		we lose one 1000 MW generator at 6:00 am and another 1000 MW generator at 4:00 pm, is that a reportable event? **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Total generation loss, within one minute, of ≥ 2,000 MW for entities in the Eastern or Western Interconnection** **OR** **≥ 1,000 MW for entities in the ERCOT or Quebec Interconnection."**
Response: The SDT thanks you for your comment.		
Luminant	No	Luminant appreciates the work of the SDT to modify Attachment 1 to address the concerns of the stakeholders. However, we are concerned that the threshold for reporting a Generation Loss in the ERCOT interconnection established by this revision is set at â‰¥ 1,000MW, which is not consistent with the level of single generation contingency used in ERCOT planning and operating studies. That level of contingency is currently set at the size of the largest generating unit in ERCOT, which is 1,375MW. For this reason, Luminant believes that the minimum threshold for reporting of a disturbance should be > 1,375MW for the ERCOT Interconnection.
Response: The SDT thanks you for your comment. The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Total generation loss, within one minute, of ≥ 2,000 MW for entities in the Eastern or Western Interconnection** **OR** **≥ 1,000 MW for entities in the ERCOT or Quebec Interconnection."** **The SDT discussed this issue and believes that ERCOT could change contingency level in the future, and this event is also applicable to the Quebec Interconnection.**		

Organization	Yes or No	Question 2 Comment
BC Hydro	No	BC Hydro supports the revisions to EOP-004 and would vote Affirmative with the following change. Attachment 1 has a One Hour Reporting requirement. BC Hydro proposes a One Hour Notification with the Report submitted within a specified timeframe afterward.
Response: The SDT thanks you for your comment. The SDT has removed all incidences involving one-hour reporting threshold; therefore, the SDT does not see the need to make this change.		
Bonneville Power Administration	No	BPA believes that clarifying language should be added to transmission loss event. (Page 19) [a report should not be required if the number of elements is forced because of pre-designed or planned configuration. System studies have to take such a configuration into account possible wording could be. Unintentional loss of three or more Transmission Facilities (excluding successful automatic reclosing or planned operating configuration)] **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** In addition, under the "Event" of Complete or partial loss of monitoring capability, BPA believes that "partial loss" is not sufficiently specific for BPA to write compliance operating procedures and suggest defining partial loss or removing it from the standard. Should the drafting team add clarifying language to remove "or partial loss" and address BPA's concerns on over emphasis on software tool to the operation of the system. BPA would change its negative position to affirmative. **The SDT has revised the language on this point in Attachment 1.**
Response: The SDT thanks you for your comment.		

Organization	Yes or No	Question 2 Comment
SPP Standards Review Group	No	To obtain an understanding of the drivers behind the events in Attachment 1, we would like to see where these events come from. If the events are required in standards, refer to them. If they are in the existing event reporting list, indicate so. If they are coming from the EAP, let us know. We have a concern that, as it currently exists, Attachment 1 can increase our reporting requirements considerably. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. Reportable events should be similar, but not identical to the events reported to DOE or EAP.** We also have concerns about what appears to be a lack of coordination between EAP reporting requirements and those contained in Attachment 1. For example, the EAP reporting requirement is for the complete loss of monitoring capability whereas Attachment 1 adds the requirement for reporting a partial loss of monitoring capability. It appears that some of the EAP reporting requirements are contained in Attachment 1. We have concerns that this is beyond the scope of the SAR and should not be incorporated in this standard. **The SDT has revised the language on this point in Attachment 1. It should be noted that the EAP can use reports submitted under EOP-004-2 as the initial notification of an event that could be further addressed in the EAP.** We have concern with several of the specific event descriptions as contained in Attachment 1: Damage or destruction of a Facility - We are comfortable with the proposed definition of Adverse Reliability Impact but have concerns with the existing definition of ARI. Any physical threat that could impact the operability of a Facility1 - We take exception to this event in that is goes beyond what is currently required in EOP-004-1, including DOE reporting requirements, and the EAP reporting requirements. We do not understand the need for this event type and object to the potential for excessive

Organization	Yes or No	Question 2 Comment
		reporting required by such an event type. Additionally, we are concerned about the potential for multiple reporting of a single event. This same concern applies to several other events including Damage or destruction of a Facility, Loss of firm load for â‰¥ 15 minutes, System separation, etc. When multiple entities are listed as the Entity with Reporting Responsibility, Attachment 1 appears to require each entity in the hierarchy to submit a report. There should only be one report and it should be filed by the entity owning the event. The SDT addressed this issue in its last posting but the issue still remains and should be reviewed again. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** **The SDT understands that there may be several reports of a single event; and as the SDT has stated before, that this will give the ERO a better understanding of the**

Organization	Yes or No	Question 2 Comment
		depth and breathe of system conditions based on the given event. BES Emergency resulting in automatic firm load shedding - For some reason, not stipulated in the Consideration of Comments, the action word in the Entity with Reporting Responsibility was changed from ‘experiences’ to ‘implements’. We recommend changing it back to ‘experiences’. Automatic load shedding is not implemented. It does not require human intervention. It’s automatic. Voltage deviation on a Facility - Similar to the comment on automatic load shedding above, the action word was changed from ‘experiences’ to ‘observes’. We again recommend that it be changed back to ‘experiences’. Using observes obligates a TOP, who is able to see a portion of a neighboring TOP’s area, to submit a report if that TOP observed a voltage deviation in the neighboring TOP’s area. The only reporting entity in this event should be the TOP within whose area the voltage deviation occurred. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Automatic firm load shedding ≥ 100 MW (via automatic undervoltage or underfrequency load shedding schemes, or SPS/RAS).”** **This language clearly states that an entity reports if the threshold is reached.** Complete or partial loss of monitoring capability - Clarification on partial loss of monitoring capability and inoperable are needed. Also, the way the Threshold is written, it implies that a State Estimator and Contingency Analysis are required. To tone this down, insert the qualifier ‘such as’ in front of State Estimator. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event now only applies to “Complete loss of monitoring capabilities” for a RC, BA, or TOP when there is a complete loss of monitoring**

Organization	Yes or No	Question 2 Comment
		capabilities for 30 continuous minutes where their State Estimator or Contingency Analysis is inoperable. This will only apply to an RC, BA, or TOP who have this capability to start with.
Response: The SDT thanks you for your comment.		
Florida Municipal Power Agency	No	The bullet on "any physical threat" is un-measurable. What constitutes a "threat"? FMPA likes the language used in the comment form discussing this item concerning the judgment of the Responsible Entity, but, the way it is worded in Attachment 1 will mean the judgment of the Compliance Enforcement Authority, not the Responsible Entity. Presumably, the Responsible Entity will need to develop methods to identify physical threats in accordance with R1; hence, FMPA suggests rewording to: "Any physical threat recognized by the Responsible Entity through processes established in R1 bullet 1.1". We understand this introduces circular logic, but, it also introduces the "judgment of the Responsible Entity" into the bullet. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility." This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or**

Organization	Yes or No	Question 2 Comment
		activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event, unless it degrades the normal operation of a Facility. On the row of the table on voltage deviation, replace the word "observes" with "experiences". It is possible for one TOP to "observe" a voltage deviation on another TOP's system. It should be the responsibility of the TOP experiencing the voltage deviation on its system to report, not the one who "observes". On the row on islanding, it does not make sense to report islanding for a system with load less than the loss of load metrics and we suggest using the same 300 MW threshold for a reporting threshold. On the row on generation loss, some clarification on what type of generation loss (especially in the time domain) would help it be more measurable, e.g., concurrent forced outages. One the row on transmission loss, the same clarity is important, e.g., three or more concurrent forced outages. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Automatic firm load shedding ≥ 100 MW (via automatic undervoltage or underfrequency load shedding schemes, or SPS/RAS)."** **This language clearly states that an entity reports if the threshold is reached.** On the row on loss of monitoring, while FMPA likes the threshold for "partial loss of monitoring capability" for those systems that have State Estimators, small BAs and TOPs will not need or have State Estimators and the reporting threshold becomes ambiguous. We suggest adding something like loss of monitoring for 25% of monitored points for those BAs and TOPs that do not have State Estimators.

Organization	Yes or No	Question 2 Comment
		The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event now only applies to "Complete loss of monitoring capabilities" for a RC, BA, or TOP when there is a complete loss of monitoring capabilities for 30 continuous minutes where their State Estimator or Contingency Analysis is inoperable. This will only apply to an RC, BA, or TOP who have this capability to start with.
Response: The SDT thanks you for your comment.		
LG&E and KU Services	No	The SDT should consider more clearly defining the Threshold for Reporting for the Event: "Any physical threat that could impact the operability of a Facility" to only address those events that have an Adverse Reliability Impact. Some proposed language might be: "Threat to a Facility excluding weather related threats that could result in an Adverse Reliability Impact."For those events specifically defined in the ERO Events Analysis Process, the SDT should consider revising the language to be more consistent with the language included in the ERO Events Analysis Process. Here is some recommended language: 1. EVENT: Transmission loss THRESHOLD FOR REPORTING: "Unintentional loss, contrary to design, of three or more BES Transmission Facilities (excluding successful automatic reclosing) caused by a common disturbance. **The SDT has taken your comment into consideration and this threshold for reporting now states:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** 2. EVENT: "Complete or partial loss of monitoring capability" - could be revised to read "Complete loss of SCADA control or monitoring functionality" THRESHOLD FOR REPORTING: "Affecting a BES control center for â‰¥ 30 continuous minutes such that analysis tools (e.g. State Estimator, Contingency Analysis) are rendered inoperable". **The SDT reviewed, discussed and updated Attachment 1 based on comments**

Organization	Yes or No	Question 2 Comment
		received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event now only applies to: **"Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable." This will only apply to an RC, BA, or TOP who have this capability to start with.**
Response: The SDT thanks you for your comment.		
MRO NSRF	No	R1.2 states: A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement, governmental or provincial agencies. This implies not only does NERC need to be notified within the specified time period but that: "other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement, governmental or provincial agencies." are also required to be notified within in the time periods specified. We suggest a forth column be added to the table to clearly identify who must be notified within the specified time period or that R1.2 be revised to clearly state that only NERC must be notified to comply with the standard. With the use of "i.e." the SDT is mandating that each other entity must be contacted. The NSRF believes that the SDT meant that "e.g." should be used to provide examples. The SDT may wish to add another column to Attachment 1 to provide clarity. **The SDT has made the required change concerning replacing "i.e." with "e.g."** Also with regards to Attachment 1, the following comments are provided: 1. Instead of referring to CIP-008 (in the 1 hour reporting section), quote the words from CIP-008, this will require coordination of future revisions but will assure clarity in reporting requirements. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we**

Organization	Yes or No	Question 2 Comment
		have remanded the one-hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement. 2. Under “Damage or destruction of a Facility” a. The wording “affects an IROL (per FAC-014),” is too vague. Many facilities could affect an IROL, not as many if lost would cause an IROL. b. Adverse Reliability Impact is defined as:”The impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.”There are an infinite number of routine events that result in the loss of generation plants due to inadvertent actions that somehow also damaged equipment. Any maintenance activity that damaged a piece of equipment that causes a unit to trip or results in a unit being taken off line in a controlled manner would now be reportable. This seems to be an excessive reporting requirement. Recommend that Adverse Reliability Impact be deleted and be replaced with actual EEA 2 or EEA 3 level events. c. The phrase “Results from actual or suspected intentional human action.” This line item used the term “suspected” which relates to “sabotage”. Recommend the following: Results from actual or malicious human action intended to damage the BES. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency.** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any**

Organization	Yes or No	Question 2 Comment
		abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System). **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** 3. "Any physical threat that could impact the operability of a Facility1"The example provided by the drafting team of a train derailment exemplifies why this requirement should be deleted. A train derailment of a load of banana's more than likely would not threaten a nearby BES Facility. However a train carrying propane that derails carrying propane could even if it were 10 miles away. Whose calculation will be used to determine if an event could have impacted the asset? As worded there is too much ambiguity left to the auditor. We suggest the drafting team clarify by saying "Any event that requires the a BES site be evacuated for safety reasons" Furthermore if weather events are excluded, we are hard pressed to understand why this information is important enough to report to NERC. So barring an explanation of the purpose of this requirement, including why weather events would be excluded, we suggest the requirement be deleted. Please note that if you align this with "Physical attack" with #1 of the OE-417. This clearly states what the SDT is looking for. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry**

Organization	Yes or No	Question 2 Comment
		comments to state: **“Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility.”** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility’s normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** 4. The phrase “or partial loss of monitoring capability” is too vague. Further definitions of “inoperable” are required to assure consistent application of this requirement. Recommend that “Complete loss of SCADA affecting a BES control center for â‰¥ 30 continuous minutes such that analysis tools of State Estimator and/or Contingency Analysis are rendered inoperable. Or, Complete loss of the ability to perform a State Estimator or Contingency Analysis function, the threshold of 30 mins is too short. A 60 min threshold will align with EOP-008-1, R1.8. Since this is the time to implement the contingency back up control center plan. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event now only applies to:** **“Complete loss of monitoring capability affecting a BES control center for 30**

Organization	Yes or No	Question 2 Comment
		continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable." This will only apply to an RC, BA, or TOP who have this capability to start with. 5. Event: Voltage deviation on a Facility. ATC believes that the term "observes" for Entity with Reporting Responsibility be changed back to "experiences" as originally written. The burden should rest with the initiating entity in consistency with other Reporting Responsibilities. Also, for Threshold for Reporting, ATC believes the language should be expanded to - plus or minus 10% "of target voltage" for greater than or equal to 15 continuous minutes. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Observed voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes."** **This language clearly states that if the threshold is met, the entity needs to submit a report within 24 hours.** 6. Event: Transmission loss. ATC recommends that Threshold for Reporting be changed to read "Unintentional loss of four, or more Transmission Facilities, excluding successful automatic reclosing, within 30 seconds of the first loss experienced and for 30 continuous minutes. Technical justification or Discussion for this recommended change: In the instance of a transformer-line-transformer, scenario commonly found close-in to Generating stations, consisting of 3 defined "facilities", 1 lightning strike can cause automatic unintentional loss by design. Increase the number of facilities to 4. In a normal shoulder season day, an entity may experience the unintentional loss of a 138kv line from storm activity, at point A in the morning, a loss of a 115kv line from a different storm 300 miles from point A in the afternoon, and a loss of 161kv line in the evening 500 miles from point A due to a

Organization	Yes or No	Question 2 Comment
		failed component, if it is an entity of significant size. Propose some type of time constraint. Add time constraint as proposed, 30 seconds, other than automatic reclosing. In the event of dense lightning occurrence, the loss of multiple transmission facilities may occur over several minutes to several hours with no significant detrimental effect to the BES, as load will most certainly be affected (lost due to breaker activity on the much more exposed Distribution system) as well. Any additional loss after 30 seconds must take into account supplemental devices with intentional relay time delays, such as shunt capacitors, reactors, or load tap changers on transformers activating as designed, arresting system decay. In addition, Generator response after this time has significant impact. Please clarify or completely delete why this is included within this version when no basis has been give and it is not contained within the current enforceable version. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2.** **The SDT has taken your comment into consideration and this threshold for reporting now states:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** 7. Modify the threshold of "BES emergency requiring a public appeal..." to include, "Public appear for a load reduction event resulting for a RC or BA implementing its emergency operators plans documented in EOP-001." The reason is that normal public appeals for conservation should be clearly excluded. **The SDT disagrees since it is clearly stated that a report is required for "Public appeal for load reduction event." The SDT has not discussed a reporting mechanism for "conservation."** 8. Add a time threshold to complete loss of off-site power to a nuclear plant. Nuclear plants are to have backup diesel generation that last for a minimum amount of time. A threshold recognizing this 4 hour or longer window needs to be added

Organization	Yes or No	Question 2 Comment
		such as complete loss of off-site power to a nuclear plant for more than 4 hours. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2.** **The SDT has taken your comment into consideration and this threshold for reporting now states:** **"Complete loss of off-site power affecting a nuclear generating station per the Nuclear Plant Interface Requirement." As stated in this event Threshold, the TOP's NIPR may have additional guidance concerning the complete loss of offsite power affecting a nuclear plant.** 9. Delete "Transmission loss". The loss of a specific number of elements has no direct bearing on the risk of a system cascade. Faults and storms can easily result in "unintentional" the loss of multiple elements. This is a flawed concept and needs to be deleted **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2.** **The SDT has taken your comment into consideration and this threshold for reporting now states:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."**
Response: The SDT thanks you for your comment.		
PPL Corporation NERC Registered Affiliates	No	1.) PPL Generation thanks the SDT for the changes made in this latest proposal. We feel our previous comments were addressed. PPL Generation offers the following additional comments. Regarding the event 'Transmission Loss': For your consideration, please consider adding a footnote to the event 'Transmission Loss' such that weather events do not need to be reported. Also please consider including operation contrary to design in the language and not just in the example. E.g. consistent with the NERC Event Analysis table, the threshold would be, 'Unintentional loss, contrary to design, of three or more

Organization	Yes or No	Question 2 Comment
		BES Transmission Facilities.' **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2.** **The SDT has taken your comment into consideration and this threshold for reporting now states:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)." The SDT has removed all footnotes within Attachment 1.** 2.) PPL Generation proposes the following changes in Attachment 1 to the first entry in the "Threshold for Reporting" column to make it clear that independent GO/GOPs are required to act only within their sphere of operation and based on the information that is available to the GO/GOPs: Damage or destruction of a Facility that: Affects an IROL (per FAC-014, not applicable to GOs and GOPs) OR Results in the need for actions to avoid an Adverse Reliability Impact (not applicable to GOs and GOPs) OR Results from actual or suspected intentional human action (applicable to all). **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any**

Organization	Yes or No	Question 2 Comment
		abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System). This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection. The SDT also developed another to read: "Damage or destruction of its Facility that results from actual or suspected intentional human action." This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s). The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within

Organization	Yes or No	Question 2 Comment
		their Operating Plan.
Response: The SDT thanks you for your comment.		
ISO/RTO Standards Review Committee	No	The SRC response to this question does not indicate support of the proposed requirement. Please see the latter part of the SRC's response to Question 4 below for an SRC proposed alternative approach:
Response: The SDT thanks you for your comment. Please review response to Question 4 comment.		
ACES Power Marketing Standards Collaborators	No	The drafting team made a number of positive changes to Attachment 1. However, there are a few changes that have introduced new issues and there are a number of existing issues that have yet to be fully addressed. One of the existing issues is that the reporting requirements will result in duplicate reporting. Considering that one of the stated purposes is to eliminate redundancy, we do not see how the scope of the SAR can be considered to be met until all duplicate reporting is eliminated. **The SDT acknowledges that reporting of the same event will come from multiple parties. However, as the industry has learned from recent events, NERC needs to have perspectives from a variety of entities instead of just one party's viewpoint. Reliability can be improved from learning how the differing parties see or experience the event. Sometimes, the differing perspectives have provided valuable insight on the true nature of the event. Therefore, the SDT believes that having multiple reports will aid reliability as we can learn from everyone's experiences.**

Organization	Yes or No	Question 2 Comment
		More specifics on our concerns are provided in the following discussion. (1) In the “Damage or destruction of a Facility” event, the statement “Affects an IROL (per FAC-014)” in the “Threshold for Reporting” is ambiguous. What does it mean? If the loss of a Facility will have a 1 MW flow change on the Facilities to which the IROL applies, is this considered to have affected the IROL? We suggest a more direct statement that damage or destruction occurred on a Facility to which the IROL applies or to one of the Facilities that comprise an IROL contingency as identified in FAC-014-2 R5.1.3. Otherwise, there will continue to be ambiguity over what constitutes “affects”. (2) In the “Damage or destruction of a Facility” event, the threshold regarding “intentional human action” is ambiguous and suffers from the same difficulties as defining sabotage. What constitutes intentional? How do we know something was intentional without a law enforcement investigation? This is the same issue that prevented the drafting team from defining sabotage. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency.** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to**

Organization	Yes or No	Question 2 Comment
		prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System). This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection. The SDT also developed another to read: "Damage or destruction of its Facility that results from actual or suspected intentional human action." This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s). The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within

Organization	Yes or No	Question 2 Comment
		their Operating Plan. (3) In the “Damage or destruction of a Facility” and “Any physical threat that could impact the operability of a Facility” events, Distribution Provider should be removed. Per the Function Model, the Distribution Provider does not have any Facilities (line, generator, shunt compensator, transformer). The only Distribution Provider equipment that even resembles a Facility would be capacitors (i.e. shunt compensator) but they do not qualify because they are not Bulk Electric System Elements. **The SDT agrees that if a DP does not own or operate a Facility then this event would not be applicable to them. However, if a DP does experience an event such as those listed, then it is a reportable incident under this standard.** (4) The “Any physical threat that could impact the operability of a Facility” event requires duplicate reporting. For example, if a large generating plant experiences such a threat, who should report the event? What if loss of the plant could cause capacity and energy shortages as well as transmission limits? The end result is that the RC, BA, TOP, GO and GOP could all end up submitting a report for the same event. For a given operating area, only one report should be required from one registered entity for each event. **The SDT acknowledges that multiple reports could result from an event. If an entity experiences an applicable event type, then they required to report it. As previously stated, the industry can benefit from having such differing perspectives when events occur.** (5) The “Any physical threat that could impact the operability of a Facility” event should not apply to a single Facility but rather multiple Facilities which if lost would impact BES reliability. As written now, a train derailment near a single 138 kV transmission line or small generator with minimal reliability impact would require reporting. **The SDT removed all language under “Entity with Reporting Responsibility,” with**

Organization	Yes or No	Question 2 Comment
		the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** (6) The "BES Emergency resulting in automatic firm load shedding" should not apply to the DP. In the existing EOP-004 standard, Distribution Provider is not included and the load shed information still gets reported. **The SDT believes that the DP should be required to report "automatic firm load shedding…" to the ERO (and whoever else the entity wishes to inform per Requirement R1).** (7) The "Voltage deviation on a Facility" event needs to be clarified that the TOP only reports voltage deviations in its Transmission Operator Area. Because TOPs may view

Organization	Yes or No	Question 2 Comment
		into other Transmission Operator Areas, it could technically be required to report another TOP's voltage deviation because one of its System Operators observed the neighboring TOP's voltage deviation. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Observed voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes ."** **This language clearly states that if the threshold is met, the entity needs to submit a report within 24 hours.** **The SDT understands that there may be several reports of a single event; and as the SDT has stated before, that this will give the ERO a better understanding of the depth and breathe of system conditions based on the given event.** (8) For the "Loss of firm load greater than 15 minutes" event, the potential for duplicate reporting needs to be eliminated. Every time a DP experiences this event, the DP, TOP and BA all appear to be required to report since the DP is within both the Balancing Authority Area and Transmission Operator Area. Only one report is necessary and should be sent. Given that the existing EOP-004 standard does not include the DP, we suggest eliminating the DP to eliminate one level of duplicate reporting. **The SDT understands that there may be several reports of a single event; and as the SDT has stated before, that this will give the ERO a better understanding of the depth and breathe of system conditions based on the given event.** (9) For the "System separation (islanding)" event, please remove DP. As long as any island remains viable, the Distribution Provider will not even be aware that an island occurred. It is not responsible for monitoring frequency or having a wide area view.

Organization	Yes or No	Question 2 Comment
		The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. **This event is now only applicable to RC, BA, and TOP.** (10) For the "System separation (islanding)" event, please remove BA. Because islanding and system separation, involve Transmission Facilities automatically being removed from service, this is largely a Transmission Operator issue. This position is further supported by the approval of system restoration standard (EOP-005-2) that gives the responsibility to restore the system to the TOP. (11) For the "System separation (islanding)" event, please eliminate duplicate reporting by clarifying that the RC should submit the report when more than one TOP is involved. If only one TOP is involved, then the single TOP can submit the report or the RC could agree to do it on their behalf. Only one report is necessary. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified.** **This event is now only applicable to RC, BA, and TOP. The SDT understands that there may be several reports of a single event; and as the SDT has stated before, that this will give the ERO a better understanding of the depth and breathe of system conditions based on the given event.** (12) For the "Generation loss" event, duplicate reporting should be eliminated. It is not necessary for both the BA and GOP to submit two separate reports with nearly identical information. Only one entity should be responsible for reporting. **The SDT understands that there may be several reports of a single event; and as the SDT has stated before, that this will give the ERO a better understanding of the depth and breathe of system conditions based on the given event.** (13) For the "Complete loss of off-site power to a nuclear generating plant", the

Organization	Yes or No	Question 2 Comment
		associated GO or GOP should be required to report rather than the TO or TOP. Maintaining power to cooling systems is ultimately the responsibility of the nuclear plant operator. At the very least, TO should be removed because it is not an operating entity and loss of off-site power is an operational issue. If the TOP remains in the reporting responsibility, it should be clarified that it is only a TOP with an agreement pursuant to NUC-001. All of this is further complicated because NUC-001 was written for a non-specific transmission entity because there was no one functional entity from which the nuclear plant operator gets it off-site power. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2.** **The SDT has taken your comment into consideration and this threshold for reporting now states:** **"Complete loss of off-site power affecting a nuclear generating station per the Nuclear Plant Interface Requirement." As stated in this event Threshold, the TOP's NIPR may have additional guidance concerning the complete loss of offsite power affecting a nuclear plant.** (14) For the "Complete or partial loss of monitoring capability", partial loss needs to be further clarified. Is loss of a single RTU a partial loss of monitoring capability? For a large RC is loss of ICCP to a single small TOP, considered a partial loss? We suggest as long as the entity has the ability to monitor their system through other means that the event should not be reported. For the loss of a single RTU, if the entity has a solving state estimator that provides estimates for the area impacted, the partial threshold loss would not be considered. If the entity has another entity (i.e. perhaps the RC is still receiving data for its TOP area, the RC can monitor for the TOP) that can monitor their system as a backup, the partial loss has not been met. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event now only applies to:** **"Complete loss of monitoring capability affecting a BES control center for 30**

Organization	Yes or No	Question 2 Comment
		continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable." This will only apply to an RC, BA, or TOP who have this capability to start with.
Response: The SDT thanks you for your comment.		
Southern Company Services	No	It appears that the SDT has incorporated the reporting requirements for CIP-008 "reportable Cyber Security Incidents"; however, the "recognition" requirements remain in CIP-008 Reliability Standard. Southern understands the desire to consolidate reporting requirements into a single standard, but it would be clearer for Cyber Security Incidents if both the recognition and reporting requirements were in one reliability standard and not spread across multiple standards. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement.** As it relates to the event type "Loss of Firm Load for > 15 minutes", Southern suggests that the SDT clarify if weather related loss of firm load is excluded from the reporting requirement. **The SDT believes that it is important to report this event based on the threshold regardless of the cause. This will give the ERO (and whoever else the entity wishes to inform per Requirement R1) a better understanding of the depth and breathe of system conditions based on the given event.** As it relates to the event type "Loss of all voice communication capability", Southern suggest that the SDT clarify if this means both primary and backup voice communication systems or just primary voice communication systems. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry**

Organization	Yes or No	Question 2 Comment
		comments to state: **"Complete loss of voice communications capabilities affecting a BES control center for 30 continuous minutes or more." The SDT intends "complete" to mean all capabilities, including back up capabilities.** Referring to "CIP-008-3 or its successor" in Requirement R1.1 is problematic. This arrangement results in a variable requirement for EOP-004-2 R1. The requirements in a particular version of a standard should be fixed and not variable. If exceptions to applicable events change, a revision should be made to EOP-004 to reflect the modified requirement. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one hour event back to CIP-008.**
Response: The SDT thanks you for your comment.		
Hydro One	No	In the Attachment 1, language identical to event descriptions in the NERC Event Analysis Process and FERC OE-417 should be used. Creating a third set of event descriptions is not helpful to system operators. Recommend aligning the Attachment 1 wording with that contained in Attachment 2, DOE Form OE-417 and the EAP whenever possible. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. Using identical terminology will be difficult to achieve as the DOE form and EAP have differing processes for identification of the reportable incidences. The SDT has tried to set up the reportable events in the standard to be as similar as possible to the other organizations without being tied to their specific language. Attachment 2 has been modified to match the events types listed in Attachment 1.** The proposed "events" are subjective and will lead to confusion and questions as to what has to be reported. - Event: A reportable Cyber Security Incident. All reportable Cyber Security Incidents may not require "One Hour Reporting." A "one-size fits all" approach may not be appropriate for the reporting of all Cyber Security

Organization	Yes or No	Question 2 Comment
		Incidents. The NERC "Security Guideline for the Electricity Sector: Threat and Incident Reporting" document provides time-frames for Cyber Security Incident Reporting. For example, a Cyber Security Compromise is recommended to be reported within one hour of detection, however, Information Theft or Loss is recommended to be reported within 48 hours. Recommend listing the Event as "A confirmed reportable Cyber Security Incident. The existing NERC "Security Guideline for the Electricity Sector: Threat and Incident Reporting" document uses reporting time-frames based on "detection" and "discovery." Recommend using the word confirmed because of the investigation time that may be required from the point of initial "detection" or "discovery" to the point of confirmation, when the compliance "time-clock" would start for the reporting requirement in EOP-004-2. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement. Note that the existing NERC "Security Guideline for the Electricity Sector: Threat and Incident Reporting" document is a "guideline" to assist entities. It should not be confused with a mandatory and enforceable Reliability Standard.** - Event: Damage or destruction of a Facility Threshold for Reporting: revise language on third item to read: "Results from actual or suspected intentional human action, excluding unintentional human errors". **The SDT reviewed, discussed and updated "Damage and destruction of a Facility" based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. The new "threshold" not states:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any**

Organization	Yes or No	Question 2 Comment
		abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System). **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** - Event: Any physical threat that could impact the operability of a Facility This Event category should be deleted. The word "could" is hypothetical and therefore unverifiable and un-auditable. The word "impact" is undefined. Please delete this reporting requirement, or provide a list of hypothetical "could impact" events, as well as a specific definition and method for determining a specific physical impact threshold for "could impact" events other than "any." **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility**

Organization	Yes or No	Question 2 Comment
		Do not report copper theft unless it degrades normal operations of a Facility.” **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility’s normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** - Event: BES Emergency requiring public appeal for load reduction. Replace wording in the Event column with language from #8 on the OE-417 Reporting Form to eliminate reporting confusion. Following this sentence add, “This shall exclude other public appeals, e.g., made for weather, air quality and power market-related conditions, which are not made in response to a specific BES event.” **The SDT disagrees with quantifying a use of public appeals reporting for different types of events. The important item here is that a public appeal was issued for load reduction. A report is require to inform the ERO (and whoever else the entity wishes to inform per Requirement R1) of your current status and provide them with the situational awareness of the status of your system.** - Event: Complete or partial loss of monitoring capability Event wording: Delete the words “or partial” to conform the wording to the NERC Event Analysis Process. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event now only applies to:** **“Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable.” This will only apply to an RC, BA, or TOP who have this capability to start with.**

Organization	Yes or No	Question 2 Comment
		Event: Transmission Loss Revise to BES Transmission Loss **The SDT removed all language under "Entity with Reporting Responsibility" with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** Event: Generation Loss Revise to BES Generation Loss **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Total generation loss, within one minute, of ≥ 2,000 MW for entities in the Eastern or Western Interconnection** **OR** **≥ 1,000 MW for entities in the ERCOT or Quebec Interconnection."** **The SDT believes that if an entity reaches this threshold, it needs to be reported.**
Response: The SDT thanks you for your comment.		
CenterPoint Energy	No	CenterPoint Energy appreciates the revisions made to Attachment 1 based on stakeholder feedback; however, the Company continues to have concerns regarding certain events and thresholds for reporting and offers the following recommendations. (1) CenterPoint Energy recommends the deletion of "per Requirement R1" in the "Note" under Attachment 1 as it contains a circular reference back to R1 which includes timeframes.

Organization	Yes or No	Question 2 Comment
		The SDT has updated Requirement R1 due to industry comments to read: "R1. Each Responsible Entity shall have an event reporting Operating Plan that includes communication protocol(s) for applicable events listed in, and within the time frames specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations based on the event type (e.g. the Regional Entity, company personnel, the Responsible Entity's Reliability Coordinator, law enforcement, governmental or provincial agencies)." (2) CenterPoint Energy maintains that a required 1 hour threshold for reporting of any event is unreasonable. CenterPoint Energy is confident that given dire circumstances Responsible Entities will act quickly on responding to and communication of any impending threat to the reliability of the Bulk Electric System. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement.** (3) For the event of "Damage or destruction of a Facility", CenterPoint Energy is concerned that the use of the term "suspected" is too broad and proposes that the SDT delete "suspected" and add "that causes an Adverse Reliability Impact..." to the threshold for reporting regarding human action. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."**

Organization	Yes or No	Question 2 Comment
		This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System). This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection. The SDT also developed another to read: "Damage or destruction of its Facility that results from actual or suspected intentional human action." This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s). The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility

Organization	Yes or No	Question 2 Comment
		was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan. (4) CenterPoint Energy believes that the event, “Any physical threat that could impact the operability of a Facility” is too broad and should be deleted. Alternatively, CenterPoint Energy recommends that the SDT delete "could” or change the event description to "A physical incident that causes an Adverse Reliability Impact". Additionally, in footnote 1, the example of a train derailment uses the phrase “could have damaged”. CenterPoint Energy is concerned that as beauty is the eye of the beholder, this phrase is open to interpretation and therefore recommends that the phrase, “causes an Adverse Reliability Impact” be incorporated into the description. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event and footnote 1. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility.”** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility’s normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this**

Organization	Yes or No	Question 2 Comment
		will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility. (5) The Company proposes that the threshold for reporting the event, "BES Emergency requiring manual firm load shedding" is too low. It appears the SDT was attempting to align this threshold with the DOE reporting requirement. However, as the SDT stated above, there are several valid reasons why this should not be done; therefore, CenterPoint Energy recommends the threshold be revised to "Manual firm load shedding â‰¥ 300 MW". **The SDT disagrees as this is currently enforceable within EOP-004-1.** (6) CenterPoint Energy also recommends a similar revision to the threshold for reporting associated with the "BES Emergency resulting in automatic firm load shedding" event. ("Firm load shedding â‰¥ 300 MW (via automatic under voltage or under frequency load shedding schemes, or SPS/RAS") **The SDT disagrees as we have aligned this with "manual firm load shedding." As written a report will be required for load shedding of 100MW for automatic or manual actions.** (7) CenterPoint Energy is uncertain of the event, "Loss of firm load for â‰¥ 15 minutes" and its fit with BES Emergency requiring manual firm load shedding or BES Emergency resulting in automatic firm load shedding. The Company believes that this event is already covered with manual firm load shedding and automatic firm load shedding and should therefore be deleted. **The SDT disagrees, as "Loss of firm load" is due to an action other than loss of load due to "automatic" or "manual" actions by the BA, TOP, or DP. The intent is to capture that load was loss by some other action. Note that this is a currently enforceable item within EOP-004-1.**

Organization	Yes or No	Question 2 Comment
		(8) For the event of “System separation (islanding)”, CenterPoint Energy believes that 100 MW is inconsequential and proposes 300 MW instead. **The SDT disagrees, as this has been vetted through the industry with very little negative feedback.** (9) For “Generation loss”, CenterPoint Energy suggests that the SDT add "only if multiple units” to the criteria of “1,000 MW for entities in the ERCOT or Quebec Interconnection”. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Total generation loss, within one minute, of ≥ 2,000 MW for entities in the Eastern or Western Interconnection** **OR** **≥ 1,000 MW for entities in the ERCOT or Quebec Interconnection.”** (10) Finally, CenterPoint Energy recommends that the SDT delete the term “partial” under the “Entity with Reporting Responsibility” for “Complete or partial loss of monitoring capability”. The Company proposes revising the event description to "Loss of monitoring capability for > 30 minutes that causes system analysis tools to be inoperable”. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event is now written to state:** **“Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable.” This will only apply to an RC, BA, or**

Georgia System Operations Corporation	No	See comments under no. 4 below.
Response: The SDT thanks you for your comment. Please review the response to Question 4.		
Texas Reliability Entity	No	(1) In the Events Table, consider whether the item for "Voltage deviation on Facility" should also be applicable to GOPs, because a loss of voltage control at a generator (e.g. failure of an automatic voltage regulator or power system stabilizer) could have a similar impact on the BES as other reportable items. Note: We made this comment last time, and the SDT's posted response was non-responsive to this concern. **The SDT reviewed TRE's comment and believe that our consideration of comments during that last posting clearly stated the SDT view correctly. We stated "The SDT disagrees with this comment. Attachment 1 is the minimum set of events that will be required to report and communicate per your Operating Plan will be aware of system conditions." Further, we note that such events do not rise to the level of notification to the ERO. When events like the ones you mention occur, then entity has obligations to notify other parties according to reliability standards relating to that equipment. The NERC Standards Process Manual does allow TRE to apply for a variance if they have special concerns that GOPs should submit a report to the ERO.** (2) In the Events Table, under Transmission Loss, the SDT indicated that reporting is triggered only if three or more Transmission Facilities operated by a single TOP are lost. What if four Facilities are lost, with two Facilities operated by each of two TOPs?

Organization	Yes or No	Question 2 Comment
		That is a larger event than three Facilities lost by one TOP, but there is no reporting requirement? Determining event status by facility ownership is not an appropriate measure. The reporting requirements should be based on the magnitude, duration, or impact of the event, and not on what entities own or operate the facilities. (3) In the Events Table, under Transmission Loss, the criteria "loss of three or more Transmission Facilities" is very indefinite and ambiguous. For example, how will bus outages be considered? Many entities consider a bus as a single "Facility," but loss of a single bus may impact as many as six 345kV transmission lines and cause a major event. It is not clear if this type of event would be reportable under the listed event threshold? Is the single-end opening of a transmission line considered as a loss of a Facility under the reporting criteria? (4) Combinations of events should be reportable. For example, a single event resulting in the loss of two Transmission Facilities (line and transformer) and a 950 MW generator would not be reportable under this standard. But loss of two lines and a transformer, or a 1000 MW generator, would be reportable. It is important to capture all events that have significant impacts. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** **The SDT has reviewed Attachment 1 as a minimum level of reporting thresholds. There may be times where an entity may wish to report when a threshold has not been reached because of their experience with their system. EOP-004-2 does not prevent any entity from reporting any type of situation (event) at anytime. Note that the SDT has received industry feedback and it is not within scope of a results**

Organization	Yes or No	Question 2 Comment
		based Standards concept to be very prescriptive in nature. (5) In the Events Table, under “Unplanned control center evacuation,” “Loss of all voice communication capability” and “Complete or partial loss of monitoring capability,” GOPs should be included. GOPs also operate control centers that are subject to these kinds of occurrences, with potentially major impacts to the BES. Note that large GOP control centers are classified as “High Impact” facilities in the CIP Version 5 standards, and a single facility can control more than 10,000 MW of generation. **The SDT appreciates your suggestion; however, as we understand the point, it doesn’t apply continent-wide. The SDT has applied these events to RCs, BAs, and TOPs.** (6) The “BES Emergency resulting in automatic firm load shedding” event row within Attachment 1 should include the BA as a responsible entity for reporting. Note that EOP-003-1 requires the BA to shed load in emergency situations (R1, R5 as examples), and any such occurrence should be reported. **The SDT has reviewed your comment and would like to note that manual load shedding is only reportable if 100 MW or more is activated. Automatic load shedding is intended to be when a “relay” performs a breaker action that sheds load without human interaction and achieves a level of 100 MW or more.**
Response: The SDT thanks you for your comment.		
Occidental Power Services, Inc.	No	There are no requirements in Attachment 1 for LSEs without BES assets so these entities should not be in the Applicability section.
Response: The SDT thanks you for your comment. The LSE obligation in this standard was tied to applicability in CIP-008 for cyber incident reporting. Reporting under CIP-008 is no longer proposed to be a part of EOP-004-2 so this applicability has been removed. Please note that LSEs will be obligated to report under CIP-008 until that standard has been changed.		
Xcel Energy	No	1) The event Damage or destruction of a Facility appears to need ‘qualifying’. Is this intended for only malicious intent? Otherwise, weather related or other operational events will often meet this criteria. For example adjustment in generation or changes

Organization	Yes or No	Question 2 Comment
		in line limits to "avoid an Adverse Reliability Impact" could occur during a weather related outage. We suggest adjusting this event and criteria to clearly exclude certain items or identify what is included. **The SDT removed all language under "Entity with Reporting Responsibility" with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and**

Organization	Yes or No	Question 2 Comment
		identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Damage or destruction of its Facility that results from actual or suspected intentional human action."** **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.** **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** 2) Also recommend placing the information in footnote 1 into the associated Threshold for Reporting column, and removing the footnote. **The SDT has removed the footnote per industry comments and concerns.**
Response: The SDT thanks you for your comment.		
American Electric Power	No	If CIP-008 is now out of scope within the requirements of this standard, any references to it should also be removed from Attachment 1. **The SDT has removed the one-hour reporting requirement as requested within**

Organization	Yes or No	Question 2 Comment
		comments received. The Threshold for Reporting column on page 26 includes "Results from actual or suspected intentional human action." This wording is too vague as many actions by their very nature are intentional. In addition, it should actually be used as a qualifying event rather than a threshold. We recommend removing it entirely from the Threshold column, and placing it in the Events column and also replacing the first row as follows: "Actual or suspected intentional human action with the goal of damage to, or destruction of, the Facility." On page 27, the event "Any physical threat that could impact the operability of a Facility" is too vague and broad. Using the phrases "any physical threat" and "could impact" sets too high a bar on what would need to be reported. On page 28, for the event "Complete loss of off-site power to a nuclear generating plant (grid supply)", TO and TOP should be removed and replaced by GOP. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has**

Organization	Yes or No	Question 2 Comment
		the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.
Response: The SDT thanks you for your comment.		
Clark Public Utilities	No	I agree with all but one. The event is "Damage or destruction of a Facility" and the threshold for reporting is "Results from actual or suspected intentional human action." I understand and agree that destruction of a facility due to actual or suspected intentional human action should always be reported. However, I do not know what level of damage should be reported. Obviously the term "damage" is meant to signify and event that is less than destruction. As a result, damage could be extensive, minimal, or hardly noticeable. There needs to be some measure of what the damage entails if the standard is to contain a broad requirement for the reporting of damage intentionally caused by human action. Whether that measure is based on the actual impacts to the BES from the damage or whether the measure is based on the ability of the damaged equipment to continue to function at 100%, 50% or some capability would be acceptable but currently it is too open ended.
Response: The SDT thanks you for your comment. The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: "Damage or destruction of its Facility that results from actual or suspected intentional human action." This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.		

Organization	Yes or No	Question 2 Comment
This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s). **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.**		
New York Power Authority	No	Please see comments submitted by NPCC Regional Standards Committee (RSC).
Response: Thank you for your comment. Please see response to the comments.		
Consolidated Edison Co. of NY, Inc.	No	General comment regarding Attachment 1:SDT should strive to use identical language to event descriptions in the NERC Event Analysis Process and FERC OE-417. Creating a third set of event descriptions is not helpful to system operators. We recommend aligning the Attachment 1 wording with that contained in Attachment 2, DOE Form OE-417 and the EAP whenever possible. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. Using identical terminology will be difficult to achieve as the DOE form and EAP have differing processes for identification of the reportable incidences. The SDT has tried to set up the reportable events in the standard to be as similar as possible to the other organizations without being tied to their specific language. Attachment 2 has been modified to match the events types listed in Attachment 1.** Replace the Attachment 1 "NOTE" with the following clarifying wording: NOTE: The Electric Reliability Organization and the Responsible Entity's Reliability Coordinator will accept the DOE OE-417 form in lieu of Attachment 2 if the entity is required to submit an OE-417 report. Submit reports to the ERO via one of the following: e-mail: esisac@nerc.com, Facsimile: 609-452-9550, Voice: 609-452-1422. Initial submittal by Voice within the reporting time frame is acceptable for all events when followed by a hardcopy submittal by Facsimile or e-mail as and if required.

Organization	Yes or No	Question 2 Comment

Response: The SDT thanks you for your comment.		
Farmington Electric Utility System	No	The reporting threshold for "Complete or partial loss of monitoring capability" should be modified to include the loss of additional equipment and not be limited to State Estimator and Contingency Analysis. Some options have been included: Affecting a BES control center for â‰¥ 30 continuous minutes such that Real-Time monitoring tools are rendered inoperable. Affecting a BES control center for â‰¥ 30 continuous minutes to the extent a Constrained Facility would not be identified or an Adverse Reliability Impact event could occur due to lack of monitoring capability. Affecting a BES control center for â‰¥ 30 continuous minutes such that an Emergency would not be identified or ma
Response: The SDT thanks you for your comment. The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event is now written to state: **"Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable." This will only apply to an RC, BA, or TOP who have this capability to start with.**		
Public Service Enterprise Group	No	We agreed with most of the revisions. However, for the 24-hour reporting time frame portion of the EOP-004 Attachment 1: Reportable Event that starts on p. 18, we have these concerns: a. Why was "RC" left out in the first row? RC is in the second row that also addresses a "Facility." We believe that "RC" was inadvertently

Organization	Yes or No	Question 2 Comment
		left out. b. In the first row, entities such as a BA, TO, GO, GOP, or DP would not know whether damage or destruction of one of its Facilities either “Affects an IROL (per FAC-014)” or “Results in the need for actions to avoid an Adverse Reliability Impact.” FAC-014-2, R5.1.1 requires Reliability Coordinators provide information for each IROL on the “Identification and status of the associated Facility (or group of Facilities) that is (are) critical to the derivation of the IROL” to entities that do NOT include the entities listed above. And frankly, those entities would not need to know. The reporting requirements associated with “Damage or destruction of a Facility” need to be changed so that the criteria for reporting by an entity whose Facilities experience damage or destruction does not rely upon information that the entity does not possess. c. A possible route to achieve the results in b. above is described below: i. All Facilities that are damaged or destroyed that “Results from actual or suspected intentional human action” would be reported to the ERO by the entity experiencing the damage or destruction. ii. All Facilities that are damaged or destroyed OTHER THAN THAT due to an “actual or suspected intentional human action” would be reported to the RC by the entity experiencing the damage or destruction. Based upon those reports, the RC would be required to report whether the reported damage or destruction of a Facility “Affects an IROL (per FAC-010)” or “Results in the need for actions to Avoid an Adverse Reliability Consequence.” (The RC may need to modify its data specifications in IRO-010-1a - Reliability Coordinator Data Specification and Collection - to specify outages due to “damage or destruction of a Facility.” We also note that “DP” is not included in IRO-010-1a, but “LSE” is included. DPs are required to also register as LSEs if they meet certain criteria. See the “Statement of Compliance Registry Criteria, Rev. 5.0”, p.7. For this reason, we suggest that DP be replaced with LSE in EOP-004-2.) d. To implement the changes in c. above, we suggest that the first row be divided into two rows: i. FIRST ROW: This would be like the existing first row on page 18, except “RC” would be added to the column for “Entity with Reporting Responsibility” and the only reporting threshold would be ““Results from actual or suspected intentional human action.” ii. SECOND ROW: The Event would be “Damage or destruction of a Facility of a BA, TO, TOP, GO,

Organization	Yes or No	Question 2 Comment
		GOP, or LSE," the Entity, the Reporting Responsibility would be "The RC that has the BA, TOP, GO, GOP, or LSE experiencing the damage or destruction in its area," and the Threshold for Reporting would be "Affects an IROL (per FAC-010)" or "Results in the need for actions to avoid an Adverse Reliability Consequence."

Response: The SDT thanks you for your comment. The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:

"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."

This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).

This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.

The SDT also developed another to read:

Organization	Yes or No	Question 2 Comment
“Damage or destruction of its Facility that results from actual or suspected intentional human action.” **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was “damaged or destroyed” intentionally by a human.** **This event was written to cover the increase of “Entity with Reporting Responsibility” and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being “suspected intentional human action.” This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.**		
MidAmerican Energy	No	Several modifications need to be made to Table 1 to enhance clarity and delete unnecessary or duplicate items. The stated reliability objective of EOP-004 and the drafting team is to reduce and prevent outages which could lead to cascading through reporting. It is understood that the EOP-004 Attachment 1 is to cover similar items to the DOE OE-417 form. Last, remember that FERC recently asked the question of what standards did not provide system reliability benefits. Those reports that cannot show a direct threat to a potential cascade need to be eliminated. Table 1 should always align with the cascade risk objectives and OE-417 where possible. Therefore Table 1 should be modified as follows: 1. Completely divorce CIP-008 from EOP-004. Constant changes, the introduction of new players such as DOE and DHS, and repeated congressional bills, make coordination with CIP-008 nearly impossible. Cyber security and operational performance under EOP-004 remain separate and different despite best efforts to combine the two concepts. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we**

Organization	Yes or No	Question 2 Comment
		have remanded the one hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement. 2. Modify R1.2 to state that ERO notification only is required for Table 1. This is similar to the DOE OE-417 notification. Notification of other entities is a best practice, not a mandatory NERC standard. If entities want to notify neighboring entities, they may do so as a best practice guideline. **The SDT has updated R1 based on comments received to read as:** **"R1. Each Responsible Entity shall have an event reporting Operating Plan that includes communication protocol(s) for applicable events listed in, and within the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations based on the event type (e.g. the Regional Entity, company personnel, the Responsible Entity's Reliability Coordinator, law enforcement, governmental or provincial agencies)."** 3. Better clarity for communicating each of the applicable events listed in the EOP-004 Attachment 1 in accordance with the timeframes specified are needed. MidAmerican suggests a forth column be added to the table to clearly identify who must be notified within the specified time period or at a minimum, that R1.2 be revised to clearly state that only the ERO must be notified to comply with the standard. **The SDT disagrees but believes that per your Operating Plan contained in Requirement R1, an entity could take Attachment 1 and insert another column to assist whoever is designated to report an event within your company. The SDT does not want to be too prescriptive within Attachment 1.** 4. Consolidate OE-417 concepts on physical attack and cyber events by consolidating OE-417 items 1, 2, 9 and 10 to: Verifiable, credible, and malicious physical damage (excluding natural weather events) to a BES generator, line, transformer, or bus that when reported requires an appropriate Reliability Coordinator or Balancing Authority to issue an Energy Emergency Alert Level 2 or higher. The whole attempt to discuss a

Organization	Yes or No	Question 2 Comment
		NERC Facility and avoid adverse reliability impacts overreaches the fundamental principal or reporting for an emergency that could result in a cascade. **The SDT disagrees since the OE-417 (and EAP) does not follow the ANSI process as NERC does in the Standards Development Process.** 5. The wording “affects an IROL (per FAC-014),” is too vague and not measurable. Many facilities could affect an IROL, but fewer facilities if lost would cause an IROL. Change “affects” to “results in” **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency.”** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a “damaged or destroyed”**

Organization	Yes or No	Question 2 Comment
		Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection. 6. Recommend that Adverse Reliability Impact be deleted and be replaced with actual EEA 2 or EEA 3 level events. **The SDT has removed Adverse Reliability Impact based on industry feedback and rewrote the event:** **The SDT removed all language under "Entity with Reporting Responsibility" with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are**

Organization	Yes or No	Question 2 Comment
		required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection. **The SDT also developed another to read:** **"Damage or destruction of its Facility that results from actual or suspected intentional human action."** **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.** **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** 7. The phrase "results from actual or suspected intentional human action" is vague

Organization	Yes or No	Question 2 Comment
		and not measurable. This line item used the term "suspected" which relates to "sabotage". MidAmerican recommends that "Results from actual or suspected intentional human action" be deleted. If not deleted the phrase should be replaced with "Results from verifiable, credible, and malicious human action intended to damage the BES." 8. Delete "Any physical threat..." as vague, and difficult to measure in a "perfect" zero defect audit environment, and as already covered by item 1 above. If not deleted, at a minimum replace "Any physical threat", with "physical attack" as being measureable and consistent with DOE OE-417. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of its Facility that results from actual or suspected intentional human action."** **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.** **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).**

Organization	Yes or No	Question 2 Comment
		The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan. 9. With the use of "i.e." the SDT is mandating that each other entity must be contacted. The NSRF believes that the SDT meant that "e.g." should be used to provide examples. The SDT may wish to add another column to Attachment 1 to provide clarity. **The SDT has made the required change concerning replacing "i.e." with "e.g."** 10. The phrase "or partial loss of monitoring capability" is too vague and should be deleted. In addition, the 30 minute window is too short for EMS and IT staff to effectively be notified and troubleshoot systems before being subjected to a federal law requiring reporting and potential violations. The time frame should be consistent with the EOP-008 standard. If not deleted, replace with "Complete loss of SCADA affecting a BES control center for â‰¥ 60 continuous minutes such that analysis tools of State Estimator and/or Contingency Analysis are rendered inoperable. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event is now written to state:** **"Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable." This will only apply to an RC, BA, or TOP who have this capability to start with.** 11. Transmission loss should be deleted. The number of transmission elements out does not directly correlate to BES stability and cascading. For that reason alone, this

Organization	Yes or No	Question 2 Comment
		item should be deleted or it would have already been included in the past EOP-004 standard. In addition, large footprints can have multiple storms or weather events resulting in normal system outages. This should not be a reportable event that deals with potential cascading. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** 12. Modify the threshold of "BES emergency requiring a public appeal..." to include, "Public appeal for a load reduction event resulting from a RC or BA implementing its emergency energy and capacity plans documented in EOP-001." Public appeals for conservation that aren't used to avoid capacity and energy emergencies should be clearly excluded. **The SDT disagrees as your request makes the event very prescriptive. The threshold is written to state: "Public appeal for load reduction event." The SDT understands that there may be several reports of a single event and as the SDT has stated before, that this will give the ERO a better understanding of the depth and breathe of system conditions based on the given event.** 13. Add a time threshold to complete loss of off-site power to a nuclear plant. Nuclear plants are to have backup diesel generation that last for a minimum amount of time. A threshold recognizing this 4 hour or longer window needs to be added such as complete loss of off-site power to a nuclear plant for more than 4 hours. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT**

Organization	Yes or No	Question 2 Comment
		removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Complete loss of off-site power affecting a nuclear generating station per the Nuclear Plant Interface Requirement."** **As stated in this event Threshold, the TOP's NIPR may have additional guidance concerning the complete loss of offsite power affecting a nuclear plant.** Also see the NSRF comments. **Please review the responses to that commenter.**
Response: The SDT thanks you for your comment.		
Illinois Municipal Electric Agency	No	Illinois Municipal Electric Agency supports comments submitted by Florida Municipal Power Agency.
Response: The SDT thanks you for your comment. Please review the responses to that commenter.		
American Transmission Company, LLC	No	ATC is proposing changes to the following Events in Attachment 1: (Reference Clean Copy of the Standard) 1) Pg. 18/ Event: Any Physical threat that could impact the operability of a Facility. ATC is proposing a language change to the Threshold- "Meets Registered Entities criteria stated in its Event Reporting Operating Plan, in addition to excluding weather." **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry**

Organization	Yes or No	Question 2 Comment
		comments to state: **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** 2) Pg. 19 / Event: Voltage deviation on a Facility. ATC believes that the term "observes" for Entity with Reporting Responsibility be changed back to "experiences" as originally written. The burden should rest with the initiating entity in consistency with other Reporting Responsibilities. Also, for Threshold for Reporting, ATC believes the language should be expanded to - plus or minus 10% "of target voltage" for greater than or equal to 15 continuous minutes. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and**

Organization	Yes or No	Question 2 Comment
		identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Observed voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes ."** **This language clearly states that if the threshold is met, the entity needs to submit a report within 24 hours.** 3) Pg. 19/ Event: Transmission loss. ATC recommends that Threshold for Reporting be changed to read "Unintentional loss of four, or more Transmission Facilities, excluding successful automatic reclosing, within 30 seconds of the first loss experienced and for 30 continuous minutes. Technical justification or Discussion for this recommended change: In the instance of a transformer-line-transformer, scenario commonly found close-in to Generating stations, consisting of 3 defined "facilities", 1 lightning strike can cause automatic unintentional loss by design. Increase the number of facilities to 4.In a normal shoulder season day, an entity may experience the unintentional loss of a 138kv line from storm activity, at point A in the morning, a loss of a 115kv line from a different storm 300 miles from point A in the afternoon, and a loss of 161kv line in the evening 500 miles from point A due to a failed component, if it is an entity of significant size. Propose some type of time constraint. Add time constraint as proposed, 30 seconds, other than automatic reclosing. In the event of dense lightning occurrence, the loss of multiple transmission facilities may occur over several minutes to several hours with no significant detrimental effect to the BES, as load will most certainly be affected (lost due to breaker activity on the much more exposed Distribution system) as well. Any additional loss after 30 seconds must take into account supplemental devices with intentional relay time delays, such as shunt capacitors, reactors, or load tap changers on transformers activating as designed, arresting system decay. In addition, Generator response after this time has significant impact. **The SDT removed all language under "Entity with Reporting Responsibility," with**

		the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** 4) Pg.20 /Event: Complete or partial loss of monitoring capability. ATC recommends that the term "partial" be deleted from the event description.ATC recommends that the term "partial" be deleted for the Entity with Reporting Responsibility and changed to read: Each RC, BA, and TOP that experiences the complete loss of monitoring capability. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event is now written to state:** **"Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable." This will only apply to an RC, BA, or TOP who have this capability to start with.**
Response: The SDT thanks you for your comment.		
Alliant Energy	No	In the first Event for twenty four hour reporting, the last item in "Threshold for Reporting" should be revised to "Results from actual or suspected intentional malicious human action." An employee may be performing maintenance and make a mistake, which could impact the BES. In the second Event for twenty four hour reporting the event should be revised to "Any physical attack that could impact the operability of a Facility." Alliant Energy believes this is clearer and easier to measure.

Organization	Yes or No	Question 2 Comment

Response: The SDT thanks you for your comment. The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:

"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."

This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).

This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.

The SDT also developed another to read:

"Damage or destruction of its Facility that results from actual or suspected intentional human action."

This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.

This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).

The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the

Organization	Yes or No	Question 2 Comment
situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.		
Consumers Energy	No	The term "Facility" seems to be much more broad and even more vague than the use of BES equipment. We recommend reverting back to use of BES equipment.
Response: The SDT thanks you for your comment. The SDT disagrees since BES is used within the definition of Facility. NERC defines Facility as: "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)."		
Ameren	No	We appreciate the efforts of the SDT and believe this latest Draft is greatly improved over the previous version. However, we propose the following suggestions: (1) The first Event category in Attachment 1 under 24 Hour Reporting is Applicable to GO and GOP entities. Yet the first 2 of 3 Thresholds for Reporting require data that is unobtainable for GO and GOP entities. Specifically, Events that "Affects an IROL (per FAC-014)" and "Results in the need for actions to avoid an Adverse Reliability Impact". We believe these thresholds, and the use of the NERC Glossary term Adverse Reliability Impact, clearly show the SDT's intent to limit reporting only to Events that have a major and significant reliability impact on the BES. GO or GOP does not have access to the wide-area view of the transmission system, making them to make this determination is impossible. As a result, we do not believe GO and GOP entities should have Reporting Responsibility for these types of Events. (2) For GO and GOP entities, the third Threshold is confusing as to which facilities in the plant it would be applicable to; because the definition of "Facility" does not provide a clear guidance in that respect. For example, would a damage to ID fan qualify as a reportable event? **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry**

Organization	Yes or No	Question 2 Comment
		comments to state: **“Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency.”** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. Organization	Yes or No	Question 2 Comment
		hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** (3) The second Event category in Attachment 1 under 24 Hour Reporting, "Any physical threat that could impact the operability of a Facility" is wide open to interpretation and thus impracticable to comply with. For example, a simple car accident that threatens any transmission circuit, whether it impacts the BES (as listed in the Threshold for the previous event in the table or any other measure) or not, is reportable. This list could become endless without the events having any substantial impact on the system. To continue this point, the Footnote 1 can also include, among many other examples, the following:(a) A wild fire near a generating plant, (b) Low river levels that might shut down a generating plant, (c) A crane that has partially collapsed near a generator switchyard, (d) Damage to a rail line into a coal plant, and/or (v) low gas pressure that might limit or stop operation of a natural gas generating plant. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT**

Organization	Yes or No	Question 2 Comment
		removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** (4) The category, "Transmission Loss" is a concern also. If the meaning of Transmission Facility is included in the meaning of Facility as described in the event list, it may be acceptable; but, we still have a question how would a loss of a bus and the multiple radial element that may be connected to that bus would be treated? Also, how would a breaker failure affect this type of an event? The loss of a circuit is

Organization	Yes or No	Question 2 Comment
		"intentional" (as opposed to Unintentional as listed in the threshold) for the failure of breaker, how will it be treated in counting three or more? We suggest a clarification for such types of scenarios. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** (5) Requirement R1.: 1.1 includes an exception from compliance with this Standard if there is a Cyber Security Incident according to CIP-008-3. However, note that the CIP-008-3 may not apply to all GO and GOP facilities. While the exception is warranted to eliminate duplicative event reporting plans, the language of this requirement is confusing as it does not clearly provides that message. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have proposed remanding the one hour event back to CIP-008.** (6) The second paragraph in Section C.1.1.2. Includes the phrases "...shall retain the current, document..." and "...the "date change page" from each version..." Is the "document" intended to be the Operating Plan? We do not see a defining reference in the text around this phrase; also, is a "date change page" mandatory for compliance with this Standard? We request additional clarification of wording in the Evidence Retention section of the Standard. (7) Page 19 / Event: Voltage deviation on a Facility: We believe that the term "observes" for Entity with Reporting Responsibility be changed back to "experiences" as originally written. The burden should rest with the initiating entity in consistency with other Reporting Responsibilities. In addition, for Threshold for Reporting, We

Organization	Yes or No	Question 2 Comment
		believe the language should be expanded to - plus or minus 10%”of nominal voltage” for greater than or equal to 15 continuous minutes. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Observed voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes .”** **This language clearly states that if the threshold is met, the entity needs to submit a report within 24 hours.** (8) Page 20 /Event: Complete or partial loss of monitoring capability. We suggest to the SDT that the term “partial” be deleted from the event description. (9) We suggest to the SDT that the term “partial” be deleted for the Entity with Reporting Responsibility and changed to read: Each RC, BA, and TOP that experiences the complete loss of monitoring capability. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event is now written to state:** **“Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable.” This will only apply to an RC, BA, or TOP who have this capability to start with.**
Response: The SDT thanks you for your comment.		
We Energies	No	Submitting reports to the ERO: NERC and all of the Regional Entities are the ERO. If I

Organization	Yes or No	Question 2 Comment
		send a report to any Regional Entity (and not NERC), I have sent it to the ERO. **The SDT would like to point out the FERC has approved NERC to be the ERO. And the NERC has a delegation agreement with each Regional Entities. This Requirement R1 requires you send a report to the ERO (and whoever else the entity wishes to inform per Requirement R1 including the applicable regions if you are so obligated or its' your desire).** Damage or Destruction of a Facility: A DP may not have a Facility by the NERC Glossary definition. All distribution is not a Facility. Did you mean to exclude all distribution? **The SDT agrees that if a DP does not own or operate a Facility then this event would not be applicable to them.** Any Physical threat that could impact the operability of a Facility: An RC does not have Facilities by the NERC Glossary definition. An RC will not have to report this. BES Emergency... Reporting Responsibility: If meeting the Reporting Threshold was due to a directive from the RC, who is the Initiating entity? **The SDT agrees concerning the RC does not own a Facility and has removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or**

Organization	Yes or No	Question 2 Comment
		Suspicious device or activity at a Facility **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** Voltage deviation on a Facility Threshold for Reporting: 10% of what voltage? Nominal, rated, scheduled, design, actual at an instant? **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Observed voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes."** **This language clearly states that if the threshold is met, the entity needs to submit a report within 24 hours.**
Response: The SDT thanks you for your comment.		
NextEra Energy Inc	No	As stated in NextEra's past comments, we continue to be concerned that EOP-004-2 does not appropriately address actual sabotage that threatens the Bulk Electric

Organization	Yes or No	Question 2 Comment
		System (BES) versus random acts that are isolated and pose no risk to the BES. Therefore, NextEra repeats a portion of its past comments below in the hope that the next revision of EOP-004-2 will more adequately address NextEra's concerns. Specifically, NextEra's requests that its definition of sabotage set forth below replace Attachment 1's "Damage and Destruction of Equipment" and "Any physical threat that could impact the operability of a Facility." In Order No. 693, FERC stated its interest in NERC revising CIP-001 to better define sabotage and requiring notification to the certain appropriate federal authorities, such as the Department of Homeland Security. FERC Order No. 693 at PP 461, 462, 467, 468, 471. NextEra has provided an approach that accomplishes FERC's objectives and remains within the framework of the drafting team, but also focuses the process of determining and reporting on only those sabotage acts that could affect other BES systems. Today, there are too many events that are being reported as sabotage to all parties in the Interconnection, when in reality these acts have no material affect or potential impact to other BES systems other than the one that experienced it. For example, while the drafting team notes the issue of copper theft is a localized act, there are other localized acts of sabotage that are committed by an individual, and these acts pose little, if any, impact or threat to other BES systems. Reporting sabotage that does not need to be sent to everyone does not add to the security or reliability of the BES. Relatedly, there is a need to clarify some of the current industry confusion on who should (and has the capabilities to) be reporting to a broader audience of entities. Hence, the NextEra approach provides a clear definition of sabotage, as well as the process for determining and reporting sabotage. New Definition for Sabotage. Attempted or Actual Sabotage: an intentional act that attempts to or does destroy or damage BES equipment for the purpose of disrupting the operations of BES equipment, or the BES, and has a potential to materially threaten or impact the reliability of one or more BES systems (i.e., one act of sabotage on BES equipment is only reportable if it is determined to be part of a larger conspiracy to threaten the reliability of the Interconnection or more than one BES system).
Response: The SDT thanks you for your comment. The SDT has stated in our "Consideration of Issues and Directives – March 15,		

Organization	Yes or No	Question 2 Comment
2012" that was posted with the last posting stated: **The SDT has not proposed a definition for inclusion in the NERC Glossary because it is impractical to define every event that should be reported without listing them in the definition. Attachment 1 is the de facto definition of "event". The SDT considered the FERC directive to "further define sabotage" and decided to eliminate the term sabotage from the standard. The team felt that without the intervention of law enforcement after the fact, it was almost impossible to determine if an act or event was that of sabotage or merely vandalism. The term "sabotage" is no longer included in the standard and therefore it is inappropriate to attempt to define it. The events listed in Attachment 1 provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The SDT believes that this is an equally effective and efficient means of addressing the FERC Directive.** **The SDT has discussed this with FERC Staff and we agree that sabotage could be a state of mind; and, therefore, the real issue: Was there an event or not?**		
ISO New England Inc	No	
Response: The SDT thanks you for your participation.		
Nebraska Public Power District	No	1. The following comments are in regard to Attachment 1:A. The row [Event] titled "Damage or destruction of Facility": 1. In column 3 [Threshold for Reporting], the word "Affect" is vague note the following concerns: i. Does "Affect" include a broken crossarm damaged without the Facility relaying out of service. This could be considered to have an "Affect" on the IROL. ii. Would the answer be different if the line relayed out of service and auto-reclosed (short interruption) for the same damaged crossarm? We need clarity from the SDT in order to know when a report is due. 2. For clarification: Who initiates the report when the IROL interfaces spans between multiple entities? We know of an IROL that has no less that four entities that operate Facilities within the interface. Who initiates the report of the IROL is affected? All? **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and**

Organization	Yes or No	Question 2 Comment
		identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** **The SDT also developed another to read:** **"Damage or destruction of its Facility that results from actual or suspected intentional human action."**

Organization	Yes or No	Question 2 Comment
		This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** B. The row [Event] titled "Any physical threat that could impact the operability of a Facility":1. In Column 1 [Event] change the word "threat" to "attack", this aligns with the OE-417 report.2. In Column 3 [Threshold for Reporting], align the threshold with the OE-417 form. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility**

Organization	Yes or No	Question 2 Comment
		Or **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** C. The row [Event] titled "Transmission loss", in column 3 [Threshold for Reporting], the defined term "Transmission Facilities" is too vague. There needs to be a more description such that an entity clearly understands when an event is reportable and for what equipment. We would recommend the definition used in the Event Reporting Field Trial: An unexpected outage, contrary to design, of three or more BES elements caused by a common disturbance. Excluding successful automatic reclosing. For example: a. The loss of a combination of NERC-defined Facilities. b. The loss of an entire generation station of three or more generators (aggregate generation of 500 MW to 1,999 MW); combined cycle units are represented as one unit. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry**

Organization	Yes or No	Question 2 Comment
		comments to state: **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** D. The row [Event] titled "Complete or partial loss of monitoring": 1. In column 1 [Event], delete the words "or partial". This is subjective without definition, delete. 2. Also in column 1 [Event], delete the word "monitoring" and replace with Supervisory Control and Data Acquisition (SCADA). SCADA is defined term that explicitly calls out in the definition "monitoring and control" and is understood by the industry as such. 3. In column 2 [Entity with Reporting Responsibility], delete the words "or partial"; also delete the word "monitoring" and replace with SCADA. 4. In column 3 [Threshold for Reporting], reword to state "Complete loss of SCADA affecting a BES control center for >/= 30 continuous minutes". **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event is now written to state:** **"Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable." This will only apply to an RC, BA, or TOP who have this capability to start with.**
Response: The SDT thanks you for your comment.		
GTC	No	Page 17 & 18, One Hour Reporting and Twenty-four Hour Reporting: append the introductory statements with the following: "meeting the threshold for reporting" after recognition of the event. Example: Submit EOP-004 Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within twenty-four hours of recognition of the event meeting the threshold for reporting. Page 19, system separation (islanding); Clarify the intent of this threshold for reporting: Load >= 100 MW and any generation; or Load >= 100 MW and Generation

Organization	Yes or No	Question 2 Comment
		>= 100 MW, or some combination of load and generation totaling 100 MW.
Response: The SDT thanks you for your comment. The SDT has chosen not add the requested language as we believe the intent is understood that the time frames means from "meeting the threshold for reporting." The SDT has revised the language regarding islanding and we believe it addresses your concern.		
Indiana Municipal Power Agency	No	The event "any physical threat that could impact the operability of a Facility" is not measurable and can be interpreted many ways by entities or auditors. IMPA recommend incorporating language that let's this be the judgment of the registered entity only. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or**

Organization	Yes or No	Question 2 Comment
		activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility. On the "voltage deviation on a Facility", IMPA recommends that only the TOP the experiences a voltage deviation be the one responsible for reporting. **The SDT has made this change per comments received from the industry.** For generation loss and transmission loss, IMPA believes that the amount of loss needs to be associated with a time period or event (concurrent forced outages).
Response: The SDT thanks you for your comment.		
Idaho Power Co.	No	I think that the category "Damage or destruction of a Facility" is too ambiguous, and the Threshold for Reporting criteria does not help to clarify the question. Any loss of a facility may result in the need for actions to get to the new operating point, would this be a reportable disturbance? **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."**

Organization	Yes or No	Question 2 Comment
		This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System). This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection. The SDT also developed another to read: "Damage or destruction of its Facility that results from actual or suspected intentional human action." This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).

Organization	Yes or No	Question 2 Comment
		The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.
Response: The SDT thanks you for your comment.		
MISO	No	
American Public Power Association	No	APPA in our comments on the previous draft of EOP-004-2 requested relief for small entities from this reporting/documentation standard. APPA suggested setting a 300 MW threshold for some of the criteria in Attachment 1. This suggestion was not accepted by the SDT. However, the SDT is still directed by FERC to "consider whether separate, less burdensome requirements for smaller entities may be appropriate. Therefore, APPA requests that the SDT provide relief to small entities by providing separate requirements for small entities by requiring reporting only when one of the four criteria in DOE-OE-417 are met: 1. Actual physical attack, 2. Actual cyber attack, 3. Complete operational failure, or 4. Electrical System Separation. APPA recommends this information should be reported to the small entity's BA as allowed in the DOE-OE-417 joint filling process.
Response: The SDT thanks you for your comment. The SDT has taken your concerns into consideration (as directed by FERC) and believes that "small entities" will most likely not meet the thresholds for reporting since items are predicated on "Facilities" or they don't meet the Threshold for reporting.		
Brazos Electric Power Cooperative	No	Please see the comments submitted by ACES Power Marketing.

Organization	Yes or No	Question 2 Comment
Response: The SDT thanks you for your comment. Please review the response to those comments.		
Puget Sound Energy, Inc.	No	The Note at the beginning of Attachment 1 references notifying parties per Requirement R1; however, notification occurs in conjunction with Requirement R2.The term “Adverse Reliability Impact” is used in the threshold section of the event “Damage or destruction of a Facility”. At this time, there are two definitions for that term in the NERC Glossary. The FERC-approved definition for this term is “The impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.” If the drafting team instead means to use the definition that NERC approved on 8/4/2011 (as seems likely, since that definition more closely aligns with the severity level indicated by the other two threshold statements) then the definition should be included in the Implementation Plan as a prerequisite approval. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency.”** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could**

		adversely affect the reliability of the Bulk Electric System). **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** In addition, would the threshold of "Results from actual or suspected intentional human action" include results from actual intentional human action which produced an accidental result, meaning, someone was intentionally doing some authorized action but unintentionally made a mistake, leading to damage of a facility? The event "Any physical threat that could impact the operability of a Facility" will require reporting for many events that have little or no significance to reliable operation of the Bulk Electric System. For example, a balloon lodged in a 115 kV transmission line is a "physical threat" that could definitely "impact the operability" of that Facility and, yet, will probably have little reliability impact. So, too, could a car-pole accident that causes a pole to lean, a leaning tree, or an unfortunately-located bird's nest. The drafting team should develop appropriate threshold language so that reporting is required only for events that do threaten the reliability of the Bulk Electric System. **The SDT also developed another to read:** **"Damage or destruction of its Facility that results from actual or suspected intentional human action."** **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per**

		Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** With respect to the event "Unplanned control center evacuation", the standard drafting team should include the term "complete" in the description and/or threshold statement to avoid having partial evacuations trigger the need to report. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Unplanned evacuation from BES control center facility for 30 continuous minutes or more." The SDT does not believe the word "complete" needs to be added.**
Response: The SDT thanks you for your comment.		
Central Lincoln	No	1) We appreciate the changes made to reduce the short time reporting requirements.

Organization	Yes or No	Question 2 Comment
		The SDT has removed the one-hour reporting time frame, and all events are to be reported within 24 hours of recognition of the event. 2) We would like to point out that the 24 hour reporting threshold for “Damage or destruction of a Facility” resulting from intentional human action will still be non-proportional BES risk for certain events. The discovery of a gunshot 115 kV insulator will start the 24 hour clock running, no matter how busy the discoverer is performing restoration or other duties that are more important. The damage may have been done a year earlier, but upon discovery the report suddenly becomes the priority task. To hit the insulator, the shooter likely had to take aim and pull the trigger, so intent is at least suspected if not actual. And the voltage level ensures the insulator is part of a Facility. **The SDT has updated Damage or destruction of a facility into 2 different thresholds:** **The SDT removed all language under “Entity with Reporting Responsibility” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency.”** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).**

Organization	Yes or No	Question 2 Comment
		This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** #2 - "Voltage Deviation on a Facility" I think the threshold definition needs to be more specific: Is it 10% from nominal? 10% from normal min/max operating

Organization	Yes or No	Question 2 Comment
		tables/schedules? Another entities 10% might be different than mine. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Observed voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes ."** **This language clearly states that if the threshold is met, the entity needs to submit a report within 24 hours.** #3 - "Transmission Loss" The threshold of three facilities is still too vague. A generator and a transformer and a gen-tie are likely to have overlapping zones of protection that could routinely take out all three. The prospect of penalties would likely cause unneeded reporting. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."**
Response: The SDT thanks you for your comment.		
Deseret Power	No	The threshold for reporting is way too low. A gun shot insulator is not an act of

Organization	Yes or No	Question 2 Comment
		terrorism... vandalism yes... and a car hit pole would be reportable on a 138 kv line. these seem to be too aggressive in reporting.
Response: The SDT thanks you for your comment. The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.**		
Kansas City Power & Light	No	For the event, "Damage or destruction of a Facility", the "Threshold for reporting" includes "Results from actual or suspected intentional human action". This is too broad and could include events such as damage to equipment resulting from stealing cooper or wire which has no intentional motivation to disrupt the reliability of the bulk electric system. Reports of this type to law enforcement and governmental agencies will quickly appear as noise and begin to be treated as noise. This may result in overlooking a report that deserves attention. Recommend the drafting team consider making this threshold conditional on the judgment by the entity on the

Organization	Yes or No	Question 2 Comment
		human action intended to be a potential threat to the reliability of the bulk electric system. For the event, "Any physical threat that could impact the operability of a Facility", the same comment as above applies. The footnote states to include copper theft if the Facility operation is impacted. Again, it is recommended to make a report of this nature conditional on the judgment of the entity on the intent to be a potential threat to the reliability of the bulk electric system.

Response: The SDT thanks you for your comment. The SDT has updated Damage or destruction of a facility into 2 different thresholds:

The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:

"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."

This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).

This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each

Organization	Yes or No	Question 2 Comment
interconnection. **The SDT also developed another to read:** **"Damage or destruction of its Facility that results from actual or suspected intentional human action."** **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.** **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.**		
Dominion	Yes	Comments: While Dominion agrees that the revisions are a much appreciated improvement, we are concerned that Attachment 1 does not explicitly contain the 'entities which must be, at a minimum, notified. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified.** Attachment 2 appears to indicate that only the ERO and the Reliability Coordinator for the Entity with Reporting Responsibility need be informed. However, the background section indicates that the Entity with Reporting Responsibility is also

Organization	Yes or No	Question 2 Comment
		expected to contact local law enforcement. We therefore suggest that Attachment 2 be modified to include local law enforcement. **The SDT has adapted the language in Attachment 2 along the lines of your concern.** Page 26 redline; Attachment 1; Event - Damage or destruction of a Facility; Threshold for Reporting - Results from actual or suspected intentional human action; Dominion is concerned with the ambiguity that this could be interpreted as applying to distribution. Page 27 redline; Attachment 1; Event - Any physical threat that could impact the operability of a Facility; Dominion is concerned the word "could" is hypothetical and therefore unverifiable and un-auditable. **The SDT has updated Damage or destruction of a facility into 2 different thresholds:** **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** The SDT could provide a list of hypothetical "could impact" events, as well as a specific definition and method for determining a specific physical impact threshold for "could impact" events other than "any."

Organization	Yes or No	Question 2 Comment
		The SDT cannot provide a list of hypothetical events, but will remind the entity that the Operating Plan that is required per Requirement R1 could contain a basis to report concerning your unique system equipment or configuration of your system.
Response: The SDT thanks you for your comment.		
Seattle City Light	Yes	This is a great improvement over the prior CIP and EOP versions. However, please see #4 for overall comment.
Response: The SDT thanks you for your comment. Please review the response to Question 4.		
Avista	Yes	In general the SDT has made significant improvements to Attachment 1. Avista does have a suggestion to further improve Attachment 1.In Attachment 1 under the 24 hour Reporting Matrix, the second event states "Any physical threat that could impact the operability of a Facility" and the Threshold for Reporting states "Threat to a Facility excluding weather related threats". This is extremely open ended. We suggest adding the following language to the Threshold for Reporting for Any Physical Threat: Threat to a facility that: Could affect an IROL (per FAC-014) OR Could result in the need for actions to avoid and Adverse Reliability Impact This new language would be consistent with the reporting threshold for a Damage event.
Response: The SDT thanks you for your comment. The SDT has updated Damage or destruction of a facility into 2 different thresholds: **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT		

Organization	Yes or No	Question 2 Comment
envisions that entities could further define what a suspected intentional human action is within their Operating Plan.		
PNGC Comment Group	Yes	We agree with reservations. Our comments are below and we are seeking clarification of the Applicability section of the standard. We are voting "no" but if slight changes are made to the applicability section we will change our votes to "yes". NERC and FERC have expressed a willingness to address the compliance burden on smaller entities that pose minimal risk to the Bulk Electric System. The PNGC Comment Group understands the SDT's intent to categorize reportable events and achieve an Adequate Level of Reliability while also understanding the costs associated. Given the changes made by the SDT to Attachment 1, we believe you have gone a long way in alleviating the potential for needless reporting from small entities that does not support reliability. **The SDT has taken your concerns into consideration (as directed by FERC) and believes that "small entities" will most likely not meet the thresholds for reporting since items are predicated on "Facilities."** One remaining concern we have are potential reporting requirements in the Event types; "Damage or destruction of a Facility" and "Any physical threat that could impact the operability of a Facility". These two event types have the following threshold language; "Results from actual or suspected intentional human action" and "Threat to a Facility excluding weather related threats" respectively. We believe these two thresholds could lead to very small entities filing reports for events that really are not a threat to the BES or Reliability. **The SDT has updated Damage or destruction of a facility into 2 different thresholds:** **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:**

		destroyed" intentionally by a human. **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** Note: For vandalism, sabotage or suspected terrorism, even the smallest entities will file a police report and at that point local law enforcement will follow their terrorism reporting procedures if necessary, as you've rightly indicated in your "Law Enforcement Reporting" section. We believe extraneous reporting could be alleviated with a small tweak to the Applicability section for 4.1.9 to exclude the smallest Distribution Providers. As stated before, even if these very small entities are excluded from filing reports under EOP-004-2, threats to Facilities that they may have will still be reported to local law enforcement while not cluttering up the NERC/DOE reporting process for real threats to the BES. Our suggested change:4.1.9. Distribution Provider: with peak load >= 200 MWs. The PNGC Comment Group arrived at the 200 MWs threshold after reviewing Attachment 1, Event "Loss of firm load for >= 15 Minutes". We agree with the SDT's intent to exclude these small firm load losses from reporting through EOP-004-2.Another approach we could support is that taken by the Project 2008-06 SDT with respect to Distribution Provider Facilities:4.2.2 Distribution Provider: One or more of the Systems or programs designed, installed, and operated for the protection or restoration of the BES:

Organization	Yes or No	Question 2 Comment
		The SDT has discussed this very issue and would like to point out that the Threshold for Reporting limits are the same as in the enforceable Reliability Standard, EOP-004-1. The SDT believes that small entities (200mw or less) would not be applicable to this event. The SDT has attempted to place these types of limits to reduce small entities from having these applicable reporting requirements. o A UFLS or UVLS System that is part of a Load shedding program required by a NERC or Regional Reliability Standard and that performs automatic Load shedding under a common control system, without human operator initiation, of 300 MW or more o A Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is required by a NERC or Regional Reliability Standard o A Protection System that applies to Transmission where the Protection System is required by a NERC or Regional Reliability Standard o Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started. We're not advocating this exact language but rather the approach that narrows the focus to what is truly impactful to reliability while minimizing costs and needless compliance burden. One last issue we have is with the language in Attachment 1, Event "BES Emergency resulting in automatic firm load shedding." Under "Entity with Reporting Responsibility", you state that the DP or TOP that "implements" automatic load shedding of >= 100 MWs must report (Also please review the CIP threshold of 300 MWs as this may be a more appropriate threshold). We believe rather than specifying a DP or TOP report, it would be appropriate for the UFLS Program Owner to file the report per EOP-004-2. In our situation we have DPs that own UFLS relays that are part of the TOP's program and this could lead to confusing reporting requirements. Also we don't believe that an entity can "Implement" "Automatic" load shedding but this is purely a semantic issue. **The SDT has updated Damage or destruction of a facility into 2 different thresholds:** **The SDT removed all language under "Entity with Reporting Responsibility" with**

Response: The SDT thanks you for your comment.		
United Illuminating Company	Yes	The phrasing of the event labeled as Event Damage or Destruction of a Facility may be improved in the Threshold for Reporting Column. Suggest the introduction sentence for this event should be phrased as Where the Damage or Destruction of a Facility: etc. The rationale for the change is that as written it is unclear if the list that follows is meant to modify the word Facilities or the overall introductory sentence. The confusion being caused by the word That. What is important to be reported is if a Facility is damaged and then an IROL is affected it should be reported, not that if a Facility is comprising an IROL Facility is damaged but there is no impact on the IROL.

