modified language so that a Facility owned by a generation entity did not contain the term “Transmission.”</p>		
SERC Reliability Corporation	Negative	There should not be a weak link under the standard. This proposed revision would create a weak-link where a portion of the otherwise covered right-of-way would be exposed.

Organization	Yes or No	Question 10 Comment
<p>Response: Thank you for your comment. As it discusses in the document titled "Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface," the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.</p> <p>To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: "Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are..."</p>		
<p>New York State Department of Public Service/ National Association of Regulatory Utility Commissioners</p>	<p>Negative</p>	<p>Understand that there is an open issue regarding the availability of generation compliance documentation that needs to be satisfactorily addressed.</p>
<p>Response: The SDT does not understand your specific concern.</p>		
<p>Infigen Energy US</p>	<p>Affirmative</p>	<p>Infigen supports the efforts of the SDT to ensure that Protection System Misoperations affecting the reliability of the BES are thoroughly analyzed and mitigated. Generator Owners are already analyzing Misoperations as/if they occur, and are employing Corrective Action Plans to avoid future Misoperations. We support maintaining "reasonable and appropriate" preventative measures and risk assessment tools to ensure that misoperations are evaluated and corrected expediently.</p>
<p>Response: Thank you for your comment and support.</p>		
<p>PPL EnergyPlus LLC/PPL NERC Registered Affiliates</p>	<p>Affirmative</p>	<p>PPL Generation, LLC, on behalf of its NERC-registered subsidiaries, appreciates the effort by the Standard Development Team to address the GO-TO interface issues in a manner that enhances the reliability of the BES without adding unnecessary burden on Generators. As registered GOs/GOPs, the PPL Generation registered entities agree with the changes made by the SDT to these three standards. To the extent that GOs/GOPs are required to register as TOs/TOPs, PPL Generation would have</p>

Organization	Yes or No	Question 10 Comment
		significant concerns with meeting the compliance requirements applicable to TOs in the standards included in the scope of this Project, as well as other TO/TOP requirements throughout other NERC standards.
Response: Thank you for your comment and support.		
SERC Reliability Corporation	Affirmative	The Generator Owner may be required to self-certify and report periodically to the region whether they have become applicable to the standard.
Response: Thank you for your comment and support.		
Southwest Transmission Cooperative, Inc./ ACES Power Marketing Standards Collaborators/ ACES Power Marketing	Affirmative	The modifications to PRC-004-2.1 R2 could be interpreted as requiring the GO to analyze Protection System Misoperations on the generator interconnection Facility even if it does not own the Facility. We suggest modifying the requirement as shown below to address this issue.”The Generator Owner shall analyze Protection System Misoperations on its generator and generator interconnection Facility that it owns ...”
Response: Thank you for your comment. The SDT believes that the language makes clear that an entity need only be concerned with the Elements or Facilities that it owns.		
SERC Reliability Corporation	Affirmative	With the understanding the Generator Interconnection FACilities will be grouped with Transmission Protection Systems for analysis at the regional level.
Response: Thank you for your comment and support.		
Entergy Services		We suggest that the Vegetation Management Standards should be consistent for both the TO and GO facilities. We would also like to suggest an additional Recommendation for added clarity regarding Category 3 Outages (Off-ROW Fall-in Outages). We understand that the Category 3 Outages are not a violation of the Standard, but we feel that there should be some level of comment added within the Standard clearly stating that these Outages are “Reportable Only” during the

Organization	Yes or No	Question 10 Comment
		<p>Quarterly Outage reports to the RE's, and that there are no associated violations/sanctions for this Category Of Outage, and that an Off-ROW fall-in outage would not be considered an encroachment into the MVCD in any way. The Technical Reference Document does a good job of clearly stating this in the Introduction on Page 5 ("This standard is not intended to address outages such as those due to vegetation fall-ins or blow-ins from outside the Right-of-Way, vandalism, human activities or acts of nature.") and we feel that this should also be stated clearly in the Standard.</p>
<p>Response: Thank you for your comment. As it discusses in the document titled "Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface," the SDT recognizes that in many cases, generation Facilities are either (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit. The SDT and industry comments support the position that these qualifiers represent a reasonable and appropriate risk prevention approach.</p> <p>To clarify the exemption, the SDT has modified 4.3.1 to include a reference to line of sight: "Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are..."</p> <p>The remainder of your comment is outside the scope of this SDT.</p>		
Southern Company		<p>We agree with the 2010-17 Standard Drafting Team's conclusion to not modify other standards such as those mentioned on page 4 of the Technical Justification document. In addition, we wish to provide the following support for exclusion of these specific standards. Southern Company believes NERC's Project 2010-07 SDT must challenge making revisions to the standards included in the FERC order on Cedar Creek and Milford. (This order supports NERC's requirement for those entities to register as a TO/TOP due to their ownership of generator interconnection circuits > 100kV.) We believe there are clear technical and reliability-based reasons that support not adding GO and GOP requirements to these standards and not requiring the GO or GOP to register as a TO or TOP. Furthermore, we also believe there are clear distinctions between GO/GOP responsibilities and TO/TOP responsibilities that must be</p>

Organization	Yes or No	Question 10 Comment
		<p>maintained to ensure BES reliability. Revising standards to assign TO/TOP responsibilities to a GO/GOP or requiring a GO/GOP to register as a TO/TOP because of generator interconnection circuits > 100kV will reduce the clarity of these responsibilities. We have provided specific comments on each standard below:</p> <p>EOP-005-1 R1, R2, R6, R7R1 and R2 require each TOP to have and maintain a system restoration plan. R6 requires the TOP to train its operating personnel in implementing this plan. R7 requires the TOP to verify its restoration plan by actual testing or simulation. These requirements are clearly the role and responsibility of the TOP, not a GO/GOP who happens to have generator interconnection facilities in the TOP's control area. The GOP's roles and responsibilities are clearly and appropriately addressed EOP-005-2. The presence of a generator interconnection circuit > 100kV that happens to be owned by the GO instead of the TOP fundamentally does not change the roles and responsibilities of the TOP or the GOP. Thus, no changes due to EOP-005 are needed.</p> <p>FAC-014-2, R2: FAC-014-2 R2 states "The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology." FAC-014-2 R2 should not be revised to include GOPs. The GO is required by FAC-008-1 R1 and FAC-009-1 (FERC approved version) and pending FAC-008-3 R3 and R6 (FAC-008-3 filed with FERC for approval) to document the Facility Ratings for a GO-owned generator interconnection circuit >100kV. The established Facility Rating must respect the most limiting applicable equipment rating in the circuit and must consider operating limitations and ambient conditions. The thermal or ampere rating of this circuit would equal its ampere operating limit and should be conveyed by the GO to the GOP if they are not the same entity. The operating voltage limits for this circuit are established by the applicable TO/TOP, not the GO or GOP. Therefore, we believe adding the GO to FAC-014-2 R2 would be redundant.</p> <p>PER-003-1 R2, R2.1, R2.2PER-003-1 R2 and its sub-requirements state:"R2. Each Transmission Operator shall staff its Real-time operating positions performing</p>

Organization	Yes or No	Question 10 Comment
		<p>Transmission Operator reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining one of the following valid NERC certificates (1) : [Risk Factor: High][Time Horizon: Real-time Operations]: R2.1. Areas of Competency R2.1.1. Transmission operations R2.1.2. Emergency preparedness and operations R2.1.3. System operations R2.1.4. Protection and control R2.1.5. Voltage and reactive R2.2. Certificates o Reliability Operator o Balancing, Interchange and Transmission Operator o Transmission Operator This requirement is specifically for TOPs. Personnel training for GOPs needs to be addressed separately and not mingled with responsibilities of the TOP. The GOPs role in supporting BES reliability needs to be clearly understood and defined prior to establishing training requirements in the standards.</p> <p>PRC-001-1, R2, R2.2, R4, R6Generator Operators (GOPs) and the scope of protection equipment for generation interconnection Facilities are already appropriately accounted for in this standard in requirement R2 and sub-requirement R2.2 The language used in requirement R2 which applies to the GOP uses the general terms “relay or equipment failures” which would include not only generator relaying, but generator interconnection relaying in the GOPs scope as well. The GOP is required to notify the TOP and Host BA in R2.1 “if a protective relay or equipment failure reduces system reliability.” Requirement R2.2 requires the affected TOP to notify its RC and affected TOPs and BAs. Thus, applying R2.2 to a GOP would be redundant to R2.1. Requirement R4 states, “Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.” A generator interconnection tie line does not constitute a ‘major tie line” or major “interconnection with neighboring GOPs, TOPs, and BAs.” Thus, R4 should not be revised to include GOPs. If a GO exists within NERC that does own such interconnection facilities, the responsibility for coordination of protection systems on such a line or interconnection should be the responsibility of the TOP in that area, not the GO/GOP. This may require formal agreements between the TO/TOP and GO/GOP, since the GO may own protection equipment on his end. The same logic applies to</p>

Organization	Yes or No	Question 10 Comment
		<p>R6. R6 states, “Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.” This is clearly the responsibility of the TOP and/or BA, not a GO/GOP who happens to have generator interconnection facilities in the area. An SPS function by definition is to maintain BES reliability. If a GO/GOP has equipment within the equipment scope of a Special Protection System (SPS), responsibility for monitoring the SPS should be conveyed in a formal agreement as appropriate.</p> <p>TOP-001-1 R1 Requirement R1 states, “Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies.” This is clearly the responsibility of the TOP, not a GO/GOP who happens to have generator interconnection facilities in the TOP’s area. Thus, R1 should not be applied to a GO/GOP who owns or operates generator interconnection facilities. Furthermore, TOP-001-1 R3 (proposed to be covered in the future in the proposed IRO-001-2 R2 and R3) appropriately requires the GOP to comply with reliability directives issued by the TO “unless such actions would violate safety, equipment, regulatory or statutory requirements.” These requirements effectively give the TOP the necessary decision-making authority over operation of all generator Facilities up to the point of interconnection. They also give the GOP the necessary authority to take appropriate actions to ensure safety and protection of the GO’s equipment. Thus, no changes to TOP-001-1 are necessary.</p> <p>TOP-004-2 R6, R6.1, R6.2, R6.3, R6.4 Requirement R6 and its sub-requirements state: “R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including: R6.1. Monitoring and controlling voltage levels and real and reactive power flows. R6.2. Switching transmission elements. R6.3. Planned outages of transmission elements. R6.4. Responding to IROL and SOL violations.” These are clearly</p>

Organization	Yes or No	Question 10 Comment
		<p>the responsibility of the TOP, not a GO/GOP who happens to have generator interconnection facilities in the TOP’s area. Thus, these requirements should not be applied to a GO/GOP who owns or operates generator interconnection facilities. The same logic applies here as stated above in our discussion on TOP-001-1. We believe it is inappropriate and would be adverse to BES reliability to apply these requirements to a GOP. TOP-004-2 effectively gives the TOP the necessary decision-making authority over operation of all generator Facilities up to the point of interconnection. They also give the GOP the necessary authority to take appropriate actions to ensure safety and protection of the GO’s equipment, such as opening high voltage generator output breakers when required to protect the unit. Thus, no changes to TOP-004-2 are necessary. TOP-006-2 R3 Requirement R3 states, “R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel. The intent of this requirement when applied to a GOP is already addressed in PRC-001-1 R1 which states, “Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area.” Thus, no change to TOP-006-2 is necessary. ”</p>
<p>Response: Thank you for your comment and support. We agree that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards and not requiring the GO or GOP to register as a TO or TOP. We have expanded our technical justification document (posted under “Supporting Materials”) to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive, and many of your explanations are included therein.</p>		
<p>American Wind Energy Association</p>		<p>AWEA appreciates the opportunity to submit these comments on the NERC Project 2010-07. AWEA supports the general direction indicated by both the Generator Requirements at the Transmission Interface Ad Hoc Group and the Project 2010-07 Standards Development Team. We agree with the sentiments from both groups that a GO or GOP that also owns or operates a generator lead line should not be required to register as a TO or TOP strictly because they own or operate a generator lead line. We also agree that requiring these GO/GOPs to comply with all the TO/TOP standards</p>

Organization	Yes or No	Question 10 Comment
		<p>would have little effect on or benefits to reliability of the Bulk Electric System, and could even detract from it. AWEA supports the intent and goal of the SDT to ensure that all generator-owned Facilities are appropriately covered under NERC’s Reliability Standards. We also agree with the SDT that while many GO/GOPs operate Elements and Facilities that might be considered by some entities to be Transmission, these are most often radial Facilities that are not part of the integrated grid, and as such should not be subject to the same standards applicable to TO/TOPs, who own and operate Transmission Elements and Facilities that are part of the integrated grid. Therefore, we support the SDT’s approach of identifying a very limited number of TO/TOP standards, such as FAC-001 and FAC-003, which should also apply to GO/GOP owners of generator lead lines. We would be concerned, however, if additional requirements were added beyond FAC-001, FAC-003, and PRC-004. Consideration of any additional standards with respect to generator lead lines should be done on a standard-by-standard basis, reviewing the applicability of each standard as well as the impact on the reliability of the Bulk Electric System.</p>
<p>Response: Thank you for your comment and support.</p>		
<p>Bonneville Power Administration</p>		<p>BPA thanks you for the opportunity to comment on Project 2010-07, Generator Requirements at the Transmission Interface. BPA stands in support of the proposed revisions and has no comments or concerns at this time.</p>
<p>Response: Thank you for your comment and support.</p>		
<p>Constellation Power Source Generation</p>		<p>Constellation appreciates and supports the work of the standard drafting team. We recognize the significant time invested by technical experts from industry to consider the appropriate application of reliability standards to address concerns raised about coverage of transmission at the generator interface. The drafting team analysis identified the standards in need of revision to appropriately address the reliability concerns raised. While the revision process focuses on specific standards, it is important to consider the reliability questions in the context of the full complement</p>

Organization	Yes or No	Question 10 Comment
		<p>of reliability standards that apply to entities. For instance, the following standards already apply to generators and relate to the reliability considerations around transmission at the generator interface:</p> <ul style="list-style-type: none"> o PRC-001-1 addresses coordination of protection system components by requiring all GOs to ensure coordination of their protection system with interconnected parties. Further, FAC-002 requires that all new facilities undergo reviews by the TOP, BA, etc. o PRC-004-1 requires all GOs to ensure that they analyze all misoperations on their protection system which would include the protection of the tie line. o TOP standards applicable to GOs aid coordination between a GO and a TO with regards to the generator tie line by requiring all GOs to coordinate all maintenance and emergency outages (both forced and planned) with all applicable interconnected parties. Further, all ISO procedures require the same of GOs. o RC, TOP and/or BA certified operators control and are responsible for overseeing that transmission. According to the NERC functional model, a Generator Operator is defined as “operat(ing) generating unit(s) and perform(ing) the functions of supplying energy and reliability related services.” Given this limited scope, the Generator Operator (GOP) cannot be considered as operating on the same level as the Reliability Coordinator, Transmission Operator or Balancing Authority when it comes to real time information on the status of the BES. The GOP does not monitor and control the BES, rather the GOP only monitors and controls the generators that it operates and relays information to other operating entities. o IRO and TOP standards applicable to GOs include tie lines in their pool of resources to alleviate operational emergencies by requiring all GOs to operate as directed by their TOP, BA, or RC as directed and must render emergency assistance. o FAC-8 and FAC-9 manage rating methodology consistency by requiring all GOs to develop a methodology to rate all equipment, and that the RC has the authority to challenge the GO on that methodology. The onus is on the GO to either change their methodology and rating accordingly, or provide a technical justification as to why

Organization	Yes or No	Question 10 Comment
		they cannot adopt the changes. Further, a generator will never be limited by its tie line, as a generator’s profits are directly tied to its output. Therefore no generator would limit its facility to the equipment that is delivering that output.
<p>Response: Thank you for your comment and support. We agree that it is important to consider the reliability questions in the context of the full complement of reliability standards, and we have endeavored to make these broader connections clear in our revised technical justification document (posted under “Supporting Materials”). That document has been expanded to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive, and the kinds of further justifications you also provided are included therein. After another thorough review of these standards, the SDT continues to believe that there are clear and technical reliability-based reasons that support not adding GO and GOP requirements to these standards.</p>		
Cowlitz County PUD		In answer to the SDT request for feedback on FERC's Order concerning Cedar Creek and Milford, the District finds no technical reason to add any of the listed standard requirements, and struggles to understand why FERC would even consider this listing as applicable.
<p>Response: Thank you for your comment and support.</p>		
Southwest Transmission Cooperative, Inc.		In section 4.2.1 of the Applicability Section, “within” should be “with”. Because NERC’s Glossary of Terms establishes that an Agreement can be verbal and not enforceable by law, section 4.2.1 should be further modified to clarify that it is a legally enforceable and fully executed Agreement. The language in R3 in parenthesis after Generation Owner should be modified to “once required by Requirement R2”. This makes it clearer that R3 does not apply until the GO has an executed Agreement to evaluate a request by a third part to interconnect.
<p>Response: Thank you for your comment. We agree that “within” should be “with.” The SDT chose not to adopt the second recommendation as the requirement already contains the term “executed.” The SDT also chose not to adopt the third recommendation as the requirement already contains the parenthetical (in accordance with Requirement R2) which we feel is synonymous with the comment.</p>		

Organization	Yes or No	Question 10 Comment
Manitoba Hydro		Manitoba Hydro would also like to point out that if the redline changes are implemented, it will greatly increase the complexity of coordination required under FAC-002-1 for Transmission Planners/Planning Authorities.
<p>Response: Thank you for your comment. The SDT agrees this is a complex issue and did its best to outline how it arrived at its position in the document titled "Technical Justification: FAC-001-1."</p>		
Compliance & Responsibility Organization		<p>NextEra Energy, Inc. (NextEra) appreciates the work of the Project 2010-07 Generator Requirements at the Transmission Interface Standard Drafting Team (SDT) on a subject that NextEra has a significant interest in resolving. In fact, NextEra has been a member of the SDT and an active observer. Given the recent events - such as (a) the North American Electric Reliability Commission's draft interim directive; (b) the denial of the Milford and Cedar Cheek requests for reconsideration at the Federal Energy Regulatory Commission (FERC) and (c) the record in this case which, at times, suggests the SDT needs to more formally consider the Milford and Cedar Cheek Reliability Standards - NextEra requests that SDT more formally consider the merits of each Reliability Standard adopted the Milford and Cedar Cheek FERC orders and the NERC draft interim directive. Although NextEra does not condone the manner in which NERC issued the interim draft directive and stated so in its comments to NERC on the interim draft directive, NextEra's overarching objective on this issue is to bring a uniform, fair and technically supported approach that resolves the interface issue. Thus, NextEra requests that the SDT (prior to proceeding any further or any additional comments or votes on specific draft Reliability Standards) issue a technical paper that point-by-point addresses the merits of including the Reliability Standards set forth in the FERC Orders and NERC's draft interim directive, and request stakeholder, including NERC staff, comment. For example, this technical paper would likely the merits of NERC's draft interim directive not requiring NERC-certified operators (but require training of interface operators), while FERC's orders require NERC-certified operators. While NextEra does not agree five days of training is necessary for an interface operator, as the draft interim directive appears to propose, NextEra does</p>

Organization	Yes or No	Question 10 Comment
		<p>believe a technical case can be made why NERC-certification is not required, and that some degree of training related to the applicable Reliability Standards is reasonable. Similar, on FAC-003 (as well as several other Standards), the draft interim directive proposes a slightly different approach than the SDT. NextEra would rather these approaches reconciled than be in conflict, with the potential for continued conflict as the SDT's work product proceeds. Further, NextEra requests that the SDT's review the technical merits of NERC's proposed criteria to determine what generator transmission lead is required to comply with additional Reliability Standards. As noted, above, this technical paper should be posted for stakeholder, including NERC staff, comment. Accordingly, while NextEra would have preferred that NERC and the Regional Entities express there interim draft directive approach on the record in this proceeding, NextEra believes it is appropriate for the SDT to draft a comprehensive technical paper that, with an open approach, considers the inclusion of additional Reliability Standards, if appropriate, as a way of building lasting support for its approach.</p>
<p>Response: Thank you for your comment and support. We certainly agree that is important for NERC staff and the SDT to continue to work together to try to develop a mutually agreed upon solution for dealing with this reliability gap, and to a certain extent, the SDT has tried to provide the kind of technical paper you suggest in its modified technical justification document (posted under "Supporting Materials"), which has been expanded to include any standard or requirement cited by FERC in its Milford/Cedar Creek orders or by NERC in its draft compliance directive. The SDT does not, at this point, plan to develop a technical paper that discusses the merits of the standards introduced by FERC and NERC, because its current focus is on filing the FAC-001-1, FAC-003-3, and PRC-004-2.1a with FERC. As it moves forward to a final solution, however, this kind of technical paper may prove useful. We appreciate the suggestion.</p>		
Dominion		No
Tennessee Valley Authority		No
Exelon		<p>PRC-004 - suggest that the Standard state that responsibility for the analysis of missoperations of protective equipment shall be the responsibility of the owner of the protective equipment.</p>

Organization	Yes or No	Question 10 Comment
<p>Response: Thank you for your comment and support. The SDT believes that the language makes clear that an entity need only be concerned with the Elements or Facilities that it owns.</p>		
ReliabilityFirst		<p>ReliabilityFist has found a number of editorial erros for the FAC-001-1 VSLs. They include the following:1. VSL R1 - should not reference sub-requirements, should reference the sub-parts consistent with the requirement (i.e. Requirement R1, Part 1.1, 1.2 or 1.3) 2. VSL for R3 - the VSL should referenced Requirement 3, Part 3.1.1 through 3.1.16 rather than what is currently stated (Requirement R3, Part 3.1.1 R3.1.6)</p>
<p>Response: Thank you for your comment. While we agree that the VSLs for R1 need to be updated, that change is outside the scope of this SDT because our changes are limited to those that incorporate the GO into the applicability of the requirement; the team made no changes to R1 as it only includes the TO. We have, however, made the suggested changes to the VSLs for R3.</p>		
RES Americas Development		<p>RES and AWEA appreciates the opportunity to submit these comments on the NERC Project 2010-07. We support the general direction indicated by both the Generator Requirements at the Transmission Interface Ad Hoc Group and the Project 2010-07 Standards Development Team. We agree with the sentiments from both groups that a GO or GOP that also owns or operates a generator lead line should not be required to register as a TO or TOP strictly because they own or operate a generator lead line. We also agree that requiring these GO/GOPs to comply with all the TO/TOP standards would have little effect on or benefits to reliability of the Bulk Electric System, and could even detract from it. RES and AWEA supports the intent and goal of the SDT to ensure that all generator-owned Facilities are appropriately covered under NERC’s Reliability Standards. We also agree with the SDT that while many GO/GOPs operate Elements and Facilities that might be considered by some entities to be Transmission, these are most often radial Facilities that are not part of the integrated grid, and as such should not be subject to the same standards applicable to TO/TOPs, who own and operate Transmission Elements and Facilities that are part of the integrated grid. Therefore, we support the SDT’s approach of identifying a very limited number of</p>

Organization	Yes or No	Question 10 Comment
		TO/TOP standards, such as FAC-001 and FAC-003, which should also apply to GO/GOP owners of generator lead lines. We would be concerned, however, if additional requirements were added beyond FAC-001, FAC-003, and PRC-004. Consideration of any additional standards with respect to generator lead lines should be done on a standard-by-standard basis, reviewing the applicability of each standard as well as the impact on the reliability of the Bulk Electric System.
Sempra Generation		Sempra Generation also supports the comments, being concurrently filed, of the Electric Power Supply Association (EPSA).
Response: Thank you for your comment and support.		
Puget Sound Energy, Inc.		The changes to this standard are minor, and seem to be centered around including "generator Interconnection facilities" to R2. This added phrase and the statement in 1.4 Data Retention "Generator Owner that owns a generation Protection System" seems to assume that the generator owner and generator interconnection facilities owner is always the same. This is not always the case, and will make this standard language confusing to prepare evidence for. A suggestion would be to revise the language to allow for a separate generator owner and generator interconnection facilities owner.
Response: Thank you for your comment and support. The SDT believes that the language makes clear that an entity need only be concerned with the Elements or Facilities that it owns.		
SERC Planning Standards Subcommittee/ SERC OC Standards Review Group		The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers"
Response: Thank you for your comment and support.		

END OF REPORT

A. Introduction

1. **Title:** **Facility Connection Requirements**
2. **Number:** FAC-001-1
3. **Purpose:** To avoid adverse impacts on reliability, Transmission Owners and Generator Owners must establish Facility connection and performance requirements.
4. **Applicability:**
 - 4.1. Transmission Owner
 - 4.2. Applicable Generator Owner
 - 4.2.1 Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission systems.
5. **Effective Date:**
 - 5.1. In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.
 - 5.2. In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

- R1. The Transmission Owner shall document, maintain, and publish Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements. The Transmission Owner's Facility connection requirements shall address connection requirements for:
 - 1.1. Generation Facilities,
 - 1.2. Transmission Facilities, and
 - 1.3. End-user Facilities

[VRF – Medium]
- R2. Each applicable Generator Owner shall, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission systems (under FAC-002-1), document and publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.

[VRF – Medium]

R3. Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall address the following items in its Facility connection requirements:

3.1. Provide a written summary of its plans to achieve the required system performance as described in Requirements R1 or R2 throughout the planning horizon:

3.1.1. Procedures for coordinated joint studies of new Facilities and their impacts on the interconnected Transmission systems.

3.1.2. Procedures for notification of new or modified Facilities to others (those responsible for the reliability of the interconnected Transmission systems) as soon as feasible.

3.1.3. Voltage level and MW and MVAR capacity or demand at point of connection.

3.1.4. Breaker duty and surge protection.

3.1.5. System protection and coordination.

3.1.6. Metering and telecommunications.

3.1.7. Grounding and safety issues.

3.1.8. Insulation and insulation coordination.

3.1.9. Voltage, Reactive Power, and power factor control.

3.1.10. Power quality impacts.

3.1.11. Equipment Ratings.

3.1.12. Synchronizing of Facilities.

3.1.13. Maintenance coordination.

3.1.14. Operational issues (abnormal frequency and voltages).

3.1.15. Inspection requirements for existing or new Facilities.

3.1.16. Communications and procedures during normal and emergency operating conditions.

[VRF – Medium]

R4. The Transmission Owner shall maintain and update its Facility connection requirements as required. The Transmission Owner shall make documentation of these requirements available to the users of the transmission system, the Regional Entity, and ERO on request (five business days).

[VRF – Medium]

C. Measures

M1. The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R1.

- M2.** Each Generator Owner that has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission systems shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R2.
- M3.** Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R3.
- M4.** The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor: Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Transmission Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Owner shall retain evidence of Requirement R1, Measure M1, Requirement R3, Measure M3, and Requirement R4, Measure M4 from its last audit.

The Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain evidence of Requirement R2, Measure M2, and Requirement R3, Measure M3 from its last audit.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Not Applicable.	<p>The Transmission Owner failed to do one of the following:</p> <p>Document or maintain or publish Facility connection requirements as specified in the Requirement</p> <p>OR</p> <p>Failed to include one (1) of the components as specified in R1.1, R1.2 or R1.3.</p>	<p>The Transmission Owner failed to do one of the following:</p> <p>Failed to include (2) of the components as specified in R1.1, R1.2 or R1.3</p> <p>OR</p> <p>Failed to document or maintain or publish its Facility connection requirements as specified in the Requirement and failed to include one (1) of the components as specified in R1.1, R1.2 or R1.3.</p>	The Transmission Owner did not develop Facility connection requirements.
R2	The Generator Owner failed to document and publish Facility connection requirements until more than 45 calendar days but less than or equal to 60 calendar days after having an Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the interconnected Transmission systems.	The Generator Owner failed to document and publish Facility connection requirements until more than 60 calendar days but less than or equal to 70 calendar days after having an Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the interconnected Transmission systems.	The Generator Owner failed to document and publish Facility connection requirements until more than 70 calendar days but less than or equal to 80 calendar days after having an Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the interconnected Transmission systems.	The Generator Owner failed to document and publish Facility connection requirements until more than 80 days after having an Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner’s existing Facility that is used to interconnect to the interconnected Transmission systems.
R3	The responsible entity’s Facility connection	The responsible entity’s Facility connection	The responsible entity’s Facility connection	The responsible entity’s Facility connection

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	TBD	Added requirements for Generator Owner and brought overall standard format up to date.	Revision under Project 2010-07

A. Introduction

1. **Title:** **Facility Connection Requirements**
2. **Number:** FAC-001-1
3. **Purpose:** To avoid adverse impacts on reliability, Transmission Owners and Generator Owners must establish Facility connection and performance requirements.
4. **Applicability:**
 - 4.1. Transmission Owner
 - 4.2. Applicable Generator Owner
 - 4.2.1 Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission systems.
5. **Effective Date:**
 - 5.1. In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.
 - 5.2. In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

- R1. The Transmission Owner shall document, maintain, and publish Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements. The Transmission Owner's Facility connection requirements shall address connection requirements for:
 - 1.1. Generation Facilities,
 - 1.2. Transmission Facilities, and
 - 1.3. End-user Facilities

[VRF – Medium]
- R2. Each applicable Generator Owner shall, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission systems (under FAC-002-1), document and publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.

[VRF – Medium]

- R3.** Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall address the following items in its Facility connection requirements:
- 3.1.** Provide a written summary of its plans to achieve the required system performance as described in Requirements R1 or R2 throughout the planning horizon:
- 3.1.1.** Procedures for coordinated joint studies of new Facilities and their impacts on the interconnected Transmission ~~s~~Systems.
 - 3.1.2.** Procedures for notification of new or modified Facilities to others (those responsible for the reliability of the interconnected Transmission ~~s~~Systems) as soon as feasible.
 - 3.1.3.** Voltage level and MW and MVAR capacity or demand at point of connection.
 - 3.1.4.** Breaker duty and surge protection.
 - 3.1.5.** System protection and coordination.
 - 3.1.6.** Metering and telecommunications.
 - 3.1.7.** Grounding and safety issues.
 - 3.1.8.** Insulation and insulation coordination.
 - 3.1.9.** Voltage, Reactive Power, and power factor control.
 - 3.1.10.** Power quality impacts.
 - 3.1.11.** Equipment Ratings.
 - 3.1.12.** Synchronizing of Facilities.
 - 3.1.13.** Maintenance coordination.
 - 3.1.14.** Operational issues (abnormal frequency and voltages).
 - 3.1.15.** Inspection requirements for existing or new Facilities.
 - 3.1.16.** Communications and procedures during normal and emergency operating conditions.

[VRF – Medium]

- R4.** The Transmission Owner shall maintain and update its Facility connection requirements as required. The Transmission Owner shall make documentation of these requirements available to the users of the transmission system, the Regional Entity, and ERO on request (five business days).

[VRF – Medium]

C. Measures

- M1.** The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R1.

- M2.** Each Generator Owner that has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission sSystems shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R2.
- M3.** Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall make available (to its Compliance Enforcement Authority) evidence that it met all requirements stated in Requirement R3.
- M4.** The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor: Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Transmission Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Owner shall retain evidence of Requirement R1, Measure M1, Requirement R3, Measure M3, and Requirement R4, Measure M4 from its last audit.

The Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain evidence of Requirement R2, Measure M2, and Requirement R3, Measure M3 from its last audit.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Not Applicable.	<p>The Transmission Owner failed to do one of the following:</p> <p>Document or maintain or publish Facility connection requirements as specified in the Requirement</p> <p>OR</p> <p>Failed to include one (1) of the components as specified in R1.1, R1.2 or R1.3.</p>	<p>The Transmission Owner failed to do one of the following:</p> <p>Failed to include (2) of the components as specified in R1.1, R1.2 or R1.3</p> <p>OR</p> <p>Failed to document or maintain or publish its Facility connection requirements as specified in the Requirement and failed to include one (1) of the components as specified in R1.1, R1.2 or R1.3.</p>	The Transmission Owner did not develop Facility connection requirements.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	TBD	Added requirements for Generator Owner and brought overall standard format up to date.	Revision under Project 2010-07

B.A. Introduction

1. **Title:** Facility Connection Requirements
2. **Number:** FAC-001-~~0~~1
3. **Purpose:**- To avoid adverse impacts on reliability, Transmission Owners and Generator Owners must establish ~~facility~~Facility connection and performance requirements.
4. **Applicability:**
 - 4.1. Transmission Owner
 - 4.2. Applicable Generator Owner
 - 4.2.1 Generator Owner with an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission systems.
5. **Effective Date:**— ~~April 1, 2005~~
 - 5.1. In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.
 - 5.2. In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

C.B. Requirements

- R1.** The Transmission Owner shall document, maintain, and publish ~~facility~~Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional ~~Reliability Organization~~Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and ~~facility~~Facility connection requirements. The Transmission Owner's ~~facility~~Facility connection requirements shall address connection requirements for:
 - R1.1.1.1. Generation ~~facilities~~Facilities,
 - R1.2.1.2. Transmission ~~facilities~~Facilities, and
 - R1.3.1.3. End-user ~~facilities~~Facilities
- ~~R2.~~ The Transmission Owner's facility connection requirements shall address, but are not limited to, the following items:

[VRF – Medium]
- R2. Each applicable Generator Owner shall, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission systems (under FAC-002-1), document and publish its Facility connection requirements to

ensure compliance with NERC Reliability Standards and applicable Regional Entity, subregional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements.

[VRF – Medium]

R3. Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall address the following items in its Facility connection requirements:

R2.1.3.1. Provide a written summary of its plans to achieve the required system performance as described ~~above~~ in Requirements R1 or R2 throughout the planning horizon:

R2.1.1.3.1.1. Procedures for coordinated joint studies of new ~~faeilities~~Facilities and their impacts on the interconnected ~~transmission~~Transmission systems.

R2.1.2.3.1.2. Procedures for notification of new or modified ~~faeilities~~Facilities to others (those responsible for the reliability of the interconnected ~~transmission~~Transmission systems) as soon as feasible.

R2.1.3.3.1.3. Voltage level and MW and MVAR capacity or demand at point of connection.

R2.1.4.3.1.4. Breaker duty and surge protection.

R2.1.5.3.1.5. System protection and coordination.

R2.1.6.3.1.6. Metering and telecommunications.

R2.1.7.3.1.7. Grounding and safety issues.

R2.1.8.3.1.8. Insulation and insulation coordination.

R2.1.9.3.1.9. Voltage, Reactive Power, and power factor control.

R2.1.10.3.1.10. Power quality impacts.

R2.1.11.3.1.11. Equipment Ratings.

R2.1.12.3.1.12. Synchronizing of ~~faeilities~~Facilities.

R2.1.13.3.1.13. Maintenance coordination.

R2.1.14.3.1.14. Operational issues (abnormal frequency and voltages).

R2.1.15.3.1.15. Inspection requirements for existing or new ~~faeilities~~Facilities.

R2.1.16.3.1.16. Communications and procedures during normal and emergency operating conditions.

[VRF – Medium]

R3-R4. The Transmission Owner shall maintain and update its ~~faeility~~Facility connection requirements as required. - The Transmission Owner shall make documentation of these requirements available to the users of the transmission system, the Regional ~~Reliability Organization~~Entity, and ~~NERC~~ERO on request (five business days).

[VRF – Medium]

D.C. Measures

- M1.** The Transmission Owner shall make available (to its Compliance ~~Monitor~~) for inspection Enforcement Authority evidence that it met all the requirements stated in Reliability Standard FAC-001-0-Requirement R1.
- M2.** ~~The~~Each Generator Owner that has an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the interconnected Transmission ~~Owners~~systems shall make available (to its Compliance ~~Monitor~~) for inspection Enforcement Authority evidence that it met all requirements stated in Reliability Standard FAC-001-0-Requirement R2.
- M3.** ~~The~~Each Transmission Owner and each applicable Generator Owner (in accordance with Requirement R2) shall make available (to its Compliance ~~Monitor~~) for inspection Enforcement Authority evidence that it met all ~~the~~ requirements stated in Reliability Standard FAC-001-0-R3 Requirement R3.
- M3.M4.** The Transmission Owner shall make available (to its Compliance Enforcement Authority) evidence that it met all the requirements stated in Requirement R4.

E.D. Compliance

1. Compliance Monitoring Process

1.1. Compliance ~~Monitoring Responsibility~~ Enforcement Authority

Compliance Monitor: Regional ~~Reliability Organization~~ Entity

1.2. Compliance Monitoring ~~Period~~ and ~~Reset Timeframe~~ Enforcement Processes:

~~On request (five business days):~~

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

~~None specified:~~

The Transmission Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Owner shall retain evidence of Requirement R1, Measure M1, Requirement R3, Measure M3, and Requirement R4, Measure M4 from its last audit.

The Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain evidence of Requirement R2, Measure M2, and Requirement R3, Measure M3 from its last audit.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels of Non-Compliance

~~2.1. **Level 1:** Facility connection requirements were provided for generation, transmission, and end-user facilities, per Reliability Standard FAC-001-0-R1, but the document(s) do not address all of the requirements of Reliability Standard FAC-001-0-R2.~~

~~2.2. **Level 2:** Facility connection requirements were not provided for all three categories (generation, transmission, or end-user) of facilities, per Reliability Standard FAC-001-0-R1, but the document(s) provided address all of the requirements of Reliability Standard FAC-001-0-R2.~~

~~2.3. **Level 3:** Facility connection requirements were not provided for all three categories (generation, transmission, or end-user) of facilities, per Reliability Standard FAC-001-0-R1, and the document(s) provided do not address all of the requirements of Reliability Standard FAC-001-0-R2.~~

~~2.4. **Level 4:** No document on facility connection requirements was provided per Reliability Standard FAC-001-0-R3.~~

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
<u>1</u>	<u>TBD</u>	<u>Added requirements for Generator Owner and brought overall standard format up to date.</u>	<u>Revision under Project 2010-07</u>

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary. When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Right-of-Way (ROW)

A corridor of land on which electric lines may be located. The applicable Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of this NERC term was modified to include applicable Generator Owners.

In November 2011, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.

A. Introduction

1. Title: Transmission Vegetation Management Program

2. Number: FAC-003-X

3. Purpose: To improve the reliability of the electric transmission systems by preventing outages from vegetation located on transmission rights-of-way (ROW) and minimizing outages from vegetation located adjacent to ROW, maintaining clearances between transmission lines and vegetation on and along transmission ROW, and reporting vegetation-related outages of the transmission systems to the respective Regional Entity and the North American Electric Reliability Council (NERC).

Within the text of NERC Reliability Standard FAC-003-X, “transmission line(s)” and “applicable line(s)” can also refer to the generation Facilities as referenced in 4.4 and its subsections.

4. Applicability:

4.1. Regional Entity.

4.2. Applicable Transmission Owner

4.2.1. Transmission Owner that owns overhead transmission lines operated at 200 kV and above and to any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region.

4.3. Applicable Generator Owner

4.3.1. Generator Owner that owns an overhead transmission line(s) that extends greater than one mile (1.609 kilometers) beyond the fenced area of the generating station switchyard up to the point of interconnection with a Transmission Owner’s Facility or does not have a clear line of sight from the switchyard fence to the point of interconnection and is operated at 200 kV and above, and any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region.

With the line of sight reference in 4.3.1, the SDT simply seeks to clarify the exception language based on the intent that has been agreed upon by the stakeholder body. In its [Consideration of Comments report](#) from the last formal comment period, which ended on July 17, 2011, the SDT explained “We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor.” With the addition of an explicit line of sight reference here, the SDT believes it has clarified its original intent.

5. Effective Dates:

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R1 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

B. Requirements

R1. Each applicable Transmission Owner or applicable Generator Owner shall prepare, and keep current, a formal transmission vegetation management program (TVMP). The TVMP shall include the applicable Transmission Owner's or applicable Generator Owner's objectives, practices, approved procedures, and work specifications¹.

R1.1. The TVMP shall define a schedule for and the type (aerial, ground) of ROW vegetation inspections. This schedule should be flexible enough to adjust for changing conditions. The inspection schedule shall be based on the anticipated growth of vegetation and any other environmental or operational factors that could impact the relationship of vegetation to the applicable Transmission Owner's or applicable Generator Owner's transmission lines.

R1.2. Each applicable Transmission Owner or applicable Generator Owner, in the TVMP, shall identify and document clearances between vegetation and any overhead, ungrounded supply conductors, taking into consideration transmission line voltage, the effects of ambient temperature on conductor sag under maximum design loading, and the effects of wind velocities on conductor sway. Specifically, the applicable Transmission Owner or applicable Generator Owner shall establish clearances to be achieved at the time of vegetation management work identified herein as Clearance 1, and shall also establish and maintain a set of clearances identified herein as Clearance 2 to prevent flashover between vegetation and overhead ungrounded supply conductors.

R1.2.1. Clearance 1 — The applicable Transmission Owner or applicable Generator Owner shall determine and document appropriate clearance distances to be achieved at the time of transmission vegetation management work based upon local conditions and the expected time frame in which the applicable

¹ ANSI A300, Tree Care Operations – Tree, Shrub, and Other Woody Plant Maintenance – Standard Practices, while not a requirement of this standard, is considered to be an industry best practice.

Transmission Owner or applicable Generator Owner plans to return for future vegetation management work. Local conditions may include, but are not limited to: operating voltage, appropriate vegetation management techniques, fire risk, reasonably anticipated tree and conductor movement, species types and growth rates, species failure characteristics, local climate and rainfall patterns, line terrain and elevation, location of the vegetation within the span, and worker approach distance requirements. Clearance 1 distances shall be greater than those defined by Clearance 2 below.

R1.2.2. Clearance 2 — The applicable Transmission Owner or applicable Generator Owner shall determine and document specific radial clearances to be maintained between vegetation and conductors under all rated electrical operating conditions. These minimum clearance distances are necessary to prevent flashover between vegetation and conductors and will vary due to such factors as altitude and operating voltage. These applicable Transmission Owner-specific or applicable Generator Owner-specific minimum clearance distances shall be no less than those set forth in the Institute of Electrical and Electronics Engineers (IEEE) Standard 516-2003 (*Guide for Maintenance Methods on Energized Power Lines*) and as specified in its Section 4.2.2.3, Minimum Air Insulation Distances without Tools in the Air Gap.

R1.2.2.1 Where transmission system transient overvoltage factors are not known, clearances shall be derived from Table 5, IEEE 516-2003, phase-to-ground distances, with appropriate altitude correction factors applied.

R1.2.2.2 Where transmission system transient overvoltage factors are known, clearances shall be derived from Table 7, IEEE 516-2003, phase-to-phase voltages, with appropriate altitude correction factors applied.

R1.3. All personnel directly involved in the design and implementation of the TVMP shall hold appropriate qualifications and training, as defined by the Transmission Owner or Generator Owner, to perform their duties.

R1.4. Each applicable Transmission Owner or applicable Generator Owner shall develop mitigation measures to achieve sufficient clearances for the protection of the transmission facilities when it identifies locations on the ROW where the Transmission Owner or applicable Generator Owner is restricted from attaining the clearances specified in Requirement 1.2.1.

R1.5. Each Transmission Owner or applicable Generator Owner shall establish and document a process for the immediate communication of vegetation conditions that present an imminent threat of a transmission line outage. This is so that action (temporary reduction in line rating, switching line out of service, etc.) may be taken until the threat is relieved.

[VRF – High]

R2. Each applicable Transmission Owner or applicable Generator Owner shall create and implement an annual plan for vegetation management work to ensure the reliability of the system. The plan shall describe the methods used, such as manual clearing, mechanical clearing, herbicide treatment, or other actions. The plan should be flexible enough to adjust to changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors that may have an impact on the reliability of the transmission systems. Adjustments to the plan shall be documented as they occur. The plan should take into consideration the time required to obtain permissions or permits from landowners or

regulatory authorities. Each applicable Transmission Owner or applicable Generator Owner shall have systems and procedures for documenting and tracking the planned vegetation management work and ensuring that the vegetation management work was completed according to work specifications.

[VRF – High]

- R3.** Each applicable Transmission Owner or applicable Generator Owner shall report quarterly to its Regional Entity, or the Regional Entity’s designee, sustained transmission line outages determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation.
- R3.1.** Multiple sustained outages on an individual line, if caused by the same vegetation, shall be reported as one outage regardless of the actual number of outages within a 24-hour period.
- R3.2.** The applicable Transmission Owner or applicable Generator Owner is not required to report to the Regional Entity, or the Regional Entity’s designee, certain sustained transmission line outages caused by vegetation: (1) Vegetation-related outages that result from vegetation falling into lines from outside the ROW that result from natural disasters shall not be considered reportable (examples of disasters that could create non-reportable outages include, but are not limited to, earthquakes, fires, tornados, hurricanes, landslides, wind shear, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods), and (2) Vegetation-related outages due to human or animal activity shall not be considered reportable (examples of human or animal activity that could cause a non-reportable outage include, but are not limited to, logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation).
- R3.3.** The outage information provided by the applicable Transmission Owner or applicable Generator Owner to the Regional Entity, or the Regional Entity’s designee, shall include at a minimum: the name of the circuit(s) outaged, the date, time and duration of the outage; a description of the cause of the outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.
- R3.4.** An outage shall be categorized as one of the following:
- R3.4.1.** Category 1 — Grow-ins: Outages caused by vegetation growing into lines from vegetation inside and/or outside of the ROW;
 - R3.4.2.** Category 2 — Fall-ins: Outages caused by vegetation falling into lines from inside the ROW;
 - R3.4.3.** Category 3 — Fall-ins: Outages caused by vegetation falling into lines from outside the ROW.

[VRF – Lower]

- R4.** The Regional Entity shall report the outage information provided to it by applicable Transmission Owners or applicable Generator Owners, as required by Requirement 3, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported outages.

[VRF – Lower]

C. Measures

- M1.** Each applicable Transmission Owner or applicable Generator Owner has a documented TVMP, as identified in Requirement 1.
 - M1.1.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the applicable Transmission Owner or applicable Generator Owner performed the vegetation inspections as identified in Requirement 1.1.
 - M1.2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that describes the clearances identified in Requirement 1.2.
 - M1.3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the personnel directly involved in the design and implementation of the applicable Transmission Owner's or applicable Generator Owner TVMP hold the qualifications identified by the Transmission Owner or applicable Generator Owner as required in Requirement 1.3.
 - M1.4.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has identified any areas not meeting the applicable Transmission Owner's or applicable Generator Owner's standard for vegetation management and any mitigating measures the Transmission Owner or applicable Generator Owner has taken to address these deficiencies as identified in Requirement 1.4.
 - M1.5.** Each applicable Transmission Owner or applicable Generator Owner has a documented process for the immediate communication of imminent threats by vegetation as identified in Requirement 1.5.
- M2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the Transmission Owner implemented the work plan identified in Requirement 2.
- M3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has supplied quarterly outage reports to the Regional Entity, or the Regional Entity's designee, as identified in Requirement 3.
- M4.** The Regional Entity has documentation that it provided quarterly outage reports to NERC as identified in Requirement 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor:

- Regional Entity for the Transmission Owner and Generator Owner
- Electric Reliability Organization or another Regional Entity approved by the ERO and FERC or other applicable government authorities

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The applicable Transmission Owner and applicable Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The applicable Transmission Owner and applicable Generator Owner shall retain evidence of Requirement 1, Measure 1, Requirement 2, Measure 2, and Requirement 3, Measure 3 from its last audit.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Version History

Version	Date	Action	Change Tracking
1	TBA	<ol style="list-style-type: none"> 1. Added “Standard Development Roadmap.” 2. Changed “60” to “Sixty” in section A, 5.2. 3. Added “Proposed Effective Date: April 7, 2006” to footer. 4. Added “Draft 3: November 17, 2005” to 	01/20/06

Standard FAC-003-X — Transmission Vegetation Management Program

		footer.	
X	May 16, 2011	Made standard applicable to certain qualifying Generator Owners and brought overall standard format up to date	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary. When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Right-of-Way (ROW)

A corridor of land on which electric lines may be located. The applicable Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of this NERC term was modified to include applicable Generator Owners.

In November 2011, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.

A. Introduction

1. Title: Transmission Vegetation Management Program

2. Number: FAC-003-X

3. Purpose: To improve the reliability of the electric transmission systems by preventing outages from vegetation located on transmission rights-of-way (ROW) and minimizing outages from vegetation located adjacent to ROW, maintaining clearances between transmission lines and vegetation on and along transmission ROW, and reporting vegetation-related outages of the transmission systems to the respective Regional Entity (~~RE~~) and the North American Electric Reliability Council (NERC).

Within the text of NERC Reliability Standard FAC-003-X, “transmission line(s)” and “applicable line(s)” can also refer to the generation Facilities as referenced in 4.4 and its subsections.

4. Applicability:

4.1. Regional Entity.

4.2. Applicable Transmission Owner

4.2.1. Transmission Owner that owns overhead transmission lines operated at 200 kV and above and to any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region.

4.3. Applicable Generator Owner

4.3.1. Generator Owner that owns an overhead transmission line(s) that extends greater than one mile ~~or~~ (1.609 kilometers) beyond the fenced area of the generating station switchyard up to the point of interconnection with a Transmission Owner’s Facility or does not have a clear line of sight from the switchyard fence to the point of interconnection and is operated at 200 kV and above, and any lower voltage lines designated by the Regional Entity as critical to the reliability of the electric system in the region.

With the line of sight reference in 4.3.1, the SDT simply seeks to clarify the exception language based on the intent that has been agreed upon by the stakeholder body. In its Consideration of Comments report from the last formal comment period, which ended on July 17, 2011, the SDT explained “We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor.” With the addition of an explicit line of sight reference here, the SDT believes it has clarified its original intent.

5. Effective Dates:

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement ~~R3-R1~~ becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

B. Requirements

R1. Each applicable Transmission Owner or applicable Generator Owner shall prepare, and keep current, a formal transmission vegetation management program (TVMP). The TVMP shall include the applicable Transmission Owner's or applicable Generator Owner's objectives, practices, approved procedures, and work specifications¹.

R1.1. The TVMP shall define a schedule for and the type (aerial, ground) of ROW vegetation inspections. This schedule should be flexible enough to adjust for changing conditions. The inspection schedule shall be based on the anticipated growth of vegetation and any other environmental or operational factors that could impact the relationship of vegetation to the applicable Transmission Owner's or applicable Generator Owner's transmission lines.

R1.2. Each applicable Transmission Owner or applicable Generator Owner, in the TVMP, shall identify and document clearances between vegetation and any overhead, ungrounded supply conductors, taking into consideration transmission line voltage, the effects of ambient temperature on conductor sag under maximum design loading, and the effects of wind velocities on conductor sway. Specifically, the applicable Transmission Owner or applicable Generator Owner shall establish clearances to be achieved at the time of vegetation management work identified herein as Clearance 1, and shall also establish and maintain a set of clearances identified herein as Clearance 2 to prevent flashover between vegetation and overhead ungrounded supply conductors.

R1.2.1. Clearance 1 — The applicable Transmission Owner or applicable Generator Owner shall determine and document appropriate clearance distances to be achieved at the time of transmission vegetation management work based upon local conditions and the expected time frame in which the applicable

¹ ANSI A300, Tree Care Operations – Tree, Shrub, and Other Woody Plant Maintenance – Standard Practices, while not a requirement of this standard, is considered to be an industry best practice.

Transmission Owner or applicable Generator Owner plans to return for future vegetation management work. Local conditions may include, but are not limited to: operating voltage, appropriate vegetation management techniques, fire risk, reasonably anticipated tree and conductor movement, species types and growth rates, species failure characteristics, local climate and rainfall patterns, line terrain and elevation, location of the vegetation within the span, and worker approach distance requirements. Clearance 1 distances shall be greater than those defined by Clearance 2 below.

R1.2.2. Clearance 2 — The applicable Transmission Owner or applicable Generator Owner shall determine and document specific radial clearances to be maintained between vegetation and conductors under all rated electrical operating conditions. These minimum clearance distances are necessary to prevent flashover between vegetation and conductors and will vary due to such factors as altitude and operating voltage. These applicable Transmission Owner-specific or applicable Generator Owner-specific minimum clearance distances shall be no less than those set forth in the Institute of Electrical and Electronics Engineers (IEEE) Standard 516-2003 (*Guide for Maintenance Methods on Energized Power Lines*) and as specified in its Section 4.2.2.3, Minimum Air Insulation Distances without Tools in the Air Gap.

R1.2.2.1 Where transmission system transient overvoltage factors are not known, clearances shall be derived from Table 5, IEEE 516-2003, phase-to-ground distances, with appropriate altitude correction factors applied.

R1.2.2.2 Where transmission system transient overvoltage factors are known, clearances shall be derived from Table 7, IEEE 516-2003, phase-to-phase voltages, with appropriate altitude correction factors applied.

R1.3. All personnel directly involved in the design and implementation of the TVMP shall hold appropriate qualifications and training, as defined by the Transmission Owner or Generator Owner, to perform their duties.

R1.4. Each applicable Transmission Owner or applicable Generator Owner shall develop mitigation measures to achieve sufficient clearances for the protection of the transmission facilities when it identifies locations on the ROW where the Transmission Owner or applicable Generator Owner is restricted from attaining the clearances specified in Requirement 1.2.1.

R1.5. Each Transmission Owner or applicable Generator Owner shall establish and document a process for the immediate communication of vegetation conditions that present an imminent threat of a transmission line outage. This is so that action (temporary reduction in line rating, switching line out of service, etc.) may be taken until the threat is relieved.

[VRF – High]

R2. Each applicable Transmission Owner or applicable Generator Owner shall create and implement an annual plan for vegetation management work to ensure the reliability of the system. The plan shall describe the methods used, such as manual clearing, mechanical clearing, herbicide treatment, or other actions. The plan should be flexible enough to adjust to changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors that may have an impact on the reliability of the transmission systems. Adjustments to the plan shall be documented as they occur. The plan should take into consideration the time required to obtain permissions or permits from landowners or

regulatory authorities. Each applicable Transmission Owner or applicable Generator Owner shall have systems and procedures for documenting and tracking the planned vegetation management work and ensuring that the vegetation management work was completed according to work specifications.

[VRF – High]

R3. Each applicable Transmission Owner or applicable Generator Owner shall report quarterly to its Regional Entity, or the Regional Entity’s designee, sustained transmission line outages determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation.