Organization	Yes or No	Question 2 Comment
		The SDT has updated Damage or destruction of a facility into 2 different thresholds: The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency. This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System). This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection. The SDT also developed another to read:

Organization	Yes or No	Question 2 Comment
		"Damage or destruction of its Facility that results from actual or suspected intentional human action." **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.** **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** Second, the top of each table is the phrase Submit EOP-004 Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within one hour of recognition of the event. This creates the requirement that the actual form is required to be transmitted to parties other than NERC/DOE. The suggested revision is Submit EOP-004 Attachment 2 or DOE-OE-417 report to NERC and/or DOE, and complete notification to other organizations identified pursuant to Requirement R1 Part 1.2 within one hour etc.. **The SDT has revised Attachment 2 heading to read "Use this form to report events. The Electric Reliability Organization will accept the DOE OE-417 form in lieu of this**

Organization	Yes or No	Question 2 Comment
		form if the entity is required to submit an OE-417 report. Submit reports to the ERO via one of the following: e-mail: systemawareness@nerc.net voice: 404-446-9780." Based on industry comments.
Response: The SDT thanks you for your comment.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration LP agrees with the removal of nearly all one hour reporting requirements. In our view there must be a valid contribution expected of the recipients of any reporting that takes place this early in the process. Any non-essential communications will impede the progress of the front-line personnel attempting to resolve the issue at hand - which has to be the priority. Secondly, there is a risk that early reporting may include some speculation of the cause, which may be found to be incorrect as more information becomes available. Recipients must temper their reactions to account for this uncertainty. In fact, Ingleside Cogeneration LP recommends that the single remaining one-hour reporting scenario be eliminated. It essentially defers the reporting of a cyber security incident to CIP-008 anyways, and may even lead to a multiple violation of both Standards if exceeded.
Response: The SDT thanks you for your comment. The SDT agrees and has removed the one-hour reporting requirement based on comments received.		
Springfield Utility Board	Yes	o Spell out Requirement 1, rather than "parties per R1" in NOTE. o On page 44, "Examples of such events include" should say, "include, but are not limited to". o SUB appreciates clarification regarding events, particularly the discussion regarding "sabotage", and recommends listing and defining "Event" in Definitions and Terms Used in NERC Standards. **The SDT has stated in our "Consideration of Issues and Directives – March 15, 2012" that was posted with the last posting stated:** **The SDT has not proposed a definition for inclusion in the NERC Glossary because it is impractical to define every event that should be reported without listing them in**

Organization	Yes or No	Question 2 Comment
		the definition. Attachment 1 is the de facto definition of "event." The SDT considered the FERC directive to "further define sabotage" and decided to eliminate the term sabotage from the standard. The team felt that without the intervention of law enforcement after the fact, it was almost impossible to determine if an act or event was that of sabotage or merely vandalism. The term "sabotage" is no longer included in the standard and therefore it is inappropriate to attempt to define it. The events listed in Attachment 1 provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The SDT believes that this is an equally effective and efficient means of addressing the FERC Directive. **The SDT has discussed this with FERC Staff and we agree that sabotage could be a state of mind and therefore the real issue was there an event or not.** o The Guideline and Technical Basis provides clarity, and SUB agrees with the removal of "NERC Guideline: Threat and Incident Reporting". o In the flow chart on page 9 there are parallel paths going from "Refer to Ops Plan for Reporting" to the 'Report Event to ERO, Reliability Coordinator' via both the Yes and No response. It seems like the yes/no decision should follow after "Refer to Ops Plan" for communication to law enforcement. **The SDT has offered the flowchart as an example of how an entity could handle the notification to law enforcement agencies. There is no requirement to follow the flowchart. Entities are free to develop their own procedures based upon their needs to report.**
Response: The SDT thanks you for your comment.		
PPL Electric Utilities	Yes	PPL EU thanks the SDT for the changes made in this latest proposal. We feel our prior comments were addressed. Regarding the event 'Transmission Loss': For your consideration, please consider adding a footnote to the event 'Transmission Loss' such that weather events do not need to be reported. Also please consider including 'operation contrary to design' in the threshold language. E.g. consistent with the

Organization	Yes or No	Question 2 Comment
		NERC Event Analysis table, the threshold would be, 'Unintentional loss, contrary to design, of three or more BES Transmission Facilities.'
Response: The SDT thanks you for your comment. The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."**		
Tacoma Power	Yes	Tacoma Power supports the revisions. It appears that all agencies and entities are willing to support the use of the DOE Form OE-417 as the initial notification form (although EOP-004 does include their own reporting form as an attachment to the Standard). Tacoma is already using the OE-417 and distributing it to all applicable Entities and Agencies.
Response: The SDT thanks you for your comment.		
Seattle City Light	Yes	This is a great improvement over the prior CIP and EOP versions. However, please see #4 for overall comment.
Response: The SDT thanks you for your comment. Please review the response to Question 4.		
MEAG Power	Yes	This is a great improvement over the prior CIP and EOP versions. However, please see #4 for overall comment.
Response: The SDT thanks you for your comment. Please review the response to Question 4.		
Public Utility District No. 1 of Snohomish County		This is an excellent improvement over the prior CIP and EOP versions. However, please see #4 for overall comment.

3. **The SDT has proposed a new Section 812 to be incorporated into the NERC Rules of Procedure. Do you agree with the proposed addition? If not, please explain in the comment area below.**

Summary Consideration: The DSR SDT proposed a revision to the NERC Rules of Procedure (Section 812). The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.

Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	No	The proposed new section does not contain specifics of the proposed system nor the interfacing outside of the system to support the report collecting.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
SPP Standards Review Group	No	We have two concerns about the proposed change to the RoP. One, we have concerns that our information and data will be circulated to an as yet undetermined audience which appears to be solely under NERC's control. Secondly, there isn't sufficient detail in the clearinghouse concept to support comments at this time.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
ISO/RTO Standards Review Committee	No	The SRC offers comments regarding the posted draft requirements; however, by so doing, the SRC does not indicate support of the proposed requirements. Following these comments, please see the latter part of the SRC's response to Question 4 below for an SRC proposed alternative approach: The SRC is unable to comment on the proposed new section as the section does not contain any description of the proposed process or the interface requirements to support the report collecting system. We reserve judgment on this proposal and our right to comment on the

Organization	Yes or No	Question 3 Comment
		proposal when the proposed addition is posted.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
ACES Power Marketing Standards Collaborators	No	(1) It is not clear to us what is the driving the need for the Rules of Procedure proposal. NERC is already collecting event and disturbance reports without memorializing the change in the Rules of Procedure. (2) The language potentially conflicts with other subsections in Section 800. For instance, the proposal says that the system will apply to collect report forms "for this section". This section would refer to Section 800. Section 800 covers NERC alerts and GADS. Electronic GADS (eGADS) already has been established to collect GADS data? Will this section cause NERC to have to incorporate eGADS into this report collection system? Incorporating NERC Alerts is also problematic because when reports are required as a result of a NERC alert, the report must be submitted through the NERC Alert system.(3) The statement that "a system to collect report forms as established for this section or standard" causes additional confusion regarding to which standards it applies. Does it only apply to this new EOP-004-2 or to all standards? If it applies to all standards, does this create a potential issue for CIP-008-3 R1.3 which requires reporting to the ES-ISAC and not this clearinghouse?
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Seattle City Light	No	Seattle City Light follows MEAG and believes this type of activity and process is better suited to NAESBE than it is to NERC Compliance.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Hydro One	No	The proposed new section does not contain specifics of the proposed system nor the

Organization	Yes or No	Question 3 Comment
		interfacing outside of the system to support the report collecting.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
CenterPoint Energy	No	CenterPoint Energy does not agree with the SDT's proposed section 812. The proposal for NERC to establish a system that will "...forward the report to the appropriate NERC departments, applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, regulatory agencies as necessary. This can include state, federal, and provincial organizations." is redundant with the draft Standard. Responsible entities are already required to report applicable events to NERC, applicable regional entities, registered entities, and appropriate governmental, law enforcement, and regulatory agencies. CenterPoint Energy believes if the SDT's intent is to require NERC to distribute these system event reports, then EOP-004-2 should be revised to require responsible entities to only report the event to NERC. As far as distribution to appropriate NERC departments, CenterPoint Energy believes that is an internal NERC matter and does not need to be included in the Rules of Procedure.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Arkansas Electric Cooperative Corporation	No	AECC supports the comments submitted by ACES Power Marketing.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
National Rural Electric Cooperative Association (NRECA)	No	NRECA is concerned with the drafting team's proposal to add a new Section 812 to the NERC ROP. NRECA does not see the need for the drafting team to make such a proposal as it relates to the new EOP-004 that the drafting team is working on. The

Organization	Yes or No	Question 3 Comment
		requirements in the draft standard clearly require what is necessary for this Event Reporting standard. NRECA requests that the drafting team withdraw its proposed ROP Section 812 from consideration. The proposed language is unclear to the point of not being able to understand who is being required to do what. Further, the language is styled in more of a proposal, and not in the style of what would appropriately be included in the NERC ROP. Finally, the SDT has not adequately supported the need for such a modification to the NERC ROP. Without that support, NRECA is not able to agree with the need for this addition to the ROP. Again, NRECA requests that the drafting team withdraw its proposed ROP Section 812 from consideration.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Occidental Power Services, Inc.	No	This section should reference the confidentiality requirements in the ROP and should have a statement about the system for collection and dissemination of disturbance reports being “subject to the confidentiality requirements of the NERC ROP.”
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Pepco Holdings Inc	No	This could create confusion.This new ROP section states that “... the system shall then forward the report to the appropriate NERC departments, applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, regulatory agencies as necessary.” Standard Section R1.2 states “A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity’s Reliability Coordinator; law enforcement, governmental or provincial agencies.” If NERC is going to be the “clearinghouse” forwarding reports to the RE and DOE, does that mean that

Organization	Yes or No	Question 3 Comment
		the reporting entity only needs to make a single submission to NERC for distribution? If the reporting entity is required to make all notifications, per R1.2, what is the purpose of NERC's duplication of sending out reports? It would be very helpful to the reporting entities if R1.2 was revised to state that NERC would forward the event form to the RE and DOE and the reporting entity would only be responsible for providing notice verbally to its associated BA, TOP, RC, etc. as appropriate and for notifying appropriate law enforcement as required.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Independent Electricity System Operator	No	We are unable to comment on the proposed new section as the section does not contain any description of the proposed process or the interface requirements to support the report collecting system. We reserve judgment on this proposal and our right to comment on the proposal when the proposed addition is posted.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
MidAmerican Energy	No	See the NSRF comments. The NERC Rules of Procedure Section 807 already addresses the dissemination of Disturbance data, as does Appendix 8 Phase 1 with the activation of NERC's crisis communication plan, and the ESISAC Concept of Operations. The addition of proposed Section 812 is not necessary. The Reliability Coordinator, through the use of the RCIS, would disseminate reliability notifications if it is in turn notified per R1.2. (As stated in the in the Clean copy of EOP-004-2)
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Public Utility District No. 1 of Snohomish County	No	This type of activity and process is better suited to NAESBE than it is to NERC Compliance.

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Illinois Municipal Electric Agency	No	Illinois Municipal Electric Agency supports comments submitted by ATC.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Amercican Transmission Company, LLC	No	ATC believes that the NERC Rules of Procedure Section 807 already addresses the dissemination of Disturbance data, as does Appendix 8 Phase 1 with the activation of NERC's crisis communication plan, and the ESISAC Concept of Operations. The addition of proposed Section 812 is not necessary. The Reliability Coordinator, through the use of the RCIS, would disseminate reliability notifications if it is in turn notified per R1.2. (As stated in the in the Clean copy of EOP-004-2)
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Ameren	No	If the SDT keeps new Section 812 we suggest to the SDT a wording change for the second sentence, underlined: "Upon receipt of the submitted report, the system shall then forward the report to the appropriate NERC department for review. After review, the report will be forwarded to the applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, regulatory agencies as necessary."
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
We Energies	No	Section 812 refers to the section as a standard and as a Procedure. That is not correct.Section 812 reads to me as if NERC (the system) will be forwarding everything

Organization	Yes or No	Question 3 Comment
		specified anywhere in RoP 800.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Exelon Corporation and its affiliates	No	While we don't have any immediate objection to revising the Rules of Procedures (ROP) to allow for report collecting under Section 800 relative to the EOP-004 standard, the proposed language is unclear and confusing. Please consider the following revision:"812. NERC Reporting Clearinghouse NERC will establish a system to collect reporting forms as required for Section 800 or per FERC approved standards from any Registered Entities. NERC shall distribute the reports to the appropriate governmental, law enforcement, regulatory agencies as required per Section 800 or the applicable standard."Further, NERC should post ROP revisions along with a discussion justifying the revision for industry comment specific to the ROP. There may be significant implications to this revision beyond the efforts relative to EOP-004.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Tacoma Power	No	Tacoma Power disagrees with the requirement to perform annual testing of each communication plan. We do not see any added value in performing annual testing of each communication plan. There are already other Standard requirements to performing routine testing of communications equipment and emergency communications with other agencies.The "proof of compliance" to the Standard should be in the documentation of the reports filed for any qualifying event, within the specified timelines and logs or phone records that it was communicated per each specified communication plan.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		

Organization	Yes or No	Question 3 Comment
Seattle City Light	No	Seattle City Light follows MEAG and believes this type of activity and process is better suited to NAESBE than it is to NERC Compliance.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
MEAG Power	No	This type of activity and process is better suited to NAESBE than it is to NERC Compliance.

Organization	Yes or No	Question 3 Comment
to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Kansas City Power & Light	No	Rules stipulating the extent of how reported information will be treated by NERC is an important consideration, however, the proposed section 812 proposes to provide reports to other governmental agencies and regulatory bodies beyond that of NERC and FERC. NERC should be treating the event information reported to NERC as confidential and should not take it upon itself to distribute such information beyond the boundaries of the national interest at NERC and FERC.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Dominion	Yes	While Dominion supports this addition, we suggest adding to the sentence "NERC will establish a system to collect report forms as established for this section or reliability standard....."
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
MRO NSRF	Yes	ATC believes that the NERC Rules of Procedure Section 807 already addresses the dissemination of Disturbance data, as does Appendix 8 Phase 1 with the activation of NERC's crisis communication plan, and the ESISAC Concept of Operations. The addition of proposed Section 812 is not necessary. The Reliability Coordinator, through the use of the RCIS, would disseminate reliability notifications if it is in turn notified per R1.2. (As stated in the in the Clean copy of EOP-004-2)

Ingleside Cogeneration LP	Yes	Ingleside Cogeneration is encouraged by NERC's willingness to act as central data gathering point for event information. However, we see this only as a starting point.

Organization	Yes or No	Question 3 Comment
		There are still multiple internal and external reporting demands that are similar to those captured in EOP-004-2 - examples include the DOE, RAPA (misoperations), EAWG (events analysis), and ES-ISAC (cyber security). Although we appreciate the difference in reporting needs expressed by each of these organizations, there are very powerful reporting applications available which capture a basic set of data and publish them in multiple desirable formats. We ask that NERC spearhead this initiative - as it is a natural part of the ERO function.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
American Electric Power	Yes	While we have no objections at this point, we would like specific details on what our obligations would be as a result of these changes. For example, would the clearinghouse tool provide verifications that the report(s) had been received as well as forwarded? In addition, if DOE OE-417 is the form being submitted, would the NERC Reporting Clearinghouse forward that report to the DOE?
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
Springfield Utility Board	Yes	o SUB supports the new Section 812 being incorporated into the NERC ROP. This addition provides clarity for what is required by whom and takes away any possible ambiguity.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.		
FirstEnergy Corp	Yes	FE agrees but asks that the defined term “registered entities” in the second sentence be capitalized.
Response: The SDT thanks you for your comment. The SDT has learned that NERC has started a new effort to forward event reports

4. Do you have any other comment, not expressed in the questions above, for the SDT?

Summary Consideration: The DSR SDT received several suggestions for improvement to the standard. The DSR SDT has removed reporting of Cyber Security Incidents from EOP-004 and have asked the team developing CIP-008-5 to retain this reporting. Most of the language contained in the "Background" Section was moved to the "Guidelines and Technical Basis" Section. Minor language changes were made to the measures and the data retention section. Attachment 2 was revised to list events in the same order in which they appear in Attachment 1.

Organization	Yes or No	Question 4 Comment
Texas Reliability Entity		(1) The ERO and Regional Entities should not be included in the Applicability of this standard. The only justification given for including them was they are required to comply with CIP-008. CIP-008 contains its own reporting requirements, and no additional reliability benefit is provided by including ERO and Regional Entities in EOP-004. Furthermore, stated NERC policy is to avoid writing requirements that apply to the ERO and Regional Entities, and we do not believe there is any sufficient reason to deviate from that policy in this standard. **The SDT is revising the standard to not contain reporting for Cyber Security Incidences. Under the revisions, CIP-008-3 and successive versions will retain the reporting requirements. The Applicability section has been revised to address this situation.** (2) Under Compliance, in section 1.1, all the words in "Compliance Enforcement Authority" should be capitalized. **The SDT agrees and has adopted this suggestion.** (3) Under Evidence Retention, it is not sufficient to retain only the "date change page" from prior versions of the Plan. It is not unduly burdensome for the entity to retain all prior versions of its "event reporting Operating Plan" since the last audit, and it should be required to do so. (What purpose is supposed to be served by

Organization	Yes or No	Question 4 Comment
		retaining only the "date change pages"?) **The SDT has revised the standard to require the retention of previous versions, not just the date change page.** (4) The title of part F, "Interpretations," is incorrect on page 23. Should perhaps be "Associated Documents." **The SDT has revised Part F and it now contains the Guidelines and Technical Basis.**
Response: The SDT thanks you for your comment.		
ACES Power Marketing Standards Collaborators		(1) IC, TSP, TO, GO, and DP should be all removed from the applicability of the standard. Previous versions of the standard did not apply to them and we see no reason to expand applicability to them. IC and TSP are not even mentioned in any of the "Entity with Reporting Responsibility" sections. For the sections that do not mention specific entities, IC and TSP would have no responsibility for any of the events. The TO and GO are not operating entities so the reporting should not apply to them. DP was not included in any previous versions of CIP-001 or EOP-004. Any information (such as load) that was necessary regarding DPs was always gathered by the BA or TOP and included in their reports. There is no indication that this process was not working and, therefore, it should not be changed. Furthermore, including the DP potentially expands the standard outside of the Bulk Electric System which is contrary to recent statements that NERC Legal has made at the April 11 and 12, 2012 SC meeting. Their comments indicated the standards are written for the Bulk Electric System. What information does a DP have to report except load loss which can easily be reported by the BA or TOP? **The SDT disagrees with some of your suggestions. As the standard is to report events associated with physical assets, it is incumbent for the asset owners to file the reports associated with any events. Thus DP, TO, and GO were added to the Applicability of this standard. Their perspectives on events can be useful in evaluating situational awareness and providing NERC with information on lessons learned. Further, this standard limits reporting to BES Elements except where**

Organization	Yes or No	Question 4 Comment
		noted. This is consistent with NERC and SC Standard Process design. Where this standard had included other functional registrations associated with the inclusion of CIP-008; those registrations have been removed from the standard. (2) Measure M2 needs to clarify an attestation is an acceptable form of evidence if there are no events. **Registered Entities must determine how to best demonstrate they have met the performance obligation of a requirement. The use of an attestation statement is already permitted and recognized with the NERC Compliance Program if that is the best means of demonstrating your performance under the requirement. Auditors will then assess whether or not an attestation meets the requirement in one's audit. Attestations cannot be specifically permitted for use.** (3) The rationale box for R3 and R4 should be modified. It in essence states that updating the event reporting Operating Plan and testing it will assure that the BES remains secure. While these requirements might contribute to reliability, these two requirements collectively will not assure BES security and stability. **The SDT has revised the rationale box language based upon the changes it has made to the requirements. It should be noted that upon acceptance of the standard, the language in the rationale boxes are removed from the standard.** (4) We disagree with the VSLs for Requirement R2. While the VSLs associated with late reporting for a 24-hour reporting requirement include four VSLs, the one-hour reporting requirement only includes three VSLs. There seems to be no justification for this inconsistency. Four VSLs should be written for the one-hour reporting requirement. **As the standard has been revised to remove the one-hour reporting provision, your suggestion is moot.** (5) Reporting of reportable Cyber Security Incidents does not appear to be fully coordinated with version 5 of the CIP standards. For instance, EOP-004-2 R1, Part 1.2 requires a process for reporting events to external entities and CIP-008-5 Part 1.5

Organization	Yes or No	Question 4 Comment
		requires identifying external groups to which to communicate Reportable Cyber Security Incidents. Thus, it appears the Cyber Security Incident response plan in CIP-008-5 R1 and the event reporting Operating Plan in EOP-004-2 R1 will compel duplication of external reporting at least in the document of the Operating Plain and Reportable Cyber Security Incident response plan. This needs to be resolved. **While the SDT had worked this through with the other standard team to resolve this concern; it is now irrelevant, as reporting of Cyber Security Incidences are no longer part of EOP-004-2.** (6) In the effective date section of the implementation plan, the statement that the prior version of the standard remains in effect until the new version is accepted by all applicable regulatory authorities is not correct. In areas where regulatory approval is required, it will only remain in effect in the areas where the regulator has not approved it. **The SDT finds that the two statements are making the same point; that the new standard does not become enforceable until all regulatory authorities have approved it.** (7) On page 6 in the background section, the statement attributing RCIS reporting to the TOP standards is not accurate. There is no requirement in the TOP standards to report events across RCIS. In fact, the only mention of RCIS in the standards occurs in EOP-002-3 and COM-001-1.1. **The SDT agrees and adopts your suggestion.** (8) On page 6 in the background section, the first sentence of the third paragraph is not completely aligned with the purpose statement of the standard. The statement in the background section indicates that the reliability objective "is to prevent outages which could lead to Cascading by effectively reporting events". However, the purpose states that the goal is to improve reliability. We think it would make more sense for the reliability objective to match the purpose statement more closely. **The SDT has revised the Background section to match the standard's purpose**

Organization	Yes or No	Question 4 Comment
		statement. (9) On page 7 in the first paragraph, "industry facility" should be changed to "Facility". **The SDT agrees and adopts your suggestion.**
Response: The SDT thanks you for your comment.		
Seattle City Light		1) Seattle City Light follows MEAG and questions if these administrative activities better should be sent over to NAESB? R1: There is merit in having a plan as identified in R1, but is this a need to support reliability or is it a business practice? Should it be in NAESB's domain? R2, R3 & R4: These are not appropriate for a Standard. If you don't annually review the plan, will reliability be reduced and the BES be subject to instability, separation and cascading? If DOE needs a form filled out, fill it out and send it to DOE. NERC doesn't need to pile on. Mike Moon and Jim Merlo have been stressing results and risk based, actual performance based, event analysis, lessons learned and situational awareness. EOP-004 is primarily a business preparedness topic and identifies administrative procedures that belong in the NAESB domain. **The SDT believes this standard is needed to provide Situational Awareness and can help in providing lessons learned to the industry. The SDT has revised the requirements to address this need. While it may be appropriate to have NAESB to adopt this obligation at some in the future, the SDT was charged with addressing deficiencies at this time. The SDT has removed all references to filing reports to DOE from the earlier versions. Today's only reference provides for NERC's acceptance of the use of their form when it is appropriate.** 2) Seattle City Light finds that even though efforts were made to differentiate between sabotage vs. criminal damage, the difference still appears to be confusing. Sabotage clearly requires FBI notification, but criminal damage (i.e. copper theft, trespassing, equipment theft) is best handled by local law agencies. A key point on how to determine the difference is to always go with the evidence. If you have a hole in the fence and cut grounding wires, this would only require local law enforcement

Organization	Yes or No	Question 4 Comment
		notification. If there is a deliberate attack on a utility's BES infrastructure for intent of sabotage and or terrorism--this is a FBI notification event. One area where a potential for confusion arises is with the term "intentional human action" in defining damage. Shooting insulators on a rural transmission tower is not generally sabotage, but removing bolts from the tower may well be. Seattle understands the difficulty in differentiating these two cases, for example, and supports the proposed Standard, but would encourage additional clarification in this one area. **The SDT appreciates the concern you raise. The SDT decided early that trying to set a definition for sabotage across the continent would be impossible as there are many differing viewpoints; particularly within the law enforcement agencies. There was consensus that even if we were able to set a definition, it may be consistent or recognized by other agencies. Therefore, the SDT decided to set event types that warranted reporting. Entities best know who they have to report to and under what considerations those reports need to be submitted. This is basis for this standard. The SDT wanted to provide entities with the result that was necessary but not prescribe how to do it. This concept has been embraced throughout this project. We believe that entities can create a single or multiple contact lists that have the right people being notified when an event type occurs. The SDT has revised the language on "intentional human action" in Attachment 1 in an attempt to provide you the clarification you requested.**
Response: Thank you for your comment.		
Essential Power, LLC		1. As this Standard does not deal with real-time reporting or analysis, and is simply considered an after the fact reporting process, I question the need for the Standard at all. This is a process that could be handled through a change to the Rules of Procedure rather than through a Standard. Developing this process as a Reliability Standard is, in my opinion, contrary to the shift toward Reliability-Based Standards Development.2. I do not believe that establishing a reporting requirement improves the reliability of the BES, as stated in the purpose statement. The reporting requirement, however, would improve situational awareness. I recommend the

Organization	Yes or No	Question 4 Comment
		purpose statement be changed to reflect this, and included with the process in the NERC Rules of Procedure.
Response: The SDT thanks you for your comment. The SDT believes this standard is needed to provide Situational Awareness and can help in providing lessons learned to the industry. The SDT has revised the requirements to address this need. The vast majority of commenters support the Purpose statement as written.		
Georgia System Operations Corporation		a) Reporting most of these items ... o Does not "provide for reliable operation of the BES" o Does not include "requirements for the operation of existing BES facilities" o Is not necessary to "provide for reliable operation of the BES"... and is therefore not in accordance with the statutory and regulatory definitions of a Reliability Standard. They should not be in a Reliability Standard. Most of this is an administrative activity to provide information for NERC to perform some mandated analysis. **The SDT believes this standard is needed to provide Situational Awareness and can help in providing lessons learned to the industry. The SDT has revised the requirements to address this need.** b) A reportable Cyber Security Incident: Delete this item from the table. It is covered in another standard and does not need to be duplicated in another standard. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement.** c) Damage or destruction of a Facility: Entities MAY only need to slightly modify their existing CIP-001 Sabotage Reporting procedures from a compliance perspective of HAVING an Operating Plan but not from a perspective of complying with the Plan. A change from an entity reporting "sabotage" on "its" facilities (especially when the common understanding of CIP-001 is to report sabotage on facilities as "one might consider facilities in everyday discussions") to reporting "damage on its Facilities" (as defined in the Glossary) is a significant change. An operator does not know off the top of his head the definition of Facility or Element. He will not know for any particular electrical device whether or not reporting is required. Although the term is

Organization	Yes or No	Question 4 Comment
		useful for legal and regulatory needs, it is problematic for practical operational needs. This creates the need for a big change in guidance, training, and tools for an operator to know which pieces of equipment this applies to. There is the need to translate from NERC-ese to Operator-ese. Much more time is needed to implement. The third threshold ("Results from actual or suspected intentional human action") perpetuates the problem of knowing the human's intention. Also, what if the action was intended but the result was not intended? The third threshold is ambiguous and subject to interpretation. The original intent of this project was to get away from the problem of the term sabotage due to its ambiguity and subjectivity. This latest change reverses all of the work so far toward that original goal. Instead of the drafted language, change this item to reporting "Damage or destruction of a Facility and any involved human action" and use only the first two threshold criteria. **The SDT has stated in our "Consideration of Issues and Directives – March 15, 2012" that was posted with the last posting stated:** **The SDT has not proposed a definition for inclusion in the NERC Glossary because it is impractical to define every event that should be reported without listing them in the definition. Attachment 1 is the de facto definition of "event." The SDT considered the FERC directive to "further define sabotage" and decided to eliminate the term sabotage from the standard. The team felt that without the intervention of law enforcement after the fact, it was almost impossible to determine if an act or event was that of sabotage or merely vandalism. The term "sabotage" is no longer included in the standard and therefore it is inappropriate to attempt to define it. The events listed in Attachment 1 provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The SDT believes that this is an equally effective and efficient means of addressing the FERC Directive.** **The SDT has discussed this with FERC Staff and we agree that sabotage could be a**

Organization	Yes or No	Question 4 Comment
		state of mind and therefore the real issue was there an event or not. **The SDT also uses the NERC defined term of "Facility: A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)."** d) Any physical threat that could impact the operability of a Facility: See comment above about the term "Facility" and the need for a much longer implementation time. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to**

Organization	Yes or No	Question 4 Comment
		operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility. e) Transmission loss: This item is very unclear. What is meant by "loss?" Above, it says to report damage or destruction of a Facility. This says to report the loss of 3 Facilities. Is the intent here to report when there are 3 or more Facilities that are unintentionally and concurrently out of service for longer than a certain threshold of time? The intent should not be to include equipment failure? Three is very arbitrary. An entity with a very large footprint with a very large number of electrical devices is highly likely to have 3 out of service at one time. An entity with very few electrical devices is less likely to have 3. Delete the word Transmission. It is somewhat redundant. A Facility is BES Element. I believe all BES Elements are Transmission Facilities. A Facility operates as a single "electrical device." What if more than 3 downstream electrical devices are all concurrently out of service due to the failure of one upstream device? Would that meet the criteria? A situation meeting the criteria will be difficult to detect. Need better operator tools, specific procedures for this, training, and more implementation time. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state"** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** f) The implementation plan says current version stays in effect until accepted by ALL regulatory authorities but it also says that the new version takes effect 12 months after the BOT or the APPLICABLE authorities accept it. It is possible that ONE regulatory authority will not accept it for 13 months and both versions will be in

Organization	Yes or No	Question 4 Comment
		effect. It is also possible for ALL regulatory authorities to accept it at the same time, the current version to no longer be in effect, but the new version will not be in effect for 12 months. **The SDT intends for this standard to not become enforceable until all regulatory authorities have approved it. The SDT will work with NERC and others to ensure a timely enforcement period without overlap.**
Response: Thank you for your comment.		
We Energies		Applicability: Change Electric Reliability Organization to NERC or delete Regional Entity. The ERO is NERC and all the Regional Entities.R1.2: The ERO is NERC and all the REs. If I report to any one on the REs (only and not to NERC), I have reported to the ERO. Change ERO to NERC. M1 refers to R1.1 and R1.2 as Parts. It would be clearer to refer to them as requirements or sub-requirements. **The SDT is limited to listing functional registrations in the Applicability section. The applicable entities are the ERO and Regional Entity, not NERC. The SDT notes that the Applicability section has nothing to do with the reporting obligations. The Applicability section denotes who has obligations within the standard to report. The Applicability section has been revised in accordance with comments received on who needs to report on event types.** M2: Add a comma after "that the event was reported" and "supplemented by operator logs". It will be easier to read. **The SDT has revised the requirement and associated language.** R3: This should be clarified to state that no reporting will be done for the annual test, not just exclude the ERO. **The SDT has revised the requirement.** M4: An annual review will not be time stamped. **The SDT has removed the time-stamp provision.**

Organization	Yes or No	Question 4 Comment
Response: The SDT thanks you for your comment.		
City of Austin dba Austin Energy		Austin Energy makes the following comments: (1) Comment on the Background section titled "A Reporting Process Solution - EOP-004": This section includes the sentence, "Essentially, reporting an event to law enforcement agencies will only require the industry to notify the state OR PROVINCIAL OR LOCAL level law enforcement agency." (emphasis added) The corresponding flowchart includes a step, "Notification Protocol to State Agency Law Enforcement." Austin Energy requests that the SDT update the flowchart to match the language of the associated paragraph and include "state or provincial or local" agencies. **The SDT wishes to point out that the flowchart is an example only – it was not meant to show every permutation. The entity can choose to use the flowchart or develop one for their own use.** (2) Comments on VSLs: Austin Energy recommends that the SDT amend the VSLs for R2 to include the "recognition of" events throughout. That is, update the R2 VSLs to state "... X hours after "recognizing" an event ..." in all locations where the phrase occurs. **The DSR SDT believes the current language is sufficient as Table 1 clearly states that the reporting 'clock' starts after recognition of the event.** (3) Austin Energy has a concern with the inclusion of the word "damage" to the phrase "damage or destruction of a Facility." We agree that any "destruction" of a facility that meets any of the three criteria be a reportable event. However, if the Standard is going to include "damage," some objective definition for "damage" (that sets a floor) ought to be included. Much like the copper theft issue, we do not see the benefit of reporting to NERC vandalism that does not rise to a certain threshold (e.g. someone who takes a pot shot at an insulator) unless the damage has some tangible impact on the reliability of the BES or is an act of an orchestrated sabotage (e.g.

Organization	Yes or No	Question 4 Comment
		removal of a bolt in a transmission structure). **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** **The SDT removed all language under "Entity with Reporting Responsibility," with**

Organization	Yes or No	Question 4 Comment
		the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Damage or destruction of its Facility that results from actual or suspected intentional human action."** **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.** **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** (4) Austin Energy voted to approve the revised Standard because it is an improvement over the existing Standard. In light of FERC's comments in Paragraph 81 of the Order approving the Find, Fix, Track and Report initiative, however, Austin Energy would propose that this Standard is the type of Standard that does not truly

Organization	Yes or No	Question 4 Comment
		enhance reliability of the BES and is, instead, an administrative activity. As such, we recommend that NERC consider whether EOP-004-2 ought to be retired. **The SDT appreciates the suggestion; however, we note that a standard cannot be retired prior to its effective and enforcement dates. Further, the SDT has been charged with addressing deficiencies that are present in current standards which the industry has determined to be needed through approval of the SAR. If the P81 process should ultimately decide to retire this standard, then the process will have made that decision. The SDT cannot presume that the P81 effort will become effective.**
Response: The SDT thanks you for your comment.		
Bonneville Power Administration		BPA believes that the VSL should allow for amending the form after a NERC specified time period without penalty and suggests that a window of 48 hours be given to amend the form to make adjustments without needing to file a self report. Should the standard be revised to allow a time period for amending the form without having to file a self report, BPA would change its negative position to affirmative.
Response: The SDT thanks you for your comment. The SDT would like to point that a window is not needed as the standard requires a report at a 24-hour time frame which provides information on what is known at the time. The standard does not require any follow up or update report. If the entity wishes to file a follow up report, it can do so on its own. A self report should only be needed if the 24-hour report was not filed.		
CenterPoint Energy		CenterPoint Energy proposes that the purpose be enhanced to reflect risk and response. For example, the purpose could read “To sustain and improve reliability of the Bulk Electric System by identifying common risks reported by Responsible Entities as a source of lessons learned.”In the Background section under Law Enforcement Reporting, “the” should be added in front of “Bulk Electric System”. Also under the Background section - “Present expectations of the industry under CIP-001-1a”, CenterPoint Energy is not aware of any current annual requirements for CIP-001 and suggests that this section be revised to reflect that fact. CenterPoint Energy strongly

Organization	Yes or No	Question 4 Comment
		believes that the Violation Severity Levels (VSL) should not be high or severe unless an Adverse Reliability Impact occurred. CenterPoint Energy is requesting that Requirement R2 be deleted and the phrase, "as a result of not implementing the plan/insufficient or untimely report, an Adverse Reliability Impact occurred" be added to the Requirement R1 VSL. Regarding the VSL for Requirement R4, the Violation Risk Factor should be "Lower" and read "the entity did not perform the annual test of the operating plan" as annual is to be defined by the entity or according to the CAN-0010.
Response: The SDT thanks you for your comment. The vast majority of commenters support the Purpose statement as written. The missing 'the' has been added to the background section under 'Law Enforcement Reporting.' 'Annual' has been changed to 'These'. VSLs refer to how closely the entity met the requirements of the standard; it is the VRF that measures impact to reliability. The DSR SDT believes use of the high and severe VSLs is appropriate. R4 has been deleted along with its VRF/VSLs.		
Cowlitz County PUD		Cowlitz is pleased with changes made to account for the difficulties small entities have in regard to reporting time frames. Although Cowlitz is confident that the current draft is manageable for small entities, we propose that the resulting reports this Standard will generate will contain many insignificant events from the event types "Damage or destruction of a Facility," and "Any physical threat that could impact the operability of a Facility." In particular, examples would be limited target practice on insulators, car-pole accidents, and accidental contact from tree trimming or construction activities. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of a Facility within its Reliability Coordinator Area,**

Organization	Yes or No	Question 4 Comment
		Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency." **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of its Facility that results from actual or suspected intentional human action."** **This language gives the required guidance that if there is actual intentional human**

Organization	Yes or No	Question 4 Comment
		action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** Cowlitz suggests that at least a >= 100 MW (200 MW would be better) and/or >= N-2 impact threshold be established for these event types. Also, Cowlitz suggests the statement "results from actual or suspected intentional human action" be changed to "results from actual or suspected intentional human action to damage or destroy a Facility." A human action may be intentional which can result in damage to a facility, but the intent may have been of good standing, and not directed at the Facility. For example, the intent may have been to legally harvest a tree, or move equipment under a line. Cowlitz believes the above proposed changes would benefit the ERO, both in reduction of nuisance reports and possible violations over minimal to no impact BES events. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and**

Organization	Yes or No	Question 4 Comment
		identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.**
Response: The SDT thanks you for your comment.		
Colorado Springs Utilities		CSU is concerned with the word 'damage'. We support any 'destruction' of a facility that meets any of the three criteria be a reportable issue, but 'damage', if it's going to be included should have some objective definition that sets a baseline.
Response: The SDT thanks you for your comment. The SDT removed all language under "Entity with Reporting Responsibility,"		

Organization	Yes or No	Question 4 Comment
with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: "Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency." This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System). This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection. The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: "Damage or destruction of its Facility that results from actual or suspected intentional human action." This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1)		

Organization	Yes or No	Question 4 Comment
the situational awareness that the Facility was "damaged or destroyed" intentionally by a human. **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.**		
Dominion		Dominion believes that the reporting of "Any physical threat that could impact the operability of a Facility4" may overwhelm the Reliability Coordinator staff with little to no value since the event may have already passed. This specific event uses the phrase "operability of a Facility" yet "operability" is not defined and is therefore ambiguous. We do support the reporting to law enforcement and the ERO but do not generally support reporting events that have passed to the Reliability Coordinator. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility**

Organization	Yes or No	Question 4 Comment
		Do not report copper theft unless it degrades normal operations of a Facility." **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** Attachment 2; section 4 Event Identification and Description: The type of events listed should match the events as they are exactly written in Attachment 1. As it is currently written, it leaves room for ambiguity. **The SDT agrees and has adopted your suggestion.** M3 - Dominion objects to having to provide additional supplemental evidence (i.e. operator logs), and the SDT maybe want to include a requirement for NERC to provide a confirmation that the report has been received. **The SDT believes that you are referring to M2. We have added "which may be" prior to "supplemented by operator logs," indicating that this is optional. The SDT has opted not to develop a requirement for the ERO to provide receipt conformation of a report.**
Response: The SDT thanks you for your comment.		
Entergy		Entergy does not agree with the Time Horizon for R2. The rationale for R2 contains phrases related to situational awareness and keeping people/agencies aware of the "current situation." However, this standard is related to after the fact event reporting, not real-time reporting via RCIS, as discussed on page 6 of the red-lined standard. Therefore the time horizon for R2 should indicate that this is an after the

Organization	Yes or No	Question 4 Comment
		fact requirement expected to be performed either in 1 hour or 24 hours after an event occurs, not in the operations assessment time frame. This change should also be made on page 15 of the redline in the Table of compliance elements for R2. Page 18 of the redline document contains a VSL for R2 which states that it will be considered a violation if the Responsible Entity submitted a report in the appropriate timeframe but failed to provide all of the required information. It has long been the practice to submit an initial report and provide additional information as it becomes available. On page 24 of the redlined document, this is included in the following "...and provide as much information as is available at the time of the notification to the ERO..." But the compliance elements table now imposes that if the entity fails to provide ALL required information at the time the initial report is required, the entity will be non compliant with the standard. This imposes an unreasonable burden to the Reliability Entity. This language should be removed. The compliance element table for R3 and R4 make it a high or severe violation to be late on either the annual test or the annual review of the Operating plan for communication. While Entergy supports that periodically verifying the information in the plan and having a test of the operating plan have value, it does not necessarily impose additional risk to the BES to have a plan that exceeds its testing or review period by two to three months. This is an administrative requirement and the failure to test or review should be a lower or moderate VSL, which would be consistent with the actual risk imposed by a late test or review. On page 24 of the redlined draft, there is a statement that says "In such cases, the affected Responsible Entity shall notify parties per Requirement R1 and provide as much information as if available at the time of the notification..." Since R1 is the requirement to have a plan, and R2 is the requirement to implement the plan for applicable events, it seems that the reference in this section should be to Requirement R2, not Requirement R1.
Response: The SDT thanks you for your comment. There is no longer a requirement for this 'two-step' reporting. The initial report is the only report an entity must make. The note at the top of Attachment 1 is to give entities the flexibility to make a quick 'something big just happened, but I don't know the extent' phone call, but realistically the reporting time frame is 24 hours which should give ample time to make one written report using OE-417 or Attachment 2. You will also notice that the amount of		

Organization	Yes or No	Question 4 Comment
information you must provide is minimal – the idea is that this is a trigger for NERC or the Event Analysis process and they will contact you if further details are required. **VSLs refer to how closely the entity met the requirements of the standard; it is the VRF that measures impact to reliability. The DSRSDT believes use of the high and severe VSLs is appropriate. Also, R4 has been deleted along with its VRF/VSLs.**		
ERCOT		ERCOT has joined the IRC comments on this project and offers these additional comments. ERCOT supports the alternative approach submitted by the IRC. ERCOT requests that time horizons be added for each of the requirements as have been with other recent Reliability Standards projects. With regards to Attachment 1, ERCOT requests the following changes: o Modify “Generation loss” from “â‰¥ 1,000 MW for entities in the ERCOT or Quebec Interconnection” to “â‰¥ 1,100 MW for entities in the ERCOT Interconnection” and “â‰¥ 1,000 MW for entities in the Quebec Interconnection”. This is consistent with the DCS threshold and eliminates possible operator confusion since DCSs event are reported in the ERCOT interconnection at 80% of single largest contingency which equates to 1100 MW. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Total generation loss, within one minute, of ≥ 2,000 MW for entities in the Eastern or Western Interconnection** **OR** **≥ 1,000 MW for entities in the ERCOT or Quebec Interconnection.”** **The NERC SPM does allow TRE to apply for a variance if they have special concerns that GOPs should submit a report to the ERO.**

Organization	Yes or No	Question 4 Comment
		o Modify “Transmission loss” from “Unintentional loss of three or more Transmission Facilities (excluding successful automatic reclosing)” to “Inconsequential loss of three or more Transmission Facilities not part of a single rated transmission path (excluding successful automatic reclosing).” If a single line is comprised of 3 or more sections, this should not be part of what is reported here as it is intended to be when you have a single event trip of 3 or more transmission facilities that is not part of its intended design. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing).”** **The NERC SPM does allow TRE to apply for a variance if they have special concerns that GOPs should submit a report to the ERO.** o ERCOT requests review of footnote 1. The footnote does not seem appropriate in including an example of a control center as the definition of a BES facility does not include control centers. **The SDT removed all foot notes within Attachment based on comments received.**
Response: The SDT thanks you for your comment.		
FirstEnergy Corp		FE supports the standard and has the following additional comments and suggestions:1. Guideline/Technical Basis Section - FE requests the SDT add specific guidance for each requirement. Much of the information in this section is either included, or should be included in the Background section of the standard. One example of guidance that would help is for Requirement R3 on how an entity could

Organization	Yes or No	Question 4 Comment
		perform the annual test. The comment form for this posting has the following paragraph on pg. 2 which could be used as guidance for R3: "the annual test will include verification that communication information contained in the Operating Plan is correct. As an example, the annual update of the Operating Plan could include calling "others as defined in the Responsibility Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated. Note that there is no requirement to test the reporting of events to the Electric Reliability Organization and the Responsible Entity's Reliability Coordinator."2. With regard to the statement in the comment form (pg 2 paragraph 7)"Note that there is no requirement to test the reporting of events to the Electric Reliability Organization and the Responsible Entity's Reliability Coordinator.", requirement R3 only includes the ERO as an entity and should also include the Reliability Coordinator. 3. The measure M3 says that an entity can use an actual event as a test to meet R3. Does this mean just 1 actual event will meet R3, or is the intent that all possible events per 1.2 are tested? Would like some clarity on this measure.
Response: The SDT thanks you for your comment. The requirements have been revised and these revisions along with the 'Rationale' boxes should provide the clarity you seek.		
Indiana Municipal Power Agency		For 1.2 under R1, is the SDT leaving it up to the registered entities do decide which organizations will be contacted for each event listed in attachment 1 or do all of those organization need to be contacted for each event listed in attachment 1? The requirement needs to clearly communicate this clarification and be independent of the rationale language. Auditors will go by the requirement and not the rationale for the requirement. For 1.1 under R1, does each event need its own process of recognition or can one process be used to cover all the applicable events? The requirement needs to clearly communicate this clarification and be independent of the rationale language. Auditors will go by the requirement and not the rationale for the requirement. For 1.2 under R1, company personnel is used as an example but in the rationale for R1, the third line uses operating personnel. IMPA recommends

Organization	Yes or No	Question 4 Comment
		changing the example in 1.2 to operating personnel which is used in the current version of CIP-001.
Response: The SDT thanks you for your comment. The SDT does not believe that it has the ability (or desire) to programmatically prescribe whether entities have a single or multiple contact lists. Entities themselves know best who and under what conditions do reports need to be provided. Further, the industry in past comment periods, clearly indicated that they did not wish to have the SDT provide the "how."		
GTC		For R2, please clarify how an entity can demonstrate that no reportable events were experienced. GTC recommends an allowance for a letter of attestation within M2.
Response: Thank you for your comment. Registered Entities must determine how to best demonstrate they have met the performance obligation of a requirement. The use of an attestation statement is already permitted and recognized with the NERC Compliance Program if that is the best means of demonstrating your performance under the requirement. Auditors will then assess whether or not an attestation meets the requirement in one's audit. Attestations cannot be specifically permitted for use.		
Orange and Rockland Utilities, Inc.		Form EOP-004, Attachment 2: Event Reporting Form: Delete the Task words "or partial." Delete the Task words "physical threat that could impact the operability of a Facility." Make any changes to the VSL's necessary to align them with the reviewed wording provided above.
Consolidated Edison Co. of NY, Inc.		Form EOP-004, Attachment 2: Event Reporting Form: Delete the Task words "or partial." Delete the Task words "physical threat that could impact the operability of a Facility." Make any changes to the VSL's necessary to align them with the reviewed wording provided above.
Response: The SDT thanks you for your comment. The SDT has updated Attachment 2 to reflect the events listed in Attachment 1.		
NextEra Energy Inc		Given that Responsible Entities are already required by other Reliability Standards to communicate threats to reliability to their Reliability Coordinator (RC), NextEra does not believe that EOP-004-2 is a Reliability Standard that promotes the reliability of the bulk power system, as envisioned by Section 215 of the Federal Power Act.

Organization	Yes or No	Question 4 Comment
		Because an RC reporting requirement is already covered in other Standards, EOP-004-2 essentially is a reporting out requirement to the Regional Reliability Organization (RRO). NextEra does not agree that the reporting of events to the RROs should be subject to fines under the Reliability Standard regulatory framework. The reporting to RROs, as required by EOP-004-2, while informative and helpful for lessons learned, etc., is not necessary to address an immediate threat to reliability. In addition, NextEra does not believe it would be constructive to fine Responsible Entities for failure to report to a RRO within a mandated deadline during times when these entities are attempting to address potential sabotage on their system. NextEra would, therefore, prefer that the EOP-004-2 Standards Drafting Team be disbanded, and instead that EOP-004-2's reporting requirements be folded in to the event analysis reporting requirements. Therefore, NextEra requests that the new Section 812 be revised to include EOP-004-2 as a data request for lessons learn or for informational purposes only, and, also, for EOP-004-2 project to be disbanded.
Response: The SDT thanks you for your comment. While the SDT appreciates your viewpoint, the SDT has been charged with addressing deficiencies identified in current standards. The SDT believes that the standard will provide NERC with the situational awareness it needs as well as providing the industry valuable information through lessons learned.		
Illinois Municipal Electric Agency		Illinois Municipal Electric Agency supports comments submitted by Florida Municipal Power Agency.
Response: The SDT thanks you for your comment. Please review the response to that commenter.		
Florida Municipal Power Agency		In R1, bullet, it is a bit ambiguous whether the list of organizations to be communicated with is an exhaustive list (i.e.) or a list of examples (e.g.). The list is preceded by an "i.e." which indicates the former, but includes an "or" which indicates the latter. We are interpreting this as meaning the list is exhaustive as separated by semi-colons, but that the last phrase separated by commas is a list of examples. Is this the correct interpretation? **The SDT has made the required change concerning replacing "i.e." with "e.g."**

Organization	Yes or No	Question 4 Comment
		The Rules of Procedure language for data retention (first paragraph of the Evidence Retention section) should not be included in the standard, but instead referred to within the standard (e.g., "Refer to Rules of Procedure, Appendix 4C: Compliance Monitoring and Enforcement Program, Section 3.1.4.2 for more retention requirements") so that changes to the RoP do not necessitate changes to the standard. **The language that you mention is part of the standard boilerplate and is included in all standards. The SDT has chosen to keep the language as is at this time.**
Response: The SDT thanks you for your comment.		
Ingleside Cogeneration LP		Ingleside Cogeneration LP strongyly believes that LSEs that do not own BES assets should be excluded from the Applicability section of this standard.
Response: The SDT thanks you for your comment. The LSE obligation in this standard was tied to applicability in CIP-008 for cyber incident reporting. Reporting under CIP-008 is no longer part of EOP-004-2 so this applicability has been removed.		
Los Angeles Department of Water and Power		LADWP does not have any other comments at this time
Response: The SDT thanks you for your participation.		
Manitoba Hydro		Manitoba Hydro is voting negative on EOP-004-2 for the reasons identified in our response to Question 1. In addition, Manitoba Hydro has the following comments:(Background section) - The section has inconsistent references to EOP-004 (eg. EOP-004 and EOP-004-2 are used). Wording should be made consistent. (Background section) - The section references entities, and responsible entities. Suggest wording is made consistent and changed to Responsible Entities. (General comment) - References in the standard to 'Part 1.2' should be changed to R1.2 as it is unclear if Part 1.2 refers to, for example, R1.2 or part 1.2 'Evidence Retention'.

Organization	Yes or No	Question 4 Comment
		(M4) -Please clarify what is meant by 'date change page'.
Response: The SDT thanks you for your comment. The SDT appreciates the points you raise and we continually review the document to make sure the language is consistent and unambiguous.		
Southern Company Services		Move the Background Section (pages 4-9) to the Guideline and Technical Basis section. They are not needed in the main body of the standard. **The SDT agrees and adopts your suggestion.** Each "Entity with Reporting Responsibility" in the one-hour reporting table (p. 17) should be explicitly listed in the table, not pointed to another variable location. The criterion for "Threshold for Reporting" in the one-hour reporting table (p. 17) should be explicitly listed in the table, not pointed to another variable location. Please specify the voltage base against which the +/- 10% voltage deviation on a Facility is to be measured in the twenty-four hour reporting table (p. 19). **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Observed voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes ."** **This language clearly states that if the threshold is met, the entity needs to submit a report within 24 hours.**
Response: The SDT thanks you for your comment.		
Oncor Electric Delivery		Oncor takes the position that the proposed objectives as prescribed in Project 2009-01 - Disturbance and Sabotage Reporting, is a "good" step forward. Currently, NERC

Organization	Yes or No	Question 4 Comment
		reporting obligations related to disturbances occurs over multiple standards including CIP-001, EOP-004-1, TOP-007-0, CIP-008-3 and Event Analysis (EA). Oncor is especially pleased that the Event Analysis Working Group (EAWG) is actively working to find ways of streamlining the disturbance reporting process especially to agencies outside of NERC such as FERC, and state agencies. Oncor is in agreement that an addition to the NERC Rules of Procedure in section 800 to develop a Reporting Clearinghouse for disturbance events by the establishment of a system to collect report and then forward completed forms to various requesting agencies, is also a very positive step."
Response: The SDT thanks you for your comment. The SDT would like to point out that the EAP is a voluntary program where the entity analyzes an issue or system condition. EOP-004-2 is a Reporting Standard where an entity informs the ERO (and whoever else per Requirement R1) of a current event. This will give other the situational awareness that their system may be degraded. Please refer to the Southwest Outage Report for more situational awareness issues that failed.		
Occidental Power Services, Inc.		OPSI continues to believe that LSEs that do not own BES assets should be excluded from the Applicability section of this standard. It is disingenuous of both the SDT and FERC to promote an argument to support this inclusion such as that stated in Section 459 of Order 693 (and referred to by the SDT in their Consideration of Comments in the last posting). The fact is that no reportable disturbance can be caused by an “attack” on an LSE that does not own BES assets. The SDT has yet to point out such an event.
Response: The SDT thanks you for your comment. The LSE obligation in this standard was tied to applicability in CIP-008 for cyber incident reporting. Reporting under CIP-008 is no longer part of EOP-004-2 so this applicability has been removed. The SDT notes that LSEs will still be subject to reporting under CIP-008 until such time they are removed from that standard.		
New York Power Authority		Please see comments submitted by NPCC Regional Standards Committee (RSC).
Response: The SDT thanks you for your comment. Please review the response to that commenter.		
MRO NSRF		R1 states: “Each Responsible Entity shall have an event reporting Operating Plan that

Organization	Yes or No	Question 4 Comment
		includes:"The definition of Operating Plan is:"A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan." This appears to us to be too prescriptive and could be interpreted to require a series of documents to for reporting issues to NERC. We suggest the following wording: R1. Each Responsible Entity shall have document methodology(ies) or process(es) for: 1.1. Recognizing each of the applicable events listed in EOP-004 Attachment 1.1.2. Reporting each of the applicable events listed in EOP-004 Attachment 1 in accordance with the time framess specified in EOP-004 Attachment 1 to the Electric Reliability Organization. LES Comment: [R1] We are concerned by the significant amount of detail an entity would be required to contain within the Operating Plan as part of Requirement R1. Rather than specifying an entity must have a documented process for recognizing each of the events listed in EOP-004-2 Attachment 1, at a minimum, consider removing the term "process" in R1.1 and replacing with "guideline" to ensure operating personnel are not forced to adhere to a specific sequence of steps and still have the flexibility to exercise their own judgment. Section 5 of the standard (Background) should be moved to the Guideline and Technical Basis document. A background that long does not belong in the standard piece as it detracts from the intent of the standard itself.
Response: The SDT thanks you for your comment. The background and Guidelines and Technical Basis sections have been combined.		
ReliabilityFirst		ReliabilityFirst votes in the Affirmative for this standard because the standard further enhances reliability by clearing up confusion and ambiguity of reporting events which were previously reported under the EOP-004-1 and CIP-001-1 standards. Even though ReliabilityFirst votes in the Affirmative, we offer the following comments for consideration: 1. Requirement R1, Part 1.2a. ReliabilityFirst recommends further prescribing whom the Responsible Entity needs to communicate with. The phrase "...

Organization	Yes or No	Question 4 Comment
		and other organizations needed for the event type...” in Part 1.2 essentially leaves it up to the Responsible Entity to determine (include in their process) whom they should communicate each applicable event to. ReliabilityFirst recommends added a fourth column under Attachment 1, which lists whom the Responsible Entity is required to communicate with, for each applicable event. 2. VSL for Requirement R2a. Requirement R2 requires the Responsible Entity to “implement its event reporting Operating Plan” and does not require the entity to submit a report. For consistency with the requirement, ReliabilityFirst recommends modifying the VSLs to begin with the following type of language: “The Responsible Entity implemented its event reporting Operating Plan more than 24 hours but...” This recommendation is based on the FERC Guideline 3, VSL assignment should be consistent with the corresponding requirement and should not expand on, nor detract from, what is required in the requirement.
Response: The SDT thanks you for your comment. The SDT believes that implementing your Operating Plan means that you report an event. Therefore the VSLs are entirely consistent with the requirement.		
DECo		Requirement R3 for annual test specifically states that ERO is not included during test. Implies that local law enforcement or state law enforcement will be included in test. Hard to coordinate with many Local organizations in our area.
Response: The SDT thanks you for your comment. The SDT has revised the language in Requirement R3 and believes that the changes will address your suggestion.		
Alliant Energy		Section 5 of the standard (Background) should be moved to the Guideline and Technical Basis document. A background that long does not belong in the standard piece as it detracts from the intent of the standard itself.
Response: The SDT thanks you for your comment. The background and Guidelines and Technical Basis sections have been combined.		

Organization	Yes or No	Question 4 Comment
MidAmerican Energy		See the NSRF comments.
Response: The SDT thanks you for your participation. Please review the response to that commenter.		
MEAG Power		Should these administrative activities be sent over to NAESB? R1: There is merit in having a plan as identified in R1, but is this a need to support reliability or is it a business practice? Should it be in NAESB's domain? R2, R3 & R4: These are not appropriate for a Standard. If you don't annually review the plan, will reliability be reduced and the BES be subject to instability, separation and cascading? If DOE needs a form filled out, fill it out and send it to DOE. NERC doesn't need to pile on. Mike Moon and Jim Merlo have been stressing results and risk based, actual performance based, event analysis, lessons learned and situational awareness. EOP-004 is primarily a business preparedness topic and identifies administrative procedures that belong in the NAESB domain.
Public Utility District No. 1 of Snohomish County		SNPD suggest moving these administrative activities to NAESB. R1: There is merit in having a plan as identified in R1, but is this a need to support reliability or is it a business practice? Should it be in NAESB's domain? R2, R3 & R4: These are not appropriate for a Standard. If you don't annually review the plan, will reliability be reduced and the BES be subject to instability, separation and cascading? If DOE needs a form filled out, fill it out and send it to DOE. NERC doesn't need to pile on. Gerry Cauley and Mike Moon have been stressing results and risk based, actual performance based, event analysis, lessons learned and situational awareness. EOP-004 is primarily a business preparedness topic and identifies administrative procedures that belong in the NAESB domain.
Response: The SDT thanks you for your comment. SDT believes this standard is needed to provide Situational Awareness and can help in providing lessons learned to the industry. The SDT has revised the requirements to address this need. While it may be appropriate to have NAESB to adopt this obligation at some in the future, the SDT was charged with addressing deficiencies at this time. The SDT has removed all references to filing reports to DOE from the earlier versions. Today's only reference provides for NERC's acceptance of the use of their form when it is appropriate.		

Organization	Yes or No	Question 4 Comment
Springfield Utility Board		SUB appreciates the opportunity to provide comments. While Staff was concerned with the consolidation of CIP and non-CIP NERC Reliability Standards (as to how they'll be audited), the Project 2009-01 SDT has done an excellent job in providing clarification around identifying and reporting events, particularly related to the varying definitions of "sabotage".
Response: The SDT thanks you for your support.		
Tacoma Power		Tacoma Power disagrees with the requirement to perform annual testing of each communication plan. We do not see any added value in performing annual testing of each communication plan. There are already other Standard requirements to performing routine testing of communications equipment and emergency communications with other agencies. The "proof of compliance" to the Standard should be in the documentation of the reports filed for any qualifying event, within the specified timelines and logs or phone records that it was communicated per each specified communication plan. Tacoma Power has none at this time. Thank you for considering our comments.
Response: The SDT thanks you for your comment. The SDT has revised Requirement R3 and we believe that our changes address your suggestion.		
Exelon Corporation and its affiliates		Thanks to the SDT. Significant progress was made in revising the proposed standard language. We appreciate the effort and have only a few remaining requests: o We understand that CIP-008 dictates the 1-hour reporting obligation for Cyber Security Incidents and this iteration of EOP-004 delineates the CIP-008 requirements. Please confirm that per the exemption language in the CIP standards (as consistent with the March 10, 2011 FERC Order (docket # RM06-22-014) nuclear generating units are not subject to this reporting requirement. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one hour event back to CIP-008. The next version of EOP-004-2**

Organization	Yes or No	Question 4 Comment
		will not contain a one-hour reporting requirement. o EOP-004 still lists “Generation Loss” as a 24 hour reporting criteria without any time threshold guidance for the generation loss. Exelon previously commented to the SDT (without the comment being addressed) that Generation Loss should provide some type of time threshold. If the 2000 MW is from a combination of units in a single location, what is the time threshold for the combined unit loss? In considering clarification language, the SDT should review the BAL standards on the disturbance recovery period for appropriate timing for closeness of trips. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Total generation loss, within one minute, of ≥ 2,000 MW for entities in the Eastern or Western Interconnection** **OR** **≥ 1,000 MW for entities in the ERCOT or Quebec Interconnection.”** o The “physical threat that could impact” requirement remains vague and it’s not clear the relevance of such information to NERC or the Regions. If a train derailment occurred near a generation facility (as stated in the footnote), are we to expect that NERC is going to send out a lesson learned with suggested corrective actions to protect generators from that occurring? The value in that event reporting criteria seems low. The requirement should be removed. **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated**

Organization	Yes or No	Question 4 Comment
		based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** o The event concerning voltage deviation of +/- 10% does not specify which type of voltage. In response to this comment in the previous comment period, the SDT indicated that the entity could determine the type of voltage. It would be clearer to specify in the standard and avoid future interpretation at the audit level. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:**

Organization	Yes or No	Question 4 Comment
		"Observed voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes ." **This language clearly states that if the threshold is met, the entity needs to submit a report within 24 hours.** o As requested previously, for nuclear facilities, EOP-004 reporting should be coordinated with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security or cyber event. Please contact the NRC about this project to ensure that required communication and reporting in response to a radiological sabotage event (as defined by the NRC) or any incident that has impacted or has the potential to impact the BES does not create duplicate reporting, conflicting reporting thresholds or confusion on the part of the nuclear generator operator. Each nuclear generating site licensee must have an NRC approved Security Plan that outlines applicable notifications to the FBI. Depending on the severity of the security event, the nuclear licensee may initiate the Emergency Plan (E-Plan). Exelon again asks that the proposed reporting process and flow chart be coordinated with the NRC to ensure it does not conflict with existing expected NRC requirements and protocol associated with site specific Emergency and Security Plans. In the alternative, the EOP-004 language should include acceptance of NRC required reporting to meet the EOP-004 requirements. **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Complete loss of off-site power affecting a nuclear generating station per the Nuclear Plant Interface Requirement."** **As stated in this event Threshold, the TOP's NIPR may have additional guidance concerning the complete loss of offsite power affecting a nuclear plant.**

Organization	Yes or No	Question 4 Comment
		o The proposed standard notes that the text boxes will be moved to the Guideline and Technical Basis Section which we support. However, it's not clear whether all the information in the background section will remain part of the standard. If this section is to remain as proposed concerted revision is needed to ensure that the discussion language matches the requirement language. At present, it does not. For instance, the flow chart on page 9 indicates when to report to law enforcement while the requirements merely state that communications to law enforcement be addressed within the operating plan. **The background sections will remain in the standard. The flowchart on Page 9 is an example only and may differ from your Operating Plan.** o Exelon voted negative vote on this ballot due to the need for further clarification and reconciliation between NERC EOP-004 and the NRC. **The SDT team does not believe that reporting under EOP-004 can in anyway 'conflicts' with any other reporting obligations that nuclear or any other type of GO/GOP may have. By allowing applicable entities to use the OE-417 form, the drafting team believes it has given industry reasonable accommodation to reduce duplicative reporting. The same is true for other agencies as well. If an entity submits to NERC the same that was submitted to the other regulatory agency, then this submission will be acceptable. Based on the historical frequency with which GO/GOPs report under the current EOP-004-1 the drafting team does not believe this places and inordinate burden on the applicable entities.**
Response: The SDT thanks you for your comment.		
Alberta Electric System Operator		The Alberta Electric System Operator will need to modify parts of this standard to fit the provincial model and current legislation when it develops the Alberta Reliability Standard.
Response: The SDT thanks you for your comment.		

Organization	Yes or No	Question 4 Comment
Puget Sound Energy, Inc.		The effective date language in the Implementation Plan is inconsistent with the effective date language in the proposed standard. **The SDT checked the language and found both to be identical.** In addition, the statement of effective date in the Implementation Plan is ambiguous - will EOP-004-2 be effective in accordance with the first paragraph or when it is "assigned an effective date" as stated in the second paragraph? **The second paragraph deals with EOP-004-1, the currently mandatory and enforceable standard.** All requirements should be assigned a Lower Violation Risk Factor. Medium risk factors require direct impact on the Bulk Electric System and the language there regarding "instability, separation, or cascading failures" is present to distinguish the Medium risk factor from the High risk factor. Since all of the requirements address after-the-fact reporting, there can be no direct impact on the Bulk Electric System. In addition, if having an Operating Plan under Requirement R1 is a Lower risk factor, then it does not make sense that reviewing that Operating Plan annually under Requirement R4 has a higher risk factor. **The SDT disagrees. Please review the VRF documentation that was posted with the standard for the analysis of the requirements.** The shift away from "the distracting element of motivation", i.e., removing "Sabotage" from the equation, runs the risk of focusing solely on what happened, how to fix it, and waiting for the next event to occur. That speaks to a reactive approach rather than a proactive one. There is a concern with the removal of the FBI from the reporting mix. Basically, the new standard will involve reporting a suspicious event or attack to local law enforcement and leaving it up to them to decide on reporting to the FBI. Depending on their evaluation, an event which is significant for a responsible entity might not rise to the priority level of the local law enforcement agency for them to report it to the FBI. While this might reduce the reporting requirements a bit, it might do so to the responsible entity's detriment.

Organization	Yes or No	Question 4 Comment
		The Operating Plan developed by each responsible entity may indeed have certain event types reported directly to the FBI. It is up the entity to determine the appropriate notifications. Entities in Canada would not report anything to the FBI. In Attachment 2 - item 4, would it be possible for the boxes be either alpha-sorted or sorted by priority? **The SDT has made changes to Attachment 2 to list the Events in order of their listing in Attachment 1.** There is a disconnect between footnote 1 on page 18 (Don't report copper theft) and the Guideline section, which suggests reporting forced intrusion attempt at a substation. **Forced Intrusion was removed from the Guidelines section. The SDT has deleted footnote 1 based on comments received from the industry, however, retained the concept in the event type "Physical threats to a Facility" as:** **"Do not report copper theft unless it degrades normal operation of a Facility."** Also, in the section discussing the removal of sabotage, the Guideline mentions certain types of events that should be reported to NERC, DHS, FBI, etc., while that specificity with respect to entities has been removed from the reporting requirement. **The SDT disagrees with your assessment on reporting. Entities know best to whom and what reporting obligations they have on the applicable event types. The SDT has learned that states vary in organization of their law enforcement agencies. As such it is impossible for the SDT to outline those obligations in a consistent and uniform manner. Entities can establish a single or multiple contact lists as needed for the different event types.**
Response: The SDT thanks you for your comments.		
Kansas City Power & Light		The flowchart states, "Notification Protocol to State Agency Law Enforcement".

Organization	Yes or No	Question 4 Comment
		Please correct this to, "Notification to State, Provincial, or Local Law Enforcement", to be consistent with the language in the background section part, "A Reporting Process Solution - EOP-004". Evidence Retention - it is not clear what the phrase "prior 3 calendar years" represents in the third paragraph of this section regarding data retention for requirements and measures for R2, R3, R4 and M2, M3, M4 respectively. Please clarify what this means. Is that different than the meaning of "since the last audit for 3 calendar years" for R1 and M1?
Response: The SDT thanks you for your comment. The flowchart is an example only and was not meant to show every permutation. The evidence retention paragraph has been revised to reflect the 'since last audit' language.		
United Illuminating Company		The measures M3 and M4 require evidence to be dated and time stamped. The time stamp is excessive and provides no benefit. A dated document is sufficient. The measure M2 requires in addition to a record of the transmittal of the EOP-004 Attachment 2 form or DOE-417 form that an operator log or other operating documentation is provided. It is unclear why this supplemental evidence of operator logs is required. We are assuming that the additional operator logs or documentation is required to demonstrate that the communication was completed to organizations other than NERC and DOE of the event. If true then the measure should be clear on this topic. For communication to NERC and DOE use the EOP-004 Form or OE-417 form and retain the transmittal record. For communication to other organizations pursuant to R1 Part 1.2 evidence may include but not limited to, operator logs, transmittal record, attestations, or voice recordings.
Response: The SDT thanks you for your comment. The SDT has removed the time-stamp provision. The SDT agrees and adopts your suggestion.		
New York Independent System Operator		The NYISO is part of and supports comments submitted by NPCC Reliability Standards Committee and the IRC Standards Review Committee. However the NYISO would also like to comment on the following items: o NERC has been proposing the future

Organization	Yes or No	Question 4 Comment
		development of performance based standards, which is directly related to reliability performance. Requirement 2 of this standard is simply a reporting requirement. We believe that this does not fall into a category of a performance based standard. NERC has the ability to ask for reports on events through ROP provisions and now the new Event Analysis Process. It does not have to make it part of the compliance program. Some have indicated that need for timely reporting of cyber or sabotage events. The counter argument is that the requirement is reporting when confirmed which would delay any useful information to fend off a simultaneous threat. Also NERC has not provided any records of how previous timely (1 hour) reporting has mitigated reliability risks. o The NERC Event Analysis Process was recently approved by the NERC OC and is in place. This was the model program for reporting outside the compliance program that the industry was asking for. This should replace the need for EOP-004.o NERC has presented Risk Based Compliance Monitoring (RBCM) to the CCC, MRC, BOT and at Workshops. This involves audit teams monitoring an entities controls to ensure they have things in place to maintain compliance with reliability rules. The proposed EOP-004 has created requirements that are controls to requirement R2, which is to file a report on predefined incidents. The RBCM is being presented as the auditor will make determinations on the detail of the sampling for compliance based on the assessment of controls an entity has in place to maintain compliance. It is also noted that compliance will not be assessed against these controls. As the APS example for COM-002 is presented in the Workshop slides, the issue is that EOP-004 R1, R3 and R4 are controls for reporting; 1) have a plan, 2) test the plan, and 3) review the plan. While R2 is the only actionable requirement. The NYISO believes that all reporting requirements have been met by OE-417 and EAP reporting requirements and that EOP-004 has served its time. At a minimum, the NYISO would suggest that EOP-004 be simplified to just R2 (reporting requirement) and the other requirements be placed at the end of the RSAW to demonstrate a culture of compliance as presented by NERC.

Response: The SDT thanks you for your comment. Please review the responses to those commenters. The SDT appreciates your suggestion, however, most of your comment is beyond the scope of the SDT's charge. The SDT would like to note your statement

Organization	Yes or No	Question 4 Comment
on reporting requirements having been met by the OE-417 and EAP requirements. The SDT fails to see how NERC gains situational awareness and the opportunity to pass along lessons learned when the aforementioned reports are not forwarded to the appropriate ERO group. The SDT would also note that the ERO does not have access to the OE-417 filings unless they are provided and the EAP does not include reporting for some of the event types listed in Attachment 1. The SDT will forward your comment to appropriate officials for their consideration.		
Hydro One		The proposed standard is not consistent with NERC's new Risk Based Compliance Monitoring. - The performance based action to "implement its event reporting Operating Plan" on defined events, as required in R2, could be considered a valid requirement. However, the concern is that this requirement could be superseded by the NERC Events Analysis Process and existing OE-417 Reporting.- The requirements laid out in R1, R3 and R4 are specific controls to ensure that the proposed requirement to report (R2) is carried out. However, controls should not be part of a compliance requirement. The only requirement proposed in this standard that is not a control is R2.NERC does not need to duplicate the enforcement of reporting already imposed by the DOE. DOE-417 is a well-established process that has regulatory obligations. NERC enforcement of reporting is redundant. NERC has the ability to request copies of these reports without making them part of the Reliability Rules. **The SDT appreciates your suggestion, however, most of your comment is beyond the scope of the SDT's charge. The SDT would like to note your statement on reporting requirements having been met by the OE-417 and EAP requirements. This statement is not true for Canadian entities. The SDT fails to see how NERC gains situational awareness and the opportunity to pass along lessons learned when the aforementioned reports are not forwarded to the appropriate ERO group. The SDT would also note that the ERO does not have access to the OE-417 filings unless they are provided and the EAP does not include reporting for some of the event types listed in Attachment 1. The SDT will forward your comment to appropriate officials for their consideration.** Form EOP-004, Attachment 2: Event Reporting Form: - Delete from the Task column

Organization	Yes or No	Question 4 Comment
		the words “or partial”.- Delete from the Task column the words “physical threat that could impact the operability of a Facility”. **The SDT has proposed changes to the language within Attachment 2 which we believe corrects the point made.** VSL’s may have to be revised to reflect revised wording. The standard as proposed is not supportive of Gerry Cauley’s performance based standard initiative **The SDT removed all language under “Entity with Reporting Responsibility,” with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the “Threshold for Reporting” column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **“Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility.”** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility’s normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.**

Delete from the Task column the words "physical threat that

Organization	Yes or No	Question 4 Comment
		could impact the operability of a Facility". **The SDT has proposed changes to the language within Attachment 2 which we believe corrects the point made.** VSL's may have to be revised to reflect revised wording. **The SDT agrees and adopts your suggestion.**
Response: The SDT thanks you for your comment.		
American Public Power Association		The SDT needs to provide some relief for the small entities in regards to the VSL in the compliance section. APPA believes there should be no High or Severe VSLs for this standard. This is a reporting/documentation standard and does not affect BES reliability at all. It is APPA's opinion that this standard should be removed from the mandatory and enforceable NERC Reliability Standards and turned over to a working group within the NERC technical committees. Timely reporting of this outage data is already mandatory under Section 13(b) of the Federal Energy Administration Act of 1974. There are already civil and criminal penalties for violation of that Act. This standard is a duplicative mandatory reporting requirement with multiple monetary penalties for US registered entities. If this standard is approved, NERC must address this duplication in their filing with FERC. This duplicative reporting and the differences in requirements between DOE-OE-417 and NERC EOP-004-2 require an analysis by FERC of the small entity impact as required by the Regulatory Flexibility of Act of 1980
Response: The SDT thanks you for your comment. VSLs refer to how closely the entity met the requirements of the standard; it is the VRF that measures impact to reliability. The SDT believes use of the high and severe VSLs is appropriate. The SDT believes that size is not the important criteria in determining an impact on reliability. The reporting thresholds are based on the BES. No entity, including small entities is required to report on equipment that is not categorized as BES, which should give small entities relief from reporting on non-impactive assets.		
Pepco Holdings Inc		The SDT's efforts have resulted in a very good draft.

Organization	Yes or No	Question 4 Comment
Response: The SDT thanks you for your support.		
ISO/RTO Standards Review Committee		The SRC offers some other comments regarding the posted draft requirements; however, by so doing, the SRC does not indicate support of the proposed requirements. Following these comments, please see below for an SRC proposed alternative approach: The SRC does not agree with the MEDIUM VRF assigned to Requirement R4. R4 is a requirement to conduct an annual review of the Event Reporting Operating Plan mandated in Requirement R1. R1 however is assigned a VRF of LOWER. We are unable to rationalize why a subsequent review of a plan should have a higher reliability risk impact than the development of the plan itself. Hypothetically, if an entity doesn't develop a plan to begin with, then it will be assigned a LOWER VRF, and the entity will have no plan to review annually and hence it will not be deemed non-compliant with requirement R4. The entity can avoid being assessed violating a requirement with a MEDIUM VRF by not having the plan to begin with, for which the entity will be assessed violating a requirement with a LOWER VRF. We suggest changing the R4 VRF to LOWER. **The SDT has revised the requirements and R4 has been deleted along with its VRF/VSL.** The SRC requests that the SDT post the following Alternative Proposal for Industry comments as required by the Standards Process to obtain Industry consensus and as permitted by FERC: An equally effective alternative is to withdraw this standard and to make the contents of the SDT's posted standard a NERC Guideline. a. This alternative is more in line with new NERC and FERC proposals b. This alternative retains the reporting format Comments 1. The FERC Order 693 directives regarding "sabotage" have already been addressed by the SDT (i.e. the concept was found outside the scope of NERC standards) 2. Current Industry actions already address the needs cited in the Order:

Organization	Yes or No	Question 4 Comment
		a. Approved Reporting Processes already exists i. The Operating Committee's Event Analysis Process ii. Alert Reporting b. The Data already exists i. Reliability Coordinators Information System (which creates hundred if not thousands of "reports" per year) ii. The DOE's OE 417 Report itself provides part of the FERC discussed data 3. The proposed standard is not supportive of Gerry Cauley's performance based standard initiative or of FERC's offer to reduce procedural standards a. The proposed requirement is a process not an outcome i. The proposal is more focused on reporting and could divert the attention of reliability entities from addressing a situation to collecting data for a report b. The proposed "events" are subjective and if followed will create an unmanageable burden on NERC staff i. Reporting "damage" to facilities can be interpreted as anything from a dent in a generator to the total destruction of a transformer ii. The reporting requirements on all applicable entities will create more questions about differences between the reports of the various entities - rather than leading to conclusions about patterns among events that indicate a global threat iii. Reporting any "physical threat" is too vague and subjective iv. Reporting "damage to a facility that affects an IROL" is subjective and can be seen to require reporting of damage on every facility in an interconnected area. v. Reporting "Partial loss of monitoring" is a data quality issue that can be anything from the loss of a single data point to the loss of an entire SCADA system vi. Testing the filling out of a Report does not make it easier to fill out the report later (moreover the reporting is already done often enough -see 2.b.i)c. The proposed requirements will create a disincentive to improving current Reporting practices (the more an entity designs into its own system the more it will be expected to do and the more likely it will be penalized for failing to comply)i. Annual reviews of the reporting practices fall into the same category, why have a detailed process to review when a simple one will suffice?

Organization	Yes or No	Question 4 Comment
		4. The proposed standard does not provide a feedback loop to either the data suppliers or to potentially impacted functional entities a. If the “wide area” data analysis indicates a threat, there is no requirement to inform the impacted entities b. As a BES reliability issue there is no performance indicators or metrics to show the value of this standard i. The SRC recognizes that specific incidents cannot be identified but if this is to be a reliability standard some information must be provided. A Guideline could be designed to address this concern. 5. The proposed standard is not consistent with NERC’s new Risk Based Compliance Monitoring. a. The performance based action to report on defined events, as required in R2, could be considered a valid requirement. However we have concerns as noted in Bullet 3 above. The requirements laid out in R1, R3 and R4 are specific controls to ensure that the proposed requirement to report (R2) is carried out. NERC is moving in the direction to assess entities’ controls, outside of the compliance enforcement arm. The industry is being informed that NERC Audit staff will conduct compliance audits based on the controls that the entity has implemented to ensure compliance. The SRC is interested in supporting this effort and making it successful. However, if this is the direction NERC is moving, we should not be making controls part of a compliance requirement. The only requirement proposed in this standard that is not a control is R2. 6. For FERC-jurisdictional entities, NERC does not need to duplicate the enforcement of reporting already imposed by the DOE. DOE-417 is a well established process that has regulatory obligations. NERC enforcement of reporting would be redundant. NERC has the ability to request copies of these reports without making them part of the Reliability Rules.
Response: The SDT thanks you for your comment. The SDT will bring this request to the attention of the SC for consideration as this request is beyond the scope of work identified in this project.		
LG&E and KU Services		The Violation Severity Level for Requirement R2 should be revised to read “...hours

Organization	Yes or No	Question 4 Comment
		after recognizing an event requiring reporting…" This will make the language in the VSL consistent with the language in Attachment 1.
Response: The SDT thanks you for your comment. The VSLs have been reviewed and revised based upon the revisions to the requirements.		
SPP Standards Review Group		The VRF for R1 is Lower which is fine. The issue is that R4, which is the review of the plan contained in R1, has a Medium VRF. We recommend moving the VRF of R4 to Lower.We recommend deleting the phrase '...supplemented by operator logs or other operating documentation...' as found in the first sentence of M2. A much clearer reference is made to operator logs and other operating documentation in the second sentence. The duplication is unnecessary.What will happen with the accompanying information contained in the Background section in the draft standard? Will it be moved to the Guideline and Technical Basis at the end of the standard as the information contained in the text boxes? This is valuable information and should not be lost.
Response: The SDT thanks you for your comment. The SDT has revised the requirements and R4 has been deleted along with its VRF/VSL. The background has been moved to the Guidelines and Technical Basis section.		
Utility Services		There are no other comments at this time.
Response: The SDT thanks you for your participation.		
Dynegy Inc.		Use of the term "Part x.x" throughout the Standard is somewhat confusing. I can't recall other Standards using that type of term. Suggest using the term "Requirement" instead.
Response: The SDT thanks you for your comment. The standard has been rewritten and revised in accordance with your suggestion.		
Central Lincoln		We agree with the comments provided by both PNGC and APPA.

Organization	Yes or No	Question 4 Comment
Response: The SDT thanks you for your comment. Please review the responses to those commenters.		
PNGC Comment Group		We appreciate the hard work of the SDT.
Response: The SDT thanks you for your support.		
PPL Corporation NERC Registered Affiliates		We appreciate the inclusion of the Process Flowchart on Page 9 of the draft standard. We submit for your consideration, removing the line from the NO decision box to the ‘Report Event to ERO, Reliability Coordinator’ box. It seems if the event does not need reporting per the decision box, this line is not needed.The decision box on ‘Report to Law Enforcement ?’ does not have a Yes or No. Perhaps, this decision box is misplaced, or is it intended to occur always and not have a different path with different actions? Ie. should it be a process box? Thank you for your work on this standard.
PPL Electric Utilities		We appreciate the inclusion of the Process Flowchart on Page 9 of the draft standard. We submit for your consideration, removing the line from the NO decision box to the ‘Report Event to ERO, Reliability Coordinator’ box. It seems if the event does not need reporting per the decision box, this line is not needed.For clarity in needed actions, please consider using a decision box following flowcharting standards such as, a decision box containing a question with a Yes and a No path. The decision box on ‘Report to Law Enforcement ?’ does not have a Yes or No. Perhaps, this decision box is misplaced, or is it intended to occur always and not have a different path with different actions? Ie. should it be a process box?Thank you for your work on this standard.
Response: The SDT thanks you for your comment. The flowchart was provided as an example and guidance for entities to use if they so choose. Entities can elect to create their own flowchart based upon their needs.		
Independent Electricity System Operator		We do not agree with the MEDIUM VRF assigned to Requirement R4. Re stipulates a requirement to conduct an annual review of the event reporting Operating Plan in

Organization	Yes or No	Question 4 Comment
		Requirement R1, which itself is assigned a VRF of LOWER. We are unable to rationalize why a subsequent review of a plan should have a higher reliability risk impact than the development of the plan itself. Hypothetically, if an entity doesn't develop a plan to begin with, then it will be assigned a LOWER VRF, and the entity will have no plan to review annually and hence it will not be deemed non-compliant with requirement R4. The entity can avoid being assessed violating a requirement with a MEDIUM VRF by not having the plan to begin with, for which the entity will be assessed violating a requirement with a LOWER VRF. We suggest changing the R4 VRF to LOWER.
Response: The SDT thanks you for your comment. The SDT has revised the requirements and R4 has been deleted along with its VRF/VSL.		
SMUD & BANC		We feel issues were addressed, but still have concern with 'damage'. We certainly support that any 'destruction' of a facility that meets any of the three criteria be a reportable issue. But 'damage', if it's going to be included should have some objective definition that sets a floor. Much like the copper theft issue, we don't see the benefit of reporting plain vandalism (gun-shot insulators results from actual or suspected intentional human action) to NERC unless the 'damage' has some tangible impact on the reliability of the system or are acts of an orchestrated sabotage (i.e. removal of bolt in a transmission structure).
Response: The SDT thanks you for comment. The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:		

Organization	Yes or No	Question 4 Comment
"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency." **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state;** **Damage or destruction of its Facility that results from actual or suspected intentional human action.** **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was "damaged or destroyed" intentionally by a human.** **This event was written to cover the increase of "Entity with Reporting Responsibility" and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.**		
ISO New England Inc		We requests that the SDT post the following Alternative Proposal for Industry

Organization	Yes or No	Question 4 Comment
		comments as required by the Standards Process to obtain Industry consensus and as permitted by FERC: An equally effective alternative is to withdraw this standard and to make the contents of the SDT's posted standard a NERC Guideline.a. We recognize that specific incidents cannot be identified but if this is to be a reliability standard some information must be provided. A Guideline could be designed to address this concern. 5. The proposed standard is not consistent with NERC’s new Risk Based Compliance Monitoring. a. The performance based action to report on defined events, as required in R2, could be considered a valid requirement. However we have concerns as noted in Bullet 3 above.The requirements laid out in R1, R3 and R4 are specific controls to ensure that the proposed requirement to report (R2) is carried out. NERC is moving in the direction to assess entities’ controls, outside of the compliance enforcement arm. The industry is being informed that NERC Audit staff will conduct compliance audits based on the controls that the entity has implemented to ensure compliance. We are interested in supporting this effort and making it successful. However, if this is the direction NERC is moving, we should not be making controls part of a compliance requirement. The only requirement proposed in this standard that is not a control is R2. 6. For FERC-jurisdictional entities, NERC does not need to duplicate the enforcement of reporting already imposed by the DOE. DOE-417 is a well established process that has regulatory obligations. NERC enforcement of reporting would be redundant. NERC has the ability to request copies of these reports without making them part of the Reliability Rules.
Response: The SDT thanks you for your comment. The SDT will bring this request to the attention of the SC for consideration as this request is beyond the scope of work identified in this project.		
Brazos Electric Power		We thank the work of the SDT on this project. However, additional improvements

Organization	Yes or No	Question 4 Comment
Cooperative		should be made as described in the comments submitted by ACES Power Marketing.
Response: The SDT thanks you for your comment. Please review the responses to that commenter.		
FirstEnergy		While FE voted affirmative on this draft, upon further review we request clarification be made in the next draft of the standard regarding the applicability of the Nuclear Generator Operator. Per FE's previous comments, nuclear generator operators already have specific regulatory requirements to notify the NRC for certain notifications to other governmental agencies in accordance with 10 CFR 50.72(b)(s)(xi). We had asked that the SDT contact the NRC about this project to ensure that existing communication and reporting that a licensee is required to perform in response to a radiological sabotage event (as defined by the NRC) or any incident that has impacted or has the potential to impact the BES does not create either duplicate reporting, conflicting reporting thresholds or confusion on the part of the nuclear generator operator. In addition, EOP-004 must acknowledge that there may be NRC reporting forms that have the equivalent information contained in their Attachment 2. For what the NRC considers a Reportable Event, Nuclear plants are required to fill out NRC form 361 and/or form 366. We do not agree with the drafting team's response to ours and Exelon's comments that "The NRC does not fall under the jurisdiction of NERC and so therefore it is not within scope of this project." While the statement is correct, we believe that requirements should not conflict with or duplicate other regulatory requirements. We remain concerned that the standard with regard to Nuclear GOP applicability causes duplicative regulatory reporting with existing reporting requirements of the NRC. Therefore, we ask:1. That NERC and the drafting team please investigate these issues further and revise the standard to clarify the scope for nuclear GOPs, and2. For any reporting deemed in the scope for nuclear GOP after NERC's and the SDT's investigation per our request in #1 above, that the SDT consider the ability to utilize information from NRC reports as meeting the EOP-004-2 requirements similar to the allowance of using the DOE form as presently proposed.

Organization	Yes or No	Question 4 Comment
Response: The SDT thanks you for your comment. The SDT team does not believe that reporting under EOP-004 can in anyway 'conflicts' with any other reporting obligations that nuclear or any other type of GO/GOP may have. By allowing applicable entities to use the OE-417 form, the drafting team believes it has given industry reasonable accommodation to reduce duplicative reporting. The same is true for other agencies as well. If an entity submits to NERC the same that was submitted to the other regulatory agency, then this submission will be acceptable. Based on the historical frequency with which GO/GOPs report under the current EOP-004-1 the drafting team does not believe this places and inordinate burden on the applicable entities.		
American Electric Power		While we do not necessarily disagree with modifying this standard, we do have serious concerns with the possibility that Form OE-417 form would not also be modified to match any changes made to this standard. To the degree they would be different, this would create unnecessary confusion and burden on operators. **While we appreciate the point raised, the SDT does have any authority with regard to the language contained within the DOE OE-417 form. The Department of Energy is responsible for the design and contents of the 417 form. As a part of the SDT's work in this proposal, we met with and collaborated with the DOE staff responsible for the 417 form establish a common understanding of reportable events. We hope that if the DOE desires to make further changes, they will pass along information for consideration in a future NERC SAR.** If CIP-008 is now out of scope within the requirements of this standard, the task "reportable Cyber Security Incident" should be removed from Attachment 2. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement.**
Response: The SDT thanks you for your comment.		
Progress Energy		Within attachment 1 (Reportable Events) an exclusion is allowed for weather related threats. PGN recommends a more generic approach to include natural events such as forest fires, sink holes, etc. This would alleviate some reporting burdens in areas that

Organization	Yes or No	Question 4 Comment
		are prone to these types of events.
Response: The SDT thanks you for your comment. The SDT has revised the language in accordance with your suggestion to "weather or natural disaster related threats".		
Xcel Energy		Xcel Energy appreciates the work of the drafting team and believes the current draft is an improvement over the existing standard. However, we would like to see the comments provided here and above addressed prior to submitting an AFFIRMATIVE vote.1) Suggest enhancing the "Example of Reporting Process..." flowchart as follows: EVENT > Refer to Ops Plan for Event Reporting > Refer to Law Enforcement? > Yes/No > .... **The SDT has provided the flowchart as an example and guidance for entities. Entities can choose to create their own version of the flowchart for use in their Operating Plan.** 2) Attachment 1 - in both the 1 hour and the 24 hour reporting they are qualified with "within x hours of recognition of the event". Is this the intent, so that if an entity recognizes at some point after an event that the time clock starts? **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement.** **The SDT envisions when the entity is made aware of an applicable event contained in Attachment 1, that they would report the event within 24 hours. Any entity could enhance their Operating Plan to describe as much detail as they wanted to provide to their employees as they see fit.** 3) VSLs - R3 & R4 "Severe" should remove the "OR....", as this is redundant. Once an entity has exceeded the 3 calendar months, the Severe VSL is triggered. **The SDT has revised the requirements and accordingly the VSLs.** 4) The Guideline and Technical Basis page 22 should be corrected to read "The

Organization	Yes or No	Question 4 Comment
		changes do not include any real-time operating notifications for the types of events covered by CIP-001 and EOP-004. The real-time reporting requirements are achieved through the RCIS and are covered in other standards (e.g. EOP-002-Capacity and Energy Emergencies). These standards deal exclusively with after-the-fact reporting.” **Response: Thank you for the grammatical correction.** 5) Also in the following section of the Guideline and Technical Basis (page 23) the third bullet item should be qualified to exclude copper theft: Examples of such events include: o Bolts removed from transmission line structures o Detection of cyber intrusion that meets criteria of CIP-008-3 or its successor standard o Forced intrusion attempt at a substation (excluding copper theft) o Train derailment near a transmission right-of-way o Destruction of Bulk Electric System equipment **Response: Thank you for the correction; however, as a result of other changes made to the standard, the SDT is proposing to remove the third bulleted item from this list.**
Response: The SDT thanks you for your comment.

Consideration of Comments

Project 2009-01 Disturbance Sabotage and Reporting

The Project 2009-01 Drafting Team thanks all commenters who submitted comments on Draft 5 of EOP-004-2. The standard was posted for a 30-day public comment period from August 29, through September 27, 2012. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 56 sets of comments, including comments from approximately 181 different people from approximately 125 companies, representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration:

The Disturbance and Sabotage Reporting standard drafting team has opted to pursue a recirculation ballot for EOP-004-2 after making a few clarifications to the Guidelines and Technical Basis section to address stakeholder concerns raised during the second successive ballot:

- Distribution Providers – Some concerns were raised with respect to applicability of the standard to all Distribution Providers. The concerns relate to DPs that do not own BES Facilities. While these entities would not have any events to report under R2, they would still be applicable under R1 and R3. The team discussed this issue and has addressed this concern with additional language in the Guidelines and Technical Basis Section of the standard as follows:

  "Distribution Provider Applicability Discussion

  The DSR SDT has included Distribution Providers (DP) as an applicable entity under this standard. The team realizes that not all DPs will own BES Facilities and will not meet the "Threshold for Reporting" for any event listed in Attachment 1. These DPs will not have

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

any reports to submit under Requirement R2. However, these DPs will be responsible for meeting Requirements R1 and R3. The DSR SDT does not intend for these entities to have a detailed Operating Plan to address events that are not applicable to them. In this instance, the DSR SDT intends for the DP to have a very simple Operating Plan that includes a statement that there are no applicable events in Attachment 1 (to meet R1) and that the DP will review the list of events in Attachment 1 each year (to meet R3). The team does not think this will be a burden on any entity as the development and annual validation of the Operating Plan should not take more that 30 minutes on an annual basis. If a DP discovers applicable events during the annual review, it is expected that the DP will develop a more detailed Operating Plan to comply with the requirements of the standard."

- Duplicative Reporting – If an entity is registered as an RC, BA and TOP, they should only have to submit a single report. The team discussed and has addressed this concern with additional language in the Guidelines and Technical Basis Section of the standard as follows:

  "Multiple Reports for a Single Organization

  For entities that have multiple registrations, the DSR SDT intends that these entities will only have to submit one report for any individual event. For example, if an entity is registered as a Reliability Coordinator, Balancing Authority and Transmission Operator, the entity would only submit one report for a particular event rather submitting three reports as each individual registered entity."

  With regards to the concern regarding multiple entities submitting a report for the same event, the team does not see this as being an issue for industry and will not make any further revisions to address this.

Other issues were raised by stakeholders and a discussion of those is below:

- **24 Hour Reporting** – Several stakeholders had concerns regarding the 24 hour reporting requirement. Commenters suggest that events or situations affecting real time reliability to the system already are required to be reported to appropriate Functional Entities that have the responsibility to take action. Adding one more responsibility to system operators increases the operator's burden, which reduces the operator's effectiveness when operating the system. Care should be given when placing additional responsibility on the system operators. Allowing reporting at the end of the next business day gives operators the flexibility to allow support staff to assist with after-the-fact reporting requirements. To this end, the DSR SDT has added clarifying language to R2 as follows:

R2. Each Responsible Entity shall report events per their Operating Plan within 24 hours of recognition of meeting an event type threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]*

- **Paragraph 81** – On March 15, 2012, FERC issued an order on NERC's Find, Fix and Track process and in paragraph 81 of that order ("P81"), invited NERC and other entities to propose to remove from Commission-approved Reliability Standards unnecessary or redundant requirements. In response to P81 and the Commission's request for comments to be coordinated, during June and July 2012, various industry stakeholders, Trade Associations, staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. In Phase 1 of the Paragraph 81 effort, only two of the requirements (in total) from CIP-001 and EOP-004 met the initial threshold for being included in the P81 Project. Both of these requirements will also be retired by EOP-004-2. Phase 2 of the Paragraph 81 Project will evaluate all NERC Reliability Standards, including any modifications to EOP-004-2. CIP-001-2a and EOP-004-1 are mandatory and enforceable NERC Reliability Standards. If EOP-004-2 is not approved by the industry, those standards will remain as is and subject to the Compliance Monitoring and Enforcement Program.

- **Reporting** – Some comments were submitted regarding the reporting burden of this standard. The revised standard combines two standards into one and removes the analysis portion of the current mandatory and enforceable standards (EOP-004-1 and CIP-001-2a). The analysis provisions will be addressed in the NERC Events Analysis Program upon approval of EOP-004-2. This revised standard involves notification only and does not require any investigation or analysis.

- **Attachment 1 comments** – Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. . The team has elected to move forward to recirculation ballot.

- **Violation Risk Factors** - Many stakeholders had concerns with the VRFs for R2 and R3 being assigned as "medium". The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF.

- **Violation Severity Levels** - Other stakeholders suggested revision to the VSLs for Requirement R1 based on if the event reporting Operating Plan fails to include one or more of the event types listed in Attachment 1. The SDT agrees and has revised the VSLs for R1 as follows:

  Lower: The Responsible Entity had an Operating Plan, but failed to include one applicable event type.

  Moderate: The Responsible Entity had an Operating Plan, but failed to include two applicable event types.

  High: The Responsible Entity had an Operating Plan, but failed to include three applicable event types.

  Severe: The Responsible Entity had an Operating Plan, but failed to include four or more applicable event types OR the Responsible Entity failed to have an event reporting Operating Plan.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

If you wish to express support for another entity's comments without entering any additional comments, you may do so here.

Organization	Supporting Comments of "Entity Name"
PNGC Comment Group	Central Lincoln PUD
Blue Ridge EMC	R3 is another example of a "paper chase", creating (or rather continuing) an administrative burden for the utility. The standard should only require that the entity have a plan and the accountability should be "did the entity follow the plan when needed, including proving that the appropriate contacts were made?"
Response: Thank you for your comment. Requirement R3 is in direct response to a FERC directive in Order 693 and as such, the SDT included this provision. Also, if the information in the plan is out of date, then the plan will not be effective.	
Flathead Electric Cooperative, Inc.	Central Lincoln
US Army Corps of Engineers	MRO NSRF
Nebraska Public Power District	Midwest Reliability Organization (MRO) NERC Standards Review Forum (NSRF); AND Southwest Power Pool RTO
MidAmerican Energy	MidAmerican supports the MRO NSRF comments
ISO New England Inc.	NPCC

1. **The DSR SDT has revised EOP-004-2 by combining Requirements R3 and R4 into a single requirement (Requirement R3) to, "… validate all contact information contained in the Operating Plan pursuant to Requirement R1 each calendar year." Do you agree with this revision? If not, please explain in the comment area below.**

Summary Consideration: The majority of stakeholders agree with the combination of R3 and R4 and with the new language of R3 to "validate" the contact information. A few commenters suggested that Requirement R3 is administrative and should be removed under the provisions of "Paragraph 81". On March 15, 2012, FERC issued an order on NERC's Find, Fix and Track process and in paragraph 81 ("P81") invited NERC and other entities to propose to remove from Commission-approved Reliability Standards unnecessary or redundant requirements. In response to P81 and the Commission's request for comments to be coordinated, during June and July 2012, various industry stakeholders, Trade Associations, staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. In Phase 1 of the Paragraph 81 effort, only two of the requirements (in total) from CIP-001 and EOP-004 met the initial threshold for being included in the P81 Project. Both of these requirements will also be retired by EOP-004-2. Phase 2 of the Paragraph 81 Project will evaluate all NERC Reliability Standards, including any modifications to EOP-004-2. CIP-001-2a and EOP-004-1 are mandatory and enforceable NERC Reliability Standards. If EOP-004-2 is not approved by the industry, those standards will remain as is and subject to the Compliance Monitoring and Enforcement Program.

Organization	Yes or No	Question 1 Comment
CenterPoint Energy	No	CenterPoint Energy supports the concept of combining Requirements R3 and R4; however, the Company still prefers an annual review requirement which would include validating the contact information and content of the Operating Plan overall. Therefore, CenterPoint Energy recommends the following revised language for Requirement R3: "Each Responsible Entity shall review and update the Operating Plan at least every 15 months." The Company also suggests that the Measure be worded as follows: "Evidence may include, but is not limited to dated documentation reflecting changes to the Operating Plan including updated contact information if necessary."

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. The SDT appreciates the suggestion on validating the content of the Operating Plan, but at this time, we feel that the step is not necessary to meet the directive from FERC Order 693. As to the comment on extending the review period to 15 months, following much discussion and review of the industry comments, we are staying with the language as proposed.		
American Electric Power	No	In the spirit of Paragraph 81 efforts, we request the removal of R3 as it is solely administrative in nature, existing only to support R2. This is more of an internal control and does not appear to rise to the level of being an industry-wide requirement. In addition, having two requirements rather than one increases the likelihood of being found non-compliant for multiple requirements rather than a single requirement.
Response: Thank you for your comment. Requirement R3 is in direct response to a FERC directive in Order 693 and as such, the SDT included this provision. On March 15, 2012, FERC issued an order on NERC's Find, Fix and Track process and in paragraph 81 ("P81") invited NERC and other entities to propose to remove from Commission-approved Reliability Standards unnecessary or redundant requirements. In response to P81 and the Commission's request for comments to be coordinated, during June and July 2012, various industry stakeholders, Trade Associations, staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. In Phase 1 of the Paragraph 81 effort, only two of the requirements (in total) from CIP-001 and EOP-004 met the initial threshold for being included in the P81 Project. Both of these requirements will also be retired by EOP-004-2. Phase 2 of the Paragraph 81 Project will evaluate all NERC Reliability Standards, including any modifications to EOP-004-2. , CIP-001-2a and EOP-004-1 are mandatory and enforceable NERC Reliability Standards. If EOP-004-2 is not approved by the industry, those standards will remain as is and subject to the Compliance Monitoring and Enforcement Program. As the SDT is moving forward with a Recirculation Ballot, your suggestions will be forwarded to NERC for future consideration.		
City and County of San Francisco - Hetch Hetchy Water and Power	No	Measure M3 specifically identifies two types of acceptable compliance evidence: Voice Recording and Log entries. Specifying only these two forms of evidence creates a risk that some auditors will reject other forms of R3 compliance evidence which are equally valid, such as emails or written call records. Although M3 states that acceptable evidence is not limited to Voice Recordings or Log Entries, we have concern that other

Organization	Yes or No	Question 1 Comment
		methods of complying with R3 may not be accepted.
Response: Thank you for your comment. The SDT believes that the phrase "may include, but are not limited to" addresses your concern. The SDT will present your comment to the NERC Compliance staff in an effort to inform audit staffs on what evidence is permissible.		
Blue Ridge EMC	No	See previous comments
Response: Thank you for previous comments. Requirement R3 is in direct response to a FERC directive in Order 693 and as such, the SDT included this provision. Also, if the information in the plan is out of date, then the plan will not be effective.		
Detroit Edison	No	The requirement is too prescriptive and difficult to document. Requirement should be for annual review of Operating Plan. This allows for entity to review plan and document this the same as other Standards that require annual review (i.e. annual review blocks on documents).The requirement as written is vague and difficult to document. Annual review of reporting process is already a requirement.
Response: Thank you for your comments. While the SDT appreciates the view that the Operating Plan should be reviewed annually, the SDT feels that the requirement only needs to address the validity of the contact information contained within the Operating Plan in order to meet the FERC directive in Order 693. If the entity is aware of changes within its operations that would make a more extensive review advisable, it can choose to do so; but where there have been no significant changes to an entity's operations in the last year, ensuring the validity of the contact information should be sufficient.		
Manitoba Hydro	No	This seems like an administrative only requirement. It would be too difficult to validate or measure.
Response: Thank you for your comment. Requirement R3 is in direct response to a FERC directive in Order 693 and as such, the SDT included this provision. The measure calls for an entity to have "dated records to show that it validated all contact information contained in the Operating Plan each calendar year. Such evidence may include, but are not limited to, dated voice recordings and operating logs or other communication documentation." The SDT does not believe that this is an administrative		

Organization	Yes or No	Question 1 Comment
requirement because, if the information in the Operating Plan is out of date, then the plan will not be effective.		
ACES Power Marketing Standards Collaborators	No	We believe that the revision to R3 and elimination of R4 are great improvements to the standard as a lot of the unnecessary burdens have been removed. However, Requirement R3 is still not needed, has several issues with it and should be eliminated. (1) While validating contact information annually in a reporting plan makes sense, it does not rise to level of importance of requiring sanctions for failure to do so. Furthermore, it does nothing to assure reliability. Shortly after the contact information has been updated, it could change. This does not mean that validation should be more frequent but simply that is an unnecessary administrative burden. If contact information changes, the registered entity will have to find it. For reliability purposes, why does it matter if they do this in the 24-hour reporting period after the event or annually before the event? (2) Requirement R3 is administrative and is not consistent with the recent direction that NERC and FERC have taken toward compliance. Violations of this requirement are likely to be candidates for FFT treatment and this is exactly the kind of requirement that FERC invited NERC to propose for retirement in Paragraph 81 of the order approving the FFT process. Furthermore, it appears to meet at least two criteria (Administrative and periodic updates) that the Paragraph 81 drafting team has proposed to use to identify candidate requirements for retirement. The requirement is also not consistent with the direction NERC has taken on internal controls. How is an auditor reviewing that contact information has been updated in an Operating Plan forward looking or for that matter beneficial to reliability? Imagine a registered entity fails to update their contact information but still reports an event within the 24 hour reporting time frame to the appropriate parties. They are in technical violation of R3 but have met the spirit of the standard. (3) Requirement R3 is not a results-based requirement. It simply compels a registered entity "how to" meet reporting deadlines. Certainly, if a

Organization	Yes or No	Question 1 Comment
		registered entity has current contact information on hand, it will be easier to notify appropriate parties of events quickly. However, it does limit a registered entity's ability to identify its own unique and possibly better way to meet a requirement. "How to" requirements prevent unique and superior solutions.
Response: Thank you for your comment. Requirement R3 is in direct response to a FERC directive in Order 693 and as such, the SDT included this provision. The SDT does not believe that this is an administrative requirement because, if the information in the Operating Plan is out of date, then the plan will not be effective. **On March 15, 2012, FERC issued an order on NERC's Find, Fix and Track process and in paragraph 81 ("P81") invited NERC and other entities to propose to remove from Commission-approved Reliability Standards unnecessary or redundant requirements. In response to P81 and the Commission's request for comments to be coordinated, during June and July 2012, various industry stakeholders, Trade Associations, staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. In Phase 1 of the Paragraph 81 effort, only two of the requirements (in total) from CIP-001 and EOP-004 met the initial threshold for being included in the P81 Project. Both of these requirements will also be retired by EOP-004-2. Phase 2 of the Paragraph 81 Project will evaluate all NERC Reliability Standards, including any modifications to EOP-004-2. CIP-001-2a and EOP-004-1 are mandatory and enforceable NERC Reliability Standards. If EOP-004-2 is not approved by the industry, those standards will remain as is and subject to the Compliance Monitoring and Enforcement Program. As the SDT is moving forward with a Recirculation Ballot, your suggestions will be forwarded to NERC for future consideration.**		
NV Energy	No	Without further clarification of what is expected by "validate all contact information" I cannot support this requirement. On the surface, "validate" appears to be acceptable terminology, as it means to me a review of the contact names and contact information (perhaps cell #, home phone, text address, email address, etc) that would be evidenced through an attestation of completion of review along with records showing the updates made to the contact information pursuant to the review. However, when the Measure is considered, it refers to evidence such as operator logs, voice recordings, etc. This seems to indicate that the

Organization	Yes or No	Question 1 Comment
		expectation is that each contact is tested, by dialing, texting, emailing, etc with some sort of confirmation that each contact was successful. If this is what is necessary to satisfy the "validate" requirement, I believe it is excessive, burdensome and unnecessary. I suggest modification of the Measure language to clearly allow for an entity to demonstrate compliance by a showing that it reviewed the contact information and made changes as deemed necessary by its review, and to remove the reference to operator logs and voice recordings as the evidence of measure.
Response: Thank you for your comment. The SDT agrees with your comment and views your direction as being consistent with the standard's intent. The SDT will submit your comment to NERC Compliance staff for their consideration. The SDT intends for operator logs and voice recordings to be acceptable as evidence, but not the only acceptable evidence. The use of the language "such as" in the measure indicates this.		
Bonneville Power Administration	Yes	BPA agrees with the revision and recognizes that it will involve a large amount of validation workload for entities with a large footprint.
Response: Thank you for your comment.		
Dominion	Yes	Dominion supports the combination of Requirements R3 and R4 into a single requirement (Requirement R3), although we remain concerned that validation requiring a phone call could be perceived as a nuisance by that entity.
Response: Thank you for your comment. The SDT appreciates this concern but feels that the requirement is necessary to address the FERC directive in the Order 693. The SDT does not believe that validation of the contact information will be a nuisance. If the information in the Operating Plan is out of date, then the plan will not be effective.		
Duke Energy	Yes	Duke Energy commends the excellent work of the Standard Drafting Team in incorporating previous comments into the current posted draft of the

Organization	Yes or No	Question 1 Comment
		standard.
Response: Thank you for your comment.		
ERCOT	Yes	ERCOT considers replacing R3 and R4 with the new R3 is an improvement and we thank the drafting team for making the change.
Response: Thank you for your comment.		
ReliabilityFirst	Yes	Even though ReliabilityFirst votes in the Affirmative, we offer the following comment regarding Requirement R3 for consideration. ReliabilityFirst recommends changing the word “validate” to “verify” in Requirement R3. ReliabilityFirst believes not only does the entity need to validate contact information is correct, they should verify (i.e. authenticate though test) that the contact information is correct.
Response: Thank you for your comment. The SDT feels that the action you define is consistent with our intent.		
Independent Electricity System Operator	Yes	IESO agrees that the intent of Requirement R3 to have the Registered Entities validate the contact information in the contact lists that they may have for the events applicable to them is achieved. IESO also agrees that the elimination of conducting an annual test of the communications process and review of the event reporting Operating Plan in merging the previous R3 and R4 into this new R3 will give entities an opportunity to develop a plan that suits its business needs.
Response: Thank you for your comment.		
Indiana Municipal Power Agency	Yes	IMPA agrees with the removal of a “test” and going with a validation requirement for the contact information in the Operating Plan.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment.		
Ingelside Cogeneration LP	Yes	Ingleside Cogeneration believes that an annual validation of contact information is sufficient for a reporting procedure. R2 provides sufficient impetus for Responsible Entities to keep their Operating plan current - as a missed report will lead to a violation. Furthermore, external agencies and law enforcement officials will be reluctant to participate in validation tests, as dozens of nearby BES entities will overwhelm them with such requests.
Response: Thank you for your comment. Requirement R3 is in direct response to a FERC directive in Order 693 and as such, the SDT included this provision. If the information in the Operating Plan is out of date, then the plan will not be effective.		
SPP Standards Review Group	Yes	We feel that replacing R3 and R4 with the new R3 is an improvement and we thank the drafting team for making the change.
Response: Thank you for your support.

2. The DSR SDT has revised the VSLs to reflect the language in the revised requirements. Do you agree with the proposed VRFs and VSLs? If not, please explain in the comment area below.

Summary Consideration: Many stakeholders had concerns with the VRFs for R2 and R3 being assigned as "medium". The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF.

Other stakeholders suggested revision to the VSLs for Requirement R1 based on if the event reporting Operating Plan fails to include one or more of the event types listed in Attachment 1. The SDT agrees and has added the following VSLs to R1, in addition to the language that was previously included in the "Severe" VSL:

Lower: The Responsible Entity had an Operating Plan, but failed to include one applicable event type.

Moderate: The Responsible Entity had an Operating Plan, but failed to include two applicable event types.

High: The Responsible Entity had an Operating Plan, but failed to include three applicable event types.

Severe: The Responsible Entity had an Operating Plan, but failed to include four or more applicable event types.

Organization	Yes or No	Question 2 Comment
Detroit Edison	No	Under VSLs for R2- We disagree with the reporting time frames. Making the time requirement as soon as 24 hours puts this reporting requirement on the real time operators. Many of the situations listed in the EOP-004 attachment are not included in the OE-417 report. The Unofficial Comment Form states the reporting obligations serve to provide input to the NERC Event Analysis Program. This program has removed the 24 hour reporting requirement and

Organization	Yes or No	Question 2 Comment
		changed it to 5 business days.
Response: Thank you for your comments. The reporting obligation under this standard is to provide notification of events to NERC Situation Awareness group. The SDT, in consultation with the DOE and NERC Events Analysis group, have recognized the where there is duplication of reporting and provided for the common use of the different group's forms. This standard is not a replacement or substitution for any other obligations to other agencies. However, the SDT recognizes the concern with having real time operations staff submitting the report. To this end, the DSR SDT has added clarifying language to R2 as follows: **R2. Each Responsible Entity shall report events per their Operating Plan within 24 hours of meeting an event type threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). [Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]**		
Texas Reliability Entity	No	(1) VSLs for R1 should have a lower level VSL if the event reporting Operating Plan fails to include one or more of the event types listed in Attachment 1. (2) VSL for R1 is incorrectly stated as there are no "parts" to R1.
Response: Thank you for your comment. 1) The SDT agrees and has added the following VSLs for R1, in addition to the language that was previously included in the "Severe" VSL: **Lower: The Responsible Entity had an Operating Plan, but failed to include one applicable event type.** **Moderate: The Responsible Entity had an Operating Plan, but failed to include two applicable event types.** **High: The Responsible Entity had an Operating Plan, but failed to include three applicable event types.** **Severe: The Responsible Entity had an Operating Plan, but failed to include four or more applicable event types.** **2) This was correct in the clean version of the standard.**		
ACES Power Marketing Standards Collaborators	No	Because R3 is administrative, the VRF should be Lower. The requirement simply compels that that registered entity update a document which is purely administrative.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a		

Organization	Yes or No	Question 2 Comment
is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF.		
Bonneville Power Administration	No	BPA does not agree with the VRFs and VSLs. BPA believes that the violation levels for administrative errors are too high. For more information, please reference comments to question #3.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF. Please see the response to your question 3 comments.		
CenterPoint Energy	No	CenterPoint Energy suggests that the phrase "which caused a negative impact to the Bulk Electric System" be added to each Violation Severity Level. For example, the wording would appear as follows: "The Responsible Entity submitted an event report (e.g., written or verbal) to all required recipients more than 24 hours but less than or equal to 36 hours after meeting an event threshold for reporting which caused a negative impact to the Bulk Electric System". Additionally or alternatively, the Company proposes that the above phrase be added to the Threshold(s) for Reporting in Attachment 1 to focus on events that have an impact or effect on the Bulk Electric System.
Response: Thank you for your comment. The SDT does not believe such a change is necessary. Each event type listed is applicable to BES reliability.		

Organization	Yes or No	Question 2 Comment
MidAmerican Energy	No	Change the VRFs / VSLs to match suggested changes in Question 3
Response: Thank you for your comment. The SDT followed the NERC guidelines for VSLs in setting the appropriate levels. Please see the response to your question 3 comments.		
The United Illuminating Company	No	Do not agree that the VRF for R3 is medium. Failure to Validate contact information will not likely lead to instability and Cascade. Reporting under EOP-004 is not an immediate action, and given a 24 hour reporting window a proper contact point can be identified on-the-fly. R2 is properly identified as the Medium VRF since a failure to report whether due to an improper Operating plan or improper contact list may lead to a BES cascade.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF.		
Southwest Power Pool Regional Entity	No	In R2, SPP RE does not understand why the VSLs are based on who was or was not contacted rather than when it was reported. An entity could decide to put only two entities in its Event Reporting Operating Plan. If the entity fails to submit an appropriate event report, it is open to a Severe VSL on the top set of VSLs but only a moderate on the lower set of VSLs. This seems to be a disconnect for applying the VSLs for the same facts and circumstances.
Response: Thank you for your comment. The SDT followed the NERC guidelines for VSLs in setting the appropriate levels. The VSLs were written based on two potential failures to meet the requirement. The first is based on the time the report was submitted while the second was based on the entity submitting the report within 24 hours but not to all applicable entities.		

Organization	Yes or No	Question 2 Comment
Midwest Independent Transmission System Operator, Inc.	No	MISO agrees with the comments submitted by the SERC Operating Committee that the VRFs for R2 and R3 should be “Lower” instead of “Medium,” since these are administrative requirements. MISO further respectfully suggests that implementing another standard that requires reporting every incident identified in a plan within 24 hours and that classifies failure to do so a “Severe” violation, will likely cause entities to limit the scope of their plans. NERC, therefore, would not receive information that appears unimportant to a single entity but could be important in the context of similar events across the country.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a “Medium” VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a “Lower” VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot “lower the bar” on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a “Medium” VRF. **The SDT does not agree with your second comment and believes that entities will report the appropriate events.**		
Oncor Electric Delivery	No	Oncor suggest the following additions to VSL language for R1 to align more closely with the measures described in M1Lower VSL - Entity has one applicable event type not properly identified in its event reporting Operating Plan. High VSL - Entity has more than one applicable event type not properly identified in its event reporting Operating Plan. Severe VSL - The Responsible Entity failed to have an event reporting Operating Plan
Response: Thank you for your comment. Based on comments from you and others, we have added the following VSLs for R1, in addition to the language that was previously included in the “Severe” VSL: **Lower: The Responsible Entity had an Operating Plan, but failed to include one applicable event type.**		

Organization	Yes or No	Question 2 Comment
Moderate: The Responsible Entity had an Operating Plan, but failed to include two applicable event types. High: The Responsible Entity had an Operating Plan, but failed to include three applicable event types. Severe: The Responsible Entity had an Operating Plan, but failed to include four or more applicable event types.		
Exelon Corporation and its affiliates	No	R2 VSLs - By measuring the amount of time taken to report and the number of entities to receive the report, the VSLs track more with size and location than with a failure to report. For instance, an entity failing to report at all to one entity would be deemed a lower VSL while an entity reporting to many, but failing to report to three entities would be deemed a high VSL. R3 VSL - The severe VSLs do not seem commensurate to oversight. A three month delay in validating that phone numbers are correct, for phone numbers that are accurate, does not track with a severe infraction.
Response: Thank you for your comment. The SDT followed the NERC guidelines for VSLs in setting the appropriate levels. The SDT will forward your suggestions to NERC for future consideration of the VSL language.		
Blue Ridge EMC	No	R3 VSLs are silly.
Response: Thank you for your comment. The SDT followed the NERC guidelines for setting the appropriate VSLs.		
Tacoma Public Utilities	No	Regarding the Severe VSL for R1, the reference to “Parts 1.1 and 1.2” appears to be outdated. For R2, change “the Responsible Entity failed to submit an event report...to X entity(ies) within 24 hours” to “the Responsible Entity failed to submit an event report...to only X entity(ies) within 24 hours.” (Add ‘only.’)
Response: Thank you for your comment. The SDT agrees with your first suggestion and this was correct in the clean version of the standard that was posted. Your second suggestion will be forwarded to NERC for future consideration.		

Organization	Yes or No	Question 2 Comment
SPP Standards Review Group	No	Since EOP-004 is about after-the-fact reporting, we suggest that all the VRFs be Lower. This would mean lowering R2 and R3 from Medium. The third component of the Severe VSL for R2 is more severe than the other two components. In an attempt to be more consistent across all the VSLs, we propose the following for the High VSL for R2: The Responsible Entity submitted an event report (e.g., written or verbal) to all required recipients more than 48 hours after meeting an event threshold for reporting. OR The Responsible Entity failed to submit an event report (e.g., written or verbal) to three or more entities identified in its event reporting Operating Plan within 24 hours. We propose the following, deleting the first two components as shown in the current draft, for the Severe VSL for R2: The Responsible Entity failed to submit a report for an event in EOP-004 Attachment 1.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF. **The VSLs were written to account for tardiness of reports, for failing to report to certain entities and for not submitting a report at all. The investigators will apply the appropriate VSL based on the type of violation found.**		
ERCOT	No	Since EOP-004 is related to ex-post reporting, which has nothing to do with operational or planning risk, this is an administrative requirement and, accordingly, the VRFs should all be Low. This would mean lowering the VRF for R2 and R3 to Low. The third component of the Severe VSL for R2 is more severe than the other two components. In an attempt to be more consistent across all the VSLs, we

Organization	Yes or No	Question 2 Comment
		propose the following for the High VSL for R2: The Responsible Entity submitted an event report (e.g., written or verbal) to all required recipients more than 48 hours after meeting an event threshold for reporting. OR The Responsible Entity failed to submit an event report (e.g., written or verbal) to three or more entities identified in its event reporting Operating Plan within 24 hours. ERCOT proposes that the first two components of the Severe VSL for R2 be deleted and replaced with: The Responsible Entity failed to submit a report for an event in EOP-004 Attachment 1.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF. **The VSLs were written to account for tardiness of reports, for failing to report to certain entities and for not submitting a report at all. The investigators will apply the appropriate VSL based on the type of violation found.**		
Duke Energy	No	The Lower VSL for R3 should be clarified. The phrase "validated 75% or more" should be modified to say "validated at least 75% but less than 100%".
Response: Thank you for your comment. The SDT agrees and has made the correction.		
SERC OC Standards Review Group	No	The VRF for R2 should be "Lower" instead of "Medium" since it is administrative which involves reporting events to entities not identified in the Functional Model that have operating responsibilities listed. The VRF for R3 should also be "Lower" instead of "Medium" since it is an administrative requirement.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC		

Organization	Yes or No	Question 2 Comment
Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF.		
Southern Company	No	The VRF for R2 should be "Lower" instead of "Medium" since it is administrative which involves reporting events to entities not identified in the Functional Model that have operating responsibilities listed. The VRF for R3 should also be "Lower" instead of "Medium" since it is an administrative requirement. In addition we suggest that the VSL for R1 should have a lower level VSL for an Operating Plan that may have one event type missing from the Operating Plan.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF.		
Cogentrix Energy	No	The VRF for R2 should be "Lower" instead of "Medium" since it is administrative which involves reporting events to entities not identified in the Functional Model that have operating responsibilities listed. The VRF for R3 should also be "Lower" instead of "Medium" since it is an administrative requirement.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a		

Organization	Yes or No	Question 2 Comment
is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF.		
Xcel Energy	No	The VSLs for column for R2 provide a range of severity based on the number of contacts made (or not made) but this seems to be arbitrarily defined. A smaller entity may only have two or three contacts so missing one or more here may be a much higher risk than for a larger utility that may have ten or more contacts. The VSLs should be drafted to include percentages instead of whole numbers. The Lower VSL column for R3 states,"...OR The Responsible Entity validated 75% or more of the contact information contained in the operating plan." This could be interpreted that even someone completed 100% (which is more than 75%) a low VSL could be assigned. This VSL should be drafted in similar fashion to the Moderate, High and Severe VSLs and include a range (i.e. less than 100% but more than 75%).
Response: Thank you for your comment. The SDT followed the NERC guidelines for VRFs and VSLs in setting the appropriate levels. The SDT will forward your suggestions to NERC for future consideration.		
Manitoba Hydro	No	This seems like an administrative only requirement. It would be too difficult to validate or measure.
Response: Thank you for your comment. Please see the response to your comment in question 1.		
Independent Electricity System Operator	No	We agree with the VRF for R2, but have a concern over the VRFs assigned to R1 (Lower) and R3 (Medium).Having an event reporting operating plan (R1) is a first step toward meeting the intent of this standard, annually validating it (R3) is a maintenance requirement which arguably can be regarded as equally important but its reliability risk impact for failure to comply should be no higher

Organization	Yes or No	Question 2 Comment
		than having no plan to begin with. We therefore suggest that the VRFs for R1 and R3 be at least the same, or that R1's VRF be higher than that for R3.
Response: Thank you for your comment. The SDT developed the VRFs based on existing, FERC Approved VRFs and NERC Guidelines for establishment of VRFs. EOP-004-2 is a result of merging CIP-001-2a and EOP-004-1. Each requirement in CIP-001-2a is assigned a "Medium" VRF. The requirements of CIP-001-2a map to EOP-004-2 Requirements R1 and R2. Having an Operating Plan (EOP-004-2, R1) merits a "Lower" VRF. The reporting of events contained in the Operating Plan required under Requirement R1 is mandated under Requirement R2 (which maps from CIP-001-2a, R2). The SDT cannot "lower the bar" on an existing VRF per NERC and FERC guidelines. Further, since R3 requires validation of the contact information in the Operating Plan, it is also assigned a "Medium" VRF.		
Southwest Power Pool RTO	No	We question the reliability benefits of this requirement.
Response: Thank you for your comment. Requirement R3 is in direct response to a FERC directive in Order 693 and as such, the SDT included this provision. If the information in the Operating Plan is out of date, then the plan will not be effective.		
Lewis County PUD	No	
American Electric Power	No	
Response: Thank you for your participation.		
ReliabilityFirst	Yes	Even though ReliabilityFirst votes in the Affirmative, we offer the following comments for consideration regarding the VSLs: VSL for Requirement R2 - ReliabilityFirst questions whether there is justification for the gradation of VSLs out to 60 hours for the reporting an event. Without justification, ReliabilityFirst believes the timeframe should be shortened to eight hour increments with a severe VSL being more than 48 hours late. ReliabilityFirst believes that being more than a day late (24 hours) falls within the entity completely not meeting the intent of submitting the report with the required 24 hour timeframe.
Response: Response: Thank you for your comment. The SDT followed the NERC guidelines for VRFs and VSLs in setting the

3. **Do you have any other comment, not expressed in the questions above, for the DSR SDT?**

Summary Consideration: Most stakeholders who responded to this question provide comments suggesting specific revisions to the requirements or to the event types listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.

Organization	Question 3 Comment
Detroit Edison	"Suspicious activity" and "suspicious device" should be eliminated from Attachment 1, Event types: 'Physical threats to a Facility' and 'Physical threat to a BES Control Center'. By including 'suspicious activity' in the standard, I believe the project team went outside of the scope of the project, which was intended to be a merger of the two standards. Regarding standard CIP 001, the threshold for reporting is “Disturbances or unusual occurrences, suspected or determined to be caused by sabotage....”, as its title suggested: Sabotage Reporting. Suspicious activity, which is not defined by the standard, clearly has a much lower threshold than sabotage, or even suspected sabotage. The reporting requirement of 24 hours, also increases the burden on the entity to either rush to investigate and make a determination regarding suspicious activity in less than 24 hours, or not perform due diligence and report uninvestigated “suspicious” activity, which normally turns out to not be a "Physical Threat”. Suspicious activity should be duly investigated by the entity, local law enforcement, or the FBI as appropriate; and then reported if it has been determined to be a physical threat, or cannot be explained. Reporting within 24 hours will devalue the information inputted, as most cases of suspicious activity are innocuous, and the standard lacks a process of follow up, which would remove the those incidents from intelligence databases. Regarding suspicious devices, determination is usually immediate, (in less than 24 hours), and then the device would be classified as either "sabotage" or "no threat". The standard is not clear whether suspicious devices still have to be reported, even if they are immediately determined as not a "Physical Threat to a Facility or BES Control Center." Disturbance and Sabotage Reporting Standard Drafting Team (Project 2009-

Organization	Question 3 Comment
	01) - Reporting Concepts states: The changes do not include any real-time operating notifications for the types of events covered by CIP-001 and EOP-004. The real-time reporting requirements are achieved through the RCIS and are covered in other standards (e.g. EOP-002-Capacity and Energy Emergencies). These standards deal exclusively with after-the-fact reporting." Attachment 1 in existing EOP-004-1 is much easier to follow (specifies time requirement to file). Also R2 states DOE OE-417 may be utilized to file reports, however Standard time requirement for update report is 48 hours, OE-417 has changed time requirement on updated filing to 72 hours. Difference can cause confusion and possible penalties. The real time operator must focus on maintaining system reliability. Putting unnecessary reporting obligations on RT puts more importance on the reporting structure than on maintaining reliability. Let 8/5 support personnel perform the reporting tasks and keep the 24/7 on shift operators focusing on the BES.
Response: Thank you for the comment. The SDT disagrees with your position on the inclusion of suspicious activities. Suspicious activities are events and notification of such events is a part of the existing and CIP-001 and EOP-004 standards. Reporting under EOP-004 is for notification purposes only. The standard does not require any analysis of events and does not require any follow up reports as you suggest.	
City of Austin dba Austin Energy	(1) City of Austin dba Austin Energy (AE) requests that the SDT clarify whether R3 requires that each Registered Entity subject to EOP-004-2 verify NERC's contact information each year. It appears this would be overly burdensome for NERC to respond to individual requests. (2) AE also asks that NERC's fax number be included in the contact information at the beginning of Attachment 1 and at the Event Reporting Form in Attachment 2. NERC included the fax number as a viable contact method in its recent NERC Alert notifying the industry of the changed information. (3) AE requests that the SDT increase the threshold for reporting loss of firm load to â‰¥ 300 MW for all entities to align the reporting threshold with the OE-417 threshold. Otherwise, smaller entities would have to report firm load losses between 200 and 299 MW to NERC but not to the DOE. This could be administratively confusing to those responsible for reporting. (4) Attachment 1 lists the threshold for reporting generation loss at â‰¥ 1,000MW for the ERCOT Interconnection. ERCOT planning is based on a single contingency of 1,375MW. For this reason, AE believes the minimum threshold for a

Organization	Question 3 Comment
	disturbance should be greater than the single contingency amount of >1,375MW for the ERCOT Interconnection.
Response: Thank you for your comment. The SDT does not feel it is necessary to specific how the validation occurs and has left this to the entity to determine how to do this. The SDT agrees with the inclusion of the fax number. The SDT will forward the other suggestions to NERC for future consideration. However, it should be noted that these suggestions have not been adopted due to consistency with other standards.	
ACES Power Marketing Standards Collaborators	(1) For the first “Damage or destruction of a Facility” event in Attachment 1, the threshold for reporting should be modified. The threshold for reporting would only include damage or destruction that necessitates the need for action to prevent an Emergency. It does not include if an Emergency actually occurs. Based on the definition of Emergency which states that it is an “abnormal system condition that requires... action to prevent or limit”, we think the threshold should be changed to “Damage or destruction of a Facility... that results in a BES Emergency”. Per the definition, the Emergency is what necessitates action which is what the threshold appeared to be focused on. (2) In the second “Damage or destruction of a Facility” event in Attachment 1, the threshold regarding “intentional human action” is ambiguous and suffers from the same difficulties as defining sabotage. What constitutes intentional? How do we know something was intentional without a law enforcement investigation? If a car runs into a transmission tower, was this an accident or intentional human action? It could be either. This appears to be the same issue that prevented the drafting team from defining sabotage.(3) Under the “Physical threats to a BES control center” event in Attachment 1, the event should very clearly define if this applies to backup control centers or not. (4) Under the “Complete loss of off-site power to a nuclear generating plant (grid supply)” event” in Attachment 1, the entity with reporting responsibility is not coordinated with NUC-001. NUC-001 used the term transmission entity to mean an entity that is responsible for providing NPIR services. They did not use only TOP because there are other entities that provide this service. Please coordinate the “Entity with Reporting Responsibility” with that standard. (5) We continue to believe that the draft standard has not satisfied the complete scope of the SAR regarding elimination of redundancy. The draft standard will continue to require redundant reporting by various entities. For instance, under the event “Loss of Firm Load” in Attachment

Organization	Question 3 Comment
	1, the DP, TOP, and BA all are required to report. The response to our last set of comments regarding this issue was that "the industry can benefit from having such differing perspectives when events occur". This response seems to confuse event analysis with event reporting. The purpose of the standard is to simply report that an event happened. In fact, the reporting form only requires the submitting entity to report the type of event. The description of what happened is optional. What additional perspectives could be gained from having multiple registered entities in the same electrical footprint report that an event happened. If the purpose is to analyze the event, this is covered in the events analysis process. Furthermore, once NERC becomes aware of the event they have the authority to request data and information from other registered entities. Please eliminate the duplicate reporting requirements. Other events that may require duplicate reporting include: Damage or destruction of a Facility, Physical threats to a Facility, BES Emergency resulting in automatic firm load shedding, Loss of firm load, System separation, Generation loss, and Complete loss of off-site power to a nuclear generating plant.(6) In the second "Damage or destruction of a Facility" event and "Physical Threats to a Facility" events, Distribution Provider should be removed. The Distribution Provider does not have any Facilities which is defined as "a set of electrical equipment that operates as a single Bulk Electric System Element". The DP's transformers interconnecting to the BES are not Facilities and the latest NERC BOT definition explicitly does not include them in Inclusion I1. If a DP did own Facilities, it would be registered as a TO or GO. Inclusion of the DP will compel the DP to provide evidence that it does not have Facilities which is an unnecessary compliance burden that does not support reliability. (7) The "BES Emergency resulting in automatic firm load shedding" should not apply to the DP. In the existing EOP-004 standard, Distribution Provider is not included and the load shed information still gets reported. (8) For the "Voltage deviation on a Facility" event in Attachment 1, we suggest changing "area" in the threshold for reporting to "Transmission Operator Area" as it is a defined term. (9) For the "System separation (islanding)" event, please remove BA. Because islanding and system separation, involve Transmission Facilities automatically being removed from service, this is largely a Transmission Operator issue. This position is further supported by the approval of system restoration standard (EOP-005-2) that gives the responsibility to restore the system to the TOP. (10) The response to our comments requesting that Measure 2 specifically identify that attestations are

Organization	Question 3 Comment
	acceptable forms of evidence to indicate that no events have occurred indicated that the measure cannot permit use of attestations. Other standards that have been recently approved by the board specifically permit the use of attestations. FAC-003-2 M1 and M2, TOP-001-2 M1-M11 and TOP-003-2 M5 all permit the use of attestations. We ask that the drafting team to reconsider including a specific reference that an attestation is acceptable to indicate no event has occurred given these new facts. (11) In requirement R1, we suggest changing “in accordance with EOP-004-2 Attachment 1” to “to report events identified in EOP-004-2 Attachment 1”. It makes more sense since the attachment is a list of events that require reporting. The other language sounds like additional requirements will be established in Attachment 1.
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Southwest Power Pool Regional Entity	(1) SPP RE thinks the following Generation reporting threshold is unclear: "Total generation loss, within one minute, of â‰¥ 2,000 MW for entities in the Eastern or Western Interconnection". What has to happen within one minute? It reads as if you have to make a report within one minute. If the intent is that a report has to be made within 24 hours if the loss is for more than one minute it should read, "Total generation loss â‰¥ 2,000 MW for more than one minute for entities in the Eastern or Western Interconnection". What is the intent of the one minute requirement? (2) It appears per R1 that entities are no longer required to include Regional Entities in their reporting chains. SPP RE believes Regional Entities must be included in the reporting chain so they can fulfill their obligations under their delegation agreements. (3) SPP RE thinks this standard was changed substantially enough that it should have been opened for a new ballot pool.

Organization	Question 3 Comment
Response: Thank you for comment. 1) The intent of the "one minute" language is to avoid having to report when a generator has a slow run back rather than a sudden loss. Typically, a unit will trip instantly and the loss will be clear. Other times, the generation will slowly decline and the SDT does not intend for this to be reported. The reporting requirement is to submit a report for an applicable event within 24 hours. 2) Entities are required to report to the ERO only and may submit reports to others, including the RE. The SDT envisions the reports generated through EOP-004-2 act as an input to the Events Analysis Process which includes participation by the Regional Entity. 3) The SDT followed the standards development process which allows significant revision to the standards a long as it proceeds to a successive ballot. The NERC Standard Processes Manual clearly states that a ballot pool stays in place until balloting is completed on a standard. On occasion, the Standards Committee has determined that it is necessary to form a new ballot pool for a project because the ballot pool has been in place for several years and many of the original ballot pool members are no longer available to vote, but this is not the normal practice.	
Ameren Services	(1) This draft refers to a number of activities in the Operations Plan that each entity is to have on hand as the primary guide of actions to be taken when an event occurs. Although there is information related to the requirements that should be included in the Operations Plan, the drafting team has not defined a structure on the format, the minimum information to be included or the direct audience for the Operations Plan. In addition, there is no guidance on the disposition, distribution of the Operations Plan which is left to the entity to determine. We request that the drafting team provide a defined structure for entities concerning the development and implementation of the Operations Plan. (2) Page 14 (Attachment 2) - Voltage Deviation of a Facility - This appears to be a contradiction to VAR-001-2 R10 for TOP which states IROL events will be corrected within 30 minutes. We request the 15 minute reporting criteria be changed to also state 30 minutes. (3) Throughout Document - "Report to the ERO and Regional Entity" - NERC and DHS established the ES-ISAC as a confidential location to report all events that happen on the BES. As these events are of a Sabotage / Disturbance nature, they should all go through the ES-ISAC both as a single location for distribution, and as a best practice that the industry has started. (4) There seems to be some differences between the red-line and clean versions which may need some clarification. For example, (a) In the redline version, the revision history box appears to indicate the inclusion of parts of CIP-008, and in the "Clean" version this has been

Organization	Question 3 Comment
	removed from the revision history box. (b) The red-line version includes a drawing at two places versus once in the clean version. (c) The correlation between the clean and redline documents is not very clear and there appears to be gaps in the reporting and tracking framework structure.
Response: Thank you for comment. 1)-3) Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot. 4) In removing tables and diagrams, the redline version tends to show both the old and new with only a red line down the side of the page. The clean version of the standard is the final version.	
Texas Reliability Entity	(A) Regional Entity should be capitalized in R1. (B) COMMENTS ON ATTACHMENT 1:In the previous comment period on this Standard, Texas RE submitted comments that we feel were not adequately addressed. There were several responses to comments regarding the Events Table that need deeper review and consideration:(1) In the Events Table, under Transmission Loss, the SDT indicated that reporting is triggered only if three or more Transmission Facilities operated by a single TOP are lost. Also, generators that are lost as a result of transmission loss events must be included when counting Facilities. As Texas RE indicated in previous comments to this Standard, determining event reporting requirements by the entity that owns/operates the facility is not an appropriate measure. If the industry wants to learn from events, these types of issues must be addressed. Including the RC as one of the Entity(s) with Reporting Responsibility may alleviate this concern. The RC would have overall view of the system and could provide the reports on multi-element events where the elements are owned/operated by different entities. For the SDT to believe that “There may be times where an entity may wish to report when a threshold has not been reached because of their experience with their system” is worthy to note but falls short of the reliability implications caused by those entities that will not report. The industry needs to learn from events and failure to report will facilitate failure to learn. (2) In the Events Table, under Transmission Loss, there has been considerable discussion

Organization	Question 3 Comment
	recently within the Events Analysis Subcommittee (EAS) regarding the definition of the phrase "contrary to design." The EAS is currently working on possible guidelines to interpret this event type. The SDT may want to consider including the EAS language into the Guidelines and Technical Basis for this Standard. (3) In the Events Table, under "Unplanned BES Control Center evacuation" and "Complete loss of voice communication capability," and "Complete loss of monitoring capability," GOPs should be included. GOPs also operate control centers that would be subject to these kinds of occurrences. As Texas RE indicated in previous comments to this Standard, in CIP-002-5 Attachment 1 there is a "High Impact Rating" for the following: "1.4 Each Control Center, backup Control Center, and associated data centers used to perform the functional obligations of the Generation Operator that includes control 1) for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection or 2) that includes control of one or more of the generation assets that meet criteria 2.3, 2.6, and 2.9." In the ERCOT Region, we experienced an event where a GOP control center lost an ICCP link that carried real-time information regarding its generation fleet (over 10,000 MWs). Without inclusion of the GOP here the event may not get recorded. While it was a "virtual" loss, the impact to the BES through generation control actions could be significant and the event should be reported and analyzed. For the GOP control centers that do exist, the reporting of such events should be a requirement. Based on the minimum of these two examples, why would the SDT NOT include GOP as being applicable? (4) In the Events Table, under "BES Emergency requiring public appeal for load reduction," the definition of Emergency is "Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities...." Is it the intent of the SDT to exclude public appeals issued in anticipation of a possible emergency, before a BES Emergency is officially declared? (5) In the Events Table, under "BES Emergency resulting in automatic firm load shedding," the SDT may want to consider including the RC as one of the Entity(s) with Reporting Responsibility. The RC would have overall view of the system and should provide the reports on events where the multiple entities may be involved. We have UVLS schemes in our region

Organization	Question 3 Comment
	where the total MW shed is greater than 100 MW, but the individual TOP MW shed is less than 100 MW. (6) In the Events Table, consider whether the item for “Voltage deviation on Facility” should also be applicable to GOPs, because a loss of voltage control at a generator (e.g. failure of an automatic voltage regulator or power system stabilizer) could have a similar impact on the BES as other reportable items. Note: We made this comment last time, and the SDT’s posted response was non-responsive to this concern. The SDT noted “Further, we note that such events do not rise to the level of notification to the ERO” but the SDT failed to recognize that “Voltage deviation on a Facility” does exactly that - notifies the ERO but from a TOP perspective only. Texas RE is trying to establish the correct Responsible Entity for reporting “Voltage deviation on a Facility” (in this case a generator regardless of the cause and other obligations the owner may have with other Reliability Standards).
Response: Thank you for comment. A) The SDT agrees and has made the correction. B) Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Central Lincoln	1) Central Lincoln must again point out the lack of proportionality for gunshot insulators and similar events under “Damage or destruction of a Facility.” Please see our last set of comments. These incidents are fairly common in the west, and typically do not cause an immediate outage. They are generally discovered months after the fact, yet the discovery starts the 24 hour clock running as if the situation had suddenly changed. Prior SDT response: “... this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was “damaged or destroyed” intentionally by a human.” There is already a great lag in awareness regarding the damaged insulator. Months or more can pass prior to discovery by the entity. We fail to see how it becomes so urgent upon discovery. Prior SDT response: “The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.”We do not share the SDT’s

Organization	Question 3 Comment
	vision. If an Operating Plan redefined suspected intentional human action so the act of preparing a gun for firing, aligning the sights on an insulator and pulling the trigger was not included, we believe the entity that operates under that plan would be found non-compliant under the language of this standard. We do not offer a simple change in text that will fix the problem, we are only pointing out the problem exists. Murphy dictates discovery will occur at the most inopportune time, which will be during an after hours outage on a stormy holiday weekend night when many employees are out of town and those that are available are already fully engaged. The entity is then faced with choosing to delay restoration or violating the standard. When proposing a zero defect event driven requirement event driven such as this one, we ask the SDT to consider all possible scenarios in which the event may occur. 2) We note that Distribution Providers are listed in the Applicability Section. We also note that there is no requirement in the Statement of Compliance Registry Criteria for Distribution Providers to own or operate BES Facilities, own or operate UFLS or UVLS of 100 MW, or to have load exceeding 200 MW. DP's that cannot meet any of the thresholds of Attachment 1 would still need an Operating Plan under R1 and annually validate the possibly null contact list in its OP under R3. We suggest that DPs that cannot meet the thresholds of Attachment 1 be removed from the Applicability Section.

Response: Thank you for comment. 1) Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.

2) To your suggestion on DPs, the SDT has clarified, in the Guidelines and Technical Basis Section of the standard, that DPs who do not meet the threshold reporting requirements can conduct an annual review of the threshold requirements and be exempted from R1 and R3 for that period. Once the DP has met the threshold reporting requirements, they will then have to comply with the standard.

> **"Distribution Provider Applicability Discussion**
>
> **The DSR SDT has included Distribution Providers (DP) as an applicable entity under this standard. The team realizes that not**

Organization	Question 3 Comment
all DPs will own BES Facilities and will not meet the "Threshold for Reporting" for any event listed in Attachment 1. These DPs will not have any reports to submit under Requirement R2. However, these DPs will be responsible for meeting Requirements R1 and R3. The DSR SDT does not intend for these entities to have a detailed Operating Plan to address events that are not applicable to them. In this instance, the DSR SDT intends for the DP to have a very simple Operating Plan that includes a statement that there are no applicable events in Attachment 1 (to meet R1) and that the DP will review the list of events in Attachment 1 each year (to meet R3). The team does not think this will be a burden on any entity as the development and annual validation of the Operating Plan should not take more that 30 minutes on an annual basis. If a DP discovers applicable events during the annual review, it is expected that the DP will develop a more detailed Operating Plan to comply with the requirements of the standard."	
Duke Energy	1) There are discrepancies between the red-lined EOP-004-2 and the Clean EOP-004-2 that were posted for this project. Our comments are based upon the Clean EOP-004-2. 2) Attachment 1 and Attachment 2 have the ERO email and phone number listed. If these ever change, does the standard have to go through the revision and balloting process again, or is there an easier way to incorporate such changes? 3) Attachment 1 - When an event occurs that meets the Threshold for Reporting, it's not clear whether all listed entities have to report or not. Several Event Types need this clarity added. For example, if a TOP loses voice communication capability, do both the TOP and RC have to report? 4) Attachment 1 - Damage or destruction of a Facility, applicable to BA, TO, TOP, GO, GOP, DP. The Threshold for Reporting should be further clarified by adding the sentence "Do not report theft or damage unless it degrades normal operation of a Facility." This would eliminate unnecessary reporting of copper theft or vandalism. 5) Attachment 1 - Physical threats to a Facility. The Threshold for Reporting should be modified by deleting the sentence "Do not report theft unless it degrades normal operation of a Facility". This sentence isn't needed here, and fits better with "Damage or destruction of a Facility" as noted in 4) above. 6) Attachment 1 - Transmission loss. This event type should be deleted because it is duplicated

Organization	Question 3 Comment
	under TADS reporting and PRC-004 Protection System Misoperations reporting. 7) Attachment 1 - Unplanned BES control center evacuation, Complete loss of voice communication capability, and Complete loss of monitoring capability. The Threshold for Reporting on all three of these Event Types is 30 minutes, and should be extended to 2 hours, consistent with the transition time identified in EOP-008 "Loss of Control Center Functionality".
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
ERCOT	As a general matter, this standard imposes an ex-post reporting obligation. Consistent with the ongoing P 81 standard review/elimination effort, this standard is arguably a candidate for elimination under the principles guiding that effort. The obligation proposed in the standards are better suited for inclusion in the Rules of Procedure or as a guideline because they are strictly administrative in nature. **Response: On March 15, 2012, FERC issued an order on NERC's Find, Fix and Track process and in paragraph 81 ("P81") invited NERC and other entities to propose to remove from Commission-approved Reliability Standards unnecessary or redundant requirements. In response to P81 and the Commission's request for comments to be coordinated, during June and July 2012, various industry stakeholders, Trade Associations, staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. In Phase 1 of the Paragraph 81 effort, only two of the requirements (in total) from CIP-001 and EOP-004 met the initial threshold for being included in the P81 Project. Both of these requirements will also be retired by EOP-004-2. Phase 2 of the Paragraph 81 Project will evaluate all NERC Reliability Standards, including any modifications to EOP-004-2. CIP-001-2a and EOP-004-1 are mandatory and enforceable NERC Reliability Standards. If EOP-**

Organization	Question 3 Comment
	004-2 is not approved by the industry, those standards will remain as is and subject to the Compliance Monitoring and Enforcement Program. As the SDT is moving forward with a Recirculation Ballot, your suggestions will be forwarded to NERC for future consideration. To the extent the SDT continues to pursue this effort, ERCOT offers the following additional comments. ERCOT has commented on the listing in the Entity with Reporting Responsibility column of Attachment 1. Consistent with those prior comments, the current version still fails to adequately create a bright line threshold for particular events. For example, in the Transmission loss event, although the TOP is listed, there is no direction regarding which TOP is required to file the event report. Is it the TOP in whose TOP area the loss occurred or is it a neighboring TOP who observes the loss? Clearly, the responsibility for reporting lies with the host system, but that responsibility is not clearly designated. There are several other similar events where there is no bright line. We suggest that the drafting team return the deleted language to the Entity with Reporting Responsibility column in those instances where the current version fails to provide a bright line in the Threshold column. Regarding multiple reports for a single event, that aspect of the proposed draft should be revised to only require a single report. While additional information may be available from others, let the Event Analysis team perform their function. This would eliminate the redundant reporting that is currently required as the standard is written. **Response: Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.** ERCOT requests that the reference to "cyber attack" be removed from the Guideline and Technical Basis section of the document since all reporting of cyber events has been removed from the standard and retained in CIP-008. **Response: This correction has been made.**

Organization	Question 3 Comment
Response: Thank you for comment. Please see responses above.	
American Public Power Association	As stated in our comments on the previous draft: It is APPA's opinion that this standard should be removed from the mandatory and enforceable NERC Reliability Standards and turned over to a working group within the NERC technical committees. Timely reporting of this outage data is already mandatory under Section 13(b) of the Federal Energy Administration Act of 1974. There are already civil and criminal penalties for violation of that Act. This standard is a duplicative mandatory reporting requirement with multiple monetary penalties for US registered entities. If this standard is approved, NERC must address this duplication in their filing with FERC. This duplicative reporting and the differences in requirements between DOE-OE-417 and NERC EOP-004-2 require an analysis by FERC of the small entity impact as required by the Regulatory Flexibility of Act of 1980
Response: Thank you for the comment. The SDT does not believe that there is duplicative reporting. The reports that you mention do not go to NERC under the FPA. We will forward your suggestion to NERC for consideration in the preparation of the filing for approval.	
NV Energy	Aside from the comment referring to the new R3 and the term "validate", I applaud the SDT for the improvements made in the remainder of the Standard. This is a much simpler and straightforward approach to meeting the directives in this project and greatly simplifies the processes necessary on the part of the registered entities.
Response: Thank you for your comment.	
CenterPoint Energy	CenterPoint Energy appreciates the revisions made to the draft Standard based on stakeholder feedback and believes that the changes made are positive overall. However, the Company recommends the additional changes noted below for a favorable vote. In the Rationale for R1, CenterPoint Energy recommends that the 2nd sentence in the 1st paragraph be revised as follows, "In addition, these event reports may serve as input to the NERC Events Analysis Program.", as not all events listed in Attachment 1 will serve as input in to the NERC Events Analysis Program. CenterPoint Energy also proposes that the Standard Drafting Team (SDT)

Organization	Question 3 Comment
	add "There cannot be a violation of Requirement R2 without an event." as noted in the Consideration of Issues and Directives to the Requirement. For Attachment 1, CenterPoint Energy recommends the following revisions: CenterPoint Energy continues to be concerned that the uses of the terms “suspicious” and “suspected” are too broad. The Company proposes that the SDT remove the terms from the Thresholds for Reporting or add “which caused a negative impact to the Bulk Electric System” or “that causes an Adverse Reliability Impact..." to each phrase where the terms are used. CenterPoint Energy proposes that the threshold for reporting the event, “BES Emergency requiring manual firm load shedding” is too low. It appears the SDT was attempting to align this threshold with the DOE reporting requirement. However, as the SDT has stated, there are several valid reasons why this should not be done. Therefore, CenterPoint Energy recommends the threshold be revised to “Manual firm load shedding â‰¥ 300 MW”. CenterPoint Energy also recommends a similar revision to the threshold for reporting associated with the “BES Emergency resulting in automatic firm load shedding” event. (“Firm load shedding â‰¥ 300 MW (via automatic under voltage or under frequency load shedding schemes, or SPS/RAS”) For the event of “System separation (islanding)”, CenterPoint Energy believes that 100 MW is inconsequential and proposes 300 MW instead. For “Generation loss”, CenterPoint Energy suggests that the SDT add "only if multiple units” to the criteria of “1,000 MW for entities in the ERCOT or Quebec Interconnection”.
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
PNGC Comment Group	Comments: The PNGC Comment group remains concerned that the “Applicability” section will inadvertently subject Distribution Providers to requirements that they should be excluded from. Please consider the two examples below and note that we’re talking about probably hundreds of small DPs being subject to these unnecessary requirements without any increase to the reliability of the BES. Example 1: Small DP with a peak load of 50 MWs. They have no

Organization	Question 3 Comment
	BES Facilities and their system is radial. Even though this utility will never have a reporting requirement per Attachment A, they are still subject to R1 and R3 plus the associated compliance (read financial) risk for non-conformance. An easy fix to this issue would be for DPs without BES Facilities and with less than 200 MW annual peak load to be excluded in the Applicability section. Example 2: Small DP with a peak load of 50 MWs. Their only BES Facilities are two Automatic UFLS relays that are capable of shedding 15 MWs. DP's Host Balance Authority (HBA) has a peak load of 10,000 MWs, meaning their UFLS plan requires them to have the capacity to shed 3000 MWs should system conditions warrant. Is it the SDT's intent for this DP to have an Operating Plan in place for "damage", "destruction", or "physical threat" for these two relays that are capable of shedding only 15 MWs out of a 3000 MW HBA UFLS plan? The SDT set a 100 MW threshold for reporting of automatic UFLS load shedding so why have reporting requirements for the threat to 15 MWs worth of UFLS relays? Once again the easy fix is to modify the Applicability section. We suggest: 4.1.7. Distribution Provider: with >= 200 MW annual peak load, or;>= 100 MW Automatic firm load shedding

Response: Thank you for comment. To your suggestion on DPs, the SDT has clarified, in the Guidelines and Technical Basis of the Standard, that DPs who do not meet the threshold reporting requirements can conduct an annual review of the threshold requirements and be exempted from R1 and R3 for that period. Once the DP has met the threshold reporting requirements, they will then have to comply with the standard.

> **"Distribution Provider Applicability Discussion**
>
> **The DSR SDT has included Distribution Providers (DP) as an applicable entity under this standard. The team realizes that not all DPs will own BES Facilities and will not meet the "Threshold for Reporting" for any event listed in Attachment 1. These DPs will not have any reports to submit under Requirement R2. However, these DPs will be responsible for meeting Requirements R1 and R3. The DSR SDT does not intend for these entities to have a detailed Operating Plan to address events that are not applicable to them. In this instance, the DSR SDT intends for the DP to have a very simple Operating Plan that includes a statement that there are no applicable events in Attachment 1 (to meet R1) and that the DP will review the list of events in Attachment 1 each year (to meet R3). The team does not think this will be a burden on any entity as the development and annual validation of the Operating Plan should not take more that 30 minutes on an annual basis. If a DP discovers applicable events during the annual review, it is expected that the DP will develop a more detailed Operating Plan**

Organization	Question 3 Comment
to comply with the requirements of the standard."	
Cowlitz PUD	Cowlitz approves of the improvement efforts on Attachment 1. However, Cowlitz must again point out the fallacy of potentially inundating the ERO with nuisance reporting of minor vandalism and accidental damage. For example, gunshot "target practice" of insulators and structures will apply under "Damage or destruction of a Facility." Such incidents are fairly common in the west, and typically do not cause an immediate outage. They are generally discovered months or years after the fact, yet the discovery starts the 24 hour compliance clock running as if the urgency is just as important as a recent event. If there is already a great lag in awareness regarding the damaged Facility, Cowlitz fails to see how it becomes so urgent upon discovery.------------Again, Cowlitz points out the sentence structure "Damage or destruction of its Facility that results from actual or suspected intentional human action" does not restrict the human action as malicious or sabotage. "Intentional human action" could be innocent, such as a land owner attempting to fall a tree for fire wood. The intent was not to damage the Facility, but the "intentional human action" to obtain fire wood resulted in the damage of the Facility. This does not comport with prior SDT response: "... this will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility was 'damaged or destroyed' intentionally by a human." Therefore, if this is the SDT's intent Cowlitz suggests this change: Damage or destruction of its Facility that causes immediate impaired operation or loss of the Facility from suspected or actual malicious human intent. Do not report mischievous vandalism, as defined in the Operating Plan, where immediate loss of, or immediate impaired operation of the Facility has not occurred. --------------Prior SDT response: "The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan." Cowlitz does not share the SDT's vision. The Standard as written does not specifically address the ability to "further define" terms used in the Attachment. Past allowance of audit teams to allow registered entity definitions, e.g. "annual," was to address gaps in standards until the standards could be revised. If this is truly the intent of the SDT, then requirement R1 would need revision such as: "The Operating plan shall define what a suspected intentional human action is." Cowlitz respectfully requests that ambiguity be avoided.------------------ Cowlitz notes that Distribution Providers are listed in the Applicability Section with no qualifiers. Cowlitz

Organization	Question 3 Comment
	points out that there is no requirement in the Statement of Compliance Registry Criteria for Distribution Providers to own or operate BES Facilities, own or operate UFLS or UVLS of 100 MW, or to have load exceeding 200 MW. DP's that cannot meet any of the thresholds of Attachment 1 would still need an Operating Plan under R1 and annually validate the possibly null contact list in its OP under R3. Cowlitz requests that DPs that cannot meet the thresholds of Attachment 1 be removed from the Applicability Section. Not doing so will increase compliance risk without any reliability return.
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot. **To your suggestion on DPs, the SDT has clarified, in the Guidelines and Technical Basis Section of the Standard, that DPs who do not meet the threshold reporting requirements can conduct an annual review of the threshold requirements and be exempted from R1 and R3 for that period. Once the DP has met the threshold reporting requirements, they will then have to comply with the standard.** **"Distribution Provider Applicability Discussion** **The DSR SDT has included Distribution Providers (DP) as an applicable entity under this standard. The team realizes that not all DPs will own BES Facilities and will not meet the "Threshold for Reporting" for any event listed in Attachment 1. These DPs will not have any reports to submit under Requirement R2. However, these DPs will be responsible for meeting Requirements R1 and R3. The DSR SDT does not intend for these entities to have a detailed Operating Plan to address events that are not applicable to them. Wisconsin Electric Power company	Damage or destruction of a Facility, Damage or destruction of its Facility that results from

Organization	Question 3 Comment
dba We Energies	actual or suspected intentional human action.: By the Functional Model, I do not believe the BA function has Facilities by the NERC Glossary definition. This would not apply to a BA. The line above this would adequately cover BA reporting. Remove a BA from applicability for this line. Physical threats to a Facility: The BA function does not have Facilities. Remove a BA from applicability for this line. There could be a separate line for Physical Threats to a Facility within an RC, FOP, BA Area as there is for Damage or Destruction of a Facility. Voltage deviation on a Facility: Please specify what voltage this is, nominal, rated, etc. This should also be > 10% deviation. Exactly at 10% could be at the edge of an allowed range.
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Manitoba Hydro	Does the Background, Guidelines and Technical Basis form part of the standard itself once published? Or are these just parts of the package that accompany the standard during circulation for comment? **The background, guidance and technical basis will remain with the standard and provides clarification on the SDT's intent and direction** Compliance 1.2: The reference to Responsible Entity is bracketed and in lowercase. We are not clear why. **This was corrected in the clean version.** VSLs, R1, Severe VSL: The words "in the event reporting Operating Plan" are missing from the end of this sentence. **This was corrected in the clean version.**

Organization	Question 3 Comment
	VSLS, R2, Lower VSL: The violation occurs if the Responsible Entity has submitted an event report to one entity whereas Moderate VSL, High VSL and Severe VSL, the level of severity of the VSL increases depending on the number of entities that the Responsible Entity fails to submit an event report to. The drafting here is not as precise as it should be. The way the Lower VSL is written, it will also be triggered when the Responsible Entity has complied with the requirement. For example, if the Responsible Entity is required to report an event to 5 entities, and it does, it will still mean that it has "submitted an event report to one entity identified in the event reporting (also, the 'ing' is missing on the Lower VSL reference)Operating Plan". It is also duplicative. For example, if the Responsible Entity submitted a report to only one entity, and failed to submit a report to 4 others, they fall under the Lower VSL and the Higher VSL (we are assuming in this case, the violation will be found to be the higher VSL). Perhaps what the drafting team intended to do was to make the Lower VSL, which the Responsible Entity failed to submit an event report...to one entity identified.... **The SDT followed the NERC guidelines for VSLs in setting the appropriate levels. The VSLs were written based on two potential failures to meet the requirement. The first is based on the time the report was submitted while the second was based on the entity submitting the report within 24 hours but not to all applicable entities. If a violation is determined, it will be for either being late with the report or for not submitting the report to everyone. The appropriate VSL will be applied ONLY if a violation is found.** The Guidelines and Technical Basis contain a reference to R4 which no longer exists in the standard. **This reference has been removed.**
Response: Thank you for comment. Please see responses above.	
Dominion	Dominion reads Requirement R1 as explicitly requiring only the inclusion of reporting to the ERO in the Operating Plan. We acknowledge that the requirement also contains additional entities in parenthesis which infers the inclusion of a larger group (and which appears to be supported by the rationale box). Dominion suggests the SDT explicitly state which entities, at a minimum, be included, for reporting, in the Operating Plan. We suggest adding a column to

Organization	Question 3 Comment
	Attachment 1 and including entities to which the event must be reported. As an examples; o All event types should include local law enforcement o Events for which the BA, RC, TOP bear responsibility should probably also be reported to the regional entity o Events for which the Facility Owner bears responsibility should probably also be reported to the respective BA and TOP, who would in turn determine whether to notify their respective RC. The RC would in turn determine if additional entities need to be contacted. Requirement R2 establishes a 24 hour reporting threshold; however, the "NOTE" provided on Attachment 1 seems to contradict Requirement 2 and could therefore lead to compliance issues. Dominion suggests that Requirement R2 be revised to agree with the "NOTE" on Attachment 1. For example, Requirement R2 could be reworded as: Except as noted on Attachment 1, Each Responsible Entity shall...Also under the "NOTE" in Attachment 1, why has the facsimile number for the ERO been removed? The DOE still provides a facsimile number for reporting. Attachment 2: Event Reporting Form #4; need to update the below to reflect the same naming convention of the events in Attachment 1, the "t" should not be capitalized in Physical Threat and add an 's' behind threat. Add (islanding) behind System separation and capitalize the 'U' in unplanned control center evacuation.
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Southern Company	**NOTE: The SDT received assistance from Southern Company personnel in parsing these comments as show below. As submitted, the formatting of the original comments was lost and very difficult for the SDT to read and understand.** Event Type Entity with Reporting Responsibility Threshold for Reporting SOCO Comment: **Damage or destruction of a Facility** RC, BA, TOP Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area, excluding weather or natural disaster related threats, that results in actions to avoid a BES

Organization	Question 3 Comment
	Emergency. – No Comment **Damage or destruction of a Facility** BA, TO, TOP, GO, GOP, DP Damage or destruction of its Facility that results from actual or suspected intentional human action.: Do not report damage unless it degrades normal operation of a Facility. How does the SDT define “intentional human action?” Further, how is the phrase “suspected intentional human action” defined? This phrase is very broad. Is “intentional human action” identified as actions intended to damage facilities or does it include accidental actions by individuals? For example, if a person accidentally shot insulators off of a 230 kV line resulting in damage, would that be considered reportable “intentional human action?” In addition, what is that actual trigger for reporting? Does it require that the action has been discovered or is it from the time the event occurs? Further, 24 hours is a very brief time period -- how is an entity to conduct an investigation within that time period to determine if damage or destruction could have resulted from “actual or suspected” human action and also determine if it could have been “intentional”? In Southern’s cases, and likely in other entities case, operating personnel submit the reports to the regulatory entities for events that fall under this standard. Southern is concerned, that the threshold for reporting for “Damage or destruction of a Facility” and “Physical threats to a Facility” is so broad that numerous reports would need to be filed that 1) may be a result of something that does not pose harm to reliability and should not be of interest to the regulators, and 2) would introduce additional burden to operating personnel that are monitoring the system every moment of the day. With the current proposed “Threshold for Reporting”, the reporting requirement would hamper the ability of system operating personnel to perform their core real-time system operator tasks which would harm reliability. **Physical threats to a Facility** BA, TO, TOP, GO, GOP, DP Physical threat to its Facility excluding weather or natural disaster related threats, which has the potential to degrade the normal operation of the Facility. OR Suspicious device or activity at a Facility. Do not report theft

Organization	Question 3 Comment
	unless it degrades normal operation of a Facility. Please provide some clarity as to what is considered suspicious activity. For example, would someone taking a photo of a BES substation fall into this category? Please provide examples of what may be considered suspicious activity and how NERC and others may use this information and what actions they would take as a result of receiving this information. In addition, what is that actual trigger for reporting? Is it when the threat is discovered or from when it should have or could have been discovered? Further, 24 hours is a very brief time period -- how is an entity to conduct an investigation within that time period in order to determine if the physical threat has the potential to degrade the normal operation of the Facility or that the “suspicious activity”? **Physical threats to a BES control center** RC, BA, TOP Physical threat to its BES control center, excluding weather or natural disaster related threats, which has the potential to degrade the normal operation of the control center. OR Suspicious device or activity at a BES control center. – No Comment **BES Emergency requiring public appeal for load reduction** Initiating entity is responsible for reporting. Public appeal for load reduction event. It is unclear which entity would be responsible for reporting this event. For example, if the RC/TOP/BA were to identify the need to do this and instruct an LSE to issue the public appeal, who would report the event? **BES Emergency requiring system-wide voltage reduction** Initiating entity is responsible for reporting System wide voltage reduction of 3% or more. It is unclear which entity would be responsible for reporting this event. For example, if the RC were to identify the need to do this and instruct a TOP to reduce voltage, who would report the event? **BES Emergency requiring manual firm load shedding** Initiating entity is responsible for reporting Manual firm load shedding â‰¥ 100 MW. – No Comment

Organization	Question 3 Comment
	BES Emergency resulting in automatic firm load shedding DP, TOP Automatic firm load shedding â‰¥ 100 MW (via automatic undervoltage or underfrequency load shedding schemes, or SPS/RAS). – No Comment **Voltage deviation on a Facility** TOP Observed within its area a voltage deviation of ± 10% of nominal voltage sustained for >or= 15 continuous minutes. Please change "nominal" to "expected" or "scheduled" **IROL Violation (all Interconnections) or SOL Violation for Major WECC Transfer Paths (WECC only)** RC Operate outside the IROL for time greater than IROL Tv (all Interconnections) or Operate outside the SOL for more than 30 minutes for Major WECC Transfer Paths (WECC only). – No Comment **Loss of firm load** BA, TOP, DP Loss of firm load due to equipment failures/system operational actions for >or= 15 Minutes: >or= 300 MW for entities with previous year's demand >or= 3,000 MW OR >or= 200 MW for all other entities This should not be as a result of weather or natural disasters. **System separation(islanding)** RC, BA, TOP Each separation resulting in an island â‰¥ 100 MW – No Comment **Generation loss** BA, GOP Total generation loss, within one minute, of â‰¥ 2,000 MW for entities in the Eastern or Western Interconnection OR â‰¥ 1,000 MW for entities in the ERCOT or Quebec Interconnection – No Comment **Complete loss of off-site power to a nuclear generating plant (grid supply)** TO, TOP Complete loss of off-site power affecting a nuclear generating station per the Nuclear Plant Interface Requirement – No Comment **Transmission loss** TOP Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing). – No Comment **Unplanned BES control center evacuation** RC, BA, TOP Unplanned evacuation from BES control center facility for 30 continuous minutes or more. – No Comment

Organization	Question 3 Comment
	Complete loss of voice communication capability RC, BA, TOP Complete loss of voice communication capability affecting a BES control center for 30 continuous minutes or more. – No Comment **Complete loss of monitoring capability** RC, BA, TOP Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (i.e., State Estimator or Contingency Analysis) is rendered inoperable. – No Comment **Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.**Guideline and Technical Basis Comments In the Summary of Key Concepts section of the Guideline and Technical Basis, the DSR SDT explains that the proposed Standard does not include any real-time operating notifications for events listed in Attachment 1. The DSR SDT should consider language in the Standard which codifies this approach. Southern Company notes that the proposed standard does not mention any exclusion of real-time notification. **Response: The SDT does not believe that this revision is necessary as the requirement R2 clearly states that events are to be reported within 24 hours.** The Law Enforcement Reporting section of the Guideline and Technical Basis unintentionally expands on the purpose of the Standard by stating that “The Standard is intended to reduce the risk of Cascading events.” The stated purpose of the Standard is “To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities.” The phrase in the Guideline should be removed or modified in order to avoid any uncertainty about the Standard’s purpose. **Response: The SDT has made the requested clarification to the Guidelines and Technical Basis section.**

Organization	Question 3 Comment
	The DSR SDT should consider integrating the content of the Concept Paper into the Guideline and Technical Basis. Presently, the Concept Paper appears as an add-on at the end of the document. When the Concept Paper existed as a stand-alone document, various segments such as "Introduction" and "Summary of Concepts and Assumptions" were helpful to stakeholders and standards developers. The revised merged document in the present draft does not need two separate sections addressing concepts nor does it need an introduction at the midway point. Additionally, two other areas are either duplicative or contribute to ambiguity within the supplemental information. First, it is not clear that the segment on Concepts and Assumptions includes any actual assumptions. The section should be modified or deleted to address this concern. Second, the segment entitled 'What about sabotage?' seems to contain topics similar to those on the first page of the Guideline. Again, the DSR SDT should consider integrating all of the necessary information into a more comprehensive document. **Response: The SDT has chosen to leave these sections in tact because it helps convey the development process as well as the information about the team's insights.**
Response: Thank you for comment. Please see responses above.	
FirstEnergy	FirstEnergy Corp (FE) appreciates the work done by the SDT by incorporating the comments and revisions from the previous draft. FE would like to see the time parameters in Requirement 3 and Measure 3 to be changed from "each calendar year" to "at least once every 12 months". This is similar to the wording that is being used in the CIP standards
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Oncor Electric Delivery	For reporting consistency, under the Event Type labeled "Generation Loss", in Appendix 1 of EOP-004-2, Oncor recommends that the reporting threshold of 1,000 KW for the ERCOT Interconnection be raised to 1,400 MW to match the 1,000 MW level in the current version of

Organization	Question 3 Comment
	the ERO Event Analysis Program. Under the Event Type labeled "Damage or Destruction of a "Facility", Appendix 1, with the threshold that states," Damage or destruction of its Facility that results from actual or suspected intentional human action", Oncor suggest the addition of the following language to address intentional human action that is theft in nature but is not intended to disrupt the normal operation of the BES: "Do not report theft unless it degrades the normal operation of a Facility."
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Georgia Transmission Corporation	GTC recommends a minor change to Attachment 2 associated with the complete loss of off-site power to nuclear generating plant. NUC-001-2 R9.3.5 describes provisions for restoration of off-site power and applies to both the Nuclear Plant Generator Operator and the applicable Transmission Entities. To maintain consistency, GTC recommends modification to this row in EOP-004-2 Attachment 2 such that the "Nuclear Plant Generator Operator" is the Responsible Entity with reporting responsibility. (A TO may not have visibility to all off-site power resources for a nuclear generating plant if multiple TO's are providing off-site power.)At a minimum, GTC recommends if the SDT believes the TO and TOP should remain involved, these entities should be limited to "TO and TOP that are responsible for providing services related to Nuclear Plant Interface Requirements (NPIRs)" which is also consistent with NUC-001-2.
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	

Organization	Question 3 Comment
South Carolina Electric and Gas	Has the drafting team considered how reports from R2 tie in with reports required by the NERC Event Analysis process? It appears that reporting deadlines conflict between the two. The SDT should clarify that the event types "Damage or Destruction" listed in attachment 1 do not pertain to "cyber events", to avoid duplication of the CIP-008 requirements.
Response: Thank you for comment. Reporting under this standard is for the notification of events to the NERC Situation Awareness Group. Reports in this standard can be the initial reports for the EA group, but are not designed to address the balance of the EA program. The SDT had removed the cyber security obligations in this draft.	
Xcel Energy	In attachment one, the “Threshold for Reporting” under Damage or Destruction of a Facility appears to closely follow the definition of sabotage that EOP-004-2 says it is trying to do away with. This definition should be drafted to better correlate with the other physical threats and include the language, “which has the potential to degrade the normal operation of the Facility”. Additionally in Attachment 1, both the Physical threats to a Facility and Physical threats to a BES control center include the wording, “Suspicious device or activity...”. What constitutes suspicious activity? With no definition this interpretation is left to the Entity which is again something the DSR SDT says they would like to eliminate. Lastly, in the Guideline and Technical Basis section, under A Reporting Process Solution - EOP-004 it states, “A proposal discussed with the FBI, FERC Staff, NERC Standards Project Coordinator and the SDT Chair is reflected in the flowchart below (Reporting Hierarchy for Reportable Events). Essentially, reporting an event to law enforcement agencies will only require the industry to notify the state or provincial or local level law enforcement agency. The state or provincial or local level law enforcement agency will coordinate with law enforcement with jurisdiction to investigate. If the state or provincial or local level law enforcement agency decides federal agency law enforcement or the RCMP should respond and investigate, the state or provincial or local level law enforcement agency will notify and coordinate with the FBI or the RCMP.” This appears to be in direct conflict with the Rationale for R1 which states, “An existing procedure that meets the requirements of CIP-001-2a may be included in this Operating Plan along with other processes, procedures or plans to meet this requirement.”