R3.1. Multiple sustained outages on an individual line, if caused by the same vegetation, shall be reported as one outage regardless of the actual number of outages within a 24-hour period.

R3.2. The applicable Transmission Owner or applicable Generator Owner is not required to report to the Regional Entity, or the Regional Entity’s designee, certain sustained transmission line outages caused by vegetation: (1) Vegetation-related outages that result from vegetation falling into lines from outside the ROW that result from natural disasters shall not be considered reportable (examples of disasters that could create non-reportable outages include, but are not limited to, earthquakes, fires, tornados, hurricanes, landslides, wind shear, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods), and (2) Vegetation-related outages due to human or animal activity shall not be considered reportable (examples of human or animal activity that could cause a non-reportable outage include, but are not limited to, logging, animal severing tree, vehicle contact with tree, arboricultural activities or horticultural or agricultural activities, or removal or digging of vegetation).

R3.3. The outage information provided by the applicable Transmission Owner or applicable Generator Owner to the Regional Entity, or the Regional Entity’s designee, shall include at a minimum: the name of the circuit(s) outaged, the date, time and duration of the outage; a description of the cause of the outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.

R3.4. An outage shall be categorized as one of the following:

R3.4.1. Category 1 — Grow-ins: Outages caused by vegetation growing into lines from vegetation inside and/or outside of the ROW;

R3.4.2. Category 2 — Fall-ins: Outages caused by vegetation falling into lines from inside the ROW;

R3.4.3. Category 3 — Fall-ins: Outages caused by vegetation falling into lines from outside the ROW.

[VRF – Lower]

R4. The Regional Entity shall report the outage information provided to it by applicable Transmission Owners or applicable Generator Owners, as required by Requirement 3, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported outages.

[VRF – Lower]

C. Measures

- M1.** Each applicable Transmission Owner or applicable Generator Owner has a documented TVMP, as identified in Requirement 1.
 - M1.1.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the applicable Transmission Owner or applicable Generator Owner performed the vegetation inspections as identified in Requirement 1.1.
 - M1.2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that describes the clearances identified in Requirement 1.2.
 - M1.3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the personnel directly involved in the design and implementation of the applicable Transmission Owner’s or applicable Generator Owner TVMP hold the qualifications identified by the Transmission Owner or applicable Generator Owner as required in Requirement 1.3.
 - M1.4.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has identified any areas not meeting the applicable Transmission Owner’s or applicable Generator Owner’s standard for vegetation management and any mitigating measures the Transmission Owner or applicable Generator Owner has taken to address these deficiencies as identified in Requirement 1.4.
 - M1.5.** Each applicable Transmission Owner or applicable Generator Owner has a documented process for the immediate communication of imminent threats by vegetation as identified in Requirement 1.5.
- M2.** Each applicable Transmission Owner or applicable Generator Owner has documentation that the Transmission Owner implemented the work plan identified in Requirement 2.
- M3.** Each applicable Transmission Owner or applicable Generator Owner has documentation that it has supplied quarterly outage reports to the Regional Entity, or the Regional Entity’s designee, as identified in Requirement 3.
- M4.** The Regional Entity has documentation that it provided quarterly outage reports to NERC as identified in Requirement 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Compliance Monitor:

- Regional Entity for the Transmission Owner and Generator Owner
- Electric Reliability Organization or another Regional Entity approved by the ERO and FERC or other applicable government authorities

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The applicable Transmission Owner and applicable Generator Owner shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The applicable Transmission Owner and applicable Generator Owner shall retain evidence of Requirement 1, Measure 1, Requirement 2, Measure 2, and Requirement 3, Measure 3 from its last audit.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity did not include and keep current one of the four required elements of its TVMP, as directed by the requirement. Version History

Version	Date	Action	Change Tracking
1	TBA	<ol style="list-style-type: none"> 1. Added “Standard Development Roadmap.” 2. Changed “60” to “Sixty” in section A, 5.2. 3. Added “Proposed Effective Date: April 7, 2006” to footer. 4. Added “Draft 3: November 17, 2005” to 	01/20/06

Standard FAC-003-X — Transmission Vegetation Management Program

		footer.	
X	May 16, 2011	Made standard applicable to certain qualifying Generator Owners and brought overall standard format up to date	Revision under Project 2010-07

Effective Dates

There are two effective dates associated with this standard.

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.
2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.
3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.

4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Version History

Version	Date	Action	Change Tracking
3	September 29, 2011	Using the latest draft of FAC-003-2 from the Project 2007-07 SDT, modified proposed definitions and Applicability to include Generator Owners of a certain length.	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

The current glossary definition of this NERC term is modified to address the issues set forth in Paragraph 734 of FERC Order 693.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

The current glossary definition of this NERC term is modified to allow both maintenance inspections and vegetation inspections to be performed concurrently.

Current definition of Vegetation Inspection:
The systematic examination of a transmission corridor to document vegetation conditions.

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

In November 2011, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.

A. Introduction

- 1. Title:** Transmission Vegetation Management
- 2. Number:** FAC-003-3
- 3. Purpose:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.

4. Applicability

4.1. Functional Entities:

4.1.1. Applicable Transmission Owners

- 4.1.1.1.** Transmission Owners that own Transmission Facilities defined in 4.2.

4.1.2. Applicable Generator Owners

- 4.1.2.1.** Generator Owners that own generation Facilities defined in 4.3

- 4.2. Transmission Facilities:** Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal¹, state, provincial, public, private, or tribal entities:

Rationale: The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards, and stations have many inspection and maintenance activities that are necessary for reliability. Those existing process manage the threat. As such, the formal steps in this standard are not well suited for this environment. 3) Specifically addressing the areas where the standard does and does not apply makes the standard clearer.

¹ EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

- 4.2.1. Each overhead transmission line operated at 200kV or higher.
 - 4.2.2. Each overhead transmission line operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.
 - 4.2.3. Each overhead transmission line operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.
 - 4.2.4. Each overhead transmission line identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.
- 4.3. Generation Facilities:** Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal², state, provincial, public, private, or tribal entities:
- 4.3.1. Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are:
 - 4.3.1.1. Operated at 200kV or higher; or
 - 4.3.1.2. Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator; or
 - 4.3.1.3. Operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

Within the text of NERC Reliability Standard FAC-003-3, “transmission line(s) and “applicable line(s) can also refer to the generation Facilities as referenced in 4.3 and its subsections.

With the line of sight reference in 4.3.1, the SDT simply seeks to clarify the exception language based on the intent that has been agreed upon by the stakeholder body. In its [Consideration of Comments report](#) from the last formal comment period, which ended on July 17, 2011, the SDT explained “We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor.” With the addition of an explicit line of sight reference here, the SDT believes it has clarified its original intent.

Enforcement:

The Requirements within a Reliability Standard govern and will be enforced. The Requirements within a Reliability Standard define what an entity must do to be compliant and binds an entity to certain obligations of performance under

² EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

Section 215 of the Federal Power Act. Compliance will in all cases be measured by determining whether a party met or failed to meet the Reliability Standard Requirement given the specific facts and circumstances of its use, ownership or operation of the bulk power system.

Measures provide guidance on assessing non-compliance with the Requirements. Measures are the evidence that could be presented to demonstrate compliance with a Reliability Standard Requirement and are not intended to contain the quantitative metrics for determining satisfactory performance nor to limit how an entity may demonstrate compliance if valid alternatives to demonstrating compliance are available in a specific case. A Reliability Standard may be enforced in the absence of specified Measures.

Entities must comply with the “Compliance” section in its entirety, including the Administrative Procedure that sets forth, among other things, reporting requirements.

The “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” are provided for informational purposes. They are designed to convey guidance from NERC’s various activities. The “Guideline and Technical Basis” section and text boxes with “Examples” and “Rationale” are not intended to establish new Requirements under NERC’s Reliability Standards or to modify the Requirements in any existing NERC Reliability Standard. Implementation of the “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” is not a substitute for compliance with Requirements in NERC’s Reliability Standards.”

5. Background:

- 5.1.1.** This standard uses three types of requirements to provide layers of protection to prevent vegetation related outages that could lead to Cascading:
- 5.1.2.** a) Performance-based — defines a particular reliability objective or outcome to be achieved. In its simplest form, a results-based requirement has four components: *who, under what conditions (if any), shall perform what action, to achieve what particular bulk power system performance result or outcome?*
- 5.1.3.** b) Risk-based — preventive requirements to reduce the risks of failure to acceptable tolerance levels. A risk-based reliability requirement should be framed as: *who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?*
- 5.1.4.** c) Competency-based — defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions. A competency-based reliability requirement should be framed as: *who, under what conditions (if any), shall have what capability, to achieve what particular result or outcome to perform an*

action to achieve a result or outcome or to reduce a risk to the reliability of the bulk power system?

- 5.1.5.** The defense-in-depth strategy for reliability standards development recognizes that each requirement in a NERC reliability standard has a role in preventing system failures, and that these roles are complementary and reinforcing. Reliability standards should not be viewed as a body of unrelated requirements, but rather should be viewed as part of a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comport with the quality objectives of a reliability standard.

This standard uses a defense-in-depth approach to improve the reliability of the electric Transmission system by:

- Requiring that vegetation be managed to prevent vegetation encroachment inside the flash-over clearance (R1 and R2);
- Requiring documentation of the maintenance strategies, procedures, processes and specifications used to manage vegetation to prevent potential flash-over conditions including consideration of 1) conductor dynamics and 2) the interrelationships between vegetation growth rates, control methods and the inspection frequency (R3);
- Requiring timely notification to the appropriate control center of vegetation conditions that could cause a flash-over at any moment (R4);
- Requiring corrective actions to ensure that flash-over distances will not be violated due to work constraints such as legal injunctions (R5);
- Requiring inspections of vegetation conditions to be performed annually (R6); and
- Requiring that the annual work needed to prevent flash-over is completed (R7).

5.1.6. For this standard, the requirements have been developed as follows:

5.1.7. Performance-based: Requirements 1 and 2

5.1.8. Competency-based: Requirement 3

5.1.9. Risk-based: Requirements 4, 5, 6 and 7

5.1.10. R3 serves as the first line of defense by ensuring that entities understand the problem they are trying to manage and have fully developed strategies and plans to manage the problem. R1, R2, and R7 serve as the second line of defense by requiring that entities carry out their plans and manage vegetation. R6, which requires inspections, may be either a part of the first line of defense (as input into the strategies and plans) or as a third line of defense (as a check of the first and second lines of defense). R4 serves as the final line of defense, as it addresses cases in which all the other lines of defense have failed.

5.1.11. Major outages and operational problems have resulted from interference between overgrown vegetation and transmission lines located on many

types of lands and ownership situations. Adherence to the standard requirements for applicable lines on any kind of land or easement, whether they are Federal Lands, state or provincial lands, public or private lands, franchises, easements or lands owned in fee, will reduce and manage this risk. For the purpose of the standard the term “public lands” includes municipal lands, village lands, city lands, and a host of other governmental entities.

- 5.1.12.** This standard addresses vegetation management along applicable overhead lines and does not apply to underground lines, submarine lines or to line sections inside an electric station boundary.
- 5.1.13.** This standard focuses on transmission lines to prevent those vegetation related outages that could lead to Cascading. It is not intended to prevent customer outages due to tree contact with lower voltage distribution system lines. For example, localized customer service might be disrupted if vegetation were to make contact with a 69kV transmission line supplying power to a 12kV distribution station. However, this standard is not written to address such isolated situations which have little impact on the overall electric transmission system.
- 5.1.14.** Since vegetation growth is constant and always present, unmanaged vegetation poses an increased outage risk, especially when numerous transmission lines are operating at or near their Rating. This can present a significant risk of consecutive line failures when lines are experiencing large sags thereby leading to Cascading. Once the first line fails the shift of the current to the other lines and/or the increasing system loads will lead to the second and subsequent line failures as contact to the vegetation under those lines occurs. Conversely, most other outage causes (such as trees falling into lines, lightning, animals, motor vehicles, etc.) are not an interrelated function of the shift of currents or the increasing system loading. These events are not any more likely to occur during heavy system loads than any other time. There is no cause-effect relationship which creates the probability of simultaneous occurrence of other such events. Therefore these types of events are highly unlikely to cause large-scale grid failures. Thus, this standard places the highest priority on the management of vegetation to prevent vegetation grow-ins.

B. Requirements and Measures

R1. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path; operating within their Rating and all Rated Electrical Operating Conditions of the types shown below³ [*Violation Risk Factor: High*] [*Time Horizon: Real-time*]:

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage⁴,
2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁵,
3. An encroachment due to the blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
4. An encroachment due to vegetation growth into the MVCD that caused a vegetation-related Sustained Outage⁴.

M1. Each applicable Transmission Owner

Rationale for R1 and R2:

Lines with the highest significance to reliability are covered in R1; all other lines are covered in R2.

Rationale for the types of failure to manage vegetation which are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of an applicable Transmission Owner's or applicable Generator Owner's vegetation maintenance program:

1. This management failure is found by routine inspection or Fault event investigation, and is normally symptomatic of unusual conditions in an otherwise sound program.
2. This management failure occurs when the height and location of a side tree within the ROW is not adequately addressed by the program.
3. This management failure occurs when side growth is not adequately addressed and may be indicative of an unsound program.
4. This management failure is usually indicative of a program that is not addressing the most fundamental dynamic of vegetation management, (i.e. a grow-in under the line). If this type of failure is pervasive on multiple lines, it provides a mechanism for a Cascade.

³ This requirement does not apply to circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, or installation, removal, or digging of vegetation. Nothing in this footnote should be construed to limit the Transmission Owner's right to exercise its full legal rights on the ROW.

⁴ If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

⁵ Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period.

and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R1)

- R2.** Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path; operating within its Rating and all Rated Electrical Operating Conditions of the types shown below² [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time*]:
1. An encroachment into the MVCD, observed in Real-time, absent a Sustained Outage³,
 2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁴,
 3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
 4. An encroachment due to vegetation growth into the line MVCD that caused a vegetation-related Sustained Outage⁴
- M2.** Each applicable Transmission Owner and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R2)

R3. Each applicable Transmission Owner and applicable Generator Owner shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines that accounts for the following:

3.1 Movement of applicable line conductors under their Rating and all Rated Electrical Operating Conditions;

3.2 Inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]:

Rationale

The documentation provides a basis for evaluating the competency of the applicable Transmission Owner’s or applicable Generator Owner’s vegetation program. There may be many acceptable approaches to maintain clearances. Any approach must demonstrate that the applicable Transmission Owner or applicable Generator Owner avoids vegetation-to-wire conflicts under all Ratings and all Rated Electrical Operating Conditions. See Figure

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner can prevent encroachment into the MVCD considering the factors identified in the requirement. (R3)

R4. Each applicable Transmission Owner and applicable Generator Owner, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable line when the applicable Transmission Owner and applicable Generator Owner has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment [Violation Risk Factor: Medium] [Time Horizon: Real-time].

Rationale

This is to ensure expeditious communication between the applicable Transmission Owner or applicable Generator Owner and the control center when a critical situation is confirmed.

M4. Each applicable Transmission Owner and applicable Generator Owner that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders. (R4)

R5. When a applicable Transmission Owner and applicable Generator Owner is constrained from performing vegetation work on an applicable line operating within its Rating and all Rated Electrical Operating Conditions, and the constraint may lead to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan, then the applicable Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management to prevent encroachments [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Legal actions and other events may occur which result in constraints that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation maintenance work.

In cases where the transmission line is put at potential risk due to constraints, the intent is for the applicable Transmission Owner and applicable Generator Owner to put interim measures in place, rather than do nothing.

The corrective action process is not intended to address situations where a planned work methodology cannot be performed but an alternate work methodology can be used.

M5. Each applicable Transmission Owner and applicable Generator Owner has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, or evidence that the line was de-energized. (R5)

R6. Each applicable Transmission Owner and applicable Generator Owner shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 calendar months between inspections on the same ROW⁶ [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Inspections are used by applicable Transmission Owners and applicable Generator Owners to assess the condition of the entire ROW. The information from the assessment can be used to determine risk, determine future work and evaluate recently-completed work. This requirement sets a minimum Vegetation Inspection frequency of once per calendar year but with no more than 18 months between inspections on the same ROW. Based upon average growth rates across North America and on common utility practice, this minimum frequency is reasonable. Transmission Owners should consider local and environmental factors that could warrant more frequent inspections.

⁶ When the applicable Transmission Owner or applicable Generator Owner is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the TO or GO is granted a time extension that is equivalent to the duration of the time the TO or GO was prevented from performing the Vegetation Inspection.

M6. Each applicable Transmission Owner and applicable Generator Owner has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable lines at least once per calendar year but with no more than 18 calendar months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records. (R6)

R7. Each applicable Transmission Owner and applicable Generator Owner shall complete 100% of its annual vegetation work plan of applicable lines to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not allow encroachment of vegetation into the MVCD) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan

Rationale

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. It allows modifications to the planned work for changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors, provided that those modifications do not put the transmission system at risk of a vegetation encroachment.

(measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]:

- Change in expected growth rate/ environmental factors
- Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner⁷
- Rescheduling work between growing seasons
- Crew or contractor availability/ Mutual assistance agreements
- Identified unanticipated high priority work
- Weather conditions/Accessibility
- Permitting delays
- Land ownership changes/Change in land use by the landowner
- Emerging technologies

M7. Each applicable Transmission Owner and applicable Generator Owner has evidence that it completed its annual vegetation work plan for its applicable lines. Examples of

⁷ Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, ice storms, floods, or major storms as defined either by the TO or GO or an applicable regulatory body.

acceptable forms of evidence may include a copy of the completed annual work plan (as finally modified), dated work orders, dated invoices, or dated inspection records.
(R7)

C. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

1.2 Regional Entity Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirements R1, R2, R3, R5, R6 and R7, Measures M1, M2, M3, M5, M6 and M7 for three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirement R4, Measure M4 for most recent 12 months of operator logs or most recent 3 months of voice recordings or transcripts of voice recordings, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a applicable Transmission Owner or applicable Generator Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3 Compliance Monitoring and Enforcement Processes:

5.1.15. Compliance Audit

5.1.16. Self-Certification

5.1.17. Spot Checking

5.1.18. Compliance Violation Investigation

5.1.19. Self-Reporting

Complaint

Periodic Data Submittal

1.4 Additional Compliance Information

Periodic Data Submittal: The applicable Transmission Owner and applicable Generator Owner will submit a quarterly report to its Regional Entity, or the Regional Entity's designee, identifying all Sustained Outages of applicable lines operated within their Rating and all Rated Electrical Operating Conditions as determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation, except as excluded in footnote 2, and including as a minimum the following:

- The name of the circuit(s), the date, time and duration of the outage; the voltage of the circuit; a description of the cause of the outage; the category associated with the Sustained Outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.

A Sustained Outage is to be categorized as one of the following:

- Category 1A — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, that are identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 1B — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 2A — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 2B — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 3 — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines from outside the ROW;
- Category 4A — Blowing together: Sustained Outages caused by vegetation and applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.
- Category 4B — Blowing together: Sustained Outages caused by vegetation and applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.

The Regional Entity will report the outage information provided by applicable Transmission Owners and applicable Generator Owners, as per the above, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported Sustained Outages.

Table of Compliance Elements

R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Real-time	High			<p>The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line identified as an element of an IROL or Major WECC transfer path and encroachment into the MVCD as identified in FAC-003-Table 2 was observed in real time absent a Sustained Outage.</p>	<p>The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line identified as an element of an IROL or Major WECC transfer path and a vegetation-related Sustained Outage was caused by one of the following:</p> <ul style="list-style-type: none"> • A fall-in from inside the active transmission line ROW • Blowing together of applicable lines and vegetation located inside the active transmission line ROW • A grow-in
R2	Real-time	Medium			<p>The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line not identified as an element of an IROL or Major WECC transfer path and encroachment into the MVCD as identified in FAC-003-Table 2 was observed in real time absent a Sustained Outage.</p>	<p>The Transmission Owner failed to manage vegetation to prevent encroachment into the MVCD of a line not identified as an element of an IROL or Major WECC transfer path and a vegetation-related Sustained Outage was caused by one of the following:</p> <ul style="list-style-type: none"> • A fall-in from inside the active transmission line

						<p>ROW</p> <ul style="list-style-type: none"> Blowing together of applicable lines and vegetation located inside the active transmission line ROW A grow-in
R3	Long-Term Planning	Lower		The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency, for the responsible entity's applicable lines. (Requirement R3, Part 3.2)	The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the movement of transmission line conductors under their Rating and all Rated Electrical Operating Conditions, for the responsible entity's applicable lines. Requirement R3, Part 3.1)	The responsible entity does not have any maintenance strategies or documented procedures or processes or specifications used to prevent the encroachment of vegetation into the MVCD, for the responsible entity's applicable lines.
R4	Real-time	Medium			The responsible entity experienced a confirmed vegetation threat and notified the control center holding switching authority for that applicable line, but there was intentional delay in that notification.	The responsible entity experienced a confirmed vegetation threat and did not notify the control center holding switching authority for that applicable line.
R5	Operations Planning	Medium				The responsible entity did not take corrective action when it was constrained from performing planned vegetation work where an applicable line was put at potential risk.
R6	Operations	Medium	The responsible entity	The responsible entity failed	The responsible entity failed to	The responsible entity failed to

	Planning		failed to inspect 5% or less of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.)	to inspect more than 5% up to and including 10% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).	inspect more than 10% up to and including 15% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).	inspect more than 15% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).
R7	Operations Planning	Medium	The responsible entity failed to complete 5% or less of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 5% and up to and including 10% of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 10% and up to and including 15% of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 15% of its annual vegetation work plan for its applicable lines (as finally modified).

D. Regional Differences

Guideline and Technical Basis (attached).

Guideline and Technical Basis

Effective dates:

The first two sentences of the Effective Dates section is standard language used in most NERC standards to cover the general effective date and is sufficient to cover the vast majority of situations. Five special cases are needed to cover effective dates for individual lines which undergo transitions after the general effective date. These special cases cover the effective dates for those lines which are initially becoming subject to the standard, those lines which are changing their applicability within the standard, and those lines which are changing in a manner that removes their applicability to the standard.

Case 1 is needed because the Planning Coordinators may designate lines below 200 kV to become elements of an IROL or Major WECC Transfer Path in a future Planning Year (PY). For example, studies by the Planning Coordinator in 2011 may identify a line to have that designation beginning in PY 2021, ten years after the planning study is performed. It is not intended for the Standard to be immediately applicable to, or in effect for, that line until that future PY begins. The effective date provision for such lines ensures that the line will become subject to the standard on January 1 of the PY specified with an allowance of at least 12 months for the applicable Transmission Owner or applicable Generator Owner to make the necessary preparations to achieve compliance on that line. The table below has some explanatory examples of the application.

<u>Date that Planning Study is completed</u>	<u>PY the line will become an IROL element</u>	<u>Date 1</u>	<u>Date 2</u>	<u>Effective Date The latter of Date 1 or Date 2</u>
05/15/2011	2012	05/15/2012	01/01/2012	05/15/2012
05/15/2011	2013	05/15/2012	01/01/2013	01/01/2013
05/15/2011	2014	05/15/2012	01/01/2014	01/01/2014
05/15/2011	2021	05/15/2012	01/01/2021	01/01/2021

Case 2 is needed because a line operating below 200kV designated as an element of an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network.

Case 3 is needed because a line operating at 200 kV or above that once was designated as an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network. Such changes result in the need to apply R1 to that line until that date is reached and then to apply R2 to that line thereafter.

Case 4 is needed because an existing line that is to be operated at 200 kV or above can be acquired by an applicable Transmission Owner or applicable Generator Owner from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network which will thereafter make the line subject to the standard.

Case 5 is needed because an existing line that is operated below 200 kV can be acquired by an applicable Transmission Owner or applicable Generator Owner from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network. In this special case the line upon acquisition was designated as an element of an Interconnection Reliability Operating Limit (IROL) or an element of a Major WECC Transfer Path.

Defined Terms:

Explanation for revising the definition of ROW:

The current NERC glossary definition of Right of Way has been modified to address the matter set forth in Paragraph 734 of FERC Order 693. The Order pointed out that Transmission Owners may in some cases own more property or rights than are needed to reliably operate transmission lines. This modified definition represents a slight but significant departure from the strict legal definition of “right of way” in that this definition is based on engineering and construction considerations that establish the width of a corridor from a technical basis. The pre-2007 maintenance records are included in the revised definition to allow the use of such vegetation widths if there were no engineering or construction standards that referenced the width of right of way to be maintained for vegetation on a particular line but the evidence exists in maintenance records for a width that was in fact maintained prior to this standard becoming mandatory. Such widths may be the only information available for lines that had limited or no vegetation easement rights and were typically maintained primarily to ensure public safety. This standard does not require additional easement rights to be purchased to satisfy a minimum right of way width that did not exist prior to this standard becoming mandatory.

Explanation for revising the definition of Vegetation Inspections:

The current glossary definition of this NERC term is being modified to allow both maintenance inspections and vegetation inspections to be performed concurrently. This allows potential efficiencies, especially for those lines with minimal vegetation and/or slow vegetation growth rates.

Explanation of the definition of the MVCD:

The MVCD is a calculated minimum distance that is derived from the Gallet Equations. This is a method of calculating a flash over distance that has been used in the design of high voltage transmission lines. Keeping vegetation away from high voltage conductors by this distance will prevent voltage flash-over to the vegetation. See the explanatory text below for Requirement R3 and associated Figure 1. Table 2 below provides MVCD values for various voltages and altitudes. Details of the equations and an example calculation are provided in Appendix 1 of the Technical Reference Document.

Requirements R1 and R2:

R1 and R2 are performance-based requirements. The reliability objective or outcome to be achieved is the management of vegetation such that there are no vegetation encroachments within a minimum distance of transmission lines. Content-wise, R1 and R2 are the same requirements; however, they apply to different Facilities. Both R1 and R2 require each applicable Transmission Owner or applicable Generator Owner to manage vegetation to prevent encroachment within the MVCD of transmission lines. R1 is applicable to lines that are identified as an element of an IROL or Major WECC Transfer Path. R2 is applicable to all other lines that are not elements of IROLs, and not elements of Major WECC Transfer Paths.

The separation of applicability (between R1 and R2) recognizes that inadequate vegetation management for an applicable line that is an element of an IROL or a Major WECC Transfer Path is a greater risk to the interconnected electric transmission system than applicable lines that are not elements of IROLs or Major WECC Transfer Paths. Applicable lines that are not elements of IROLs or Major WECC Transfer Paths do require effective vegetation management, but these lines are comparatively less operationally significant. As a reflection of this difference in risk impact, the Violation Risk Factors (VRFs) are assigned as High for R1 and Medium for R2.

Requirements R1 and R2 state that if inadequate vegetation management allows vegetation to encroach within the MVCD distance as shown in Table 2, it is a violation of the standard. Table 2 distances are the minimum clearances that will prevent spark-over based on the Gallet equations as described more fully in the Technical Reference document.

These requirements assume that transmission lines and their conductors are operating within their Rating. If a line conductor is intentionally or inadvertently operated beyond its Rating and Rated Electrical Operating Condition (potentially in violation of other standards), the occurrence of a clearance encroachment may occur solely due to that condition. For example, emergency actions taken by an applicable Transmission Owner or applicable Generator Owner or Reliability Coordinator to protect an Interconnection may cause excessive sagging and an outage. Another example would be ice loading beyond the line's Rating and Rated Electrical Operating Condition. Such vegetation-related encroachments and outages are not violations of this standard.

Evidence of failures to adequately manage vegetation include real-time observation of a vegetation encroachment into the MVCD (absent a Sustained Outage), or a vegetation-related encroachment resulting in a Sustained Outage due to a fall-in from inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to the blowing together of the lines and vegetation located inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to a grow-in. Faults which do not cause a Sustained outage and which are confirmed to have been caused by vegetation encroachment within the MVCD are considered the equivalent of a Real-time observation for violation severity levels.

With this approach, the VSLs for R1 and R2 are structured such that they directly correlate to the severity of a failure of an applicable Transmission Owner or applicable Generator Owner to manage vegetation and to the corresponding performance level of the Transmission Owner's vegetation program's ability to meet the objective of "preventing the risk of those vegetation related outages that could lead to Cascading." Thus violation severity increases with an applicable Transmission Owner's or applicable Generator Owner's inability to meet this goal and its potential of leading to a Cascading event. The additional benefits of such a combination are that it simplifies the standard and clearly defines performance for compliance. A performance-based requirement of this nature will promote high quality, cost effective vegetation management programs that will deliver the overall end result of improved reliability to the system.

Multiple Sustained Outages on an individual line can be caused by the same vegetation. For example initial investigations and corrective actions may not identify and remove the actual outage cause then another outage occurs after the line is re-energized and previous high conductor temperatures return. Such events are considered to be a single vegetation-related Sustained Outage under the standard where the Sustained Outages occur within a 24 hour period.

The MVCD is a calculated minimum distance stated in feet (or meters) to prevent spark-over, for various altitudes and operating voltages that is used in the design of Transmission Facilities. Keeping vegetation from entering this space will prevent transmission outages.

If the applicable Transmission Owner or applicable Generator Owner has applicable lines operated at nominal voltage levels not listed in Table 2, then the applicable TO or applicable GO should use the next largest clearance distance based on the next highest nominal voltage in the table to determine an acceptable distance.

Requirement R3: R3 is a competency based requirement concerned with the maintenance strategies, procedures, processes, or specifications, an applicable Transmission Owner or applicable Generator Owner uses for vegetation management.

An adequate transmission vegetation management program formally establishes the approach the applicable Transmission Owner or applicable Generator Owner uses to plan and perform vegetation work to prevent transmission Sustained Outages and minimize risk to the transmission system. The approach provides the basis for evaluating the intent, allocation of appropriate resources, and the competency of the applicable Transmission Owner or applicable Generator Owner in managing vegetation. There are many acceptable approaches to manage vegetation and avoid Sustained Outages. However, the applicable Transmission Owner or applicable Generator Owner must be able to show the documentation of its approach and how it conducts work to maintain clearances.

An example of one approach commonly used by industry is ANSI Standard A300, part 7. However, regardless of the approach a utility uses to manage vegetation, any approach an applicable Transmission Owner or applicable Generator Owner chooses to use will generally contain the following elements:

1. *the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation height) to ensure that MVCD clearances are never violated.*
2. *the work methods that the applicable Transmission Owner or applicable Generator Owner uses to control vegetation*
3. *a stated Vegetation Inspection frequency*
4. *an annual work plan*

The conductor's position in space at any point in time is continuously changing in reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and wind loading. The movement of the transmission line conductor and the MVCD is illustrated in Figure 1 below. In the Technical Reference document more figures and explanations of conductor dynamics are provided.

Figure 1

A cross-section view of a single conductor at a given point along the span is shown with six possible conductor positions due to movement resulting from thermal and mechanical loading.

Requirement R4:

R4 is a risk-based requirement. It focuses on preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Fault risk when a vegetation threat is confirmed. R4 involves the notification of potentially threatening vegetation conditions, without any intentional delay, to the control center holding switching authority for that specific transmission line. Examples of acceptable unintentional delays may include communication system problems (for example, cellular service or two-way radio disabled), crews located in remote field locations with no communication access, delays due to severe weather, etc.

Confirmation is key that a threat actually exists due to vegetation. This confirmation could be in the form of an applicable Transmission Owner or applicable Generator Owner employee who personally identifies such a threat in the field. Confirmation could also be made by sending out an employee to evaluate a situation reported by a landowner.

Vegetation-related conditions that warrant a response include vegetation that is near or encroaching into the MVCD (a grow-in issue) or vegetation that could fall into the transmission conductor (a fall-in issue). A knowledgeable verification of the risk would include an assessment of the possible sag or movement of the conductor while operating between no-load conditions and its rating.

The applicable Transmission Owner or applicable Generator Owner has the responsibility to ensure the proper communication between field personnel and the control center to allow the control center to take the appropriate action until or as the vegetation threat is relieved. Appropriate actions may include a temporary reduction in the line loading, switching the line out of service, or other preparatory actions in recognition of the increased risk of outage on that circuit. The notification of the threat should be communicated in terms of minutes or hours as opposed to a longer time frame for corrective action plans (see R5).

All potential grow-in or fall-in vegetation-related conditions will not necessarily cause a Fault at any moment. For example, some applicable Transmission Owners or applicable Generator Owners may have a danger tree identification program that identifies trees for removal with the potential to fall near the line. These trees would not require notification to the control center unless they pose an immediate fall-in threat.

Requirement R5:

R5 is a risk-based requirement. It focuses upon preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Sustained Outage risk when temporarily constrained from performing vegetation maintenance. The intent of this requirement is to deal with situations that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation management work and, as a result, have the potential to put the transmission line at risk. Constraints to performing vegetation maintenance work as planned could result from legal injunctions filed by property owners, the discovery of easement stipulations which limit the applicable Transmission Owner's or applicable Generator Owner's rights, or other circumstances.

This requirement is not intended to address situations where the transmission line is not at potential risk and the work event can be rescheduled or re-planned using an alternate work methodology. For example, a land owner may prevent the planned use of chemicals on non-threatening, low growth vegetation but agree to the use of mechanical clearing. In this case the applicable Transmission Owner or applicable Generator Owner is not under any immediate time constraint for achieving the management objective, can easily reschedule work using an alternate approach, and therefore does not need to take interim corrective action.

However, in situations where transmission line reliability is potentially at risk due to a constraint, the applicable Transmission Owner or applicable Generator Owner is required to take an interim corrective action to mitigate the potential risk to the transmission line. A wide range of actions can be taken to address various situations. General considerations include:

- Identifying locations where the applicable Transmission Owner or applicable Generator Owner is constrained from performing planned vegetation maintenance work which potentially leaves the transmission line at risk.
- Developing the specific action to mitigate any potential risk associated with not performing the vegetation maintenance work as planned.
- Documenting and tracking the specific action taken for the location.
- In developing the specific action to mitigate the potential risk to the transmission line the applicable Transmission Owner or applicable Generator Owner could consider location specific measures such as modifying the inspection and/or maintenance intervals. Where a legal constraint would not allow any vegetation work, the interim corrective action could include limiting the loading on the transmission line.
- The applicable Transmission Owner or applicable Generator Owner should document and track the specific corrective action taken at each location. This location may be indicated as one span, one tree or a combination of spans on one property where the constraint is considered to be temporary.

Requirement R6:

R6 is a risk-based requirement. This requirement sets a minimum time period for completing Vegetation Inspections. The provision that Vegetation Inspections can be performed in conjunction with general line inspections facilitates a Transmission Owner’s ability to meet this requirement. However, the applicable Transmission Owner or applicable Generator Owner may determine that more frequent vegetation specific inspections are needed to maintain reliability levels, based on factors such as anticipated growth rates of the local vegetation, length of the local growing season, limited ROW width, and local rainfall. Therefore it is expected that some transmission lines may be designated with a higher frequency of inspections.

The VSLs for Requirement R6 have levels ranked by the failure to inspect a percentage of the applicable lines to be inspected. To calculate the appropriate VSL the applicable Transmission Owner or applicable Generator Owner may choose units such as: circuit, pole line, line miles or kilometers, etc.

For example, when an applicable Transmission Owner or applicable Generator Owner operates 2,000 miles of applicable transmission lines this applicable Transmission Owner or applicable Generator Owner will be responsible for inspecting all the 2,000 miles of lines at least once during the calendar year. If one of the included lines was 100 miles long, and if it was not inspected during the year, then the amount failed to inspect would be $100/2000 = 0.05$ or 5%. The “Low VSL” for R6 would apply in this example.

Requirement R7:

R7 is a risk-based requirement. The applicable Transmission Owner or applicable Generator Owner is required to complete its annual work plan for vegetation management to accomplish the purpose of this standard. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made and documented provided they do not put the transmission system at risk. The annual work plan requirement is not intended to necessarily require a “span-by-span”, or even a “line-by-line” detailed description of all work to be performed. It is only intended to require that the applicable Transmission Owner or applicable Generator Owner provide evidence of annual planning and execution of a vegetation management maintenance approach which successfully prevents encroachment of vegetation into the MVCD.

For example, when an applicable Transmission Owner or applicable Generator Owner identifies 1,000 miles of applicable transmission lines to be completed in the applicable Transmission Owner’s or applicable Generator Owner’s annual plan, the applicable Transmission Owner or applicable Generator Owner will be responsible completing those identified miles. If a applicable Transmission Owner or applicable Generator Owner makes a modification to the annual plan that does not put the transmission system at risk of an encroachment the annual plan may be modified. If 100 miles of the annual plan is deferred until next year the calculation to determine what percentage was completed for the current year would be: $1000 - 100$ (deferred miles) = 900 modified annual plan, or $900 / 900 = 100\%$ completed annual miles. If an applicable Transmission Owner or applicable Generator Owner only completed 875 of the total 1000 miles with no acceptable documentation for modification of the annual plan the calculation for failure to complete the annual plan would be: $1000 - 875 = 125$ miles failed to complete then, 125 miles (not completed) / 1000 total annual plan miles = 12.5% failed to complete.

The ability to modify the work plan allows the applicable Transmission Owner or applicable Generator Owner to change priorities or treatment methodologies during the year as conditions or situations dictate. For example recent line inspections may identify unanticipated high priority work, weather conditions (drought) could make herbicide application ineffective during the plan year, or a major storm could require redirecting local resources away from planned maintenance. This situation may also include complying with mutual assistance agreements by moving resources off the applicable Transmission Owner’s or applicable Generator Owner’s system to work on another system. Any of these examples could result in acceptable deferrals or additions to the annual work plan provided that they do not put the transmission system at risk of a vegetation encroachment.

In general, the vegetation management maintenance approach should use the full extent of the applicable Transmission Owner’s or applicable Generator Owner’s easement, fee simple and other legal rights allowed. A comprehensive approach that exercises the full extent of legal rights on the ROW is superior to incremental management because in the long term it reduces the overall potential for encroachments, and it ensures that future planned work and future planned inspection cycles are sufficient.

When developing the annual work plan the applicable Transmission Owner or applicable Generator Owner should allow time for procedural requirements to obtain permits to work on federal, state, provincial, public, tribal lands. In some cases the lead time for obtaining permits may necessitate preparing work plans more than a year prior to work start dates. Applicable Transmission Owners or applicable Generator Owners may also need to consider those special landowner requirements as documented in easement instruments.

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Therefore, deferrals or relevant changes to the annual plan shall be documented. Depending on the planning and documentation format used by the applicable Transmission Owner or applicable Generator Owner, evidence of successful annual work plan execution could consist of signed-off work orders, signed contracts, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, or paid invoices. Other evidence may include photographs, and walk-through reports.

Notes:

The SDT determined that the use of IEEE 516-2003 in version 1 of FAC-003 was a misapplication. The SDT consulted specialists who advised that the Gallet Equation would be a technically justified method. The explanation of why the Gallet approach is more appropriate is explained in the paragraphs below.

The drafting team sought a method of establishing minimum clearance distances that uses realistic weather conditions and realistic maximum transient over-voltages factors for in-service transmission lines.

The SDT considered several factors when looking at changes to the minimum vegetation to conductor distances in FAC-003-1:

- avoid the problem associated with referring to tables in another standard (IEEE-516-2003)
- transmission lines operate in non-laboratory environments (wet conditions)
- transient over-voltage factors are lower for in-service transmission lines than for inadvertently re-energized transmission lines with trapped charges.

FAC-003-1 uses the minimum air insulation distance (MAID) without tools formula provided in IEEE 516-2003 to determine the minimum distance between a transmission line conductor and vegetation. The equations and methods provided in IEEE 516 were developed by an IEEE Task Force in 1968 from test data provided by thirteen independent laboratories. The distances provided in IEEE 516 Tables 5 and 7 are based on the withstand voltage of a dry rod-rod air gap, or in other words, dry laboratory conditions. Consequently, the validity of using these distances in an outside environment application has been questioned.

FAC-003-01 allowed Transmission Owners to use either Table 5 or Table 7 to establish the minimum clearance distances. Table 7 could be used if the Transmission Owner knew the maximum transient over-voltage factor for its system. Otherwise, Table 5 would have to be used. Table 5 represented minimum air insulation distances under the worst possible case for transient over-voltage factors. These worst case transient over-voltage factors were as follows: 3.5 for voltages up to 362 kV phase to phase; 3.0 for 500 - 550 kV phase to phase; and 2.5 for 765 to 800 kV phase to phase. These worst case over-voltage factors were also a cause for concern in this particular application of the distances.

In general, the worst case transient over-voltages occur on a transmission line that is inadvertently re-energized immediately after the line is de-energized and a trapped charge is still present. The intent of FAC-003 is to keep a transmission line that is *in service* from becoming de-energized (i.e. tripped out) due to spark-over from the line conductor to nearby vegetation. Thus, the worst case transient overvoltage assumptions are not appropriate for this application. Rather, the appropriate over voltage values are those that occur only while the line is energized.

Typical values of transient over-voltages of in-service lines, as such, are not readily available in the literature because they are negligible compared with the maximums. A conservative value for the maximum transient over-voltage that can occur anywhere along the length of an in-service ac line is approximately 2.0 per unit. This value is a conservative estimate of the transient over-voltage that is created at the point of application (e.g. a substation) by switching a capacitor bank without pre-insertion devices (e.g. closing resistors). At voltage levels where capacitor banks are not very common (e.g. Maximum System Voltage of 362 kV), the

maximum transient over-voltage of an in-service ac line are created by fault initiation on adjacent ac lines and shunt reactor bank switching. These transient voltages are usually 1.5 per unit or less.

Even though these transient over-voltages will not be experienced at locations remote from the bus at which they are created, in order to be conservative, it is assumed that all nearby ac lines are subjected to this same level of over-voltage. Thus, a maximum transient over-voltage factor of 2.0 per unit for transmission lines operated at 302 kV and below is considered to be a realistic maximum in this application. Likewise, for ac transmission lines operated at Maximum System Voltages of 362 kV and above a transient over-voltage factor of 1.4 per unit is considered a realistic maximum.

The Gallet Equations are an accepted method for insulation coordination in tower design. These equations are used for computing the required strike distances for proper transmission line insulation coordination. They were developed for both wet and dry applications and can be used with any value of transient over-voltage factor. The Gallet Equation also can take into account various air gap geometries. This approach was used to design the first 500 kV and 765 kV lines in North America.

If one compares the MAID using the IEEE 516-2003 Table 7 (table D.5 for English values) with the critical spark-over distances computed using the Gallet wet equations, for each of the nominal voltage classes and identical transient over-voltage factors, the Gallet equations yield a more conservative (larger) minimum distance value.

Distances calculated from either the IEEE 516 (dry) formulas or the Gallet “wet” formulas are not vastly different when the same transient overvoltage factors are used; the “wet” equations will consistently produce slightly larger distances than the IEEE 516 equations when the same transient overvoltage is used. While the IEEE 516 equations were only developed for dry conditions the Gallet equations have provisions to calculate spark-over distances for both wet and dry conditions.

While EPRI is currently trying to establish empirical data for spark-over distances to live vegetation, there are no spark-over formulas currently derived expressly for vegetation to conductor minimum distances. Therefore the SDT chose a proven method that has been used in other EHV applications. The Gallet equations relevance to wet conditions and the selection of a Transient Overvoltage Factor that is consistent with the absence of trapped charges on an in-service transmission line make this methodology a better choice. The following table is an example of the comparison of distances derived from IEEE 516 and the Gallet equations.

**Comparison of spark-over distances computed using Gallet wet equations vs.
IEEE 516-2003 MAID distances**

(AC) Nom System Voltage (kV)	(AC) Max System Voltage (kV)	Transient Over-voltage Factor (T)	Clearance (ft.) Gallet (wet) @ Alt. 3000 feet	Table 7 (Table D.5 for feet) IEEE 516-2003 MAID (ft) @ Alt. 3000 feet

Effective Dates

There are two effective dates associated with this standard.

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.
2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.
3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.

4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Version History

Version	Date	Action	Change Tracking
3	September 29, 2011	Using the latest draft of FAC-003-2 from the Project 2007-07 SDT, modified proposed definitions and Applicability to include Generator Owners of a certain length.	Revision under Project 2010-07

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

The current glossary definition of this NERC term is modified to address the issues set forth in Paragraph 734 of FERC Order 693.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

The current glossary definition of this NERC term is modified to allow both maintenance inspections and vegetation inspections to be performed concurrently.

Current definition of Vegetation Inspection:
The systematic examination of a transmission corridor to document vegetation conditions.

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

In November 2011, NERC’s Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.

A. Introduction

- 1. Title:** Transmission Vegetation Management
- 2. Number:** FAC-003-3
- 3. Purpose:** To maintain a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission rights of way (ROW) and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading.

4. Applicability

4.1. Functional Entities:

4.1.1. Applicable Transmission Owners

- 4.1.1.1.** Transmission Owners that own Transmission Facilities defined in 4.2.

4.1.2. Applicable Generator Owners

- 4.1.2.1.** Generator Owners that own generation Facilities defined in 4.3

- 4.2. Transmission Facilities:** Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal¹, state, provincial, public, private, or tribal entities:

Rationale: The areas excluded in 4.2.4 were excluded based on comments from industry for reasons summarized as follows: 1) There is a very low risk from vegetation in this area. Based on an informal survey, no TOs reported such an event. 2) Substations, switchyards, and stations have many inspection and maintenance activities that are necessary for reliability. Those existing process manage the threat. As such, the formal steps in this standard are not well suited for this environment. 3) Specifically addressing the areas where the standard does and does not apply makes the standard clearer.

¹ EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

- 4.2.1. Each overhead transmission line operated at 200kV or higher.
 - 4.2.2. Each overhead transmission line operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator.
 - 4.2.3. Each overhead transmission line operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.
 - 4.2.4. Each overhead transmission line identified above (4.2.1 through 4.2.3) located outside the fenced area of the switchyard, station or substation and any portion of the span of the transmission line that is crossing the substation fence.
- 4.3. **Generation Facilities:** Defined below (referred to as “applicable lines”), including but not limited to those that cross lands owned by federal², state, provincial, public, private, or tribal entities:
- 4.3.1. Overhead transmission lines that extend greater than one mile ~~or~~ (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are:
 - 4.3.1.1. Operated at 200kV or higher; or
 - 4.3.1.2. Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator; or;
 - 4.3.1.3. Operated below 200 kV identified as an element of a Major WECC Transfer Path in the Bulk Electric System by WECC.

Within the text of NERC Reliability Standard FAC-003-3, “transmission line(s) and “applicable line(s) can also refer to the generation Facilities as referenced in 4.3 and its subsections.

With the line of sight reference in 4.3.1, the SDT simply seeks to clarify the exception language based on the intent that has been agreed upon by the stakeholder body. In its Consideration of Comments report from the last formal comment period, which ended on July 17, 2011, the SDT explained “We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor.” With the addition of an explicit line of sight reference here, the SDT believes it has clarified its original intent.

Enforcement:

The Requirements within a Reliability Standard govern and will be enforced. The Requirements within a Reliability Standard define what an entity must do to be compliant and binds an entity to certain obligations of performance under

² EPAAct 2005 section 1211c: “Access approvals by Federal agencies.”

Section 215 of the Federal Power Act. Compliance will in all cases be measured by determining whether a party met or failed to meet the Reliability Standard Requirement given the specific facts and circumstances of its use, ownership or operation of the bulk power system.

Measures provide guidance on assessing non-compliance with the Requirements. Measures are the evidence that could be presented to demonstrate compliance with a Reliability Standard Requirement and are not intended to contain the quantitative metrics for determining satisfactory performance nor to limit how an entity may demonstrate compliance if valid alternatives to demonstrating compliance are available in a specific case. A Reliability Standard may be enforced in the absence of specified Measures.

Entities must comply with the “Compliance” section in its entirety, including the Administrative Procedure that sets forth, among other things, reporting requirements.

The “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” are provided for informational purposes. They are designed to convey guidance from NERC’s various activities. The “Guideline and Technical Basis” section and text boxes with “Examples” and “Rationale” are not intended to establish new Requirements under NERC’s Reliability Standards or to modify the Requirements in any existing NERC Reliability Standard. Implementation of the “Guideline and Technical Basis” section, the Background section and text boxes with “Examples” and “Rationale” is not a substitute for compliance with Requirements in NERC’s Reliability Standards.”

5. Background:

- 5.1.1. This standard uses three types of requirements to provide layers of protection to prevent vegetation related outages that could lead to Cascading:
- 5.1.2. a) Performance-based — defines a particular reliability objective or outcome to be achieved. In its simplest form, a results-based requirement has four components: *who, under what conditions (if any), shall perform what action, to achieve what particular bulk power system performance result or outcome?*
- 5.1.3. b) Risk-based — preventive requirements to reduce the risks of failure to acceptable tolerance levels. A risk-based reliability requirement should be framed as: *who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?*
- 5.1.4. c) Competency-based — defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions. A competency-based reliability requirement should be framed as: *who, under what conditions (if any), shall have what capability, to achieve what particular result or outcome to perform an*

action to achieve a result or outcome or to reduce a risk to the reliability of the bulk power system?

- 5.1.5.** The defense-in-depth strategy for reliability standards development recognizes that each requirement in a NERC reliability standard has a role in preventing system failures, and that these roles are complementary and reinforcing. Reliability standards should not be viewed as a body of unrelated requirements, but rather should be viewed as part of a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comport with the quality objectives of a reliability standard.

This standard uses a defense-in-depth approach to improve the reliability of the electric Transmission system by:

- Requiring that vegetation be managed to prevent vegetation encroachment inside the flash-over clearance (R1 and R2);
- Requiring documentation of the maintenance strategies, procedures, processes and specifications used to manage vegetation to prevent potential flash-over conditions including consideration of 1) conductor dynamics and 2) the interrelationships between vegetation growth rates, control methods and the inspection frequency (R3);
- Requiring timely notification to the appropriate control center of vegetation conditions that could cause a flash-over at any moment (R4);
- Requiring corrective actions to ensure that flash-over distances will not be violated due to work constraints such as legal injunctions (R5);
- Requiring inspections of vegetation conditions to be performed annually (R6); and
- Requiring that the annual work needed to prevent flash-over is completed (R7).

5.1.6. For this standard, the requirements have been developed as follows:

5.1.7. Performance-based: Requirements 1 and 2

5.1.8. Competency-based: Requirement 3

5.1.9. Risk-based: Requirements 4, 5, 6 and 7

5.1.10. R3 serves as the first line of defense by ensuring that entities understand the problem they are trying to manage and have fully developed strategies and plans to manage the problem. R1, R2, and R7 serve as the second line of defense by requiring that entities carry out their plans and manage vegetation. R6, which requires inspections, may be either a part of the first line of defense (as input into the strategies and plans) or as a third line of defense (as a check of the first and second lines of defense). R4 serves as the final line of defense, as it addresses cases in which all the other lines of defense have failed.

5.1.11. Major outages and operational problems have resulted from interference between overgrown vegetation and transmission lines located on many

types of lands and ownership situations. Adherence to the standard requirements for applicable lines on any kind of land or easement, whether they are Federal Lands, state or provincial lands, public or private lands, franchises, easements or lands owned in fee, will reduce and manage this risk. For the purpose of the standard the term “public lands” includes municipal lands, village lands, city lands, and a host of other governmental entities.

- 5.1.12.** This standard addresses vegetation management along applicable overhead lines and does not apply to underground lines, submarine lines or to line sections inside an electric station boundary.
- 5.1.13.** This standard focuses on transmission lines to prevent those vegetation related outages that could lead to Cascading. It is not intended to prevent customer outages due to tree contact with lower voltage distribution system lines. For example, localized customer service might be disrupted if vegetation were to make contact with a 69kV transmission line supplying power to a 12kV distribution station. However, this standard is not written to address such isolated situations which have little impact on the overall electric transmission system.
- 5.1.14.** Since vegetation growth is constant and always present, unmanaged vegetation poses an increased outage risk, especially when numerous transmission lines are operating at or near their Rating. This can present a significant risk of consecutive line failures when lines are experiencing large sags thereby leading to Cascading. Once the first line fails the shift of the current to the other lines and/or the increasing system loads will lead to the second and subsequent line failures as contact to the vegetation under those lines occurs. Conversely, most other outage causes (such as trees falling into lines, lightning, animals, motor vehicles, etc.) are not an interrelated function of the shift of currents or the increasing system loading. These events are not any more likely to occur during heavy system loads than any other time. There is no cause-effect relationship which creates the probability of simultaneous occurrence of other such events. Therefore these types of events are highly unlikely to cause large-scale grid failures. Thus, this standard places the highest priority on the management of vegetation to prevent vegetation grow-ins.

B. Requirements and Measures

R1. Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path; operating within their Rating and all Rated Electrical Operating Conditions of the types shown below³ [*Violation Risk Factor: High*] [*Time Horizon: Real-time*]:

1. An encroachment into the MVCD as shown in FAC-003-Table 2, observed in Real-time, absent a Sustained Outage⁴,
2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁵,
3. An encroachment due to the blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
4. An encroachment due to vegetation growth into the MVCD that caused a vegetation-related Sustained Outage⁴.

M1. Each applicable Transmission Owner

Rationale for R1 and R2:

Lines with the highest significance to reliability are covered in R1; all other lines are covered in R2.

Rationale for the types of failure to manage vegetation which are listed in order of increasing degrees of severity in non-compliant performance as it relates to a failure of an applicable Transmission Owner's or applicable Generator Owner's vegetation maintenance program:

1. This management failure is found by routine inspection or Fault event investigation, and is normally symptomatic of unusual conditions in an otherwise sound program.
2. This management failure occurs when the height and location of a side tree within the ROW is not adequately addressed by the program.
3. This management failure occurs when side growth is not adequately addressed and may be indicative of an unsound program.
4. This management failure is usually indicative of a program that is not addressing the most fundamental dynamic of vegetation management, (i.e. a grow-in under the line). If this type of failure is pervasive on multiple lines, it provides a mechanism for a Cascade.

³ This requirement does not apply to circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner subject to this reliability standard, including natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, wind shear, fresh gale, major storms as defined either by the applicable Transmission Owner or applicable Generator Owner or an applicable regulatory body, ice storms, and floods; human or animal activity such as logging, animal severing tree, vehicle contact with tree, or installation, removal, or digging of vegetation. Nothing in this footnote should be construed to limit the Transmission Owner's right to exercise its full legal rights on the ROW.