Organization	Question 3 Comment
	CIP-001-2a required "communication contacts, as applicable, with local Federal Bureau of Investigation (FBI)..." so if the CIP-001-2a procedure is included this does not seem to meet the requirements of the operating plan required under EOP-004-2. Also, if the intent of the Operating Plan is to include all local law enforcement and not FBI the operating plan would become very detailed and when validated annually as required in R3, this becomes very burdensome on an entity.
Response: Thank you for comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
American Electric Power	In the spirit of Paragraph 81 efforts, we request the removal of R1. R1 is administrative in nature, existing only to support R2. Reporting an event externally might necessitate the need for a plan/procedure/policy/job aide, but requiring it is an overreach. Having two requirements rather than one increases the likelihood of being found non-compliant for multiple requirements rather than a single requirement. The Paragraph 81 project team has already recommended removing the requirement to have contact information with law enforcement from CIP-001 R4. Notwithstanding our comments above, we recommend removing the phrase "and other organizations..." from R1. If this requirement is to remain, it needs to be very specific regarding who needs to be included in the reporting.R2 – We recommend removing "per their Operating Plan" from R2 so it reads "Each Responsible Entity shall report events within 24 hours of meeting an event type threshold for reporting." If an entity deviates from its plan but still meets the intent of the requirement (e.g. reporting to NERC with 24 hours), this could be viewed as a finding of non-compliance. We need to get away from "compliance for compliance's sake", and focus solely on those efforts which will benefit the reliability of the BES. Attachment 1 Page 13, Row 1 (Clean Version): This is too open-ended and would likely lead to voluminous reporting. As it currently reads, "Damage or destruction of a Facility within its

Organization	Question 3 Comment
	Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in actions to avoid a BES Emergency" could bring all copper thefts into scope. Thefts should not need to be reported unless the theft results in reliability concerns as specified by other criteria or parameters in Attachment 1. Attachment 1 Page 13, Row 2 (Clean Version): The threshold "Damage or destruction of its Facility that results from actual or suspected intentional human action" should be eliminated entirely. For the event Damage or destruction of a Facility, the threshold for reporting is set too low. Attachment 1 Page 13, Row 3 (Clean Version): We suggest modifying the text to read "Do not report theft... unless the theft results in reliability concerns as specified by other criteria or parameters in Attachment 1." Attachment 1 Page 14, Row 4 (Clean Version): Regarding "Loss of Firm Load", we suggest making it clear that the MW threshold is an aggregate value for those entities whose TOP is responsible for multiple operating companies or legal entities. In addition, is it necessary to include the DP as an entity with reporting responsibility? Its inclusion could create confusion by further segmenting the established threshold. Attachment 1 Page 15, Row 1 (Clean Version): Including "Transmission loss" as currently drafted would result in much more reporting than is necessary or warranted. As currently drafted, it could bring more events into scope than intended, especially for larger entities. EOP-004 Attachment 2: Event Reporting Form: AEP remains concerned that industry would be required to report similar information to multiple Federal entities, in this case to both NERC (Attachment 2) and the DOE (OE-417). In addition, the reporting requirement are not clear for every kind of event as to which entity the reports must be forwarded to, and it is unclear how information would be passed to other entities as necessary. EOP-004 Attachment 2: Event Reporting Form: This form is a further example of mixing security concepts with operational concepts. Not only is not advisable, it does not serve the interests of either concept.

Organization	Question 3 Comment
Response: Thank you for your comment. On March 15, 2012, FERC issued an order on NERC's Find, Fix and Track process and in paragraph 81 ("P81") invited NERC and other entities to propose to remove from Commission-approved Reliability Standards unnecessary or redundant requirements. In response to P81 and the Commission's request for comments to be coordinated, during June and July 2012, various industry stakeholders, Trade Associations, staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. In Phase 1 of the Paragraph 81 effort, only two of the requirements (in total) from CIP-001 and EOP-004 met the initial threshold for being included in the P81 Project. Both of these requirements will also be retired by EOP-004-2. Phase 2 of the Paragraph 81 Project will evaluate all NERC Reliability Standards, including any modifications to EOP-004-2. CIP-001-2a and EOP-004-1 are mandatory and enforceable NERC Reliability Standards. If EOP-004-2 is not approved by the industry, those standards will remain as is and subject to the Compliance Monitoring and Enforcement Program. As the SDT is moving forward with a Recirculation Ballot, your suggestions will be forwarded to NERC for future consideration. As the Paragraph 81 efforts are beyond the scope of this project, the SDT can only pass along your suggestion to that project team for action there. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Midwest Independent Transmission System Operator, Inc.	MISO respectfully submits that several of the thresholds for reporting in EOP-004 - Attachment 1 should be modified to clarify when the reporting obligation is triggered, and to ensure that entities are reporting events of the type and significance intended. In particular, MISO focuses on the following draft thresholds in EOP-004 - Attachment 1: o The requirement that an entity report when "[d]amage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in actions to avoid a BES Emergency." A BES Emergency is defined as "Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System."RCs and BAs take actions each and every day to "avoid a BES Emergency." At the time of those actions, they are reacting to conditions that their operating personnel are observing on the

Organization	Question 3 Comment
	BES. There is no way for an RC or a BA to discern whether the conditions to which they reacted resulted from the "damage or destruction of a Facility" and there is no requirement for Transmission Operators and/or Owners to report "damage or destruction of a Facility" to their BA or RC. Accordingly, RCs and BAs will likely, often not be sufficiently informed to determine if their actions require them to submit a report. Responsible entities are likely to expend significant time and resources reporting daily operations and actions routinely taken to respond to observed BES conditions as they present themselves. These actions may be in response to congestion, equipment outages, relay malfunctions, etc. Whether or not the initiating factor was "damage to or destruction of a Facility" will often be an unknown factor and - even if such is known - the genesis of that damage and/or what constitutes damage (as discussed below) present further potential for confusion and over-reporting, Nonetheless, the lack of clarity in the standard is likely to result in some RCs and BAs preparing reports whether or not they definitely ascertain the underlying cause for the system conditions that prompted them to take actions "to avoid a BES Emergency." The preparation and submission of such reports, in many cases, will not facilitate the stated objective of this standard, which is the improvement of the reliability of the Bulk Electric System. In addition, with respect to damage or destruction of a Facility, it is debatable as to what would be considered "damage." For example, would an improper repair or outage that results in damage to a Facility that requires a more extended repair or outage be deemed "damage" to that Facility under this standard? These ambiguities will likely result in significant over-reporting, over-burdening responsible entities, and inundating Regional Entities and NERC with information that is not useful for the purpose of facilitating the reliable operation of the Bulk Electric System. These effects would undermine the express purpose of the standard and the potential value of information if the reporting obligations are appropriately defined, assigned, and scoped. For these reasons, MISO recommends that the SDT revise the standard to: (1) remove the requirement for RCs and BAs to report the "damage or destruction of a Facility" as it is redundant of the immediately subsequent requirement, (2) to remove reporting responsibility from BAs to report the "damage or destruction of a Facility" as this obligation is more properly placed with the TO, TOP, GO , GOP, and DP, and (3) provide guidance to the remaining responsible entities, TO, TOP, GO , GOP, and DP, regarding when "damage" to a Facility should be reported, e.g., an illustrative list of the types of "damage" that would yield information and/or trends that

Organization	Question 3 Comment
	would facilitate the improvement of the reliability of the BES. o The requirement to report “[p]hysical threats to a Facility” and/or “[p]hysical threats to a BES Control Center”With respect to physical threats to Facilities or BES Control Centers, what is considered a “physical threat” and/or a “suspicious device or activity”? Is a crank call count that the building is on fire a physical threat? Is the return of a disgruntled employee suspicious? MISO understands and supports the reporting and analysis of threats and even certain types of suspicious activities, etc. It is merely concerned that the reporting threshold expressed in this standard will result in the reporting of substantial amounts of data that will not facilitate the improvement of the reliability of the BES and that the volume of reports may delay or otherwise obscure the detection of notable trends. Accordingly, MISO recommends that the SDT revise the standard to: (1) require the reporting only of substantial physical threats that are likely to have an adverse impact on the reliable operation of the Bulk Electric System, and (2) to provide an illustrative list of the types of “suspicious activity or devices” as guidance to responsible entities. o Timing of reports Finally, MISO respectfully suggests that NERC re-assess the timing requirements as related to the objectives expressed within this standard. MISO believes that NERC should clarify that its “situational awareness” staff will review submitted information to determine whether there are indications of possible coordinated attack and to quickly inform responsible entities that there are signals of possible coordinated attack. This clarification could be made in the standard, or the standard could describe the process that NERC staff will use. Unless such review and information is provided, the need that the standard attempts to address will not be fully met. Conversely, many of the events listed in Attachment A that require reporting do not need to be reported within 24 hours and would not offer significant benefit or value if reported within that time period as NERC and Regional Entities primarily utilize such information to capture metrics or perform after-the-fact events analysis. Accordingly, MISO respectfully suggests that, while performing analysis to determine clarifications that would result in the appropriate definition, assignment, and scope of reporting obligations, NERC should also examine the events and identify those events for which a longer time period for reporting would be suitable. This would significantly reduce the administrative burden on responsible entities and likely result in more comprehensive,

Organization	Question 3 Comment
	rigorous, and beneficial reporting.
Response: Thank you for your comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Indiana Municipal Power Agency	On page 6 of 23 of the draft standard document, second paragraph under Rationale for R1, the SDT uses the words “Every industry participant that owns or operates elements or devices on the grid has a formal or informal process...” The use of these words implies that this requirement and others in this standard may apply to every industry entity regardless if they are a registered entity or not. IMPA understands that standards can only apply to entities that are registered with NERC, but we still prefer to see different wording in this sentence. IMPA recommends using “Every registered entity that owns or operates elements or devices on the grid has a formal or informal process...” **We have revised “industry participants” to Registered Entity”.** Another concern is on pages 18, 19, and 20 of 23. It is not clear what exactly is required of a registered entity and the law enforcement reporting process. IMPA understands it is up to the entity to decide just how its event reporting Operating Plan is made up and who is contacted for the events in attachment 1. These pages are confusing when it comes to the listing of stakeholders in the reporting process on page 18 of 23 and then when the SDT states that an entity may just notify the state or provincial or local level law enforcement agency. The SDT needs to clarify that the listing of stakeholders on page 18 of 23 is just a suggestive listing and that if the entity so decides per its reporting Operating Plan that notification of the local law enforcement agency is sufficient (the thought that the local law enforcement agency can coordinate with additional law enforcement agencies if it sees the need). The requirement to contact the FBI in CIP-001 is not a requirement in EOP-004-2 unless the registered entity puts that requirement in its event reporting Operating Plan. **The information on law enforcement in the Guidelines and Technical Basis section is**

Organization	Question 3 Comment
	designed to provide *one* example of how an entity *could* report to law enforcement. It is not intended to be the *only* possible way. As a clarification, in the Background section's second paragraph, it should read "retiring both EOP-004-1 and CIP-001-2a" as opposed to CIP-002-2a as written above in this comment document. **We have searched the comment form and cannot find this.**
Response: Thank you for your comment. Please see responses above.	
Cogentrix Energy	Overall: The standard makes good stride in eliminating the redundancy of CIP-001 and EOP-004. M1 States: "... and each organization identified to receive an event report for event types specified in EOP-004-2 Attachment 1". It is an unclear in the statement that the protocols go with Attachment 1 and entities to receive report are part of Attachment 2While this draft is an improvement on the previous draft, the proposed R2 is unacceptable, and should be amended to, at a minimum, require reporting by the end of the next business day, instead of within 24 hours. Events or situations affecting real time reliability to the system already are required to be reported to appropriate Functional Entities that have the responsibility to take action. Adding one more responsibility to system operators increases the operator's burden, which reduces the operator's effectiveness when operating the system. Care should be given when placing additional responsibility on the system operators. Allowing reporting at the end of the next business day gives operators the flexibility to allow support staff to assist with after-the-fact reporting requirements. For some event types where in order to provide real time situational awareness over a wide area (for example coordinated sabotage event) it may be appropriate to have more timely reporting. If the intent of this standard is to address sabotage reporting there needs to be an understanding of the actions to be taken by those receiving the reports so the reporting entities can incorporate those actions into their plan. As a minimum, NERC should have a process in place to assess the reports and take appropriate actions. Attachment 1: Threshold for reporting should not be defined such that multiple reports would be required for the same event. For example, both the TOP and RC being required to report

Organization	Question 3 Comment
	the outage of a transmission line. 2nd event type (Damage or destruction of a Facility): Add the following sentence to the Threshold for Reporting: “Do not report theft or damage unless it degrades normal operation of a Facility.” 4th event type (Physical threats to a BES control center): The term “BES control center” needs to be clarified. 5th, 6th, and 7th event types: In instances where a reliability directive is issued, is the “initiating entity” the entity that issues the directive or the entity that carried out the directive. 9th event type (Voltage deviation on a Facility): Change “nominal” to “expected or scheduled.” 15th event type (Transmission loss): It is not clear what is meant by “contrary to design.” This is so broad that it could be interpreted as requiring reporting misoperations within the reporting time frame before even an initial investigation can begin. This needs to be clarified and tied to the impact on the reliability of the BES.

Response: Thank you for your comment. The full Measure M1 states: “Each Responsible Entity will have a dated event reporting Operating Plan that includes, but is not limited to the protocol(s) and each organization identified to receive an event report for event types specified in EOP-004-2 Attachment 1 and in accordance with the entity responsible for reporting.” It is expected that the Operating Plan will contain the entities to which a report will be submitted. The Measure indicates evidence needs to be provided showing that these entities received the event report. The protocol(s) refer to the Operating Plan and could include any procedures for identification of events as well as communicating to other entities.

In response to your suggestion on Requirement R2, the DSR SDT has added clarifying language to R2 as follows:

R2. Each Responsible Entity shall report events per their Operating Plan within 24 hours of meeting an event type threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). [Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]

Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation

Organization	Question 3 Comment
ballot.	
Northeast Power Coordinating Council	Paragraph 81 efforts are underway to eliminate requirements that have little or no reliability benefit. This Standard only addresses documentation and has no impact on reliability.
Response: Thank you for your comment. On March 15, 2012, FERC issued an order on NERC's Find, Fix and Track process and in paragraph 81 ("P81") invited NERC and other entities to propose to remove from Commission-approved Reliability Standards unnecessary or redundant requirements. In response to P81 and the Commission's request for comments to be coordinated, during June and July 2012, various industry stakeholders, Trade Associations, staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. In Phase 1 of the Paragraph 81 effort, only two of the requirements (in total) from CIP-001 and EOP-004 met the initial threshold for being included in the P81 Project. Both of these requirements will also be retired by EOP-004-2. Phase 2 of the Paragraph 81 Project will evaluate all NERC Reliability Standards, including any modifications to EOP-004-2. CIP-001-2a and EOP-004-1 are mandatory and enforceable NERC Reliability Standards. If EOP-004-2 is not approved by the industry, those standards will remain as is and subject to the Compliance Monitoring and Enforcement Program. As the Paragraph 81 efforts are beyond the scope of this project, the SDT can only pass along your suggestion to that project team for action there.	
Puget Sound Energy Inc.	Puget Sound Energy appreciates the Standard Drafting Team's work to streamline and clarify the proposed standard. In addition, we understand that the Standard Drafting Team faces a significant challenge in developing workable thresholds for reporting under this standard. Unfortunately, Puget Sound Energy cannot support the proposed standard because the reporting thresholds remain too vague and, thus, too broad - especially those related to damage or destruction of a Facility and those related to physical threats. The first four events listed on Attachment 1 are not brightline rules, because they each involve significant elements of judgment and interpretation. An example of our concern relates to the phrase "... that results from actual or suspected intentional human action." Puget Sound Energy, like many regulated entities, is staffed only with System Operators at night and on weekends. As a result, the 24-hour reporting requirement necessarily requires the System Operators to submit the required reports. So, how is a System Operator going to judge whether a human action is "intentional"? As a result, it will be necessary to report any event in which human action is

Organization	Question 3 Comment
	involved because there is no way for a System Operator to know for sure whether the action is intentional or not. And, regulated entities will need to instruct their System Operators to make such reports, because the failure to submit a report of even one event listed in EOP-004 Attachment 1 is assigned a severe VSL under the proposed standard. We believe that the proposed threshold language will likely result in a flood of event reports that will not improve situation awareness.
Response: Thank you for your comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot. **In response to your concern on the 24-hour reporting requirement, the DSR SDT has added clarifying language to R2 as follows:** **R2. Each Responsible Entity shall report events per their Operating Plan within 24 hours of recognition of meeting an event type threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). [Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]**	
Exelon Corporation and its affiliates	Thanks to the drafting team for all the work on this revision. Significant progress was made, though Exelon has some remaining comments: o It's not clear why the team separated 'Damage or destruction of a Facility' into two rows. Please advise. **Response: The first row applies to the RC, which may not own any Facilities but has them under their operational control. This event applies to damage or destruction whereby the RC, TOP or BA has to take action to avoid a BES Emergency. The second row is simply damage or destruction of a Facility. It is expected that this second type of event would not be severe enough to have to take action to avoid a BES Emergency.** o Damage or destruction of a Facility - The threshold for "damage or destruction of a Facility"

Organization	Question 3 Comment
	is too open-ended without qualifying the device or activity as “confirmed”. Event reporting for nuclear generating units are initiated when an incident such as tampering is "confirmed". EOP-004 should include some threshold of proof for a reason to believe that no other possibility exists for "damage or destruction of a facility" event other than actual or suspected intentional human action. **Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.** o Physical threats to a Facility - Reporting of every “suspicious activity” such as photographing equipment or site could result in an unwieldy volume of reports and dilute the data from depicting quality insight. For example, nuclear generating units are required to report all unauthorized and/or suspicious activity to the NRC. Please confirm that the intent of this threshold for notification would include all unauthorized and/or suspicious activity. **The SDT concurs that the intent of the threshold for notification would include all unauthorized and/or suspicious activity.** o Physical threats to a BES control center - please confirm that reporting responsibility falls to the RC, BA, TOP and not GOs. In addition, please confirm that by use of the lower case “control center” other definitions in development through other standards development projects (e.g. CIP version 5) and that may be added to the NERC Glossary will not apply until formally vetted in a future EOP-004 standards development project. **The entities listed for this event type are the RC, BA and TOP only. No other entities are applicable for this event type. If the lower case “control center” is replaced by a definition developed in future standards actions, a change to EOP-004-2 to use the defined term would require notice to the industry and a ballot of the revised standard in some manner. The DSR**

Organization	Question 3 Comment
	SDT does not have control over how that would be accomplished. o Loss of firm load - “Loss of firm load for â‰¥ 15 Minutes: â‰¥ 300 MW for entities with previous year’s demand â‰¥ 3,000 MW”. Please clarify whether the team intends for this to apply to a single event a loss of more than 300 MW due to non-concurrent multiple distribution outages that total > 300MW. **This event relates to a single incident of the loss of firm load.** o Generation loss - Exelon appreciates the timing clarification added to the generation loss threshold. The phrase “within one minute” should also be included in the threshold for the ERCOT and Quebec Interconnections to read: “Total generation loss, within one minute, of â‰¥ 2,000 MW for entities in the Eastern or Western Interconnection OR Total generation loss, within one minute, of â‰¥ 1,000 MW for entities in the ERCOT or Quebec Interconnection” **The phrase “within one minute” applies to everything listed in the event. To clarify this, we have inserted a colon after the word “of” and moved “≥ 2,000 MW for entities in the Eastern or Western Interconnection” down one line.** o The Law Enforcement Reporting section in the Guideline and Technical Basis states: "The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of the BES from malicious physical or cyber attack." Since CIP-008 now covers reporting of cyber incidents the reference to cyber should be removed. **We have made the correction in your last point regarding “cyber attacks” and have removed it from the Guidelines and Technical Basis section.**
Response: Thank you for your comment. Please see responses embedded above.	
MRO NSRF	The NSRF requests that the SDT address the following concerns and clarifications in Attachment 1; 1) Please explore redundancy reporting event Item #14; Complete loss of off-site power to a

Organization	Question 3 Comment
	nuclear generating plant with obligations of NUC-001-2.1 R9.4.4."Provisions for supplying information necessary to report to government agencies, as related to NPIRs." The NSRF understands the importance concerning safety issues with a nuclear plant. A multiple unit coal facility may have a larger reliability impact to the BES than a nuclear plant. The SDT is stating that the fuel source is a reporting issue, not the reliability of a plant loosing off sight power. Recommend that this item be deleted. 2) Item 2 in Attachment 1 would obligate an entity to report any loss of (copper) grounds either on a T-Line or grounds associated with a transformer or breakers and that this level of reporting should not rise to the NERC level. Believes that additional qualifying language similar to Item 1 be incorporated into the threshold and read as follows:"Damage or destruction of its Facility that results from actual or suspected intentional human action that results in actions to avoid a BES Emergency." 3) Item 3 Attachment 1 needs clarification since a physical threat needs to be actual and confirmed so that the TO or TOP repositions the system. In addition, the SDT needs to clarify what the phrase "normal operations" means. (Is this a ratings issue? or a result in how the System Operator operates the system.) 4) Item 3 should provide clarification as to "Suspicious device or activity at a Facility" to determine when threshold raises to the level of reporting. We are concerned that, based on an Auditors perception, these words could be interpreted in several different ways. In addition, we believe that language needs to be included that the threat causes the reporting entity to change to an abnormal operating state. This situation could be interpreted differently by the auditor or the entity at the time of the event. Recommend the following language: "Suspicious device or activity at a Facility with the potential to degrade the normal operation of the Facility". This language is similar to the first threshold. 5) The term Initiating entity is used three times within Attachment 1 and needs to be more clearly defined or reworded. Is it the entity that identifies the needs of a Public Appeal or the entity that makes the public appeal the initiating entity? The word "initiating" does not provide clarity but only provides uncertainty to the industry. The Standard needs to be clear on who has the responsibility as the "initiating". Recommend the following: a. For public

Organization	Question 3 Comment
	appeal, under Entity with Reporting Responsibility; “entity that issues a public appeal to the public” b. For system wide voltage reduction, under Entity with Reporting Responsibility; “entity that activates a voltage reduction” c. For manual load shedding, under Entity with Reporting Responsibility; “entity that activates manual load shedding” 6) The NSRF recommends transmission loss to read as: “contrary to protection system design” found in threshold for reporting within the Attachment for a Transmission loss event. 7) In Requirement 2/ Measure 2, recommend adding “upon recognition of “ as a starting point to the 24 hour reporting requirement, within the threshold of reporting where perceived threats are the threshold, or transmission loss, when contrary to design is determined.
Response: Thank you for your comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot. **7) This was the intent of the drafting team and we have made this clarification to R2 and M2.**	
Independent Electricity System Operator	The proposed implementation plan may conflict with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by: Moving the last part “, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.” to right after “this standard is approved by applicable regulatory approval” in the Effective Dates Section on P.2 of the draft standard, and the proposed Implementation Plan.
Response: Thank you for your comment. The SDT used the standard language provide by NERC Legal and intended to address all of the jurisdictions in which the standard may become enforceable. We will refer your suggestion to NERC Legal for consideration in the preparation of the filing.	
Bonneville Power Administration	The proposed standard does not have any oral reporting option for system operators and thus appears to be administrative in nature. Due to this and the fact that administrative staff are

Organization	Question 3 Comment
	not available on weekends, the "24 hour" reporting requirements should be modified to "Next Business Day" to allow for weekend delays in reporting.BPA believes that there are too many minor events that have to be reported within 24 hours. Reporting during the next business day would suffice. Some examples include: A 115 shunt capacitor bank failure for the first event type does not seem important enough to require reporting within 24 hours just because action has to be taken to raise generation or switching of line. A failure of a line tower that has proper protective action to clear the line and also has automatic (SPS) to properly protect as designed the BES system (a good normal practice) from overloads or voltage issues does not seem important enough to require reporting within 24 hours either.
Response: Thank you for your comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Clark Public Utilities	The SDT has not adequately addressed my comments from the last draft regarding damage or destruction of its facility that results from actual or suspected intentional human action. The SDT needs to limit what it means by damage. As an example, if someone breaks into a substation and paints graffiti on a breaker that is part of the BES, the breaker has been "damaged." However, the breaker's ability to function has not been compromised and there are no emergency actions that need to be taken. There is no reason for an emergency reporting procedure to require this to be reported. The SDT needs to add the same modifier for damage that it added in the previous event threshold for reporting. The reference for this type of damage should be as follows:Event: Damage or destruction of a Facility.Entity with Reporting Responsibility: BA, TO, TOP, GO, GOP, DP.Threshold for Reporting: Damage or destruction of its Facility that results from actual or suspected intentional human action that results in actions to avoid a BES Emergency.
Response: Thank you for your comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has	

Organization	Question 3 Comment
reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Lewis County PUD	We are a small utility with little impact to the BES with a small hydro on the end of a 230kV line. CIP-001 requires us to contact the FBI who has repeatedly instructed us to call the local sheriff office. The sheriff office has instructed us to call 911 and they will contact the FBI as needed. Therefore, 911 is our only contact number and our plan if vandalism, property destruction or sabotage is to have a supervisor call 911 and report. I do not think calling 911 to confirm the contact number serves any propose. Our plan will be simple with not a lot detail. The drafting team should recognize the reality of small utilities and state the required plan may be simple and not follow the flowchart in the draft standard.
Response: Thank you for your comment. The SDT did recognize your circumstances and set the requirements to provide the flexibility to address the diversity of entities to which the standard is intended to apply.	
SPP Standards Review Group	We have made previous comments in the past regarding the listing in the Entity with Reporting Responsibility column of Attachment 1. While we concur with some of the changes that the drafting team has made regarding the addition of a bright line in the Threshold for Reporting column, there remain events where there is no line at all. For example, in the Transmission loss event, the TOP is listed and there is no distinction regarding which TOP is required to file the event report. Is it the TOP in whose TOP area the loss occurred or is it a neighboring TOP who observes the loss. Clearly, the responsibility for reporting lies with the host system. There are several other similar events where the bright line is non-existent and needs to be added. We suggest that the drafting team return the deleted language to the Entity with Reporting Responsibility column in those instances where the bright line has not been added in the Threshold column. Regarding multiple reports for a single event, we again believe that only a single report should be required. While additional information may be available from others, let the Event Analysis personnel do their job investigating an event and eliminate any redundant reporting that is currently required as the standard is written. If not, this standard, if approved, would then appear to be a likely candidate for Phase 2 of the

Organization	Question 3 Comment
	Paragraph 81 project.
Response: Thank you for your comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot. On March 15, 2012, FERC issued an order on NERC's Find, Fix and Track process and in paragraph 81 ("P81") invited NERC and other entities to propose to remove from Commission-approved Reliability Standards unnecessary or redundant requirements. In response to P81 and the Commission's request for comments to be coordinated, during June and July 2012, various industry stakeholders, Trade Associations, staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. In Phase 1 of the Paragraph 81 effort, only two of the requirements (in total) from CIP-001 and EOP-004 met the initial threshold for being included in the P81 Project. Both of these requirements will also be retired by EOP-004-2. Phase 2 of the Paragraph 81 Project will evaluate all NERC Reliability Standards, including any modifications to EOP-004-2. CIP-001-2a and EOP-004-1 are mandatory and enforceable NERC Reliability Standards. If EOP-004-2 is not approved by the industry, those standards will remain as is and subject to the Compliance Monitoring and Enforcement Program. As the SDT is moving forward with a Recirculation Ballot, your suggestions will be forwarded to NERC for future consideration.	
SERC OC Standards Review Group	While this draft is an improvement on the previous draft, the proposed R2 is unacceptable, and should be amended to, at a minimum, require reporting by the end of the next business day, instead of within 24 hours. Events or situations affecting real time reliability to the system already are required to be reported to appropriate Functional Entities that have the responsibility to take action. Adding one more responsibility to system operators increases the operator's burden, which reduces the operator's effectiveness when operating the system. Care should be given when placing additional responsibility on the system operators. Allowing reporting at the end of the next business day gives operators the flexibility to allow support staff to assist with after-the-fact reporting requirements. For some event types where in order to provide real time situational awareness over a wide area (for example coordinated sabotage event) it may be appropriate to have more timely reporting .If the intent of this standard is to address sabotage reporting there needs to be an understanding of the actions to be taken by those receiving the reports so the reporting entities can incorporate those actions into their

Organization	Question 3 Comment
	plan. As a minimum, NERC should have a process in place to assess the reports and take appropriate actions. Attachment 1: Threshold for reporting should not be defined such that multiple reports would be required for the same event. For example, both the TOP and RC being required to report the outage of a transmission line. 2nd event type (Damage or destruction of a Facility): Add the following sentence to the Threshold for Reporting: “Do not report theft or damage unless it degrades normal operation of a Facility.” 4th event type (Physical threats to a BES control center): The term “BES control center” needs to be clarified. 5th, 6th, and 7th event types: In instances where a reliability directive is issued, is the “initiating entity” the entity that issues the directive or the entity that carried out the directive. 9th event type (Voltage deviation on a Facility): Change “nominal” to “expected or scheduled.” 15th event type (Transmission loss): It is not clear what is meant by “contrary to design.” This is so broad that it could be interpreted as requiring reporting misoperations within the reporting time frame before even an initial investigation can begin. This needs to be clarified and tied to the impact on the reliability of the BES. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review Group only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Response: Thank you for your comment. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
Tacoma Public Utilities	Why does the text “...but is not limited to...” in M1 have to be included? Does this mean that

Organization	Question 3 Comment
	there are unwritten requirements that an auditor might look for? What if, in trying to validate contact information, contacts do not confirm their information? Regarding the Loss of firm load row in Attachment 1, an exception should be made for weather or natural disaster related threats in the Threshold for Reporting. Regarding the Transmission loss row in Attachment 1, it is not quite clear which types of BES Elements would meet the Threshold for Reporting. Is it just lines, buses, and transformers? What about reactive resources? What about generators that unexpectedly trip offline during a fault on the transmission system?
Response: Thank you for your comment. In Measure M1 the text "but is not limited to" is intended to provide flexibility for each entity to determine, based on its assets and unique situation, to develop an Operating Plan that appropriately supports reliability. Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.	
MidAmerican Energy	Yes. 1) MidAmerican Energy agrees with and supports MRO NSRF comments. 2) Add additional wording to clearly provide for compliance when events are found more than 24 hours after an event. Add the following to the end of R2. Add, Events not identified until sometime later after they occurred shall be reported within 24 hours. 3) In R3 add "external" for R3 to read Validate "external" contact information. 4) In EOP-004-2 Attachment 1 - the wording "Damage or destruction of its Facility that results from actual or suspected intentional human action that results in actions to avoid a BES Emergency" is not specific or measureable and therefore ambiguous. Zero defect standards which carry penalties must be specific. Please reword to "Intentional human action to destroy a NERC BES facility whose loss could result in actions to avoid a BES Emergency". This clearly aligns with the EOP-004 intent of sabotage and emergency reporting. EOP-004 should not report on unexpected conditions such as when a system operator attempts to reclose a line

Organization	Question 3 Comment
	during a storm believing the line tripped for a temporary fault due to debris, when in fact the fault was permanent and damaged a transformer.

Response: Thank you for your comment. See response to MRO NSF comments.

Many suggestions were made regarding the language of certain events listed in Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot.

Organization	Question 3 Comment
american Transmission Company	Yes A. ATC requests that the Standards Drafting Team address the following concerns and clarifications in Attachment 1: a.) Reporting event #14 in Attachment 1, is duplicative with respect to Nuclear Reliability Standard NUC-001-2.1 R 9.4.4. Reporting event #14 requires entities to report to NERC a “Complete loss of off-site power to a nuclear generating plant” while Nuclear Reliability Standard NUC-001-2.1 R9.4.4., i.e. includes “Provisions for supplying information necessary to report to government agencies, as related to Nuclear Plant Interface Requirements (NPIRs)”. In addition, ATC believes the reporting related to event #14 in Attachment 1 is not a “reliability” issue, and more appropriately covered under Standard NUC-001 as a “Nuclear Safety Shutdown” issue. Therefore, ATC recommends that Item #14 in Attachment 1 of EOP-004-2 be deleted. b.) In Attachment 1, reporting event #2, i.e. Damage or destruction of a Facility” could obligate an entity to report any loss of copper grounds either on a T-Line or grounds associated with a transformer or breakers. ATC believes this does not rise to a reporting level such as NERC. ATC believes that additional qualifying language similar to reporting item #1 be incorporated into the threshold and read as follows: “Damage or destruction of its Facility that results from actual or suspected intentional human action that results in actions to avoid a BES Emergency.” c.) In Attachment 1, reporting event #3 i.e. “Physical threats to a Facility” needs clarification

Organization	Question 3 Comment
	since a physical threat needs to be actual and confirmed so that the TO or TOP repositions the system. In addition, the SDT needs to clarify what the phrase “normal operations” means. Is this a ratings issue? Or a result in how the Operator operates the system. d.) In Attachment 1, reporting event #3 threshold i.e. “Suspicious device or activity at a Facility” needs clarification to determine when it raises to the level of reporting. These words could be interpreted in several different ways. In addition, ATC believe that language needs to be added that the threat causes the reporting entity to change to an abnormal operating state. ATC recommends the threshold be revised to read: “Suspicious device or activity at a Facility with the potential to degrade the normal operation of the Facility”. e.) In Attachment 1, the term “Initiating entity” is used three times for reporting events and needs to be clearly defined or reworded. Is it the entity that identifies the needs of a Public Appeal or the entity that makes the public appeal the initiating entity? The Standard needs to be clear on who has the responsibility as the “initiating” party, especially when multiple parties may be involved. ATC recommends the following:1) For public appeal, under Entity with Reporting Responsibility; it is the “entity that issues a public appeal to the public”2) For system wide voltage reduction, under Entity with Reporting Responsibility; it is the “entity that activates a voltage reduction”3) For manual load shedding, under Entity with Reporting Responsibility; it is the “entity that activates manual load shedding” f.) In Attachment 1, reporting event #15 i.e. “Transmission Loss”, the threshold includes the phrase “contrary to design”. ATC recommends this be clarified to read “contrary to protection system design”. B. In EOP-004-2 Requirement 2/ Measure 2 both have the following language:”Each Responsible Entity shall report events per their Operating Plan within 24 hours of meeting an event type threshold for reporting.” ATC recommends adding “upon recognition” as a starting point to the 24 hour reporting requirement. This would be revised to read: “Each Responsible Entity shall report events per their Operating Plan within 24 hours of recognition of an event type threshold”

Response: Thank you for your comment. A) Many suggestions were made regarding the language of certain events listed in

Organization	Question 3 Comment
Attachment 1. Most of these comments are about a single event type and were made by only one stakeholder. The team has reviewed all of these comments. In several cases, the same or a similar suggestion was made on an earlier draft, and the team considered it at that time. The SDT believes that stakeholder consensus has been achieved regarding these event types. The team has elected to move forward to recirculation ballot. **B) This was the intent of the drafting team and we have made this clarification to R2 and M2.**

RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Assignments

Project 2009-01 – Disturbance and Sabotage Reporting

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in

EOP-004-2 — Event Reporting

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors in EOP-004-2

The Disturbance and Sabotage Reporting Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements in EOP-004-2:

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for EOP-004-2:

There are three requirements in EOP-004-2. Requirement R1 was assigned a Lower VRF while Requirements R2 and R3 were assigned a Medium VRF.

VRF for EOP-004-2, Requirements R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The Requirement specifies which entities are required to have processes for recognition of events and for communicating with other entities. This Requirement is the only administrative Requirement within the Standard. The VRF is only applied at the Requirement level. FERC's Guideline 3 — Consistency among Reliability Standards. This requirement calls for an entity to have processes for recognition of events and communicating with other entities. This requirement is administrative in nature and deals with the means to report events after the fact. All event reporting requirements in Attachment 1 are for 24 hours after recognition that an event has occurred. The current approved VRFs for EOP-004-1 are

all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have an event reporting Operating Plan is not likely to directly affect the electrical state or the capability of the bulk electric system. Development of the Operating Plan is a requirement that is administrative in nature and is in a planning time frame that, if violated, would not, under emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.. Therefore this requirement was assigned a Lower VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. EOP-004-2, Requirement R1 contains only one objective which is to have an Operating Plan with two distinct processes. Since the requirement is to have an Operating Plan, only one VRF was assigned.

VRF for EOP-004-2, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. This Requirement calls for the Responsible Entity to implements its Operating Plan and is assigned a Medium VRF. There is one other similar Requirement in this Standard which specify an annual validation of the information contained in the Operating Plan (R3). Both of these Requirements are assigned a Medium VRF.
- FERC's Guideline 3 — Consistency among Reliability Standards. EOP-004-2, Requirement R2 is a requirement for entities to report events using the process for recognition of events per Attachment 1. Failure to report events within 24 hours is not likely to "directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system." However, violation of a medium risk requirement should also be "unlikely to lead to bulk electric system instability, separation, or cascading failures…" Such an instance could occur if personnel do not report events. Therefore, this requirement was assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. EOP-004-2, Requirement R2 mandates that Responsible Entities implement their Operating Plan. Bulk power system instability, separation, or cascading failures are not likely to occur due to a failure to notify another entity of the event failure, but there is a slight chance that it could occur. Therefore, this requirement was assigned a Medium VRF.

- FERC's Guideline 5 - Treatment of Requirements that Co-mingle More Than One Objective. EOP-004-2, Requirement R2 addresses a single objective and has a single VRF.

VRF for EOP-004-2, Requirement R3:

- FERC’s Guideline 2 — Consistency within a Reliability Standard. This Requirement calls for the Responsible Entity to perform an annual validation of the information contained in the Operating Plan and is assigned a Medium VRF. There is one other similar Requirement in this Standard which specifies that the Responsible Entity implement its Operating Plan (R2).. Both of these Requirements is assigned a Medium VRF.
- FERC’s Guideline 3 — Consistency among Reliability Standards. EOP-004-2, Requirement R3 is a requirement for entities to perform an annual validation of the information contained of the information in the Operating Plan. Failure to perform an annual validation of the information contained in the Operating Plan is not likely to “directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system.” However, violation of a medium risk requirement should also be “unlikely to lead to bulk electric system instability, separation, or cascading failures…” Such an instance could occur if personnel do not perform an annual test of the Operating Plan and it is out of date or contains erroneous information. Therefore, this requirement was assigned a Medium VRF.
- FERC’s Guideline 4 — Consistency with NERC’s Definition of a VRF. EOP-004-2, Requirement R3 mandates that Responsible Entities perform an annual validation of the information contained of the information in the Operating Plan. Bulk power system instability, separation, or cascading failures are not likely to occur due to a failure to perform an annual test of the Operating Plan, but there is a slight chance that it could occur if the Operating Plan is out of date or contains erroneous information. Therefore, this requirement was assigned a Medium VRF.
- FERC’s Guideline 5 - Treatment of Requirements that Co-mingle More Than One Objective. EOP-004-2, Requirement R3 addresses a single objective and has a single VRF.

Justification for Assignment of Violation Severity Levels for EOP-004-2:

In developing the VSLs for the EOP-004-2 standard, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in EOP-004-2 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSLs for EOP-004-2 Requirements R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1	Meets NERC's VSL guidelines. The requirement calls for the entity to have an Operating Plan and is binary in nature. The VSL is therefore set to "Severe".	The proposed requirement is a revision of CIP-001-1, R1-R4, and EOP-004-1, R2. The Requirement has no Parts and is binary in nature. The binary VSL does not lower the current level of Compliance.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed binary VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for EOP-004-2 Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2	Meets NERC's VSL guidelines. There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is a revision of EOP-004-1, R3. There is only a Severe VSL for that requirement. However, the reporting of events is based on timing intervals listed in EOP-004 Attachment 1. Based on the VSL Guidance, the DSR SDT developed four VSLs based on tardiness of the submittal of the report. If a report is not submitted, then the VSL is Severe. This maintains the current VSL.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for EOP-004-2 Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3	Meets NERC's VSL guidelines. There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is a new Requirement. The test of the Operating Plan is based on the calendar year. Based on the VSL Guidance, the DSR SDT developed four VSLs based on tardiness of the submittal of the report. If a test is not performed, then the VSL is Severe.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

Record of Development of Proposed Reliability Standard

Project 2009-01
Disturbance and Sabotage Reporting

Related Files

Status:
Adopted by the Board of Trustees on November 6, 2012, pending regulatory approval.

Background:
This project will entail revision to the following existing standards:

- CIP-001-1 – Sabotage Reporting
- EOP-004-1 – Disturbance Reporting

Stakeholders have indicated that identifying potential acts of “sabotage” is difficult to do in real time, and additional clarity is needed to identify thresholds for reporting potential acts of sabotage in CIP-001-1. Stakeholders have also reported that EOP-004-1 has some requirements that reference out-of-date Department of Energy forms, making the requirements ambiguous. EOP-004-1 also has some ‘fill-in-the-blank’ components to eliminate.

The project will include addressing previously identified stakeholder concerns and FERC directives; will bring the standards into conformance with the latest approved version of the ERO Rules of Procedure; and may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Standard Authorization Request Form

Title of Proposed Project:	Disturbance and Sabotage Reporting (Project 2009-01)
Request Date	April 2, 2009
Approved by SC for posting:	April 15, 2009

SAR Requester Information		**SAR Type** (*Check a box for each one that applies.*)
Name Patrick Brown	☐	New Standard
Primary Contact Patrick Brown Manager, NERC and Regional Coordination PJM Interconnection	☒	Revision to existing Standards: CIP-001-1 and EOP-004-1
Telephone 610-666-4597	☒	Withdrawal of existing Standard
E-mail brownp@pjm.com	☐	Urgent Action

Purpose **(Describe the proposed standard action: Nomination of a proposed standard, revision to a standard, or withdrawal of a standard and describe what the standard action will achieve.)**

This project will entail revision to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Industry Need (Provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

The existing requirements need to be revised to be more specific – and there needs to be more clarity in what sabotage looks like.

Brief Description (Provide a paragraph that describes the scope of this standard action.)

CIP-001 may be merged with EOP-004 to eliminate redundancies. Acts of sabotage have to be reported to the DOE as part of EOP-004. Specific references to the DOE form need to be

eliminated. EOP-004 has some ‘fill-in-the-blank’ components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards (see tables for each standard at the end of this SAR for more detailed information).
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR.) See “Issues to be Considered by Drafting Team” tables for each standard at the end of this SAR for more detailed information.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☒	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

	Disposition: Approved with modifications • Consider the need for wider application of the standard. Consider whether separate, less burdensome requirements for smaller entities may be appropriate. • Define “sabotage” and provide guidance on triggering events that would cause an entity to report an event. • In the interim, provide advice to entities about the reporting of particular circumstances as they arise. • Consider FirstEnergy’s suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality. • Incorporate a periodic review or updating of the sabotage reporting procedures and for their periodic testing. Consider a staggered schedule of annual testing and formal review every two to three years. • Include a requirement to report a sabotage event to the proper government authorities. Develop the language to specifically implement this directive. • Explore ways to reduce redundant reporting, including central coordination of sabotage reports and a uniform reporting format. V0 Industry Comments • Object to multi-site requirement • Definition of sabotage required VRF comments • Adequate procedures will insure it is unlikely to lead to bulk electric system instability, separation, or cascading failures. Other • Modify standard to conform to the latest version of NERC’s Reliability Standards Development Procedure, the NERC Standard Drafting Team Guidelines, and the ERO Rules of Procedure. NERC Audit and Observation Team • Applicability — How does this standard pertain to Load Serving Entities, LSE's. • Registered Entities have sabotage reporting processes and procedures in place but not all personnel has been trained. • Question: How do you “and make the operator aware” • R4 — "What is meant by: “establish contact with the FBI”. Is a phone number adequate? Many entities which call the FBI are referred back to the local authority. The AOT noted that on the FBI website it states to contact the local authorities. Is this a question for Homeland Security to deal with for us?" • R4 — Establish communications contacts, as applicable with local FBI and RAMP officials. Some entities are very remote and the sheriff is the only local authority does the FBI still need to be contacted? FERC’s December 20, 2007 and April 4, 2008 Orders in Docket Nos. RC07-004-000, RC07-6-000, and RC07-7-000 • In FERC’s December 20, 2007 Order, the Commission reversed NERC’s Compliance Registry decisions with respect to three load serving entities in the ReliabilityFirst (RFC) footprint. The distinguishing feature of these three LSEs is that none owned physical assets. Both NERC and RFC assert that there will be a “reliability gap” if retail marketers are not registered as LSEs. To avoid a possible gap, a consistent, uniform approach to

	ensure that appropriate Reliability Standards and associated requirements are applied to retail marketers must be applied. Each drafting team responsible for reliability standards applicable to LSEs is to review and change as necessary, requirements in the applicable reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. For additional information see: • FERC's December 20, 2007 Order (http://www.nerc.com/files/LSE_decision_order.pdf) • NERC's March 4, 2008 (http://www.nerc.com/files/FinalFiledLSE3408.pdf), • FERC's April 4, 2008 Order (http://www.nerc.com/files/AcceptLSECompFiling-040408.pdf) and • NERC's July 31, 2008 (http://www.nerc.com/files/FinalFiled-CompFiling-LSE-07312008.pdf) compliance filings to FERC on this subject.

Issues to be Considered by Drafting Team Project 2009-01 — Disturbance and Sabotage Reporting	
Standard #	**Title**
EOP-004-1	Disturbance Reporting
Issues	FERC Order 693 Disposition: Approved with modification • Include any requirements for users, owners, and operators of the bulk power system to provide data that will assist NERC in the investigation of a blackout or disturbance. • Change NERC's Rules of Procedure to assure the Commission receives these reports in the same frame as the DOE. • Consider APPA's concern about generator operators and LSEs analyzing performance of their equipment and provide data and information on the equipment to assist others with analysis. • Consider all comments offered in a future modification of the reliability standard. Fill-in-the-Blank Team Comments • Consider changes to R1 and R3.4 to standardize the disturbance reporting requirements (requirements for disturbance reporting need to be added to this standard) • Regions currently have procedures, but not in the form of a standard. The drafting team will need to review regional requirements to determine reporting requirements for the North American standard. V0 Industry Comments • R3 – too many reports, narrow requirement to RC • How does this apply to generator operator? Other • Modify standard to conform to the latest version of NERC's Reliability Standards Development Procedure, the NERC Standard Drafting Team Guidelines, and the ERO Rules of Procedure. NERC Audit and Observation Team • R3.1 — Can there be a violation without an event?

	Event Analysis Team
	• Reliability Issue: Coordination and follow up on lessons learned from event analyses Consider adding to EOP-004 – Disturbance Reporting. Proposed requirement: Regional Entities (REs) shall work together with Reliability Coordinators, Transmission Owners, and Generation Owners to develop an Event Analysis Process to prevent similar events from happening and follow up with the recommendations. This process shall be defined within the appropriate NERC Standard.
	
	FERC's December 20, 2007 and April 4, 2008 Orders in Docket Nos. RC07-004-000, RC07-6-000, and RC07-7-000
	• In FERC's December 20, 2007 Order, the Commission reversed NERC's Compliance Registry decisions with respect to three load serving entities in the ReliabilityFirst (RFC) footprint. The distinguishing feature of these three LSEs is that none owned physical assets. Both NERC and RFC assert that there will be a "reliability gap" if retail marketers are not registered as LSEs. To avoid a possible gap, a consistent, uniform approach to ensure that appropriate Reliability Standards and associated requirements are applied to retail marketers must be applied. Each drafting team responsible for reliability standards applicable to LSEs is to review and change as necessary, requirements in the applicable reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. Unofficial Comment Form for Project 2009-01 — SAR for Disturbance and Sabotage Reporting

Please **DO NOT** use this comment form. Please use the electronic comment form located at the link below to submit comments on the proposed SAR for revisions to the existing Disturbance and Sabotage Reporting standards. Comments must be submitted by **May 21, 2009**. If you have questions please contact Stephen Crutchfield at Stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Background Information
This project will entail revision to the following existing standards:

- CIP-001-1 — Sabotage Reporting
- EOP-004-1 — Disturbance Reporting

Stakeholders have indicated that identifying potential acts of "sabotage" is difficult to identify in real-time, and additional clarity is needed to identify thresholds for reporting potential acts of sabotage in CIP-001-1. Stakeholders have also reported that EOP-004-1 has some requirements that reference out-of-date Department of Energy forms, making the requirements ambiguous. EOP-004 also has some 'fill-in-the-blank' components to eliminate.

The project will include addressing previously identified stakeholder concerns and FERC directives, will bring the standards into conformance with the latest approved version of the ERO Rules of Procedure, and may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

***Please use the electronic comment form to submit your final responses to NERC.**

1. Do you agree that there is a reliability-related reason to support modifying CIP-001-1 and EOP-004-1? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

2. Do you agree with the scope of the proposed SAR? If not, please explain what should be added or deleted to the proposed scope.

   ☐ Yes

   ☐ No

   Comments:

3. Are you aware of any associated business practices that we should consider with this SAR? If yes, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

4. CIP-001-1 applies to the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and the Load-serving Entity. EOP-004-1 applies to the same entities, plus the Regional Reliability Organization. Do you agree with the applicability of the existing CIP-001-1 and the existing EOP-004-1? If no, please identify what you believe should be modified.

   ☐ Yes

   ☐ No

   Comments:

5. If you have any other comments on the SAR or proposed modifications to CIP-001-1 and EOP-004-1 that you haven't provided in response to the previous questions, please provide them here.

Individual
Stephen V. Fisher
Lands Energy Consulting
Yes
I have worked with 5 Northwest public utilities on developing procedures related to CIP-001-1 and EOP-004-1. All 5 utilities operate electric systems in fairly remote locations and are embedded in a larger utility's Balancing Authority/Transmission Operator area. A. CIP-001-1 - Developing procedures to unambiguously identify acts of sabotage has been particularly challenging for these systems. In general, it's hard for them to determine whether the most prevalent forms of malicious and intentional system damage that they incur - copper theft and gun shot insulators/equipment - should qualify as acts of sabotage. Although none of the systems consider copper theft to be acts of sabotage, two of the systems consider gun shot insulators/equipment to be acts of sabotage. The other systems look for intent to disrupt electric system operations as a key component of their sabotage identification procedures. Additional guidance from NERC in the form of CIP-001-1 modifications or a companion guidelines document on sabotage identification would provide much needed guidance for these procedures. B. EOP-004-1 - This standard was clearly drafted with the larger electric systems in mind. I have one client that serves 3300 commercial/residential customers from 4-115/13 kV substation transformers and one large industrial customer (80% of its energy load) from a 230/13 kV substation. 75% of the client's load is served from three substations attached to a long, 115 kV transmission line operated by the Bonneville Power Administration. Whenever the line relays open on a permanent fault (which happens 2-3 times per year), the client loses over 50% of its customers (but no more than 10-15 MW during winter peak), thereby necessitating the preparation of a Disturbance Report. To allow utilities to concentrate on operating their systems, without fear of violating EOP-004-1 for failure to report trivial outages, I would remove LSEs from the obligation to report disturbances - leave the reporting to the BA/TOP for large outages in their footprint.
No
I would like to see the SAR expanded to cover the issues I mentioned in my prior comment. Otherwise, the scope of the SAR looks fine to me.
No
No
CIP-001-1 - Yes. In many cases, the staff of an LSE embedded in another entity's BA/TOP area is more

likely to discover an act of sabotage directed toward a BA/TOP-owned facility that could affect the BES than the asset owner. This is because the LSE likely has more operating staff in the area. I have included a requirement in my clients' Sabotage Identification and Reporting Procedures that the client treat acts of sabotage to a third party's system discovered by client employees as though the act was directed toward client facilities. EOP-004-1 - As mentioned before, I would eliminate the LSE from the applicability list and leave the responsibility for disturbance reporting and response to the TOP/BA. However, I would retain a responsibility for the LSEs to cooperate (when requested) with any disturbance investigation.
One final comment on CIP-001-1. My clients received universally rude treatment from the FBI field offices when they attempted to establish the contacts required by the Standard. If the FBI doesn't see value in establishing these contacts, remove the requirement from the Standard. Making sure the LSE knows the FBI field office phone number is probably all the Standard should require.

Communication of facility status or emergencies between merchant generators registered as GOP and the RC, BA, GOP, or LSE in which the facility resides should be coordinated for EOP -004 reporting. The reporting to NERC/DOE should come from the RC, BA, GOP, or LSE.
Yes
No
The reporting requirements of EOP - 004 are needed for the RC, BA, LSE and the GOP that operates or controls generation in a system as defined by NERC. (System – A combination of generation, transmission, and distribution components). A disturbance is described as an unplanned event that produces and abnormal system condition, any perturbation to the electric system, and the unexpected change in ACE that is caused by the sudden failure of generation or interruption of load. The GOP operating/controlling generation within a system has the ability to analyze system conditions to determine if reporting is necessary. A NERC registered GOP that is a merchant generator within another company’s system does not have the ability for a wide area view and cannot analyze system conditions beyond the interconnection point of the facility. Moreover, in most cases the reporting requirements outlined in the Interconnection Reliability Operating Limits and Preliminary Disturbance Report do not apply to the merchant generator that is not a generation only BA. The applicability of the standard does encompass the true merchant generation entities required to register as GOP. Similarly, the OE-417 table 1 reporting requirements generally do not apply to a true merchant generating entity that is required to register as a GOP.

Yes
Yes - the key to Sabotage reporting requirements is identifying what the 'definition' is of an actual or potential 'Sabotage' event. Like any other standard, if FERC/NERC leave it up to 2000+ entities to establish their own definitions of 'Sabotage', you may likely get 2000+ answers. That is not a controlled and coordinated approach. I offer the following definition, "Sabotage - Deliberate or malicious destruction of property, obstruction of normal operations, or injury to personnel by outside agents." Examples of sabotage events could include, but are not limited to, suspicious packages left near site electrical generating or electrical transmission assets, identified destruction of generating assets, telephone/e mail received threats to destroy or interrupt electrical generating efforts, etc." These have passed multiple NERC regional audits and reviews to date.
Yes

No
Yes
It would be a welcome enhancement to the end users to understand to communication link between all "appropriate parties" who shall be notified of potential or actual sabotage events.... which also needs to be defined.
Individual

Yes
Need single report for Sabotage so whatever is required results in notification of all parties (State Emergency Management, Homeland Security, FBI, Grid Reliability Chain of Command). Any and all of these can 'expand' knowledge later but all seem to require 'instant' notification.
Individual

Yes
The standards as written now create reporting on local customer quality of service outage events not related to BPS disturbances. Sabotage reporting has degenerated into reporting of mischievous vandalism and minor theft occurences. This creates compliance documentation overburden and waste of limited funds needed for true BPS reliability concerns, and also adds nuisance calls to the FBI and Homeland Security.
No
Added to the scope: For EOP-004 add a provision for a reporting flow rather than everything going to the RE and NERC, that is something going like the DP and TOP reports to the BA, the BA to the RE, and the RE to NERC. This would allow for multiple related reports to be combined into a single coherent report as the reporting goes up the chain. For CIP-001 consider reporting flow as above with local law enforcement notification. Let an upper entity in the reporting chain decide when to contact Federal Agencies such as the BA or the RC.
No
No
Replace LSE with DP, and the Regional Reliability Organization with the Regional Entity.
Local Law enforcement agencies often are not friendly to Federal involvement with smaller problems they consider their "turf." Need to make sure the small stuff stays with them, however have a system of internal reporting that will catch coordinated sabotage efforts (multiple attacks on DPs and small BAs) at the RC or RE level who then can report to the Federal agencies. Currently EOP-004-1 requires small entities to report a "disturbance" if half of their firm customer load is lost. For some entities, this can be one small substation going down due to a bird. The "50% of total demand" requirement should be removed or improved to better define a true BPS disturbance.

EOP-004-1 indicates that Generators should analyze disturbances on the bulk electrical system or their facilities. Generators do not have the capability of analyzing the bulk electrical system other than Frequency. Even so, generators can not unilaterlly respond to what it thinks are disturbances. In the case of CAISO The Participating Generator Agreement prevents me from making any unilateral moves save for the direst frequency emergencies. If the System operator or Reliability Coordinator informs the generator that there is a disturbance and that logs and readouts etc. are required then the generator should respond with all available informaiton for the subject hours or time. Clearer responsibilities provide clearer results.
No
I think Generator opeators shuld be excluded accept to provide requested information from the System Operator or Reliability coordinator.
No
No
EOOP-004-1 should exclude the generator operator from disturbance reporting except providing the system operator or reliability coordinator with appropriate unit operation informaiton upon request. Acts of sabotage should be identified clearley and reported to the indicated authorities.

Add GO and TO to the list of applicability. The intent of CIP-001-1 when it was first written was to have the proper and most likely entities associated directly with operations to be the ones to begin the reporting process in the case of sabotage on the system. In the ERCOT Region and other regions in the US, the GOP may not be physically located at the site. The GOP is often removed from the minute-by-minute responsibilities of plant operations and, therefore, may be less able to react to physical sabotage at the location/plant/facility in a timely manner. The concern is that, in the case of an actual sabotage event, the failure to report to the appropriate authorities in a timely manner may jeopardize the reliability of the BPS. Therefore, the Generator Owner (GO) should be added to the list of applicability for CIP-001-1, because it is

the GO that is more likely to be on location at the generation site and thus aware of sabotage when it first occurs. This would disallow for any possible communication gap and put responsibility on all of the appropriate entities to report such an event. Additionally, and for the same reasons as adding the GO, the Transmission Owner (TO) should also be added to the list of applicability for reporting sabotage on its facilities.

Consolidation of redundant requiremnts and clarifications of difficult to follow / interpret standards should be a high priority at NERC.
No
We are not sure what this question means. Who's Associated Business practices, NERC, Applicable Entities in the Standard, our business practices?
No
CIP-001, remove LSE's from the standard for the reasons identified in the FERC LSE order. Ad TO and DP. EOP-004, remove LSE's from the standard for the reasons identified in the FERC LSE order. Remove RRO's, they are not a user, owner, operator of the BES. Add DP or TO. Consider conditional applicability as in the UFLS standards, " the TO or DP who performs the functions specified in the standard..."
Exelon agrees this is a worthwhile project and that reliability will be enhanced and the compliance process will be simplified by clarifying terminology and reporting requirements in these standards. If nothing else, defining "Sabotage" so as to end interpretations of this term and the related requirements is necessary.

The EOP-004-1 standard is an unnecessary duplication of existing DOE reporting requirements. This essentially exposes an entity to fines by NERC, enforced by FERC, for failure to comply with a DOE regulation, which seems improper to us. In addition, reporting requirements do not have an impact on the reliability of the BES

Project 2007-02 Operating Personnel Comms Protocols SDT
NERC OPCP SDT
No
The Operating Personnel Communication Protocols standard drafting team respectfully requests that the Sabotage Reporting SAR Drafting Team incorporate the following into your proposed SAR: “Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have procedures for the communication of information concerning the Cyber and Physical emergency alerts in accordance with the conditions described in Attachment 1 Security Emergency Alerts .” The Operating Personnel Communications Protocols Project 2007-02 was initiated to ensure that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The SDT developed a new COM-003-1 Standard that has yet to be posted and is dependent upon revising at least two other standards (CIP-001 and TOP Standard). COM-003 contains requirements that specify: 1. Use of three-part communication; 2. English language; 3. Common time zone; 4. NATO alpha-numeric alphabet; 5. Mutually agreed line identifiers; 6. The use of pre-defined system condition terminology such as those contained in the RCWG Alert Level Guide and EOP-002-2. This request is based on recent NERC Standards Committee direction to our team to incorporate the Reliability Coordinator Working Group’s (RCWG) Alert Level Guide into a Standard. The consensus of our team is that a TOP Standard is the most appropriate location for the Transmission Emergency Alert language from the Guide as the energy emergency alert language is currently described in EOP-002-2. The RCWG Guide proposes the use of pre-defined system condition descriptions for use during emergencies for reliability related information. This guide was developed in response to a Blackout Report recommendation. Our team placed the Transmission Emergency Alert language into a TOP standard. Since the Sabotage Reporting SAR DT intends to modifyCIP-001, we seek your consent to incorporate the cyber and physical security alert language to comply with the wishes of the Standards Committee. We believe that the CIP-001 Standard is the most appropriate location for this language for the following reasons: • The levels of emergency conditions related to the cyber and physical security of the electric system is directly related to Critical Infrastructure Protection. • The current version of CIP-001 already requires the timely reporting of actual and suspected security emergency conditions and the use of pre-defined terminology supports the efficient sharing of such information. The OPCP SDT includes the following text for the record. It is a proposed draft revision of CIP-001. A. Introduction 1. Title: Security Incidents 2. Number: CIP-001-2 3. Purpose: To ensure the recognition, communication and response to cyber and physical security incidents suspected or determined to be caused by sabotage. 4. Applicability 4.1. Reliability Coordinators. 4.2. Balancing Authorities. 4.3. Transmission Operators. 4.4. Generator Operators. 4.5. Load Serving Entities. 5. Effective

Date: The standard is effective the first day of the first calendar quarter after applicable regulatory approvals (or the standard otherwise becomes effective the first day of the first calendar quarter after NERC BOT adoption in those jurisdictions where regulatory approval is not required). B. Requirements R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of security threats on its facilities and multi site security threats affecting larger portions of the Interconnection. R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning the physical and cyber security status of their facilities in accordance with the conditions described in Attachment 1-CIP-001-1. R3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall provide its operating personnel with security threat or incident response guidelines, including personnel to contact, for reporting security threats and incidents. R4. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances. C. Measures M1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request a procedure (either electronic or hard copy) as defined in Requirement 1 M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request the procedures or guidelines that will be used to confirm that it meets Requirements 2 and 3. M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request evidence that could include, but is not limited to procedures, policies, a letter of understanding, communication records, or other equivalent evidence that will be used to confirm that it has established communications contacts with the applicable, local FBI or RCMP officials to communicate sabotage events (Requirement 4). D. Compliance 1. Compliance Monitoring Process 1.1. Compliance Enforcement Authority Regional Entity 1.2. Compliance Monitoring Period and Reset One or more of the following methods will be used to verify compliance: - Compliance Audits - Self-certifications - Spot Checking - Compliance Violation Investigations - Self-Reporting - Complaints 1.3. Data Retention The Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: o The Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator and Distribution Provider shall retain its current, in force document and any documents in force since the last compliance audit. o If a Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant. o The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records. 1.4. Additional Compliance Information None. 2. Levels of Non-Compliance: 2.1. Level 1: There shall be a separate Level 1 non-compliance, for every one of the following requirements that is in violation: 2.1.1 Does not have procedures for the recognition of and for making its operating personnel aware of sabotage events (R1). 2.1.2 Does not have procedures or guidelines for the communication of information concerning sabotage events to appropriate parties in the Interconnection (R2). 2.1.3 Has not established communications contacts, as specified in R4. 2.2. Level 2: Not applicable. 2.3. Level 3: Has not provided its operating personnel with sabotage response procedures or guidelines (R3). 2.4. Level 4:.Not applicable. E. Regional Differences None. Version History Version Date Action Change Tracking 0 April 1, 2005 Effective Date New 0 August 8, 2005 Removed “Proposed” from Effective Date Errata 1 November 1, 2006 Adopted by Board of Trustees Amended 1 April 4, 2007 Regulatory Approval — Effective Date New 2 March 2009 Added SEA attachment and updates to Effective Date and Compliance sections. New Attachment 1-CIP-001-2 Physical Security Emergency Alerts General Requirements 1. Initiation by Reliability Coordinator. A Physical Security Emergency Alert may be initiated only by a Reliability Coordinator at: a. The Reliability Coordinator’s own decision, b. By request from a Transmission Operator, c. By request from a Balancing Authority, or d. By request from federal, state, or local Law Enforcement Officials. 2. Situations for initiating alert. An Alert may be initiated for the following reasons: a. A physical threat affecting a control center, grid or generator asset has been identified, or b. A physical attack affecting a control center, grid or generator asset has occurred or is imminent. 3.

Notification. A Reliability Coordinator who initiates a Physical Security Emergency Alert shall notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify other Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) using the “CIP” category. Additionally, conference calls between Reliability Coordinators shall be held as necessary to communicate system conditions. The Reliability Coordinator shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area and other Reliability Coordinators when the alert has changed levels or ended. Physical Security Emergency Alert Levels To ensure that all Reliability Coordinators clearly understand potential and actual Physical Security Emergency Alerts, NERC has established three levels of Security Emergency Alerts. The Reliability Coordinators will use these terms when explaining security alerts to each other. The Reliability Coordinator may declare whatever alert level is necessary, and need not proceed through the alerts sequentially. 1. Alert 1 – “Control Center / Bulk Electric System asset threat identified” Circumstances: A credible threat of physical attack on a Bulk Electric System asset has been communicated to the Reliability Coordinator. No physical attack has occurred at this point. Determining the credibility of any threat is a subjective process, but the following factors should be considered: a. The nature and specificity of the threat, b. The timing of the threat, c. Mode of threat communication, and d. The criticality of the threatened asset. During a Physical Security Emergency Alert Level 1, Reliability Coordinators, Transmission Operators and Balancing Authorities shall have the following responsibilities: i. Notification The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The declaring Entity shall update the Reliability Coordinator of any changes in the situation until the Alert Level 1 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 2. Alert 2 – “Verified Physical attack at a single site” Circumstances: A Reliability Coordinator, Transmission Operator, or Balancing Authority has identified a physical attack upon a control center, generator asset, or other bulk electric system asset. During a Physical Security Emergency Alert Level 2, Reliability Coordinators, Transmission Operators and Balancing Authorities shall have the following responsibilities: i. Notification The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The declaring Entity shall update the Reliability Coordinator of the situation a minimum of once per hour until the Alert Level 2 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 3. Alert 3 – “Verified Physical attack at multiple sites” Circumstances: Multiple attacks have been confirmed on control centers, generator assets or other bulk electric system assets. A Reliability Coordinator shall declare a Physical Security Emergency Alert 3 whenever: a. A Transmission Operator or Balancing Authority reports multiple physical attacks on bulk electric system assets, b. Multiple Transmission Operators or Balancing Authorities report one or more physical attacks on their bulk electric system assets. i. Notification The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The declaring Entity(ies) shall update the Reliability Coordinator of the situation a minimum of once per hour until the Alert Level 3 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 4. Alert 0 – “Termination of Alert Level” Circumstances: The threat which prompted the Physical Security Emergency Alert Level has diminished or has been removed. i. Notification The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall notify all other Reliability Coordinators via the RCIS, and it shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area that the Alert Level has been terminated. Cyber Security Emergency Alerts Cyber Assets – Those programmable electronic devices and communication networks, including hardware, software, and data, associated with bulk electric system assets. Cyber Security Incident – Any malicious act or suspicious event that compromises, or attempts to compromise, the electronic or physical security perimeter of a critical cyber asset or disrupts or attempts to disrupt the operation of a critical cyber asset. Critical Cyber Asset – Those cyber assets essential to the reliable operation of critical assets. Electronic Security Perimeter – The logical border surrounding the network or group of sub-networks to which the critical cyber assets are connected, and for which access is controlled. Physical Security Perimeter – The physical border surrounding computer rooms, telecommunications rooms, operations centers and other locations in which critical cyber assets are housed and for which access is controlled. General Requirements 1. Initiation - A Cyber Security Emergency Alert shall be initiated by: a. The Reliability Coordinator’s analysis, b. By request from any NERC functional Model entitiy that Com-003-0 is applicable to. c. By request from federal, state, or local Law Enforcement Officials. 2. Situations for initiating alert. An Alert shall be initiated for the following reasons: a. A cyber threat affecting a control center or bulk electric system asset has been identified, or b. A cyber attack affecting a control center or bulk electric system has occurred or is imminent. 3. Notification. An entity who initiates a Cyber Security Emergency Alert shall make notification as per the NERC Functional model or as Regional / local instruction. The Reliability Coordinator shall notify FBI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. The Reliability Coordinator shall also notify as necessary other Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) using the “CIP” category. The Reliability Coordinator shall notify all Transmission Operators and Balancing Authorities in its Reliability Area and other Reliability Coordinators when the alert has changed levels or ended. Cyber Security Emergency Alert Levels To ensure that all applicable entities clearly understand potential and actual Cyber Security Emergency Alerts, three levels of Security Emergency Alerts shall be used. The Reliability Coordinators will use these terms when communicating security alerts to each other. When declaring the applicable alert level it is important to note that the applicable level can be determined without sequentially proceeding through levels. As an example given circumstances an Alert Level 3 could be called without previously being in an Alert Level 1 or Level 2 state. 1. Alert 1 – “Verified Control Center / Bulk Electric System Cyber Asset threat identified or imminent” What is “verified” - unknown or unauthorized access to a cyber device, unknown or unauthorized change to a cyber device (i,e., config file, O/S, firmware change. ‘Verified’ could mean the elimination of a false positive in your security monitoring system. ‘Verified’ could also be the differentiation between malicious and non-malicious (ie human error, not following policy, etc) intent. What is a “threat” - A threat can be perceived as any action or event that occurs where the monitoring authority was not previously made aware that that action would occur. With flimsy change control or access controls, field staff or technical staff performing troubleshooting or other maintenance may access or change devices without notifying the monitoring entity. The monitoring entity would have to treat this as a threat and take appropriate action to either isolate that device from the rest of the system, notify appropriate authority, dispatch a crew, etc Examples of threats - Over and above the examples above, another threat example could be a notification from DHS or other security agency that they have reason to believe a hack, virus or other cyber terrorism activity could occur. Also, noticing a distinct change in network traffic which could imply someone has intercepted your data and can manipulate it before sending it from the control room to the device being controlled or manipulating the data coming from the device before a controller seeing it and forcing them to perform an incorrect control event in reaction to erroneous data. Circumstances: A credible threat of Cyber attack on a Control Center or Bulk Electric System asset has been communicated to the Reliability Coordinator. No cyber attack has occurred at this point. Determining the credibility of any threat is a subjective process, but the following factors should be considered: a. The nature and specificity of the threat, b. The timing of the threat, c. Mode of threat communication, and d. The criticality of the threatened asset. During a Cyber Security Emergency Alert Level 1, applicable entities shall have the following responsibilities: i. Notification An entity who initiates a Cyber Security Emergency Alert Level 1 shall make notification as per the NERC Functional model or as Regional / local instruction. The Reliability Coordinator shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify as necessary the FBI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity shall update those applicable entities of any changes in the situation until the Alert Level 1 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 2. Alert 2 – “Verified Cyber attack on a Control Center or Bulk Electric System asset” Circumstances: An applicable entity has identified a cyber attack upon a control center or bulk electric system asset. During a Cyber Security Emergency Alert Level 2, applicable entities shall have the following responsibilities: i. Notification An entity who initiates a Cyber Security Emergency Alert Level 2 shall make notification as per the NERC Functional model or as Regional / local instruction. The Reliability Coordinator responsible shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify the FBI local office,

Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity shall provide updates of the situation a minimum of once per hour until the Alert Level 2 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 3. Alert 3 – “Verified Cyber attack at one or more Control Center or Bulk Electric System cyber asset” Circumstances: An applicable entity has identified a cyber attack upon a control center or bulk electric system asset and shall declare a Cyber Security Emergency Alert 3 whenever: a. A Transmission Operator or Balancing Authority reports one or more cyber attacks on bulk electric system that render an asset(s) unavailable. i. Notification An entity who initiates a Cyber Security Emergency Alert Level 3 shall make notification as per the NERC Functional model or as Regional / local instruction. The Reliability Coordinator shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify the FBI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity(ies) shall provide an update of the situation a minimum of once per hour until the Alert Level 3 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 4. Alert 0 – “Termination of Alert Level” Circumstances: The threat which prompted the Cyber Security Emergency Alert Level has diminished or has been removed. i. Notification An entity who initiates a Cyber Security Emergency Alert shall make notification as per the NERC Functional model or as Regional / local instruction when situation has diminished or returned to normal. The Reliability Coordinator shall notify all other Reliability Coordinators via the RCIS, and it shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area that the Alert Level has been terminated.

The scope should be modified to provide for a different treatment of reporting requirements that are administrative in nature, or that are after-the-fact (thus cannot impact reliability unless analysis and follow-up is not performed; even then, the impact would be at some future time). Reporting requirements which are of the nature to assist in identification of system concerns or which serve to prevent or mitigate on-going system problems (including, but not limited to, actual or attempted sabotage activity) should remain in standards, but should be separate and apart from the administrative reporting.
No
No
The Regional Reliability Organization is not a registered Functional Entity in the NERC registry. The applicability must be revised to more appropriately assign the requirements to registered functional entities. Also, the industry needs to recognize that there are other resources than generation for which the operators need to be included. Perhaps a demand-side resource should have a resource operator. This particular SAR may not be the appropriate venue for this, but control of resources which can be used to mitigate sabotage events or disturbance events may need to be addressed.
Due to the fact that both the CIP-001-1 and EOP-004-1 have similar reporting standards, initially combining the two sounds like a correct analysis. However, after further consideration and due to the critical nature of its intended function involving Security aspects, the CIP-001 should be intensely evaluated to determine if its intended purpose meets the threshold or criteria to stand alone. The existing standards for CIP-001-1 Sabotage Reporting may help prevent future mitigation actions caused by sabotage events. EOP-004-1 Disturbance Reporting is administrative in nature, thus the jeopardy of the Bulk Electric System reliability is

impacted only if analysis is not performed or if corrective follow-up actions are not implemented. Combining EOP-004 Standard requirements under the umbrella of the CIP -001 Standard would create a high profile Disturbance Reporting Standard. The industry would be better served if information defining sabotage was provided as well as a technical reference document on recognizing sabotage that would also clarify or state any personnel training requirements. All aspects of the intended functions must be reviewed before merging the two standards. At a minimum, we must consider modification that provides improved understanding of the reporting standards and implications as they are currently written.

Yes
No
Yes
The PSEG Companies ask that the drafting team allow sufficient flexibilty for sabotage recognigion and reporting requirements such that nothing precludes ultilizing a single corporate-wide program for both bulk electic system assets and other businesses. PSEG's Sabotage Recognition, Response and Reporting Program is directed to all business areas which are directed to follow the same internal protocol that also satisfies the NERC Standards requirements. For example, for gas assets, PSEG's gas distribution business follows the PSEG corporate-wide program for sabotage recognition and response. PSEG agrees that some modifications should be made to CIP-001 (ex. better define or give examples of sabotage) and EOP-004 to make them clearer • If they are merged, then Sabotage will not be in the title (or the primary focus) because several of the Disturbances that reporting is required for in EOP-004 have nothing to do with sabotage. • EOP-004 has criteria listed in 4 places to determine when to send a report: o Criteria listed in EOP-004 Attachment 1 o Criteria listed in EOP-004 Attachment 2 o Criteria listed in top portion of Table 1-EOP-004 o Criteria listed in bottom potion of Table 1-EOP-004 Therefore, it would be much easier if there was one table of criteria for reference that addressed all of the reportable conditions and all of the applicable reports. • If the 2 standards are merged as suggested in the SAR, any differences in the reporting obligation for actual or attempted sabotage and reporting of disturbances must be clear.

The SAR needs to be more specific in defining its objectives. CIP-001 Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms “operating personnel” and “sabotage events.” The definition of “operating personnel,” should be clarified and limited to staff at BES facilities. Operating personnel should report only those events which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term “sabotage event” needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement

individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be “aware of” such “sabotage events,” e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term “aware” in the standard. “Aware” can be interpreted in accordance with its largely passive, dictionary-based meaning, where being “aware” simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of “aware” could refer to more active wording, involving more than mere awareness, e.g., “alert and quick to respond,” pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies. EOP-004 The SDT needs to work on the following areas. 1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction …The entity on whose system a reportable disturbance occurs shall notify NERC … 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: … c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance …” The sense of Attachment 1 is internally inconsistent between the introduction (“occurs”) and the required actions in 6c (“could have resulted in a system disturbance”). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase “or could have resulted in” a potential system disturbance. This inconsistency should be clarified.

The SAR drafting team should include in the SAR scope a review of the NRC sabotage and event reporting requirements to ensure there are no overlapping or conflicting requirements between NERC, FERC, and the NRC. The SAR scope should include a review of the CIP Cyber Security Standards and coordination with the CIP SDT to ensure that cyber sabotage reporting definitions are in concert, and ensure that cyber sabotage reporting requirements are not duplicated in multiple standards.

Agree with the SAR that clarity would be helpful in establishing criteria regarding what constitutes sabotage reporting.
No
Agree with the scope of the SAR except for the applicable entities. See response to question #4.
No
No
Do not agree Load Serving Entities need to continue to be included for sabotage. According the NERC Functional Model, an LSE provides for estimating customer load and provides for the acquisition of transmission and energy to meet customer load demand. An LSE has no real impact on maintaining the reliability of electric network short of their planning function. Unfortunately, an LSE needs to be included for disturbance reporting to the DOE under certain conditions for loss of customer load. This may be a reason to maintain a separation of CIP-001 and EOP-004 so as not to unnecessarily include an LSE when it is not needed.
If it is desirable to keep CIP-001 and EOP-004 separate, it is recommended the SDT consider adding a reference in CIP-001 to the DOE reporting form either by name or by internet link in the standard.

Individual
Terry Harbour
MidAmerican Energy
No
MidAmerican Energy believes only EOP-004-1 is confusing and needs to modified or clarified. There is no need to combine the two standards. Standard EOP-004 could be clarified to eliminate references to sabotage which are already covered by CIP-001-1. Standard EOP-004 should be strictly limited to system events, not sabotage.
No
See the responses to questions 1 and 5.
Yes
Attachment TOP-005, section 2.9 speaks of “Multi-site sabotage” with no definition. The ES-ISAC 2008 advisory is an associated standard or practice on sabotage. All references to sabotage should be eliminated or retired except for CIP-001.
No
MidAmerican Energy believes the requirement for the Regional Reliability Organization should be removed from EOP-004-1 since the RRO is a holdover from making the standards enforceable. It is no longer appropriate for the regions to be named as responsible entities within the standards.
Conflicting time frames exist from document updates. Reporting should be consolidated to one form and / or site to minimize conflicts, confusion, and errors. 1) Reporting requirements for the outage of 50,000 or more customers in EOP-004-1 requires a report to be made within one hour while the form OE-417 requires a report be made within six hours of the outage. The six hour reference on the updated OE-417 form is the correct reference. 2) Reporting for either CIP-001 or EOP-004 should center on the DOE Form OE-417. This would eliminate confusion, simplify reporting for system operators thereby directly enhancing reliability during system events. This would also eliminate much of the duplicate material and attachments in EOP-004 3) Although it is beyond the scope of this SAR, the industry would benefit if there was a central location or link on the NERC website containing all reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable System Operators to more efficiently locate and report events.