⁴ If a later confirmation of a Fault by the applicable Transmission Owner or applicable Generator Owner shows that a vegetation encroachment within the MVCD has occurred from vegetation within the ROW, this shall be considered the equivalent of a Real-time observation.

⁵ Multiple Sustained Outages on an individual line, if caused by the same vegetation, will be reported as one outage regardless of the actual number of outages within a 24-hour period.

and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R1. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R1)

- R2.** Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path; operating within its Rating and all Rated Electrical Operating Conditions of the types shown below² [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time*]:
1. An encroachment into the MVCD, observed in Real-time, absent a Sustained Outage³,
 2. An encroachment due to a fall-in from inside the ROW that caused a vegetation-related Sustained Outage⁴,
 3. An encroachment due to blowing together of applicable lines and vegetation located inside the ROW that caused a vegetation-related Sustained Outage⁴,
 4. An encroachment due to vegetation growth into the line MVCD that caused a vegetation-related Sustained Outage⁴
- M2.** Each applicable Transmission Owner and applicable Generator Owner has evidence that it managed vegetation to prevent encroachment into the MVCD as described in R2. Examples of acceptable forms of evidence may include dated attestations, dated reports containing no Sustained Outages associated with encroachment types 2 through 4 above, or records confirming no Real-time observations of any MVCD encroachments. (R2)

R3. Each applicable Transmission Owner and applicable Generator Owner shall have documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines that accounts for the following:

3.1 Movement of applicable line conductors under their Rating and all Rated Electrical Operating Conditions;

3.2 Inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency.

[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]:

Rationale

The documentation provides a basis for evaluating the competency of the applicable Transmission Owner’s or applicable Generator Owner’s vegetation program. There may be many acceptable approaches to maintain clearances. Any approach must demonstrate that the applicable Transmission Owner or applicable Generator Owner avoids vegetation-to-wire conflicts under all Ratings and all Rated Electrical Operating Conditions. See Figure

M3. The maintenance strategies or procedures or processes or specifications provided demonstrate that the applicable Transmission Owner and applicable Generator Owner can prevent encroachment into the MVCD considering the factors identified in the requirement. (R3)

R4. Each applicable Transmission Owner and applicable Generator Owner, without any intentional time delay, shall notify the control center holding switching authority for the associated applicable line when the applicable Transmission Owner and applicable Generator Owner has confirmed the existence of a vegetation condition that is likely to cause a Fault at any moment [Violation Risk Factor: Medium] [Time Horizon: Real-time].

Rationale

This is to ensure expeditious communication between the applicable Transmission Owner or applicable Generator Owner and the control center when a critical situation is confirmed.

M4. Each applicable Transmission Owner and applicable Generator Owner that has a confirmed vegetation condition likely to cause a Fault at any moment will have evidence that it notified the control center holding switching authority for the associated transmission line without any intentional time delay. Examples of evidence may include control center logs, voice recordings, switching orders, clearance orders and subsequent work orders. (R4)

R5. When a applicable Transmission Owner and applicable Generator Owner is constrained from performing vegetation work on an applicable line operating within its Rating and all Rated Electrical Operating Conditions, and the constraint may lead to a vegetation encroachment into the MVCD prior to the implementation of the next annual work plan, then the applicable Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management to prevent encroachments [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Legal actions and other events may occur which result in constraints that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation maintenance work.

In cases where the transmission line is put at potential risk due to constraints, the intent is for the applicable Transmission Owner and applicable Generator Owner to put interim measures in place, rather than do nothing.

The corrective action process is not intended to address situations where a planned work methodology cannot be performed but an alternate work methodology can be used.

M5. Each applicable Transmission Owner and applicable Generator Owner has evidence of the corrective action taken for each constraint where an applicable transmission line was put at potential risk. Examples of acceptable forms of evidence may include initially-planned work orders, documentation of constraints from landowners, court orders, inspection records of increased monitoring, documentation of the de-rating of lines, revised work orders, invoices, or evidence that the line was de-energized. (R5)

R6. Each applicable Transmission Owner and applicable Generator Owner shall perform a Vegetation Inspection of 100% of its applicable transmission lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.) at least once per calendar year and with no more than 18 calendar months between inspections on the same ROW⁶ [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*].

Rationale

Inspections are used by applicable Transmission Owners and applicable Generator Owners to assess the condition of the entire ROW. The information from the assessment can be used to determine risk, determine future work and evaluate recently-completed work. This requirement sets a minimum Vegetation Inspection frequency of once per calendar year but with no more than 18 months between inspections on the same ROW. Based upon average growth rates across North America and on common utility practice, this minimum frequency is reasonable. Transmission Owners should consider local and environmental factors that could warrant more frequent inspections.

⁶ When the applicable Transmission Owner or applicable Generator Owner is prevented from performing a Vegetation Inspection within the timeframe in R6 due to a natural disaster, the TO or GO is granted a time extension that is equivalent to the duration of the time the TO or GO was prevented from performing the Vegetation Inspection.

M6. Each applicable Transmission Owner and applicable Generator Owner has evidence that it conducted Vegetation Inspections of the transmission line ROW for all applicable lines at least once per calendar year but with no more than 18 calendar months between inspections on the same ROW. Examples of acceptable forms of evidence may include completed and dated work orders, dated invoices, or dated inspection records. (R6)

R7. Each applicable Transmission Owner and applicable Generator Owner shall complete 100% of its annual vegetation work plan of applicable lines to ensure no vegetation encroachments occur within the MVCD. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made (provided they do not allow encroachment of vegetation into the MVCD) and must be documented. The percent completed calculation is based on the number of units actually completed divided by the number of units in the final amended plan

Rationale

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. It allows modifications to the planned work for changing conditions, taking into consideration anticipated growth of vegetation and all other environmental factors, provided that those modifications do not put the transmission system at risk of a vegetation encroachment.

(measured in units of choice - circuit, pole line, line miles or kilometers, etc.) Examples of reasons for modification to annual plan may include [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]:

- Change in expected growth rate/ environmental factors
- Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner⁷
- Rescheduling work between growing seasons
- Crew or contractor availability/ Mutual assistance agreements
- Identified unanticipated high priority work
- Weather conditions/Accessibility
- Permitting delays
- Land ownership changes/Change in land use by the landowner
- Emerging technologies

M7. Each applicable Transmission Owner and applicable Generator Owner has evidence that it completed its annual vegetation work plan for its applicable lines. Examples of

⁷ Circumstances that are beyond the control of an applicable Transmission Owner or applicable Generator Owner include but are not limited to natural disasters such as earthquakes, fires, tornados, hurricanes, landslides, ice storms, floods, or major storms as defined either by the TO or GO or an applicable regulatory body.

acceptable forms of evidence may include a copy of the completed annual work plan (as finally modified), dated work orders, dated invoices, or dated inspection records.
(R7)

C. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

1.2 Regional Entity Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirements R1, R2, R3, R5, R6 and R7, Measures M1, M2, M3, M5, M6 and M7 for three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable Transmission Owner and applicable Generator Owner retains data or evidence to show compliance with Requirement R4, Measure M4 for most recent 12 months of operator logs or most recent 3 months of voice recordings or transcripts of voice recordings, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a applicable Transmission Owner or applicable Generator Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3 Compliance Monitoring and Enforcement Processes:

5.1.15. Compliance Audit

5.1.16. Self-Certification

5.1.17. Spot Checking

5.1.18. Compliance Violation Investigation

5.1.19. Self-Reporting

Complaint

Periodic Data Submittal

1.4 Additional Compliance Information

Periodic Data Submittal: The applicable Transmission Owner and applicable Generator Owner will submit a quarterly report to its Regional Entity, or the Regional Entity's designee, identifying all Sustained Outages of applicable lines operated within their Rating and all Rated Electrical Operating Conditions as determined by the applicable Transmission Owner or applicable Generator Owner to have been caused by vegetation, except as excluded in footnote 2, and including as a minimum the following:

- The name of the circuit(s), the date, time and duration of the outage; the voltage of the circuit; a description of the cause of the outage; the category associated with the Sustained Outage; other pertinent comments; and any countermeasures taken by the applicable Transmission Owner or applicable Generator Owner.

A Sustained Outage is to be categorized as one of the following:

- Category 1A — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, that are identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 1B — Grow-ins: Sustained Outages caused by vegetation growing into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, by vegetation inside and/or outside of the ROW;
- Category 2A — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 2B — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, from within the ROW;
- Category 3 — Fall-ins: Sustained Outages caused by vegetation falling into applicable lines from outside the ROW;
- Category 4A — Blowing together: Sustained Outages caused by vegetation and applicable lines that are identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.
- Category 4B — Blowing together: Sustained Outages caused by vegetation and applicable lines, but are not identified as an element of an IROL or Major WECC Transfer Path, blowing together from within the ROW.

The Regional Entity will report the outage information provided by applicable Transmission Owners and applicable Generator Owners, as per the above, quarterly to NERC, as well as any actions taken by the Regional Entity as a result of any of the reported Sustained Outages.

Table of Compliance Elements

R#	Time Horizon	VRF	Violation Severity Level			
			Lower	Moderate	High	Severe
R1	Real-time	High			<p>The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line identified as an element of an IROL or Major WECC transfer path and encroachment into the MVCD as identified in FAC-003-Table 2 was observed in real time absent a Sustained Outage.</p>	<p>The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line identified as an element of an IROL or Major WECC transfer path and a vegetation-related Sustained Outage was caused by one of the following:</p> <ul style="list-style-type: none"> • A fall-in from inside the active transmission line ROW • Blowing together of applicable lines and vegetation located inside the active transmission line ROW • A grow-in
R2	Real-time	Medium			<p>The responsible entity failed to manage vegetation to prevent encroachment into the MVCD of a line not identified as an element of an IROL or Major WECC transfer path and encroachment into the MVCD as identified in FAC-003-Table 2 was observed in real time absent a Sustained Outage.</p>	<p>The Transmission Owner failed to manage vegetation to prevent encroachment into the MVCD of a line not identified as an element of an IROL or Major WECC transfer path and a vegetation-related Sustained Outage was caused by one of the following:</p> <ul style="list-style-type: none"> • A fall-in from inside the active transmission line

						<p>ROW</p> <ul style="list-style-type: none"> Blowing together of applicable lines and vegetation located inside the active transmission line ROW A grow-in
R3	Long-Term Planning	Lower		The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the inter-relationships between vegetation growth rates, vegetation control methods, and inspection frequency, for the responsible entity's applicable lines. (Requirement R3, Part 3.2)	The responsible entity has maintenance strategies or documented procedures or processes or specifications but has not accounted for the movement of transmission line conductors under their Rating and all Rated Electrical Operating Conditions, for the responsible entity's applicable lines. Requirement R3, Part 3.1)	The responsible entity does not have any maintenance strategies or documented procedures or processes or specifications used to prevent the encroachment of vegetation into the MVCD, for the responsible entity's applicable lines.
R4	Real-time	Medium			The responsible entity experienced a confirmed vegetation threat and notified the control center holding switching authority for that applicable line, but there was intentional delay in that notification.	The responsible entity experienced a confirmed vegetation threat and did not notify the control center holding switching authority for that applicable line.
R5	Operations Planning	Medium				The responsible entity did not take corrective action when it was constrained from performing planned vegetation work where an applicable line was put at potential risk.
R6	Operations	Medium	The responsible entity	The responsible entity failed	The responsible entity failed to	The responsible entity failed to

	Planning		failed to inspect 5% or less of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.)	to inspect more than 5% up to and including 10% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).	inspect more than 10% up to and including 15% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).	inspect more than 15% of its applicable lines (measured in units of choice - circuit, pole line, line miles or kilometers, etc.).
R7	Operations Planning	Medium	The responsible entity failed to complete 5% or less of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 5% and up to and including 10% of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 10% and up to and including 15% of its annual vegetation work plan for its applicable lines (as finally modified).	The responsible entity failed to complete more than 15% of its annual vegetation work plan for its applicable lines (as finally modified).

Guideline and Technical Basis (attached).

Guideline and Technical Basis

Effective dates:

The first two sentences of the Effective Dates section is standard language used in most NERC standards to cover the general effective date and is sufficient to cover the vast majority of situations. Five special cases are needed to cover effective dates for individual lines which undergo transitions after the general effective date. These special cases cover the effective dates for those lines which are initially becoming subject to the standard, those lines which are changing their applicability within the standard, and those lines which are changing in a manner that removes their applicability to the standard.

Case 1 is needed because the Planning Coordinators may designate lines below 200 kV to become elements of an IROL or Major WECC Transfer Path in a future Planning Year (PY). For example, studies by the Planning Coordinator in 2011 may identify a line to have that designation beginning in PY 2021, ten years after the planning study is performed. It is not intended for the Standard to be immediately applicable to, or in effect for, that line until that future PY begins. The effective date provision for such lines ensures that the line will become subject to the standard on January 1 of the PY specified with an allowance of at least 12 months for the applicable Transmission Owner or applicable Generator Owner to make the necessary preparations to achieve compliance on that line. The table below has some explanatory examples of the application.

<u>Date that Planning Study is completed</u>	<u>PY the line will become an IROL element</u>	<u>Date 1</u>	<u>Date 2</u>	<u>Effective Date The latter of Date 1 or Date 2</u>
05/15/2011	2012	05/15/2012	01/01/2012	05/15/2012
05/15/2011	2013	05/15/2012	01/01/2013	01/01/2013
05/15/2011	2014	05/15/2012	01/01/2014	01/01/2014
05/15/2011	2021	05/15/2012	01/01/2021	01/01/2021

Case 2 is needed because a line operating below 200kV designated as an element of an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network.

Case 3 is needed because a line operating at 200 kV or above that once was designated as an IROL or Major WECC Transfer Path may be removed from that designation due to system improvements, changes in generation, changes in loads or changes in studies and analysis of the network. Such changes result in the need to apply R1 to that line until that date is reached and then to apply R2 to that line thereafter.

Case 4 is needed because an existing line that is to be operated at 200 kV or above can be acquired by an applicable Transmission Owner or applicable Generator Owner from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network which will thereafter make the line subject to the standard.

Case 5 is needed because an existing line that is operated below 200 kV can be acquired by an applicable Transmission Owner or applicable Generator Owner from a third party such as a Distribution Provider or other end-user who was using the line solely for local distribution purposes, but the applicable Transmission Owner or applicable Generator Owner, upon acquisition, is incorporating the line into the interconnected electrical energy transmission network. In this special case the line upon acquisition was designated as an element of an Interconnection Reliability Operating Limit (IROL) or an element of a Major WECC Transfer Path.

Defined Terms:

Explanation for revising the definition of ROW:

The current NERC glossary definition of Right of Way has been modified to address the matter set forth in Paragraph 734 of FERC Order 693. The Order pointed out that Transmission Owners may in some cases own more property or rights than are needed to reliably operate transmission lines. This modified definition represents a slight but significant departure from the strict legal definition of “right of way” in that this definition is based on engineering and construction considerations that establish the width of a corridor from a technical basis. The pre-2007 maintenance records are included in the revised definition to allow the use of such vegetation widths if there were no engineering or construction standards that referenced the width of right of way to be maintained for vegetation on a particular line but the evidence exists in maintenance records for a width that was in fact maintained prior to this standard becoming mandatory. Such widths may be the only information available for lines that had limited or no vegetation easement rights and were typically maintained primarily to ensure public safety. This standard does not require additional easement rights to be purchased to satisfy a minimum right of way width that did not exist prior to this standard becoming mandatory.

Explanation for revising the definition of Vegetation Inspections:

The current glossary definition of this NERC term is being modified to allow both maintenance inspections and vegetation inspections to be performed concurrently. This allows potential efficiencies, especially for those lines with minimal vegetation and/or slow vegetation growth rates.

Explanation of the definition of the MVCD:

The MVCD is a calculated minimum distance that is derived from the Gallet Equations. This is a method of calculating a flash over distance that has been used in the design of high voltage transmission lines. Keeping vegetation away from high voltage conductors by this distance will prevent voltage flash-over to the vegetation. See the explanatory text below for Requirement R3 and associated Figure 1. Table 2 below provides MVCD values for various voltages and altitudes. Details of the equations and an example calculation are provided in Appendix 1 of the Technical Reference Document.

Requirements R1 and R2:

R1 and R2 are performance-based requirements. The reliability objective or outcome to be achieved is the management of vegetation such that there are no vegetation encroachments within a minimum distance of transmission lines. Content-wise, R1 and R2 are the same requirements; however, they apply to different Facilities. Both R1 and R2 require each applicable Transmission Owner or applicable Generator Owner to manage vegetation to prevent encroachment within the MVCD of transmission lines. R1 is applicable to lines that are identified as an element of an IROL or Major WECC Transfer Path. R2 is applicable to all other lines that are not elements of IROLs, and not elements of Major WECC Transfer Paths.

The separation of applicability (between R1 and R2) recognizes that inadequate vegetation management for an applicable line that is an element of an IROL or a Major WECC Transfer Path is a greater risk to the interconnected electric transmission system than applicable lines that are not elements of IROLs or Major WECC Transfer Paths. Applicable lines that are not elements of IROLs or Major WECC Transfer Paths do require effective vegetation management, but these lines are comparatively less operationally significant. As a reflection of this difference in risk impact, the Violation Risk Factors (VRFs) are assigned as High for R1 and Medium for R2.

Requirements R1 and R2 state that if inadequate vegetation management allows vegetation to encroach within the MVCD distance as shown in Table 2, it is a violation of the standard. Table 2 distances are the minimum clearances that will prevent spark-over based on the Gallet equations as described more fully in the Technical Reference document.

These requirements assume that transmission lines and their conductors are operating within their Rating. If a line conductor is intentionally or inadvertently operated beyond its Rating and Rated Electrical Operating Condition (potentially in violation of other standards), the occurrence of a clearance encroachment may occur solely due to that condition. For example, emergency actions taken by an applicable Transmission Owner or applicable Generator Owner or Reliability Coordinator to protect an Interconnection may cause excessive sagging and an outage. Another example would be ice loading beyond the line's Rating and Rated Electrical Operating Condition. Such vegetation-related encroachments and outages are not violations of this standard.

Evidence of failures to adequately manage vegetation include real-time observation of a vegetation encroachment into the MVCD (absent a Sustained Outage), or a vegetation-related encroachment resulting in a Sustained Outage due to a fall-in from inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to the blowing together of the lines and vegetation located inside the ROW, or a vegetation-related encroachment resulting in a Sustained Outage due to a grow-in. Faults which do not cause a Sustained outage and which are confirmed to have been caused by vegetation encroachment within the MVCD are considered the equivalent of a Real-time observation for violation severity levels.

With this approach, the VSLs for R1 and R2 are structured such that they directly correlate to the severity of a failure of an applicable Transmission Owner or applicable Generator Owner to manage vegetation and to the corresponding performance level of the Transmission Owner's vegetation program's ability to meet the objective of "preventing the risk of those vegetation related outages that could lead to Cascading." Thus violation severity increases with an applicable Transmission Owner's or applicable Generator Owner's inability to meet this goal and its potential of leading to a Cascading event. The additional benefits of such a combination are that it simplifies the standard and clearly defines performance for compliance. A performance-based requirement of this nature will promote high quality, cost effective vegetation management programs that will deliver the overall end result of improved reliability to the system.

Multiple Sustained Outages on an individual line can be caused by the same vegetation. For example initial investigations and corrective actions may not identify and remove the actual outage cause then another outage occurs after the line is re-energized and previous high conductor temperatures return. Such events are considered to be a single vegetation-related Sustained Outage under the standard where the Sustained Outages occur within a 24 hour period.

The MVCD is a calculated minimum distance stated in feet (or meters) to prevent spark-over, for various altitudes and operating voltages that is used in the design of Transmission Facilities. Keeping vegetation from entering this space will prevent transmission outages.

If the applicable Transmission Owner or applicable Generator Owner has applicable lines operated at nominal voltage levels not listed in Table 2, then the applicable TO or applicable GO should use the next largest clearance distance based on the next highest nominal voltage in the table to determine an acceptable distance.

Requirement R3: R3 is a competency based requirement concerned with the maintenance strategies, procedures, processes, or specifications, an applicable Transmission Owner or applicable Generator Owner uses for vegetation management.

An adequate transmission vegetation management program formally establishes the approach the applicable Transmission Owner or applicable Generator Owner uses to plan and perform vegetation work to prevent transmission Sustained Outages and minimize risk to the transmission system. The approach provides the basis for evaluating the intent, allocation of appropriate resources, and the competency of the applicable Transmission Owner or applicable Generator Owner in managing vegetation. There are many acceptable approaches to manage vegetation and avoid Sustained Outages. However, the applicable Transmission Owner or applicable Generator Owner must be able to show the documentation of its approach and how it conducts work to maintain clearances.

An example of one approach commonly used by industry is ANSI Standard A300, part 7. However, regardless of the approach a utility uses to manage vegetation, any approach an applicable Transmission Owner or applicable Generator Owner chooses to use will generally contain the following elements:

1. *the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation height) to ensure that MVCD clearances are never violated.*
2. *the work methods that the applicable Transmission Owner or applicable Generator Owner uses to control vegetation*
3. *a stated Vegetation Inspection frequency*
4. *an annual work plan*

The conductor's position in space at any point in time is continuously changing in reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and wind loading. The movement of the transmission line conductor and the MVCD is illustrated in Figure 1 below. In the Technical Reference document more figures and explanations of conductor dynamics are provided.

Figure 1

A cross-section view of a single conductor at a given point along the span is shown with six possible conductor positions due to movement resulting from thermal and mechanical loading.

Requirement R4:

R4 is a risk-based requirement. It focuses on preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Fault risk when a vegetation threat is confirmed. R4 involves the notification of potentially threatening vegetation conditions, without any intentional delay, to the control center holding switching authority for that specific transmission line. Examples of acceptable unintentional delays may include communication system problems (for example, cellular service or two-way radio disabled), crews located in remote field locations with no communication access, delays due to severe weather, etc.

Confirmation is key that a threat actually exists due to vegetation. This confirmation could be in the form of an applicable Transmission Owner or applicable Generator Owner employee who personally identifies such a threat in the field. Confirmation could also be made by sending out an employee to evaluate a situation reported by a landowner.

Vegetation-related conditions that warrant a response include vegetation that is near or encroaching into the MVCD (a grow-in issue) or vegetation that could fall into the transmission conductor (a fall-in issue). A knowledgeable verification of the risk would include an assessment of the possible sag or movement of the conductor while operating between no-load conditions and its rating.

The applicable Transmission Owner or applicable Generator Owner has the responsibility to ensure the proper communication between field personnel and the control center to allow the control center to take the appropriate action until or as the vegetation threat is relieved. Appropriate actions may include a temporary reduction in the line loading, switching the line out of service, or other preparatory actions in recognition of the increased risk of outage on that circuit. The notification of the threat should be communicated in terms of minutes or hours as opposed to a longer time frame for corrective action plans (see R5).

All potential grow-in or fall-in vegetation-related conditions will not necessarily cause a Fault at any moment. For example, some applicable Transmission Owners or applicable Generator Owners may have a danger tree identification program that identifies trees for removal with the potential to fall near the line. These trees would not require notification to the control center unless they pose an immediate fall-in threat.

Requirement R5:

R5 is a risk-based requirement. It focuses upon preventative actions to be taken by the applicable Transmission Owner or applicable Generator Owner for the mitigation of Sustained Outage risk when temporarily constrained from performing vegetation maintenance. The intent of this requirement is to deal with situations that prevent the applicable Transmission Owner or applicable Generator Owner from performing planned vegetation management work and, as a result, have the potential to put the transmission line at risk. Constraints to performing vegetation maintenance work as planned could result from legal injunctions filed by property owners, the discovery of easement stipulations which limit the applicable Transmission Owner's or applicable Generator Owner's rights, or other circumstances.

This requirement is not intended to address situations where the transmission line is not at potential risk and the work event can be rescheduled or re-planned using an alternate work methodology. For example, a land owner may prevent the planned use of chemicals on non-threatening, low growth vegetation but agree to the use of mechanical clearing. In this case the applicable Transmission Owner or applicable Generator Owner is not under any immediate time constraint for achieving the management objective, can easily reschedule work using an alternate approach, and therefore does not need to take interim corrective action.

However, in situations where transmission line reliability is potentially at risk due to a constraint, the applicable Transmission Owner or applicable Generator Owner is required to take an interim corrective action to mitigate the potential risk to the transmission line. A wide range of actions can be taken to address various situations. General considerations include:

- Identifying locations where the applicable Transmission Owner or applicable Generator Owner is constrained from performing planned vegetation maintenance work which potentially leaves the transmission line at risk.
- Developing the specific action to mitigate any potential risk associated with not performing the vegetation maintenance work as planned.
- Documenting and tracking the specific action taken for the location.
- In developing the specific action to mitigate the potential risk to the transmission line the applicable Transmission Owner or applicable Generator Owner could consider location specific measures such as modifying the inspection and/or maintenance intervals. Where a legal constraint would not allow any vegetation work, the interim corrective action could include limiting the loading on the transmission line.
- The applicable Transmission Owner or applicable Generator Owner should document and track the specific corrective action taken at each location. This location may be indicated as one span, one tree or a combination of spans on one property where the constraint is considered to be temporary.

Requirement R6:

R6 is a risk-based requirement. This requirement sets a minimum time period for completing Vegetation Inspections. The provision that Vegetation Inspections can be performed in conjunction with general line inspections facilitates a Transmission Owner’s ability to meet this requirement. However, the applicable Transmission Owner or applicable Generator Owner may determine that more frequent vegetation specific inspections are needed to maintain reliability levels, based on factors such as anticipated growth rates of the local vegetation, length of the local growing season, limited ROW width, and local rainfall. Therefore it is expected that some transmission lines may be designated with a higher frequency of inspections.

The VSLs for Requirement R6 have levels ranked by the failure to inspect a percentage of the applicable lines to be inspected. To calculate the appropriate VSL the applicable Transmission Owner or applicable Generator Owner may choose units such as: circuit, pole line, line miles or kilometers, etc.

For example, when an applicable Transmission Owner or applicable Generator Owner operates 2,000 miles of applicable transmission lines this applicable Transmission Owner or applicable Generator Owner will be responsible for inspecting all the 2,000 miles of lines at least once during the calendar year. If one of the included lines was 100 miles long, and if it was not inspected during the year, then the amount failed to inspect would be $100/2000 = 0.05$ or 5%. The “Low VSL” for R6 would apply in this example.

Requirement R7:

R7 is a risk-based requirement. The applicable Transmission Owner or applicable Generator Owner is required to complete its annual work plan for vegetation management to accomplish the purpose of this standard. Modifications to the work plan in response to changing conditions or to findings from vegetation inspections may be made and documented provided they do not put the transmission system at risk. The annual work plan requirement is not intended to necessarily require a “span-by-span”, or even a “line-by-line” detailed description of all work to be performed. It is only intended to require that the applicable Transmission Owner or applicable Generator Owner provide evidence of annual planning and execution of a vegetation management maintenance approach which successfully prevents encroachment of vegetation into the MVCD.

For example, when an applicable Transmission Owner or applicable Generator Owner identifies 1,000 miles of applicable transmission lines to be completed in the applicable Transmission Owner’s or applicable Generator Owner’s annual plan, the applicable Transmission Owner or applicable Generator Owner will be responsible completing those identified miles. If a applicable Transmission Owner or applicable Generator Owner makes a modification to the annual plan that does not put the transmission system at risk of an encroachment the annual plan may be modified. If 100 miles of the annual plan is deferred until next year the calculation to determine what percentage was completed for the current year would be: $1000 - 100$ (deferred miles) = 900 modified annual plan, or $900 / 900 = 100\%$ completed annual miles. If an applicable Transmission Owner or applicable Generator Owner only completed 875 of the total 1000 miles with no acceptable documentation for modification of the annual plan the calculation for failure to complete the annual plan would be: $1000 - 875 = 125$ miles failed to complete then, 125 miles (not completed) / 1000 total annual plan miles = 12.5% failed to complete.

The ability to modify the work plan allows the applicable Transmission Owner or applicable Generator Owner to change priorities or treatment methodologies during the year as conditions or situations dictate. For example recent line inspections may identify unanticipated high priority work, weather conditions (drought) could make herbicide application ineffective during the plan year, or a major storm could require redirecting local resources away from planned maintenance. This situation may also include complying with mutual assistance agreements by moving resources off the applicable Transmission Owner’s or applicable Generator Owner’s system to work on another system. Any of these examples could result in acceptable deferrals or additions to the annual work plan provided that they do not put the transmission system at risk of a vegetation encroachment.

In general, the vegetation management maintenance approach should use the full extent of the applicable Transmission Owner’s or applicable Generator Owner’s easement, fee simple and other legal rights allowed. A comprehensive approach that exercises the full extent of legal rights on the ROW is superior to incremental management because in the long term it reduces the overall potential for encroachments, and it ensures that future planned work and future planned inspection cycles are sufficient.

When developing the annual work plan the applicable Transmission Owner or applicable Generator Owner should allow time for procedural requirements to obtain permits to work on federal, state, provincial, public, tribal lands. In some cases the lead time for obtaining permits may necessitate preparing work plans more than a year prior to work start dates. Applicable Transmission Owners or applicable Generator Owners may also need to consider those special landowner requirements as documented in easement instruments.

This requirement sets the expectation that the work identified in the annual work plan will be completed as planned. Therefore, deferrals or relevant changes to the annual plan shall be documented. Depending on the planning and documentation format used by the applicable Transmission Owner or applicable Generator Owner, evidence of successful annual work plan execution could consist of signed-off work orders, signed contracts, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, or paid invoices. Other evidence may include photographs, and walk-through reports.

FAC-003 — TABLE 2 — Minimum Vegetation Clearance Distances (MVCD)⁸

* Such lines are applicable to this standard only if PC has determined such per FAC-014 (refer to the Applicability Section above)

⁸ The distances in this Table are the minimums required to prevent Flash-over; however prudent vegetation maintenance practices dictate that substantially greater distances will be achieved at time of vegetation maintenance.

⁹ Where applicable lines are operated at nominal voltages other than those listed, the applicable Transmission Owner or applicable Generator Owner should use the maximum system voltage to determine the appropriate clearance for that line.

Notes:

The SDT determined that the use of IEEE 516-2003 in version 1 of FAC-003 was a misapplication. The SDT consulted specialists who advised that the Gallet Equation would be a technically justified method. The explanation of why the Gallet approach is more appropriate is explained in the paragraphs below.

The drafting team sought a method of establishing minimum clearance distances that uses realistic weather conditions and realistic maximum transient over-voltages factors for in-service transmission lines.

The SDT considered several factors when looking at changes to the minimum vegetation to conductor distances in FAC-003-1:

- avoid the problem associated with referring to tables in another standard (IEEE-516-2003)
- transmission lines operate in non-laboratory environments (wet conditions)
- transient over-voltage factors are lower for in-service transmission lines than for inadvertently re-energized transmission lines with trapped charges.

FAC-003-1 uses the minimum air insulation distance (MAID) without tools formula provided in IEEE 516-2003 to determine the minimum distance between a transmission line conductor and vegetation. The equations and methods provided in IEEE 516 were developed by an IEEE Task Force in 1968 from test data provided by thirteen independent laboratories. The distances provided in IEEE 516 Tables 5 and 7 are based on the withstand voltage of a dry rod-rod air gap, or in other words, dry laboratory conditions. Consequently, the validity of using these distances in an outside environment application has been questioned.

FAC-003-01 allowed Transmission Owners to use either Table 5 or Table 7 to establish the minimum clearance distances. Table 7 could be used if the Transmission Owner knew the maximum transient over-voltage factor for its system. Otherwise, Table 5 would have to be used. Table 5 represented minimum air insulation distances under the worst possible case for transient over-voltage factors. These worst case transient over-voltage factors were as follows: 3.5 for voltages up to 362 kV phase to phase; 3.0 for 500 - 550 kV phase to phase; and 2.5 for 765 to 800 kV phase to phase. These worst case over-voltage factors were also a cause for concern in this particular application of the distances.

In general, the worst case transient over-voltages occur on a transmission line that is inadvertently re-energized immediately after the line is de-energized and a trapped charge is still present. The intent of FAC-003 is to keep a transmission line that is *in service* from becoming de-energized (i.e. tripped out) due to spark-over from the line conductor to nearby vegetation. Thus, the worst case transient overvoltage assumptions are not appropriate for this application. Rather, the appropriate over voltage values are those that occur only while the line is energized.

Typical values of transient over-voltages of in-service lines, as such, are not readily available in the literature because they are negligible compared with the maximums. A conservative value for the maximum transient over-voltage that can occur anywhere along the length of an in-service ac line is approximately 2.0 per unit. This value is a conservative estimate of the transient over-voltage that is created at the point of application (e.g. a substation) by switching a capacitor bank without pre-insertion devices (e.g. closing resistors). At voltage levels where capacitor banks are not very common (e.g. Maximum System Voltage of 362 kV), the

maximum transient over-voltage of an in-service ac line are created by fault initiation on adjacent ac lines and shunt reactor bank switching. These transient voltages are usually 1.5 per unit or less.

Even though these transient over-voltages will not be experienced at locations remote from the bus at which they are created, in order to be conservative, it is assumed that all nearby ac lines are subjected to this same level of over-voltage. Thus, a maximum transient over-voltage factor of 2.0 per unit for transmission lines operated at 302 kV and below is considered to be a realistic maximum in this application. Likewise, for ac transmission lines operated at Maximum System Voltages of 362 kV and above a transient over-voltage factor of 1.4 per unit is considered a realistic maximum.

The Gallet Equations are an accepted method for insulation coordination in tower design. These equations are used for computing the required strike distances for proper transmission line insulation coordination. They were developed for both wet and dry applications and can be used with any value of transient over-voltage factor. The Gallet Equation also can take into account various air gap geometries. This approach was used to design the first 500 kV and 765 kV lines in North America.

If one compares the MAID using the IEEE 516-2003 Table 7 (table D.5 for English values) with the critical spark-over distances computed using the Gallet wet equations, for each of the nominal voltage classes and identical transient over-voltage factors, the Gallet equations yield a more conservative (larger) minimum distance value.

Distances calculated from either the IEEE 516 (dry) formulas or the Gallet “wet” formulas are not vastly different when the same transient overvoltage factors are used; the “wet” equations will consistently produce slightly larger distances than the IEEE 516 equations when the same transient overvoltage is used. While the IEEE 516 equations were only developed for dry conditions the Gallet equations have provisions to calculate spark-over distances for both wet and dry conditions.

While EPRI is currently trying to establish empirical data for spark-over distances to live vegetation, there are no spark-over formulas currently derived expressly for vegetation to conductor minimum distances. Therefore the SDT chose a proven method that has been used in other EHV applications. The Gallet equations relevance to wet conditions and the selection of a Transient Overvoltage Factor that is consistent with the absence of trapped charges on an in-service transmission line make this methodology a better choice. The following table is an example of the comparison of distances derived from IEEE 516 and the Gallet equations.

**Comparison of spark-over distances computed using Gallet wet equations vs.
IEEE 516-2003 MAID distances**

Standard PRC-004-2.1 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

A. Introduction

1. **Title:** Analysis and Mitigation of Transmission and Generation Protection System Misoperations
2. **Number:** PRC-004-2.1
3. **Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.
4. **Applicability**
 - 4.1. Transmission Owner.
 - 4.2. Distribution Provider that owns a transmission Protection System.
 - 4.3. Generator Owner.
5. **(Proposed) Effective Date:** In those jurisdictions where regulatory approval is required, all requirements become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements become effective upon Board of Trustees' adoption.

B. Requirements

- R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.
- R2. The Generator Owner shall analyze its generator and generator interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.
- R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.

C. Measures

- M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.
- M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.
- M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Entity's procedures.

D. Compliance

1. **Compliance Monitoring Process**
 - 1.1. **Compliance Enforcement Authority**

Regional Entity.

Standard PRC-004-2.1 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation or generator interconnection Facility Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.5. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Violation Severity Levels (no changes)

E. Regional Differences

None identified.

--	--	---	----------------

Implementation Plan for FAC-001-1—Facility Connection Requirements

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. FAC-001-0 – Facility Connection Requirements will be retired at midnight the day before FAC-001-1 becomes effective.

Compliance with Standard

Since this version of the standard imposes no changes to Transmission Owners from those in the FERC-approved version of the standard, the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to the FERC-approved version of this standard only address Generator Owner applicability and requirements (add Generator Owner to section 4.2, introduce a new requirement (R2), and modify one existing requirement (now R3)). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

Effective Date

There are two effective dates associated with this standard:

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner and Regional Entity become effective upon Board of Trustees' adoption.

In those jurisdictions where regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities. In those jurisdictions where no regulatory approval is required, all requirements applied to the Generator Owner become effective on the first calendar day of the first calendar quarter one year after Board of Trustees' adoption.

Implementation Plan for FAC-003-3— Transmission Vegetation Management

Prerequisite Approvals

There are a number of scenarios that could occur regarding the approval of FAC-003-2 that would affect the implementation of FAC-003-3.

If FAC-003-2 is filed with applicable regulatory authorities and approved before FAC-003-3 is filed with applicable regulatory authorities, then when and if FAC-003-3 is approved by applicable regulatory authorities, the implementation plan and effective dates for Transmission Owners in FAC-003-2 will be transferred into this implementation plan. The “clock” for calculating effective dates for Transmission Owners will still have started at the time specified in FAC-003-2 (based on the approval date of that standard). Generator Owners will be required to comply with the implementation plan as outlined below.

If applicable regulatory authorities elect to approve only FAC-003-3 and not FAC-003-2, the original implementation plan for Transmission Owners as outlined in FAC-003-2 will be transferred into this implementation plan. Generator Owners will be required to comply with the implementation plan as outlined below. The “clocks” for calculating the effective dates for both Transmission Owners and Generator Owners will begin at the same time.

If applicable regulatory authorities approve FAC-003-2 and FAC-003-3 at the same time, the implementation plan and effective dates for Transmission Owners in FAC-003-2 will be transferred into this implementation plan and FAC-003-2 will be immediately retired. Generator Owners will be required to comply with the implementation plan as outlined below. The “clocks” for calculating the effective dates for both Transmission Owners and Generator Owners will begin at the same time.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. All requirements and the two revised definitions in the proposed standard FAC-003-2 will be retired at midnight the day before FAC-003-3 becomes effective.

There are two revised definitions in the proposed standard:

Right-of-Way (ROW)

The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either

construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

Vegetation Inspection

The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.

There is one new definition in the proposed standard:

Minimum Vegetation Clearance Distance (MVCD)

The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

The current glossary definitions of Right-of-Way and Vegetation Inspection, or the glossary definitions of Right-of-Way and Vegetation Inspection in FAC-003-2, if that standard has been approved, will be retired at midnight the day before FAC-003-3 (and with it, the above definitions of Right-of-Way and Vegetation Inspection) becomes effective. The above definition of Minimum Vegetation Clearance Distance will be added to the NERC glossary upon approval of FAC-003-3, or the above definition of Minimum Vegetation Clearance Distance will replace (and thus force the retirement, at midnight the day before FAC-003-3 is approved) of the same definition in FAC-003-2, if FAC-003-2 has been approved.

Compliance with Standard

As outlined above under "Prerequisite Approvals," the inclusion of Transmission Owners in this implementation plan will depend on order in which regulatory authorities approved FAC-003-2 and FAC-003-3. Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

To reach compliance with the standard, a Generator Owner will have to perform a full review of as-built drawings and determine which generation interconnection Facilities require a Transmission Vegetation Management Plan (TVMP) and inspection as specified by NERC Reliability Standard FAC-003-3. In general, Generator Owners do not have staff that are qualified and experienced to create a TVMP, perform Right-of-Way inspections, and perform any required tree trimming (as is required by FAC-003-3 Requirement 1.3). Once a complete inventory is created, the Generator Owner will begin the process of gathering information for the TVMP. In instances where the generation interconnection Facilities are owned by a partnership, a majority or operating partner will need to obtain partnership

approval to proceed with procurement of a TVMP expert, and later a tree trimming crew. Typically, a request for proposal to hire TVMP consultant is initiated which could take several weeks in order to obtain sufficient bids (and also satisfy Sarbanes Oxley requirements). Once all bids have been received, a contract with a TVMP consultant is signed. At this point, the TVMP consultant and Generator Owner staff will develop the TVMP, which needs to take into account local growth conditions, types of vegetation and other aspects required by FAC-003. Once the TVMP is developed, Generator Owner staff and the TVMP consultant will need to perform a Right-of-Way inspection (as required in FAC-003-3 Requirement 1), usually done using GPS, LIDAR and other tools by experienced and qualified staff.

Once a Right-of-Way inspection is completed and clearances are required, the Generator Owner will need to issue a request for proposal to hire a tree trimming crew that is qualified and experienced to perform required clearance trimming. Once all bids have been received, a contract with a tree trimming crew is signed. When the tree trimming crew is acquired, the crew will need to familiarize themselves with the entity's TVMP and required clearances. The Generator Owner will typically need to schedule any required outages in order for the tree trimming crew to perform the needed clearance trimming. This action would also include the implementation of the work plan as required in FAC-003-3 Requirement 2. During scheduled outages, if required, the tree trimming crew will perform any required clearances and document the activities.

Another typical action is the Generator Owner establishing a system for maintaining TVMP-related activities, including maintenance of inspection and clearance documentation (as required in FAC-003-3 Requirement 1.2). On an ongoing basis, in addition to performing inspections and clearances as required by the entity's TVMP, the Generator Owner will need to ensure that the training and qualification requirements for the standard are met. The entity will also need to maintain documentation of all FAC-003-3 activities for compliance period of one year to meet compliance with the standard.

Again, due to a typical lack of experience and qualifications required by FAC-003-3, compliance with this standard by a Generator Owner may take as long as two years – in part because many entities will have generator interconnection Facilities in various parts of the country which may require several instances of TVMP and numerous Right-of-Way inspections.

Effective Date

There are two effective dates associated with this implementation plan:

The first effective date allows Generator Owners time to develop documented maintenance strategies or procedures or processes or specifications as outlined in Requirement R3.

In those jurisdictions where regulatory approval is required, Requirement R3 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one

year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R3 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The second effective date allows entities time to comply with Requirements R1, R2, R4, R5, R6, and R7.

In those jurisdictions where regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R1, R2, R4, R5, R6, and R7 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Effective dates for individual lines when they undergo specific transition cases:

1. A line operated below 200kV, designated by the Planning Coordinator as an element of an Interconnection Reliability Operating Limit (IROL) or designated by the Western Electricity Coordinating Council (WECC) as an element of a Major WECC Transfer Path, becomes subject to this standard the latter of: 1) 12 months after the date the Planning Coordinator or WECC initially designates the line as being an element of an IROL or an element of a Major WECC Transfer Path, or 2) January 1 of the planning year when the line is forecast to become an element of an IROL or an element of a Major WECC Transfer Path.
2. A line operated below 200 kV currently subject to this standard as a designated element of an IROL or a Major WECC Transfer Path which has a specified date for the removal of such designation will no longer be subject to this standard effective on that specified date.
3. A line operated at 200 kV or above, currently subject to this standard which is a designated element of an IROL or a Major WECC Transfer Path and which has a specified date for the removal of such designation will be subject to Requirement R2 and no longer be subject to Requirement R1 effective on that specified date.
4. An existing transmission line operated at 200kV or higher which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12 months after the acquisition date.
5. An existing transmission line operated below 200kV which is newly acquired by an asset owner and which was not previously subject to this standard becomes subject to this standard 12

months after the acquisition date of the line if at the time of acquisition the line is designated by the Planning Coordinator as an element of an IROL or by WECC as an element of a Major WECC Transfer Path.

Implementation Plan for FAC-003-X – Transmission Vegetation Management Program

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. FAC-003-1 will be retired at midnight the day before FAC-003-X becomes effective.

There is one revised definition in the proposed standard:

Right-of-Way: A corridor of land on which electric lines may be located. The Transmission Owner or applicable Generator Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

The current glossary definition of Right-of-Way will be retired at midnight the day before FAC-003-X (and with it, the above definition of Right-of-Way) becomes effective.

Compliance with Standard

There are no changes to the requirements applicable to Transmission Owners already in effect in FAC-003-1, and the expectation is that Transmission Owners will maintain their current state of compliance. Thus, the standard is effective for Transmission Owners upon approval, as detailed below.

The proposed changes to FAC-003-1 only address Generator Owner applicability and requirements (add Generator Owner to section 4.3 and add applicable Generator Owner to all requirements). Therefore, this implementation plan only identifies a compliance timeframe for Generator Owners to which this standard will apply.

To reach compliance with the standard, a Generator Owner will have to perform a full review of as-built drawings and determine which generation interconnection Facilities require a Transmission Vegetation Management Plan (TVMP) and inspection as specified by NERC Reliability Standard FAC-003-X. In general, Generator Owners do not have staff that are qualified and experienced to create a TVMP and implement annual plans for vegetation management. Once a complete inventory is created, the Generator Owner will begin the process of gathering information for the TVMP. In instances where the generation interconnection Facilities are owned by a partnership, a majority or operating partner will need to obtain partnership approval to proceed with procurement of a TVMP expert, and later a tree trimming crew. Typically, a request for proposal to hire TVMP consultant is initiated, which could take several weeks in order to obtain sufficient bids (and also satisfy Sarbanes Oxley requirements). Once all bids have been received, a contract with a TVMP consultant is signed. At this point, the TVMP consultant and

Generator Owner staff will develop the TVMP, which needs to take into account local growth conditions, types of vegetation and other aspects required by FAC-003-X. Once the TVMP is developed, Generator Owner staff and the TVMP consultant will need to perform a Right-of-Way inspection, usually done using GPS, LIDAR and other tools by experienced and qualified staff.

Once a Right-of-Way inspection is completed and clearances are required, the Generator Owner will need to issue a request for proposal to hire a tree trimming crew that is qualified and experienced to perform required clearance trimming. Once all bids have been received, a contract with a tree trimming crew is signed. When the tree trimming crew is acquired, the crew will need to familiarize themselves with the entity's TVMP and required clearances. The Generator Owner will typically need to schedule any required outages in order for the tree trimming crew to perform the needed clearance trimming. This action would also include the implementation of the work plan. During scheduled outages, if required, the tree trimming crew will perform any required clearances and document the activities.

Another typical action is the Generator Owner establishing a system for maintaining TVMP-related activities, including maintenance of inspection and clearance documentation. On an ongoing basis, in addition to performing inspections and clearances as required by the entity's TVMP, the Generator Owner will need to ensure that the training and qualification requirements for the standard are met. The entity will also need to maintain documentation of all FAC-003-X activities for compliance period of one year to meet compliance with the standard.

Again, due to a typical lack of experience and qualifications required by FAC-003-X, compliance with this standard by a Generator Owner may take as long as two years – in part because many entities will have generator interconnection Facilities in various parts of the country which may require several instances of TVMP and numerous Right-of-Way inspections.

Effective Date

There are three effective dates associated with this implementation plan:

The first effective date applies to Transmission Owners.

In those jurisdictions where regulatory approval is required, all requirements applied to the Transmission Owner become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements applied to the Transmission Owner become effective upon Board of Trustees' adoption.

The second effective date allows Generator Owners time to prepare a formal transmission vegetation management program as outlined in Requirement R1.

In those jurisdictions where regulatory approval is required, Requirement R1 applied to the Generator Owner becomes effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirement R1 becomes effective on the first day of the first calendar quarter one year following Board of Trustees adoption.

The third effective date allows entities time to comply with Requirements R2, R3, and R4.

In those jurisdictions where regulatory approval is required, Requirements R2, R3, and R4 applied to the Generator Owner become effective on the first calendar day of the first calendar quarter two years after the date of the order approving the standard from applicable regulatory authorities where such explicit approval for all requirements is required. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, and R4 become effective on the first day of the first calendar quarter two years following Board of Trustees adoption.

Implementation Plan for PRC-004-2.1— Analysis of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no proposed revisions to requirements in other already approved standards. PRC-004-2 will be retired when PRC-004-2.1 becomes effective.

Compliance with Standard

The proposed change to Requirement R2 is a clarifying change. While there was no reliability gap in the previous version of the standard, if applied literally, there was the possibility for the misperception that the Generator Owner was only responsible for analyzing its generator Protection System Misoperations, exclusive of its generator interconnection Facility. The errata change to R2 makes clear that generator interconnection Facilities are also part of Generator Owners' responsibility in the context of this standard.

Because the change is merely a clarifying change, no additional time for compliance is needed.

Effective Date

In those jurisdictions where regulatory approval is required, all requirements become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements become effective upon Board of Trustees' adoption.

Technical Justification Resource Document

Project 2010-07 Generator Requirements at the Transmission Interface

Background

As part of its work on Project 2010-07—Generator Requirements at the Transmission Interface, the standard drafting team (SDT) reviewed 34 reliability standards and 102 requirements to determine what changes are necessary to close a reliability gap with respect to what is commonly known as the generator interconnection Facility. Many of these standards and requirements had been addressed in the [Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface](#) (Ad Hoc Report) and additional standards were reviewed as a result of informal discussions with NERC and FERC staffs.

The basis for standard modifications recommended by the Ad Hoc Group for Generator Requirements at the Transmission Interface (Ad Hoc Group) was a few fundamental clarifications to the definitions of Generator Owner, Generator Operator, and Transmission, along with the creation of new definitions: one for Generator Interconnection Facility and one for Generator Interconnection Operational Interface. The Ad Hoc Group proposed the addition of these two new definitions to 26 standards encompassing 29 requirements (new and old), along with some modifications to FAC-003 to make it applicable to Generator Owners under certain circumstances.

Since the publication of the Ad Hoc Report, various entities have challenged these modifications and the recommended creation of the new definitions. The SDT has developed a more focused approach than that of the Ad Hoc Group: to propose recommendations whereby sole-use interconnection Facilities (at or above 100 kV) that are owned and operated by generating entities will be included in a small set of standards and requirements previously only applicable to Transmission Owners. The SDT agrees completely with the Ad Hoc Group's conclusion that Generator Owners and Operators of these sole-use generator tie-line Facilities (at voltages equal to or greater than 100 kV) should not be registered as Transmission Owners and Transmission Operators in order to maintain reliability on the Bulk Electric System (BES).

The SDT's justification for this strategy is rooted in the very title of its standards project: "Generator Requirements at the Transmission Interface." That is, the goal and scope of the project has always been to determine the responsibilities of those Generator Owners and Generator Operators that own or operate an interconnection Facility (in some cases labeled a "transmission Facility") between the generator and the interface with the portion of the BES where Transmission Owners and Transmission Operators take over ownership and operating responsibility. These kinds of Generator Owners and Generator Operators do not own or operate Facilities that are part of the interconnected system; rather, they own and operate sole-use Facilities that are connected to the boundary of the

interconnected system and as such have a limited role in providing reliability compared to those that operate in a networked fashion beyond the point of interconnection.

While some argue that these interconnecting portions of a Generator Owner's Facilities could be defined as Transmission and thus require the Generator Owner and Generator Operator for the Facility to be classified and registered as a Transmission Owner and Transmission Operator, the SDT does not believe this is necessary to provide an appropriate level of reliability for the BES. Just as important, such classification and registration could actually cause a reduction in reliability. Generator Owners and Generator Operators do not need, and in some cases may be prohibited from having, a wide-area view and responsibility for the integrated transmission system. Requiring Generator Owners and Generator Operators to have such responsibilities would require significant training, require substantially more data and modeling responsibilities, and detract from the entities' primary functions: to own and operate their generation equipment – including any Facilities owned and operated at voltages of 100 kV or greater that connect to the interconnected system – in a reliable manner.

Additionally, the SDT believes that the industry is much more aware today of the need to include *all* elements (owned and operated at 100 kV or higher) of a generator Facility in the procedures and compliance program of the registered entity that owns or has operational responsibility of those elements. Industry awareness was raised substantially at the time the [October 17, 2010 Facility Ratings Recommendation to Industry](#) was issued (which included Generator Owners and specifically addressed interconnection Facilities in [the Q&A document](#) with the statement that the alert applied to generator interconnection tie lines that are radial only and do not serve load “if the generator is considered part of the bulk electric system”). While this applies to a specific NERC Recommendation, the SDT considers this compelling evidence that the paradigm for thinking about generator interconnection Facilities is shifting.

All of this has led the SDT to its current conclusions to modify FAC-001, FAC-003, and PRC-004 and later, PRC-005. The SDT does not believe any further modifications to standards are necessary to maintain an appropriate level of reliability based on the revised assumption that while generator Facilities (at 100 kV and above) will be considered by some to be transmission, Generator Owners and Generator Operators should not be registered as Transmission Owners and Transmission Operators simply as a result of the ownership and operation of such Facilities. Because the majority of commenters support the SDT's current recommendation to not adopt new terms, the SDT has elected to focus on its standard changes and not, at this time, propose revisions to existing, or creation of new, glossary terms.

Below, the SDT discusses the changes it has proposed for FAC-001, FAC-003, and PRC-004 and the changes it plans to propose for PRC-005 and then provides justification for not modifying any of the additional standards and requirements it has reviewed.

Review of SDT's Proposed Standard Changes

FAC-001-1—Facility Connection Requirements

While some stakeholders have questioned the modifications in the proposed FAC-001-1, the SDT remains convinced that there is the potential for a reliability gap if this standard is not modified so that it applies to a Generator Owner *if and when it executes an Agreement* to evaluate the reliability impact of interconnecting a third party Facility to its existing generation interconnection Facility. The intent of this modified language is to start the compliance clock when the Generator Owner executes an Agreement to perform the reliability assessment required in FAC-002-1. This step is expected to occur if a Generator Owner is compelled by a regulatory body to allow such interconnection. Assuming that a regulatory body would require a Generator Owner to evaluate such an interconnection request, the SDT expects the Generator Owner and the third party to execute some form of an Agreement. The SDT intentionally excluded a specific reference to the form of Agreement (such as a feasibility study) in deference to stakeholder suggestions to avoid comingling of commercial and reliability issues in reliability standards.