GENERAL – CECONY and ORU support the general objectives of the SAR to merge existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting to improve clarity and remove redundancy. However, the SAR needs to be more specific in defining its objectives. CIP-001 Requirement R1

currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms “operating personnel” and “sabotage events.” The definition of “operating personnel,” should be clarified and limited to staff at BES facilities. Operating personnel should report only those events which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term “sabotage event” needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be “aware of” such “sabotage events,” e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term “aware” in the standard. “Aware” can be interpreted in accordance with its largely passive, dictionary-based meaning, where being “aware” simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of “aware” could refer to more active wording, involving more than mere awareness, e.g., “alert and quick to respond,” pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies. EOP-004 The SDT needs to work on the following areas. 1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction …The entity on whose system a reportable disturbance occurs shall notify NERC … 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: … c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance …” The sense of Attachment 1 is internally inconsistent between the introduction (“occurs”) and the required actions in 6c (“could have resulted in a system disturbance”). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase “or could have resulted in” a potential system disturbance. This inconsistency should be clarified.

Yes
There is a need to eliminate burdensome reporting deadlines which interfere with the reliable operations or recovery of the BES. There is also a need to move requirements for reporting to NERC or Regional Entities (except for reporting of threats to physical or cyber security) from the Requirements section of Reliability Standards to elsewhere.
No
The scope of the SAR should be to move all requirements to report to NERC or Regional Entities out of the Requirements section of all Reliability Standards to elsewhere. This does not include reporting, communicating, or coordinating between reliability entities. The NERC/Region reporting requirements could be consolidated in another document and referenced in the Supporting References section of the Reliability Standards. The deadlines for reporting should be changed to realistic timeframes that do not interfere with operating the BES or responding to incidents yet still allow NERC and the Regions to accomplish their missions.
No

Business practices should not be part of a Reliability Standard. Neither should NERC/Region reporting requirements (except for reporting of threats to physical or cyber security). NERC may need to take some action in the case of threats but does not and cannot take any operational action for most of the reporting requirements that are presently in the Requirements section of the Reliability Standards.
No
EOP-004 should be retired. CIP-001 should not apply to LSEs other than those that are retail marketers.
Entity reporting to NERC/Regions is needed by NERC and the Regions to accomplish their missions of overseeing the reliability of the BES and enforcing compliance with Reliability Standards. An entity not reporting as quickly as possible does not harm the integrity of the Interconnection. In fact, it increases the risk to the BES to be investigating details and filling out forms during a time when attention should be on correcting or mitigating an incident.
Individual
Bob Thomas
Illinois Municipal Electric Agency
Yes
Simplification of reporting requirements should facilitate reliability.
Yes
Yes
A one-stop reporting tool/site would facilitate efficient reporting and compliance; e.g., further development of the ES-ISAC/CIPIS to include all reportable categories and automatic notification of required parties. A single report form would be best.
Yes
IMEA recommends the following considerations: Simplification of reportable events and the reporting process should be the overriding objective. NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting (Version 2.0) should be updated to support this standards developement initiative. At some point in the process, it may help if examples are given of events actually reported that did not need to be reported.

We agree with the applicability of CIP-001-1 but question the need to include the RRO in EOP-004-1. Requirement R1 of EOP-004-1 can be turned into an industry developed and approved procedural requirement with details included in an appendix; whereas R5 can be changed to a requirement for the responsible entities to act on recommendations and to self-report compliance. Tracking and reviewing status of recommendation do not need to be performed by the RRO, or any entity for that matter, if a self-reporting mechanism is developed.
We suggest that the revision not be conducted with a preconceived notion that the two standards must be combined since there are some differences between sabotage and emergency system conditions, and in the communication and reporting processes and channels. We suggest the SDT start off with a neutral position to focus on improving the standards, then assess the pros and cons of merging the two based on technical merit only.
Group
Pepco Holdings, Inc. - Affiliates
Pepco Holdings, Inc.
Yes
PHI recommends merging these two standards into one.
Yes
No
No
As specified in Order 693, Regional Reliability Organizations are not to be assigned applicability. The revised standard(s) should contain the reporting form either directly or by reference and the RRO should be removed. The other EOP-004 requirements for RROs are now considered normal monitoring activities of the Regional Entities.
Consider CIP-008-2 as potentially having overlaps with the proposed standard
Individual
Jim Sorrels
AEP
Yes
No
Sabotage is a term of intent that is often determined after the fact by the registered entity and/or law enforcement officials. In fact, it is often difficult to determine in real-time the intent of a suspicious event. We would suggest that suspicious events become reportable at the point that the event is determined to have had sabotage intent. The entities should have a methodology to collect evidence, to have the evidence analyzed, and to report those events that are determined to have had the intent of sabotage.
Yes
The current reporting process necessitates multiple reports be sent to multiple parties, which is inefficient and may, inadvertently, result in alignment issues between the separate reports. We would recommend that a single report that combines NERC (CIPIS) and NERC ESISAC information be provided to NERC (CIPIS) that is systematically (programmatically) forwarded to all necessary entities. Further, updates to incidents would also go through NERC with the same electronic processing. Currently, we are not aware of a formal method to report incidents to the FBI, which should be also included in the distribution. The current reporting mechanism to the FBI JTTF is by telephone and the NERC platform described would provide more consistent reporting.
No

We would recommend that the Load Serving Entity (LSE) be removed from both standards, and that the Generator Owner and Transmission Owner be added to the resulting standard.
Group
FirstEnergy
FirstEnergy Corp.
Yes
Yes
We agree with the scope but would also like to see the following considered: 1. References to the DOE reporting process in EOP-004 need to be revised. They currently refer to the old EIA form. 2. Besides "sabotage", it may be helpful to clearly define "vandalism". It is vaguely written in the standards. Also, the process of "public appeals" for the DOE reportable requirements needs to be more clearly defined. 3. Consolidate documents covering reporting requirements. There are currently several documents that require reporting (EOP-004, CIP-001, DOE oe-417, and NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting). NERC also has the "Bulk Power System Disturbance Classification Scale" that does not completely align with all the reporting requirements. Therefore we recommend keeping this as simple as possible by combining all the reporting requirements into one standard. It would be beneficial to not require operators to have to go to 4 different documents to determine what to report on.
No
Although we are not aware of any NAESB business practices that need to be reviewed in conjunction with these proposed revisions, the SDT should consider reviewing current RTO procedures and practices that may require the need for variances in the revised standards.
No
The Regional Reliability Organization should be removed from the applicability of EOP-004-1. Any report they receive would be from the other entities listed. For consistency, the entities should report to the appropriate law enforcement agency. A report to the Reliability Entity should also be made for that entities information only.
1. Under Industry Need it states: "The existing requirements need to be revised to be more specific – and there needs to be more clarity in what sabotage looks like." The use of the phrase "more specific" should be qualified by adding "while not being too prescriptive". As with other reliability standards, we do not want a standard that causes unwarranted and unnecessary additional work and costs to an entity to comply. 2. As pointed out by the NERC Audit and Observation Team in the "Issues to be considered" for CIP-001, clarification is needed regarding contacting the FBI. Prior audits dwelled heavily on FBI notification. For example, our policy states that Corporate Security notifies the FBI. In recent events it appears that local law enforcement handles day to day activities. The notification process for contacting the FBI needs clarification along with specific instances in which to call them. Who should make the call to the FBI? It appears that a protocol needs to be developed to clarify what events require notifying the FBI. It could be as simple as after an incident a standard form is completed and forwarded to the FBI, letting them decide if follow up is needed. 3. We suggest aligning all reporting requirements for consistency. The items requiring reporting and the timelines to report are very inconsistent between NERC and the DOE. NERC's timelines are also not consistent with their own Security Guideline for the Electricity Sector: Threat and Incident Reporting.
Individual

Duke Energy
Yes
We agree that additional clarity is needed regarding sabotage and disturbance reporting. Requirements should be tightened up and triggering events/thresholds of materiality need to be better defined.
No
While we agree with the need for clarity in sabotage and disturbance reporting, we believe that the Standards Drafting Team should carefully consider whether there is a reliability-related need for each

requirement. Some disturbance reporting requirements are triggered not just to assist in real-time reliability but also to identify lessons-learned opportunities. If disturbance and sabotage reporting continue to be reliability standards, we believe that all linkages to lessons-learned/improvements need to be stripped out. We have other forums to identify lessons-learned opportunities and to follow-up on those opportunities. Also, requirements to report possible non-compliances should be eliminated. We strongly support voluntary self-reporting, but not mandatory self-reporting.
No
No
It's unclear to us that the RRO should continue to be an applicable entity.

Comments: Agree with the statement that sabotage is hard to determine in real time by operations staffs. The determination of sabotage should be left up to law enforcement. They have the knowledge and peer contacts needed to adequately determine whether physical or cyber intrusions are merely malicious acts or coordinated efforts (sabotage). The operators should only be required to report physical and cyber intrusions to law enforcement. All other reporting requirements should apply to law enforcement once a determination of sabotage has been made. If the recommendations above are not to be accepted, then we have the following comments: CIP-001-1 1) R1 – states entities "shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and "multi-site sabotage" affecting larger portions of the Interconnection. The SAR notes that the industry objects to the multi-site requirement, most likely because the term is ambiguous. If this term remains in the standard, it needs to be clearly defined and responsibilities for obtaining (how do you get this information and from whom?) and distributing need to be included. 2) R1 – audits have shown confusion over the requirement to make operating personnel aware of sabotage events. The term operating personnel needs to be defined. Are they the individuals responsible for operating the facility, coordinating with other entities (i.e., RC, BA, TOP, GOP, and LSE)? It has been suggested that notification is required to all personnel at a facility. Keep in mind the purpose of the standard is to ensure sabotage events are properly reported, not to address emergency response. 3) R1 – The SAR (NERC Audit and Observation Team) notes that Registered Entities have processes and procedures in place, but not all personnel have been trained. There is no specific training requirement in the standard. 4) R2 & R3 – I agree with the SAR that sabotage needs to be defined and these requirements should be more specific with respect to the information to be communicated. It seems to me that the standard should mirror the criteria contained in DOE OE-417. The emphasis should be placed on ensuring that the same information communicated to DOE is shared with the appropriate parties in the Interconnection. 5) R4 – I agree with the SAR (NERC Audit and Observation Team) comments regarding the intention of this requirement. There is no language that directs contact with FBI or RCMP

although that is what is implied by the Purpose statement. 6) VRF Comments – I’m not sure what is intended by the statement “Adequate procedures will insure it is unlikely to lead to bulk electric system instability, separation, or cascading failures.” The purpose of the standard is that of communication. No operational decisions or actions are directed by this standard, nor does it require entities to address operational aspects resulting from sabotage. 7) The potential exists for overlapping sabotage reporting requirements at nuclear power plants due to multiple regulators (Nuclear Regulatory Commission (NRC) – 10 CFR 73 and Federal Energy Regulatory Commission (FERC) – NUC-001-1). Some entities may have revised existing NRC driven procedures to accommodate reporting requirements of both regulators. Because of the restrictions placed on NRC driven documents (i.e., procedures are classified as “safeguards information”), it can be difficult to demonstrate compliance to NERC and/or FERC without ensuring that the individuals are qualified for receipt of such information per 10 CFR 73. Additionally, multiple procedures may have the unintended consequence of delaying appropriate communication. EOP-004-1 Consider removing Attachment 2 as the information is duplicated in DOE Form OE-417. A simple reference to the form should suffice.
Yes
No
No
Applicability should not apply to LSE unless they have physical assets. If they do not have such assets, they are unable to determine how many customers are out, how much load was lost or the duration of an outage. We continue to question the need for the LSE entity in reliability standards. End use customer load is either connected to transmission or distribution facilities. So, the applicable planner has to plan for that load when designing its facilities or the load will not have reliable service. To the extent that energy and capacity for that load is supplied by an entity other than the TO or DP, the TO or DP should have interconnection requirements that compel the supplier to provide any and all data necessary to meet the requirements of reliability standards.
CIP-008-1 Incident Reporting and Response Planning – include some requirements that require coordination with the requirements addressed in this project.

No. It is not clear that the issues listed in a revised standard will improve reliability. Revision based on redundancy is not sufficient reason for combination. Extensive documentation efforts have been made to comply with the current Standards. Unless combining these Standards provides compelling Reliability benefit, it is not worth the industry's resources to revise existing documentation and processes for the sake of eliminating redundancy. Redundancy issues were raised prior to the ERO adopting the initial Standard set into law. We have noted the other issues raised in the SAR, however, it is still unclear where the Reliability benefit of this SAR is evidenced.
No
No. If this SAR moves forward other standards may need to be considered. For example, in CIP-008, incident reporting for cyber incidents leads to filing of the OE-417 form.
Yes
Yes. If this SAR moves forward other practices such as those required by CIP-008 (cyber incident reporting via the OE-417 form) may need to be considered.

The MRO NSRS would like to keep the references to the DOE reporting form.
Yes
No
As FERC has directed, the RRO should be removed since they are not owners or operators of the BES.
A. The SAR states that there may be impact on a related standard, COM-003-1 (page SAR-5). Is the SDT referring to Project 2007-02, Operating Personnel Communication Protocols? If so, this is a SAR too and should not be used as a reference. B. CIP-001-1 and EOP-004-1 should be combined into one EOP Standard. C. Within EOP-004-1 there is industry confusion on what form to submit in the event of an event. There should only be one form for the new combination Standard eliminating the need for reporting form attachments. It should be the DOE Form, OE-417. Although it is beyond the scope of this SAR, it would greatly benefit industry if there was a central location on the NERC website containing ALL reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable the System Operators to efficiently locate the most current version of the appropriate form in order to report events. D. The word Disturbance is primarily used in other Standards as in, Disturbance Control Standard or system separation due to a disturbance. Should the NERC definition be updated? Should the word “Sabotage” be defined by NERC? Additionally, we recommend that one definition of “Sabotage” be utilized industry-wide, instead of varying definitions by multiple groups like the DOE, ESIAC, etc.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments on Project 2009-01 — SAR for Disturbance and Sabotage Reporting

The Disturbance and Sabotage Reporting SAR Drafting Team (DSR SAR DT) thanks all commenters who submitted comments on the first draft SAR. The SAR was posted for a 30-day public comment period from April 22, 2009 through May 21, 2009. The stakeholders were asked to provide feedback on the documents through a special Electronic Comment Form. There were 40 sets of comments, including comments from more than 120 different people from over 60 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

The majority of stakeholders agree that there is a reliability related need to support modifying CIP-001-1 and EOP-004-1. Of those stakeholders providing comments, they predominantly agreed with the reliability-related reason for the SAR but offered the following concerns:

1) Concerns with applicability of the requirements: The SAR DT notes that applicability will be determined by the final requirements that are written for the standard.
2) Concerns on combining the standards: The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting team to make this determination through the Standard Development Process (with stakeholder input).
3) Concerns with the definition of sabotage and the inclusion of vandalism, thresholds for defining sabotage, etc.
4) Concerns on onerous or duplicative reporting: The Brief Description section of the SAR states “Specific references to the DOE form need to be eliminated”. This should address its concerns.

The SAR DT does not feel that the SAR should be revised based on these comments. The SAR DT will forward these comments to the Standard Drafting Team for its consideration in the drafting of the standards.

The majority of stakeholders agree with the scope of the SAR. Several stakeholders offered suggestions for items to include in the SAR, however the SAR DT believes that these comments may be too prescriptive to include with the SAR. The team feels that inclusion of these types of comments would prevent the Standard Drafting Team from having the ability to develop standard(s) based on stakeholder consensus. The SAR DT will forward these comments to the Standard Drafting Team for its consideration. Some of the comments received include:

1) The inclusion of specific definitions in the SAR (operating personnel, sabotage events, obligations): The SAR DT believes that this would be too prescriptive and believe that this should be addressed by the Standard Drafting Team.
2) Consolidate documents covering reporting requirements: The SAR DT agrees and suggests that the Standard Drafting Team investigate a “one-stop-shopping” solution for the various reports required, including the DOE report.

Stakeholders did not identify any associated business practices for consideration under the SAR. One stakeholder identified a related standard that references multi-site sabotage. The team has included a reference to TOP-005, section 2.9 (Appendix 1) in the SAR under Related Standards. Two stakeholders suggested that Business Practices should not be considered in a standard. The SAR DT notes that standard development projects must not invalidate business practices that are already in place and aids in coordination with North American Energy Standards Board (NAESB).

Many stakeholders had comments regarding applicability of the two standards. Based on these comments, the SAR DT has added Transmission Owner, Generator Owner and Distribution Provider to the Applicability section of the SAR as *possible* entities in the standard(s) developed under this SAR as the Standard Drafting team may have a need to include them in the standard(s). The applicability of Load-Serving Entity or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process. The three main comments were:

1) Regional Reliability Organization applicability: Several commenters do not feel the RRO should be in the standards. The DSR SAR DT concurs and notes that the SAR states that “EOP-004 has some ‘fill-in-the-blank’ components to eliminate”. This will remove the RRO from applicability.

2) Load-Serving Entity/Distribution Provider: Several stakeholders do not feel that the standards should be applicable to LSEs, but should apply to Distribution Providers. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process.

3) Transmission Owner/Generator Owner: Several stakeholders have indicated a need to include the TO as an applicable entity. A couple of those would also include the GO. The SAR DT discussed the addition of the TO and GO. The team has a concern that there may be duplication of requirements between the TO/TOP and GO/GOP if the TO and GO are added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process.

Stakeholders provided many good comments that should be considered in the development of the standards under this project. The SAR DT does not believe that these comments require any significant revisions to the SAR, but will forward these comments to the Standard Drafting Team for its consideration in drafting the standard(s). The comments include:

1) Consolidation of reports: The SAR DT agrees with this concept and will forward the comment to the Standard Drafting Team for its consideration.
2) Concerns about pre-determination of combining CIP-001 and EOP-004 into one standard: The SAR states: CIP-001 may be merged with EOP-004 to eliminate redundancies. The two standards may be left separate.

3) Reporting criteria in multiple tables: The team agrees that it would be easier if there were only one table. Part of this scope of this project is to eliminate redundancies and make general improvements to the standard. The team also agrees that the requirements developed should be clear in their reliability objective.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. Do you agree that there is a reliability-related reason to support modifying CIP-001-1 and EOP-004-1? If not, please explain in the comment area.

Summary Consideration: The majority of stakeholders agree that there is a reliability related need to support modifying CIP-001-1 and EOP-004-1. Of those stakeholders providing comments, they predominantly agreed with the reliability-related reason for the SAR but offered the following concerns:

1) Applicability of the requirements: The SAR DT notes that applicability will be determined by the final requirements that are written for the standard.

2) Combining the standards: The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting team to make this determination through the Standard Development Process (with stakeholder input).

3) Definition of sabotage and the inclusion of vandalism, thresholds for defining sabotage, etc.

4) Onerous or duplicative reporting: The Brief Description section of the SAR states "Specific references to the DOE form need to be eliminated". This should address any concerns.

The SAR DT will forward these comments to the Standard Drafting Team for its consideration in the drafting of the standards.

Organization	Yes or No	Question 1 Comment
SERC OC Standards Review Group	No	The EOP-004-1 standard is an unnecessary duplication of existing DOE reporting requirements. This essentially exposes an entity to fines by NERC, enforced by FERC, for failure to comply with a DOE regulation, which seems improper to us. In addition, reporting requirements do not have an impact on the reliability of the BES
Response: The DSR SAR DT thanks you for your comment. The Brief Description section of the SAR states "Specific references to the DOE form need to be eliminated".		
MidAmerican Energy	No	MidAmerican Energy believes only EOP-004-1 is confusing and needs to modified or clarified. There is no need to combine the two standards. Standard EOP-004 could be clarified to eliminate references to sabotage which are already covered by CIP-001-1. Standard EOP-004 should be strictly limited to system events, not sabotage.
Response: The DSR SAR DT thanks you for your comment. The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting Team to make this determination through the Standard Development Process (with stakeholder input).		

Organization	Yes or No	Question 1 Comment
Bonneville Power Administration	No	Eliminating a single standard by consolidating two standards does not improve reliability. All of the defined actions are indeed being taken now.
Response: The DSR SAR DT thanks you for your comment. The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting team to make this determination through the Standard Development Process (with stakeholder input).		
Progress Energy	No	No. It is not clear that the issues listed in a revised standard will improve reliability. Revision based on redundancy is not sufficient reason for combination. Extensive documentation efforts have been made to comply with the current Standards. Unless combining these Standards provides compelling Reliability benefit, it is not worth the industry's resources to revise existing documentation and processes for the sake of eliminating redundancy. Redundancy issues were raised prior to the ERO adopting the initial Standard set into law. We have noted the other issues raised in the SAR, however, it is still unclear where the Reliability benefit of this SAR is evidenced.
Response: The DSR SAR DT thanks you for your comment. Industry consensus indicates that eliminating redundancy between standards is required to avoid potential double jeopardy issues with compliance to the standards. Furthermore, one of the FERC Order 693 directives for CIP-001 is: **Explore ways to reduce redundant reporting, including central coordination of sabotage reports and a uniform reporting format.**		
Kansas City Power & Light	Yes	Agree with the SAR that clarity would be helpful in establishing criteria regarding what constitutes sabotage reporting.
Response: The DSR SAR DT thanks you for your comment. One of the FERC Order 693 directives for CIP-001 is: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.**		
Pepco Holdings, Inc. - Affiliates	Yes	PHI recommends merging these two standards into one.
Response: The DSR SAR DT thanks you for your comment. The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting team to make this determination through the Standard Development Process (with stakeholder input).		
Electric Market Policy	Yes	Comments: Agree with the statement that sabotage is hard to determine in real time by operations staffs. The determination of sabotage should be left up to law enforcement. They have the knowledge and peer contacts needed to adequately determine whether physical or cyber intrusions are merely malicious acts or coordinated efforts (sabotage).

Organization	Yes or No	Question 1 Comment
		The operators should only be required to report physical and cyber intrusions to law enforcement. All other reporting requirements should apply to law enforcement once a determination of sabotage has been made. If the recommendations above are not to be accepted, then we have the following comments: CIP-001-1 1) R1 states entities shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SAR notes that the industry objects to the multi-site requirement, most likely because the term is ambiguous. If this term remains in the standard, it needs to be clearly defined and responsibilities for obtaining (how do you get this information and from whom?) and distributing need to be included. 2) R1 audits have shown confusion over the requirement to make operating personnel aware of sabotage events. The term operating personnel needs to be defined. Are they the individuals responsible for operating the facility, coordinating with other entities (i.e., RC, BA, TOP, GOP, and LSE)? It has been suggested that notification is required to all personnel at a facility. Keep in mind the purpose of the standard is to ensure sabotage events are properly reported, not to address emergency response. 3) R1 The SAR (NERC Audit and Observation Team) notes that Registered Entities have processes and procedures in place, but not all personnel have been trained. There is no specific training requirement in the standard. 4) R2 & R3 I agree with the SAR that sabotage needs to be defined and these requirements should be more specific with respect to the information to be communicated. It seems to me that the standard should mirror the criteria contained in DOE OE-417. The emphasis should be placed on ensuring that the same information communicated to DOE is shared with the appropriate parties in the Interconnection. 5) R4 I agree with the SAR (NERC Audit and Observation Team) comments regarding the intention of this requirement. There is no language that directs contact with FBI or RCMP although that is what is implied by the Purpose statement. 6) VRF Comments I'm not sure what is intended by the statement Adequate procedures will insure it is unlikely to lead to bulk electric system instability, separation, or cascading failures? The purpose of the standard is that of communication. No operational decisions or actions are directed by this standard, nor does it require entities to address operational aspects resulting from sabotage. 7) The potential exists for overlapping sabotage reporting requirements at nuclear power plants due to multiple regulators (Nuclear Regulatory Commission (NRC) 10 CFR 73 and Federal Energy Regulatory Commission (FERC) NUC-001-1). Some entities may have revised existing NRC driven procedures to accommodate reporting requirements of both regulators. Because of the restrictions placed on NRC driven documents (i.e., procedures are classified as safeguards information), it can be difficult to demonstrate compliance to NERC and/or FERC without ensuring that the individuals are qualified for receipt of such information per 10 CFR 73. Additionally, multiple procedures may have the unintended consequence of delaying appropriate communication.EOP-004-1Consider removing Attachment 2 as the information is

Organization	Yes or No	Question 1 Comment
		duplicated in DOE Form OE-417. A simple reference to the form should suffice.
Response: The DSR SAR DT thanks you for your comment. The team notes that your comments relate directly to potential revisions of the standard requirements. The team will pass your comments along to the Standards Drafting Team for its consideration. For item 4, one of the FERC Order 693 directives for CIP-001 is: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.**		
Lands Energy Consulting	Yes	I have worked with 5 Northwest public utilities on developing procedures related to CIP-001-1 and EOP-004-1. All 5 utilities operate electric systems in fairly remote locations and are embedded in a larger utility's Balancing Authority/Transmission Operator area. A. CIP-001-1 - Developing procedures to unambiguously identify acts of sabotage has been particularly challenging for these systems. In general, it's hard for them to determine whether the most prevalent forms of malicious and intentional system damage that they incur - copper theft and gun shot insulators/equipment - should qualify as acts of sabotage. Although none of the systems consider copper theft to be acts of sabotage, two of the systems consider gun shot insulators/equipment to be acts of sabotage. The other systems look for intent to disrupt electric system operations as a key component of their sabotage identification procedures. Additional guidance from NERC in the form of CIP-001-1 modifications or a companion guidelines document on sabotage identification would provide much needed guidance for these procedures. B. EOP-004-1 - This standard was clearly drafted with the larger electric systems in mind. I have one client that serves 3300 commercial/residential customers from 4-115/13 kV substation transformers and one large industrial customer (80% of its energy load) from a 230/13 kV substation. 75% of the client's load is served from three substations attached to a long, 115 kV transmission line operated by the Bonneville Power Administration. Whenever the line relays open on a permanent fault (which happens 2-3 times per year), the client loses over 50% of its customers (but no more than 10-15 MW during winter peak), thereby necessitating the preparation of a Disturbance Report. To allow utilities to concentrate on operating their systems, without fear of violating EOP-004-1 for failure to report trivial outages, I would remove LSEs from the obligation to report disturbances - leave the reporting to the BA/TOP for large outages in their footprint.
Response: The DSR SAR DT thanks you for your comment. **A. The team notes that your comments relate directly to potential revisions of the standard requirements. The team will pass your comments along to the Standards Drafting Team for its consideration.** **B. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process. The team**		

Organization	Yes or No	Question 1 Comment
will pass your comments along to the Standards Drafting Team for its consideration.		
Calpine Corporation	Yes	Communication of facility status or emergencies between merchant generators registered as GOP and the RC, BA, GOP, or LSE in which the facility resides should be coordinated for EOP -004 reporting. The reporting to NERC/DOE should come from the RC, BA, GOP, or LSE.
Response: The DSR SAR DT thanks you for your comment. The team concurs that reporting should be coordinated and will pass your comments along to the Standards Drafting Team for its consideration.		
Covanta	Yes	Yes - the key to Sabotage reporting requirements is identifying what the 'definition' is of an actual or potential 'Sabotage' event. Like any other standard, if FERC/NERC leave it up to 2000+ entities to establish their own definitions of 'Sabotage', you may likely get 2000+ answers. That is not a controlled and coordinated approach. I offer the following definition, "Sabotage - Deliberate or malicious destruction of property, obstruction of normal operations, or injury to personnel by outside agents." Examples of sabotage events could include, but are not limited to, suspicious packages left near site electrical generating or electrical transmission assets, identified destruction of generating assets, telephone/e mail received threats to destroy or interrupt electrical generating efforts, etc." These have passed multiple NERC regional audits and reviews to date.
Response: The DSR SAR DT thanks you for your comment. One of the FERC Order 693 directives for CIP-001 is: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.** **The team will pass your comments along to the Standards Drafting Team for its consideration.**		
Cowlitz County PUD	Yes	The standards as written now create reporting on local customer quality of service outage events not related to BPS disturbances. Sabotage reporting has degenerated into reporting of mischievous vandalism and minor theft occurences. This creates compliance documentation overburden and waste of limited funds needed for true BPS reliability concerns, and also adds nuisance calls to the FBI and Homeland Security.
Response: The DSR SAR DT thanks you for your comment. One of the FERC Order 693 directives for CIP-001 is: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.** **This should address the concern of sabotage vs. vandalism/theft reporting.**		
Reliant Energy	Yes	EOP-004-1 indicates that Generators should analyze disturbances on the bulk electrical system or their facilities. Generators do not have the capability of analyzing the bulk electrical system other than Frequency. Even so, generators can not unilaterally respond to what it thinks are disturbances. In the case of CAISO The Participating Generator

Organization	Yes or No	Question 1 Comment
		Agreement prevents me from making any unilateral moves save for the direst frequency emergencies. If the System operator or Reliability Coordinator informs the generator that there is a disturbance and that logs and readouts etc. are required then the generator should respond with all available information for the subject hours or time. Clearer responsibilities provide clearer results.
Response: The DSR SAR DT thanks you for your comment. While the team agrees that generators may not have the capability to analyze events, the team note that you concern is regarding applicability of requirements. The final wording of the requirements developed by the Standard Drafting Team will determine the applicability.		
Georgia System Operations Corp.	Yes	There is a need to eliminate burdensome reporting deadlines which interfere with the reliable operations or recovery of the BES. There is also a need to move requirements for reporting to NERC or Regional Entities (except for reporting of threats to physical or cyber security) from the Requirements section of Reliability Standards to elsewhere.
Response: The DSR SAR DT thanks you for your comment. Specific revisions to the requirements will be vetted during the standard development process.		
Illinois Municipal Electric Agency	Yes	Simplification of reporting requirements should facilitate reliability.
Response: The DSR SAR DT thanks you for your comment.		
Duke Energy	Yes	We agree that additional clarity is needed regarding sabotage and disturbance reporting. Requirements should be tightened up and triggering events/thresholds of materiality need to be better defined.
Response: The DSR SAR DT thanks you for your comment. One of the FERC Order 693 directives for this project is: Define “sabotage” and provide guidance on triggering events that would cause an entity to report an event.

2. Do you agree with the scope of the proposed SAR? If not, please explain what should be added or deleted to the proposed scope.

Summary Consideration: The majority of stakeholders agree with the scope of the SAR. Several stakeholders offered suggestions for items to include in the SAR, however the SAR DT believes that these comments may be too prescriptive to include with the SAR. The team feels that inclusion of these types of comments would prevent the Standard Drafting Team from having the ability to develop standard(s) based on stakeholder consensus. The SAR DT will forward these comments to the Standard Drafting Team for its consideration. Some of the comments received include:

1 The inclusion of specific definitions in the SAR (operating personnel, sabotage events, obligations): The SAR DT believes that this would be too prescriptive and believe that this should be addressed by the Standard Drafting Team.

2 Consolidate documents covering reporting requirements: The SAR DT agrees and suggests that the Standard Drafting Team investigate a "one-stop-shopping" solution for the various reports required, including the DOE report.

Organization	Yes or No	Question 2 Comment
Project 2007-02 Operating Personnel Comms Protocols SDT	No	The Operating Personnel Communication Protocols standard drafting team respectfully requests that the Sabotage Reporting SAR Drafting Team incorporate the following into your proposed SAR: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have procedures for the communication of information concerning the Cyber and Physical emergency alerts in accordance with the conditions described in "Attachment 1 Security Emergency Alerts." The Operating Personnel Communications Protocols Project 2007-02 was initiated to ensure that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The SDT developed a new COM-003-1 Standard that has yet to be posted and is dependent upon revising at least two other standards (CIP-001 and TOP Standard). COM-003 contains requirements that specify: 1. Use of three-part communication; 2. English language; 3. Common time zone; 4. NATO alpha-numeric alphabet; 5. Mutually agreed line identifiers; 6. The use of pre-defined system condition terminology such as those contained in the RCWG Alert Level Guide and EOP-002-2.

Organization	Yes or No	Question 2 Comment
		This request is based on recent NERC Standards Committee direction to our team to incorporate the Reliability Coordinator Working Group's (RCWG) Alert Level Guide into a Standard. The consensus of our team is that a TOP Standard is the most appropriate location for the Transmission Emergency Alert language from the Guide as the energy emergency alert language is currently described in EOP-002-2. The RCWG Guide proposes the se of pre-defined system condition descriptions for use during emergencies for reliability related formation. This guide was developed in response to a Blackout Report recommendation. Our team placed the Transmission Emergency Alert language into a TOP standard. Since the Sabotage Reporting SAR DT intends to modify CIP-001, we seek your consent to incorporate the cyber and physical security alert language to comply with the wishes of the Standards Committee. We believe that the CIP-001 Standard is the most appropriate location for this language for the following reasons: • The levels of emergency conditions related to the cyber and physical security of the electric system is directly related to Critical Infrastructure Protection. • The current version of CIP-001 already requires the timely reporting of actual and suspected security emergency conditions and the use of pre-defined terminology supports the efficient haring of such information. The OPCP SDT includes the following text for the record. It is a proposed draft revision of CIP-001. **A. Introduction** 1. Title: Security Incidents 2. Number: CIP-001-2 3. Purpose: To ensure the recognition, communication and response to cyber and physical security incidents suspected or determined to be caused by sabotage. 4. Applicability 4.1. Reliability Coordinators. 4.2. Balancing Authorities. 4.3. Transmission Operators. 4.4. Generator Operators. 4.5. Load Serving Entities. 5. Effective Date: The standard is effective the first day of the first calendar quarter after applicable regulatory approvals (or the standard otherwise becomes effective the first day of the first calendar quarter after NERC OT adoption in those jurisdictions where regulatory approval is not required).

Organization	Yes or No	Question 2 Comment
		B. Requirements R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of security threats on its facilities and multi site security threats affecting larger portions of the Interconnection. R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning the physical and cyber security status of their facilities in accordance with the conditions described in Attachment 1-CIP-001-1. R3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall provide its operating personnel with security threat or incident response guidelines, including personnel to contact, for reporting security threats and incidents. R4. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances. **C. Measures** M1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request a procedure (either electronic or hard copy) as defined in Requirement 1 M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request the procedures or guidelines that will be used to confirm that it meets Requirements 2 and 3. M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request evidence that could include, but is not limited o procedures, policies, a letter of understanding, communication records, or other equivalent evidence that will be used to confirm that it has established communications contacts with the applicable, local FBI or CMP officials to communicate sabotage events (Requirement 4). **D. Compliance** 1. Compliance Monitoring Process 1.1. Compliance Enforcement Authority Regional Entity 1.2. Compliance Monitoring Period and Reset One or more of the following methods will be used to verify compliance: - Compliance Audits

Organization	Yes or No	Question 2 Comment
		- Self-Certifications - Spot Checking - Compliance Violation Investigations - Self-Reporting - Complaints 1.3. Data Retention The Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: o The Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator and Distribution Provider shall retain its current, in force document and any documents in force since the last compliance audit. o If a Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant. o The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records. 1.4. Additional Compliance Information None. 2. Levels of Non-Compliance: 2.1. Level 1: There shall be a separate Level 1 non-compliance, for every one of the following requirements that is in violation: 2.1.1 Does not have procedures for the recognition of and for making its operating personnel aware of sabotage events (R1). 2.1.2 Does not have procedures or guidelines for the communication of information concerning sabotage events to appropriate parties in the Interconnection (R2). 2.1.3 Has not established communications contacts, as specified in R4. 2.2. Level 2: Not applicable.

Organization	Yes or No	Question 2 Comment
		2.3. Level 3: Has not provided its operating personnel with sabotage response procedures or guidelines (R3). 2.4. Level 4:.Not applicable. E. Regional Differences None. Version History Version Date Action Change Tracking 0 April 1, 2005 Effective Date New 0 August 8, 2005 Removed “Proposed” from Effective ate Errata 1 November 1, 2006 Adopted by Board of Trustees Amended 1 April 4, 2007 Regulatory approval — Effective Date New 2 March 2009 Added SEA attachment and updates to Effective Date and compliance sections. New **Attachment 1-CIP-001-2 Physical Security Emergency Alerts** General requirements 1. Initiation by Reliability Coordinator. A Physical Security Emergency Alert may be initiated only by a Reliability Coordinator at: a. The Reliability Coordinator’s own decision, b. By request from a Transmission Operator, c. By request from a Balancing Authority, or d. By request from federal, state, or cal Law Enforcement Officials. 2. Situations for initiating alert. An Alert may be initiated for the following reasons: a. A physical threat affecting a control center, grid or generator asset has been identified, or b. A physical attack affecting a control center, grid or generator asset has occurred or is imminent. 3. Notification. A Reliability Coordinator who initiates a Physical Security Emergency Alert shall notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify other Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) using the “CIP” category. Additionally, conference calls between Reliability Coordinators shall be held as necessary to communicate system conditions. The Reliability Coordinator shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area and other Reliability Coordinators hen the alert has changed levels or ended.

Organization	Yes or No	Question 2 Comment
		Physical Security Emergency Alert Levels To ensure that all Reliability Coordinators clearly understand potential and actual Physical Security Emergency Alerts, NERC as established three levels of Security Emergency Alerts. The Reliability Coordinators will use these terms hen explaining security alerts to each other. The Reliability Coordinator may declare whatever alert level is necessary, and need not proceed through the alerts sequentially. 1. Alert 1 – "Control Center / Bulk Electric system asset threat identified" Circumstances: A credible threat of physical attack on a Bulk Electric System asset has been communicated to the Reliability Coordinator. No physical attack has occurred at this point. Determining the credibility of any threat is a subjective process, but the following factors should be considered: a. The nature and specificity of the threat, b. The timing of the threat, c. Mode of threat communication, and d. The criticality of the threatened asset. During a Physical Security Emergency Alert Level 1, Reliability Coordinators, Transmission Operators and Balancing Authorities shall have the following responsibilities: i. Notification: The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under "CIP" and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The declaring Entity shall update the reliability Coordinator of any changes in the situation until the Alert Level 1 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 2. Alert 2 – "Verified Physical attack at a single site" circumstances: A Reliability Coordinator, Transmission Operator, or Balancing Authority has identified a physical attack upon a control center, generator asset, or other bulk electric system asset. During a Physical Security Emergency Alert Level 2, Reliability Coordinators, Transmission Operators and Balancing Authorities shall have the following responsibilities: i. Notification: The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under "CIP" and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The Declaring Entity shall update the Reliability Coordinator of the situation a minimum of once per hour until the Alert Level 2 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 3. Alert 3– "Verified Physical attack at multiple sites" Circumstances: Multiple attacks have been confirmed on control centers, generator assets or other bulk electric system assets. A Reliability Coordinator shall declare Physical Security

Organization	Yes or No	Question 2 Comment
		Emergency Alert 3 whenever: a. A Transmission Operator or Balancing Authority reports multiple physical attacks on bulk electric system assets, b. Multiple Transmission Operators or Balancing authorities report one or more physical attacks on their bulk electric system assets. i. Notification: The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under "CIP" and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The declaring Entity(ies) shall update the Reliability Coordinator of the situation a minimum of once per hour until the Alert Level 3 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 4. Alert 0 – "Termination of Alert Level" Circumstances: The threat which prompted the Physical Security Emergency Alert Level has diminished or has been removed. i. Notification The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall notify all other Reliability Coordinators via the RCIS, and it shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area that the Alert Level has been terminated. Cyber Security Emergency Alerts Cyber Assets – Those programmable electronic devices and communication networks, including hardware, software, and data, associated with bulk electric system assets. Cyber Security Incident - Any malicious act or suspicious event that compromises, or attempts to compromise, the electronic or physical security perimeter of a critical cyber asset or disrupts or attempts to disrupt the operation of a critical cyber asset. Critical Cyber Asset – Those cyber assets essential to the reliable operation of critical assets. Electronic Security Perimeter – The logical border surrounding the network or group of sub-networks to which the critical cyber assets are connected, and for which access is controlled. Physical Security Perimeter – The physical border surrounding computer rooms, telecommunications rooms, operations centers and other locations in which critical cyber assets are housed and for which access is controlled. General Requirements 1. Initiation - A Cyber Security Emergency Alert shall be initiated by: a. The Reliability Coordinator's analysis, b. By request from any NERC functional Model entity that Com-003-0 is applicable to.

Organization	Yes or No	Question 2 Comment
		c. By request from federal, state, or local Law Enforcement Officials. 2. Situations for initiating alert. An Alert shall be initiated for the following reasons: a. A cyber threat affecting a control center or bulk electric system asset has been identified, or b. A cyber attack affecting a control center or bulk electric system has occurred or is imminent. 3. Notification. An entity who initiates a Cyber Security Emergency Alert shall make notification as per the NERC Functional model or as Regional / local instruction. The Reliability Coordinator shall notify FBI local office, Electricity Sector Information Sharing Analysis Center ESISAC) and Department of Homeland Security. The Reliability Coordinator shall also notify as necessary other Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) sing the "CIP" category. The Reliability Coordinator shall notify all Transmission Operators and Balancing Authorities in its Reliability Area and other Reliability Coordinators when the alert has changed levels or ended. Cyber Security Emergency Alert Levels To ensure that all applicable entities clearly understand potential and actual Cyber Security Emergency Alerts, three levels of Security Emergency Alerts shall be sed. The Reliability Coordinators will use these terms when communicating security alerts to each other. When declaring the applicable alert level it is important to note that the applicable level can be determined without sequentially proceeding through levels. As an example given circumstances an Alert Level 3 could be called without previously being in an Alert Level 1 or Level 2 state. 1. Alert 1 – "Verified Control Center / Bulk Electric System Cyber Asset threat identified or imminent" What is "verified" - unknown or unauthorized access to a cyber device, unknown or unauthorized change to a cyber device (i,e., config file, /S, firmware change. 'Verified' could mean the elimination of a false positive in your security monitoring system. 'Verified' could also be the differentiation between malicious and non-malicious (ie human error, not following policy, etc) intent. What is a "threat" - A threat can be perceived as any action or event that occurs where the monitoring authority was not previously made aware that that action would occur. With flimsy change control or access controls, field staff or technical staff performing troubleshooting or other maintenance may access or change devices without notifying the monitoring entity. The monitoring entity would have to treat this as a threat and take appropriate action to either isolate that device from the rest of the system, notify appropriate authority, dispatch a crew, etc. Examples of threats - Over and above the examples above, another threat example could be a notification from DHS or other security agency that they have reason to believe a hack, virus or other cyber terrorism activity could occur. Also, noticing a distinct change in network traffic which could imply someone has intercepted your data and can manipulate

Organization	Yes or No	Question 2 Comment
		before sending it from the control room to the device being controlled or manipulating the data coming from the device before a controller seeing it and forcing them to perform an incorrect control event in reaction to erroneous data. Circumstances: A credible threat of Cyber attack on a Control Center or Bulk Electric System asset has been communicated to the Reliability Coordinator. No cyber attack has occurred t this point. Determining the credibility of any threat is a subjective process, but the following factors should be considered: a. The nature and specificity of the threat, b. The timing of the threat, c. Mode of threat communication, and d. The criticality of the threatened asset. During a Cyber Security Emergency Alert Level 1, applicable entities shall have the following responsibilities: i. Notification An entity who initiates a Cyber Security Emergency Alert Level 1 shall make notification as per the NERC Functional model r as Regional / local instruction. The Reliability Coordinator shall post the declaration of the alert level long with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify as necessary the BI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity shall update those applicable entities of any changes in the situation until the Alert Level 1 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 2. Alert 2 – “Verified Cyber attack on a Control Center or Bulk Electric System asset” Circumstances: An applicable entity has identified a cyber attack upon a control center or bulk electric system asset. During a Cyber Security Emergency Alert Level 2, applicable entities shall have the following responsibilities: i. Notification An entity who initiates a Cyber Security Emergency Alert Level 2 shall make notification as per the NERC Functional model or as Regional / cal instruction. The Reliability Coordinator responsible shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify the FBI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity shall provide updates of the situation a minimum of once per hour until the Alert Level 2 is terminated. The Reliability Coordinator shall update the RCIS as changes occur.

Organization	Yes or No	Question 2 Comment
		3. Alert 3 – "Verified Cyber attack at one or more Control Center or Bulk Electric System cyber asset" Circumstances: An applicable entity has identified a cyber attack upon a control center or bulk electric system asset and shall declare a Cyber Security Emergency Alert 3 whenever: a. A Transmission Operator or Balancing Authority reports one or more cyber attacks on bulk electric system that render an asset(s) unavailable. i. Notification An entity who initiates a Cyber Security Emergency Alert Level 3 shall make notification as per the NERC Functional model or as Regional / local instruction. The Reliability Coordinator shall post the declaration of the alert level along with the location of the affected facility on the RCIS under "CIP" and notify all Transmission Operators and Balancing Authorities its Reliability Area. The Reliability Coordinator shall also notify the FBI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity(ies) shall provide an update of the situation minimum of once per hour until the Alert Level 3 is terminated. The Reliability Coordinator shall update he RCIS as changes occur. 4. Alert 0 – "Termination of Alert Level" Circumstances: The threat which prompted the Cyber Security Emergency Alert Level has diminished or has been removed. i. Notification An entity who initiates a Cyber Security Emergency Alert shall make notification as per the NERC Functional model or as Regional / local instruction when situation has diminished or returned to normal. The Reliability Coordinator shall notify all other Reliability Coordinators via the RCIS, and it shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area that the Alert Level has been terminated.
Response: The DSR SAR DT thanks you for your comment. The standards in this Project 2009-01 SAR are designed to specify reporting requirements for disturbance and sabotage events. The DSR SAR DT believes that the suggested additions go beyond the intended scope of the revisions to the standards, and do not feel that communications protocols belong in these reporting standards. The proposed revisions and Alert Levels are real-time requirements, and the team feels that these would be more appropriately addressed in an IRO or COM standard.		
Northeast Power Coordinating Council	No	The SAR needs to be more specific in defining its objectives. CIP-001Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms "operating personnel" and "sabotage events." The definition of "operating personnel," should be clarified and limited to staff at BES facilities. Operating personnel should report only those events

Organization	Yes or No	Question 2 Comment
		which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term “sabotage event” needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be aware of such “sabotage events,” e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term “aware” in the standard. “Aware” can be interpreted in accordance with its largely passive, dictionary-based meaning, where being “aware” simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of “aware” could refer to more active wording, involving more than mere awareness, e.g., “alert and quick to respond,” pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies. EOP-004 - The SDT needs to work on the following areas. 1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction “The entity on whose system a reportable disturbance occurs shall notify NERC ... 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance - The sense of Attachment 1 is internally inconsistent between the introduction (“occurs”) and the required actions in 6c (could have resulted in a system disturbance). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase “or could have resulted in” a potential system disturbance. This inconsistency should be clarified.
Response: The DSR SAR DT thanks you for your comment. **CIP-001: The inclusion of specific definitions in the SAR as you suggest (operating personnel, sabotage events, obligations) are too prescriptive and could prevent better definitions from being developed during the Standards Development stage of the project. The team will pass your comments along to the standard drafting team for its consideration.** **EOP-004: Your comment addresses specific revisions to the standard. The team will pass your comments along to the standard drafting team for its consideration.**		
Kansas City Power & Light	No	Agree with the scope of the SAR except for the applicable entities. See response to question #4.
Response: The DSR SAR DT thanks you for your comment. Please see response to Q4.		

Organization	Yes or No	Question 2 Comment
MRO NERC Standards Review Subcommittee	No	The MRO NSRS would like to keep the references to the DOE reporting form.
Response: The DSR SAR DT thanks you for your comment. The DSR SAR DT understands your comment to indicate that you would like to see a "one stop" reporting form for disturbances and sabotage events. The DSR SAR DT agrees with you and will pass this comment along to the standard drafting team for its consideration in developing the standard(s).		
Lands Energy Consulting	No	I would like to see the SAR expanded to cover the issues I mentioned in my prior comment. Otherwise, the scope of the SAR looks fine to me.
Response: The DSR SAR DT thanks you for your comment. Please see response to Q1 on other issues.		
Bonneville Power Administration	No	Leave as is, all requirements for reporting are now covered. A common definition of sabotage is already widely available.
Response: The DSR SAR DT thanks you for your comment. Most stakeholders desire more clarity around the definition of sabotage as well as examples of what is and is not sabotage as opposed to vandalism.		
Cowlitz County PUD	No	Added to the scope: For EOP-004 add a provision for a reporting flow rather than everything going to the RE and NERC. That is something going like the DP and TOP reports to the BA, the BA to the RE, and the RE to NERC. This would allow for multiple related reports to be combined into a single coherent report as the reporting goes up the chain. For CIP-001 consider reporting flow as above with local law enforcement notification. Let an upper entity in the reporting chain decide when to contact Federal Agencies such as the BA or the RC.
Response: The DSR SAR DT thanks you for your comment. The DSR SAR DT feels that your comments are "how" comments that should be addressed in standard drafting stage. The team will pass this comment along to the standard drafting team for its consideration.		
Reliant Energy	No	I think Generator operators should be excluded except to provide requested information from the System Operator or Reliability coordinator.
Response: The DSR SAR DT thanks you for your comment. Other commenters have questioned the ability of Generator Operators to have a wide area view and to be able to analyze disturbances on the system. The team agrees that generators may not have a wide area view and the capability to analyze system events. The final wording of the requirements (i.e. reporting vs. data provision) developed by the Standard Drafting Team will		

Organization	Yes or No	Question 2 Comment
determine the applicability to GOPs. The team will pass your comment on to the Standard Drafting Team for its consideration.		
ERCOT ISO	No	The scope should be modified to provide for a different treatment of reporting requirements that are administrative in nature, or that are after-the-fact (thus cannot impact reliability unless analysis and follow-up is not performed; even then, the impact would be at some future time). Reporting requirements which are of the nature to assist in identification of system concerns or which serve to prevent or mitigate on-going system problems (including, but not limited to, actual or attempted sabotage activity) should remain in standards, but should be separate and apart from the administrative reporting.
Response: The DSR SAR DT thanks you for your comment. The team concurs with the concepts on reporting as you suggest, however the team does not feel that this should be addressed in the SAR. The team suggests that this is more appropriately addressed in the standard drafting process, and the team will pass your comment along to the standard drafting team for its consideration in drafting the standard.		
MidAmerican Energy	No	See the responses to questions 1 and 5.
Response: The DSR SAR DT thanks you for your comment. Please see responses to Q1 and Q5.		
We Energies	No	Consider including the sabotage issues in IRO-014-1 R 1.1.1 footnote 1 and TOP-005-1 Attachment 1, 2.9.
Response: The DSR SAR DT thanks you for your comment. The team has added references to these two standards in the "Related Standards" section for the SAR.		
NextEra Energy Resources, LLC	No	The scope of the SAR should not include Generator Operators.
Response: The DSR SAR DT thanks you for your comment. Other commenters have questioned the ability of Generator Operators to have a wide area view and to be able to analyze disturbances on the system. The team agrees that generators may not have a wide area view and the capability to analyze system events. The final wording of the requirements (i.e. reporting vs. data provision) developed by the Standard Drafting Team will determine the applicability to GOPs. The team will pass your comment on to the Standards Drafting Team for its consideration.		
Progress Energy	No	No. If this SAR moves forward other standards may need to be considered. For example, in CIP-008, incident reporting for cyber incidents leads to filing of the OE-417 form.
Response: The DSR SAR DT thanks you for your comment. The SAR states "Specific references to the DOE form need to be eliminated." **This will remove the linkage that you identify between CIP-001 and CIP-008. There is also a directive from FERC Order 693 in the SAR that states:**		

Organization	Yes or No	Question 2 Comment
Consider FirstEnergy's suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality. **This allows the standard drafting team to delineate physical and cyber assets. The DSR SAR DT also notes that CIP-008 might be a good framework for drafting the standard requirements pertaining to sabotage and disturbance reporting of physical assets.**		
Ameren	No	There seems to be an open slate including the following language in the scope. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards (see tables for each standard at the end of this SAR for more detailed information). The unnamed improvements should be limited to those requirements that relate only to Disturbance and Sabotage NOT a general wish list (or witch hunt).
Response: The DSR SAR DT thanks you for your comment. The passage that you mention is the intent of each SAR and is a stock statement that is included in almost every SAR. The SAR is limited to the standards listed in the SAR which is approved by the NERC SC to move to standards development.		
Consolidated Edison Co. of New York, Inc.	No	GENERAL CECONY and ORU support the general objectives of the SAR to merge existing standards CIP-001-1 Sabotage Reporting and EOP-004-1 Disturbance Reporting to improve clarity and remove redundancy. However, the SAR needs to be more specific in defining its objectives. CIP-001Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms operating personnel and sabotage events. The definition of operating personnel, should be clarified and limited to staff at BES facilities. Operating personnel should report only those events which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term sabotage event needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be aware of such sabotage events, e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term aware in the standard. Aware can be interpreted in accordance with its largely passive, dictionary-

Organization	Yes or No	Question 2 Comment
		based meaning, where being aware simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of aware could refer to more active wording, involving more than mere awareness, e.g., alert and quick to respond, pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies. EOP-004 - The SDT needs to work on the following areas. 1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction The entity on whose system a reportable disturbance occurs shall notify NERC ... 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: ?c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance. The sense of Attachment 1 is internally inconsistent between the introduction (occurs) and the required actions in 6c (could have resulted in a system disturbance). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase or could have resulted in a potential system disturbance. This inconsistency should be clarified.
Response: The DSR SAR DT thanks you for your comment. **CIP-001: The inclusion of specific definitions in the SAR as you suggest (operating personnel, sabotage events, obligations) are too prescriptive and could prevent better definitions from being developed during the standard drafting stage of the project. The team will pass your comments along to the standard drafting team for its consideration.** **EOP-004: Your comment addresses specific revisions to the standard. The team will pass your comments along to the standard drafting team for its consideration.**		
Georgia System Operations Corp.	No	The scope of the SAR should be to move all requirements to report to NERC or Regional Entities out of the Requirements section of all Reliability Standards to elsewhere. This does not include reporting, communicating, or coordinating between reliability entities. The NERC/Region reporting requirements could be consolidated in another document and referenced in the Supporting References section of the Reliability Standards. The deadlines for reporting should be changed to realistic timeframes that do not interfere with operating the BES or responding to incidents yet still allow NERC and the Regions to accomplish their missions.
Response: The DSR SAR DT thanks you for your comment. The team does not feel that this should be addressed explicitly in the SAR, but suggests that this is more appropriately addressed in the standard drafting stage for full industry vetting of the concepts. The team will pass your comment along to the standard drafting team for its consideration in developing the standard.		

Organization	Yes or No	Question 2 Comment
AEP	No	Sabotage is a term of intent that is often determined after the fact by the registered entity and/or law enforcement officials. In fact, it is often difficult to determine in real-time the intent of a suspicious event. We would suggest that suspicious events become reportable at the point that the event is determined to have had sabotage intent. The entities should have a methodology to collect evidence, to have the evidence analyzed, and to report those events that are determined to have had the intent of sabotage.
Response: The DSR SAR DT thanks you for your comment. The team concurs that it is difficult to determine sabotage in real-time. The teamdoes not feel that this should be addressed explicitly in the SAR and suggests that this is more appropriately addressed in the standard drafting stage for full industry vetting of the concepts. The team will pass your comment along to the standard drafting team for its consideration in developing the standard.		
Duke Energy	No	While we agree with the need for clarity in sabotage and disturbance reporting, we believe that the Standards Drafting Team should carefully consider whether there is a reliability-related need for each requirement. Some disturbance reporting requirements are triggered not just to assist in real-time reliability but also to identify lessons-learned opportunities. If disturbance and sabotage reporting continue to be reliability standards, we believe that all linkages to lessons-learned/improvements need to be stripped out. We have other forums to identify lessons-learned opportunities and to follow-up on those opportunities. Also, requirements to report possible non-compliances should be eliminated. We strongly support voluntary self-reporting, but not mandatory self-reporting.
Response: The DSR SAR DT thanks you for your comment. The team concurs that each requirement should be evaluated for its reliability need, and the team will pass your comment along to the standard drafting team for its consideration in the drafting stage of the standard.		
FirstEnergy	Yes	We agree with the scope but would also like to see the following considered: 1. References to the DOE reporting process in EOP-004 need to be revised. They currently refer to the old EIA form. 2. Besides "sabotage", it may be helpful to clearly define "vandalism". It is vaguely written in the standards. Also, the process of "public appeals" for the DOE reportable requirements needs to be more clearly defined. 3. Consolidate documents covering reporting requirements. There are currently several documents that require reporting (EOP-004, CIP-001, DOE oe-417, and NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting). NERC also has the "Bulk Power System Disturbance Classification Scale" that does not completely align with all the reporting requirements. Therefore we recommend keeping this as simple as possible by combining all the reporting requirements into one standard. It would be beneficial to not require operators to have to go to 4 different documents to determine what to report on.
Response: The DSR SAR DT thanks you for your comment.		

Organization	Yes or No	Question 2 Comment
The Brief Description of the SAR states: Specific references to the DOE form need to be eliminated. **The team will pass your comment along to the standard drafting team for its consideration.** **The team concurs that this should be considered in drafting the standards. The team will pass your comment along to the standard drafting team for its consideration.**		
Exelon	Yes	Consolidation of redundant requirements and clarifications of difficult to follow / interpret standards should be a high priority at NERC.
Response: The DSR SAR DT thanks you for your comment. One of the FERC directives for CIP-001 is: Explore ways to reduce redundant reporting, including central coordination of sabotage reports and a uniform reporting format.		
Electric Market Policy	Yes	
SERC OC Standards Review Group	Yes

3. Are you aware of any associated business practices that we should consider with this SAR? If yes, please explain in the comment area.

Summary Consideration: Stakeholders did not identify any associated business practices for consideration under the SAR. One stakeholder identified a related standard that references multi-site sabotage. The team has included a reference to TOP-005, section 2.9 (Appendix 1) in the SAR under Related Standards. Two stakeholders suggested that Business Practices should not be considered in a standard. The SAR DT notes that standard development projects must not invalidate business practices that are already in place. This question is required to be asked per the Standard Drafting Team Guidelines (page 8) and aids in coordination with North American Energy Standards Board. One stakeholder suggested a "one-stop-shopping" solution. The SAR DT agrees with this approach and will forward this comment to the Standard Drafting Team.

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 3 Comment</th></tr>
<tr><td>MRO NERC Standards Review Subcommittee</td><td>Yes</td><td></td></tr>
<tr><td>Luminant Power</td><td>Yes</td><td>The SAR drafting team should include in the SAR scope a review of the NRC sabotage and event reporting requirements to ensure there are no overlapping or conflicting requirements between NERC, FERC, and the NRC. The SAR scope should include a review of the CIP Cyber Security Standards and coordination with the CIP SDT to ensure that cyber sabotage reporting definitions are in concert, and ensure that cyber sabotage reporting requirements are not duplicated in multiple standards.</td></tr>
<tr><td colspan="3">Response: The DSR SAR DT thanks you for your comment. The team notes that your comments relate directly to potential revisions of the standard itself. Part of this SAR is to eliminate redundancies as well. The team will pass your comments along to the Standards Drafting Team for its consideration. This project is designed to address physical asset reporting, not cyber assets. Therefore, cyber assets will not be included in this SAR.</td></tr>
<tr><td>MidAmerican Energy</td><td>Yes</td><td>Attachment TOP-005, section 2.9 speaks of "Multi-site sabotage" with no definition. The ES-ISAC 2008 advisory is an associated standard or practice on sabotage. All references to sabotage should be eliminated or retired except for CIP-001.</td></tr>
<tr><td colspan="3">Response: The DSR SAR DT thanks you for your comment. The team has included a reference to TOP-005, section 2.9 (Appendix 1) in the SAR under Related Standards. Project 2009-01 is designed to address physical asset reporting, not cyber asset sabotage and disturbance reporting. The standard drafting team will remove redundancies per the SAR.</td></tr>
</table>

Organization	Yes or No	Question 3 Comment
Illinois Municipal Electric Agency	Yes	A one-stop reporting tool/site would facilitate efficient reporting and compliance; e.g., further development of the ES-ISAC/CIPIS to include all reportable categories and automatic notification of required parties. A single report form would be best.
Response: The DSR SAR DT thanks you for your comment. The team agrees with your suggestion and will pass this along to the Standard Drafting Team for its consideration in developing standards.		
AEP	Yes	The current reporting process necessitates multiple reports be sent to multiple parties, which is inefficient and may, inadvertently, result in alignment issues between the separate reports. We would recommend that a single report that combines NERC (CIPIS) and NERC ESISAC information be provided to NERC (CIPIS) that is systematically (programmatically) forwarded to all necessary entities. Further, updates to incidents would also go through NERC with the same electronic processing. Currently, we are not aware of a formal method to report incidents to the FBI, which should be also included in the distribution. The current reporting mechanism to the FBI JTTF is by telephone and the NERC platform described would provide more consistent reporting.
Response: The DSR SAR DT thanks you for your comment. The team agrees with your suggestion and will pass this along to the Standard Drafting Team for its consideration in developing standards. This project is designed to address physical asset reporting, not cyber assets.		
Progress Energy	Yes	Yes. If this SAR moves forward other practices such as those required by CIP-008 (cyber incident reporting via the OE-417 form) may need to be considered.
Response: The DSR SAR DT thanks you for your comment. The SAR states "Specific references to the DOE form need to be eliminated." **This will remove the linkage that you identify between CIP-001 and CIP-008. There is also a directive from FERC Order 693 in the SAR that states:** **Consider FirstEnergy's suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality.** **This allows the standard drafting team to delineate physical and cyber assets. The DSR SAR DT also notes that the general layout and sequencing of requirements in CIP-008 might be a good framework for drafting the standard requirements pertaining to sabotage and disturbance reporting of physical assets.**		
Exelon	No	We are not sure what this question means. Who's Associated Business practices, NERC, Applicable Entities in the Standard, our business practices?
Response: The DSR SAR DT thanks you for your comment. "Business practices" refers to any business practice of any stakeholder (e.g. North American Energy Standards Board business practices).		

Organization	Yes or No	Question 3 Comment
SERC OC Standards Review Group	No	Business practices should not be considered in a standard.
Response: The DSR SAR DT thanks you for your comment. Standard development projects must not invalidate business practices that are already in place. This question is required to be asked per the Standard Drafting Team Guidelines (page 8) and aids in coordination with North American Energy Standards Board.		
FirstEnergy	No	Although we are not aware of any NAESB business practices that need to be reviewed in conjunction with these proposed revisions, the SDT should consider reviewing current RTO procedures and practices that may require the need for variances in the revised standards.
Response: The DSR SAR DT thanks you for your comment. The Standard Drafting Team will review any procedures or practices that are identified for potential variances.		
Georgia System Operations Corp.	No	Business practices should not be part of a Reliability Standard. Neither should NERC/Region reporting requirements (except for reporting of threats to physical or cyber security). NERC may need to take some action in the case of threats but does not and cannot take any operational action for most of the reporting requirements that are presently in the Requirements section of the Reliability Standards.
Response: The DSR SAR DT thanks you for your comment. Standard development projects must not invalidate business practices that are already in place. This question is required to be asked per the Standard Drafting Team Guidelines (page 8) and aids in coordination with North American Energy Standards Board. The team disagrees with your assertion about reporting. Instances of sabotage are often not identified until after the fact, and these should be reported to alert other entities of the sabotage and for "lessons learned".

4. CIP-001-1 applies to the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and the Load-serving Entity. EOP-004-1 applies to the same entities, plus the Regional Reliability Organization. Do you agree with the applicability of the existing CIP-001-1 and the existing EOP-004-1? If no, please identify what you believe should be modified.

Summary Consideration: Many stakeholders had comments regarding applicability of the two standards. The three main concerns were:

1 Regional Reliability Organization applicability: Many commenters do not feel the RRO should be in the standards. The DSR SAR DT concurs and notes that the SAR states that "EOP-004 has some 'fill-in-the-blank' components to eliminate". This will remove the RRO from applicability.

2 Load-Serving Entity/Distribution Provider: Many stakeholders do not feel that the standards should be applicable to LSEs, but should apply to Distribution Providers. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process.

3 Transmission Owner/Generator Owner: Many stakeholders have indicated a need to include the TO as an applicable entity. A couple of those would also include the GO. The SAR DT discussed the addition of both the TO and GO. The team has a concern that there will be duplication of requirements between the TO/TOP and GO/GOP if the TO and GO are added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process.

Organization	Yes or No	Question 4 Comment
SERC OC Standards Review Group	No	The EOP-004-1 standard should not apply to the RRO.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. This will remove the RRO from applicability.		
Kansas City Power &	No	Do not agree Load Serving Entities need to continue to be included for sabotage. According the NERC Functional Model,

Organization	Yes or No	Question 4 Comment
Light		an LSE provides for estimating customer load and provides for the acquisition of transmission and energy to meet customer load demand. An LSE has no real impact on maintaining the reliability of electric network short of their planning function. Unfortunately, an LSE needs to be included for disturbance reporting to the DOE under certain conditions for loss of customer load. This may be a reason to maintain a separation of CIP-001 and EOP-004 so as not to unnecessarily include an LSE when it is not needed.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the standard drafting stage of the process. The team will pass your comment along to the Standard Drafting Team for its consideration.		
IRC Standards Review Committee	No	We agree with the applicability of CIP-001-1 but question the need to include the RRO in EOP-004-1. Requirement R1 of EOP-004-1 can be turned into an industry developed and approved procedural requirement with details included in an appendix; whereas R5 can be changed to a requirement for the responsible entities to act on recommendations and to self-report compliance. Tracking and reviewing status of recommendation do not need to be performed by the RRO, or any entity for that matter, if a self-reporting mechanism is developed.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. This will remove the RRO from applicability.		
Pepco Holdings, Inc. - Affiliates	No	As specified in Order 693, Regional Reliability Organizations are not to be assigned applicability. The revised standard(s) should contain the reporting form either directly or by reference and the RRO should be removed. The other EOP-004 requirements for RROs are now considered normal monitoring activities of the Regional Entities.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. This will remove the RRO from applicability.		
FirstEnergy	No	The Regional Reliability Organization should be removed from the applicability of EOP-004-1. Any report they receive would be from the other entities listed. For consistency, the entities should report to the appropriate law enforcement agency. A report to the Reliability Entity should also be made for that entities information only.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. This will remove the RRO from applicability.		
Electric Market Policy	No	Applicability should not apply to LSE unless they have physical assets. If they do not have such assets, they are unable to

Organization	Yes or No	Question 4 Comment
		determine how many customers are out, how much load was lost or the duration of an outage. We continue to question the need for the LSE entity in reliability standards. End use customer load is either connected to transmission or distribution facilities. So, the applicable planner has to plan for that load when designing its facilities or the load will not have reliable service. To the extent that energy and capacity for that load is supplied by an entity other than the TO or DP, the TO or DP should have interconnection requirements that compel the supplier to provide any and all data necessary to meet the requirements of reliability standards.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The team will pass your comment along to the Standard Drafting Team for its consideration.		
MRO NERC Standards Review Subcommittee	No	As FERC has directed, the RRO should be removed since they are not owners or operators of the BES.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some ‘fill-in-the-blank’ components to eliminate. **This will remove the RRO from applicability.**		
Lands Energy Consulting	No	CIP-001-1 - Yes. In many cases, the staff of an LSE embedded in another entity's BA/TOP area is more likely to discover an act of sabotage directed toward a BA/TOP-owned facility that could affect the BES than the asset owner. This is because the LSE likely has more operating staff in the area. I have included a requirement in my clients' Sabotage Identification and Reporting Procedures that the client treat acts of sabotage to a third party's system discovered by client employees as though the act was directed toward client facilities. EOP-004-1 - As mentioned before, I would eliminate the LSE from the applicability list and leave the responsibility for disturbance reporting and response to the TOP/BA. However, I would retain a responsibility for the LSEs to cooperate (when requested) with any disturbance investigation.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The team will pass your comment along to the Standard Drafting Team for its consideration.		
Calpine Corporation	No	The reporting requirements of EOP - 004 are needed for the RC, BA, LSE and the GOP that operates or controls generation in a system as defined by NERC. (System - A combination of generation, transmission, and distribution components). A disturbance is described as an unplanned event that produces and abnormal system condition, any

Organization	Yes or No	Question 4 Comment
		perturbation to the electric system, and the unexpected change in ACE that is caused by the sudden failure of generation or interruption of load. The GOP operating/controlling generation within a system has the ability to analyze system conditions to determine if reporting is necessary. A NERC registered GOP that is a merchant generator within another company's system does not have the ability for a wide area view and cannot analyze system conditions beyond the interconnection point of the facility. Moreover, in most cases the reporting requirements outlined in the Interconnection Reliability Operating Limits and Preliminary Disturbance Report do not apply to the merchant generator that is not a generation only BA. The applicability of the standard does encompass the true merchant generation entities required to register as GOP. Similarly, the OE-417 table 1 reporting requirements generally do not apply to a true merchant generating entity that is required to register as a GOP.
Response: The DSR SAR DT thanks you for your comment. The team agrees that generators may not have a wide area view and the capability to analyze events. The final wording of the requirements developed by the Standard Drafting Team will determine the applicability. The team will pass your comment on to the Standards Drafting Team for its consideration. The SAR calls for the removal of references to the DOE form OE-417.		
Cowlitz County PUD	No	Replace LSE with DP, and the Regional Reliability Organization with the Regional Entity.
Response: The DSR SAR DT thanks you for your comment. The team has added DP to the applicability of the SAR. The SAR calls for removing the fill-in-the-blank standard elements which will remove the RRO.		
United Illuminating	No	Add Distribution Provider
Response: The DSR SAR DT thanks you for your comment. The team has added DP to the applicability of the SAR.		
Reliant Energy	No	EOOP-004-1 should exclude the generator operator from disturbance reporting except providing the system operator or reliability coordinator with appropriate unit operation information upon request. Acts of sabotage should be identified clearly and reported to the indicated authorities.
Response: The DSR SAR DT thanks you for your comment. Other commenters have questioned the ability of Generator Operators to have a wide area view and to be able to analyze disturbances on the system. The team agrees that generators may not have a wide area view and the capability to analyze system events. The final wording of the requirements (i.e. reporting vs. data provision) developed by the Standard Drafting Team will determine the applicability to GOPs. The team will pass your comment on to the Standards Drafting Team for its consideration.		
Texas Regional Entity	No	Add GO and TO to the list of applicability. The intent of CIP-001-1 when it was first written was to have the proper and most likely entities associated directly with operations to be the ones to begin the reporting process in the case of sabotage on the system. In the ERCOT Region and other regions in the US, the GOP may not be physically located at the site. The GOP is often removed from the minute-by-minute responsibilities of plant operations and, therefore, may be less

Organization	Yes or No	Question 4 Comment
		able to react to physical sabotage at the location/plant/facility in a timely manner. The concern is that, in the case of an actual sabotage event, the failure to report to the appropriate authorities in a timely manner may jeopardize the reliability of the BPS. Therefore, the Generator Owner (GO) should be added to the list of applicability for CIP-001-1, because it is the GO that is more likely to be on location at the generation site and thus aware of sabotage when it first occurs. This would disallow for any possible communication gap and put responsibility on all of the appropriate entities to report such an event. Additionally, and for the same reasons as adding the GO, the Transmission Owner (TO) should also be added to the list of applicability for reporting sabotage on its facilities.
Response: The DSR SAR DT thanks you for your comment. The SAR DT discussed the addition of the TO and GO. The team was concerned that there may be duplication of requirements between the TO/TOP and GO/GOP if the TO and GO are added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the standard drafting Process. The team will pass your comment along to the Standard Drafting Team for its consideration concerning applicability.		
NextEra Energy Resources, LLC	No	The scope of the proposed SAR should not include the Generator Operator.
Response: The DSR SAR DT thanks you for your comment. Other commenters have questioned the ability of Generator Operators to have a wide area view and to be able to analyze disturbances on the system. The team agrees that generators may not have a wide area view and the capability to analyze system events. The final wording of the requirements (i.e. reporting vs. data provision) developed by the Standard Drafting Team will determine the applicability to GOPs. The team will pass your comment on to the Standards Drafting Team for its consideration.		
Exelon	No	CIP-001, remove LSE's from the standard for the reasons identified in the FERC LSE order. Ad TO and DP. EOP-004, remove LSE's from the standard for the reasons identified in the FERC LSE order. Remove RRO's, they are not a user, owner, operator of the BES. Add DP or TO. Consider conditional applicability as in the UFLS standards, " the TO or DP who performs the functions specified in the standard..."
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the SAR. The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The SAR DT discussed the addition of the TO. The team is concerned that there may be duplication of requirements between the TO/TOP if the TO is added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the standard drafting Process. The SAR calls for elimination of fill in the blanks elements, which will remove the RRO from the standard. The team will pass your comment along to the Standard Drafting Team for its consideration concerning conditional applicability.		

Organization	Yes or No	Question 4 Comment
ERCOT ISO	No	The Regional Reliability Organization is not a registered Functional Entity in the NERC registry. The applicability must be revised to more appropriately assign the requirements to registered functional entities. Also, the industry needs to recognize that there are other resources than generation for which the operators need to be included. Perhaps a demand-side resource should have a resource operator. This particular SAR may not be the appropriate venue for this, but control of resources which can be used to mitigate sabotage events or disturbance events may need to be addressed.
Response: The DSR SAR DT thanks you for your comment. The SAR calls for elimination of fill-in-the-blank elements, which will remove the RRO from the standard. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The team will pass your comment along to the Standard Drafting Team for its consideration concerning conditional applicability. This SAR is for reporting rather than control actions as you mention.		
Brazos Electric Power Cooperative, Inc.	No	May need to consider adding Transmission Owner. I don't see a need for the RRO to be included as they are not owner/operators of grid facilities.
Response: The DSR SAR DT thanks you for your comment. The SAR DT discussed the addition of the TO. The team is concerned that there may be duplication of requirements between the TO/TOP if the TO is added to the SAR. That being said, the TO has been added to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The SAR calls for elimination of fill in the blank elements, which will remove the RRO from the standard. The team will pass your comment along to the Standard Drafting Team for its consideration concerning conditional applicability.		
PacifiCorp	No	LSE's don't generally own/operate facilities/systems that would experience a logical or physical sabotage event.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the SAR. The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process.		
MidAmerican Energy	No	MidAmerican Energy believes the requirement for the Regional Reliability Organization should be removed from EOP-004-1 since the RRO is a holdover from making the standards enforceable. It is no longer appropriate for the regions to be named as responsible entities within the standards.
Response: The DSR SAR DT thanks you for your comment. The SAR calls for elimination of fill-in-the-blank elements, which will remove the RRO from the standard.		

Organization	Yes or No	Question 4 Comment
Georgia System Operations Corp.	No	EOP-004 should be retired. CIP-001 should not apply to LSEs other than those that are retail marketers.
Response: The DSR SAR DT thanks you for your comment. The SAR calls for EOP-004 to be revised. The Standard Drafting Team may, with stakeholder approval, retire it. CIP-001: NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the SAR. The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting process.		
AEP	No	We would recommend that the Load Serving Entity (LSE) be removed from both standards, and that the Generator Owner and Transmission Owner be added to the resulting standard.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the SAR. The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The SAR DT discussed the addition of the TO and GO. The team has a concern that there may be duplication of requirements between the TO/TOP and GO/GOP if the TO and GO are added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the standard drafting Process. The team will pass your comment along to the Standard Drafting Team for its consideration concerning applicability.		
Duke Energy	No	It’s unclear to us that the RRO should continue to be an applicable entity.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some ‘fill-in-the-blank’ components to eliminate. **This will remove the RRO from applicability.**		
Covanta	Yes	It would be a welcome enhancement to the end users to understand to communication link between all "appropriate parties" who shall be notified of potential or actual sabotage events.... which also needs to be defined.
Response: The DSR SAR DT thanks you for your comment. The team concurs, and will pass this comment on to the standard drafting team for its consideration.		
Edward C. Stein	Yes

5. If you have any other comments on the SAR or proposed modifications to CIP-001-1 and EOP-004-1 that you haven't provided in response to the previous questions, please provide them here.

Summary Consideration: Stakeholders provided many good comments that should be considered in the development of the standards under this project. The SAR DT does not believe that these require any revisions to the SAR and will forward these comments to the Standard Drafting Team for its consideration in developing the standard(s). These include:

1 Consolidation of reports: The SAR DT agrees with this concept and will forward the comment to the Standard Drafting Team for its consideration.

2 Concerns about pre-determination of combining CIP-001 and EOP-004 into one standard: The SAR states: CIP-001 *may* be merged with EOP-004 to eliminate redundancies. The two standards may be left separate.

3 Reporting criteria in multiple tables: The team agrees that it would be easier if there were only one table. Part of this SAR is to eliminate redundancies and make general improvements to the standard. The team also agrees that the requirements developed should be clear in their reliability objective.

Organization	Question 5 Comment
PSEG Enterprise Group Inc Companies	The PSEG Companies ask that the drafting team allow sufficient flexibility for sabotage recognition and reporting requirements such that nothing precludes utilizing a single corporate-wide program for both bulk electric system assets and other businesses. PSEG's Sabotage Recognition, Response and Reporting Program is directed to all business areas which are directed to follow the same internal protocol that also satisfies the NERC Standards requirements. For example, for gas assets, PSEG's gas distribution business follows the PSEG corporate-wide program for sabotage recognition and response. PSEG agrees that some modifications should be made to CIP-001 (ex. better define or give examples of sabotage) and EOP-004 to make them clearer? If they are merged, then Sabotage will not be in the title (or the primary focus) because several of the Disturbances that reporting is required for in EOP-004 have nothing to do with sabotage. EOP-004 has criteria listed in 4 places to determine when to send a report: o Criteria listed in EOP-004 Attachment 1 o Criteria listed in EOP-004 Attachment 2 o Criteria listed in top portion of Table 1-EOP-004 o Criteria listed in bottom potion of Table 1-EOP-004 Therefore, it would be much easier if there was one table of criteria for reference that addressed all of the reportable conditions and all of the applicable reports. If the 2 standards are merged as suggested in the SAR, any differences in the reporting obligation for actual or attempted sabotage and reporting of disturbances must be clear.

Organization	Question 5 Comment
Response: The DSR SAR DT thanks you for your comment. The team agrees that it would be easier if there were only one table. Part of this project is to eliminate redundancies and make general improvements to the standard. The team also agrees that the requirements developed should be clear in their reliability objective. The team will forward your comment to the standard drafting team for its consideration in the drafting of the standard.	
Kansas City Power & Light	If it is desirable to keep CIP-001 and EOP-004 separate, it is recommended the SDT consider adding a reference in CIP-001 to the DOE reporting form either by name or by internet link in the standard.
Response: The DSR SAR DT thanks you for your comment. The SAR SDT recommends eliminating all references to the DOE report, so there won't be a reference to it in CIP-001.	
IRC Standards Review Committee	We suggest that the revision not be conducted with a preconceived notion that the two standards must be combined since there are some differences between sabotage and emergency system conditions, and in the communication and reporting processes and channels. We suggest the SDT start off with a neutral position to focus on improving the standards, then assess the pros and cons of merging the two based on technical merit only.
Response: The DSR SAR DT thanks you for your comment. The SAR states: CIP-001 may be merged with EOP-004 to eliminate redundancies. The two standards may be left separate.	
Pepco Holdings, Inc. - Affiliates	Consider CIP-008-2 as potentially having overlaps with the proposed standard
Response: The DSR SAR DT thanks you for your comment. The SAR states "Specific references to the DOE form need to be eliminated." This will remove the linkage that you identify between CIP-001 and CIP-008. There is also a directive from FERC Order 693 in the SAR that states: **Consider FirstEnergy's suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality.** **This allows the standard drafting team to delineate physical and cyber assets. The DSR SAR DT also notes that CIP-008 might be a good framework for drafting the standard requirements pertaining to sabotage and disturbance reporting of physical assets.**	
FirstEnergy	1. Under Industry Need it states: "The existing requirements need to be revised to be more specific and there needs to be more clarity in what sabotage looks like." The use of the phrase "more specific" should be qualified by adding "while not being too prescriptive". As with other reliability standards, we do not want a standard that causes unwarranted and unnecessary additional work and costs to an entity to comply. 2. As pointed out by the NERC Audit and Observation Team in the "Issues to be considered" for CIP-001, clarification is needed regarding contacting the FBI. Prior audits dwelled heavily on FBI notification. For example, our policy states that Corporate Security notifies the FBI. In recent events it appears that local law enforcement handles day to day activities. The notification process for

<table>
<tr><th>Organization</th><th>Question 5 Comment</th></tr>
<tr><td></td><td>contacting the FBI needs clarification along with specific instances in which to call them. Who should make the call to the FBI? It appears that a protocol needs to be developed to clarify what events require notifying the FBI. It could be as simple as after an incident a standard form is completed and forwarded to the FBI, letting them decide if follow up is needed.

3. We suggest aligning all reporting requirements for consistency. The items requiring reporting and the timelines to report are very inconsistent between NERC and the DOE. NERC's timelines are also not consistent with their own Security Guideline for the Electricity Sector: Threat and Incident Reporting.</td></tr>
<tr><td colspan="2">Response: The DSR SAR DT thanks you for your comment.

The team concurs that the standards should provide the “what” without the “how”. The standard drafting team will develop the standards using the NERC Standard Development Process that includes stakeholder consensus. The team does not feel it is necessary to add the “not too prescriptive” qualifier to the SAR.

The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).

The team concurs with your comment and notes that other commenters have suggested “one stop shopping” reporting for disturbances and sabotage. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).</td></tr>
<tr><td>Electric Market Policy</td><td>CIP-008-1 Incident Reporting and Response Planning include some requirements that require coordination with the requirements addressed in this project.</td></tr>
<tr><td colspan="2">Response: The DSR SAR DT thanks you for your comment. The SAR states “Specific references to the DOE form need to be eliminated.” This will remove the linkage that you identify between CIP-001 and CIP-008. There is also a directive from FERC Order 693 in the SAR that states:

Consider FirstEnergy’s suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality.

This allows the standard drafting team to delineate physical and cyber assets. The DSR SAR DT also notes that CIP-008 might be a good framework for drafting the standard requirements pertaining to sabotage and disturbance reporting of physical assets.</td></tr>
<tr><td>MRO NERC Standards Review Subcommittee</td><td>A. The SAR states that there may be impact on a related standard, COM-003-1 (page SAR-5). Is the SDT referring to Project 2007-02, Operating Personnel Communication Protocols? If so, this is a SAR too and should not be used as a reference.

B. CIP-001-1 and EOP-004-1 should be combined into one EOP Standard.

C. Within EOP-004-1 there is industry confusion on what form to submit in the event of an event. There should only be one form for the new combination Standard eliminating the need for reporting form attachments. It should be the DOE Form, OE-417. Although it is beyond the scope of this SAR, it would greatly benefit industry if there was a central location on the NERC website containing ALL reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable the System Operators to efficiently locate the most current version of the appropriate form in order to report events.</td></tr>
</table>

Organization	Question 5 Comment
	D. The word Disturbance is primarily used in other Standards as in, Disturbance Control Standard or system separation due to a disturbance. Should the NERC definition be updated? Should the word “Sabotage” be defined by NERC? Additionally, we recommend that one definition of “Sabotage” be utilized industry-wide, instead of varying definitions by multiple groups like the DOE, ESIAC, etc.
Response: The DSR SAR DT thanks you for your comment. **A. It does reference project 2007-02, and it has been noted in the SAR.** **B. Will forward this comment to the standard drafting team for its consideration in developing the standard(s).** **C. The team concurs with your comment and notes that other commenters have suggested “one stop shopping” reporting for disturbances and sabotage. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).** **D. References to DOE are to be removed from the standards per the SAR. FERC Order 693 directives include definition of sabotage for CIP-001.**	
Lands Energy Consulting	One final comment on CIP-001-1. My clients received universally rude treatment from the FBI field offices when they attempted to establish the contacts required by the Standard. If the FBI doesn't see value in establishing these contacts, remove the requirement from the Standard. Making sure the LSE knows the FBI field office phone number is probably all the Standard should require.
Response: The DSR SAR DT thanks you for your comment. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).	
Colmac Clarion	Need single report for Sabotage so whatever is required results in notification of all parties (State Emergency Management, Homeland Security, FBI, Grid Reliability Chain of Command). Any and all of these can 'expand' knowledge later but all seem to require 'instant' notification.
Response: The DSR SAR DT thanks you for your comment. The team concur with your comment and notes that other commenters have suggested “one stop shopping” reporting for disturbances and sabotage. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).	
Cowlitz County PUD	Local Law enforcement agencies often are not friendly to Federal involvement with smaller problems they consider their "turf." Need to make sure the small stuff stays with them, however have a system of internal reporting that will catch coordinated sabotage efforts (multiple attacks on DPs and small BAs) at the RC or RE level who then can report to the Federal agencies. Currently EOP-004-1 requires small entities to report a "disturbance" if half of their firm customer load is lost. For some entities, this can be one small substation going down due to a bird. The "50% of total demand" requirement should be removed or improved to better define a true BPS disturbance.

Organization	Question 5 Comment
Response: The DSR SAR DT thanks you for your comment. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).	
Exelon	Exelon agrees this is a worthwhile project and that reliability will be enhanced and the compliance process will be simplified by clarifying terminology and reporting requirements in these standards. If nothing else, defining "Sabotage" so as to end interpretations of this term and the related requirements is necessary.
Response: The DSR SAR DT thanks you for your comment.	
ERCOT ISO	Due to the fact that both the CIP-001-1 and EOP-004-1 have similar reporting standards, initially combining the two sounds like a correct analysis. However, after further consideration and due to the critical nature of its intended function involving Security aspects, the CIP-001 should be intensely evaluated to determine if its intended purpose meets the threshold or criteria to stand alone. The existing standards for CIP-001-1 Sabotage Reporting may help prevent future mitigation actions caused by sabotage events. EOP-004-1 Disturbance Reporting is administrative in nature, thus the jeopardy of the Bulk Electric System reliability is impacted only if analysis is not performed or if corrective follow-up actions are not implemented. Combining EOP-004 Standard requirements under the umbrella of the CIP -001 Standard would create a high profile Disturbance Reporting Standard. The industry would be better served if information defining sabotage was provided as well as a technical reference document on recognizing sabotage that would also clarify or state any personnel training requirements. All aspects of the intended functions must be reviewed before merging the two standards. At a minimum, we must consider modification that provides improved understanding of the reporting standards and implications as they are currently written.
Response: The DSR SAR DT thanks you for your comment. The SAR states: CIP-001 *may* be merged with EOP-004 to eliminate redundancies. The two standards may be left separate. One of the FERC Order 693 directives for CIP-001 states: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.** **The Standard Drafting Team will follow the NERC Standard Development Process in making revisions under this SAR, including a thorough review of the requirements of both standards. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).**	
MidAmerican Energy	Conflicting time frames exist from document updates. Reporting should be consolidated to one form and / or site to minimize conflicts, confusion, and errors. 1) Reporting requirements for the outage of 50,000 or more customers in EOP-004-1 requires a report to be made within one hour while the form OE-417 requires a report be made within six hours of the outage. The six hour reference on the updated OE-417 form is the correct reference. 2) Reporting for either CIP-001 or EOP-004 should center on the DOE Form OE-417. This would eliminate confusion and simplify reporting for system operators thereby directly enhancing reliability during system events. This would also eliminate much of the duplicate material and attachments in EOP-004. 3) Although it is beyond the scope of this SAR, the industry would benefit if there was a central location or link on the NERC website containing all

Organization	Question 5 Comment
	reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable System Operators to more efficiently locate and report events.
Response: The DSR SAR DT thanks you for your comment. The team notes that other commenters have suggested "one stop shopping" reporting for disturbances and sabotage. The team concurs that timeframes for similar reports should be the same. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).	
Georgia System Operations Corp.	Entity reporting to NERC/Regions is needed by NERC and the Regions to accomplish their missions of overseeing the reliability of the BES and enforcing compliance with Reliability Standards. An entity not reporting as quickly as possible does not harm the integrity of the Interconnection. In fact, it increases the risk to the BES to be investigating details and filling out forms during a time when attention should be on correcting or mitigating an incident.
Response: The DSR SAR DT thanks you for your comment. The team agrees that non-reporting, in the administrative sense, may not harm the integrity of the Interconnection. The team suggests that the appropriate avenue for addressing this concern is through the development of Violation Risk Factors and Violation Severity Levels for each requirement. These compliance elements will be developed during the standard drafting stage of the development process.	
Illinois Municipal Electric Agency	IMEA recommends the following considerations: Simplification of reportable events and the reporting process should be the overriding objective. NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting (Version 2.0) should be updated to support this standards development initiative. At some point in the process, it may help if examples are given of events actually reported that did not need to be reported.
Response: The DSR SAR DT thanks you for your comment. The team notes that other commenters have suggested "one stop shopping" reporting for disturbances and sabotage. The team agrees that NERC's Security Guide should be in sync with the standards. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s). One of the FERC Order 693 directives for CIP-001 states: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.** **Events that were reported, but didn't need to be, may be identified in "lessons learned".**

Unofficial Nomination Form for SAR Drafting Team for Disturbance and Sabotage Reporting (Project 2009-01)

Please use the electronic nomination form located at the link below. If you have any questions, please contact David Taylor at david.taylor@nerc.net or by telephone at 609-651-5089.

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

By submitting the following information you are indicating your commitment to actively participate in SAR Drafting Team meetings if appointed to the SAR Drafting Team by the Standards Committee.

Name: Organization: Address: Telephone: E-mail:
Project 2009-01 Disturbance and Sabotage Reporting will entail revising existing standards CIP-001 — Sabotage Reporting and EOP-004 — Disturbance Reporting to eliminate redundancies and provide clarity on sabotage events. The project includes addressing several issues identified by stakeholders, FERC directives from Order 693, and may include improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. Please briefly describe (no more than a couple of paragraphs) your experience and qualifications directly related to the issues to be addressed by the Disturbance and Sabotage Reporting SAR Drafting Team. We are seeking a cross section of the industry to participate on the team, but in particular are seeking individuals with experience in management of real-time bulk power operations activities. Please include any previous experience related to developing or applying IEEE or other industry related standards as this type of experience might be beneficial to include on the team, but is not a requisite to be appointed to the team.

Are you currently a member of any NERC or Regional Entity SAR or standard drafting team? If yes, please list each team here.	☐ No ☐ Yes:
Have you previously worked on any NERC or Regional Entity SAR or standard drafting teams? If yes, please list them here.	☐ No ☐ Yes:

Please identify the NERC Region(s) for which you are able to represent your company's position relative to the topics addressed in the SAR:	Please identify the Industry Segment(s) for which you are able to represent your company's position relative to the topics addressed in the SAR:	
☐ ERCOT	☐	1 — Transmission Owners
☐ FRCC	☐	2 — RTOs and ISOs
☐ MRO	☐	3 — Load-serving Entities
☐ NPCC	☐	4 — Transmission-dependent Utilities
☐ RFC	☐	5 — Electric Generators
☐ SERC	☐	6 — Electricity Brokers, Aggregators, and Marketers
☐ SPP	☐	7 — Large Electricity End Users

Standards Announcement

Nomination Period Opens for Standard Authorization Request (SAR) Drafting Team
April 29–May 13, 2009

Now available at: http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Nominations for SAR Drafting Team (Project 2009-01 — Disturbance and Sabotage Reporting)

The Standards Committee is seeking industry experts to serve on the Disturbance and Sabotage Reporting SAR Drafting Team (see project background below). The SAR drafting team will assist the requester in further developing the SAR and considering stakeholder comments.

If you are interested in serving on this standard drafting team, please complete the following electronic nomination form **by May 13, 2009**:
https://www.nerc.net/nercsurvey/Survey.aspx?s=bf869d5cbde94f9788c7606a2f50829f

Please contact Dave Taylor at david.taylor@nerc.net or at 609-651-5089 with any questions about the team.

Project Background:

Project 2009-01 — Disturbance and Sabotage Reporting will entail revising existing standards CIP-001-1 — Sabotage Reporting and EOP-004-1 — Disturbance Reporting to eliminate redundancies and provide clarity on sabotage events. The project includes addressing several issues identified by stakeholders, FERC directives from Order 693, and may include improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

More information about the project is available on the following page:
http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Standards Development Process

The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance,
please contact Shaun Streeter at shaun.streeter@nerc.net or at 609.452.8060.

Standard Authorization Request Form

Title of Proposed Standard: Disturbance and Sabotage reporting (Project 2009-01)	
Request Date: April 2, 2009	
Approved by SC for posting: April 15, 2009	
Revision Date: August 13, 2009	

SAR Requester Information	**SAR Type** (*Check a box for each one that applies.*)	
Name: Patrick Brown	☐	New Standard
Primary Contact: Patrick Brown Manager, NERC and Regional Coordination PJM Interconnection	☒	Revision to existing Standard
Telephone: 610-666-4597	☒	Withdrawal of existing Standard
E-mail: brownp@pjm.com	☐	Urgent Action

Purpose **(Describe the proposed standard action: Nomination of a proposed standard, revision to a standard, or withdrawal of a standard and describe what the standard action will achieve.)**

This project will entail revision to existing standards CIP-001-1 – Sabotage Reporting and EOP-

004-1 – Disturbance Reporting. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Industry Need (Provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

The existing requirements need to be revised to be more specific – and there needs to be more clarity in what sabotage looks like.

Brief Description (Provide a paragraph that describes the scope of this standard action.)

CIP-001 may be merged with EOP-004 to eliminate redundancies. Acts of sabotage have to be reported to the DOE as part of EOP-004. Specific references to the DOE form need to be eliminated.

EOP-004 has some 'fill-in-the-blank' components to eliminate.

The development may include other improvements to the standards deemed appropriate by

the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards (see tables for each standard at the end of this SAR for more detailed information).
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR.) See "Issues to be Considered by Drafting Team" tables for each standard at the end of this SAR for more detailed information.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☒	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Related Standards

Standard No.	Explanation
COM-003-1	Operations Communications Protocols – this standard may include some requirements that require coordination with the requirements addressed in this project. (still in standard development stage)
IRO-014-1	R1.1.1, footnote 1 lists sabotage. The standard drafting team should consider this reference and the impact of their work on this specific item.
TOP-005-1.1	Attachment 1, item 2.9 is “Multi-site sabotage”. The standard drafting team should consider this reference and the impact of their work on this specific item.

Issues to be Considered by Drafting Team Project 2009-01 — Disturbance and Sabotage Reporting	
Standard #	**Title**
CIP-001-0	Sabotage Reporting
Issues	FERC Order 693 Disposition: Approved with modifications • Consider the need for wider application of the standard. Consider whether separate, less burdensome requirements for smaller entities may be appropriate. • Define “sabotage” and provide guidance on triggering events that would cause an entity to report an event. • In the interim, provide advice to entities about the reporting of particular circumstances as they arise. • Consider FirstEnergy’s suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality. • Incorporate a periodic review or updating of the sabotage reporting procedures and for their periodic testing. Consider a staggered schedule of annual testing and formal review every two to three years. • Include a requirement to report a sabotage event to the proper government authorities. Develop the language to specifically implement this directive. • Explore ways to reduce redundant reporting, including central coordination of sabotage reports and a uniform reporting format. V0 Industry Comments • Object to multi-site requirement • Definition of sabotage required VRF comments • Adequate procedures will insure it is unlikely to lead to bulk electric system instability, separation, or cascading failures. Other • Modify standard to conform to the latest version of NERC’s Reliability Standards Development Procedure, the NERC Standard Drafting Team Guidelines, and the ERO Rules of Procedure. NERC Audit and Observation Team • Applicability — How does this standard pertain to Load Serving Entities, LSE's. • Registered Entities have sabotage reporting processes and procedures in place but not all personnel has been trained. • Question: How do you “and make the operator aware” • R4 — "What is meant by: “establish contact with the FBI”. Is a phone number adequate? Many entities which call the FBI are referred back to the local authority. The AOT noted that on the FBI website it states

	to contact the local authorities. Is this a question for Homeland Security to deal with for us?"
	• R4 — Establish communications contacts, as applicable with local FBI and RAMP officials. Some entities are very remote and the sheriff is the only local authority does the FBI still need to be contacted?
	FERC's December 20, 2007 and April 4, 2008 Orders in Docket Nos. RC07-004-000, RC07-6-000, and RC07-7-000
	• In FERC's December 20, 2007 Order, the Commission reversed NERC's Compliance Registry decisions with respect to three load serving entities in the ReliabilityFirst (RFC) footprint. The distinguishing feature of these three LSEs is that none owned physical assets. Both NERC and RFC assert that there will be a "reliability gap" if retail marketers are not registered as LSEs. To avoid a possible gap, a consistent, uniform approach to ensure that appropriate Reliability Standards and associated requirements are applied to retail marketers must be applied. Each drafting team responsible for reliability standards applicable to LSEs is to review and change as necessary, requirements in the applicable reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. For additional information see:
	  • FERC's December 20, 2007 Order (http://www.nerc.com/files/LSE_decision_order.pdf)
	  • NERC's March 4, 2008 (http://www.nerc.com/files/FinalFiledLSE3408.pdf),
	  • FERC's April 4, 2008 Order (http://www.nerc.com/files/AcceptLSECompFiling-040408.pdf) and
	  • NERC's July 31, 2008 (http://www.nerc.com/files/FinalFiled-CompFiling-LSE-07312008.pdf) compliance filings to FERC on this subject.

Issues to be Considered by Drafting Team Project 2009-01 — Disturbance and Sabotage Reporting	
Standard #	**Title**
EOP-004-1	Disturbance Reporting
Issues	FERC Order 693 Disposition: Approved with modification • Include any requirements for users, owners, and operators of the bulk power system to provide data that will assist NERC in the investigation of a blackout or disturbance. • Change NERC's Rules of Procedure to assure the Commission receives these reports in the same frame as the DOE. • Consider APPA's concern about generator operators and LSEs analyzing performance of their equipment and provide data and information on the equipment to assist others with analysis. • Consider all comments offered in a future modification of the reliability standard.

	Fill-in-the-Blank Team Comments
	• Consider changes to R1 and R3.4 to standardize the disturbance reporting requirements (requirements for disturbance reporting need to be added to this standard)
	• Regions currently have procedures, but not in the form of a standard. The drafting team will need to review regional requirements to determine reporting requirements for the North American standard.
	V0 Industry Comments
	• R3 – too many reports, narrow requirement to RC
	• How does this apply to generator operator?
	Other
	• Modify standard to conform to the latest version of NERC's Reliability Standards Development Procedure, the NERC Standard Drafting Team Guidelines, and the ERO Rules of Procedure.
	NERC Audit and Observation Team
	• R3.1 — Can there be a violation without an event?
	Event Analysis Team
	• Reliability Issue: Coordination and follow up on lessons learned from event analyses Consider adding to EOP-004 – Disturbance Reporting. Proposed requirement: Regional Entities (REs) shall work together with Reliability Coordinators, Transmission Owners, and Generation Owners to develop an Event Analysis Process to prevent similar events from happening and follow up with the recommendations. This process shall be defined within the appropriate NERC Standard.
	FERC's December 20, 2007 and April 4, 2008 Orders in Docket Nos. RC07-004-000, RC07-6-000, and RC07-7-000
	• In FERC's December 20, 2007 Order, the Commission reversed NERC's Compliance Registry decisions with respect to three load serving entities in the ReliabilityFirst (RFC) footprint. The distinguishing feature of these three LSEs is that none owned physical assets. Both NERC and RFC assert that there will be a "reliability gap" if retail marketers are not registered as LSEs. To avoid a possible gap, a consistent, uniform approach to ensure that appropriate Reliability Standards and associated requirements are applied to retail marketers must be applied. Each drafting team responsible for reliability standards applicable to LSEs is to review and change as necessary, requirements in the applicable reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. 	  ◦ FERC's April 4, 2008 Order (http://www.nerc.com/files/AcceptLSECompFiling-040408.pdf) and
	  ◦ NERC's July 31, 2008 (http://www.nerc.com/files/FinalFiled-CompFiling-LSE-07312008.pdf) compliance filings to FERC on this subject.

Comments received on Project 2009-01 — Disturbance and Sabotage Reporting

The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) received many suggestions for improvements to the standards during the SAR comment period. These comments do not indicate any revisions to the SAR, but the DSRSDT thought that these comments merited further consideration during the standard drafting phase of the project. The comments below are being compiled for use by the Standard Development Team.

Organization	Comment
Electric Market Policy	Comments: Agree with the statement that sabotage is hard to determine in real time by operations staffs. The determination of sabotage should be left up to law enforcement. They have the knowledge and peer contacts needed to adequately determine whether physical or cyber intrusions are merely malicious acts or coordinated efforts (sabotage). The operators should only be required to report physical and cyber intrusions to law enforcement. All other reporting requirements should apply to law enforcement once a determination of sabotage has been made. If the recommendations above are not to be accepted, then we have the following comments: CIP-001-1 1) R1 states entities shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SAR notes that the industry objects to the multi-site requirement, most likely because the term is ambiguous. If this term remains in the standard, it needs to be clearly defined and responsibilities for obtaining (how do you get this information and from whom?) and distributing need to be included. 2) R1 audits have shown confusion over the requirement to make operating personnel aware of sabotage events. The term operating personnel needs to be defined. Are they the individuals responsible for operating the facility, coordinating with other entities (i.e., RC, BA, TOP, GOP, and LSE)? It has been suggested that notification is required to all personnel at a facility. Keep in mind the purpose of the standard is to ensure sabotage events are properly reported, not to address emergency response. 3) R1 The SAR (NERC Audit and Observation Team) notes that Registered Entities have processes and procedures in place, but not all personnel have been trained. There is no specific training requirement in the standard. 4) R2 & R3 I agree with the SAR that sabotage needs to be defined and these requirements should be more specific with respect to the information to be communicated. It seems to me that the standard should mirror the criteria contained in DOE OE-417. The emphasis should be placed on ensuring that the same information communicated to DOE is shared with the appropriate parties in the Interconnection. 5) R4 I agree with the SAR (NERC Audit and Observation Team) comments regarding the intention of this requirement. There is no language that directs contact with FBI or RCMP although that is what is implied by the Purpose statement.

Organization	Comment
	6) VRF Comments I'm not sure what is intended by the statement Adequate procedures will insure it is unlikely to lead to bulk electric system instability, separation, or cascading failures? The purpose of the standard is that of communication. No operational decisions or actions are directed by this standard, nor does it require entities to address operational aspects resulting from sabotage. 7) The potential exists for overlapping sabotage reporting requirements at nuclear power plants due to multiple regulators (Nuclear Regulatory Commission (NRC) 10 CFR 73 and Federal Energy Regulatory Commission (FERC) NUC-001-1). Some entities may have revised existing NRC driven procedures to accommodate reporting requirements of both regulators. Because of the restrictions placed on NRC driven documents (i.e., procedures are classified as safeguards information), it can be difficult to demonstrate compliance to NERC and/or FERC without ensuring that the individuals are qualified for receipt of such information per 10 CFR 73. Additionally, multiple procedures may have the unintended consequence of delaying appropriate communication.EOP-004-1Consider removing Attachment 2 as the information is duplicated in DOE Form OE-417. A simple reference to the form should suffice.
Lands Energy Consulting	I have worked with 5 Northwest public utilities on developing procedures related to CIP-001-1 and EOP-004-1. All 5 utilities operate electric systems in fairly remote locations and are embedded in a larger utility's Balancing Authority/Transmission Operator area. A. CIP-001-1 - Developing procedures to unambiguously identify acts of sabotage has been particularly challenging for these systems. In general, it's hard for them to determine whether the most prevalent forms of malicious and intentional system damage that they incur - copper theft and gun shot insulators/equipment - should qualify as acts of sabotage. Although none of the systems consider copper theft to be acts of sabotage, two of the systems consider gun shot insulators/equipment to be acts of sabotage. The other systems look for intent to disrupt electric system operations as a key component of their sabotage identification procedures. Additional guidance from NERC in the form of CIP-001-1 modifications or a companion guidelines document on sabotage identification would provide much needed guidance for these procedures. B. EOP-004-1 - This standard was clearly drafted with the larger electric systems in mind. I have one client that serves 3300 commercial/residential customers from 4-115/13 kV substation transformers and one large industrial customer (80% of its energy load) from a 230/13 kV substation. 75% of the client's load is served from three substations attached to a long, 115 kV transmission line operated by the Bonneville Power Administration. Whenever the line relays open on a permanent fault (which happens 2-3 times per year), the client loses over 50% of its customers (but no more than 10-15 MW during winter peak), thereby necessitating the preparation of a Disturbance Report. To allow utilities to concentrate on operating their systems, without fear of violating EOP-004-1 for failure to report trivial outages, I would remove LSEs from the obligation to report disturbances - leave the reporting to the BA/TOP for large outages in their footprint.
Calpine Corporation	Communication of facility status or emergencies between merchant generators registered as GOP and the RC, BA,

Organization	Comment
	GOP, or LSE in which the facility resides should be coordinated for EOP -004 reporting. The reporting to NERC/DOE should come from the RC, BA, GOP, or LSE.
Covanta	Yes - the key to Sabotage reporting requirements is identifying what the 'definition' is of an actual or potential 'Sabotage' event. Like any other standard, if FERC/NERC leave it up to 2000+ entities to establish their own definitions of 'Sabotage', you may likely get 2000+ answers. That is not a controlled and coordinated approach. I offer the following definition, "Sabotage - Deliberate or malicious destruction of property, obstruction of normal operations, or injury to personnel by outside agents." Examples of sabotage events could include, but are not limited to, suspicious packages left near site electrical generating or electrical transmission assets, identified destruction of generating assets, telephone/e mail received threats to destroy or interrupt electrical generating efforts, etc." These have passed multiple NERC regional audits and reviews to date.
Northeast Power Coordinating Council	The SAR needs to be more specific in defining its objectives. CIP-001Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms “operating personnel” and “sabotage events.” The definition of “operating personnel,” should be clarified and limited to staff at BES facilities. Operating personnel should report only those events which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term “sabotage event” needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be aware of such “sabotage events,” e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term “aware” in the standard. “Aware” can be interpreted in accordance with its largely passive, dictionary-based meaning, where being “aware” simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of “aware” could refer to more active wording, involving more than mere awareness, e.g., “alert and quick to respond,” pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies.

Organization	Comment
	EOP-004 - The SDT needs to work on the following areas. 1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction “The entity on whose system a reportable disturbance occurs shall notify NERC ... 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance - The sense of Attachment 1 is internally inconsistent between the introduction (“occurs”) and the required actions in 6c (could have resulted in a system disturbance). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase “or could have resulted in” a potential system disturbance. This inconsistency should be clarified.
FirstEnergy	We agree with the scope but would also like to see the following considered: 1. References to the DOE reporting process in EOP-004 need to be revised. They currently refer to the old EIA form. 2. Besides "sabotage", it may be helpful to clearly define "vandalism". It is vaguely written in the standards. Also, the process of "public appeals" for the DOE reportable requirements needs to be more clearly defined. 3. Consolidate documents covering reporting requirements. There are currently several documents that require reporting (EOP-004, CIP-001, DOE oe-417, and NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting). NERC also has the "Bulk Power System Disturbance Classification Scale" that does not completely align with all the reporting requirements. Therefore we recommend keeping this as simple as possible by combining all the reporting requirements into one standard. It would be beneficial to not require operators to have to go to 4 different documents to determine what to report on.
MRO NERC Standards Review Subcommittee	The MRO NSRS would like to keep the references to the DOE reporting form.
Cowlitz County PUD	Added to the scope: For EOP-004 add a provision for a reporting flow rather than everything going to the RE and NERC. That is something going like the DP and TOP reports to the BA, the BA to the RE, and the RE to NERC. This would allow for multiple related reports to be combined into a single coherent report as the reporting goes up the chain. For CIP-001 consider reporting flow as above with local law enforcement notification. Let an upper entity in the reporting chain decide when to contact Federal Agencies such as the BA or the RC.
Reliant Energy	I think Generator operators should be excluded except to provide requested information from the System Operator or

Organization	Comment
	Reliability coordinator.
ERCOT ISO	The scope should be modified to provide for a different treatment of reporting requirements that are administrative in nature, or that are after-the-fact (thus cannot impact reliability unless analysis and follow-up is not performed; even then, the impact would be at some future time). Reporting requirements which are of the nature to assist in identification of system concerns or which serve to prevent or mitigate on-going system problems (including, but not limited to, actual or attempted sabotage activity) should remain in standards, but should be separate and apart from the administrative reporting.
Consolidated Edison Co. of New York, Inc.	GENERAL CECONY and ORU support the general objectives of the SAR to merge existing standards CIP-001-1 Sabotage Reporting and EOP-004-1 Disturbance Reporting to improve clarity and remove redundancy. However, the SAR needs to be more specific in defining its objectives. CIP-001Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms operating personnel and sabotage events. The definition of operating personnel, should be clarified and limited to staff at BES facilities. Operating personnel should report only those events which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term sabotage event needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be aware of such sabotage events, e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term aware in the standard. Aware can be interpreted in accordance with its largely passive, dictionary-based meaning, where being aware simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of aware could refer to more active wording, involving more than mere awareness, e.g., alert and quick to respond, pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies. EOP-004 - The SDT needs to work on the following areas.

Organization	Comment
	1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction The entity on whose system a reportable disturbance occurs shall notify NERC ... 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: ?c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance. The sense of Attachment 1 is internally inconsistent between the introduction (occurs) and the required actions in 6c (could have resulted in a system disturbance). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase or could have resulted in a potential system disturbance. This inconsistency should be clarified.
Georgia System Operations Corp.	The scope of the SAR should be to move all requirements to report to NERC or Regional Entities out of the Requirements section of all Reliability Standards to elsewhere. This does not include reporting, communicating, or coordinating between reliability entities. The NERC/Region reporting requirements could be consolidated in another document and referenced in the Supporting References section of the Reliability Standards. The deadlines for reporting should be changed to realistic timeframes that do not interfere with operating the BES or responding to incidents yet still allow NERC and the Regions to accomplish their missions.
AEP	Sabotage is a term of intent that is often determined after the fact by the registered entity and/or law enforcement officials. In fact, it is often difficult to determine in real-time the intent of a suspicious event. We would suggest that suspicious events become reportable at the point that the event is determined to have had sabotage intent. The entities should have a methodology to collect evidence, to have the evidence analyzed, and to report those events that are determined to have had the intent of sabotage.
Duke Energy	While we agree with the need for clarity in sabotage and disturbance reporting, we believe that the Standards Drafting Team should carefully consider whether there is a reliability-related need for each requirement. Some disturbance reporting requirements are triggered not just to assist in real-time reliability but also to identify lessons-learned opportunities. If disturbance and sabotage reporting continue to be reliability standards, we believe that all linkages to lessons-learned/improvements need to be stripped out. We have other forums to identify lessons-learned opportunities and to follow-up on those opportunities. Also, requirements to report possible non-compliances should be eliminated. We strongly support voluntary self-reporting, but not mandatory self-reporting.
NextEra Energy Resources, LLC	The scope of the SAR should not include Generator Operators.

Organization	Comment
Luminant Power	The SAR drafting team should include in the SAR scope a review of the NRC sabotage and event reporting requirements to ensure there are no overlapping or conflicting requirements between NERC, FERC, and the NRC. The SAR scope should include a review of the CIP Cyber Security Standards and coordination with the CIP SDT to ensure that cyber sabotage reporting definitions are in concert, and ensure that cyber sabotage reporting requirements are not duplicated in multiple standards.
Illinois Municipal Electric Agency	A one-stop reporting tool/site would facilitate efficient reporting and compliance; e.g., further development of the ES-ISAC/CIPIS to include all reportable categories and automatic notification of required parties. A single report form would be best.
AEP	The current reporting process necessitates multiple reports be sent to multiple parties, which is inefficient and may, inadvertently, result in alignment issues between the separate reports. We would recommend that a single report that combines NERC (CIPIS) and NERC ESISAC information be provided to NERC (CIPIS) that is systematically (programmatically) forwarded to all necessary entities. Further, updates to incidents would also go through NERC with the same electronic processing. Currently, we are not aware of a formal method to report incidents to the FBI, which should be also included in the distribution. The current reporting mechanism to the FBI JTTF is by telephone and the NERC platform described would provide more consistent reporting.
Kansas City Power & Light	Do not agree Load Serving Entities need to continue to be included for sabotage. According the NERC Functional Model, an LSE provides for estimating customer load and provides for the acquisition of transmission and energy to meet customer load demand. An LSE has no real impact on maintaining the reliability of electric network short of their planning function. Unfortunately, an LSE needs to be included for disturbance reporting to the DOE under certain conditions for loss of customer load. This may be a reason to maintain a separation of CIP-001 and EOP-004 so as not to unnecessarily include an LSE when it is not needed.
Electric Market Policy	Applicability should not apply to LSE unless they have physical assets. If they do not have such assets, they are unable to determine how many customers are out, how much load was lost or the duration of an outage. We continue to question the need for the LSE entity in reliability standards. End use customer load is either connected to transmission or distribution facilities. So, the applicable planner has to plan for that load when designing its facilities or the load will not have reliable service. To the extent that energy and capacity for that load is supplied by an entity other than the TO or DP, the TO or DP should have interconnection requirements that compel the supplier to provide any and all data necessary to meet the requirements of reliability standards.
Lands Energy Consulting	CIP-001-1 - Yes. In many cases, the staff of an LSE embedded in another entity's BA/TOP area is more likely to discover an act of sabotage directed toward a BA/TOP-owned facility that could affect the BES than the asset owner. This is because the LSE likely has more operating staff in the area. I have included a requirement in my clients'

Organization	Comment
	Sabotage Identification and Reporting Procedures that the client treat acts of sabotage to a third party's system discovered by client employees as though the act was directed toward client facilities. EOP-004-1 - As mentioned before, I would eliminate the LSE from the applicability list and leave the responsibility for disturbance reporting and response to the TOP/BA. However, I would retain a responsibility for the LSEs to cooperate (when requested) with any disturbance investigation.
Calpine Corporation	The reporting requirements of EOP - 004 are needed for the RC, BA, LSE and the GOP that operates or controls generation in a system as defined by NERC. (System - A combination of generation, transmission, and distribution components). A disturbance is described as an unplanned event that produces and abnormal system condition, any perturbation to the electric system, and the unexpected change in ACE that is caused by the sudden failure of generation or interruption of load. The GOP operating/controlling generation within a system has the ability to analyze system conditions to determine if reporting is necessary. A NERC registered GOP that is a merchant generator within another company's system does not have the ability for a wide area view and cannot analyze system conditions beyond the interconnection point of the facility. Moreover, in most cases the reporting requirements outlined in the Interconnection Reliability Operating Limits and Preliminary Disturbance Report do not apply to the merchant generator that is not a generation only BA. The applicability of the standard does encompass the true merchant generation entities required to register as GOP. Similarly, the OE-417 table 1 reporting requirements generally do not apply to a true merchant generating entity that is required to register as a GOP.
Covanta	It would be a welcome enhancement to the end users to understand to communication link between all "appropriate parties" who shall be notified of potential or actual sabotage events.... which also needs to be defined.
Reliant Energy	EOOP-004-1 should exclude the generator operator from disturbance reporting except providing the system operator or reliability coordinator with appropriate unit operation information upon request. Acts of sabotage should be identified clearly and reported to the indicated authorities.
Texas Regional Entity	Add GO and TO to the list of applicability. The intent of CIP-001-1 when it was first written was to have the proper and most likely entities associated directly with operations to be the ones to begin the reporting process in the case of sabotage on the system. In the ERCOT Region and other regions in the US, the GOP may not be physically located at the site. The GOP is often removed from the minute-by-minute responsibilities of plant operations and, therefore, may be less able to react to physical sabotage at the location/plant/facility in a timely manner. The concern is that, in the case of an actual sabotage event, the failure to report to the appropriate authorities in a timely manner may jeopardize the reliability of the BPS. Therefore, the Generator Owner (GO) should be added to the list of applicability for CIP-001-1, because it is the GO that is more likely to be on location at the generation site and thus aware of sabotage when it first occurs. This would disallow for any possible communication gap and put responsibility on all of the appropriate entities to report such an event. Additionally, and for the same reasons as adding the GO, the Transmission Owner

Organization	Comment
	(TO) should also be added to the list of applicability for reporting sabotage on its facilities.
Exelon	CIP-001, remove LSE's from the standard for the reasons identified in the FERC LSE order. Ad TO and DP. EOP-004, remove LSE's from the standard for the reasons identified in the FERC LSE order. Remove RRO's, they are not a user, owner, operator of the BES. Add DP or TO. Consider conditional applicability as in the UFLS standards, " the TO or DP who performs the functions specified in the standard..."
ERCOT ISO	The Regional Reliability Organization is not a registered Functional Entity in the NERC registry. The applicability must be revised to more appropriately assign the requirements to registered functional entities. Also, the industry needs to recognize that there are other resources than generation for which the operators need to be included. Perhaps a demand-side resource should have a resource operator. This particular SAR may not be the appropriate venue for this, but control of resources which can be used to mitigate sabotage events or disturbance events may need to be addressed.
AEP	We would recommend that the Load Serving Entity (LSE) be removed from both standards, and that the Generator Owner and Transmission Owner be added to the resulting standard.
NextEra Energy Resources, LLC	The scope of the proposed SAR should not include the Generator Operator.
PSEG Enterprise Group Inc Companies	The PSEG Companies ask that the drafting team allow sufficient flexibility for sabotage recognition and reporting requirements such that nothing precludes utilizing a single corporate-wide program for both bulk electric system assets and other businesses. PSEG's Sabotage Recognition, Response and Reporting Program is directed to all business areas which are directed to follow the same internal protocol that also satisfies the NERC Standards requirements. For example, for gas assets, PSEG's gas distribution business follows the PSEG corporate-wide program for sabotage recognition and response. PSEG agrees that some modifications should be made to CIP-001 (ex. better define or give examples of sabotage) and EOP-004 to make them clearer? If they are merged, then Sabotage will not be in the title (or the primary focus) because several of the Disturbances that reporting is required for in EOP-004 have nothing to do with sabotage. EOP-004 has criteria listed in 4 places to determine when to send a report: o Criteria listed in EOP-004 Attachment 1 o Criteria listed in EOP-004 Attachment 2 o Criteria listed in top portion of Table 1-EOP-004 o Criteria listed in bottom potion of Table 1-EOP-004 Therefore, it would be much easier if there was one table of criteria for reference that addressed all of the reportable

Organization	Comment
	conditions and all of the applicable reports. If the 2 standards are merged as suggested in the SAR, any differences in the reporting obligation for actual or attempted sabotage and reporting of disturbances must be clear.
FirstEnergy	2. As pointed out by the NERC Audit and Observation Team in the "Issues to be considered" for CIP-001, clarification is needed regarding contacting the FBI. Prior audits dwelled heavily on FBI notification. For example, our policy states that Corporate Security notifies the FBI. In recent events it appears that local law enforcement handles day to day activities. The notification process for contacting the FBI needs clarification along with specific instances in which to call them. Who should make the call to the FBI? It appears that a protocol needs to be developed to clarify what events require notifying the FBI. It could be as simple as after an incident a standard form is completed and forwarded to the FBI, letting them decide if follow up is needed. 3. We suggest aligning all reporting requirements for consistency. The items requiring reporting and the timelines to report are very inconsistent between NERC and the DOE. NERC's timelines are also not consistent with their own Security Guideline for the Electricity Sector: Threat and Incident Reporting.
MRO NERC Standards Review Subcommittee	B. CIP-001-1 and EOP-004-1 should be combined into one EOP Standard. C. Within EOP-004-1 there is industry confusion on what form to submit in the event of an event. There should only be one form for the new combination Standard eliminating the need for reporting form attachments. It should be the DOE Form, OE-417. Although it is beyond the scope of this SAR, it would greatly benefit industry if there was a central location on the NERC website containing ALL reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable the System Operators to efficiently locate the most current version of the appropriate form in order to report events.
Lands Energy Consulting	One final comment on CIP-001-1. My clients received universally rude treatment from the FBI field offices when they attempted to establish the contacts required by the Standard. If the FBI doesn't see value in establishing these contacts, remove the requirement from the Standard. Making sure the LSE knows the FBI field office phone number is probably all the Standard should require.
Colmac Clarion	Need single report for Sabotage so whatever is required results in notification of all parties (State Emergency Management, Homeland Security, FBI, Grid Reliability Chain of Command). Any and all of these can 'expand' knowledge later but all seem to require 'instant' notification.
Cowlitz County PUD	Local Law enforcement agencies often are not friendly to Federal involvement with smaller problems they consider their "turf." Need to make sure the small stuff stays with them, however have a system of internal reporting that will catch coordinated sabotage efforts (multiple attacks on DPs and small BAs) at the RC or RE level who then can report to the Federal agencies. Currently EOP-004-1 requires small entities to report a "disturbance" if half of their firm customer

Organization	Comment
	load is lost. For some entities, this can be one small substation going down due to a bird. The "50% of total demand" requirement should be removed or improved to better define a true BPS disturbance.
ERCOT ISO	Due to the fact that both the CIP-001-1 and EOP-004-1 have similar reporting standards, initially combining the two sounds like a correct analysis. However, after further consideration and due to the critical nature of its intended function involving Security aspects, the CIP-001 should be intensely evaluated to determine if its intended purpose meets the threshold or criteria to stand alone. The existing standards for CIP-001-1 Sabotage Reporting may help prevent future mitigation actions caused by sabotage events. EOP-004-1 Disturbance Reporting is administrative in nature, thus the jeopardy of the Bulk Electric System reliability is impacted only if analysis is not performed or if corrective follow-up actions are not implemented. Combining EOP-004 Standard requirements under the umbrella of the CIP -001 Standard would create a high profile Disturbance Reporting Standard. The industry would be better served if information defining sabotage was provided as well as a technical reference document on recognizing sabotage that would also clarify or state any personnel training requirements. All aspects of the intended functions must be reviewed before merging the two standards. At a minimum, we must consider modification that provides improved understanding of the reporting standards and implications as they are currently written.
MidAmerican Energy	Conflicting time frames exist from document updates. Reporting should be consolidated to one form and / or site to minimize conflicts, confusion, and errors. 1) Reporting requirements for the outage of 50,000 or more customers in EOP-004-1 requires a report to be made within one hour while the form OE-417 requires a report be made within six hours of the outage. The six hour reference on the updated OE-417 form is the correct reference. 2) Reporting for either CIP-001 or EOP-004 should center on the DOE Form OE-417. This would eliminate confusion and simplify reporting for system operators thereby directly enhancing reliability during system events. This would also eliminate much of the duplicate material and attachments in EOP-004. 3) Although it is beyond the scope of this SAR, the industry would benefit if there was a central location or link on the NERC website containing all reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable System Operators to more efficiently locate and report events.
Illinois Municipal Electric Agency	IMEA recommends the following considerations: Simplification of reportable events and the reporting process should be the overriding objective. NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting (Version 2.0) should be updated to support this standards development initiative. At some point in the process, it may help if examples are given of events actually reported that did not need to be reported.

Standard Authorization Request Form

Title of Proposed Standard: Disturbance and Sabotage reporting (Project 2009-01)	
Request Date: April 2, 2009	
Approved by SC for posting: April 15, 2009	
Revision Date: ~~July 22, 2009~~August 13, 2009	

SAR Requester Information	**SAR Type** (*Check a box for each one that applies.*)	
Name: Patrick Brown	☐	New Standard
Primary Contact: Patrick Brown Manager, NERC and Regional Coordination PJM Interconnection	☒	Revision to existing Standard
Telephone: 610-666-4597	☒	Withdrawal of existing Standard
E-mail: brownp@pjm.com	☐	Urgent Action

Purpose (Describe the proposed standard action: Nomination of a proposed standard, revision to a standard, or withdrawal of a standard and describe what the standard action will achieve.)

This project will entail revision to existing standards CIP-001-1 – Sabotage Reporting and EOP-

004-1 – Disturbance Reporting. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some ‘fill-in-the-blank’ components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Industry Need (Provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

The existing requirements need to be revised to be more specific – and there needs to be more clarity in what sabotage looks like.

Brief Description (Provide a paragraph that describes the scope of this standard action.)

CIP-001 may be merged with EOP-004 to eliminate redundancies. Acts of sabotage have to be reported to the DOE as part of EOP-004. Specific references to the DOE form need to be eliminated.

EOP-004 has some ‘fill-in-the-blank’ components to eliminate.

The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards (see tables for each standard at the end of this SAR for more detailed information).
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR.) See "Issues to be Considered by Drafting Team" tables for each standard at the end of this SAR for more detailed information.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒ ~~☐~~	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒ ~~☐~~	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☒	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Issues to be Considered by Drafting Team Project 2009-01 — Disturbance and Sabotage Reporting	
Standard #	**Title**
CIP-001-0	Sabotage Reporting
Issues	FERC Order 693 Disposition: Approved with modifications • Consider the need for wider application of the standard. Consider whether separate, less burdensome requirements for smaller entities may be appropriate. • Define “sabotage” and provide guidance on triggering events that would cause an entity to report an event. • In the interim, provide advice to entities about the reporting of particular circumstances as they arise. • Consider FirstEnergy’s suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality. • Incorporate a periodic review or updating of the sabotage reporting procedures and for their periodic testing. Consider a staggered schedule of annual testing and formal review every two to three years. • Include a requirement to report a sabotage event to the proper government authorities. Develop the language to specifically implement this directive. • Explore ways to reduce redundant reporting, including central coordination of sabotage reports and a uniform reporting format. V0 Industry Comments • Object to multi-site requirement • Definition of sabotage required VRF comments • Adequate procedures will insure it is unlikely to lead to bulk electric system instability, separation, or cascading failures. Other • Modify standard to conform to the latest version of NERC’s Reliability Standards Development Procedure, the NERC Standard Drafting Team Guidelines, and the ERO Rules of Procedure. NERC Audit and Observation Team • Applicability — How does this standard pertain to Load Serving Entities, LSE's. • Registered Entities have sabotage reporting processes and procedures in place but not all personnel has been trained. • Question: How do you “and make the operator aware” • R4 — "What is meant by: “establish contact with the FBI”. Is a phone number adequate? Many entities which call the FBI are referred back to the local authority. The AOT noted that on the FBI website it states to

	contact the local authorities. Is this a question for Homeland Security to deal with for us?"
	• R4 — Establish communications contacts, as applicable with local FBI and RAMP officials. Some entities are very remote and the sheriff is the only local authority does the FBI still need to be contacted?
	FERC's December 20, 2007 and April 4, 2008 Orders in Docket Nos. RC07-004-000, RC07-6-000, and RC07-7-000
	• In FERC's December 20, 2007 Order, the Commission reversed NERC's Compliance Registry decisions with respect to three load serving entities in the ReliabilityFirst (RFC) footprint. The distinguishing feature of these three LSEs is that none owned physical assets. Both NERC and RFC assert that there will be a "reliability gap" if retail marketers are not registered as LSEs. To avoid a possible gap, a consistent, uniform approach to ensure that appropriate Reliability Standards and associated requirements are applied to retail marketers must be applied. Each drafting team responsible for reliability standards applicable to LSEs is to review and change as necessary, requirements in the applicable reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. For additional information see:
	  ◦ FERC's December 20, 2007 Order (http://www.nerc.com/files/LSE_decision_order.pdf)
	  ◦ NERC's March 4, 2008 (http://www.nerc.com/files/FinalFiledLSE3408.pdf),
	  ◦ FERC's April 4, 2008 Order (http://www.nerc.com/files/AcceptLSECompFiling-040408.pdf) and
	  ◦ NERC's July 31, 2008 (http://www.nerc.com/files/FinalFiled-CompFiling-LSE-07312008.pdf) compliance filings to FERC on this subject.

Issues to be Considered by Drafting Team Project 2009-01 — Disturbance and Sabotage Reporting	
Standard #	**Title**
EOP-004-1	Disturbance Reporting
Issues	FERC Order 693 Disposition: Approved with modification • Include any requirements for users, owners, and operators of the bulk power system to provide data that will assist NERC in the investigation of a blackout or disturbance. • Change NERC's Rules of Procedure to assure the Commission receives these reports in the same frame as the DOE. • Consider APPA's concern about generator operators and LSEs analyzing performance of their equipment and provide data and information on the equipment to assist others with analysis. • Consider all comments offered in a future modification of the reliability standard.

	Fill-in-the-Blank Team Comments
	• Consider changes to R1 and R3.4 to standardize the disturbance reporting requirements (requirements for disturbance reporting need to be added to this standard)
	• Regions currently have procedures, but not in the form of a standard. The drafting team will need to review regional requirements to determine reporting requirements for the North American standard.
	V0 Industry Comments
	• R3 – too many reports, narrow requirement to RC
	• How does this apply to generator operator?
	Other
	• Modify standard to conform to the latest version of NERC's Reliability Standards Development Procedure, the NERC Standard Drafting Team Guidelines, and the ERO Rules of Procedure.
	NERC Audit and Observation Team
	• R3.1 — Can there be a violation without an event?
	Event Analysis Team
	• Reliability Issue: Coordination and follow up on lessons learned from event analyses Consider adding to EOP-004 – Disturbance Reporting. Proposed requirement: Regional Entities (REs) shall work together with Reliability Coordinators, Transmission Owners, and Generation Owners to develop an Event Analysis Process to prevent similar events from happening and follow up with the recommendations. This process shall be defined within the appropriate NERC Standard.
	FERC's December 20, 2007 and April 4, 2008 Orders in Docket Nos. RC07-004-000, RC07-6-000, and RC07-7-000
	• In FERC's December 20, 2007 Order, the Commission reversed NERC's Compliance Registry decisions with respect to three load serving entities in the ReliabilityFirst (RFC) footprint. The distinguishing feature of these three LSEs is that none owned physical assets. Both NERC and RFC assert that there will be a "reliability gap" if retail marketers are not registered as LSEs. To avoid a possible gap, a consistent, uniform approach to ensure that appropriate Reliability Standards and associated requirements are applied to retail marketers must be applied. Each drafting team responsible for reliability standards applicable to LSEs is to review and change as necessary, requirements in the applicable reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. 	  • NERC's July 31, 2008 (http://www.nerc.com/files/FinalFiled-CompFiling-LSE-07312008.pdf) compliance filings to FERC on this subject.

Comments received on Project 2009-01 — Disturbance and Sabotage Reporting

The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) received many suggestions for improvements to the standards during the SAR comment period. These comments do not indicate any revisions to the SAR, but the DSRSDT thought that these comments merited further consideration during the standard drafting phase of the project. The comments below are being compiled for use by the Standard Development Team.

Organization	Comment
Electric Market Policy	Comments: Agree with the statement that sabotage is hard to determine in real time by operations staffs. The determination of sabotage should be left up to law enforcement. They have the knowledge and peer contacts needed to adequately determine whether physical or cyber intrusions are merely malicious acts or coordinated efforts (sabotage). The operators should only be required to report physical and cyber intrusions to law enforcement. All other reporting requirements should apply to law enforcement once a determination of sabotage has been made. If the recommendations above are not to be accepted, then we have the following comments: CIP-001-1 1) R1 states entities shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SAR notes that the industry objects to the multi-site requirement, most likely because the term is ambiguous. If this term remains in the standard, it needs to be clearly defined and responsibilities for obtaining (how do you get this information and from whom?) and distributing need to be included. 2) R1 audits have shown confusion over the requirement to make operating personnel aware of sabotage events. The term operating personnel needs to be defined. Are they the individuals responsible for operating the facility, coordinating with other entities (i.e., RC, BA, TOP, GOP, and LSE)? It has been suggested that notification is required to all personnel at a facility. Keep in mind the purpose of the standard is to ensure sabotage events are properly reported, not to address emergency response. 3) R1 The SAR (NERC Audit and Observation Team) notes that Registered Entities have processes and procedures in place, but not all personnel have been trained. There is no specific training requirement in the standard. 4) R2 & R3 I agree with the SAR that sabotage needs to be defined and these requirements should be more specific with respect to the information to be communicated. It seems to me that the standard should mirror the criteria contained in DOE OE-417. The emphasis should be placed on ensuring that the same information communicated to DOE is shared with the appropriate parties in the Interconnection. 5) R4 I agree with the SAR (NERC Audit and Observation Team) comments regarding the intention of this requirement. There is no language that directs contact with FBI or RCMP although that is what is implied by the Purpose statement.

Organization	Comment
	6) VRF Comments I'm not sure what is intended by the statement Adequate procedures will insure it is unlikely to lead to bulk electric system instability, separation, or cascading failures? The purpose of the standard is that of communication. No operational decisions or actions are directed by this standard, nor does it require entities to address operational aspects resulting from sabotage. 7) The potential exists for overlapping sabotage reporting requirements at nuclear power plants due to multiple regulators (Nuclear Regulatory Commission (NRC) 10 CFR 73 and Federal Energy Regulatory Commission (FERC) NUC-001-1). Some entities may have revised existing NRC driven procedures to accommodate reporting requirements of both regulators. Because of the restrictions placed on NRC driven documents (i.e., procedures are classified as safeguards information), it can be difficult to demonstrate compliance to NERC and/or FERC without ensuring that the individuals are qualified for receipt of such information per 10 CFR 73. Additionally, multiple procedures may have the unintended consequence of delaying appropriate communication.EOP-004-1Consider removing Attachment 2 as the information is duplicated in DOE Form OE-417. A simple reference to the form should suffice.
Lands Energy Consulting	I have worked with 5 Northwest public utilities on developing procedures related to CIP-001-1 and EOP-004-1. All 5 utilities operate electric systems in fairly remote locations and are embedded in a larger utility's Balancing Authority/Transmission Operator area. A. CIP-001-1 - Developing procedures to unambiguously identify acts of sabotage has been particularly challenging for these systems. In general, it's hard for them to determine whether the most prevalent forms of malicious and intentional system damage that they incur - copper theft and gun shot insulators/equipment - should qualify as acts of sabotage. Although none of the systems consider copper theft to be acts of sabotage, two of the systems consider gun shot insulators/equipment to be acts of sabotage. The other systems look for intent to disrupt electric system operations as a key component of their sabotage identification procedures. Additional guidance from NERC in the form of CIP-001-1 modifications or a companion guidelines document on sabotage identification would provide much needed guidance for these procedures. B. EOP-004-1 - This standard was clearly drafted with the larger electric systems in mind. I have one client that serves 3300 commercial/residential customers from 4-115/13 kV substation transformers and one large industrial customer (80% of its energy load) from a 230/13 kV substation. 75% of the client's load is served from three substations attached to a long, 115 kV transmission line operated by the Bonneville Power Administration. Whenever the line relays open on a permanent fault (which happens 2-3 times per year), the client loses over 50% of its customers (but no more than 10-15 MW during winter peak), thereby necessitating the preparation of a Disturbance Report. To allow utilities to concentrate on operating their systems, without fear of violating EOP-004-1 for failure to report trivial outages, I would remove LSEs from the obligation to report disturbances - leave the reporting to the BA/TOP for large outages in their footprint.
Calpine Corporation	Communication of facility status or emergencies between merchant generators registered as GOP and the RC, BA, GOP, or LSE in which the facility resides should be coordinated for EOP -004 reporting. The reporting to NERC/DOE should

Organization	Comment
	come from the RC, BA, GOP, or LSE.
Covanta	Yes - the key to Sabotage reporting requirements is identifying what the 'definition' is of an actual or potential 'Sabotage' event. Like any other standard, if FERC/NERC leave it up to 2000+ entities to establish their own definitions of 'Sabotage', you may likely get 2000+ answers. That is not a controlled and coordinated approach. I offer the following definition, "Sabotage - Deliberate or malicious destruction of property, obstruction of normal operations, or injury to personnel by outside agents." Examples of sabotage events could include, but are not limited to, suspicious packages left near site electrical generating or electrical transmission assets, identified destruction of generating assets, telephone/e mail received threats to destroy or interrupt electrical generating efforts, etc." These have passed multiple NERC regional audits and reviews to date.
Northeast Power Coordinating Council	The SAR needs to be more specific in defining its objectives. CIP-001Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms “operating personnel” and “sabotage events.” The definition of “operating personnel,” should be clarified and limited to staff at BES facilities. Operating personnel should report only those events which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term “sabotage event” needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be aware of such “sabotage events,” e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term “aware” in the standard. “Aware” can be interpreted in accordance with its largely passive, dictionary-based meaning, where being “aware” simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of “aware” could refer to more active wording, involving more than mere awareness, e.g., “alert and quick to respond,” pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies. EOP-004 - The SDT needs to work on the following areas.

Organization	Comment
	1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction "The entity on whose system a reportable disturbance occurs shall notify NERC ... 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance - The sense of Attachment 1 is internally inconsistent between the introduction ("occurs") and the required actions in 6c (could have resulted in a system disturbance). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase "or could have resulted in" a potential system disturbance. This inconsistency should be clarified.
FirstEnergy	We agree with the scope but would also like to see the following considered: 1. References to the DOE reporting process in EOP-004 need to be revised. They currently refer to the old EIA form. 2. Besides "sabotage", it may be helpful to clearly define "vandalism". It is vaguely written in the standards. Also, the process of "public appeals" for the DOE reportable requirements needs to be more clearly defined. 3. Consolidate documents covering reporting requirements. There are currently several documents that require reporting (EOP-004, CIP-001, DOE oe-417, and NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting). NERC also has the "Bulk Power System Disturbance Classification Scale" that does not completely align with all the reporting requirements. Therefore we recommend keeping this as simple as possible by combining all the reporting requirements into one standard. It would be beneficial to not require operators to have to go to 4 different documents to determine what to report on.
MRO NERC Standards Review Subcommittee	The MRO NSRS would like to keep the references to the DOE reporting form.
Cowlitz County PUD	Added to the scope: For EOP-004 add a provision for a reporting flow rather than everything going to the RE and NERC. That is something going like the DP and TOP reports to the BA, the BA to the RE, and the RE to NERC. This would allow for multiple related reports to be combined into a single coherent report as the reporting goes up the chain. For CIP-001 consider reporting flow as above with local law enforcement notification. Let an upper entity in the reporting chain decide when to contact Federal Agencies such as the BA or the RC.
Reliant Energy	I think Generator operators should be excluded except to provide requested information from the System Operator or Reliability coordinator.

Organization	Comment
ERCOT ISO	The scope should be modified to provide for a different treatment of reporting requirements that are administrative in nature, or that are after-the-fact (thus cannot impact reliability unless analysis and follow-up is not performed; even then, the impact would be at some future time). Reporting requirements which are of the nature to assist in identification of system concerns or which serve to prevent or mitigate on-going system problems (including, but not limited to, actual or attempted sabotage activity) should remain in standards, but should be separate and apart from the administrative reporting.
Consolidated Edison Co. of New York, Inc.	GENERAL CECONY and ORU support the general objectives of the SAR to merge existing standards CIP-001-1 Sabotage Reporting and EOP-004-1 Disturbance Reporting to improve clarity and remove redundancy. However, the SAR needs to be more specific in defining its objectives. CIP-001Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms operating personnel and sabotage events. The definition of operating personnel, should be clarified and limited to staff at BES facilities. Operating personnel should report only those events which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term sabotage event needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be aware of such sabotage events, e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term aware in the standard. Aware can be interpreted in accordance with its largely passive, dictionary-based meaning, where being aware simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of aware could refer to more active wording, involving more than mere awareness, e.g., alert and quick to respond, pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies. EOP-004 - The SDT needs to work on the following areas. 1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states:

Organization	Comment
	Introduction The entity on whose system a reportable disturbance occurs shall notify NERC ... 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: ?c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance. The sense of Attachment 1 is internally inconsistent between the introduction (occurs) and the required actions in 6c (could have resulted in a system disturbance). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase or could have resulted in a potential system disturbance. This inconsistency should be clarified.
Georgia System Operations Corp.	The scope of the SAR should be to move all requirements to report to NERC or Regional Entities out of the Requirements section of all Reliability Standards to elsewhere. This does not include reporting, communicating, or coordinating between reliability entities. The NERC/Region reporting requirements could be consolidated in another document and referenced in the Supporting References section of the Reliability Standards. The deadlines for reporting should be changed to realistic timeframes that do not interfere with operating the BES or responding to incidents yet still allow NERC and the Regions to accomplish their missions.
AEP	Sabotage is a term of intent that is often determined after the fact by the registered entity and/or law enforcement officials. In fact, it is often difficult to determine in real-time the intent of a suspicious event. We would suggest that suspicious events become reportable at the point that the event is determined to have had sabotage intent. The entities should have a methodology to collect evidence, to have the evidence analyzed, and to report those events that are determined to have had the intent of sabotage.
Duke Energy	While we agree with the need for clarity in sabotage and disturbance reporting, we believe that the Standards Drafting Team should carefully consider whether there is a reliability-related need for each requirement. Some disturbance reporting requirements are triggered not just to assist in real-time reliability but also to identify lessons-learned opportunities. If disturbance and sabotage reporting continue to be reliability standards, we believe that all linkages to lessons-learned/improvements need to be stripped out. We have other forums to identify lessons-learned opportunities and to follow-up on those opportunities. Also, requirements to report possible non-compliances should be eliminated. We strongly support voluntary self-reporting, but not mandatory self-reporting.
NextEra Energy Resources, LLC	The scope of the SAR should not include Generator Operators.
Luminant Power	The SAR drafting team should include in the SAR scope a review of the NRC sabotage and event reporting requirements to ensure there are no overlapping or conflicting requirements between NERC, FERC, and the NRC. The SAR scope

Organization	Comment
	should include a review of the CIP Cyber Security Standards and coordination with the CIP SDT to ensure that cyber sabotage reporting definitions are in concert, and ensure that cyber sabotage reporting requirements are not duplicated in multiple standards.
Illinois Municipal Electric Agency	A one-stop reporting tool/site would facilitate efficient reporting and compliance; e.g., further development of the ES-ISAC/CIPIS to include all reportable categories and automatic notification of required parties. A single report form would be best.
AEP	The current reporting process necessitates multiple reports be sent to multiple parties, which is inefficient and may, inadvertently, result in alignment issues between the separate reports. We would recommend that a single report that combines NERC (CIPIS) and NERC ESISAC information be provided to NERC (CIPIS) that is systematically (programmatically) forwarded to all necessary entities. Further, updates to incidents would also go through NERC with the same electronic processing. Currently, we are not aware of a formal method to report incidents to the FBI, which should be also included in the distribution. The current reporting mechanism to the FBI JTTF is by telephone and the NERC platform described would provide more consistent reporting.
Kansas City Power & Light	Do not agree Load Serving Entities need to continue to be included for sabotage. According the NERC Functional Model, an LSE provides for estimating customer load and provides for the acquisition of transmission and energy to meet customer load demand. An LSE has no real impact on maintaining the reliability of electric network short of their planning function. Unfortunately, an LSE needs to be included for disturbance reporting to the DOE under certain conditions for loss of customer load. This may be a reason to maintain a separation of CIP-001 and EOP-004 so as not to unnecessarily include an LSE when it is not needed.
Electric Market Policy	Applicability should not apply to LSE unless they have physical assets. If they do not have such assets, they are unable to determine how many customers are out, how much load was lost or the duration of an outage. We continue to question the need for the LSE entity in reliability standards. End use customer load is either connected to transmission or distribution facilities. So, the applicable planner has to plan for that load when designing its facilities or the load will not have reliable service. To the extent that energy and capacity for that load is supplied by an entity other than the TO or DP, the TO or DP should have interconnection requirements that compel the supplier to provide any and all data necessary to meet the requirements of reliability standards.
Lands Energy Consulting	CIP-001-1 - Yes. In many cases, the staff of an LSE embedded in another entity's BA/TOP area is more likely to discover an act of sabotage directed toward a BA/TOP-owned facility that could affect the BES than the asset owner. This is because the LSE likely has more operating staff in the area. I have included a requirement in my clients' Sabotage Identification and Reporting Procedures that the client treat acts of sabotage to a third party's system discovered by client employees as though the act was directed toward client facilities. EOP-004-1 - As mentioned before, I would eliminate the

Organization	Comment
	LSE from the applicability list and leave the responsibility for disturbance reporting and response to the TOP/BA. However, I would retain a responsibility for the LSEs to cooperate (when requested) with any disturbance investigation.
Calpine Corporation	The reporting requirements of EOP - 004 are needed for the RC, BA, LSE and the GOP that operates or controls generation in a system as defined by NERC. (System - A combination of generation, transmission, and distribution components). A disturbance is described as an unplanned event that produces and abnormal system condition, any perturbation to the electric system, and the unexpected change in ACE that is caused by the sudden failure of generation or interruption of load. The GOP operating/controlling generation within a system has the ability to analyze system conditions to determine if reporting is necessary. A NERC registered GOP that is a merchant generator within another company’s system does not have the ability for a wide area view and cannot analyze system conditions beyond the interconnection point of the facility. Moreover, in most cases the reporting requirements outlined in the Interconnection Reliability Operating Limits and Preliminary Disturbance Report do not apply to the merchant generator that is not a generation only BA. The applicability of the standard does encompass the true merchant generation entities required to register as GOP. Similarly, the OE-417 table 1 reporting requirements generally do not apply to a true merchant generating entity that is required to register as a GOP.
Covanta	It would be a welcome enhancement to the end users to understand to communication link between all "appropriate parties" who shall be notified of potential or actual sabotage events.... which also needs to be defined.
Reliant Energy	EOOP-004-1 should exclude the generator operator from disturbance reporting except providing the system operator or reliability coordinator with appropriate unit operation information upon request. Acts of sabotage should be identified clearly and reported to the indicated authorities.
Texas Regional Entity	Add GO and TO to the list of applicability. The intent of CIP-001-1 when it was first written was to have the proper and most likely entities associated directly with operations to be the ones to begin the reporting process in the case of sabotage on the system. In the ERCOT Region and other regions in the US, the GOP may not be physically located at the site. The GOP is often removed from the minute-by-minute responsibilities of plant operations and, therefore, may be less able to react to physical sabotage at the location/plant/facility in a timely manner. The concern is that, in the case of an actual sabotage event, the failure to report to the appropriate authorities in a timely manner may jeopardize the reliability of the BPS. Therefore, the Generator Owner (GO) should be added to the list of applicability for CIP-001-1, because it is the GO that is more likely to be on location at the generation site and thus aware of sabotage when it first occurs. This would disallow for any possible communication gap and put responsibility on all of the appropriate entities to report such an event. Additionally, and for the same reasons as adding the GO, the Transmission Owner (TO) should also be added to the list of applicability for reporting sabotage on its facilities.
Exelon	CIP-001, remove LSE's from the standard for the reasons identified in the FERC LSE order. Ad TO and DP. EOP-004,

Organization	Comment
	remove LSE's from the standard for the reasons identified in the FERC LSE order. Remove RRO's, they are not a user, owner, operator of the BES. Add DP or TO. Consider conditional applicability as in the UFLS standards, " the TO or DP who performs the functions specified in the standard..."
ERCOT ISO	The Regional Reliability Organization is not a registered Functional Entity in the NERC registry. The applicability must be revised to more appropriately assign the requirements to registered functional entities. Also, the industry needs to recognize that there are other resources than generation for which the operators need to be included. Perhaps a demand-side resource should have a resource operator. This particular SAR may not be the appropriate venue for this, but control of resources which can be used to mitigate sabotage events or disturbance events may need to be addressed.
AEP	We would recommend that the Load Serving Entity (LSE) be removed from both standards, and that the Generator Owner and Transmission Owner be added to the resulting standard.
NextEra Energy Resources, LLC	The scope of the proposed SAR should not include the Generator Operator.
PSEG Enterprise Group Inc Companies	The PSEG Companies ask that the drafting team allow sufficient flexibility for sabotage recognition and reporting requirements such that nothing precludes utilizing a single corporate-wide program for both bulk electric system assets and other businesses. PSEG's Sabotage Recognition, Response and Reporting Program is directed to all business areas which are directed to follow the same internal protocol that also satisfies the NERC Standards requirements. For example, for gas assets, PSEG's gas distribution business follows the PSEG corporate-wide program for sabotage recognition and response. PSEG agrees that some modifications should be made to CIP-001 (ex. better define or give examples of sabotage) and EOP-004 to make them clearer? If they are merged, then Sabotage will not be in the title (or the primary focus) because several of the Disturbances that reporting is required for in EOP-004 have nothing to do with sabotage. EOP-004 has criteria listed in 4 places to determine when to send a report: o Criteria listed in EOP-004 Attachment 1 o Criteria listed in EOP-004 Attachment 2 o Criteria listed in top portion of Table 1-EOP-004 o Criteria listed in bottom potion of Table 1-EOP-004 Therefore, it would be much easier if there was one table of criteria for reference that addressed all of the reportable conditions and all of the applicable reports. If the 2 standards are merged as suggested in the SAR, any differences in the reporting obligation for actual or attempted sabotage and reporting of disturbances must be clear.

Organization	Comment
FirstEnergy	2. As pointed out by the NERC Audit and Observation Team in the "Issues to be considered" for CIP-001, clarification is needed regarding contacting the FBI. Prior audits dwelled heavily on FBI notification. For example, our policy states that Corporate Security notifies the FBI. In recent events it appears that local law enforcement handles day to day activities. The notification process for contacting the FBI needs clarification along with specific instances in which to call them. Who should make the call to the FBI? It appears that a protocol needs to be developed to clarify what events require notifying the FBI. It could be as simple as after an incident a standard form is completed and forwarded to the FBI, letting them decide if follow up is needed. 3. We suggest aligning all reporting requirements for consistency. The items requiring reporting and the timelines to report are very inconsistent between NERC and the DOE. NERC's timelines are also not consistent with their own Security Guideline for the Electricity Sector: Threat and Incident Reporting.
MRO NERC Standards Review Subcommittee	B. CIP-001-1 and EOP-004-1 should be combined into one EOP Standard. C. Within EOP-004-1 there is industry confusion on what form to submit in the event of an event. There should only be one form for the new combination Standard eliminating the need for reporting form attachments. It should be the DOE Form, OE-417. Although it is beyond the scope of this SAR, it would greatly benefit industry if there was a central location on the NERC website containing ALL reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable the System Operators to efficiently locate the most current version of the appropriate form in order to report events.
Lands Energy Consulting	One final comment on CIP-001-1. My clients received universally rude treatment from the FBI field offices when they attempted to establish the contacts required by the Standard. If the FBI doesn't see value in establishing these contacts, remove the requirement from the Standard. Making sure the LSE knows the FBI field office phone number is probably all the Standard should require.
Colmac Clarion	Need single report for Sabotage so whatever is required results in notification of all parties (State Emergency Management, Homeland Security, FBI, Grid Reliability Chain of Command). Any and all of these can 'expand' knowledge later but all seem to require 'instant' notification.
Cowlitz County PUD	Local Law enforcement agencies often are not friendly to Federal involvement with smaller problems they consider their "turf." Need to make sure the small stuff stays with them, however have a system of internal reporting that will catch coordinated sabotage efforts (multiple attacks on DPs and small BAs) at the RC or RE level who then can report to the Federal agencies. Currently EOP-004-1 requires small entities to report a "disturbance" if half of their firm customer load is lost. For some entities, this can be one small substation going down due to a bird. The "50% of total demand" requirement should be removed or improved to better define a true BPS disturbance.

Organization	Comment
ERCOT ISO	Due to the fact that both the CIP-001-1 and EOP-004-1 have similar reporting standards, initially combining the two sounds like a correct analysis. However, after further consideration and due to the critical nature of its intended function involving Security aspects, the CIP-001 should be intensely evaluated to determine if its intended purpose meets the threshold or criteria to stand alone. The existing standards for CIP-001-1 Sabotage Reporting may help prevent future mitigation actions caused by sabotage events. EOP-004-1 Disturbance Reporting is administrative in nature, thus the jeopardy of the Bulk Electric System reliability is impacted only if analysis is not performed or if corrective follow-up actions are not implemented. Combining EOP-004 Standard requirements under the umbrella of the CIP -001 Standard would create a high profile Disturbance Reporting Standard. The industry would be better served if information defining sabotage was provided as well as a technical reference document on recognizing sabotage that would also clarify or state any personnel training requirements. All aspects of the intended functions must be reviewed before merging the two standards. At a minimum, we must consider modification that provides improved understanding of the reporting standards and implications as they are currently written.
MidAmerican Energy	Conflicting time frames exist from document updates. Reporting should be consolidated to one form and / or site to minimize conflicts, confusion, and errors. 1) Reporting requirements for the outage of 50,000 or more customers in EOP-004-1 requires a report to be made within one hour while the form OE-417 requires a report be made within six hours of the outage. The six hour reference on the updated OE-417 form is the correct reference. 2) Reporting for either CIP-001 or EOP-004 should center on the DOE Form OE-417. This would eliminate confusion and simplify reporting for system operators thereby directly enhancing reliability during system events. This would also eliminate much of the duplicate material and attachments in EOP-004. 3) Although it is beyond the scope of this SAR, the industry would benefit if there was a central location or link on the NERC website containing all reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable System Operators to more efficiently locate and report events.
Illinois Municipal Electric Agency	IMEA recommends the following considerations: Simplification of reportable events and the reporting process should be the overriding objective. NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting (Version 2.0) should be updated to support this standards development initiative. At some point in the process, it may help if examples are given of events actually reported that did not need to be reported.

Unofficial Nomination Form for Standard Drafting Team for Disturbance and Sabotage Reporting (Project 2009-01)

Please **DO NOT** use this form. Please use the electronic nomination form located at the link below. If you have any questions, please contact Stephen Crutchfield at stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

By submitting the following information you are indicating your commitment to actively participate (including physically attending face-to-face) Standard Drafting Team meetings if appointed to the Standard Drafting Team by the Standards Committee.

Name:	
Organization:	
Address:	
Telephone:	
E-mail:	

Project 2009-01 Disturbance and Sabotage Reporting will entail revising existing standards CIP-001 — Sabotage Reporting and EOP-004 — Disturbance Reporting to eliminate redundancies and provide clarity on sabotage events. The project includes addressing several issues identified by stakeholders, FERC directives from Order 693, and may include improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Please briefly describe (no more than a couple of paragraphs) your experience and qualifications directly related to the issues to be addressed by the Disturbance and Sabotage Reporting Standard Drafting Team. We are seeking a cross section of the industry to participate on the team, but in particular are seeking individuals with experience in management of real-time bulk power operations activities. Please include any previous experience related to developing or applying IEEE or other industry related standards as this type of experience might be beneficial to include on the team, but is not a requisite to be appointed to the team.

Are you currently a member of any NERC or Regional Entity SAR or standard drafting team? If yes, please list each	☐ No ☐ Yes:

team here.	
Have you previously worked on any NERC or Regional Entity SAR or standard drafting teams? If yes, please list them here.	☐ No ☐ Yes:

Please identify the NERC Region(s) for which you are able to represent your company's position relative to the topics addressed in the SAR:	Please identify the Industry Segment(s) for which you are able to represent your company's position relative to the topics addressed in the SAR:	
☐ ERCOT	☐	1 — Transmission Owners
☐ FRCC	☐	2 — RTOs and ISOs
☐ MRO	☐	3 — Load-serving Entities
☐ NPCC	☐	4 — Transmission-dependent Utilities
☐ RFC	☐	5 — Electric Generators
☐ SERC	☐	6 — Electricity Brokers, Aggregators, and Marketers
☐ SPP	☐	7 — Large Electricity End Users
☐ WECC	☐	8 — Small Electricity End Users
☐ Not Applicable or None of the Above	☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
	☐	10 — Regional Reliability Organizations and Regional Entities
	☐	Not applicable

Please identify the Functional Entities[1] for which you are able to represent your company's position relative to the topics addressed in the SAR:

☐ Balancing Authority	☐ Planning Coordinator
☐ Compliance Enforcement Authority	☐ Transmission Operator
☐ Distribution Provider	☐ Transmission Owner
☐ Generator Operator	☐ Transmission Planner
☐ Generator Owner	☐ Transmission Service Provider
☐ Interchange Authority	☐ Purchasing-selling Entity
☐ Load-serving Entity	☐ Resource Planner
☐ Market Operator	☐ Reliability Coordinator

[1] These functions are defined in the NERC Functional Model, which is available on the NERC Web site.

Please provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group. NERC staff may contact these references.

Standards Announcement

Nomination Period Opens for Standard Drafting Team
September 16-30, 2009

Now available at: http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Project 2009-01: Disturbance and Sabotage Reporting

The Standards Committee is seeking industry experts to serve on the Disturbance and Sabotage Reporting Standard Drafting Team. The nomination period is open **until September 30, 2009.**

Instructions

If you are interested in serving on this standard drafting team, please complete the following electronic nomination form**:** https://www.nerc.net/nercsurvey/Survey.aspx?s=ba96a1dc8506404889e26d05aaf490c6 . Please contact Dave Taylor at david.taylor@nerc.net or 609-651-5089 with any questions about the team.

Project Background

Project 2009-01 — Disturbance and Sabotage Reporting will entail revising existing standards CIP-001-1 — Sabotage Reporting and EOP-004-1 — Disturbance Reporting to eliminate redundancies and provide clarity on sabotage events. The project includes addressing several issues identified by stakeholders, FERC directives from Order 693, and may include improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

More information about the project is available on the following page:
http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Standards Development Process

The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance,
please contact Shaun Streeter at shaun.streeter@nerc.net or at 609.452.8060.

Disturbance and Sabotage Reporting Standard Drafting Team (Project 2009-01) Reporting Concepts

Introduction

The SAR for Project 2009-01 Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009 and is progressing toward developing standards based on the SAR. This concepts paper is designed to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT has developed.

The standards listed under the SAR are:

- CIP-001 — Sabotage Reporting
- EOP-004 — Disturbance Reporting

The DSR SDT is also proposing to investigate incorporation of the cyber incident reporting aspects of CIP-008 under this project. This will be coordinated with the Cyber Security — Order 706 Standard Drafting Team (Project 2008-06).

The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC database and FERC Order 693 Directives to determine a prudent course of action with respect to these standards.

This concept paper provides stakeholders with a proposed “road map” that will be used by the DSR SDT in updating or revising CIP-001 and EOP-004. This concept paper provides the background information and thought process of the DSR SDT.

The proposed changes do not include any real-time operating notifications for the types of events covered by CIP-001 and EOP-004. The real-time reporting requirements are achieved through the RCIS and are covered in other standards (e.g. TOP). The proposed standards deal exclusively with after-the-fact reporting.

The DSR SDT is proposing to consolidate disturbance and event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

Summary of Concepts and Assumptions:

The Standard Will: Require use of a single form to report disturbances and "impact events" that threaten the reliability of the bulk electric system

- Provide clear criteria for reporting
- Include consistent reporting timelines
- Identify appropriate applicability, including a reporting hierarchy in the case of disturbance reporting
- Provide clarity around of who will receive the information

The drafting team will explore other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements

Discussion of Disturbance Reporting

Disturbance reporting requirements currently exist in EOP-004. The current approved definition of Disturbance from the NERC Glossary of Terms is:

1. An unplanned event that produces an abnormal system condition.
2. Any perturbation to the electric system.
3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.

Disturbance reporting requirements and criteria are in the existing EOP-004 standard and its attachments. The DST SDT discussed the reliability needs for disturbance reporting and will consider guidance found in the document "NERC Guideline: Threat and Incident Reporting" in the development of requirements, which will include clear criteria for reporting. The new/revised standard will specify who has access to reported information about disturbances.

The DSR SDT is considering developing a reporting hierarchy that requires the Reliability Coordinator (RC) to submit the disturbance report. Any entity (Distribution Provider, Load-Serving Entity, Generator Operator) that experiences a disturbance would report the appropriate information to the Transmission Operator or Balancing Authority (if applicable) who would then report to the RC. The RC would then submit the report to NERC, the affected Regional Entity (RE) and/or Department of Energy (DOE) as appropriate. By having the RC submit the report, situational awareness would be enhanced. All affected entities would be aware of the disturbance and relevant information. Also, the flow of information between entities would be enhanced and a more comprehensive report could be developed.

Discussion of "Impact Event" Reporting

There are situations worthy of reporting because they have the potential to impact reliability. The DSR SDT proposes calling such incidents 'impact events' with the following definition:

> An impact event is any situation that has the potential to significantly impact the reliability of the Bulk Electric System. Such events may originate from malicious intent, accidental behavior, or natural occurrences.

Impact event reporting facilitates situational awareness, which allows potentially impacted parties to prepare for and possibly mitigate the reliability risk. It also provides the raw material, in the case of certain potential reliability threats, to see emerging patterns.

Examples of impact events include:

- Bolts removed from transmission line structures
- Detection of cyber intrusion that meets criteria of CIP-008
- Forced intrusion attempt at a substation
- Train derailment near a transmission right-of-way
- Destruction of Bulk Electrical System equipment

What about sabotage?

One thing became clear in the DSR SDT's discussion concerning sabotage: everyone has a different definition. The current standard CIP-001 elicited the following response from FERC in FERC Order 693, paragraph 471 which states in part: *". . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event."*

Often, the underlying reason for an event is unknown or cannot be confirmed. The DSR SDT believes that reporting material risks to the Bulk Electrical System using the impact event categorization, it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.

The DSR SDT discussed the reliability needs for impact event reporting and will consider guidance found in the document "NERC Guideline: Threat and Incident Reporting" in the development of requirements, which will include clear criteria for reporting.

Certain types of impact events should be reported to NERC, the Department of Homeland Security (DHS), the Federal Bureau of Investigation (FBI), and/or Provincial or local law enforcement. Other types of impact events may have different reporting requirements. For example, an impact event that is related to copper theft may only need to be reported to the local law enforcement authorities. The new standard will specify who has access to reported information about impact events.

Potential Uses of Reportable Information

Event analysis, correlation of data, and trend identification are a few potential uses for the information reported under this standard. As envisioned, the standard will only require Functional entities to report the incidents and provide information or data necessary for these analyses. Other entities (e.g. – NERC, Law Enforcement, etc) will be responsible for performing the analyses. The NERC Rules of Procedure (section 800) provide an overview of the responsibilities of the ERO in regards to analysis and dissemination of information for reliability.

Jurisdictional agencies (which may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE) have other duties and responsibilities.

Collection of Reportable Information or "One stop shopping"

The goal of the DSR SDT is to have one reporting form for all functional entities (US, Canada, Mexico) to submit to NERC. Ultimately, it may make sense to develop an electronic version to expedite completion, sharing and storage. Ideally, entities would complete a single form which could then be distributed to jurisdictional agencies and functional entities as appropriate. Specific reporting forms[1] that exist today (i.e. - OE-417, etc) could be included as part of the electronic form to accommodate US entities with a requirement to submit the form. Or may be removed (but still be mandatory for US entities under Public Law 93-275) to streamline the proposed consolidated reliability standard for all North American entities (US, Canada, Mexico). Jurisdictional agencies may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE. Functional entities may include the RC, TOP, and BA for situational awareness. Applicability of the standard will be determined based on the specific requirements.

The DSR SDT recognizes that some regions require reporting of additional information beyond what is in EOP-004. The DSR SDT is planning to update the listing of reportable events from discussions with jurisdictional agencies, NERC, Regional Entities and stakeholder input. There is a possibility that regional differences may still exist.

The reporting proposed by the DSR SDT is intended to meet the uses and purposes of NERC. The DSR SDT recognizes that other requirements for reporting exist (e.g., DOE-417 reporting), which may duplicate or overlap the information required by NERC. To the extent that other reporting is required, the DSR SDT envisions that duplicate entry of information is not necessary, and the submission of the alternate report will be acceptable to NERC so long as all information required by NERC is submitted. For example, if the NERC Report duplicates information from the DOE form, the DOE report may be included or attached to the NERC report, in lieu of entering that information on the NERC report.

[1] The DOE Reporting Form, OE-417 is currently a part of the EOP-004 standard. If this report is removed from the standard, it should be noted that this form is still required by law as noted on the form: NOTICE: This report is mandatory under Public Law 93-275. Failure to comply may result in criminal fines, civil penalties and other sanctions as provided by law. For the sanctions and the provisions concerning the confidentiality of information submitted on this form, see General Information portion of the instructions. Title 18 USC 1001 makes it a criminal offense for any person knowingly and willingly to make to any Agency or Department of the United States any false, fictitious, or fraudulent statements as to any matter within its jurisdiction.

Unofficial Comment Form for Project 2009-01 — Disturbance and Sabotage Reporting

Please **DO NOT** use this form to submit comments. Please use the electronic form located at the site below to submit comments on the proposed Concepts Paper for Disturbance and Sabotage Reporting. Comments must be submitted by **April 16, 2010**. If you have questions please contact Stephen Crutchfield by email at Stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Background:
The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009 and is progressing toward developing standards based on the SAR. The concepts paper was developed to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT has developed. Please review the redlined SAR and then answer the following questions.

This initial comment period is requesting industry input on the direction herein proposed by the DSR SDT. Should your organization feel that the direction proposed is not the direction that should be pursued then your comments on what direction the SDT should take would be greatly appreciated. The "concept paper" lays out the foundation for the reporting requirements in the standard. We are not seeking input or guidance on the definition of physical or cyber sabotage, what type of disturbances should be reported, who should do reporting, or to whom or what organizations will be receiving the reports. All of these points will be addressed by the SDT in later phases of the project and we will be seeking important industry guidance at those times. The SDT does recognize the importance of all of that data and information, but at this time, we are only seeking input on the direction of the concepts we propose to build upon.

1. The details of reporting requirements and criteria are in the existing EOP-004 standard and its attachments. The DSR SDT discussed the reliability needs for disturbance reporting and will consider guidance found in the document "NERC Guideline: Threat and Incident Reporting" in the development of requirements. Do you agree with using the existing guidance as the foundation for disturbance reporting? Please explain your response (yes or no) in the comment area.

   ☐ Yes

   ☐ No

   Comments:

2. The DSR SDT is considering developing a reporting hierarchy for disturbances that requires entities to submit information to the Reliability Coordinator and then for the Reliability Coordinator to submit the report. Do you agree with this hierarchy concept? Please explain your response (yes or no) in the comment area.

   ☐ Yes

   ☐ No

   Comments:

3. The goal of the DSR SDT is to have one report form for all functional entities (US, Canada, Mexico) to submit to NERC. Do you agree with this change? Please explain your response (yes or no) in the comment area.