The SDT acknowledges that the scenario described in the proposed FAC-001-1 may be rare, but in the past (for instance, FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the SDT thinks it is important to clarify the responsibilities related to such a request in NERC's Reliability Standards. And, while the SDT acknowledges that such regulatory action might also result in the Generator Owner being registered for other functions, such as Transmission Owner, Transmission Planner, and/or Transmission Service Provider, it decided the proposed revision provides appropriate reliability coverage until any additional registration is required and does not impact any Generator Owner that never executes an Agreement as described in the standard.

FAC-003-X and FAC-003-3—Vegetation Management

The SDT and most stakeholders agree with the Ad Hoc Group recommendation that FAC-003 be applicable to Generator Owners that own a generation interconnection Facility if that Facility contains overhead conductors. The Ad Hoc Group originally excluded such a Facility from this requirement if its length is less than two spans (generally one half mile from the generator property line). The SDT agrees with that intended exclusion in principle; as it discusses in the document titled "[Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface](#)," the SDT recognizes that in many cases, generation Facilities are (1) staffed and the overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale for exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit.

Thus, the SDT has maintained this exception language but has modified it based on stakeholder input such that it excludes Facilities shorter than one mile which have a clear line of sight from the fenced area of the generating switchyard to the point of interconnection. Specifically, sections 4.3.1 of both versions of FAC-003 (which address applicable generation Facilities) now state: "Overhead transmission

lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are...” The SDT took into consideration all comments submitted in both formal comment periods, and believes that this exemption now adequately addresses the reliability impact for a majority of the Facilities, while balancing the efforts necessary to support the standard from all entities.

PRC-004-2.1—Analysis and Mitigation of Transmission and Generation Protection System Misoperations

After examining all standards it had previously reviewed, the SDT elected to propose a slight change to PRC-004-2.1. While the SDT rejected other opportunities to “drop” the phrase “generator interconnection Facility” into requirements because it is not typically the best way to add clarity, in the case of PRC-004-2, the SDT fears that the phrasing of R2 (“The Generator Owner shall analyze its generator Protection System Misoperations...”) could lead to some confusion about whether an interconnection Facility is included. Thus, the SDT proposes adding “and generator interconnection Facility” as redlined in the draft standard. Because there is no change in applicability, and because the SDT believes that most Generator Owners already interpret the standard in this manner, we consider this to be a minor and not substantive change employed only to add clarity.

PRC-005-1a—Transmission and Generation Protection System Maintenance and Testing

In the concurrent 45-day comment and ballot period that ended in November 2011, several commenters pointed out that the wording in R1 and R2 of PRC-005-1a requires the same explicit reference to a generator interconnection Facility that was added in PRC-004-2.1 R2. The SDT agrees and is developing revisions to PRC-005-1a. These will be posted (separate from the recirculation ballot posting) soon.

Review of Other Standards Considered by the Standard Drafting Team

To ensure that no reliability gaps were left when the SDT shifted its strategy from the original strategy of the Ad Hoc Group, the SDT reviewed all standards for which the Ad Hoc Group had proposed changes, and again discussed whether making these standards applicable to Generator Owners or Generator Operators would increase reliability with respect to generator requirements at the transmission interface. During the 45-day concurrent comment and ballot period that ended in November 2011, the SDT also received comments from NERC staff encouraging it to review additional standards that NERC staff had proposed to apply to Generator Owners and Generator Operators in [NERC Compliance Process Directive #2011-CAG-001 Regarding Generator Transmission Leads](#) (Directive). Similarly, stakeholder commenters encouraged the SDT to review standards cited in FERC’s Order Denying Compliance Registry Appeals of Cedar Creek Wind Energy and Milford Wind Corridor Phase I (135 FERC ¶ 61,241) (FERC Order).

The SDT reviewed all of these standards and requirements again and continues to find clear and technical reliability-based reasons that support not adding Generator Owner and Generator Operator requirements to the standards. The chart below indicates where else (the Ad Hoc Report, the NERC Directive, or the FERC Order) the standards addressed were discussed. While both the NERC Directive and FERC Orders address specific requirements within these standards, the SDT has found it useful to address each standard as a whole. Often, requirements within a standard, or even from standard to standard, work in concert to ensure that there are no reliability gaps, whereas a review of a requirement in isolation might give the impression that there is gap.

Standard	Ad Hoc Report*	NERC Directive	FERC Order
EOP-003-1	X		
EOP-005-1		X	
FAC-001-0		X	
FAC-003-1 or FAC-003-2	X	X	X
FAC-014-2		X	X
IRO-005-2	X		
PER-001-0	X		
PER-002-0	X	X	
PER-003-1			X
PRC-001-1		X	X
TOP-001-1	X	X	X
TOP-004-2	X	X	X
TOP-006-1		X	
TOP-008-1	X		

*This chart and accompanying document only address those standards in the Ad Hoc Report for which substantive changes (change in applicability or the addition of a new requirement) were proposed.

The SDT acknowledges that both NERC and FERC have stated that neither the NERC Directive nor the FERC Order is intended to prejudge the work of the SDT. The SDT also acknowledges that the discussion in the FERC Order is related to specific cases in which certain entities will actually be registered as Transmission Owners and Transmission Operators, a process that is distinct from the SDT’s work, which assumes that once this project is complete, Generator Owners and Generator Operators will not be registered for any other functions based on ownership of a sole-use generator interconnection Facility. Still, because these related efforts are ongoing, the SDT thought it would be useful to directly address some of the discussion in the Directive and the Order. The rest of this document provides the SDT’s technical justification for limiting the scope of its work to FAC-001, FAC-003, PRC-004, and PRC-005.

EOP-003-1—Load Shedding Plans (addressed in the Ad Hoc Report)

For EOP-003-1, the Ad Hoc Group originally proposed that Generator Operators be added to the requirement that requires Transmission Operators and Balancing Authorities to coordinate automatic load-shedding throughout their areas. The SDT determined that this addition was unnecessary because PRC-001 already includes the requirement that Transmission Operators coordinate their underfrequency load shedding programs with underfrequency isolation of generating units, which implies that Generator Operators need to provide their underfrequency settings to their respective Transmission Operator. Further, Generator Operators typically do not have the technical expertise or access to the data necessary for the high-level coordination that this standard requires.

EOP-005-1—System Restoration Plans (addressed in the NERC Directive)

In its Directive, NERC staff states the following by way of rationale for applying EOP-005-1 Requirements R1, R2, R5, R6, and R7 to Generator Operators:

“If GOP has blackstart capability, then EOP-005 applies, GOP restoration plan would require coordination with TOP per the TOP Blackstart Restoration Plan. The GOP would start its blackstart resources to provide necessary real and reactive power to its generating resources per interconnecting TOP directives. In addition, if GOP has blackstart capability the interconnection TOP will have included this capability in its restoration planning for its area of responsibility. If GOP does not have blackstart capability, GOP restoration plan is dependent upon provision of real and reactive power service from interconnecting TOP, per VAR-001 and VAR-002 requiring the GOP to follow the directives of the interconnecting TOP, compliance with this standard/requirements is not required.”

Blackstart capability of a generating unit is unrelated to owning or operating transmission Facilities or a generation interconnection Facility. During a system restoration event, Generator Operators provide real and reactive power to the BES only at the direction of a Transmission Operator. The Generator Operators are not providing Transmission Operator services through their blackstart Facilities. In addition, many units with blackstart capability are not included in a TOP System Restoration Plan.

In FERC Order 693, paragraph 630, FERC approved EOP-005-1 and found the standard “adequately addresses operating personnel training and system restoration plans to ensure that transmission operators, balancing authorities and reliability coordinators are prepared to restore the Interconnection following a blackout. Accordingly, the Commission approves Reliability Standard EOP-005-1 as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to EOP-005-1 through the Reliability Standards development process that identifies time frames for training and review of restoration plan requirements.”

FERC also specifically addressed system restoration training concerns and requirements in FERC Order 693 in its review and approval of Reliability Standard EOP-005-1. In that order, FERC stated that

personnel outside a control room should be trained in system restoration, but also that this should be included in a system restoration Reliability Standard, as follows:

627. With regard to comments that the Commission's concerns are being addressed in NERC's drafting of proposed PER-005-1 Reliability Standard on operator training, we note PER-005-1 only includes Requirements on the control room personnel and not those outside of the control room. System restoration requires the participation of not only control room personnel but also those outside of the control room. These include blackstart unit operators and field switching operators in situations where SCADA capability is unavailable. As such, the Commission believes that inclusion of periodic system restoration drills and training and review of restoration plans in a system restoration Reliability Standard is the most effective way of achieving the desired goal of ensuring that all participants are trained in system restoration and that the restoration plans are up to date to deal with system changes.

Thus, FERC clearly found that the existing standard EOP-005-1 adequately addressed operating personnel training and would ensure the restoration of the BES in the event of a blackstart, and further directed that any modifications be addressed through the Reliability Standard Development Process.

Pursuant to Order 693, NERC initiated Project 2006-03, and empowered the System Restoration and Blackstart Standard Drafting Team (SRBSDT) to modify the related standards. The SRBSDT developed Reliability Standard EOP-005-2, which includes Generator Operator system restoration requirements including training, restoration plans, drills, and testing of blackstart resources. In Order 749, FERC approved EOP-005-2, which included its approval of the implementation plan for EOP-005-2. Again, both FERC and NERC had the opportunity to identify issues with the implementation time of EOP-005-2 and declined to do so.

5. Currently effective Reliability Standard EOP-005-1 requires transmission operators, balancing authorities, and reliability coordinators to have a restoration plan, test the plan, train operating personnel in the restoration plan, and have the ability to restore the Interconnection using the plans following a blackout. In Order No. 693, the Commission directed the ERO to develop, through the Reliability Standard development process, a modification to EOP-005-1 that identifies time frames for training and review of restoration plan requirements to simulate contingencies and prepare operators for anticipated and unforeseen events . . .

Also, in FERC Order 749, both NERC and FERC identified the modifications to EOP-005 as "improvements" to the standard, not changes to close a reliability gap:

10. NERC states that the proposed Reliability Standards "represent significant revision and improvement from the current set of enforceable standards" and address the Commission's directives in Order No. 693 related to the EOP standards. NERC explains that, among other

enhancements, “[t]he proposed revisions now clearly delineate the responsibilities of the Reliability Coordinator and Transmission Operator in the restoration process and restoration planning.” NERC describes the proposed Reliability Standards as providing “specific requirements for what must be in a restoration plan, how and when it needs to be updated and approved, what needs to be provided to operators and what training is necessary for personnel involved in restoration processes.

17. . . . By enhancing the rigor of the restoration planning process, the Reliability Standards represent an improvement from the current Standards and will improve the reliability of the Bulk-Power System. . . .

In summary, the Generator Operator blackstart requirements have been already been appropriately addressed through the Reliability Standards Development Process. EOP-005-2 will become effective in 2013 as approved by both the NERC Board of Trustees and FERC. There is no existing reliability gap related to owning a generation interconnection Facility and Standard EOP-005-1.

FAC-014-2—Establish and Communicate System Operating Limits (addressed in the NERC Directive and the FERC Order)

FAC-014-2, R2 states “The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator’s SOL Methodology.”

In its Directive, NERC states, with respect to FAC-014-2: “In the event an RC directs the establishment of an SOL, the SOL must be established in accordance with the RC’s SOL Methodology.”

In paragraphs 68 and 84 of the FERC Order, FERC states that without compliance with FAC-014, R2, the entity in questions could “avoid establishing the system operating limit for its line or be allowed to establish an operating limit for its line that is not consistent with the requirements of the reliability coordinator’s methodology.”

The SDT does not believe that FAC-014-2 R2 should be revised to include Generator Operators. The Generator Owner is required by the FERC-approved versions of FAC-008-1 R1 and FAC-009-1 and pending FAC-008-3 R1, R2, and R6 (which has been filed for approval with FERC) to document the Facility Ratings for a Generator Owner-owned generator interconnection circuit greater than 100kV. The established Facility Rating must respect the most limiting applicable equipment rating in the circuit and must consider operating limitations and ambient conditions. The thermal or ampere rating of this circuit would equal its ampere operating limit and should be conveyed by the Generator Owner to the Generator Operator if they are not the same entity. The operating voltage limits for this circuit are established by the applicable Transmission Owner or Transmission Operator, not the Generator Owner or Generator Operator.

Therefore, we believe adding the Generator Owner to FAC-014-2 R2 would be redundant. What's more, the SDT is concerned that entities with a limited view of the system should not be setting IROLs or SOLs. We believe this should be the responsibility of entities with a wide-area view, as shown in the standard today; otherwise, we are concerned that reliability may be jeopardized. Commenters – including one from the Transmission Owner segment – have offered this same justification.

IRO-005-2—Reliability Coordination – Current Day Operations (addressed in the Ad Hoc Report)

The SDT chose not to adopt the revision to IRO-005-2 proposed by the Ad Hoc Group. This revision would have added a new requirement that would read, “The Generator Operator shall immediately inform the Transmission Operator of the status of the Special Protection System, including any degradation or potential failure to operate as expected for SPS relay or control equipment under its control.” The SDT initially determined that IRO-005-2 did not require modification because of the October 2011 retirement of the standard. In subsequent meetings, the SDT also reached the conclusion that there is no reliability gap as PRC-001-1 R2 already requires the Generator Operator to notify reliability entities of relay or equipment failures. The SDT believes that a Special Protection System is a form of protection system and therefore any degradation or potential failure to operate as expected would be required to be reported by the Generator Operator to reliability entities (Balancing Authorities, Transmission Operators, and Reliability Coordinators).

PER Standards (PER-001-0 and PER-002-0 were addressed in the Ad Hoc Report; PER-002-0 was addressed in the NERC Directive; and PER-003-1 was addressed in the FERC Order)

The Ad Hoc Group had proposed changes to PER-001-0—Operating Personnel Responsibility and Authority and PER-002-0—Operating Personnel Training. For PER-001-0, the Ad Hoc Group proposed adding a new R2 that would read “Each Generator Operator shall provide operating personnel with the responsibility and authority to implement real-time actions to ensure the stable and reliable operation of the Generation Facility and Generation Interconnection Facility, and the responsibility and authority to follow the directives of reliability authorities including the Transmission Operator and Balancing Authority.” To PER-002-0, the Ad Hoc Group proposed adding the Generator Operator to R1 (“Each Transmission Operator, Generator Operator, and Balancing Authority shall be staffed with adequately trained operating personnel”) and adding a new R3 that would read: “Each Generator Operator shall implement an initial and continuing training program for all operating personnel that are responsible for operating the Generator Interconnection Facility that verifies the personnel’s ability and understanding to operate the equipment in a reliable manner.”

In its Directive, NERC does not address PER-001-0, but it states the following with respect to PER-002-0:

“The registered entity will develop an appropriate training program that contains the necessary elements for the GO/GOP operating a transmission facility to understand fully the impacts of the operation on the BPS, such as equipment involved, including protection systems, the

coordination aspects with the TO/TOP to which it is connected, and the protocols for and impacts of operating facilities associated with the transmission facility. The objective of this training is to ensure that the GO/GOP is completely aware of its obligations to follow the directives of the appropriate TOP and has personnel with the skills and training to execute these obligations in the best interest of reliability.”

These proposed changes to the PER standards have little to do with responsibilities that relate specifically to a generator interconnection Facility. Issues related to the training of Generator Operators existed separately from the work of Project 2010-07, and the SDT agrees that its scope limits its efforts to standards that are directly related to generator requirements at the transmission interface. The SDT also cites past FERC Orders as proof that this issue is not within the scope of Project 2010-07. In Order 693, FERC directed NERC to "expand the applicability of the personnel training Reliability Standard, PER-002-0, to include (i) generator operators centrally-located at a generation control center with a direct impact on the reliable operation of the Bulk-Power System..." In Order 742, FERC reaffirmed this, stating that it is "not modifying the Order No. 693 directive regarding training for certain generator operator dispatch personnel, nor are we expanding a generator operator's responsibilities.”

Centrally-located generator operators working at a generation control center typically dispatch the output from multiple generating units. As such, they can be called upon to comply with orders from their Balancing Authority that may have a significant impact on the reliable operation of the BES. Their training would be covered by proposed changes to PER-002-0 and Order 742. Generator Operators who deal with interconnection Facilities at individual generating plants, on the other hand, typically do not receive reliability-based orders specific to the interconnection Facilities and are therefore not covered by Order 742. Further, the SDT believes there is no reliability gap as TOP-001-1 R3 already requires Generator Operators to follow the directives of the appropriate Transmission Operators.

These training-related items are clearly important ones for the Commission, but the SDT does not think it is appropriate to fold modifications to these PER standards into the scope of its work unless it is specifically directed to do so. For now, modifications to PER-002-0 based on Order 693 directives are already included in [NERC's Issue Database](#) (P. 52-53) to be addressed by a future project. PER-001-0 is not addressed in the Issues Database, but the [Project 2007-03 drafting team has proposed](#) that the standard be retired.

The FERC Order does not address PER-001-0 or PER-002-0, but it does address PER-003-1. In paragraphs 67 and 81 of the FERC Order, FERC expresses concern that operational control over the transmission line breakers owned by the entities in question are not under the control of NERC certified operators. FERC goes on to say that “Reliability Standard PER-003-001 requires NERC certification of all operators that have responsibility for the real-time operation of the interconnected Bulk Electric System. When switching the tie-line in or out of service, operators must have the

appropriate credentials and training to properly perform the switching and coordinate the switching to prevent adverse impacts such as the introduction of faults on the system.”

The SDT can find no evidence that the kinds of training requirements for operating the breakers of the generator interconnection Facility cited in the FERC Order exist elsewhere for other entities that operate breakers on lines. For instance, Transmission Owners that are not also Transmission Operators are not required to undergo any sort of training. The SDT does not mean to dismiss this issue altogether, and it may be that training should be expanded to include Generator Owners, Generator Operators, Transmission Owners, end users, and possibly others, but the development of such requirements would have implications far beyond the scope and expertise of this team.

PRC-001-1—System Protection Coordination (addressed in the NERC Directive and the FERC Order)

The NERC Directive addresses PRC-001-1 R2, R2.2, and R4. The FERC Order addresses these requirements, along with Requirement R6.

About R2 and R4, NERC’s Directive simply states: “PRC-001-R2 requires notification and corrective action for relay or equipment failure. R4 coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.”

In paragraphs 64 and 78 of the FERC Order, FERC expresses concern that “there is a risk of an adverse impact on reliability if the protection relays or protection systems on the [entity’s] line are not coordinated with those on the transmission network facilities in its area.”

Generator Operators and the scope of protection equipment for generation interconnection Facilities are already appropriately accounted for in this standard in requirement R2 and sub-requirement R2.2. The language used in R2 that applies to the Generator Operator uses the general terms “relay or equipment failures” which would include not only generator relaying, but generator interconnection relaying in the Generator Operator’s scope as well. The Generator Operator is required to notify the Transmission Operator and Host Balancing Authority in R2.1 “if a protective relay or equipment failure reduces system reliability.” Requirement R2.2 requires the affected Transmission Operator to notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. Thus, applying R2.2 to a Generator Operator would be redundant to R2.1. If a Generator Operator had a relay or equipment failure on its Facility, including its interconnection Facility it would be required to report that to its Transmission Operator under R2.1, and the Transmission Operator is then required to notify its Reliability Coordinator and other affected Transmission Operators and Balancing Authorities under R2.2.

PRC-001-1 R4 states, “Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission

Operators, and Balancing Authorities.” A sole-use generator interconnection Facility does not constitute a major transmission line or major interconnection with neighboring Generator Operators, Transmission Operators, and Balancing Authorities. Thus, R4 should not be revised to include Generator Operators. In general, any coordination that might be required is covered by the fact that the Transmission Operator that is connected to a major transmission lines or interconnection has the requirement to coordinate protection on the interconnection, and there is no reliability gap.

PRC-001-1 R6 states, “Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.” It is clearly the responsibility of the Transmission Operator and/or Balancing Authority to monitor the Special Protection System, as they are the entity with a wide-area view, not the responsibility of a Generator Owner/Generator Operator with a local-area view who happens to have generator interconnection Facilities in the area. The requirement focuses on the Transmission Operator and Balancing Authority monitoring the status of each Special Protection System *in their area*; there is no “area” for the Generator Operator to monitor. For these reasons, there is no need to make this requirement applicable to Generator Operators.

TOP-001-1—Reliability Responsibilities and Authority (addressed in the Ad Hoc Report, NERC Directive, and FERC Order)

Both the NERC Directive and the FERC Order discuss making TOP-001-1 R1 applicable to Generator Operators. About TOP-001-1, the NERC Directive simply states: “TOP-001-1 R1 ensures personnel assigned to operate BES transmission facilities have clear and unambiguous authority to operate those facilities.” With respect to R1, paragraphs 68 and 83 of FERC’s Order focus on ensuring that “system operators have the authority to take actions to maintain Bulk-Power System facilities within operating limits.”

TOP-001-1 R1 states, “Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies.” TOP-001-1 R3 appropriately requires the GOP to comply with reliability directives issued by the Transmission Operator “unless such actions would violate safety, equipment, regulatory or statutory requirements.” These requirements effectively give the Transmission Operator the necessary decision-making authority over operation of all generator Facilities up to the point of interconnection. Thus, no changes to TOP-001-1 are necessary.

Additionally, the Ad Hoc Group proposed adding two new requirements to TOP-001-1. The first was proposed as R9 and read: “The Generator Operator shall coordinate the operation of its Generator Interconnection Facility with the Transmission Operator to whom it interconnects in order to preserve Interconnection reliability...” The SDT does not agree that TOP-001-1 needs to apply to Generator Operators in any form. TOP-002-2 R3 (proposed to be covered in the future by TOP-003-2, as outlined

in Project 2007-03's Implementation Plan) already requires the Generator Operator to coordinate its current-day, next-day, and seasonal operations with its Host Balancing Authority and Transmission Service Provider. These entities are, in turn, required to coordinate with their respective Transmission Operator. Additionally, TOP-002-2 R4 (proposed to be covered in the future by TOP-003-2, as outlined in Project 2007-03's Implementation Plan) requires each Balancing Authority and Transmission Operator to coordinate with neighboring Balancing Authorities and Transmission Operators and with its Reliability Coordinator. With these requirements, Generator Operators are already required to provide necessary operations information to Transmission Operators. To require the same thing in TOP-001-1 would be redundant.

The second new requirement proposed by the Ad Hoc Group for TOP-001-1 was R10, which was to read: "The Transmission Operator shall have decision-making authority over operation of the Generator Interconnection Operational Interface at all times in order to preserve Interconnection reliability." As cited above, TOP-002-2 R3 (proposed to be covered in the future by TOP-003-2, as outlined in Project 2007-03's Implementation Plan) already requires the Generator Operator to coordinate with its interconnecting Transmission Operator. Further, TOP-001-1 R3 (proposed to be covered in the future in the proposed IRO-001-2 R2 and R3) already requires the Generator Operator to comply with reliability directives issued by the Transmission Operator. These requirements effectively give the Transmission Operator decision-making authority over operation of all generator Facilities up to the point of interconnection. To require the same thing in TOP-001-1 would be redundant.

TOP-004-2—Transmission Operations (addressed in the NERC Directive and the FERC Order)

Both the NERC Directive and the FERC Order address the application of TOP-004-2 R6 to Generator Operators. In its Directive, NERC simply states: "TOP-004-2 R6 ensures formal policies and procedures are formulated to provide for coordination of activities that may impact reliability." In paragraphs 67 and 82 of the FERC Order, FERC talks about entities ensuring the development of coordination protection to coordinate switching a generator interconnection Facility in and out of service, since different entities have control over different ends of the line. FERC concludes that for the entities in question, TOP-004-2 R6 must apply.

Requirement R6 and its sub-requirements state: "R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including: R6.1. Monitoring and controlling voltage levels and real and reactive power flows, R6.2. Switching transmission elements, R6.3. Planned outages of transmission elements, R6.4. Responding to IROL and SOL violations."

TOP-001-1 R3 appropriately requires the Generator Operator to comply with reliability directives issued by the Transmission Operator. These requirements give the Transmission Operator the necessary decision-making authority over operation of all generator Facilities, including interconnection Facilities, up to the point of interconnection. Further, TOP-002-2 R3 requires the Generator Owner to coordinate its current-day, next-day, and seasonal operations with its Host Balancing Authority and Transmission Service Provider. These entities are, in turn, required to coordinate with their respective Transmission Operators (also in TOP-002-2 R3). Each Balancing Authority and Transmission Operator is also then required to coordinate with neighboring Balancing Authorities and Transmission Operators and with its Reliability Coordinator (in TOP-002-2 R4). The coordination with which NERC and FERC are concerned is already addressed by these other requirements.

The Ad Hoc Group had proposed a new requirement, R7, for TOP-004-2 that would read: “The Generator Operator shall operate its Generator Interconnection Facility within its applicable ratings.” The SDT does not agree that a reliability gap exists, because an operator has a fiduciary obligation to protect a Facility for which it is operationally responsible. FAC-008-1—Facility Ratings Methodology and FAC-009-1—Establish and Communicate Facility Ratings already infer that the reason for establishing a ratings methodology and communicating Facility Ratings to the Reliability Coordinator, Planning Authority, Transmission Planner, and Transmission Operator is “...for use in reliable planning and operation of the Bulk Electric System.” Further, TOP-004-2 is proposed to be retired under the work of the Project 2007-03 drafting team. Its requirements will either be deleted or assigned elsewhere.

TOP-006-1—Monitoring System Conditions (addressed in the NERC Directive; the SDT believes NERC intended to refer to TOP-006-2)

Only the NERC Directive addresses TOP-006. It states: “TOP-006-1 R3 ensures technical information is provided to the responsible personnel; R6 ensures correct and accurate data to TOP and BA.” But PRC-001-1 R1 (“Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area”) addresses the necessary Generator Operator requirements with respect to TOP-006-2 R3. The SDT believes that knowledge of the purpose and limitations of protection system schemes applied in its area (required in PRC-001-1 R1) constitutes knowledge of “the appropriate technical information concerning protective relays” (required in TOP-006-1 R3).

TOP-006-2 R6 states “Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.” FAC-001-1 R2.1.6 already requires the Transmission Owner’s facility connection requirements to address “metering and telecommunications.” Any generator Facility that interconnected with a Transmission Owner would

have had to meet their Facility connection and system performance requirements for metering and telecommunications. Thus, there is no reliability gap.

TOP-008-1—Response to Transmission Limit Violations (addressed in the Ad Hoc Report)

Only the Ad Hoc Report addressed TOP-008-1, and it proposed a new requirement, R5, to TOP-008-1—Response to Transmission Limit Violations that would read “The Generator Operator shall disconnect the Generator Interconnection Facility when safety is jeopardized or the overload or abnormal voltage or reactive condition persists and generating equipment or the Generator Interconnection Facility is endangered. In doing so, the Generator Operator shall notify its Transmission Operator and Balancing Authority impacted by the disconnection prior to switching, if time permits, otherwise, immediately thereafter.” The SDT sees no reliability benefit to adding this requirement. TOP-001-1 R7 (“Each Transmission Operator and Generator Operator shall not remove Bulk Electric System facilities from service if removing those facilities would burden neighboring systems unless...”) and its parts give the Generator Operator authority over its Facilities, which would include the generator interconnection Facility. If there is an outage, R7.1 requires the Generator Operator to notify and coordinate with its Transmission Operator, which is required to notify the Reliability Coordinator and other affected Transmission Operators. And as with TOP-004-2, the Project 2007-03 drafting team has proposed to delete all of TOP-008-1’s requirements and retiring the standard.

Conclusion

The Project 2010-07 SDT is confident that the changes it has proposed address the reliability gap that exists with respect to the responsibilities of Generator Owners and Generator Operations that own sole-use interconnection Facilities. The changes to FAC-001, FAC-003, and PRC-004 have been supported by stakeholders during comment periods, and there has been no strong support of technical justification provided for bringing other standards into the scope of this project.

Technical Justification Resource Document

Project 2010-07 Generator Requirements at the Transmission Interface

Background

As part of its work on Project 2010-07—Generator Requirements at the Transmission Interface, the standard drafting team (SDT) reviewed 34 reliability standards and 102 requirements to determine what changes are necessary to close a reliability gap with respect to what is commonly known as the generator interconnection Facility. ~~The majority~~ Many of these standards and requirements had been addressed in the [Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface](#) (Ad Hoc Report), and additional standards ~~have been~~ were reviewed, ~~and will~~ continued to be reviewed, as a result of informal discussions with NERC and FERC staffs.

The basis for standard modifications recommended by the Ad Hoc Group for Generator Requirements at the Transmission Interface (Ad Hoc Group) was a few fundamental clarifications to the definitions of Generator Owner, Generator Operator, and Transmission, along with the creation of new definitions: one for Generator Interconnection Facility and one for Generator Interconnection Operational Interface. The Ad Hoc Group proposed the addition of these two new definitions to 26 standards encompassing 29 requirements (new and old), along with some modifications to FAC-003 to make it applicable to Generator Owners under certain circumstances.

Since the publication of the Ad Hoc Report, various entities have challenged these modifications and the recommended creation of the new definitions. The SDT has developed a more focused approach than that of the Ad Hoc Group: to propose recommendations whereby ~~radial~~ sole-use interconnection Facilities (at or above 100 kV) that are owned and operated by generating entities will be included in a small set of standards and requirements previously only applicable to Transmission Owners. The SDT agrees completely with the Ad Hoc Group's conclusion that Generator Owners and Operators of these ~~radial~~ sole-use generator tie-line Facilities (at voltages equal to or greater than 100 kV) should not be registered as Transmission Owners and Transmission Operators in order to maintain reliability on the Bulk Electric System (BES).

The SDT's justification for this strategy is rooted in the very title of its standards project: "Generator Requirements at the Transmission Interface." That is, the goal and scope of the project has always been to determine the responsibilities of those Generator Owners and Generator Operators that own or operate an interconnection Facility (in some cases labeled a "transmission Facility") between the generator and the interface with the portion of the BES where Transmission Owners and Transmission Operators take over ownership and operating responsibility. These kinds of Generator Owners and Generator Operators do not own or operate Facilities that are part of the interconnected system; rather, they own and operate ~~radial~~ sole-use Facilities that are connected to the boundary of the

interconnected system and as such have a limited role in providing reliability compared to those that operate in a networked fashion beyond the point of interconnection.

While some argue that these interconnecting portions of a Generator Owner's Facilities could be defined as Transmission and thus require the Generator Owner and Generator Operator for the Facility to be classified and registered as a Transmission Owner and Transmission Operator, the SDT does not believe this is necessary to provide an appropriate level of reliability for the BES. Just as important, such classification and registration could actually cause a reduction in reliability. Generator Owners and Generator Operators do not need, and in some cases may be prohibited from having, a wide-area view and responsibility for the integrated transmission system. Requiring Generator Owners and Generator Operators to have such responsibilities would require significant training, ~~would~~ require substantially more data and modeling responsibilities, and ~~would~~ detract from the entities' primary functions: to own and operate their generation equipment – including any Facilities owned and operated at voltages of 100 kV or greater that connect to the interconnected system – in a reliable manner.

Additionally, the SDT believes that the industry is much more aware today of the need to include *all* elements (owned and operated at 100 kV or higher) of a generator Facility in the procedures and compliance program of the registered entity that owns or has operational responsibility of those elements. Industry awareness was raised substantially at the time the [October 17, 2010 Facility Ratings Recommendation to Industry](#) was issued (which included Generator Owners and specifically addressed interconnection Facilities in [the Q&A document](#)); ~~with the statement that the alert applied to generator interconnection tie lines that are radial only and do not serve load "if the generator is considered part of the bulk electric system"~~. While this applies to a specific NERC Recommendation, the SDT considers this compelling evidence that the paradigm for thinking about generator interconnection Facilities is shifting.

All of this has led the SDT to its current conclusions to modify FAC-001, FAC-003, and PRC-004; ~~and later, PRC-005~~. The SDT does not believe any further modifications to standards are necessary to maintain an appropriate level of reliability based on the revised assumption that while generator Facilities (at 100 kV and above) will be considered by some to be transmission, Generator Owners and Generator Operators should not be registered as Transmission Owners and Transmission Operators simply as a result of the ownership and operation of such Facilities. Because the majority of commenters support the SDT's current recommendation to not adopt new terms, the SDT has elected to focus on its standard changes and ~~to postpone discussions on not, at this time, propose~~ revisions to existing, or creation of new, ~~definitions until the standards have been successfully balloted.~~ [glossary terms](#).

Below, the SDT discusses the changes it has proposed for FAC-001, FAC-003, and PRC-004 and [the changes it plans to propose for PRC-005 and](#) then provides justification for not modifying any [of the](#)

additional standards ~~that had been proposed for substantive modification in the Ad Hoc Report and requirements it has reviewed.~~

Review of SDT's Proposed Standard Changes

FAC-001-1—Facility Connection Requirements

While some stakeholders have questioned the modifications in the proposed FAC-001-1, the SDT remains convinced that there is the potential for a reliability gap if this standard is not modified so that it applies to a Generator Owner *if and when it executes an Agreement* to evaluate the reliability impact of interconnecting a third party Facility to its existing generation interconnection Facility. The intent of this modified language is to start the compliance clock when the Generator Owner executes an Agreement to perform the reliability assessment required in FAC-002-1. This step is expected to occur if a Generator Owner is compelled by a regulatory body to allow such interconnection. Assuming that a regulatory body would require a Generator Owner to evaluate such an interconnection request, the SDT expects the Generator Owner and the third party to execute some form of an Agreement. The SDT intentionally excluded a specific reference to the form of Agreement (such as a feasibility study) in deference to stakeholder suggestions to avoid comingling of commercial and reliability issues in reliability standards.

The SDT acknowledges that the scenario described in the proposed FAC-001-1 may be rare, but in the past (for instance, FERC ¶ 61,109 at P. 19 and 134 FERC ¶ 61,064 at P. 13), Generator Owners have received or have been directed to execute interconnection requests for their Facilities, and the SDT thinks it is important to clarify the responsibilities related to such a request in NERC's Reliability Standards. And, while the SDT acknowledges that such regulatory action might also result in the Generator Owner being registered for other functions, such as Transmission Owner, Transmission Planner, and/or Transmission Service Provider, it decided the proposed revision provides appropriate reliability coverage until any additional registration is required and does not impact any Generator Owner that never executes an Agreement as described in the standard.

FAC-003-X and FAC-003-3—Vegetation Management

The SDT and most stakeholders agree with the Ad Hoc Group recommendation that FAC-003 be applicable to Generator Owners that own a generation interconnection Facility if that Facility contains overhead conductors. The Ad Hoc Group originally excluded such a Facility from this requirement if its length is less than two spans (generally one half mile from the generator property line). ~~After reviewing formal comments, the The SDT agreed to revise the agrees with that intended exclusion so that it applies to a Facility if its length is "one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard" to approximate line of sign from a fixed point. Other than revising this exclusion, in principle; as it discusses in the document titled "Technical Justification Project 2010-07 Generator Requirements at the Transmission Interface," the SDT applied the same criteria to the Generator Owner as applies to the Transmission Owner in the current FERC approved version of this standard as well as one approved by stakeholders (under Project 2007-07) in February 2011. The SDT is~~

communicating with NERC staff recognizes that in many cases, generation Facilities are (1) staffed and the Project 2007-07 SDT to ensure that changes to this standard will be coordinated before submitting to NERC's Board of Trustees, but feels compelled to continue to posting both versions until the outcome of Project 2007-07 efforts is clearer overhead portion is within line of sight or (2) the overhead Facility is over a paved surface. Stakeholders have generally supported the rationale for exempting these Facilities because incorporating them into FAC-003 would offer no reliability benefit.

Thus, the SDT has maintained this exception language but has modified it based on stakeholder input such that it excludes Facilities shorter than one mile which have a clear line of sight from the fenced area of the generating switchyard to the point of interconnection. Specifically, sections 4.3.1 of both versions of FAC-003 (which address applicable generation Facilities) now state: "Overhead transmission lines that extend greater than one mile (1.609 kilometers) beyond the fenced area of the generating switchyard or do not have a clear line of sight from the switchyard fence to the point of interconnection and are..." The SDT took into consideration all comments submitted in both formal comment periods, and believes that this exemption now adequately addresses the reliability impact for a majority of the Facilities, while balancing the efforts necessary to support the standard from all entities.

PRC-004-2.1—Analysis and Mitigation of Transmission and Generation Protection System Misoperations

After examining all standards it had previously reviewed, the SDT elected to propose a slight change to PRC-004-2.1. While the SDT rejected other opportunities to "drop" the phrase "generator interconnection Facility" into requirements because it is not typically the best way to add clarity, in the case of PRC-004-2, the SDT fears that the phrasing of R2 ("The Generator Owner shall analyze its generator Protection System Misoperations...") could lead to some confusion about whether an interconnection Facility is included. Thus, the SDT proposes adding "and generator interconnection Facility" as redlined in the draft standard. Because there is no change in applicability, and because the SDT believes that most Generator Owners already interpret the standard in this manner, we consider this to be a minor and not substantive change employed only to add clarity.

PRC-005-1a—Transmission and Generation Protection System Maintenance and Testing

In the concurrent 45-day comment and ballot period that ended in November 2011, several commenters pointed out that the wording in R1 and R2 of PRC-005-1a requires the same explicit reference to a generator interconnection Facility that was added in PRC-004-2.1 R2. The SDT agrees and is developing revisions to PRC-005-1a. These will be posted (separate from the recirculation ballot posting) soon.

Review of Other Substantive Standards Considered by the Standard Modifications from the Ad-Hoc Report Drafting Team

To ensure that no reliability gaps were left when the SDT shifted its strategy from the original strategy of the Ad Hoc Group, the SDT reviewed all standards for which the Ad Hoc Group had proposed changes, and again discussed whether making these standards applicable to Generator Owners or Generator Operators would increase reliability with respect to generator requirements at the transmission interface. ~~Below, the SDT provides its reasons for not proposing the substantive changes that were included in the Ad Hoc Report (that is, a change in applicability or new requirement, beyond simply adding the text “including its Generator Interconnection Facility” to an existing requirement). As Project 2010-07 continues, the SDT will work with FERC staff, NERC staff, and industry groups to determine if its list of proposed standards is supported industry-wide, and whether other standards need to be considered.~~ During the 45-day concurrent comment and ballot period that ended in November 2011, the SDT also received comments from NERC staff encouraging it to review additional standards that NERC staff had proposed to apply to Generator Owners and Generator Operators in NERC Compliance Process Directive #2011-CAG-001 Regarding Generator Transmission Leads (Directive). Similarly, stakeholder commenters encouraged the SDT to review standards cited in FERC’s Order Denying Compliance Registry Appeals of Cedar Creek Wind Energy and Milford Wind Corridor Phase I (135 FERC ¶ 61,241) (FERC Order).

~~The SDT reviewed all of these standards and requirements again and continues to find clear and technical reliability-based reasons that support not adding Generator Owner and Generator Operator requirements to the standards. The chart below indicates where else (the Ad Hoc Report, the NERC Directive, or the FERC Order) the standards addressed were discussed. While both the NERC Directive and FERC Orders address specific requirements within these standards, the SDT has found it useful to address each standard as a whole. Often, requirements within a standard, or even from standard to standard, work in concert to ensure that there are no reliability gaps, whereas a review of a requirement in isolation might give the impression that there is gap.~~

-----------	---	--	--

*This chart and accompanying document only address those standards in the Ad Hoc Report for which substantive changes (change in applicability or the addition of a new requirement) were proposed.

The SDT acknowledges that both NERC and FERC have stated that neither the NERC Directive nor the FERC Order is intended to prejudge the work of the SDT. The SDT also acknowledges that the discussion in the FERC Order is related to specific cases in which certain entities will actually be registered as Transmission Owners and Transmission Operators, a process that is distinct from the SDT's work, which assumes that once this project is complete, Generator Owners and Generator Operators will not be registered for any other functions based on ownership of a sole-use generator interconnection Facility. Still, because these related efforts are ongoing, the SDT thought it would be useful to directly address some of the discussion in the Directive and the Order. The rest of this document provides the SDT's technical justification for limiting the scope of its work to FAC-001, FAC-003, PRC-004, and PRC-005.

EOP-003-1—Load Shedding Plans (addressed in the Ad Hoc Report)

For EOP-003-1, the Ad Hoc Group originally proposed that Generator Operators be added to the requirement that requires Transmission Operators and Balancing Authorities to coordinate automatic load-shedding throughout their areas. The SDT determined that this addition was unnecessary because PRC-001 already includes the requirement that Transmission Operators coordinate their underfrequency load shedding programs with underfrequency isolation of generating units, which ~~infers~~implies that Generator Operators need to provide their underfrequency settings to their respective Transmission Operator. Further, Generator Operators typically do not have the technical expertise or access to the data necessary for the high-level coordination that this standard requires.

EOP-005-1—System Restoration Plans (addressed in the NERC Directive)

In its Directive, NERC staff states the following by way of rationale for applying EOP-005-1 Requirements R1, R2, R5, R6, and R7 to Generator Operators:

“If GOP has blackstart capability, then EOP-005 applies, GOP restoration plan would require coordination with TOP per the TOP Blackstart Restoration Plan. The GOP would start its blackstart resources to provide necessary real and reactive power to its generating resources per interconnecting TOP directives. In addition, if GOP has blackstart capability the interconnection TOP will have included this capability in its restoration planning for its area of responsibility. If GOP does not have blackstart capability, GOP restoration plan is dependent upon provision of real and reactive power service from interconnecting TOP, per VAR-001 and VAR-002 requiring the GOP to follow the directives of the interconnecting TOP, compliance with this standard/requirments is not required.”

Blackstart capability of a generating unit is unrelated to owning or operating transmission Facilities or a generation interconnection Facility. During a system restoration event, Generator Operators provide real and reactive power to the BES only at the direction of a Transmission Operator. The Generator Operators are not providing Transmission Operator services through their blackstart Facilities. In addition, many units with blackstart capability are not included in a TOP System Restoration Plan.

In FERC Order 693, paragraph 630, FERC approved EOP-005-1 and found the standard “adequately addresses operating personnel training and system restoration plans to ensure that transmission operators, balancing authorities and reliability coordinators are prepared to restore the Interconnection following a blackout. Accordingly, the Commission approves Reliability Standard EOP-005-1 as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to EOP-005-1 through the Reliability Standards development process that identifies time frames for training and review of restoration plan requirements.”

FERC also specifically addressed system restoration training concerns and requirements in FERC Order 693 in its review and approval of Reliability Standard EOP-005-1. In that order, FERC stated that personnel outside a control room should be trained in system restoration, but also that this should be included in a system restoration Reliability Standard, as follows:

627. With regard to comments that the Commission’s concerns are being addressed in NERC’s drafting of proposed PER-005-1 Reliability Standard on operator training, we note PER-005-1 only includes Requirements on the control room personnel and not those outside of the control room. System restoration requires the participation of not only control room personnel but also those outside of the control room. These include blackstart unit operators and field switching operators in situations where SCADA capability is unavailable. As such, the Commission believes that inclusion of periodic system restoration drills and training and review of restoration plans in a system restoration Reliability Standard is the most effective way of achieving the desired goal of ensuring that all participants are trained in system restoration and that the restoration plans are up to date to deal with system changes.

Thus, FERC clearly found that the existing standard EOP-005-1 adequately addressed operating personnel training and would ensure the restoration of the BES in the event of a blackstart, and further directed that any modifications be addressed through the Reliability Standard Development Process.

Pursuant to Order 693, NERC initiated Project 2006-03, and empowered the System Restoration and Blackstart Standard Drafting Team (SRBSDT) to modify the related standards. The SRBSDT developed Reliability Standard EOP-005-2, which includes Generator Operator system restoration requirements including training, restoration plans, drills, and testing of blackstart resources. In Order 749, FERC approved EOP-005-2, which included its approval of the implementation plan for EOP-005-2. Again,

both FERC and NERC had the opportunity to identify issues with the implementation time of EOP-005-2 and declined to do so.

5. Currently effective Reliability Standard EOP-005-1 requires transmission operators, balancing authorities, and reliability coordinators to have a restoration plan, test the plan, train operating personnel in the restoration plan, and have the ability to restore the Interconnection using the plans following a blackout. In Order No. 693, the Commission directed the ERO to develop, through the Reliability Standard development process, a modification to EOP-005-1 that identifies time frames for training and review of restoration plan requirements to simulate contingencies and prepare operators for anticipated and unforeseen events . . .

Also, in FERC Order 749, both NERC and FERC identified the modifications to EOP-005 as “improvements” to the standard, not changes to close a reliability gap:

10. NERC states that the proposed Reliability Standards “represent significant revision and improvement from the current set of enforceable standards” and address the Commission’s directives in Order No. 693 related to the EOP standards. NERC explains that, among other enhancements, “[t]he proposed revisions now clearly delineate the responsibilities of the Reliability Coordinator and Transmission Operator in the restoration process and restoration planning.” NERC describes the proposed Reliability Standards as providing “specific requirements for what must be in a restoration plan, how and when it needs to be updated and approved, what needs to be provided to operators and what training is necessary for personnel involved in restoration processes.

17. . . . By enhancing the rigor of the restoration planning process, the Reliability Standards represent an improvement from the current Standards and will improve the reliability of the Bulk-Power System. . . .

In summary, the Generator Operator blackstart requirements have been already been appropriately addressed through the Reliability Standards Development Process. EOP-005-2 will become effective in 2013 as approved by both the NERC Board of Trustees and FERC. There is no existing reliability gap related to owning a generation interconnection Facility and Standard EOP-005-1.

FAC-014-2—Establish and Communicate System Operating Limits (addressed in the NERC Directive and the FERC Order)

FAC-014-2, R2 states “The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator’s SOL Methodology.”

In its Directive, NERC states, with respect to FAC-014-2: “In the event an RC directs the establishment of an SOL, the SOL must be established in accordance with the RC’s SOL Methodology.”

In paragraphs 68 and 84 of the FERC Order, FERC states that without compliance with FAC-014, R2, the entity in questions could “avoid establishing the system operating limit for its line or be allowed to establish an operating limit for its line that is not consistent with the requirements of the reliability coordinator’s methodology.”

The SDT does not believe that FAC-014-2 R2 should be revised to include Generator Operators. The Generator Owner is required by the FERC-approved versions of FAC-008-1 R1 and FAC-009-1 and pending FAC-008-3 R1, R2, and R6 (which has been filed for approval with FERC) to document the Facility Ratings for a Generator Owner-owned generator interconnection circuit greater than 100kV. The established Facility Rating must respect the most limiting applicable equipment rating in the circuit and must consider operating limitations and ambient conditions. The thermal or ampere rating of this circuit would equal its ampere operating limit and should be conveyed by the Generator Owner to the Generator Operator if they are not the same entity. The operating voltage limits for this circuit are established by the applicable Transmission Owner or Transmission Operator, not the Generator Owner or Generator Operator.

Therefore, we believe adding the Generator Owner to FAC-014-2 R2 would be redundant. What’s more, the SDT is concerned that entities with a limited view of the system should not be setting IROLs or SOLs. We believe this should be the responsibility of entities with a wide-area view, as shown in the standard today; otherwise, we are concerned that reliability may be jeopardized. Commenters – including one from the Transmission Owner segment – have offered this same justification.

IRO-005-2—Reliability Coordination – Current Day Operations (addressed in the Ad Hoc Report)

The SDT chose not to adopt the revision to IRO-005-2 proposed by the Ad Hoc Group. This revision would have added a new requirement that would read, “The Generator Operator shall immediately inform the Transmission Operator of the status of the Special Protection System, including any degradation or potential failure to operate as expected for SPS relay or control equipment under its control.” The SDT initially ~~arrived at this decision~~ determined that IRO-005-2 did not require modification because of the ~~planned~~ October 2011 retirement of ~~IRO-005-2~~ the standard. In subsequent meetings, the SDT also reached the conclusion that there is no reliability gap as PRC-001-1 R2 already requires the Generator Operator to notify reliability entities of relay or equipment failures. The SDT believes that a Special Protection System is a form of protection system and therefore any degradation or potential failure to operate as expected would be required to be reported by the Generator Operator to reliability entities (Balancing Authorities, Transmission Operators, and Reliability Coordinators).

~~Personnel Performance, Training, and Qualifications (PER) Standards~~

The SDT also chose not to propose the revisions *PER Standards (PER-001-0 and PER-002-0 were addressed in the Ad Hoc Report; PER-002-0 was addressed in the NERC Directive; and PER-003-1 was addressed in the FERC Order)*

The Ad Hoc Group had proposed changes to PER-001-0—Operating Personnel Responsibility and Authority ~~and~~ PER-002-0—Operating Personnel Training ~~that were proposed by the Ad Hoc Group.~~ For PER-001-0, the Ad Hoc Group ~~had~~ proposed adding a new R2 that would read “Each Generator Operator shall provide operating personnel with the responsibility and authority to implement real-time actions to ensure the stable and reliable operation of the Generation Facility and Generation Interconnection Facility, and the responsibility and authority to follow the directives of reliability authorities including the Transmission Operator and Balancing Authority.” To PER-002-0, the Ad Hoc Group proposed adding the Generator Operator to R1 (“Each Transmission Operator, Generator Operator, and Balancing Authority shall be staffed with adequately trained operating personnel”) and adding a new R3 that would read: “Each Generator Operator shall implement an initial and continuing training program for all operating personnel that are responsible for operating the Generator Interconnection Facility that verifies the personnel’s ability and understanding to operate the equipment in a reliable manner.”

In its Directive, NERC does not address PER-001-0, but it states the following with respect to PER-002-0:

“The registered entity will develop an appropriate training program that contains the necessary elements for the GO/GOP operating a transmission facility to understand fully the impacts of the operation on the BPS, such as equipment involved, including protection systems, the coordination aspects with the TO/TOP to which it is connected, and the protocols for and impacts of operating facilities associated with the transmission facility. The objective of this training is to ensure that the GO/GOP is completely aware of its obligations to follow the directives of the appropriate TOP and has personnel with the skills and training to execute these obligations in the best interest of reliability.”

These proposed changes to the PER standards have little to do with responsibilities that relate specifically to a generator interconnection Facility. Issues related to the training of Generator Operators existed separately from the work of Project 2010-07, and the SDT agrees that its scope limits its efforts to standards that are directly related to generator requirements at the transmission interface. The SDT also cites past FERC Orders as proof that this issue is not within the scope of Project 2010-07. In Order 693, FERC directed NERC to "expand the applicability of the personnel training Reliability Standard, PER-002-0, to include (i) generator operators centrally-located at a generation control center with a direct impact on the reliable operation of the Bulk-Power System..." In Order 742, FERC reaffirmed this, stating that it is "not modifying the Order No. 693 directive regarding training for certain generator operator dispatch personnel, nor are we expanding a generator operator’s responsibilities—.”

Centrally-located generator operators working at a generation control center typically dispatch the output from multiple generating units. As such, they can be called upon to comply with orders from their Balancing Authority that may have a significant impact on the reliable operation of the BES. Their training would be covered by proposed ~~changechanges~~ to PER-002-0 and Order 742. Generator Operators who deal with interconnection ~~facilitiesFacilities~~ at individual generating plants, on the other hand, typically do not receive reliability-based orders specific to the interconnection Facilities and are therefore not covered by Order 742. Further, the SDT believes there is no reliability gap as TOP-001-1 R3 already requires Generator Operators ~~are, under currently approved reliability standards, required~~ to follow the directives issued by a Balancing Authority, Reliability Coordinator or of the appropriate Transmission Operator. Operators.

These training-related items are clearly important ones for the Commission, but the SDT does not think it is appropriate to fold modifications to these PER standards into the scope of its work ~~untilunless~~ it is specifically directed to do so. For now, modifications to PER-002-0 based on Order 693 directives are already included in NERC's Issue Database (P. 52-53) to be addressed by a future project. PER-001-0 is not addressed in the Issues Database, but the Project 2007-03 drafting team has proposed that the standard be retired.

~~Transmission Operations (TOP) Standards~~

~~For TOP standards, the Ad Hoc Group proposed a number of new requirements that the SDT does not see as supportive of reliability. This set of standards was somewhat difficult to analyze, as the Project 2007-03 — Real-time Transmission Operations drafting team has made significant changes to TOP-001 through TOP-008, resulting in three proposed TOP standards where are currently eight (see the project's Implementation Plan). The Project 2010-07 reviewed both the FERC approved TOP standards and the fifth draft of the modified standards in Project 2007-03 to determine whether it needed to propose any additional changes to cover radial generator interconnection Facilities. In addition, the Project 2010-07 SDT contacted the Project 2010-07 to get its opinion as to whether there might be any reliability gaps related to generator interconnection facilities. No such changes will be proposed for the reasons outlined below.~~

~~The Ad Hoc Group proposed adding two new requirements to~~ The FERC Order does not address PER-001-0 or PER-002-0, but it does address PER-003-1. In paragraphs 67 and 81 of the FERC Order, FERC expresses concern that operational control over the transmission line breakers owned by the entities in question are not under the control of NERC certified operators. FERC goes on to say that "Reliability Standard PER-003-001 requires NERC certification of all operators that have responsibility for the real-time operation of the interconnected Bulk Electric System. When switching the tie-line in or out of service, operators must have the appropriate credentials and training to properly perform the switching and coordinate the switching to prevent adverse impacts such as the introduction of faults on the system."

The SDT can find no evidence that the kinds of training requirements for operating the breakers of the generator interconnection Facility cited in the FERC Order exist elsewhere for other entities that operate breakers on lines. For instance, Transmission Owners that are not also Transmission Operators are not required to undergo any sort of training. The SDT does not mean to dismiss this issue altogether, and it may be that training should be expanded to include Generator Owners, Generator Operators, Transmission Owners, end users, and possibly others, but the development of such requirements would have implications far beyond the scope and expertise of this team.

PRC-001-1—System Protection Coordination (addressed in the NERC Directive and the FERC Order)

The NERC Directive addresses PRC-001-1 R2, R2.2, and R4. The FERC Order addresses these requirements, along with Requirement R6.

About R2 and R4, NERC’s Directive simply states: “PRC-001-R2 requires notification and corrective action for relay or equipment failure. R4 coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.”

In paragraphs 64 and 78 of the FERC Order, FERC expresses concern that “there is a risk of an adverse impact on reliability if the protection relays or protection systems on the [entity’s] line are not coordinated with those on the transmission network facilities in its area.”