   ☐ Yes
   ☐ No

   Comments:

4. The goal of the DSR SDT is to eliminate the need to file duplicate reports. The standards will specify information required by NERC for reliability. To the extent that this information is also required for other reports (e.g. DOE OE-417), those reports will be allowed to supplement the NERC report in lieu of duplicating the entries in the NERC report. Do you agree with this concept? Please explain your response (yes or no) in the comment area.

   ☐ Yes
   ☐ No

   Comments:

5. In its discussion concerning sabotage, the DSR SDT has determined that the spectrum of all sabotage-type events is not well understood throughout the industry. In an effort to provide clarity and guidance, the DSR SDT developed the concept of an impact event.

By developing impact events, it allows us to identify situations in the "gray area" where sabotage is not clearly defined. Other types of events may need to be reported for situational awareness and trend identification. Do you agree with this concept? Please explain your response (yes or no) in the comment area.

☐ Yes

☐ No

Comments:

6. If you are aware of any regional reporting requirements beyond the scope of CIP-001, CIP-008 and EOP-004 please provide them here.

   Comments:

7. If you have any other comments on the Concepts Paper that you haven't already provided in response to the previous questions, please provide them here.

   Comments:

A. Introduction

1. **Title:** **Sabotage Reporting**

2. **Number:** CIP-001-1

3. **Purpose:** Disturbances or unusual occurrences, suspected or determined to be caused by sabotage, shall be reported to the appropriate systems, governmental agencies, and regulatory bodies.

4. **Applicability**

   4.1. Reliability Coordinators.

   4.2. Balancing Authorities.

   4.3. Transmission Operators.

   4.4. Generator Operators.

   4.5. Load Serving Entities.

5. **Effective Date:** January 1, 2007

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection.

R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning sabotage events to appropriate parties in the Interconnection.

R3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall provide its operating personnel with sabotage response guidelines, including personnel to contact, for reporting disturbances due to sabotage events.

R4. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request a procedure (either electronic or hard copy) as defined in Requirement 1

M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request the procedures or guidelines that will be used to confirm that it meets Requirements 2 and 3.

M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request evidence that could include, but is not limited to procedures, policies, a letter of understanding, communication records, or other equivalent evidence that will be used to confirm that it has established communications contacts with the applicable, local FBI or RCMP officials to communicate sabotage events (Requirement 4).

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to verify compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator, Transmission Operator, Generator Operator, Distribution Provider, and Load Serving Entity shall have current, in-force documents available as evidence of compliance as specified in each of the Measures.

If an entity is found non-compliant the entity shall keep information related to the non-compliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance:

2.1. Level 1: There shall be a separate Level 1 non-compliance, for every one of the following requirements that is in violation:

2.1.1 Does not have procedures for the recognition of and for making its operating personnel aware of sabotage events (R1).

2.1.2 Does not have procedures or guidelines for the communication of information concerning sabotage events to appropriate parties in the Interconnection (R2).

2.1.3 Has not established communications contacts, as specified in R4.

2.2. Level 2: Not applicable.

2.3. Level 3: Has not provided its operating personnel with sabotage response procedures or guidelines (R3).

2.4. Level 4:.Not applicable.

E. Regional Differences

None indicated.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Amended

A. Introduction

1. **Title:** **Disturbance Reporting**
2. **Number:** EOP-004-1
3. **Purpose:** Disturbances or unusual occurrences that jeopardize the operation of the Bulk Electric System, or result in system equipment damage or customer interruptions, need to be studied and understood to minimize the likelihood of similar events in the future.
4. **Applicability**
   - **4.1.** Reliability Coordinators.
   - **4.2.** Balancing Authorities.
   - **4.3.** Transmission Operators.
   - **4.4.** Generator Operators.
   - **4.5.** Load Serving Entities.
   - **4.6.** Regional Reliability Organizations.
5. **Effective Date:** January 1, 2007

B. Requirements

R1. Each Regional Reliability Organization shall establish and maintain a Regional reporting procedure to facilitate preparation of preliminary and final disturbance reports.

R2. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity shall promptly analyze Bulk Electric System disturbances on its system or facilities.

R3. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity experiencing a reportable incident shall provide a preliminary written report to its Regional Reliability Organization and NERC.

R3.1. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity shall submit within 24 hours of the disturbance or unusual occurrence either a copy of the report submitted to DOE, or, if no DOE report is required, a copy of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report form. Events that are not identified until some time after they occur shall be reported within 24 hours of being recognized.

R3.2. Applicable reporting forms are provided in Attachments 1-EOP-004 and 2-EOP-004.

R3.3. Under certain adverse conditions, e.g., severe weather, it may not be possible to assess the damage caused by a disturbance and issue a written Interconnection Reliability Operating Limit and Preliminary Disturbance Report within 24 hours. In such cases, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall promptly notify its Regional Reliability Organization(s) and NERC, and verbally provide as much information as is available at that

time. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall then provide timely, periodic verbal updates until adequate information is available to issue a written Preliminary Disturbance Report.

R3.4. If, in the judgment of the Regional Reliability Organization, after consultation with the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity in which a disturbance occurred, a final report is required, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall prepare this report within 60 days. As a minimum, the final report shall have a discussion of the events and its cause, the conclusions reached, and recommendations to prevent recurrence of this type of event. The report shall be subject to Regional Reliability Organization approval.

R4. When a Bulk Electric System disturbance occurs, the Regional Reliability Organization shall make its representatives on the NERC Operating Committee and Disturbance Analysis Working Group available to the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity immediately affected by the disturbance for the purpose of providing any needed assistance in the investigation and to assist in the preparation of a final report.

R5. The Regional Reliability Organization shall track and review the status of all final report recommendations at least twice each year to ensure they are being acted upon in a timely manner. If any recommendation has not been acted on within two years, or if Regional Reliability Organization tracking and review indicates at any time that any recommendation is not being acted on with sufficient diligence, the Regional Reliability Organization shall notify the NERC Planning Committee and Operating Committee of the status of the recommendation(s) and the steps the Regional Reliability Organization has taken to accelerate implementation.

C. Measures

M1. The Regional Reliability Organization shall have and provide upon request as evidence, its current regional reporting procedure that is used to facilitate preparation of preliminary and final disturbance reports. (Requirement 1)

M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity that has a reportable incident shall have and provide upon request evidence that could include, but is not limited to, the preliminary report, computer printouts, operator logs, or other equivalent evidence that will be used to confirm that it prepared and delivered the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports to NERC within 24 hours of its recognition as specified in Requirement 3.1.

M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and/or Load Serving Entity that has a reportable incident shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it provided information verbally as time permitted, when system conditions precluded the preparation of a report in 24 hours. (Requirement 3.3)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations.

Regional Reliability Organizations shall be responsible for compliance monitoring of Reliability Coordinators, Balancing Authorities, Transmission Operators, Generator Operators, and Load-serving Entities.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Regional Reliability Organization shall have its current, in-force, regional reporting procedure as evidence of compliance. (Measure 1)

Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and/or Load Serving Entity that is either involved in a Bulk Electric System disturbance or has a reportable incident shall keep data related to the incident for a year from the event or for the duration of any regional investigation, whichever is longer. (Measures 2 through 4)

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

See Attachments:

- EOP-004 Disturbance Reporting Form
- Table 1 EOP-004

2. Levels of Non-Compliance for a Regional Reliability Organization

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: No current procedure to facilitate preparation of preliminary and final disturbance reports as specified in R1.

3. Levels of Non-Compliance for a Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load- Serving Entity:

3.1. Level 1: There shall be a level one non-compliance if any of the following conditions exist:

3.1.1 Failed to prepare and deliver the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports to NERC within 24 hours of its recognition as specified in Requirement 3.1

3.1.2 Failed to provide disturbance information verbally as time permitted, when system conditions precluded the preparation of a report in 24 hours as specified in R3.3

3.1.3 Failed to prepare a final report within 60 days as specified in R3.4

3.2. Level 2: Not applicable.

3.3. Level 3: Not applicable

3.4. Level 4: Not applicable.

E. Regional Differences

None identified.

Attachment 1-EOP-004
NERC Disturbance Report Form

Introduction

These disturbance reporting requirements apply to all Reliability Coordinators, Balancing Authorities, Transmission Operators, Generator Operators, and Load Serving Entities, and provide a common basis for all NERC disturbance reporting. The entity on whose system a reportable disturbance occurs shall notify NERC and its Regional Reliability Organization of the disturbance using the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report forms. Reports can be sent to NERC via email (esisac@nerc.com) by facsimile (609-452-9550) using the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report forms. If a disturbance is to be reported to the U.S. Department of Energy also, the responding entity may use the DOE reporting form when reporting to NERC. Note: All Emergency Incident and Disturbance Reports (Schedules 1 and 2) sent to DOE shall be simultaneously sent to NERC, preferably electronically at esisac@nerc.com.

The NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports are to be made for any of the following events:

1. The loss of a bulk power transmission component that significantly affects the integrity of interconnected system operations. Generally, a disturbance report will be required if the event results in actions such as:
    a. Modification of operating procedures.
    b. Modification of equipment (e.g. control systems or special protection systems) to prevent reoccurrence of the event.
    c. Identification of valuable lessons learned.
    d. Identification of non-compliance with NERC standards or policies.
    e. Identification of a disturbance that is beyond recognized criteria, i.e. three-phase fault with breaker failure, etc.
    f. Frequency or voltage going below the under-frequency or under-voltage load shed points.
2. The occurrence of an interconnected system separation or system islanding or both.
3. Loss of generation by a Generator Operator, Balancing Authority, or Load-Serving Entity — 2,000 MW or more in the Eastern Interconnection or Western Interconnection and 1,000 MW or more in the ERCOT Interconnection.
4. Equipment failures/system operational actions which result in the loss of firm system demands for more than 15 minutes, as described below:
    a. Entities with a previous year recorded peak demand of more than 3,000 MW are required to report all such losses of firm demands totaling more than 300 MW.
    b. All other entities are required to report all such losses of firm demands totaling more than 200 MW or 50% of the total customers being supplied immediately prior to the incident, whichever is less.
5. Firm load shedding of 100 MW or more to maintain the continuity of the bulk electric system.

6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in:
   a. Sustained voltage excursions equal to or greater than ±10%, or
   b. Major damage to power system components, or
   c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance as defined by steps 1 through 5 above.
7. An Interconnection Reliability Operating Limit (IROL) violation as required in reliability standard TOP-007.
8. Any event that the Operating Committee requests to be submitted to Disturbance Analysis Working Group (DAWG) for review because of the nature of the disturbance and the insight and lessons the electricity supply and delivery industry could learn.

NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report

☐ Check here if this is an Interconnection Reliability Operating Limit (IROL) violation report.

1.	Organization filing report.

Attachment 2-EOP-004
U.S. Department of Energy Disturbance Reporting Requirements

Introduction

The U.S. Department of Energy (DOE), under its relevant authorities, has established mandatory reporting requirements for electric emergency incidents and disturbances in the United States. DOE collects this information from the electric power industry on Form OE-417 to meet its overall national security and Federal Energy Management Agency's Federal Response Plan (FRP) responsibilities. DOE will use the data from this form to obtain current information regarding emergency situations on U.S. electric energy supply systems. DOE's Energy Information Administration (EIA) will use the data for reporting on electric power emergency incidents and disturbances in monthly EIA reports. In addition, the data may be used to develop legislative recommendations, reports to the Congress and as a basis for DOE investigations following severe, prolonged, or repeated electric power reliability problems.

Every Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity must use this form to submit mandatory reports of electric power system incidents or disturbances to the DOE Operations Center, which operates on a 24-hour basis, seven days a week. All other entities operating electric systems have filing responsibilities to provide information to the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity when necessary for their reporting obligations and to file form OE-417 in cases where these entities will not be involved. EIA requests that it be notified of those that plan to file jointly and of those electric entities that want to file separately.

Special reporting provisions exist for those electric utilities located within the United States, but for whom Reliability Coordinator oversight responsibilities are handled by electrical systems located across an international border. A foreign utility handling U.S. Balancing Authority responsibilities, may wish to file this information voluntarily to the DOE. Any U.S.-based utility in this international situation needs to inform DOE that these filings will come from a foreign-based electric system or file the required reports themselves.

Form EIA-417 must be submitted to the DOE Operations Center if any one of the following applies (see Table 1-EOP-004-0 — Summary of NERC and DOE Reporting Requirements for Major Electric System Emergencies):

1. Uncontrolled loss of 300 MW or more of firm system load for more than 15 minutes from a single incident.
2. Load shedding of 100 MW or more implemented under emergency operational policy.
3. System-wide voltage reductions of 3 percent or more.
4. Public appeal to reduce the use of electricity for purposes of maintaining the continuity of the electric power system.
5. Actual or suspected physical attacks that could impact electric power system adequacy or reliability; or vandalism, which target components of any security system. Actual or suspected cyber or communications attacks that could impact electric power system adequacy or vulnerability.

6. Actual or suspected cyber or communications attacks that could impact electric power system adequacy or vulnerability.
7. Fuel supply emergencies that could impact electric power system adequacy or reliability.
8. Loss of electric service to more than 50,000 customers for one hour or more.
9. Complete operational failure or shut-down of the transmission and/or distribution electrical system.

The initial DOE Emergency Incident and Disturbance Report (form OE-417 – Schedule 1) shall be submitted to the DOE Operations Center within 60 minutes of the time of the system disruption. Complete information may not be available at the time of the disruption. However, provide as much information as is known or suspected at the time of the initial filing. If the incident is having a critical impact on operations, a telephone notification to the DOE Operations Center (202-586-8100) is acceptable, pending submission of the completed form OE-417. Electronic submission via an on-line web-based form is the preferred method of notification. However, electronic submission by facsimile or email is acceptable.

An updated form OE-417 (Schedule 1 and 2) is due within 48 hours of the event to provide complete disruption information. Electronic submission via facsimile or email is the preferred method of notification. Detailed DOE Incident and Disturbance reporting requirements can be found at: http://www.oe.netl.doe.gov/oe417.aspx.

Table 1-EOP-004-0 Summary of NERC and DOE Reporting Requirements for Major Electric System Emergencies				
Incident No.	**Incident**	**Threshold**	**Report Required**	**Time**
1	Uncontrolled loss of Firm System Load	≥ 300 MW – 15 minutes or more	OE – Sch-1 OE – Sch-2	1 hour 48 hour
2	Load Shedding	≥ 100 MW under emergency operational policy	OE – Sch-1 OE – Sch-2	1 hour 48 hour
3	Voltage Reductions	3% or more – applied system-wide	OE – Sch-1 OE – Sch-2	1 hour 48 hour
4	Public Appeals	Emergency conditions to reduce demand	OE – Sch-1 OE – Sch-2	1 hour 48 hour
5	Physical sabotage, terrorism or vandalism	On physical security systems – suspected or real	OE – Sch-1 OE – Sch-2	1 hour 48 hour
6	Cyber sabotage, terrorism or vandalism	If the attempt is believed to have or did happen	OE – Sch-1 OE – Sch-2	1 hour 48 hour
7	Fuel supply emergencies	Fuel inventory or hydro storage levels ≤ 50% of normal	OE – Sch-1 OE – Sch-2	1 hour 48 hour
8	Loss of electric service	≥ 50,000 for 1 hour or more	OE – Sch-1 OE – Sch-2	1 hour 48 hour
9	Complete operation failure of electrical system	If isolated or interconnected electrical systems suffer total electrical system collapse	OE – Sch-1 OE – Sch-2	1 hour 48 hour
All DOE OE-417 Schedule 1 reports are to be filed within 60-minutes after the start of an incident or disturbance All DOE OE-417 Schedule 2 reports are to be filed within 48-hours after the start of an incident or disturbance				
All entities required to file a DOE OE-417 report (Schedule 1 & 2) shall send a copy of these reports to NERC simultaneously, but no later than 24 hours after the start of the incident or disturbance.				
Incident No.	**Incident**	**Threshold**	**Report Required**	**Time**
1	Loss of major system component	Significantly affects integrity of interconnected system operations	NERC Prelim Final report	24 hour 60 day

2	Interconnected system separation or system islanding	Total system shutdown Partial shutdown, separation, or islanding	NERC Prelim Final report	24 hour 60 day
3	Loss of generation	≥ 2,000 – Eastern Interconnection ≥ 2,000 – Western Interconnection ≥ 1,000 – ERCOT Interconnection	NERC Prelim Final report	24 hour 60 day
4	Loss of firm load ≥15-minutes	Entities with peak demand ≥3,000: loss ≥300 MW All others ≥200MW or 50% of total demand	NERC Prelim Final report	24 hour 60 day
5	Firm load shedding	≥100 MW to maintain continuity of bulk system	NERC Prelim Final report	24 hour 60 day
6	System operation or operation actions resulting in:	• Voltage excursions ≥10% • Major damage to system components • Failure, degradation, or misoperation of SPS	NERC Prelim Final report	24 hour 60 day
7	IROL violation	Reliability standard TOP-007.	NERC Prelim Final report	72 hour 60 day
8	As requested by ORS Chairman	Due to nature of disturbance & usefulness to industry (lessons learned)	NERC Prelim Final report	24 hour 60 day
All NERC Operating Security Limit and Preliminary Disturbance reports will be filed within 24 hours after the start of the incident. If an entity must file a DOE OE-417 report on an incident, which requires a NERC Preliminary report, the Entity may use the DOE OE-417 form for both DOE and NERC reports.				
Any entity reporting a DOE or NERC incident or disturbance has the responsibility to also notify its Regional Reliability Organization.

Standards Announcement

Comment Period Open
March 17–April 16, 2010

Now available at: http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Project 2009-01: Disturbance and Sabotage Reporting
The Disturbance and Sabotage Reporting Drafting Team is seeking comments on a proposed concepts paper for disturbance and sabotage reporting **until 8 p.m. Eastern on April 16, 2010.**

The concepts paper lays out the foundation for the reporting requirements in the standard and was developed to solicit stakeholder input regarding the drafting team's proposed reporting concepts.

Instructions
Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Lauren Koller at Lauren.Koller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page: http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Next Steps
The drafting team will draft and post responses to comments received during this period.

Project Background
This project will entail revising existing standards CIP-001-1 — Sabotage Reporting and EOP-004-1 — Disturbance Reporting to eliminate redundancies and provide clarity on sabotage events. The project will address several issues identified by stakeholders, as well as FERC directives from Order 693. The other changes may include improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Standards Development Process
The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance,
please contact Lauren Koller at Lauren.Koller@nerc.net

	Exelon
	Exelon Transmission Strategy & Compliance
	Yes
	No
	Some of the DOE related reporting is driven by distribution events, i.e. outages greater then 50,000 customers, is it realistic to expect the RC, whose focus is on the transmission system to perform distribution related reporting?
	Yes
	Yes
	No
	We agree with the direction to identify impact events examples that would trigger reporting and not be limited to sabotage reporting only. It is important to note that when an incident occurs, some level of investigation is required before a determination can be made as to the event is sabotage or not. The focus should be on reporting events when they occur and allow follow-up investigations to make the sabotage determination. That being said, care must be taken in the development of any list of impact events so that it doesn't become or is misinterpreted to be a definitive list. Therefore if it is not on the list, it is not reportable.
	At the 2010 RFC Spring Workshop the following disturbance reporting Criteria was rolled out: All events that are required to be reported by the OE-417 and EOP-004 criteria will use those published procedures. For other events that do not meet the OE-417 and EOP-004 reporting criteria, ReliabilityFirst expects to receive notification of any events involving a sustained outage of multiple BES facilities (buses, lines, generators, and/or transformers, etc.) that are in close proximity (electrically) to one another and occur in a short time frame (such as a few minutes).
	You should consider providing clear and concise instructions as to the expectation on submitting forms, i.e. the DOE 417. There should be no guessing as to when and how reports should be submitted and who should receive them. Specific details on reporting criteria should be included.

	Steve Fisher
	Lands Energy Consulting
	No
	My firm provides compliance consulting services to a number of smaller (50-700 MW peak load) LSE/DP registered entities. EOP-004 creates an obligation for LSEs to report "disturbances" that affect their systems. A few of the smaller of these systems receive service from Bonneville-owned transmission lines that serve only 4-6 substations. The NERC Form establishes loss of 50% of the LSE's retail customers as a reportable disturbances. One of my clients receives service from BPA at 5 substations. A single industrial customer with a substantially dedicated

	substation comprises 90% of the utility's MWH load. Were it not for this customer, the utility would have been well below the registration requirement for a DP/LSE. The balance of the load, about 15 MW of peak and 4000 retail customers, is served from 5 substations. Four of these substations serving 3000 customers are served from a long Bonneville 115 kV BES transmission line that runs through a heavily treed right of way. Every time this single line experiences a permanent outage (which will happen a few times a year), the utility loses less than 10 MW of load, but 75% of its retail customers. Under the disturbance reporting criteria, this outage would constitute a reportable disturbance for the utility. When the NERC disturbance reporting criteria were adopted, I doubt that anyone conceived that they would apply to cases like I just desribed. Reporting trivial events like I've just described constitutes a nuisance to the entity making the report and NERC/WECC for having to process the report. The outage has no earthly effect on the reliability of the BES and certainly doesn't warrant preparation of any kind of disturbance report.
	Yes
	I would give the RC the authority to establish impact thresholds for reporting. Consistent with my earlier comment, I would set the materiality threshold for disturbance reporting purposes at LSEs (or a combination of LSEs in the case of BPA) serving at least 90,000 customers.
	Yes
	I think that the impact approach makes sense and that EOP-004 and CIP-001 are logically connected. Many entities of which I am aware link Sabotage Reporting Training to Disturbance Reporting obligation awareness already.
	Yes
	Less paperwork and fewer requirements to keep in mind during what may be once in a lifetime events are always good.
	No
	The level of complexity described will overwhelm the 20-200 employee utilities that have yet to see - and will never see - the kind of sabotage event that scares the Department of Homeland Security.
	I believe WECC sets its loss of load criteria for disturbance reporting at 200 MW rather than the 300 MW in the NERC reporting form.
	The lack of common sense that leads to a 15 MW loss of load resulting from a 115 kV line outage being catagorized as a "reportable disturbance" really hurts the credibility of the entire NERC Compliance Program. The smaller utilities look at application of EOP-004 in particular to their operation and conclude that either the EO/RRO is: a. stupid; or b. Out to persecute the smaller utilities. In reality, EOP-004 was drafted for application to Southern California Edison, where loss of 50% of customers would be 2-3 million customers. Now that's really disturbing!
	Individual
	David Kahly
	Kootenai Electric Cooperative
	No
	Impact events seems to add another layer of uncertainty to the reporting. Define a transmission line. Our transmission lines have very little impact on the grid. It is possible for our lines to cause a local area outage on our transmission provider - but neither is of national security interest or even regional interest. There is no power flow going on across the lines other than local power delivery supply. It seems you run more risk of losing the important reports in the snow of reporting - similar to what we have to avoid on our SCADA systems for our operators to see the key information.
	Group
	Northeast Power Coordinating Council
	Northeast Power Coordinating Council
	Yes
	In considering guidance found in the document “NERC Guideline: Threat and Incident Reporting”, the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
	No
	This is not a standards issue, and NERC should not dictate the reporting structure. It should be left to the RCs and their members.
	Yes

	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
	Yes
	We agree with the objective of eliminating duplicate reporting. However, EOP-004 currently allows substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today. We agree with the recommendation to eliminate the need for filing duplicate reports such as the DOE form OE-417. There is no benefit with regard to CIP-001 in filing separate reports. Duplicate reports introduce the potential for incomplete information to be supplied to responsible parties. Removing jurisdictional agencies from the Standard, and having NERC provide either query or situational awareness to those agencies being considered, might not be easy to achieve. There is an obligation under law to require entities to report to the DOE on the OE-417 form as amended or modified. This might drive the “omitted” agencies to have reporting laws enacted as well.
	No
	We believe that physical and cyber events must be investigated before a determination of sabotage or impact event can be made. The purpose of the NERC Standards is to maintain the reliability of the BES. Therefore, impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on ‘newsworthy’ events or to gather information for trending. It is the law enforcement industry’s responsibility to make a determination of “sabotage” or other. This determination cannot definitively be made by industry personnel, there is no expertise or time to investigate causes. It is the industry’s job to mitigate effects. Examples would help provide for better guidance/direction. Industry examples would be welcomed to help reinforce developed internal processes for compliance.
	SERC and RFC are developing additional requirements at this time. We suggest that reporting be based on impact to reliability, not on ‘newsworthy’ events. We therefore do not agree with such regional efforts and would prefer a continent wide reporting requirement.
	a. NERC should focus efforts on developing specific event reporting criteria and not base the requirement on the definition of the term ‘sabotage’, but on the reporting criteria itself. See comments above. b. The “opportunities for efficiency” discussed in the Concept Paper would be best achieved by focusing on those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. If there are elements that need to be reported that do not support this objective, then that reporting should not be required in reliability standards. Consider making NERC the distributor of reports to other agencies. We recognize that the key is to simplify reporting to a single form, and to the extent possible, to one agency. “Front line” reliability personnel must have the “timely” knowledge to know when a situation warrants local, area, regional, or national involvement.

	Darryl Curtis
	Oncor Electric Delivery Company LLC
	Yes
	NERC Guideline: Threat and Incident Reporting" document should be used for guidance as it identifies best practices for reporting.
	Yes
	Oncor agrees that with this reporting hierarchy, in that dual reporting should be elminated
	Yes
	Oncor agrees that by using the same type reporting format, there should be consistency in regard to each functional entity's expectations.
	Yes
	Oncor agrees that this effort should eliminate file duplication
	Yes
	Oncor agrees that there are no broadly used guidance documents that detail how an event may be accurately defined.
	Oncor is not aware of any regional reporting requirements beyond the scope of CIP-001, CIP-008 and EOP-004.
	Group
	SERC Reliability Coordinator Sub-committee (RCS)
	SERC RCS
	No
	Routine minor incidents such as copper theft and gun shots to insulators should not be reported. These types of minor events do not affect the reliability of the BPS. Existing reporting requirements are satisfactory. The focus of reporting should be on reliability related incidents and not incidents related to vandalism as such.

	No
	The RC should not be responsible for submitting the report to FERC, NERC or the RRO. The RC may not have the necessary first hand information concerning the facts of the event. Situation awareness can be maintained by including the RC in the distribution of any sabotage related reporting.
	Yes
	There should only be one report for all functional entities.
	No
	The requirement should be a single report that satisfies the need for all US governmental agencies as well as NERC and the RRO's.
	No
	Impact events that do not afffect reliability should not be reported.
	We are not aware of any regional reporting requirements beyond the requirements of CIP-001, CIP-008 and EOP-004. However, the SERC RRO has shared a list of events of interest that it would like to be made aware of to maintain situation awareness.
	None.

	APS supports standard revisions which streamline the reporting process for security incidents with a single form, which aligns both with EIA reporting and NERC Standards requirements, particularly those identified in the NERC Threat and Incident Reporting Guidelines. This would eliminate users issuing reports to multiple locations/government entities without a standard form or format. The DOE 417 form which is currently utilized for reporting purposes is out-dated and does not account for the types of incidents as identified in the NERC Threat and Incident Reporting Guidelines. The guidelines state that an entity can report security incidents to the ESISAC , through CIPIS (Critical Infrastructure Protection Information System), and or RCIS (Reliability Coordinator Information Center). CIPIS refers an entity to the NICC and to the WECC. Additionally, APS proposes that the terms and timelines of reporting security incidents be clearly identified. Events are often detected quickly or immediately. Determining whether or not the event was sabotage and/or a reportable event; however, typically takes much longer. There is no time allowance for an entity to investigate the event to determine what actually occurred. Currently, DOE 417 provides that acts of sabotage should be reported within one hour of detection if the impact could affect the reliable operation of the bulk power system. This may affect the accuracy of the information being provided by an entity on it's initial reporting. Finally, provisions should be incorporated to address the privacy of information being submitted, including handling and storage.
	Yes
	All disturbance reporting should go through the RC.
	Yes
	APS supports the standardization of the form for consistency and format.
	Yes
	APS supports eliminating the need to file duplicate reports. This standardized form should generate and send the DOE OE-417 report, totally eliminating duplicate work. Streamline the process.
	Individual
	Edward Bedder
	Orange and Rockland Utilities, Inc.
	Yes
	However, the SDT needs to maintain clear demarcation for the criteria for reporting events, and only those events that directly effect the reliability of the BES.
	Yes
	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System. The reporting hierarchy should be to submit the information to the Reliability Coordinator, and to have the RC submit the report. This would eliminate the duplication of information.

	Yes
	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
	Yes
	No
	Physical and cyber events must be investigated before a determination of sabotage or impact event can be made. Impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on 'newsworthy' events or to gather information for trending. It is the law enforcement industry's responsibility to make a determination of "sabotage" or other. This determination cannot definitively be made by industry (operating) personnel. If NERC's definition is expanded for CIP-001 and/or EOP-004, responsibility and timing of reporting needs to addressed so that appropriate agencies conduct the investigation and assessment. Operating personnel need to remain focused on the primary responsibility of mitigating the effects.
	NERC's SDT effort requires a clear, consistent, and comprehensive continent-wide approach, thus mitigating any need for regional reporting requirements.
	Individual
	Kasia Mihalchuk
	Manitoba Hydro
	Yes
	The "Threat and Incident Reporting" document contains a lot of detailed information which greatly assists in determining reporting events and weaning out non important events. The document contains some examples and expected reporting time lines. Attachment 1-EOP-004, though considerably smaller and condensed it does contain some detail not mentioned in "Threat and Incident Reporting". Integrating the "Threat and Incident Reporting" into Attachment 1-EOP-004, though large in size, has lots of information and is easy to follow would be a large improvement to existing protocol OR SEE QUESTION 3 COMMENTS. Incidences we have experienced on our system, in past were difficult to delineate as reportable, who to report to and when. An improvement to this Standard is welcome.
	Yes
	The Reporting Concept states that the new hierarchy is, " Affected entity to TOP/ BA to RC. Then the RC will then submit to NERC and DOE (if required)". This will enhance the existing requirement EOP-004-1 R4 which states that the RC shall assist the affected entity by providing representatives to assist in the investigation (this is also all reiterated in Attachment 1-EOP-004) . In an disturbance, the local resources would be tied up in the rectification of the problem. Analyzing and reporting the event (is it reportable, who to report to, what is the timeline) is distracting and time consuming. By leaving the final upper level steps of reporting to NERC/DOE by the RC would be efficient.
	Yes
	This is a promising idea, though there would be different requirements for the three countries, this could easily be rectified with "drop down menus". This electronic form could contain a lot of information without distracting clutter as you "tree" down the menu depending on the event that occurred. This could also contain electronic references to information located in Attachment 1-EOP-004 and Threat and Incident Reporting.
	Yes
	This could be easily incorporated into the electronic form. You could be prompted for information required immediately, and notified for information that could be entered later. This form could contain all the enterable data that all agencies could require. If the form is live and on line, all entities could be notified (depending on the entries) of an going event immediately. Form could be web based similar to ARS program or even integrated into the ARS program.
	Yes
	Though there are some specific events already included in this new definition, more could be added to dissolve specific "gray areas" and as new ones come up. Again these examples could be added into the electronic form and could contain a large data base which would be available depending on the event that occurred.
	No. CIP-001 contains references to NERC and the DOE. CIP-008 makes exclusions for facilities regulated by US Nuclear Regulatory Commission and Canadian Nuclear Safety Commission. It also contains references to ES ISAC (Electricity Sector Information Sharing and Analysis Center). EOP-004 contains reference to NERC and DOE There is no reference to Homeland Security, FBI, etc or to Canadian equivalent references in any of these Standards. When NERC is notified of an event, it is likely other organizations will have to be notified. There should be some sort of consistency to cover all these Standards and all notifiable parties at a NERC Standards level.
	No

	E.ON U.S. believe that the guidelines provide greater clarity for reporting forced outages caused by disturbances and sabotage but there remains issues that in need of further clarification. For example, there remains too much subjectivity on the reporting of forced outages when there is “identification of valuable lessons learned”
	Yes
	The hierarchy will simplify reporting from the entity in that the RC is always notified and then the RC notifies other parties as required, (with the exception of OE-417, which still has to be filled out per law) E.ON U.S. recommends that the drafting team pay particular attention to the report process to make sure that duplicate reports are not being required. Currently information on forced outages is already communicated to the RC so formalizing a requirement to provide data to the RC may represent duplication to reports already provided.
	Yes
	E.ON U.S. supports the proposal.
	No
	Reliability standards are federal law enforced by fines that can reach up to $1,000,000 per day of violation. There is no reason to deliberately include ambiguity, i.e. “gray areas,” in requirements such that registered entities are left unable to determine what it is they must do or refrain from doing to remain compliant. “Sabotage” for the purposes of these standards must be defined. .

	This process is in place and utilities are familiar with it. This is a good place to start.
	Yes
	PGE is familiar with and works closely with WECC today so the hierarchial consideration makes sense.
	Yes
	PGE supports the efforts of the Standards Drafting Team on the SAR for Project 2009-01 to consolidate the disturbance and saborage reporting processes as outlined in the concept paper.
	Yes
	PGE supports reducing the duplication of reporting.
	Yes
	PGE supports the DSR SDT's efforts to bring clarity and guidance to the spectrum of sabotage-type events.
	Individual
	Gregory Miller
	BGE
	Yes
	We have no problem with NERC using the existing guidance as the foundation for disturbance reporting; however, since this project proposes to investigate incorporation of the Cyber Incident reporting aspects of CIP-008, we feel that if adopted, this concept should be added to the NERC Guideline document "Threat and Incident Reporting".
	No
	As currently worded, BGE opposes the reporting hierarchy concept, since insufficient guidelines were proposed to prevent translation errors between the responsible entity (RE) and the RC. In addition to creating possible reporting errors, this also opens a risk that the RC could misrepresent the true intent of an RE's report contents if called upon to explain/justify a submitted report. Reporting delays are another concern with this proposal because the RE would basically be relinquishing control of the reporting process to the RC, while ultimately retaining the responsibility for ensuring the report gets submitted within the required timeframe. However, BGE recognizes that avoiding duplication and conflicting reports as well as encouraging communication are valuable. To make the reporting hierarchy concept acceptable to BGE, the DSR SDT must develop proper controls to ensure the RE has the ability to control or approve the information submitted and/or subsequently discussed with the respective authorities, and that it is done within the permissible timeframe to satisfy compliance requirements.
	Yes
	One form makes sense to us; less is better is the sense that it makes filing reports easier by not creating unnecessary complications.
	Yes
	We agree with this approach, as long as the latest version of the DOE OE-417 form is fully incorporated in the new single-reporting form, so that it maintains its credibility with the DOE.
	Yes
	We agree that "the spectrum of all sabotage-type events is not well understood throughout the industry"; however, we feel that the proposed concept of an "Impact Event" falls short of clarifying what constitutes such events. We believe that "Impact Events" needs further clarification to eliminate "gray areas" and to provide more reporting consistency between entities.
	We are not aware of any regional requirements beyond the scope of CIP-001, CIP-008 and EOP-004.
	1. If we move to a "one size fits all" single reporting form, it is important that the form be properly developed to cover any foreseeable event, which appears to be the intent of the DSR SDT, as outlined on page 4 of the concept document. Such an approach should also incorporate a single point of contact for reporting information, to avoid any confusion. 2. We would like clarification that any proposed CIP-008-related reporting requirement (including any linked reporting requirement between CIP-008 and CIP-001) is only applicable in situations where the incident/event involves a registered entity's Critical Cyber Asset.

	Individual
	Dan Roethemeyer
	Dynegy Inc.
	Yes
	We agree with using the guidance; however, please consider revising the NERC Guideline: Threat and Incident Reporting document to (i) lengthen the reporting timelines related to attempted sabotage to allow for additional time to deem the threat credible, (ii) expand the description of forced outage of generation greater than 2000 MW to include whether it is at the BA or GO level and if GO level, whether it is for one site or the combined GO's sites in a Region, and (iii) add a Responsible Party column to the Appendix A matrix.
	Yes
	This seems to be straightforward approach in that the RC is the best judge of threats to the overall system and could eliminate multiple reports of a single event.
	Yes
	Please keep it short and simple.
	Yes
	Short and simple should be the goal.
	Yes
	We agree with the concept but please provide specific examples. Also, please consider whether their are any penalties for misinterpreting an incident, who would determine if an event was a threat, and whether this could result in over reporting non-threats.
	Please consider MISO RTO-OP-023.
	N/A
	Group
	Electric Market Policy
	Dominion Resources Services, Inc.
	Yes
	Yes; however, in considering guidance found in the document “NERC Guideline: Threat and Incident Reporting” the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
	Yes
	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System.
	Yes
	Yes, we agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC.
	Yes
	Yes, we agree with the objective of eliminating duplicate reporting; however, EOP-004 currently allows substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today.
	Yes
	We believe that physical and cyber events must be investigated before a determination of sabotage or impact event can be made.
	SERC and RFC are developing additional requirements at this time. We suggest that reporting be based on impact to reliability, not on ‘newsworthy’ events. We therefore do not agree with such regional efforts and would prefer a continent wide reporting requirements.
	a. NERC should focus efforts on developing specific event reporting criteria and not base the requirement on the definition of the term ‘sabotage’ but on the reporting criteria itself. b. The “opportunities for efficiency” discussed in the Concept Paper would be best achieved by focusing on those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. If there are elements that need to be reported that do not support this objective, than that reporting should not be required in reliability standards.
	Individual
	Rick Terrill
	Luminant

	No
	While the guidance is generally ok in the “NERC Guideline: Threat and Incidence Reporting”, the reporting timelines include 1 hour, 2 hours, 4 hours, 6 hours, 8 hours, 24 hours, and 48 hours. Please simplify and reduce the variation in timelines. When it comes to Sabotage reporting, some time requirements start with detection, some start with determination of sabotage and some events do not specify the trigger for the reporting clock to start. Again, please provide clarity and consistency around the start of the timeline for reporting. Generally, the reporting timing should start with the recognition or determination that a suspected or known sabotage event occurred.
	Yes
	Luminant believes that one report should be filed with the Reliability Coordinator or one responsible entity, who then files the report with all applicable entities.
	Yes
	Luminant agrees with the concept of reducing reporting requirements, but asks the SDT to go even further. In the concept paper, the SDT discussed that information would not be duplicated on the NERC report and the DOE OE-417 report. The concept paper described a process where one report would simply supplement the other, but two reports would still be filed when required. Can the NERC SDT work with the DOE to develop one report to meet the needs of NERC and the DOE?
	No
	Luminant would prefer to report disturbances and sabotage events. The reporting of impact events could lead to unnecessary reporting. A definition of an “impact event” may be even more confusing than sabotage events.
	Luminant disagrees with the direction of utilizing impact events, as this is an expansion in scope beyond the simplification of sabotage and disturbance reporting.
	Group
	MRO's NERC Standards Review Subcommittee
	Midwestreliability Organization
	No
	We agree with using the present documentation but would like just one reporting form. We are concerned that the guidelines and reporting periods specified within the DOE OE-417 report conflict with the NERC Guidelines. For example. DOE OE-417 report requires “Suspected Physical or Cyber Impairment” to be reported within 6 hours. The NERC guidelines indicate “Suspected Activities” are to be reported within 1 hour. We recommend the SDT use the DOE OE-417 report as a guiding document, and then determine additional reporting requirements using guidance from the NERC Guideline. FERC Order 693 appears to indicate conflicts and confusion with NERC reporting requirements and DOE reporting requirements should be eliminated.
	No
	We agree a coordinated reporting process is beneficial for the entity and the Reliability Coordinator (RC). However, a hierarchy would likely lengthen the reporting timeframe, or reduce the allotted time for each entity to provide notification to the RC in order to meet DOE or NERC timelines. Communication and coordination with the RC would likely provide more accurate and complete data submissions within a timely process and create shared accountability for the report being submitted.
	Yes
	However, We believe the primary goal should focus on “each entity” being able to submit one report for all functional requirements. Entities in the US that are required to submit the DOE OE-417 form should not be required to submit an additional form developed for other entities (Canada & Mexico). One approach to satisfy this goal is for NERC to require all entities (US, Canada, & Mexico) to complete the DOE OE-417 form as their report.
	Yes
	We agree with the concept to eliminate duplicate reports. However, we are concerned with the reference of the DOE OE-417 report being a “supplement” of the NERC report rather than “accepted” as the NERC report.
	No
	Rather than attempting to define a new term (impact event), we suggest that the concept of impact event be replaced with further defining sabotage and providing guidance on trigger events (impact event) that would cause an entity to report.
	No Comment.
	Confusion often arises in the industry between the CIP standards and other reliability standards based on CIP-001 naming convention. We would suggest the SDT retire CIP-001 and incorporate requirements within the EOP-004 standard or a new EOP-xxx standard to avoid confusion rising from CIP and other NERC Reliability Standards. Additionally, we assume the SDT has been created to specifically address FERC Order 693 directives to the ERO which appears to include the following items: 1. Applicability – “possible revisions to CIP-001-1 that address our concerns regarding the need for wider application of the Reliability Standard… the ERO should consider whether separate, less burdensome requirements for smaller entities may be appropriate” (FERC, 2007, para. 460). 2. Definition of Sabotage – “we direct that the ERO further define the term and provide guidance on triggering events

	that would cause an entity to report an event… we believe the term sabotage is commonly understood and that common understanding should suffice in most instances… the ERO should consider FirstEnergy's suggestions to differentiate between cyber and physical sabotage and develop a threshold of materiality." (FERC, 2007, para. 461-462) 3. Periodic Review and Testing – "directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures." (FERC, 2007, para. 466) 4. Redundant Reporting – "now direct the ERO to address our underlying concern regarding mandatory reporting of a sabotage event… Regarding the potential for redundant reporting under CIP-001-1 and other government reporting standards, and the need for greater coordination… We direct the ERO to explore ways to address these concerns – including central coordination of sabotage reports and a uniform reporting format… with the appropriate governmental agencies that have levied the reporting requirements." (FERC, 2007, para. 468-469) 5. Specified Time – "the Commission directs the ERO to modify CIP-001-1 to require an applicable entity to contact appropriate governmental authorities in the event of sabotage within a specified period of time… the ERO should consider suggestions raised… to define the specified period for reporting an incident beginning from when an event is discovered or suspected to be sabotage" (FERC, 2007, para. 470). 6. Summary of CIP-001-1 – "the Commission directs the ERO to develop the following modifications… (1) further define sabotage and provide guidance as to the triggering events… (2) specify baseline requirements regarding… procedures for recognizing sabotage events… (3) incorporate a periodic review… and for the periodic testing… (4) require an applicable specified period of time. In addition… address our concerns regarding applicability to smaller entities… consolidation of the sabotage reporting forms and the sabotage reporting channels with the appropriate governmental authorities to minimize the impact of these reporting requirements on all entities." (FERC, 2007, para. 471) 7. Analyze Performance – "at a minimum, generator operators and LSEs should analyze the performance of their equipment and provide the data… The Commission directs the ERO to consider this concern in future revisions… that includes any Requirements necessary for users, owners and operators… to provide data that will assist NERC" (FERC, 2007, para. 613, 617). 8. Reporting Time Frames – "The Commission directs the ERO to change its Rules of Procedures to assure that the Commission also receives these reports within the same time frames as the DOE." (FERC, 2007, para. 618)

	At least not exclusively. The current standards and the guidance fail to consider that different registered entities will have different scopes of awareness for when disturbances may take place. We want to avoid the situation where a generator (for example) is cited for failure to report a disturbance of which they have way of knowing occurred.
	Yes
	Yes
	There should have probably been one report all along.
	Yes
	Duplication is inefficient and casts the whole reporting mechanism in a questionable light.
	Yes
	The term sabotage was always too narrow a concept for the standards. At times, questionable activities are not confirmed as sabotage events until well after the fact, forcing the registered entity to speculate on whether or not to report an activity that may not be a confirmed sabotage event at the time, and hence encounter another silly violation based on imprecise terminology.
	Again, please consider the unique scope of the entities to which these standards are to comply. Don't dump all the requirements on all the applicable entities and perpetuate the current practice of forcing them to parse the requirements into what is logical or illogical from their perspective. The drafting team should have the expertise to do this. Identify which requirements apply to which applicable entity.

	Calpine Corp.
	Yes
	Yes
	A Functional Entity such as a Generator Owner/Operator is not always aware that an event, such as a plant trip, is part of a wider system disturbance that rises to the level of a reportable event under EOP-004. A reporting hierarchy that allows a Generator to report the facts to its Transmission Operator and have that entity take a wider view to determine whether there is a disturbance should facilitate the reporting of actual disturbances. The SDT needs to ensure that some thought goes into the flow of information within the hierarchy and what triggers are needed to drive the reporting up the hierarchy.

	Yes
	A single approach is desirable, particularly for those entities that find themselves in multiple regions or countries.
	Yes
	Clarification, simplicity and the removal of duplicate reporting is beneficial.

	The guidance document makes no distinction between entities that operate 24/7 dispatch and those that don't. The 1 hour and even the 24 hour reporting requirements in some cases will be impossible for entities without 24/7 dispatch to meet without changing business practices. These are the same entities that present little or no risk to the BES.
	Yes
	In the west at least, this hierarchy should be extended to include BA's as indicated in the Concepts Paper. See http://www.bpa.gov/corporate/business/reliability/Docs/2007/PNSC_RE_Data_Letter_2_070723.pdf for the RC's policy on which entities it chooses to communicate with.
	Yes
	The existing reporting is needlessly complex. We appreciate the SDT's goal.
	Yes
	The existing reporting is needlessly complex. We appreciate the SDT's goal.
	Yes
	An act of vandalism may have impact. An act of sabotage may not be impactful alone, but may be part of a wider coordinated attack. Dictionary definitions speaking of "intent" are not helpful in this regard, since acts of vandalism and sabotage are both generally committed intentionally. Saboteurs, though, work for a higher cause. That cause may be political, social, environmental, etc. We ask that the SDT look beyond dictionary definitions in developing a definition of sabotage.

USBR
Yes
The reporting outlined in the proposed plan does not include a clear indication of how NERC will use the information they collect from the entities. Care needs to be taken in addressing the reporting requirements to not create a more confusing or onerous reporting process.
No
The existing reporting methods collect reports of disturbances and analyze them by committees of the respective coordinating councils. The new process would introduce a duplicate layer and associated staffing. It would be better to ensure communication between the existing committees of the respective coordinating councils and the RC rather than creating a new layer of review tracking and analysis. While the layered reporting hierarchy discussed in the Disturbance Reporting section of the paper will eventually help with overall event awareness, the additional delays the hierarchical approach could result in a decrease in situational (timely) awareness. Having more comprehensive information as a result of the potential enhancements each layer adds to the chain of reporting may not be more valuable than timely and well disseminated information in an actual disturbance situation. We would suggest the SDT give careful consideration to this proposed direction. It may be appropriate to consider that expedited reporting of operational impacts would outweigh the benefit of administratively intensive reporting procedures. The events reported through the existing process have not yielded material feedback other than statistical analysis. Statistical analysis is not as sensitive to timely reporting. Operational impacts which may be the result of possible sabotage may be evident through assessment of widespread outage patterns or following event analysis. Comprehensive event analysis can take anywhere from 15 days to 90 days depending on the event.
Yes
The Bureau of Reclamation utilizes a form for tracking unexpected events. This form contains information which the agency considers important for its one reliability improvement program. The form is also used to meet NERC standard requirements for protection system operations analysis. This form contains most of information required by DOE. The SDT should consider requiring the submission of specific information rather than lock responses in one specific form. In this manner the agency would be avoid duplicate forms, one for NERC, the other for agency purposes.
Yes
It should be clear what information is to be supplemented. The fewer times the information has to be handled the more efficient the process becomes. If the information exists on a required form, that legal form should be allowed. Also, if the form is already submitted, then reference to it should be sufficient rather than requiring resubmission of the form. That would require handling the information again. As explained in the previous answer, the SDT should recognize that responsible entities have already developed internal reporting processes which utilize forms for consistent responses. Those forms may contain more information than is needed by the new standard to be proposed. The entity should be allowed to submit the internal form or else duplication would be created, which may reduce the effectiveness of an entities reliability improvement program.
Yes
There should be a clear distinction between a cyber event and a cyber event that has a material impact on the reliability of the bulk electric system. Not all CIP-008 events will carry such a distinction. That being said, CIP 008 cannot be completely incorporated in this process. Denying access to a cyber asset is noteworthy under CIP008 but may not pose a threat to the reliability of the bulk electric system. Consider recognizing the impact on the bulk electric system when modifying definitions of adding the bulk electric system description to the definitions. This will help to clarify that disturbances, as discussed in this effort, are situations that produce an abnormal condition on the electric power system, not necessarily on ancillary or supporting systems, such as SCADA systems or the water-related systems at hydroelectric dams.
The concept of "threat" evaluation criteria is somewhat vague and a great care is needed to ensure it is clear enough that the most individuals would be able to analyze an event and end up at the same threat. Otherwise it would be almost impossible to ensure compliance with a requirement which cannot accurately describe criteria to be used to ensure that proper evaluation has occurred.

Wolverine Power Supply Cooperative, Inc.
Yes
I agree with referencing existing guidelines - However: My concern is that, until all reportable incidents are anaylzed by the parties to which they are reported, their "impact" on the BES will not be quantified. Therefore, the tendency to want to "report all events so that their impact can be determined" or "report all events because the information can be utilized for informational purposes, regardless of impact on BES" might lead to expanded reporting requirements, some of which may have questionable value from a reliability standpoint.
Yes
From the persepective of a TOP, this seems to alleviate reporting burden and move it upline. I can understand the logic in wanting the reporting to flow through the RC for awareness purposes, but I can understand the RC's reluctance to bear the additional potential burden. Again, a focused effort to minimize the necessary reporting to 'true impact events" should be kept in mind, regardless of who has to report. Collecting reams of data and figuring out what

	impact it has later should not be the goal.
	Yes
	I can't see how anyone would disgaree with this concept - However - I question how practical it will be to implement, since various agencies would have to collaborate and coordinate to accomplish this task.
	Yes
	I agree with the concept of minimizing duplication - See previous question 3 for concerns.
	Yes
	I agree with the concept of focusing on impact instead of the type of event (sabotage, accident, vandalism, etc.) I hope that the reporting proposal that comes out of this project will clearly make a separation between true impact events that must be reported per the standards (enforceable), vs. "other" information that may be (electively - not enforceable) reported, per some set of guidelines.
	The concepts of removing duplication, consolidation, and focusing on "impact events" sound logical. I am concerned that the focus may drift to expanded reporting, not reduced reporting.

	Thad Ness
	American Electric Power
	Yes
	Yes
	This approach may work as long as there is a uniform process across all of the Reliability Coordinators. AEP owns and operates BES facilities under three separate RCs and having differing rules and processes would create confusion and additional burdens. There are some concerns about the time lag of reporting the information and this might not work well in all cases especially if the information and knowledge are at the local level. AEP recommends that the standard could have a default hierarchy, but this should not prohibit any entity from reporting directly.
	Yes
	Yes
	Yes

	James McCloskey
	Central Hudson Gas & Electric
	Yes
	Central Hudson agrees with using the “NERC Guideline: Threat and Incident Reporting” in the development of requirements. Central Hudson has currently in place a NERC-DOE Threat and Incident Reporting Table developed from this NERC Guideline that allows for a quick-reference to all threat and incident reporting criteria (arranged by category)with a cross-reference to the specfic reporting form (NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report, DOE Form OE-417, or NERC ES-ISAC Threat and Incident Report Form). Central Hudson recommends maintaining the option of utilizing only 1 form, the DOE Form OE-417, for incidents that require reporting to the DOE and NERC to maintain the streamlined approach to this reporting process.
	Yes
	Central Hudson agrees with this reporting hierarchy for disturbances given the "wider-view" of the Reliability Coordinator as opposed to an entity such as a Transmission Owner or Load-Serving Entity. While, based on past experience, the current process works if reports are filed to the DOE, RRO, and RC simultaneously via email for example. However, the RC is in a better position to identify multi-site incidents and escalate the reporting process if necessary.
	Yes
	Central Hudson agress with this goal if the intent is to develop and implement an electronic version that would meet DOE requirements as well.
	Yes

	Central Hudson agrees with this concept and, as stated in a previous response, recommends that the ability of utilizing the DOE OE-417 to supplement the NERC report be maintained.
	Yes
	Central Hudson agrees with this concept, particularly if the reporting hierarchy through the RC is implemented in order to better identify trends.
	Although not beyond the scope of these standards, NPCC maintains a document and reporting form (Document C-17 - Procedures for Monitoring and Reporting Critical Operating Tool Failures) that outlines the reporting requirements, responsibilities, and obligations of NPCC RCs in response to unforeseen critical operating tool failures.
	The NERC Guideline: Threat and Incident Reporting Attachment A matrix is an extremely beneficial document that organizes reporting criteria. However, it identifies communications systems failure sub-category under the Equipment And/Or Systems Failure category as reportable with a reference to OE-417 - Schedule 1, Item 10. Item 10 on Schedule 1 addresses only failures due to attacks (not failures for other resaons).

	We Energies
	No
	While the NERC Guideline includes readily discernible information (and we would like to see that format carried forward into any future documentation), utilize OE-417 as the foundation document in order to eliminate reporting redundancies. If supplemental references are necessary for the proposed resolution, list the document as an official attachment to the standard. Minimize the need to search in multiple locations for guideline information – some may not be aware supporting documentation exists without explicit reference within the standard.
	Yes
	A hierarchical approach in conjunction with a single, electronic form would provide consistent reporting timelines, provide clarity in the reporting process, and provide more accurate and meaningful data submissions while having shared accountability. Confusion in the current method could be alleviated while providing more consistency in the reporting of an "impact event".
	Yes
	Agree in conjunction with proposed concept that DOE OE-417 will be allowed to supplement the NERC report in lieu of duplicating entries.
	Yes
	However, also evaluate whether or not DOE OE-417 is sufficient in lieu of a NERC report. If additional information is required, duplicate format of DOE-OE-417 with additional NERC information listed at the end of the form.
	Yes
	We would prefer to refer to all sabotage, vandalism, cyber attacks, and other criminal behavior as impact events. Focusing more on the event's impact on reliability and its ramifications on the systems seems to be more useful than to try to determine the intent of the perpetrator.
	What is meant by beyond the scope of the referenced standards? We Energies also has reporting obligations with the MISO RC (MISO OP-023), RFC (PRC-002-RFC-01), and the Wisconsin and Michigan Public Service Commissions.

	Give consideration to combining CIP-001 and EOP-004-1 through a common categorization. For example, “System Risk Reporting” could encompass both actual and potential events and would minimize the need to cross reference both standards, and provide one location for event and potential-event reporting. Much of the challenge in this project is in achieving a common understanding of the words sabotage and terrorism. There are nuances of meaning in the words that imply a relationship between the attacker and the victim, or a motive other than simple profit or mischief. This nuance of meaning requires the victim of the damage to discern a relationship or motive which may not be discoverable in the relatively brief time window during which the entity must report the event. In fact, they may never be known. Consequently, We Energies recommends elimination of the words sabotage and terrorism from these standards. We also recommend elimination of the word vandalism since it also implies an ability and duty to discern whether a particular act (barbed wire thrown over transformer bushings) was done out of pure mischief (vandalism) or with intent to destroy equipment for a political purpose (terrorism). And if the act was committed by a disgruntled employee, it becomes sabotage. No wonder there is confusion and indecision. Instead, We Energies recommends using the simple words “criminal damage”. One need not be a prosecuting attorney or FBI Special Agent to know what this means. Simply ask, “Does is look like somebody damaged it (or hacked in) intentionally?” and, “Did we give consent?” and you’re done. With elimination of sabotage, terrorism and vandalism, and all of their baggage, comes the ability to integrate both CIP 001 and EOP 004. We now have criminal damage (or cyber attack) as just another event to be evaluated against certain pre-defined impact measures. No value judgments, no speculation. Another benefit of using these simple words and tests is that operating personnel, whether in the field or at the console, will not require special awareness training in discerning these nuances of meaning. They already have experience with the equipment or cyber systems and its normal performance. Operating personnel can readily assess whether an impact event is due to equipment failure, weather or animal contact vs. intentionally caused by a person. If it appears to be criminal damage, call the local police agency. Report the event and the impact. Cooperate with the investigation. Share your knowledge of the normal condition of the equipment or performance of the system. Share your experience with similar events. It will be important to highlight that the theft of all the grounding pigtails in a substation is different from the act of simply snipping each of them to leave the equipment electrically floating. The technical condition is the same, but this allows the police to make an inference with respect to motive, suspect profile, sophistication, etc. That’s their job. They may ask us to speculate on the motive or skills of the attacker. That's okay. But at least we don't have to know or guess at it for the purpose of determining whether to report the event. No training required. With respect to notification to the FBI, We Energies recommends that the standard merely state that the owner of the damaged asset ensure the local office of the FBI is notified. The standard should permit documentation of either a direct phone call by the asset owner or obtaining an assurance from the local police that they will do so. There should be no need to prove earlier establishment of a relationship with the FBI. There should be no expectation that the entity have a signed letter from the FBI Special Agent in Charge acknowledging his agency’s duty. This document means nothing. With respect to reporting within the industry, We Energies recommends that the only events to be reported “up the chain” are those that we choose to characterize as “impact events”. That is, the events that meet some measurable threshold with respect to BES impact. We should describe these efficiently to avoid over-reporting of trivial events. It is apparent that we are already over-reporting since DHS HITRAC recently fed back to the industry that copper thieves attacked a substation in San Bernardino, CA taking some of the grounding conductors. The industry should have the option to report non-impact events that are unusual in some respect and which may have some mutual industry benefit in terms of prevention, awareness or recovery. Attack attempts with no impact, or observations of suspicious activity could fall into this optional category. These optional reports could be aggregated by the entity for the purpose of detecting patterns or trends, or be reported ad hoc. The ES-ISAC should be the recipient of the reports. It should be the single point of contact since it has the industry insight, engineering expertise and cross-sector relationships to analyze and return valuable intelligence to the industry. With the ES-ISAC as the recipient of the reports, efficient sharing with Federal agencies, with the regional entities and with neighboring asset owners could be automated and rapid. There is much benefit to be gained from this project, primarily in the area of creating clarity and uniformity. There is some risk that the reporting requirements will become onerous and prescriptive.

	No
	The existing guidelines ignore the fact that there are currently three overlapping and inconsistent reporting requirements for disturbances of various types: CIP-001, EOP-004, and DOE OE-417. The reporting should be such that any single event type needs to be reported only once, and to only a single agency, for any disturbance. First, CIP-001 events should be reported to the ES-ISAC under one specific requirement (or set of requirements) and removed from OE-417 and EOP-004, such that all interested agencies obtain their information from only that one source. Second, OE-417 events should be reportable ONLY to DOE, and, again, other agencies should obtain their information from only that one source. If NERC wishes to make such reporting mandatory and enforceable, the NERC requirements should indicate ONLY that such reporting should be made in accordance with OE-417. Finally, EOP-004 (or similar requirements) should require reporting to NERC ONLY in the case of events that don’t fit under CIP-001 or OE-417 requirements. Alternatively, OE-417 should be submitted ONLY to NERC and they should disseminate the information. EOP-004 has several issues and inconsistencies: a. EOP-004 requires that the entity that submits form DOE-417 to provide copies to NERC. The DOE-417 form intermixes NERC entity definitions (e.g. BA, LSE, TO) with generic terms such as “Electric Utilities” and “Generating Entities”. Is it the Generator Owner or Generator Operator that is required to submit the information? There should be one form or at least well defined definitions that apply to both forms. b. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-0 which purports to summarize the standard appears to change this requirement to 1 hour for several disturbances. Additionally, it incorrectly summaries the reporting time for 50,000 customers, which is 6 hours in DOE-417 and summarized in Table 1-EOP-004-0 as 1-hour. An attachment to a standard should not be allowed to supersede the standard or create additional rules. c. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-

	0 which purports to summarize the standard appears to change the standard. R3.1 clearly states that events are to be reported within 24 hours of identification, however Table 1-EOP-004-0 state that the events are to be reported on the basis of the start of the disturbance. An attachment to a standard should not be allowed to supersede the standard or create additional rules. d. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-0 which purports to summarize the standard appears to change the standard. R3.1 clearly states that events are to be reported within 24 hours of identification, however Table 1-EOP-004-0 states that copies of DOE-417 are required to be submitted "simultaneously". It also states that schedules 1 and 2 are due within 24 hours of start of the event instead of 48 hours for per DOE-417 for schedule 2. An attachment to a standard should not be allowed to supersede the standard or create additional rules. e. The requirement of loss of customers should be scaled based on customers served. Loss of 50,000 customers to a utility that serves 100,000 customers is different than loss of 50,000 customers to a utility that serves 2,000,000 customers.
	No
	It would be inefficient for RC's to accumulate ALL disturbance data and submit it, and to bifurcate the reporting based on type of disturbance above and beyond OE-417 data (which should go ONLY to DOE) would make a standard very involved for an entity to comply with. We're discussing after-event data here, not data needed for current operations – and there's no reason to make it any more complicated than necessary.
	Yes
	Agreed – to the extent that it's consistent with the concept that any specific type of data is submitted to ONLY one entity.
	No
	NERC should either coordinate with DOE for a single reporting process or simply adopt the DOE's standard.
	Yes
	We agree with the concept, however, based on the information provided, it may be too vague to be of value. Terms such as "potential" and "significant" can be subjective and therefore provide little direction. We would like to see something more specific. Also, inclusion of the destruction of BES assets may be too inclusive and needs to be restricted to BES assets that will cause a specific level of impact on reliability.
	Group
	Western Electricity Coodinating Council
	WECC
	Yes
	It is comprehensive; however, we must keep in mind that the OE-417 is required under Public Law 93-275 and needs to be attached if applicable in the US.
	Yes
	There should be an established time sequence that allows the RC to review the entities material prior to forwarding to NERC. By channelling all reports through the RC situational awareness will be enhanced. Instead of "submit information", it should be clarified that entities submit complete written reports to RC in electronic format.
	Yes
	Canadian and Mexican entities should be consulted on content of report form to assure their "buy in".
	No
	This will work well for the USA entities to save us time in re-entering the same information. We believe that FERC and NERC and the Regions should have one common reporting form for North America. The OE-417 is not required by law outside of the United States. Canadian and Mexican entities may feel that US DOE has no juristiction in these countries, and therefore no right to required reporting as is stated on the OE-417.
	Yes
	This will help eliminate regional differences in sabotage reporting. The definition should be broad enough so it covers new types of sabotage that may evolve. Event analysis facilitates situational awareness and if it requires further investigation regarding developing patterns and severity, it should be handled by law enforcement if need be.
	There is a need to learn what reporting requirements are required by the Mexican and Canadian entities.
	As stated previously, for "One stop shopping" we need "buy in" from the foreign nationals. The way to do this is to engage their opinions and respect their juristictional agencies as well.

	Amir Hammad
	Constellation Power Source Generation
	Yes
	The existing guidance is an excellent base on which to build changes to EOP-004 and CIP-001. However, the SDT

	must challenge each item in the different event categories and clarify or omit bullet points that are seemingly vague. For example, under System Disturbances, a forced outage report is needed when “a generation asset of 500 MW or above is on a forced outage for unknown reasons, or a forced outage of generation of 2,000 MW occurs…” Simply removing the 500 MW criteria would make this criterion less vague. There are other examples of this in the guideline.
	Yes
	As stated in the concept paper, a hierarchy ensures proper communications, but it has the added benefit of reducing redundancy on the Registered Entities, so long as responsibilities and accountability are clearly established.
	Yes
	Yes
	Constellation agrees with the concept of eliminating the need to file duplicate reports. If the single NERC reporting form is both comprehensive and easy to use, then using a single report should not be an issue. It is essential that all elements of DOE OE-417, and any similar documents, be incorporated into this single report. Not incorporating all elements will result in gaps in reporting for all Registered Entities.
	No
	Although defining an impact event would bring clarity to defining sabotage events, adding another situation would further complicate things. Furthermore, the examples of impact events used all fall under the Sabotage category in the Threat and Incident Reporting Guideline. Constellation Power Generation suggests the SDT further clarifies the items in the Sabotage category to ensure all grey area situations are included. Clarification is also needed in how a Cyber Security Incident (CIP-008) would map into the categories of Disturbance/Impact Events (CIP-001). To that point, Constellation Power Generation questions whether cyber related incidents should fall under the spectrum of sabotage type events, or remain separate and be incorporated in the CIP revisions. Having cyber related incidents separate from other sabotage events would provide the clarity and guidance that the DSR SDT is striving to achieve.
	Constellation Power Generation would like clarification that any proposed CIP-008-related reporting requirement (including any linked reporting requirement between CIP-008 and CIP-001) is only applicable in situations where the incident/event involves a registered entity’s Critical Cyber Asset. In that vein, we want to emphasize the importance of the DSR SDT working with the CIP SDT on the cyber related events. If the DSR SDT is going to be adding clarity to cyber related events, then coordination with the CIP SDT is needed to ensure the same verbiage is being used. Furthermore, having any duplication of requirements will cause a double jeopardy scenario which would go against the SAR for the DSR SDT. As stated earlier, Constellation Power Generation also questions whether cyber related incidents should fall under the spectrum of sabotage type events, or remain separate and be incorporated in the CIP revisions.

	Public Service Enterprise Group Companies
	PSE&G
	Yes
	EOP reportable disturbances are familiar concepts in the industry.
	Yes
	The PSEG Companies believe that all entities with a reportable disturbance should report to the RC. The RC is best positioned to evaluate the impact of the event and forward the information to the appropriate entities. There should not be any intermediate entities to relay information to the RC as that can introduce delay and has the potential to introduce transcription errors. Sabotage events should be reported to the RC as well as to law enforcement. CIP-008 reporting is highly specialized and should be retained in the set of cyber security standards, not merged with CIP-001 and EOP-004.
	No
	While simplification and consistency is a laudable goal, it should not be applied to different governmental agencies (USA, Canada, Mexico) which may have different structures and processes. Moreover, results based standards should not include administrative matters such as reporting forms.
	Yes
	The PSEG Companies agree with the avoidance of duplicate reports. NERC report forms should not include anything in the DOE form, and NERC Regional report forms should not include anything in the DOE or NERC forms. Hence, a DOE report should not "supplement" a NERC form, but rather replace it unless the NERC form calls for other information for the same reportable incident, and likewise for the DOE - NERC - Regional form structure. DOE forms would be filed with DOE, NERC and the Regional Entity where the event originated. NERC forms would be filed with NERC and the region where the event originated and the Regional form filed only with the Region. In designing the NERC and Regional forms, the need to file multiple reports should be minimized, and in no event should any of the three (DOE, NERC, Region) forms contain duplicative information requests.
	Yes
	The PSEG Companies agree with the concept, but reserve judgment on the descriptions of the impacts. There is clearly a need to better define what constitutes a sabotage incident versus common theft or vandalism. Moreover,

	where it may be impossible to determine if any given incident (e.g., several loose bolts on a transmission tower cross brace could be sabotage or could be human error in construction) falls within sabotage, a registered entity should not be second guessed in an audit if the registered entity determines not to report. Excessive unnecessary reporting can mask real incidents.
	The PSEG Companies believe that RFC is developing a regional disturbance reporting requirement for events not meeting the criteria of current DOE and NERC reports.
	If reporting does become the responsibility of the Reliability Coordinators, the RCIS should be made available view-only to registered entities with a notification when RC's have posted new entries. That will enhance the situational awareness of registered entities. The PSEG Companies disagree with inclusion of CIP-008 reporting requirements as part of the CIP-001 and EOP-004 initiative. CIP-008 reporting as part of the cyber security set of NERC standards is usually managed by specialized corporate organizations separate from those involved with the other NERC standards, and with highly specialized cyber skill sets. CIP-008 reporting requirements should remain where they are, and any perceived need for improvement addressed in the ongoing CIP Version 4 development process.
	Individual
	Greg Rowland
	Duke Energy
	Yes
	No
	The RC should not be responsible for submitting the report to FERC, NERC or the RRO. The RC may not have the necessary first hand information concerning the facts of the event. Situation awareness can be maintained by including the RC in the distribution of any sabotage related reporting.
	Yes
	There should only be one report for all functional entities to submit to NERC.
	Yes
	Since the OE-417 is a DOE required report, it must be submitted. Including the OE-417 as part of the NERC electronic form will facilitate reporting to NERC.
	No
	As FERC ordered in Order No. 693, the drafting team should further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event. Suggested definition: “Sabotage – the malicious destruction of, or damage to assets of the electric industry, with the intention of disrupting or adversely affecting the reliability of the electric grid for the purposes of weakening the critical infrastructure of our nation.”
	None
	We don’t think CIP-001, EOP-004 and cyber incident reporting aspects of CIP-008 should all be combined into one standard, because of the significant differences between sabotage and disturbances. We have suggested that the drafting team further define sabotage, and we have included a suggested definition in our response to question #5 above. Sabotage is very specific due to the intent (for the purpose of weakening the critical infrastructure), and the potential impact to the BES. We believe that sabotage and cyber incident reporting should remain a part of the CIP Standards due to the emphasis placed on the criticality and vulnerability of the assets needed to support reliable operation of the BES. Cyber Security and Physical Security could be placed together in the same standard (remain in CIP) and other disturbances (i.e., accidental, natural) in a separate standard. “One stop shopping” for reporting is still possible as long as the OE-417 form is included as part of the NERC electronic form. And while we agree with the need for additional clarity in sabotage and disturbance reporting, we believe that the Standards Drafting Team should carefully consider whether there is a reliability-related need for each requirement. Some disturbance reporting requirements are triggered not just to assist in real-time reliability but also to identify lessons-learned opportunities. If disturbance and sabotage reporting continue to be reliability standards, we believe that all linkages to lessons-learned/improvements need to be stripped out. We have other forums to identify lessons-learned opportunities and to follow-up on those opportunities.
	Group
	ERCOT ISO
	ERCOT ISO
	Parts of the Guideline are helpful, but the guideline goes beyond the scope of the requirements of the current standards, which could pose potential audit concerns. ERCOT ISO strongly feels this approach for reporting should be focused on physical events only and cyber event reporting should be contained within CIP-008 only. Continue to keep physical separate from cyber.
	No
	There are some events that are truly local and should be handled by local entities and reported to local authorities (i.e. theft). If there is an impact or potential to have an impact to the BES or to the region, then hierarchical reporting would be appropriate.
	Yes

	Standardization ensures consistency and relevance of the information received.
	ERCOT ISO agrees with the concept of eliminating the need to file duplicate reports, but as stated in the Concept Paper, the DOE form (OE-417) is required by law. Based on this, the elimination of EOP-004 (after the fact reporting) is essential, since the OE-417 is mandatory and all-inclusive.
	ERCOT ISO recognizes the risks associated with "gray areas" not being clarified. While "gray areas" pose compliance risk due to differing interpretations, a risk remains that some items will go unreported. A more prescriptive approach raises an even greater risk of events not being reported. People will not report events that are not specifically listed, and will not use judgment in determining the need for reporting.
	All references to CIP-008 should be removed and we reassert that physical and cyber reporting should be separate. There is documentation available from the CIPC that the drafting team considered CIP-001 related physical sabotage reporting and specified cyber incident reporting requirements in CIP-008. ERCOT ISO requests the DSR SDT to continue to improve its guidelines and to post those guidelines for all to use, but not to create sanctionable standards whose good intentions could result in unintended adverse consequences for the Industry. ERCOT ISO also suggests that all reporting forms and guidance should be located in a central, easily accessible location, eliminating confusion and simplify reporting for system operators thereby directly enhancing reliability during system events. The industry would benefit from a central location or link on the NERC website containing all reporting forms.
	Group
	ISO RTO Council Standards Review Committee
	IESO
	Yes
	The guidelines in EOP-004 and its attachments should be retained as the foundation for reporting disturbances. One would note that such EOP Disturbances are relatively well defined reliability impacts. Thus EOP-004 disturbances are based on HOW certain events impacted the BES. [Sabotage on the other hand requires an implication of WHY an event occurred.] The original EOP-004 represents a common sense approach to defining reliability events that may be useful to analyze on a regional basis. In the current environment, Regions are not sanctionable entities but they still are valuable sources to collect, analyze and trend the few disturbances that occur in each region. To make use of Regions, however, precludes the use of sanctionable NERC standards. EOP-004 as written does not meet the NERC requirements for standards but it does meet the Industry needs for a guideline for reporting events that deserve to be reviewed. The SDT should propose deleting EOP-004 and use it as a Disturbance Reporting Guideline.
	No
	The idea of a reporting hierarchy provides an easy to follow pro forma approach. But disturbance reports should not always follow a common reporting path. A disturbance on the transmission system for example need not be routed through an "if applicable" Balancing Authority. To mandate that a BA be in the path is inappropriate. To leave the applicability open is to create a subjective compliance problem for the impacted BA. Copper theft is another example that should not require reporting up through the RC. It is a local issue and the Transmission Owner should be able to report this directly to the appropriate parties. How would a DP, LSE or GO know if an event is an "impact event"? The posed impact events are a series of conditions for sabotage but not for EOP-type disturbances. The aforementioned entities have no requirement to monitor and analyze the BES, which then means every event would be an impact event for those entities (not an EOP disturbance but an impact event). Thus every theft of copper is an impact event mandating a Disturbance Report even though the SDT notes the RC only has to send it to the "local authorities". This seems to be a misuse of the RC resources; every train derailment is an impact event requiring a Disturbance report (is that a commercial train, regional rail line a local trolley car); every teenage prank would also generate an impact event mandating a disturbance report. The SDT defined impact events are not appropriate for use in defining disturbances. There is a big difference from creating a set of guidelines to follow as opposed to creating sanctionable standards
	No
	The SRC supports NERC's initiative for Results Based Standards. The SRC understood RBS to mean the results were reliability based quantities not administrative quantities. There is no need for a NERC Reliability standard on reporting. The idea that all functional entities in each of the said countries will use one form would be a good idea if and only if all the countries and all of their agencies were willing to accept that form. The SRC does not believe that those agencies will be willing to cede what information they ask for to NERC; nor that NERC will be able to create a single form that all such agencies will accept.
	No
	The concept of eliminating duplication is laudable, but the idea of writing a standard to mandate reporting that involves reporting to governmental areas does not make sense unless NERC will do all of the reporting for the Industry. A governmental agency is as likely as not to change the forms they require which would then mean two different reports (one for NERC and one for the given agency) or that the standard would have to be re-written every time there is a change.
	No
	The nature of the fact that "gray areas" exists preclude the idea of using a standard to report; particularly a standard for the vague topic of motivation such as sabotage events and the more defined disturbance events.
	The FERC Order merely asked NERC to "further define sabotage and provide guidance as to the triggering events

	that would cause an entity to report a sabotage event." There is no requirement to create a Reporting Standard and no mention of Disturbance events. There is a strong need to avoid heavy-handed use of NERC standards particularly for such post event reporting guidelines. The SRC would urge the DSR SDT to continue to improve its guidelines and to post those guidelines for all to use, but not to create sanctionable standards whose good intentions will inevitably result in many unintended adverse consequences for the Industry. Rather, the SDT should seek to retire sanctionable requirements that require event reporting in favor of guidelines for reporting.
	Group
	Bonneville Power Administration
	BPA, Transmission Reliability Program
	No
	BPA likes the idea of consolidating information and eliminating duplication of reported information. In the report, don't include every detail possible found in the "Threat Guideline". TOP's are supposed to be operating the electrical system, not doing investigative work for copper theft incidents (see comment on #5).
	No
	The RC is made aware of these type of incidents and goes right back to incorporating that in their awareness and to focusing on system reliability. If the RC is the recipient for further distribution of information of this type they will be forever going back for more information. Eliminate the middleman in whatever concept you propose, folks have plenty to do now. Let people make good judgments with the direct field people on the seriousness of the breach with their security personnel contacting the appropriate law enforcement agency. (Or are you looking to do a simple RE reports to the RC who marks various category items on a secure website Yes/No category item indicator that can be rolled up in ES-ISAC mapboard.?)
	Yes
	As long as we don't make one form that requires extraneous information for the sake of having agreement.
	Yes
	Minimizing the number of reports is a good thing. The concept of actually sharing information should be utilized as much as practical.
	Yes
	BPA agrees with providing an industry-wide definition and guideline. We do NOT agree with requiring reports for every instance of every activity. If your definition is good, you'll get what is needed and not much chaff.
	Individual
	Kirit Shah
	Ameren
	Yes
	We agree that it makes sense to build upon existing documentation. However, we do not believe it is necessary to require event reporting to be in an enforceable standard. Rather the drafting team should consider developing a reporting guideline document and retiring the EOP-004 standard.
	Yes
	The heirarchy is appealing in the fact that the TOP/BA will be kept in the loop and receive critical information from the Generators, Distribution, LSE, etc. But there will be an inherent delay in reporting due to the fact that at every hand-off of information there will be questions for additional and/or clarified information, and there is always a possibility for the loss of information due to the transfer from one entity to the next. Further, this reporting through a heirarchy could also take away from the operators ability to respond to system events due to being tied to an information transfer ladder.
	Yes
	One report would be great for this standard. While this standard needs simplification and automation, we strongly suggest developing a guideline for reporting rather than enforceable standards.
	No
	The DOE OE-417 report should not supplement the NERC report due to the fact that the majority of reportable events are defined in/come from the OE-417 report. The NERC reporting form should be based on the OE-417 report and then include additional reporting requirements defined by NERC. However, it does not make sense to require reporting to the governmental agencies through enforceable NERC standards. The governmental agencies already have legal authority to compel reporting.
	While we are not opposed to the concept of identifying impact events, we are concerned that the drafting team may actually be expanding reporting requirements. We do not support expansion of reporting requirements unless a clear

	reliability or legal need is identified. Some of the impact events are almost never sabotage and do not warrant reporting for reliability needs and should not be included. For example, copper theft should not require reporting, in general, because it is almost never sabotage and rarely impacts reliability. If it does impact reliability because, for example, the protection system is impacted and causes more significant potential contingencies, then reporting could be required. Why is a train derailment near a transmission right of way significant? It would only be significant if an investigation identified sabotage as the reason. Furthermore, what is considered near?
	Group
	Midwest ISO Standards Collaborators
	Midwest ISO
	Yes
	We agree that it makes sense to build upon existing documentation. However, we do not believe it is necessary to require event reporting to be in an enforceable standard. Rather the drafting team should consider developing a reporting guideline document and retiring the EOP-004 standard. This is further supported by the fact that there is a role in the existing standard for the Regional Entities even though these requirements can't be enforced against the Regional Entities because they are not a user, owner or operator of the system.
	No
	We do not agree with developing a hierarchy for reporting for all disturbances and impacting events. For instance, copper theft is an example of an item that should be reported to the appropriate entities directly by the Transmission Owner. The RC does not need to be made aware of every copper theft unless it has a direct impact on reliability (affects rating, protection system, etc.) and the RC should not be burdened with expending resources for this reporting. A further example in which the hierarchy is not needed would be the case in which only one entity is impacted. If a significant event occurs on one TOP's system, then the TOP should be able to handle the reporting of all entities under its purview.. If more than one TOP is involved, then it would be necessary to involve the RC in the reporting.
	Yes
	We agree with the goal of having a single report form but believe there will be a significant challenge to get varying governmental agencies to agree on single report format.
	No
	It certainly makes sense to eliminate duplication in reporting and to allow supplemental information to be submitted in other reports. However, it does not make sense to require reporting to other governmental agencies through NERC enforceable NERC standards. Those governmental agencies already have legal authority to compel reporting. Again, we support developing a guideline for reporting rather than enforceable standards. The guideline could certainly explain the various reporting requirements and supplemental reporting requirements mentioned in the question without causing the issues we have identified in our comments.
	No
	We agree with the idea of identifying impact events but do not support the requirement for these to be always reported through the hierarchical structure identified in question 2. If an impact event only affects one entity, that entity should have the reporting requirement.
	While we are not opposed to the concept of identifying impact events, we are concerned that the drafting team may actually be expanding reporting requirements. We do not support expansion of reporting requirements unless a clear reliability or legal need is identified. Some of the impact events are almost never sabotage and do not warrant reporting for reliability needs and should not be included. For example, copper theft should not require reporting, in general, because it is almost never sabotage and rarely impacts reliability. If it does impact reliability because, for example, the protection system is impacted and causes more significant potential contingencies, then reporting could be required. Why is a train derailment near a transmission right of way significant? It would only be significant if an investigation identified sabotage as the reason. Furthermore, what is considered near?
	Group
	FirstEnergy
	FirstEnergy Corp.
	Yes
	This guideline appears to be a good starting point for developing consistency in reporting. However, we believe that after-the-fact event reporting is administrative in nature and seldom rises to the level of mandated reliability standard requirements. It is not clear what reporting would be made through this effort and how it differs from reporting made through the NERC Reliability Coordinator Information System (RCIS). With the initiative for more results-based standards being the goal of NERC, true after the fact reporting-type requirements should become administrative procedures and only be included in standards if they are truly required for preserving an Adequate Level of Reliability. If there are aspects that rise to be retained in a mandatory and enforceable reliability standard, we propose that those associated with sabotage be moved to CIP-001 and that EOP-004 be focused on operational disturbances that warrant a wide area knowledge. However, if the RCIS is the mechanism to convey real-time information and that is presently occurring outside of reliability standards, it is unclear what the delta improvement this project aims to achieve.

	No
	While we appreciate the team's effort to serialize the reporting process, with the electronic communication methods available today, it seems that reporting can be accomplished simultaneously to multiple entities without shifting the burden of reporting to others along the communications path. This is particularly true if the reporting format is standardized to a one-size-fits-all report. Additionally, it would be a great burden to the Reliability Coordinator to review all events perceived by entities to be malicious sabotage events.
	No
	While one consistent form for reporting may simplify reporting requirements, it would be very difficult to get all governmental agencies to agree to a one-size-fits all approach.
	Yes
	We agree that the simplification and consistency of reporting will improve the reporting of this information. We support the drafting team's efforts in this area and hope that all regulatory agencies will as well. However, as we have mentioned in our other comments, the reporting requirements should not be in a reliability standard unless they are proven to be necessary to maintain an Adequate Level of Reliability of the BES. Reporting of these events should be required by NERC in arenas outside of the standards.
	Yes
	The concept paper makes good progress in this area and the drafting team is on the right track, and agree that better clarity needs to be developed surrounding sabotage events. However, some of the examples stated in the paper are too vague and do not address extenuating circumstances or reasons for the events. One example sighted in the paper is "Bolts removed from transmission line structures." This statement may be too broad. For instance, if the bolts are removed from the tower and the organization is not experiencing a labor dispute, it could be considered a sabotage event with wide area implications. However, if the organization is in the middle of a labor dispute, this would be vandalism and would most likely not be of a wide area concern. Also, the number and location of towers affected could be an important determination related to the risk the event imposes on the Bulk Electric System.
	We fully agree that sabotage events need to be more clearly defined and reporting requirements need to be better coordinated. But as we have stated in previous comments, the drafting team needs to determine if standard requirements need to be developed for this type of reporting or if this is better left to administrative requirements outside the standards arena. Also, while we appreciate the team's effort to simplify reporting requirements for entities, we are concerned with the serial communication offered by the concept paper. As an example, the team proposes to have LSE report the incident to the BA and/or TOP and then have the BA and/or TOP report it to the RC and the RC to report it to NERC and the NERC report to the regulatory agencies. While this simplifies it for each individual organization, this method introduces many opportunities for errors and miscommunications. Since this is after-the-fact reporting, it is difficult to defend this type of communication path when one consistent report could be sent simultaneously to all agencies at the same time from the originating location.
	Individual
	Dan Rochester
	Independent Electricity System Operator
	Yes
	Yes
	We do not agree with the need of such a hierarchy setup solely for the purpose of making reports to the need-to-know entities. All responsible entities (RC, BA, TOP, etc.) need to file a report. With the proposed set up noted under Q3, which we support, these reports should go directly to NERC. The RC should not be held responsible for forwarding other entities’ reports to NERC, and in doing so subject itself to potential non-compliance.
	Yes
	Yes, this will simplify the reporting effort. NERC may forward the reports to the other need-to-know entities.
	Yes
	We support this concept since it works well for those entities that are not required to file reports with the US agencies, e.g. the DOE.
	Yes
	We agree with the general concept. However, we suggest that the classification of “events” to be compatible if not identical to those which need to be reported in real time as required in CIP-001, for otherwise it will create confusion and unnecessary, extra work. Also, this proposal appears to focus on the sabotage-type events only but the SAR deals with both sabotage and other disturbances (e.g. emergency type of events) reporting. A parallel type of “impact event” is needed for non-sabotage-type of events.
	In the Background Section of the comment form, it is indicated that the SDT “…is NOT seeking input or guidance on the definition of physical or cyber sabotage, what type of disturbances should be reported, who should do reporting, or to whom or what organizations will be receiving the reports.” Yet there are proposed definitions, with examples, in the concept paper. The SDT should make it absolutely clear that by supporting the general concept as described in

	the paper, the commenting entities are not endorsing the proposed definitions, nor the examples as elements to be included in the standard.
	Individual
	Roger Champagne
	Hydro-Québec TransÉnergie (HQT)
	Yes
	In considering guidance found in the document “NERC Guideline: Threat and Incident Reporting”, the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
	Yes
	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System. The reporting hierarchy should be to submit the information to the Reliability Coordinator, and to have the RC submit the report. This would eliminate the duplication of information.
	Yes
	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
	Yes
	We agree with the objective of eliminating duplicate reporting. However, EOP-004 currently allows substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today. We agree with the recommendation to eliminate the need for filing duplicate reports such as the DOE form OE-417. There is no benefit with regard to CIP-001 in filing separate reports. Duplicate reports introduce the potential for incomplete information to be supplied to responsible parties. Removing jurisdictional agencies from the Standard, and having NERC provide either query or situational awareness to those agencies being considered, might not be easy to achieve. There is an obligation under law to require entities to report to the DOE on the OE-417 form as amended or modified. This might drive the “omitted” agencies to have reporting laws enacted as well.
	No
	We believe that physical and cyber events must be investigated before a determination of sabotage or impact event can be made. The purpose of the NERC Standards is to maintain the reliability of the BES. Therefore, impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on ‘newsworthy’ events or to gather information for trending. It is the law enforcement industry’s responsibility to make a determination of “sabotage” or other. This determination cannot definitively be made by industry personnel, there is no expertise or time to investigate causes. It is the industry’s job to mitigate effects. Examples would help provide for better guidance/direction. Industry examples would be welcomed to help reinforce developed internal processes for compliance.
	SERC and RFC are developing additional requirements at this time. We suggest that reporting be based on impact to reliability, not on ‘newsworthy’ events. We therefore do not agree with such regional efforts and would prefer a continent wide reporting requirement.
	a. NERC should focus efforts on developing specific event reporting criteria and not base the requirement on the definition of the term ‘sabotage’, but on the reporting criteria itself. See comments above. b. The “opportunities for efficiency” discussed in the Concept Paper would be best achieved by focusing on those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. If there are elements that need to be reported that do not support this objective, then that reporting should not be required in reliability standards. Consider making NERC the distributor of reports to other agencies. We recognize that the key is to simplify reporting to a single form, and to the extent possible, to one agency. “Front line” reliability personnel must have the “timely” knowledge to know when a situation warrants local, area, regional, or national involvement. Finally, the SDT should keep in mind the fact that Canadian stakeholders might have some difference in the way reports are made to Security Agencies.

Consideration of Comments on Disturbance and Sabotage Reporting — Project 2009-01

The Disturbance and Sabotage Reporting Standard Drafting Team thanks all commenters who submitted comments on the proposed Concepts Paper for Disturbance and Sabotage Reporting. The document was posted for a 30-day public comment period from March 17, 2010 through April 16, 2010. Stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 41 sets of comments, including comments from more than 95 different people from approximately 50 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

The comments have been sorted and organized by question number in this report; the comments are shown in the original format on the following project web page:

http://www.nerc.com/filez/standards/Project2009-1_Disturbance_Sabotage_Reporting.html

Summary Consideration:

Use of "NERC Guideline: Threat and Incident Reporting"

Most stakeholders agree that existing guidance should be used as the foundation for disturbance reporting. Most commenters felt that the "NERC Guideline: Threat and Incident Reporting" document contains a lot of detailed information which greatly assists in determining reporting events and weaning out non important events. The most common desire was one, common form to be used for reporting and the OE-417 was considered to be a good starting point. Most respondents thought the form could be streamlined. The DSR SDT was urged to focus on applicable events and reporting timelines which are not clear now and to report items that are clearly essential to the reliability of the BES. There was some concern expressed about "over-reporting", out of fear of non-compliance rather than the over the reliability of the BES. There was also a clear desire to separate out vandalism & copper theft from reporting requirements.

Hierarchy for Reporting Disturbances

Most stakeholders (about 2/3) agree with the concept of developing a reporting hierarchy for disturbances. Stakeholders who disagreed believed that the RC should be one of many to receive information on impact events (DOE, RRO, etc.). Such a hierarchy would lead to reporting delays (leading to lack of situational awareness), be cumbersome and complicated and clouds responsibility for who is to report what to whom. Other negative comments believed that a hierarchy would distract the RC's focus from its primary responsibility. Those stakeholders who agreed commented that the RC should be the collection point for reports and information and take the responsibility to forward as required. This is from the concept that the RC has the "wider view" and can recognize patterns, and has the ability to "escalate" the reporting process. This would also minimize duplication of reports and information.

Single Form for All Agencies

Most stakeholders agreed with the concept of having one reporting form for all entities. Several commenters suggested that there is no need for a standard on reporting as they considered it administrative in nature. Most dissenters thought there should be a guideline, rather than an enforceable standard. There is widespread agreement that the one-size-fits-all approach would be very difficult to get agreement on, given the different countries and agencies involved. Many stakeholders pointed out that consistency and simplification were drivers for one report form. Having multiple recipients, with different information requirements, seems to support an electronic format that would guide information only to those who need it. The concept of an electronic reporting tool will need to be further vetted and developed.

Supplements to NERC Form
Most stakeholders agreed with the concept of entities being able to use information from other sources such as the OE-417 form, to supplement the NERC report form. Some thought that duplicate reports were acceptable, as long as the information was not duplicated (if # of customers lost is required on form A, don't ask on forms B & C). Several stakeholders commented on the need for an electronic, one stop reporting tool. This would avoid duplication while ensuring that the information reported goes only to intended recipients. With an electronic, one stop reporting tool, reports can be updated/corrected instantly, without repeating previously submitted information. Some stakeholders cautioned that the OE-417 can change every three years and this should be taken into account when developing an electronic reporting tool. Again, such a reporting tool would need to be vetted and developed to meet reliability needs.

Impact Events
The majority of stakeholders agreed with the concept of "impact events." Some stakeholders felt that the introduction of impact events increased the risk that some items will go unreported. However, most felt that impact events would dramatically increase the number of reports being submitted, and it would be difficult to separate important information from background noise. Several respondents felt that the SDT ignored the FERC Directive, and did not define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event. Many respondents supplied the SDT with their own definition of "Sabotage". The DSR SDT believes that the concept of impact events and the specificity of what needs to be reported in the standard will be an equally efficient and effective means of address the FERC directive regarding sabotage. Some stakeholders felt that impact events add another layer of uncertainty to the reporting. Even with the switch from sabotage to impact events, several felt that "intent" was still key to determining reportability.

Regional Differences
Several commenters provided information on regional reporting. The SDT will consider whether these should be included in the continent-wide standard. These include:

1. NPCC maintains a document and reporting form (Document C-17 - Procedures for Monitoring and Reporting Critical Operating Tool Failures) that outlines the reporting requirements, responsibilities, and obligations of NPCC RCs in response to unforeseen critical operating tool failures.

2. For other events that do not meet the OE-417 and EOP-004 reporting criteria, ReliabilityFirst expects to receive notification of any events involving a sustained outage of multiple BES facilities (buses, lines, generators, and/or transformers, etc.) that are in close proximity (electrically) to one another and occur in a short time frame (such as a few minutes).

3. WECC sets its loss of load criteria for disturbance reporting at 200 MW rather than the 300 MW in the NERC reporting form.

4. SERC and RFC are developing additional requirements at this time. We suggest that reporting be based on impact to reliability, not on 'newsworthy'

events. We therefore do not agree with such regional efforts and would prefer a continent wide reporting requirements.

5. Some entities identified some in-force Regional Standards and other regional reporting requirements.

Project Scope

Some stakeholders suggested that the SDT has gone beyond its approved scope to "further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event." Further, there is no requirement to create a Reporting Standard to define sabotage. The SDT contends that the development of impact events and the reporting requirements for them will provide the clarity sought in the directive. Other stakeholders suggested that the SDT should seek to retire sanctionable requirements that require event reporting in favor of guidelines for reporting. Several commenters suggested that the introduction of impact events actually expands the reporting requirements. It should be noted that the list of impact events is expected to be explicit as to who is to report what to whom and within certain timelines.

Electronic Tool

Several stakeholders provided input as to what they believed an electronic reporting tool should contain:

1 If the decision is made to go to a single reporting form, it should be developed to cover any foreseeable event.

2 The SDT should work toward a single form, located in a central location, and submitted to one common entity (NERC)

3 Reports should be forwarded to the ES-ISAC, not NERC, as the infrastructure is already in place for efficient sharing with Federal agencies, with the regional entities and with neighboring asset owners. Reports should flow to all affected entities in parallel, rather than series (timing issues).

Commenters also suggested that the SDT should consider the impacts of the reporting requirements on the small and very small utilities.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herbert Schrayshuen, at 609-452-8060 or at Herb.Schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. **The details of reporting requirements and criteria are in the existing EOP-004 standard and its attachments. The DSR SDT discussed the reliability needs for disturbance reporting and will consider guidance found in the document "NERC Guideline: Threat and Incident Reporting" in the development of requirements. Do you agree with using the existing guidance as the foundation for disturbance reporting? Please explain your response (yes or no) in the comment area.**

Summary Consideration: Most stakeholders agree that existing guidance should be used as the foundation for disturbance reporting. Most commenters felt that the "NERC Guideline: Threat and Incident Reporting" document contains a lot of detailed information which greatly assists in determining reporting events and weaning out non important events. The most common desire expressed was to have one common form for all reporting, and the OE-417 was suggested as a good starting point. Most respondents thought the form could be streamlined. The DSR SDT was urged to focus on applicable events and reporting timelines which are not clear now and to report items that are clearly essential to the reliability of the BES. There was some concern expressed about "over-reporting", out of fear of non-compliance rather reporting based on the reliability of the BES. There was also a clear desire to exclude vandalism & copper theft from reporting requirements.

Several specific suggestions were made to modify existing reporting requirements, and the drafting team will consider these when developing the proposed requirements.

Organization	Yes or No	Question 1 Comment
ERCOT ISO	Possible Yes	Parts of the Guideline are helpful, but the guideline goes beyond the scope of the requirements of the current standards, which could pose potential audit concerns. ERCOT ISO strongly feels this approach for reporting should be focused on physical events only and cyber event reporting should be contained within CIP-008 only. Continue to keep physical separate from cyber.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). The DSR SDT will take into consideration your comment on keeping cyber and physical events separate.		
Arizona Public Service Company	No Then Yes	APS supports standard revisions which streamline the reporting process for security incidents with a single form, which aligns both with EIA reporting and NERC Standards requirements, particularly those identified in the NERC Threat and Incident Reporting Guidelines. This would eliminate users issuing reports to multiple locations/government entities without a standard form or format. The DOE 417 form which is currently utilized

Organization	Yes or No	Question 1 Comment
		for reporting purposes is out-dated and does not account for the types of incidents as identified in the NERC Threat and Incident Reporting Guidelines. The guidelines state that an entity can report security incidents to the ESISAC , through CIPIS (Critical Infrastructure Protection Information System), and or RCIS (Reliability Coordinator Information Center). CIPIS refers an entity to the NICC and to the WECC. Additionally, APS proposes that the terms and timelines of reporting security incidents be clearly identified. Events are often detected quickly or immediately. Determining whether or not the event was sabotage and/or a reportable event; however, typically takes much longer. There is no time allowance for an entity to investigate the event to determine what actually occurred. Currently, DOE 417 provides that acts of sabotage should be reported within one hour of detection if the impact could affect the reliable operation of the bulk power system. This may affect the accuracy of the information being provided by an entity on it's initial reporting. Finally, provisions should be incorporated to address the privacy of information being submitted, including handling and storage.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s) which should streamline the reporting process (what events and what timeline should be used). c		
SPS Consulting Group Inc.	No	At least not exclusively. The current standards and the guidance fail to consider that different registered entities will have different scopes of awareness for when disturbances may take place. We want to avoid the situation where a generator (for example) is cited for failure to report a disturbance of which they have way of knowing occurred.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT will take into consideration what Registered Entities are to be included within the yet to be written standard(s) based on the SAR and the facilities each type of Registered Entity is required to have.		
Bonneville Power Administration	No Then Yes	BPA likes the idea of consolidating information and eliminating duplication of reported information. In the report, don't include every detail possible found in the "Threat Guideline". TOP's are supposed to be operating the electrical system, not doing investigative work for copper theft incidents (see comment on #5).
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). We will consider your specific suggestion for not requiring reporting of incidents such as copper threat, when we develop the proposed requirements.		

Organization	Yes or No	Question 1 Comment
Lands Energy Consulting	No	My firm provides compliance consulting services to a number of smaller (50-700 MW peak load) LSE/DP registered entities. EOP-004 creates an obligation for LSEs to report "disturbances" that affect their systems. A few of the smaller of these systems receive service from Bonneville-owned transmission lines that serve only 4-6 substations. The NERC Form establishes loss of 50% of the LSE's retail customers as a reportable disturbances. One of my clients receives service from BPA at 5 substations. A single industrial customer with a substantially dedicated substation comprises 90% of the utility's MWH load. Were it not for this customer, the utility would have been well below the registration requirement for a DP/LSE. The balance of the load, about 15 MW of peak and 4000 retail customers, is served from 5 substations. Four of these substations serving 3000 customers are served from a long Bonneville 115 kV BES transmission line that runs through a heavily treed right of way. Every time this single line experiences a permanent outage (which will happen a few times a year), the utility loses less than 10 MW of load, but 75% of its retail customers. Under the disturbance reporting criteria, this outage would constitute a reportable disturbance for the utility. When the NERC disturbance reporting criteria were adopted, I doubt that anyone conceived that they would apply to cases like I just described. Reporting trivial events like I've just described constitutes a nuisance to the entity making the report and NERC/WECC for having to process the report. The outage has no earthly effect on the reliability of the BES and certainly doesn't warrant preparation of any kind of disturbance report.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT will take into consideration what Registered Entities are to be included within the yet to be written standard(s) based on the NERC Standards Committee approved SAR. The DSR SDT will review the Commissions concern that, an adversary might determine that a small LSE is the appropriate target when the adversary aims at a particular population or facility, as stated in FERC Order 693, paragraph 459. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
SERC Reliability Coordinator Sub-committee (RCS)	No	Routine minor incidents such as copper theft and gun shots to insulators should not be reported. These types of minor events do not affect the reliability of the BPS. Existing reporting requirements are satisfactory. The focus of reporting should be on reliability related incidents and not incidents related to vandalism as such.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). Reporting threasholds will be determined during the next step of the Standards Development process. The DSR SDT agrees with your comments on vandalism but a balance must be further explored to meet industry and regulatory requirements specifically under FERC Order 693.		
Consumers Energy Company	No	The existing guidelines ignore the fact that there are currently three overlapping and inconsistent reporting requirements for disturbances of various types: CIP-001, EOP-004, and DOE OE-417. The reporting should be such that any single event type needs to be reported only once, and to only a single agency, for any

Organization	Yes or No	Question 1 Comment
		disturbance. First, CIP-001 events should be reported to the ES-ISAC under one specific requirement (or set of requirements) and removed from OE-417 and EOP-004, such that all interested agencies obtain their information from only that one source. Second, OE-417 events should be reportable ONLY to DOE, and, again, other agencies should obtain their information from only that one source. If NERC wishes to make such reporting mandatory and enforceable, the NERC requirements should indicate ONLY that such reporting should be made in accordance with OE-417. Finally, EOP-004 (or similar requirements) should require reporting to NERC ONLY in the case of events that don't fit under CIP-001 or OE-417 requirements. Alternatively, OE-417 should be submitted ONLY to NERC and they should disseminate the information.EOP-004 has several issues and inconsistencies: a. EOP-004 requires that the entity that submits form DOE-417 to provide copies to NERC. The DOE-417 form intermixes NERC entity definitions (e.g. BA, LSE, TO) with generic terms such as "Electric Utilities" and "Generating Entities". Is it the Generator Owner or Generator Operator that is required to submit the information? There should be one form or at least well defined definitions that apply to both forms. b. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-0 which purports to summarize the standard appears to change this requirement to 1 hour for several disturbances. Additionally, it incorrectly summaries the reporting time for 50,000 customers, which is 6 hours in DOE-417 and summarized in Table 1-EOP-004-0 as 1-hour. An attachment to a standard should not be allowed to supersede the standard or create additional rules. c. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-0 which purports to summarize the standard appears to change the standard. R3.1 clearly states that events are to be reported within 24 hours of identification, however Table 1-EOP-004-0 state that the events are to be reported on the basis of the start of the disturbance. An attachment to a standard should not be allowed to supersede the standard or create additional rules. d. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-0 which purports to summarize the standard appears to change the standard. R3.1 clearly states that events are to be reported within 24 hours of identification, however Table 1-EOP-004-0 states that copies of DOE-417 are required to be submitted "simultaneously". It also states that schedules 1 and 2 are due within 24 hours of start of the event instead of 48 hours for per DOE-417 for schedule 2. An attachment to a standard should not be allowed to supersede the standard or create additional rules. e. The requirement of loss of customers should be scaled based on customers served. Loss of 50,000 customers to a utility that serves 100,000 customers is different than loss of 50,000 customers to a utility that serves 2,000,000 customers.

Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and

Organization	Yes or No	Question 1 Comment
ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT agrees that present Reliability Standards can be complicated and lead to confusion when working on maintaining system reliability in the area of reporting per CIP-001-1 and EOP-004-1. We will consider the disagreements you've identified in existing reporting requirements when we develop the proposed requirements.		
Central Lincoln	No	The guidance document makes no distinction between entities that operate 24/7 dispatch and those that don't. The 1 hour and even the 24 hour reporting requirements in some cases will be impossible for entities without 24/7 dispatch to meet without changing business practices. These are the same entities that present little or no risk to the BES.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT will take into consideration what Registered Entities are to be included within the yet to be written standard(s) based on the SAR. The DSR SDT will establish the "requirements necessary for users, owners, and operators of the Bulk-Power-System" as stated in FERC Order 693, paragraph 617 and the difference in reporting of events on the BES, as stated in the Purpose statement of EOP-004-1. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
MRO's NERC Standards Review Subcommittee	No Then Yes	We agree with using the present documentation but would like just one reporting form. We are concerned that the guidelines and reporting periods specified within the DOE OE-417 report conflict with the NERC Guidelines. For example. DOE OE-417 report requires "Suspected Physical or Cyber Impairment" to be reported within 6 hours. The NERC guidelines indicate "Suspected Activities" are to be reported within 1 hour. We recommend the SDT use the DOE OE-417 report as a guiding document, and then determine additional reporting requirements using guidance from the NERC Guideline. FERC Order 693 appears to indicate conflicts and confusion with NERC reporting requirements and DOE reporting requirements should be eliminated.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT is looking to streamline required reporting actions and remove any redundant reporting requirements if at all possible. The DOE Form OE-417 is currently mandatory under Public Law 93-275 for entities within the juristicion of the U.S Department of Energy. We will consider the disagreements you've identified in existing reporting requirements when we develop the proposed requirements.		
Luminant	No Then Yes	While the guidance is generally ok in the "NERC Guideline: Threat and Incidence Reporting", the reporting timelines include 1 hour, 2 hours, 4 hours, 6 hours, 8 hours, 24 hours, and 48 hours. Please simplify and reduce the variation in timelines. When it comes to Sabotage reporting, some time requirements start with detection, some start with determination of sabotage and some events do not specify the trigger for the reporting clock to start. Again, please provide clarity and consistency around the start of the timeline for

Organization	Yes or No	Question 1 Comment
		reporting. Generally, the reporting timing should start with the recognition or determination that a suspected or known sabotage event occurred.
Response: The DSR SDT thanks you for your comment. The DSR SDT is looking to streamline required reporting actions and remove any redundant reporting requirements if at all possible. The DSR SDT agrees that present Reliability Standards can be complicated and lead to confusion when working on maintaining system reliability in the area of reporting per CIP-001-1 and EOP-004-1. We will consider your specific suggestion for less variation in reporting timeframes, when we develop the proposed requirements.		
We Energies	No Then Yes	While the NERC Guideline includes readily discernible information (and we would like to see that format carried forward into any future documentation), utilize OE-417 as the foundation document in order to eliminate reporting redundancies. If supplemental references are necessary for the proposed resolution, list the document as an official attachment to the standard. Minimize the need to search in multiple locations for guideline information - some may not be aware supporting documentation exists without explicit reference within the standard.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT is looking to streamline required reporting actions and remove any redundant reporting requirements if at all possible. The DSR SDT agrees that present Reliability Standards can be complicated and lead to confusion when working on maintaining system reliabiltiy in the area of reporting per CIP-001-1 and EOP-004-1. The DOE Form OE-417 is currently mandatory under Public Law 93-275 for entities within the juristicion of the U.S Department of Energy. We will consider your recommendation regarding listing supplemental references within the body of the standard when we draft the proposed standard(s).		
American Electric Power	Yes	
Bandera Electric Cooperative, Inc.	Yes	
Calpine Corp.	Yes	
Duke Energy	Yes	
Edison Mission Marketing & Trading	Yes	

Organization	Yes or No	Question 1 Comment
Exelon	Yes	
Independent Electricity System Operator	Yes	
PacifiCorp	Yes	
Platte River Power Authority	Yes	
Central Hudson Gas & Electric	Yes	Central Hudson agrees with using the “NERC Guideline: Threat and Incident Reporting” in the development of requirements. Central Hudson has currently in place a NERC-DOE Threat and Incident Reporting Table developed from this NERC Guideline that allows for a quick-reference to all threat and incident reporting criteria (arranged by category)with a cross-reference to the specfic reporting form (NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report, DOE Form OE-417, or NERC ES-ISAC Threat and Incident Report Form). Central Hudson recommends maintaining the option of utilizing only 1 form, the DOE Form OE-417, for incidents that require reporting to the DOE and NERC to maintain the streamlined approach to this reporting process.
Response: The DSR SDT thanks you for your comment. The DSR SDT is looking to have a single reporting report form (per question 3) and streamline the reporting processes that may be developed within ~~a~~ yet to be written requirement(s).		
E.ON U.S. LLC	Yes	E.ON U.S. believe that the guidelines provide greater clarity for reporting forced outages caused by disturbances and sabotage but there remains issues that in need of further clarification. For example, there remains too much subjectivity on the reporting of forced outages when there is “identification of valuable lessons learned”
Response: The DSR SDT thanks you for your comment. The DSR SDT concurs that further clarification is required with the ambigious statement “identification of valuable lessons learned” contained in the guideline – use of this phrase does not meet the technical writing threshold required for inclusion in a NERC Standard. The DSR SDT’s intent was to look at the posted NERC Guideline and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). Recommendation of changes to the “NERC Guideline: Threat and Incident Reporting” should be submitted to NERC via the Critical Infrastructure Protection Committee. I		
Public Service Enterprise Group Companies	Yes	EOP reportable disturbances are familiar concepts in the industry.

Organization	Yes or No	Question 1 Comment
Response: The DSR SDT thanks you for your comment and support.		
Orange and Rockland Utilities, Inc.	Yes	However, the SDT needs to maintain clear demarcation for the criteria for reporting events, and only those events that directly effect the reliability of the BES.
Response: The DSR SDT thanks you for your comment. The DSR SDT has been directed to review all disturbance type activities and submit to the industry a well thought out set of requirements that clearly define disturbance events and what information is required to enhance an entity'ssituational awareness. Clear demarcation for the criteria for reporting will be determined in the near future based on the approved SAR and industry feedback. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
Wolverine Power Supply Cooperative, Inc.	Yes	I agree with referencing existing guidelines - However: My concern is that, until all reportable incidents are analyzed by the parties to which they are reported, their "impact" on the BES will not be quantified. Therefore, the tendency to want to "report all events so that their impact can be determined" or "report all events because the information can be utilized for informational purposes, regardless of impact on BES" might lead to expanded reporting requirements, some of which may have questionable value from a reliability standpoint.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if the DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has been directed to review all disturbance type activities and submit to the industry a well thought out set of requirements that clearly define reportable events and what information is required to enhance an entity's situational awareness. Clear demarcation for the criteria for reporting will be determined in the near future based on the approved SAR and industry feedback. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
Hydro-Québec TransEnergie (HQT)	Yes	In considering guidance found in the document "NERC Guideline: Threat and Incident Reporting", the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
Northeast Power Coordinating Council	Yes	In considering guidance found in the document "NERC Guideline: Threat and Incident Reporting", the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
Response: The DSR SDT thanks you for your comment. The DSR SDT will establish the "requirements necessary for users, owners, and operators of		

Organization	Yes or No	Question 1 Comment
the Bulk-Power-System" as stated in FERC Order 693, paragraph 617 and the difference in reporting of events on the BES, as stated in the Purpose statement of EOP-004-1. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
Western Electricity Coordinating Council	Yes	It is comprehensive; however, we must keep in mind that the OE-417 is required under Public Law 93-275 and needs to be attached if applicable in the US.
Response: The DSR SDT thanks you for your comment.		
Oncor Electric Delivery Company LLC	Yes	NERC Guideline: Threat and Incident Reporting" document should be used for guidance as it identifies best practices for reporting.
Response: The DSR SDT thanks you for your comment.		
Manitoba Hydro	Yes	The "Threat and Incident Reporting" document contains a lot of detailed information which greatly assists in determining reporting events and weaning out non important events. The document contains some examples and expected reporting time lines. Attachment 1-EOP-004, though considerably smaller and condensed it does contain some detail not mentioned in "Threat and Incident Reporting". Integrating the "Threat and Incident Reporting" into Attachment 1-EOP-004, though large in size, has lots of information and is easy to follow would be a large improvement to existing protocol OR SEE QUESTION 3 COMMENTS. Incidences we have experienced on our system, in past were difficult to delineate as reportable, who to report to and when. An improvement to this Standard is welcome.
Response: The DSR SDT thanks you for your comment. The DSR SDT is looking to streamline and remove any redundancies within the NERC Standard's requirements.		
Constellation Power Source Generation	Yes	The existing guidance is an excellent base on which to build changes to EOP-004 and CIP-001. However, the SDT must challenge each item in the different event categories and clarify or omit bullet points that are seemingly vague. For example, under System Disturbances, a forced outage report is needed when "a generation asset of 500 MW or above is on a forced outage for unknown reasons, or a forced outage of generation of 2,000 MW occurs..." Simply removing the 500 MW criteria would make this criterion less vague. There are other examples of this in the guideline.
Response: The DSR SDT thanks you for your comment. The DSR SDT is looking to streamline and remove any redundancies within the NERC Standard's requirements. It is the intent of the SDT to carefully review the different event categories and provide clarity where needed to remove ambiguity.		

Organization	Yes or No	Question 1 Comment
ISO RTO Council Standards Review Committee	Yes	The guidelines in EOP-004 and its attachments should be retained as the foundation for reporting disturbances. One would note that such EOP Disturbances are relatively well defined reliability impacts. Thus EOP-004 disturbances are based on HOW certain events impacted the BES. [Sabotage on the other hand requires an implication of WHY an event occurred.]The original EOP-004 represents a common sense approach to defining reliability events that may be useful to analyze on a regional basis. In the current environment, Regions are not sanctionable entities but they still are valuable sources to collect, analyze and trend the few disturbances that occur in each region. To make use of Regions, however, precludes the use of sanctionable NERC standards. EOP-004 as written does not meet the NERC requirements for standards but it does meet the Industry needs for a guideline for reporting events that deserve to be reviewed. The SDT should propose deleting EOP-004 and use it as a Disturbance Reporting Guideline.
Response: The DSR SDT thanks you for your comment. Regions are required to comply with requirements in NERC Reliability Standards – however Regions are not sanctioned the same way as users, owners and operators of the bulk power system – if a Region fails to comply with a NERC Reliability Standard, it can be fined for failure to comply under the ERO's Rules of Procedure.		
USBR	Yes	The reporting outlined in the proposed plan does not include a clear indication of how NERC will use the information they collect from the entities. Care needs to be taken in addressing the reporting requirements to not create a more confusing or onerous reporting process.
Response: The DSR SDT thanks you for your comment. It is anticipated that NERC will analyze events to assess trends and identify lessons learned for industry feedback and reliability improvement.		
FirstEnergy	Yes	This guideline appears to be a good starting point for developing consistency in reporting. However, we believe that after-the-fact event reporting is administrative in nature and seldom rises to the level of mandated reliability standard requirements. It is not clear what reporting would be made through this effort and how it differs from reporting made through the NERC Reliability Coordinator Information System (RCIS). With the initiative for more results-based standards being the goal of NERC, true after the fact reporting-type requirements should become administrative procedures and only be included in standards if they are truly required for preserving an Adequate Level of Reliability. If there are aspects that rise to be retained in a mandatory and enforceable reliability standard, we propose that those associated with sabotage be moved to CIP-001 and that EOP-004 be focused on operational disturbances that warrant wide-area knowledge. However, if the RCIS is the mechanism to convey real-time information and that is presently occurring outside of reliability standards, it is unclear what the delta improvement this project aims to achieve.
Response: The DSR SDT thanks you for your comment. As stated in FERC Order, 693, paragraph 611, "Complete and timely data is essential for analyzing system disturbances" and in paragraph 617, "the Commission directs the ERO to develop a modification to EOP-004-1 through the		

Organization	Yes or No	Question 1 Comment
Reliabiloity Standards development process that includes any requirements necessary for users, owners, and operators of the Bulk-Power-System to provide data that will assist NERC in the investigation of a blackout or disturbance". Some data is needed, therefore, for after-the-fact analyses. In addition, some data is needed much more quickly for situational awareness. The DSR SDT will analize and determine what constitues a reportable event and what information is required for situational awareness as opposed to after the fact analyses of events.		
Portland General Electric	Yes	This process is in place and utilities are familiar with it. This is a good place to start.
Response: The DSR SDT thanks you for your comment and support.		
Ameren	Yes	We agree that it makes sense to build upon existing documentation. However, we do not believe it is necessary to require event reporting to be in an enforceable standard. Rather the drafting team should consider developing a reporting guideline document and retiring the EOP-004 standard.
Response: The DSR SDT thanks you for your comment. As stated in FERC Order, 693, paragraph 611, "Complete and timely data is essential for analyzing system disturbances" and in paragraph 617, "the Commission directs the ERO to develop a modification to EOP-004-1 through the Reliabiloity Standards development process that includes any requirements necessary for users, owners, and operators of the Bulk-Power-System to provide data that will assist NERC in the investigation of a blackout or disturbance". Some data is needed, therefore, for after-the-fact analyses. In addition, some data is needed much more quickly for situational awareness. As envisioned, the requirements developed under this project will address both types of reporting requirements.		
Midwest ISO Standards Collaborators	Yes	We agree that it makes sense to build upon existing documentation. However, we do not believe it is necessary to require event reporting to be in an enforceable standard. Rather the drafting team should consider developing a reporting guideline document and retiring the EOP-004 standard. This is further supported by the fact that there is a role in the existing standard for the Regional Entities even though these requirements can't be enforced against the Regional Entities because they are not a user, owner or operator of the system.
Response: The DSR SDT thanks you for your comment. As stated in FERC Order, 693, paragraph 611, "Complete and timely data is essential for analyzing system disturbances" and in paragraph 617, "the Commission directs the ERO to develop a modification to EOP-004-1 through the Reliabiloity Standards development process that includes any requirements necessary for users, owners, and operators of the Bulk-Power-System to provide data that will assist NERC in the investigation of a blackout or disturbance". Some data is needed, therefore, for after-the-fact analyses. In addition, some data is needed much more quickly for situational awareness. As envisioned, the requirements developed under this project will address both types of reporting requirements.		
Dynegy Inc.	Yes	We agree with using the guidance; however, please consider revising the NERC Guideline: Threat and Incident Reporting document to (i) lengthen the reporting timelines related to attempted sabotage to allow for

Organization	Yes or No	Question 1 Comment
		additional time to deem the threat credible, (ii) expand the description of forced outage of generation greater than 2000 MW to include whether it is at the BA or GO level and if GO level, whether it is for one site or the combined GO's sites in a Region, and (iii) add a Responsible Party column to the Appendix A matrix.
Response: The DSR SDT thanks you for your comment. Recommendation of changes to the "NERC Guideline: Threat and Incident Reporting" should submitted to NERC via the Critical Infrastructure Protection Committee since that falls outside the scope of the SAR. **We will consider your specific suggestions for revisions to reporting requirements when we develop the proposed requirements.**		
BGE	Yes	We have no problem with NERC using the existing guidance as the foundation for disturbance reporting; however, since this project proposes to investigate incorporation of the Cyber Incident reporting aspects of CIP-008, we feel that if adopted, this concept should be added to the NERC Guideline document "Threat and Incident Reporting".
Response: The DSR SDT thanks you for your comment. Recommendation of changes to the "NERC Guideline: Threat and Incident Reporting" should submitted to NERC via the Critical Infrastructure Protection Committee since that falls outside the scope of the SAR.		
Electric Market Policy	Yes	Yes; however, in considering guidance found in the document "NERC Guideline: Threat and Incident Reporting" the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
Response: The DSR SDT thanks you for your comment. The DSR SDT will establish the "requirements necessary for users, owners, and operators of the Bulk-Power-System" as stated in FERC Order 693, paragraph 617 and the difference in reporting of events on the BES, as stated in the Purpose statement of EOP-004-1. As envisioned, the requirements developed under this project will address reporting requirements that are used for after-the-fact analyses as well as reporting requirements that are associated with situational awareness.		

2. The DSR SDT is considering developing a reporting hierarchy for disturbances that requires entities to submit information to the Reliability Coordinator and then for the Reliability Coordinator to submit the report. Do you agree with this hierarchy concept? Please explain your response (yes or no) in the comment area.

Summary Consideration: Most stakeholders (about 2/3) agree with the concept of developing a reporting hierarchy for disturbances. Stakeholders who disagreed believed that the RC should be one of many to receive information on impact events (DOE, RRO, etc.). Such a hierarchy would lead to reporting delays (leading to lack of situational awareness), be cumbersome and complicated and clouds responsibility for who is to report what to whom. Other negative comments believed that a hierarchy would distract the RC's focus from its primary responsibility. Thos stakeholders who agreed commented that the RC should be the collection point for reports and information and take the responsibility to forward as required. This is from the concept that the RC has the “wider view” and can recognize patterns, and has the ability to “escalate” the reporting process. This would also minimize duplication of reports and information.

Organization	Yes or No	Question 2 Comment
BGE	No	As currently worded, BGE opposes the reporting hierarchy concept, since insufficient guidelines were proposed to prevent translation errors between the responsible entity (RE) and the RC. In addition to creating possible reporting errors, this also opens a risk that the RC could misrepresent the true intent of an RE's report contents if called upon to explain/justify a submitted report. Reporting delays are another concern with this proposal because the RE would basically be relinquishing control of the reporting process to the RC, while ultimately retaining the responsibility for ensuring the report gets submitted within the required timeframe. However, BGE recognizes that avoiding duplication and conflicting reports as well as encouraging communication are valuable. To make the reporting hierarchy concept acceptable to BGE, the DSR SDT must develop proper controls to ensure the RE has the ability to control or approve the information submitted and/or subsequently discussed with the respective authorities, and that it is done within the permissible timeframe to satisfy compliance requirements.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk is not transferred, and a mechansim to ensure the Responsible Entity's reported information remains as submitted.		

Organization		Yes or No	Question 2 Comment
Consumers Energy Company		No	It would be inefficient for RC's to accumulate ALL disturbance data and submit it, and to bifurcate the reporting based on type of disturbance above and beyond OE-417 data (which should go ONLY to DOE) would make a standard very involved for an entity to comply with. We're discussing after-event data here, not data needed for current operations - and there's no reason to make it any more complicated than necessary.
Response: The DSR SDT thanks you for your comment. In order for a reporting hierarchy concept to be adopted, it will result in real effiency gains by eliminating duplication of reports. It will not be pursued if the result is a complicated or burdensome process for responsible entities.			
Exelon		No	Some of the DOE related reporting is driven by distribution events, i.e. outages greater then 50,000 customers, is it realistic to expect the RC, whose focus is on the transmission system to perform distribution related reporting?
Response: The DSR SDT thanks you for your comment. The DOE Reporting Form OE 417 is currently mandatory by Public Law and only applies to US entities and contains reporting thresholds that are not required by NERC. Our goal is to derive reporting thresholds that meet NERC's needs for information on bulk electric system disturbances and real-time events, not distribution level-only problems.			
USBR		No	The existing reporting methods collect reports of disturbances and analyze them by committees of the respective coordinating councils. The new process would introduce a duplicate layer and associated staffing. It would be better to ensure communication between the existing committees of the respective coordinating councils and the RC rather than creating a new layer of review tracking and analysis. While the layered reporting hierarchy discussed in the Disturbance Reporting section of the paper will eventually help with overall event awareness, the additional delays the hierarchical approach could result in a decrease in situational (timely) awareness. Having more comprehensive information as a result of the potential enhancements each layer adds to the chain of reporting may not be more valuable than timely and well disseminated information in an actual disturbance situation. We would suggest the SDT give careful consideration to this proposed direction. It may be appropriate to consider that expedited reporting of operational impacts would outweigh the benefit of administratively intensive reporting procedures. The events reported through the existing process have not yielded material feedback other than statistical analysis. Statistical analysis is not as sensitive to timely reporting. Operational impacts which may be the result of possible sabotage may be evident through assessment of widespread outage patterns or following event analysis. Comprehensive event analysis can take anywhere from 15 days to 90 days depending on the event.
Response: The DSR SDT thanks you for your comment. We agree that reporting timeliness must be weighed against the percieved benefits of a reporting hierarchy. If the reporting hierarchy concept is adopted, it should include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and a process to ensure the responsible entities' reported information remains as submitted. Also it must result in real effiency gains and support the reliability of the bulk electric system.			

Organization	Yes or No	Question 2 Comment
ISO RTO Council Standards Review Committee	No	The idea of a reporting hierarchy provides an easy to follow pro forma approach. But disturbance reports should not always follow a common reporting path. A disturbance on the transmission system for example need not be routed through an "if applicable" Balancing Authority. To mandate that a BA be in the path is inappropriate. To leave the applicability open is to create a subjective compliance problem for the impacted BA. Copper theft is another example that should not require reporting up through the RC. It is a local issue and the Transmission Owner should be able to report this directly to the appropriate parties. How would a DP, LSE or GO know if an event is an "impact event"? The posed impact events are a series of conditions for sabotage but not for EOP-type disturbances. The aforementioned entities have no requirement to monitor and analyze the BES, which then means every event would be an impact event for those entities (not an EOP disturbance but an impact event). Thus every theft of copper is an impact event mandating a Disturbance Report even though the SDT notes the RC only has to send it to the "local authorities". This seems to be a misuse of the RC resources; every train derailment is an impact event requiring a Disturbance report (is that a commercial train, regional rail line a local trolley car); every teenage prank would also generate an impact event mandating a disturbance report. The SDT defined impact events are not appropriate for use in defining disturbances. There is a big difference from creating a set of guidelines to follow as opposed to creating sanctionable standards
Response: The DSR SDT thanks you for your comment. Furthermore, impact events should not include copper theft or other conditions that pose no threat to the reliability of the BES. A train derailment is only an impact event if it threatens some element of the bulk electric system such as a transmission line corridor - the deraillment in itself is not an impact event. See more on impact events under the responses to Question 3.		
Bonneville Power Administration	No	The RC is made aware of these type of incidents and goes right back to incorporating that in their awareness and to focusing on system reliability. If the RC is the recipient for further distribution of information of this type they will be forever going back for more information. Eliminate the middleman in whatever concept you propose, folks have plenty to do now. Let people make good judgments with the direct field people on the seriousness of the breach with their security personnel contacting the appropriate law enforcement agency. (Or are you looking to do a simple RE reports to the RC who marks various category items on a secure website Yes/No category item indicator that can be rolled up in ES-ISAC map board?)
Response: The DSR SDT thanks you for your comment. The Reliability Coordinator's suggested role in this is to allow them to incorporate the relevant data from responsible entities in their footprint for further analysis.		
Duke Energy	No	The RC should not be responsible for submitting the report to FERC, NERC or the RRO. The RC may not have the necessary first hand information concerning the facts of the event. Situation awareness can be maintained by including the RC in the distribution of any sabotage related reporting.

Organization	Yes or No	Question 2 Comment
SERC Reliability Coordinator Sub-committee (RCS)	No	The RC should not be responsible for submitting the report to FERC, NERC or the RRO. The RC may not have the necessary first hand information concerning the facts of the event. Situation awareness can be maintained by including the RC in the distribution of any sabotage related reporting.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and a process to ensure the responsible entities' reported information remains as submitted. Also it must result in real effiency gains and support the reliability of the bulk electric system.		
ERCOT ISO	No	There are some events that are truly local and should be handled by local entities and reported to local authorities (i.e. theft). If there is an impact or potential to have an impact to the BES or to the region, then hierarchical reporting would be appropriate.
Response: The DSR SDT thanks you for your comment. We agree - a clearly defined impact event criteria would do just as you suggest - leave local issues on the local level.		
Northeast Power Coordinating Council	No	This is not a standards issue, and NERC should not dictate the reporting structure. It should be left to the RCs and their members.
Response: The DSR SDT thanks you for your comment. In defining a disturbance reporting hierarchy we sought to realize efficencies. If the reporting hierarchy concept is adopted, it must result in real effiency gains and support the reliability of the bulk electric system. It will not be adopted if the result in a complicated or burdensome process for responsible entities.		
MRO's NERC Standards Review Subcommittee	No	We agree a coordinated reporting process is beneficial for the entity and the Reliability Coordinator (RC). However, a hierarchy would likely lengthen the reporting timeframe, or reduce the allotted time for each entity to provide notification to the RC in order to meet DOE or NERC timelines. Communication and coordination with the RC would likely provide more accurate and complete data submissions within a timely process and create shared accountability for the report being submitted.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and some mechansim to ensure the responsible entities's reported information remains as submitted.		

Organization	Yes or No	Question 2 Comment
Midwest ISO Standards Collaborators	No	We do not agree with developing a hierarchy for reporting for all disturbances and impacting events. For instance, copper theft is an example of an item that should be reported to the appropriate entities directly by the Transmission Owner. The RC does not need to be made aware of every copper theft unless it has a direct impact on reliability (affects rating, protection system, etc.) and the RC should not be burdened with expending resources for this reporting. A further example in which the hierarchy is not needed would be the case in which only one entity is impacted. If a significant event occurs on one TOP's system, then the TOP should be able to handle the reporting of all entities under its purview. If more than one TOP is involved, then it would be necessary to involve the RC in the reporting.
Response: The DSR SDT thanks you for your comment. The reporting hierarchy concept is meant to apply only to disturbance reporting. We agree that copper theft and other situations that do not pose a direct threat to reliability shouldn't be reported to NERC through this standard.		
FirstEnergy	No	While we appreciate the team's effort to serialize the reporting process, with the electronic communication methods available today, it seems that reporting can be accomplished simultaneously to multiple entities without shifting the burden of reporting to others along the communications path. This is particularly true if the reporting format is standardized to a one-size-fits-all report. Additionally, it would be a great burden to the Reliability Coordinator to review all events perceived by entities to be malicious sabotage events.
Response: The DSR SDT thanks you for your comment. The reporting hierarchy concept would only apply to disturbance reporting, not impact events. The Reliability Coordinator's suggested role in this to allow them to incorporate the relevent datea from responsible entities in their footprint for further analysis. We will consider your suggestion of simulataneous submissions as a means to effectively notify the necessary parties.		
Edison Mission Marketing & Trading	Yes	
PacifiCorp	Yes	
SPS Consulting Group Inc.	Yes	
Calpine Corp.	Yes	A Functional Entity such as a Generator Owner/Operator is not always aware that an event, such as a plant trip, is part of a wider system disturbance that rises to the level of a reportable event under EOP-004. A reporting hierarchy that allows a Generator to report the facts to its Transmission Operator and have that entity take a wider view to determine whether there is a disturbance should facilitate the reporting of actual disturbances. The SDT needs to ensure that some thought goes into the flow of information within the hierarchy and what triggers are needed to drive the reporting up the hierarchy.

Organization	Yes or No	Question 2 Comment
Response: The DSR SDT thanks you for your comment. A reporting hierarchy process must include clear triggers for reporting and provide an efficient, well-defined information flow.		
We Energies	Yes	A hierarchical approach in conjunction with a single, electronic form would provide consistent reporting timelines, provide clarity in the reporting process, and provide more accurate and meaningful data submissions while having shared accountability. Confusion in the current method could be alleviated while providing more consistency in the reporting of an "impact event".
Response: The DSR SDT thanks you for your comment.		
Arizona Public Service Company	Yes	All disturbance reporting should go through the RC.
Response: The DSR SDT thanks you for your comment.		
Constellation Power Source Generation	Yes	As stated in the concept paper, a hierarchy ensures proper communications, but it has the added benefit of reducing redundancy on the Registered Entities, so long as responsibilities and accountability are clearly established.
Response: The DSR SDT thanks you for your comment.		
Central Hudson Gas & Electric	Yes	Central Hudson agrees with this reporting hierarchy for disturbances given the "wider-view" of the Reliability Coordinator as opposed to an entity such as a Transmission Owner or Load-Serving Entity. While, based on past experience, the current process works if reports are filed to the DOE, RRO, and RC simultaneously via email for example. However, the RC is in a better position to identify multi-site incidents and escalate the reporting process if necessary.
Response: The DSR SDT thanks you for your comment.		
Wolverine Power Supply Cooperative, Inc.	Yes	From the perspective of a TOP, this seems to alleviate reporting burden and move it up line. I can understand the logic in wanting the reporting to flow through the RC for awareness purposes, but I can understand the RC's reluctance to bear the additional potential burden. Again, a focused effort to minimize the necessary reporting to 'true impact events" should be kept in mind, regardless of who has to report. Collecting reams of data and figuring out what impact it has later should not be the goal.

Organization	Yes or No	Question 2 Comment
Response: The DSR SDT thanks you for your comment. We agree that regardless of any reporting hierarchy, the goal is to report on disturbances and events with meaningful impact on the bulk electric system. See Question 3 responses for more information on how we view impact events.		
Electric Market Policy	Yes	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System.
Hydro-Québec TransEnergie (HQT)	Yes	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System. The reporting hierarchy should be to submit the information to the Reliability Coordinator, and to have the RC submit the report. This would eliminate the duplication of information.
Orange and Rockland Utilities, Inc.	Yes	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System. The reporting hierarchy should be to submit the information to the Reliability Coordinator, and to have the RC submit the report. This would eliminate the duplication of information.
Response: The DSR SDT thanks you for your comment.		
Lands Energy Consulting	Yes	I would give the RC the authority to establish impact thresholds for reporting. Consistent with my earlier comment, I would set the materiality threshold for disturbance reporting purposes at LSEs (or a combination of LSEs in the case of BPA) serving at least 90,000 customers.
Response: The DSR SDT thanks you for your comment. Reporting thresholds in the standard will meet NERC requirements: Reliability Coordinator's may have different reporting criteria to meet Regional requirements, but they will not appear in this yet to be written Standard.		
Central Lincoln	Yes	In the west at least, this hierarchy should be extended to include BA's as indicated in the Concepts Paper. See: http://www.bpa.gov/corporate/business/reliability/Docs/2007/PNSC_RE_Data_Letter_2_070723.pdf for the RC's policy on which entities it chooses to communicate with.

Organization	Yes or No	Question 2 Comment
Response: The DSR SDT thanks you for your comment. The hierarchy concept includes BAs as appropriate in the reporting structure.		
Luminant	Yes	Luminant believes that one report should be filed with the Reliability Coordinator or one responsible entity, who then files the report with all applicable entities.
Response: The DSR SDT thanks you for your comment.		
Oncor Electric Delivery Company LLC	Yes	Oncor agrees that with this reporting hierarchy, in that dual reporting should be eliminated
Response: The DSR SDT thanks you for your comment.		
Portland General Electric	Yes	PGE is familiar with and works closely with WECC today so the hierarchial consideration makes sense.
Response: The DSR SDT thanks you for your comment.		
Platte River Power Authority	Yes	Situational awareness would be enhanced. All affected entities would be aware of the disturbance and relevant information. Also, the flow of information between entities would be enhanced and a more comprehensive report could be developed.
Response: The DSR SDT thanks you for your comment.		
Ameren	Yes	The hierarchy is appealing in the fact that the TOP/BA will be kept in the loop and receive critical information from the Generators, Distribution, LSE, etc. But there will be an inherent delay in reporting due to the fact that at every hand-off of information there will be questions for additional and/or clarified information, and there is always a possibility for the loss of information due to the transfer from one entity to the next. Further, this reporting through a hierarchy could also take away from the operators ability to respond to system events due to being tied to an information transfer ladder.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and some process to ensure the responsible entities' reported information remains as submitted. It must also ensure that it does not place any extra burden on operators that could create an additional risk to reliability.		

Organization	Yes or No	Question 2 Comment
E.ON U.S. LLC	Yes	The hierarchy will simplify reporting from the entity in that the RC is always notified and then the RC notifies other parties as required, (with the exception of OE-417, which still has to be filled out per law) E.ON U.S. recommends that the drafting team pay particular attention to the report process to make sure that duplicate reports are not being required. Currently information on forced outages is already communicated to the RC so formalizing a requirement to provide data to the RC may represent duplication to reports already provided.
Response: The DSR SDT thanks you for your comment. Avoiding duplication is a key goal of the drafting team.		
Public Service Enterprise Group Companies	Yes	The PSEG Companies believe that all entities with a reportable disturbance should report to the RC. The RC is best positioned to evaluate the impact of the event and forward the information to the appropriate entities. There should not be any intermediate entities to relay information to the RC as that can introduce delay and has the potential to introduce transcription errors. Sabotage events should be reported to the RC as well as to law enforcement. CIP-008 reporting is highly specialized and should be retained in the set of cyber security standards, not merged with CIP-001 and EOP-004.
Response: The DSR SDT thanks you for your comment. Detection of cyber events may be specialized but report of them is not. Threats to reliability must be reported no matter what the cause. The DSR SDT proposes using the thresholds found in CIP-008 - this standard would provide a one stop form to submit the information. Note that the current CIP-008 has a reporting requirement to the ES-ISAC only.		
Manitoba Hydro	Yes	The Reporting Concept states that the new hierarchy is, “Affected entity to TOP/ BA to RC. Then the RC will then submit to NERC and DOE (if required)”.This will enhance the existing requirement EOP-004-1 R4 which states that the RC shall assist the affected entity by providing representatives to assist in the investigation (this is also all reiterated in Attachment 1-EOP-004) .In an disturbance, the local resources would be tied up in the rectification of the problem. Analyzing and reporting the event (is it reportable, who to report to, what is the timeline) is distracting and time consuming. By leaving the final upper level steps of reporting to NERC/DOE by the RC would be efficient.
Response: The DSR SDT thanks you for your comment.		
Western Electricity Coordinating Council	Yes	There should be an established time sequence that allows the RC to review the entities material prior to forwarding to NERC. By channeling all reports through the RC situational awareness will be enhanced. Instead of "submit information", it should be clarified that entities submit complete written reports to RC in electronic format.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and a process to ensure the responsible entities’ reported information remains as submitted.		

Organization	Yes or No	Question 2 Comment
American Electric Power	Yes	This approach may work as long as there is a uniform process across all of the Reliability Coordinators. AEP owns and operates BES facilities under three separate RCs and having differing rules and processes would create confusion and additional burdens. There are some concerns about the time lag of reporting the information and this might not work well in all cases especially if the information and knowledge are at the local level. AEP recommends that the standard could have a default hierarchy, but this should not prohibit any entity from reporting directly.
Response: The DSR SDT thanks you for your comment. Our goal is uniform reporting criteria to meet specified requirements. We will consider the risks and benefits of allowing a default hierarchical reporting structure with the ability for responsible entities to report directly to NERC.		
Bandera Electric Cooperative, Inc.	Yes	This approach, while I suspect will not be universally agreed to, should provide some definitive guidance in reporting.
Response: The DSR SDT thanks you for your comment.		
Dynegy Inc.	Yes	This seems to be straightforward approach in that the RC is the best judge of threats to the overall system and could eliminate multiple reports of a single event.
Response: The DSR SDT thanks you for your comment.		
Independent Electricity System Operator	Yes	We do not agree with the need of such a hierarchy setup solely for the purpose of making reports to the need-to-know entities. All responsible entities (RC, BA, TOP, etc.) need to file a report. With the proposed set up noted under Q3, which we support, these reports should go directly to NERC. The RC should not be held responsible for forwarding other entities' reports to NERC, and in doing so subject itself to potential non-compliance.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and a process to ensure the responsible entities' reported information remains as submitted.		

3. The goal of the DSR SDT is to have one report form for all functional entities (US, Canada, Mexico) to submit to NERC. Do you agree with this change? Please explain your response (yes or no) in the comment area.

Summary Consideration: Most stakeholders agreed with the concept of having one reporting form for all entities.

Several commenters suggested that there is no need for a standard on reporting as they considered it administrative in nature. Most thought it should be a guideline, rather than an enforceable standard.

There is widespread agreement that the one-size-fits-all approach would be very difficult to get agreement on, given the different countries and agencies involved. Many stakeholders pointed out that consistency and simplification were drivers for one report form.

Having multiple recipients, with different information requirements, seem to support an electronic format that would guide information only to those who need it. The concept of an electronic reporting tool would need to be further vetted and developed.

Organization	Yes or No	Question 3 Comment
Bandera Electric Cooperative, Inc.		No preference in this area.
ISO RTO Council Standards Review Committee	No	The SRC supports NERC's initiative for Results Based Standards. The SRC understood RBS to mean the results were reliability based quantities not administrative quantities. There is no need for a NERC Reliability standard on reporting. The idea that all functional entities in each of the said countries will use one form would be a good idea if and only if all the countries and all of their agencies were willing to accept that form. The SRC does not believe that those agencies will be willing to cede what information they ask for to NERC; nor that NERC will be able to create a single form that all such agencies will accept.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements. The set of results-based standards is intended to provide a 'defense-in-depth' approach to protecting reliability of the bulk power system. While many reports are administrative and are only used to assess compliance with specific requirements, the reporting addressed in this project is focused on providing data needed to support		

Organization	Yes or No	Question 3 Comment
after-the-fact analyses of events, and reporting information needed to maintain situaitional awareness. As such, the SDT believes that these reporting requirements do need to be enforceable.		
FirstEnergy	No	While one consistent form for reporting may simplify reporting requirements, it would be very difficult to get all governmental agencies to agree to a one-size-fits all approach.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Public Service Enterprise Group Companies	No	While simplification and consistency is a laudable goal, it should not be applied to different governmental agencies (USA, Canada, Mexico) which may have different structures and processes. Moreover, results based standards should not include administrative matters such as reporting forms.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements. The set of results-based standards is intended to provide a 'defense-in-depth' approach to protecting reliability of the bulk power system. While many reports are administrative and are only used to assess compliance with specific requirements, the reporting addressed in this project is focused on providing data needed to support after-the-fact analyses of events, and reporting information needed to maintain situaitional awareness. As such, the SDT believes that these reporting requirements do need to be enforceable.		
American Electric Power	Yes	
Constellation Power Source Generation	Yes	
Exelon	Yes	
PacifiCorp	Yes	
Platte River Power Authority	Yes	

Organization	Yes or No	Question 3 Comment
Calpine Corp.	Yes	A single approach is desirable, particularly for those entities that find themselves in multiple regions or countries.
Response: The DSR SDT thanks you for your comment.		
We Energies	Yes	Agree in conjunction with proposed concept that DOE OE-417 will be allowed to supplement the NERC report in lieu of duplicating entries.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Consumers Energy Company	Yes	Agreed - to the extent that it's consistent with the concept that any specific type of data is submitted to ONLY one entity.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Arizona Public Service Company	Yes	APS supports the standardization of the form for consistency and format.
Response: The DSR SDT thanks you for your comment.		
Bonneville Power Administration	Yes	As long as we don't make one form that requires extraneous information for the sake of having agreement.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		

Organization	Yes or No	Question 3 Comment
Western Electricity Coordinating Council	Yes	Canadian and Mexican entities should be consulted on content of report form to assure their "buy in".
Response: The DSR SDT thanks you for your comment. It is DSR SDT's intent to discuss the need for information with appropriate jurisdictional agencies.		
Central Hudson Gas & Electric	Yes	Central Hudson agrees with this goal if the intent is to develop and implement an electronic version that would meet DOE requirements as well.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
E.ON U.S. LLC	Yes	E.ON U.S. supports the proposal.
Response: The DSR SDT thanks you for your comment.		
MRO's NERC Standards Review Subcommittee	Yes	However, We believe the primary goal should focus on "each entity" being able to submit one report for all functional requirements. Entities in the US that are required to submit the DOE OE-417 form should not be required to submit an additional form developed for other entities (Canada & Mexico). One approach to satisfy this goal is for NERC to require all entities (US, Canada, & Mexico) to complete the DOE OE-417 form as their report.
Response: The DSR SDT thanks you for your comment.		
Wolverine Power Supply Cooperative, Inc.	Yes	I can't see how anyone would disagree with this concept - However - I question how practical it will be to implement, since various agencies would have to collaborate and coordinate to accomplish this task.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		

Organization	Yes or No	Question 3 Comment
Lands Energy Consulting	Yes	I think that the impact approach makes sense and that EOP-004 and CIP-001 are logically connected. Many entities of which I am aware link Sabotage Reporting Training to Disturbance Reporting obligation awareness already.
Response: The DSR SDT thanks you for your comment.		
Oncor Electric Delivery Company LLC	Yes	Oncor agrees that by using the same type reporting format, there should be consistency in regard to each functional entity's expectations.
Response: The DSR SDT thanks you for your comment.		
BGE	Yes	One form makes sense to us; less is better is the sense that it makes filing reports easier by not creating unnecessary complications.
Response: The DSR SDT thanks you for your comment.		
Ameren	Yes	One report would be great for this standard. While this standard needs simplification and automation, we strongly suggest developing a guideline for reporting rather than enforceable standards.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements. The set of results-based standards is intended to provide a 'defense-in-depth' approach to protecting reliability of the bulk power system. While many reports are administrative and are only used to assess compliance with specific requirements, the reporting addressed in this project is focused on providing data needed to support after-the-fact analyses of events, and reporting information needed to maintain situaitional awareness. As such, the SDT believes that these reporting requirements do need to be enforceable.		
Portland General Electric	Yes	PGE supports the efforts of the Standards Drafting Team on the SAR for Project 2009-01 to consolidate the disturbance and sabotage reporting processes as outlined in the concept paper.
Response: The DSR SDT thanks you for your comment.		
Dynegy Inc.	Yes	Please keep it short and simple.

Organization	Yes or No	Question 3 Comment
Response: The DSR SDT thanks you for your comment.		
ERCOT ISO	Yes	Standardization ensures consistency and relevance of the information received.
Response: The DSR SDT thanks you for your comment.		
USBR	Yes	The Bureau of Reclamation utilizes a form for tracking unexpected events. This form contains information which the agency considers important for its one reliability improvement program. The form is also used to meet NERC standard requirements for protection system operations analysis. This form contains most of information required by DOE. The SDT should consider requiring the submission of specific information rather than lock responses in one specific form. In this manner the agency would be avoid duplicate forms, one for NERC, the other for agency purposes.
Response: The DSR SDT thanks you for your comment.		
Central Lincoln	Yes	The existing reporting is needlessly complex. We appreciate the SDT's goal.
Response: The DSR SDT thanks you for your comment.		
SPS Consulting Group Inc.	Yes	There should have probably been one report all along.
Response: The DSR SDT thanks you for your comment.		
Duke Energy	Yes	There should only be one report for all functional entities to submit to NERC.
Response: The DSR SDT thanks you for your comment.		
SERC Reliability Coordinator Sub-committee (RCS)	Yes	There should only be one report for all functional entities.
Response: The DSR SDT thanks you for your comment.		
Manitoba Hydro	Yes	This is a promising idea, though there would be different requirements for the three countries, this could easily be rectified with “drop down menus”. This electronic form could contain a lot of information without distracting clutter as you “tree” down the menu depending on the event that occurred. This could also contain electronic

Organization	Yes or No	Question 3 Comment
		references to information located in Attachment 1-EOP-004 and Threat and Incident Reporting.
Response: The DSR SDT thanks you for your comment. We will consider your specific suggestions when we develop the reporting requirements.		
Hydro-Québec TransEnergie (HQT)	Yes	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
Response: The DSR SDT thanks you for your comment.		
Northeast Power Coordinating Council	Yes	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
Response: The DSR SDT thanks you for your comment.		
Orange and Rockland Utilities, Inc.	Yes	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
Response: The DSR SDT thanks you for your comment.		
Midwest ISO Standards Collaborators	Yes	We agree with the goal of having a single report form but believe there will be a significant challenge to get varying governmental agencies to agree on single report format.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question “Describe the event” or “What steps did you take” on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Edison Mission Marketing & Trading	Yes	With the realization that having a common report form may be difficult to coordinate between differen agencies.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide		

Organization	Yes or No	Question 3 Comment
contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Independent Electricity System Operator	Yes	Yes, this will simplify the reporting effort. NERC may forward the reports to the other need-to-know entities.
Response: The DSR SDT thanks you for your comment.		
Electric Market Policy	Yes	Yes, we agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC.
Response: The DSR SDT thanks you for your comment.		

4. The goal of the DSR SDT is to eliminate the need to file duplicate reports. The standards will specify information required by NERC for reliability. To the extent that this information is also required for other reports (e.g. DOE OE-417), those reports will be allowed to supplement the NERC report in lieu of duplicating the entries in the NERC report. Do you agree with this concept? Please explain your response (yes or no) in the comment area.

Summary Consideration: Most stakeholders agreed with the concept of entities being able to use information from other sources such as the OE-417 form, to supplement the NERC report form. Some thought that duplicate reports were acceptable, as long as the information was not duplicated (if # of customers lost is required on form A, don't ask on forms B & C). Several stakeholders commented on the need for an electronic, one stop reporting tool. This would avoid duplication while ensuring that the information reported goes only to intended recipients. With an electronic, one stop reporting tool, reports can be updated/corrected instantly, without repeating previously submitted information. Some stakeholders cautioned that the OE-417 can change every three years and this should be taken into account when developing an electronic reporting tool. Again, such a reporting tool would need to be vetted and developed to meet reliability needs.

Organization	Yes or No	Question 4 Comment
ERCOT ISO		ERCOT ISO agrees with the concept of eliminating the need to file duplicate reports, but as stated in the Concept Paper, the DOE form (OE-417) is required by law. Based on this, the elimination of EOP-004 (after the fact reporting) is essential, since the OE-417 is mandatory and all-inclusive.
Response: The DSR SDT thanks you for your comment. We agree that the OE-417 compiles a baseline set of information for disturbances, however, it does not function as an all-inclusive report of sabotage and cyber security incidents. The DSR SDT certainly seeks to gain effienciencies through the modification of EOP-004 and CIP-001, which may include the elimination of one or both. Further, the OE-417 is only mandatory for US entities.		
Midwest ISO Standards Collaborators	No	It certainly makes sense to eliminate duplication in reporting and to allow supplemental information to be submitted in other reports. However, it does not make sense to require reporting to other governmental agencies through NERC enforceable NERC standards. Those governmental agencies already have legal authority to compel reporting. Again, we support developing a guideline for reporting rather than enforceable standards. The guideline could certainly explain the various reporting requirements and supplemental reporting requirements mentioned in the question without causing the issues we have identified in our comments.
Response: The DSR SDT thanks you for your comment. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE, which is mandatory under Public Law for US entities. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an		

Organization	Yes or No	Question 4 Comment
option to have the report submitted to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements.		
Consumers Energy Company	No	NERC should either coordinate with DOE for a single reporting process or simply adopt the DOE's standard.
Response: The DSR SDT thanks you for your comment. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE, which is mandatory under Public Law for US entities. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an option to have the report submitted to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements. The DOE report does not collect all the information that NERC needs.		
E.ON U.S. LLC	No	Reliability standards are federal law enforced by fines that can reach up to $1,000,000 per day of violation. There is no reason to deliberately include ambiguity, i.e. "gray areas," in requirements such that registered entities are left unable to determine what it is they must do or refrain from doing to remain compliant. "Sabotage" for the purposes of these standards must be defined.
Response: The DSR SDT thanks you for your comment. The intent of the DSR SDT is to develop requirements for reporting that will be clear and unambiguous with respect to compliance issues. Sabotage will be included in the reporting for "impact events", but may not be called 'sabotage' as there are many different interpretations of "sabotage".		
ISO RTO Council Standards Review Committee	No	The concept of eliminating duplication is laudable, but the idea of writing a standard to mandate reporting that involves reporting to governmental areas does not make sense unless NERC will do all of the reporting for the Industry. A governmental agency is as likely as not to change the forms they require which would then mean two different reports (one for NERC and one for the given agency) or that the standard would have to be re-written every time there is a change.
Response: The DSR SDT thanks you for your comment. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE, which is mandatory under Public Law for US entities. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an option to have the report submitted to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements.		
Ameren	No	The DOE OE-417 report should not supplement the NERC report due to the fact that the majority of reportable events are defined in/come from the OE-417 report. The NERC reporting form should be based on the OE-417 report and then include additional reporting requirements defined by NERC. However, it does not make sense to require reporting to the governmental agencies through enforceable NERC standards. The governmental agencies already have legal authority to compel reporting.

Organization	Yes or No	Question 4 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE, which is mandatory under Public Law for US entities. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an option to have the report submitted to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements.		
SERC Reliability Coordinator Sub-committee (RCS)	No	The requirement should be a single report that satisfies the need for all US governmental agencies as well as NERC and the RRO's.
Response: The DSR SDT thanks you for your comment. The intent of the DSR SDT is to develop standards to address the reliability needs for NERC and not governmental agency reporting criteria.		
Western Electricity Coordinating Council	No	This will work well for the USA entities to save us time in re-entering the same information. We believe that FERC and NERC and the Regions should have one common reporting form for North America. The OE-417 is not required by law outside of the United States. Canadian and Mexican entities may feel that US DOE has no jurisdiction in these countries, and therefore no right to required reporting as is stated on the OE-417.
Response: The DSR SDT thanks you for your comment. We agree that the OE-417 report is not required for Canadian or Mexican entities. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an option to have the report submitted (or not) to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements.		
American Electric Power	Yes	
Edison Mission Marketing & Trading	Yes	
Exelon	Yes	
Orange and Rockland Utilities, Inc.	Yes	
PacifiCorp	Yes	
Platte River Power Authority	Yes	

Organization	Yes or No	Question 4 Comment
Arizona Public Service Company	Yes	APS supports eliminating the need to file duplicate reports. This standardized form should generate and send the DOE OE-417 report, totally eliminating duplicate work. Streamline the process.
Response: The DSR SDT thanks you for your comment.		
Central Hudson Gas & Electric	Yes	Central Hudson agrees with this concept and, as stated in a previous response, recommends that the ability of utilizing the DOE OE-417 to supplement the NERC report be maintained.
Response: The DSR SDT thanks you for your comment.		
Calpine Corp.	Yes	Clarification, simplicity and the removal of duplicate reporting is beneficial.
Response: The DSR SDT thanks you for your comment.		
Constellation Power Source Generation	Yes	Constellation agrees with the concept of eliminating the need to file duplicate reports. If the single NERC reporting form is both comprehensive and easy to use, then using a single report should not be an issue. It is essential that all elements of DOE OE-417, and any similar documents, be incorporated into this single report. Not incorporating all elements will result in gaps in reporting for all Registered Entities.
Response: The DSR SDT thanks you for your comment.		
SPS Consulting Group Inc.	Yes	Duplication is inefficient and casts the whole reporting mechanism in a questionable light.
Response: The DSR SDT thanks you for your comment.		
We Energies	Yes	However, also evaluate whether or not DOE OE-417 is sufficient in lieu of a NERC report. If additional information is required, duplicate format of DOE-OE-417 with additional NERC information listed at the end of the form.
Response: The DSR SDT thanks you for your comment.		
Wolverine Power Supply Cooperative, Inc.	Yes	I agree with the concept of minimizing duplication - See previous question 3 for concerns.
Response: The DSR SDT thanks you for your comment.		

Organization	Yes or No	Question 4 Comment
USBR	Yes	It should be clear what information is to be supplemented. The fewer times the information has to be handled the more efficient the process becomes. If the information exists on a required form, that legal form should be allowed. Also, if the form is already submitted, then reference to it should be sufficient rather than requiring resubmission of the form. That would require handling the information again. As explained in the previous answer, the SDT should recognize that responsible entities have already developed internal reporting processes which utilize forms for consistent responses. Those forms may contain more information than is needed by the new standard to be proposed. The entity should be allowed to submit the internal form or else duplication would be created, which may reduce the effectiveness of an entities reliability improvement program.
Response: The DSR SDT thanks you for your comment. The DSR SDT envisions a one-stop-shopping form that allows reports to be saved, revised and resubmitted at a later date without re-entry of data or information. However, as a caution the DSR SDT cannot guarantee the possibility to submit custom forms.		
Lands Energy Consulting	Yes	Less paperwork and fewer requirements to keep in mind during what may be once in a lifetime events are always good.
Response: The DSR SDT thanks you for your comment.		
Luminant	Yes	Luminant agrees with the concept of reducing reporting requirements, but asks the SDT to go even further. In the concept paper, the SDT discussed that information would not be duplicated on the NERC report and the DOE OE-417 report. The concept paper described a process where one report would simply supplement the other, but two reports would still be filed when required. Can the NERC SDT work with the DOE to develop one report to meet the needs of NERC and the DOE?
Response: The DSR SDT thanks you for your comment. We will consult with the DOE to see if it one report will meet the reporting needs for NERC and the DOE. NERC reliability needs will take precedence.		
Bonneville Power Administration	Yes	Minimizing the number of reports is a good thing. The concept of actually sharing information should be utilized as much as practical.
Response: The DSR SDT thanks you for your comment.		
Oncor Electric Delivery Company LLC	Yes	Oncor agrees that this effort should eliminate file duplication

Organization	Yes or No	Question 4 Comment
Response: The DSR SDT thanks you for your comment.		
Bandera Electric Cooperative, Inc.	Yes	One can only assume the number of reports required in this area will continue to increase in terms of scope and to which agency wants this data. The SDT is encouraged to attempt to find a reporting format and scope that does not needlessly duplicate or complicate overall reporting obligations.
Response: The DSR SDT thanks you for your comment. We will consult with the DOE and FERC to see if it one report will meet the reporting needs for NERC, FERC and the DOE. NERC reliability needs will take precedence.		
Portland General Electric	Yes	PGE supports reducing the duplication of reporting.
Response: The DSR SDT thanks you for your comment.		
Dynegy Inc.	Yes	Short and simple should be the goal.
Response: The DSR SDT thanks you for your comment.		
Duke Energy	Yes	Since the OE-417 is a DOE required report, it must be submitted. Including the OE-417 as part of the NERC electronic form will facilitate reporting to NERC.
Response: The DSR SDT thanks you for your comment. We will consult with the DOE to see if it one report will meet the reporting needs for NERC and the DOE. NERC reliability needs will take precedence.		
Central Lincoln	Yes	The existing reporting is needlessly complex. We appreciate the SDT's goal.
Response: The DSR SDT thanks you for your comment.		
Public Service Enterprise Group Companies	Yes	The PSEG Companies agree with the avoidance of duplicate reports. NERC report forms should not include anything in the DOE form, and NERC Regional report forms should not include anything in the DOE or NERC forms. Hence, a DOE report should not "supplement" a NERC form, but rather replace it unless the NERC form calls for other information for the same reportable incident, and likewise for the DOE - NERC - Regional form structure. DOE forms would be filed with DOE, NERC and the Regional Entity where the event originated. NERC forms would be filed with NERC and the region where the event originated and the Regional form filed only with the Region. In designing the NERC and Regional forms, the need to file multiple reports should be minimized, and in no event should any of the three (DOE, NERC, Region) forms contain

Organization	Yes or No	Question 4 Comment
		duplicative information requests.
Response: The DSR SDT thanks you for your comment. We will consider your comment in the development of the reporting structure / forms.		
Manitoba Hydro	Yes	This could be easily incorporated into the electronic form. You could be prompted for information required immediately, and notified for information that could be entered later. This form could contain all the enterable data that all agencies could require. If the form is live and on line, all entities could be notified (depending on the entries) of an going event immediately. Form could be web based similar to ARS program or even integrated into the ARS program.
Response: The DSR SDT thanks you for your comment. We will consider your comment in the development of the reporting structure / forms.		
FirstEnergy	Yes	We agree that the simplification and consistency of reporting will improve the reporting of this information. We support the drafting team's efforts in this area and hope that all regulatory agencies will as well. However, as we have mentioned in our other comments, the reporting requirements should not be in a reliability standard unless they are proven to be necessary to maintain an Adequate Level of Reliability of the BES. Reporting of these events should be required by NERC in arenas outside of the standards.
Response: The DSR SDT thanks you for your comment. The information provided in the reports is either used after the fact for analyses or used to maintain situational awareness, and is needed for reliability.		
MRO's NERC Standards Review Subcommittee	Yes	We agree with the concept to eliminate duplicate reports. However, we are concerned with the reference of the DOE OE-417 report being a “supplement” of the NERC report rather than “accepted” as the NERC report.
Response: The DSR SDT thanks you for your comment. Future NERC reliability reporting needs may not totally align with DOE report information. Therefore, the OE-417 report would not necessarily substitute for the NERC report. The DOE Reporting Form OE 417 is currently mandatory by Public for US entities.		
Hydro-Québec TransEnergie (HQT)	Yes	We agree with the objective of eliminating duplicate reporting. However, EOP-004 currently allows substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today. We agree with the recommendation to eliminate the need for filing duplicate reports such as the DOE form OE-417. There is no benefit with regard to CIP-001 in filing separate reports. Duplicate reports introduce the potential for incomplete information to be supplied to responsible parties.

Organization	Yes or No	Question 4 Comment
		Removing jurisdictional agencies from the Standard, and having NERC provide either query or situational awareness to those agencies being considered, might not be easy to achieve. There is an obligation under law to require entities to report to the DOE on the OE-417 form as amended or modified. This might drive the "omitted" agencies to have reporting laws enacted as well.
Northeast Power Coordinating Council	Yes	We agree with the objective of eliminating duplicate reporting. However, EOP-004 currently allows substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today. We agree with the recommendation to eliminate the need for filing duplicate reports such as the DOE form OE-417. There is no benefit with regard to CIP-001 in filing separate reports. Duplicate reports introduce the potential for incomplete information to be supplied to responsible parties. Removing jurisdictional agencies from the Standard, and having NERC provide either query or situational awareness to those agencies being considered, might not be easy to achieve. There is an obligation under law to require entities to report to the DOE on the OE-417 form as amended or modified. This might drive the "omitted" agencies to have reporting laws enacted as well.
Response: The DSR SDT thanks you for your comment. The DSR SDT has discussed the possibility of consolidating CIP-001 and EOP-004 to create a single reporting standard. FERC directives require modifications to the standards which also may impose additional reporting requirements (see paragraph 470 of Order 693). **We concur with your comments regarding the legal obligations to submit certain reports. The DSR SDT is attempting to consult with appropriate governmental aencies to address this.**		
BGE	Yes	We agree with this approach, as long as the latest version of the DOE OE-417 form is fully incorporated in the new single-reporting form, so that it maintains its credibility with the DOE.
Response: The DSR SDT thanks you for your comment. The intent is to maintain credibility with the DOE reporting requirements.		
Independent Electricity System Operator	Yes	We support this concept since it works well for those entities that are not required to file reports with the US agencies, e.g. the DOE.
Response: The DSR SDT thanks you for your comment.		
Electric Market Policy	Yes	Yes, we agree with the objective of eliminating duplicate reporting; however, EOP-004 currently allows

Organization	Yes or No	Question 4 Comment
		substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today.
Response: The DSR SDT thanks you for your comment. The DSR SDT has discussed the possibility of consolidating CIP-001 and EOP-004 to create a single reporting standard. FERC directives require modifications to the standards which also may impose additional reporting requirements (see paragraph 470 of Order 693).		

5. In its discussion concerning sabotage, the DSR SDT has determined that the spectrum of all sabotage-type events is not well understood throughout the industry. In an effort to provide clarity and guidance, the DSR SDT developed the concept of an impact event. By developing impact events, it allows us to identify situations in the "gray area" where sabotage is not clearly defined. Other types of events may need to be reported for situational awareness and trend identification. Do you agree with this concept? Please explain your response (yes or no) in the comment area.

Summary Consideration: The majority of stakeholders agreed with the concept of impact events. Some stakeholders felt that the introduction of impact events increased the risk that some items will go unreported. However, most felt that impact events would dramatically increase the number of reports being submitted, and it would be difficult to separate important information from background noise. Several respondents felt that the SDT ignored the FERC Directive, and did not define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event. Many respondents supplied the SDT with their own definition of "Sabotage". The DSR SDT believes that the concept of impact events and the specificity of what needs to be reported in the standard will be an equally efficient and effective means of addressing the FERC directive regarding sabotage. Some stakeholders felt that impact events add another layer of uncertainty to the reporting. Even with the switch from sabotage to impact events, several felt that "intent" was still key to determining reportability.

Organization	Yes or No	Question 5 Comment
ERCOT ISO		ERCOT ISO recognizes the risks associated with "gray areas" not being clarified. While "gray areas" pose compliance risk due to differing interpretations, a risk remains that some items will go unreported. A more prescriptive approach raises an even greater risk of events not being reported. People will not report events that are not specifically listed, and will not use judgment in determining the need for reporting.
Response: The DSR SDT thanks you for your comment. We agree that a more prescriptive approach could pose greater risks but we will attempt to clarify and define an approach to assist the industry and stakeholders for reporting impact events.		
Constellation Power Source Generation	No	Although defining an impact event would bring clarity to defining sabotage events, adding another situation would further complicate things. Furthermore, the examples of impact events used all fall under the Sabotage category in the Threat and Incident Reporting Guideline. Constellation Power Generation suggests the SDT further clarifies the items in the Sabotage category to ensure all grey area situations are included. Clarification is also needed in how a Cyber Security Incident (CIP-008) would map into the categories of Disturbance/Impact Events (CIP-001). To that point, Constellation Power Generation questions whether cyber related incidents should fall under the spectrum of sabotage type events, or remain separate and be incorporated in the CIP revisions. Having cyber related incidents separate from other sabotage events would

Organization	Yes or No	Question 5 Comment
		provide the clarity and guidance that the DSR SDT is striving to achieve.
Response: The DSR SDT thanks you for your comment. We are suggesting the term "Impact Event" be substituted to include all events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact the reliability of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples.		
Duke Energy	No	As FERC ordered in Order No. 693, the drafting team should further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event. Suggested definition: "Sabotage - the malicious destruction of, or damage to assets of the electric industry, with the intention of disrupting or adversely affecting the reliability of the electric grid for the purposes of weakening the critical infrastructure of our nation."
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "intent" which may not be determined until after a lengthy investigation. We will continue to discuss for inclusion in a future draft of this project. The DSR SDT believes that the concept of impact events and the specificity of what needs to be reported in the standard will be an equally efficient and effective means of addressing the FERC directive regarding sabotage.		
Kootenai Electric Cooperative	No	Impact events seems to add another layer of uncertainty to the reporting. Define a transmission line. Our transmission lines have very little impact on the grid. It is possible for our lines to cause a local area outage on our transmission provider - but neither is of national security interest or even regional interest. There is no power flow going on across the lines other than local power delivery supply. It seems you run more risk of losing the important reports in the snow of reporting - similar to what we have to avoid on our SCADA systems for our operators to see the key information.
Response: The DSR SDT thanks you for your comment. The DSR SDT understands your concern and this was discussed a great deal. It is our belief that criteria of the "impact events" to be reported will be properly defined and discriminated from local events that have no impact on the reliability of the BES.		
SERC Reliability Coordinator Sub-committee (RCS)	No	Impact events that do not affect reliability should not be reported.
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees but a balance must be further explored to meet industry and regulatory requirements specifically under FERC Order 693.		
Luminant	No	Luminant would prefer to report disturbances and sabotage events. The reporting of impact events could lead to unnecessary reporting. A definition of an "impact event" may be even more confusing than sabotage

Organization	Yes or No	Question 5 Comment
		events.
Response: The DSR SDT thanks you for your comment. The DSR SDT understands your concern and this was discussed a great deal. It is our belief that criteria of the "impact events" to be reported will be properly defined and discriminated from local events that have no impact on the reliability of the BES. We are suggesting the term "Impact Event" be substituted to include only events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact reliabiltiy of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples.		
Orange and Rockland Utilities, Inc.	No	Physical and cyber events must be investigated before a determination of sabotage or impact event can be made. Impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on 'newsworthy' events or to gather information for trending. It is the law enforcement industry's responsibility to make a determination of "sabotage" or other. This determination cannot definitively be made by industry (operating) personnel. If NERC's definition is expanded for CIP-001 and/or EOP-004, responsibility and timing of reporting needs to addressed so that appropriate agencies conduct the investigation and assessment. Operating personnel need to remain focused on the primary responsibility of mitigating the effects.
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "intent" which may not be determined until after a lengthy investigation. We will continue to discuss these ideas for inclusion in a future draft of this project. Timing of the reporting process will be further clarified based upon your comments and those in the industry that have voiced similar concerns.		
MRO's NERC Standards Review Subcommittee	No	Rather than attempting to define a new term (impact event), we suggest that the concept of impact event be replaced with further defining sabotage and providing guidance on trigger events (impact event) that would cause an entity to report.
Response: The DSR SDT thanks you for your comment. We will continue to discuss the FERC "Clarification of sabotage" directive and seek further guidance to meet this directive. The term sabotage has created conflict in its meaning among stakeholders as to when its determined and by whom and how long an investigation would take to make that call on the intent of the saboteur. The DSR SDT is reviewing what a reportable disturbance actually is and sabotage may be a sub component of a reportable disturbance event.		
Lands Energy Consulting	No	The level of complexity described will overwhelm the 20-200 employee utilities that have yet to see - and will never see - the kind of sabotage event that scares the Department of Homeland Security.
Response: The DSR SDT thanks you for your comment. The DSR SDT does not intend for the reporting of impact events to overwhelm smaller entities. If events do not affect the reliability of the BES, then it is our intent that they will be excluded from reporting requirements under our proposal. We will attempt to clarify and define an approach to assist the industry and stakeholders for reporting impact events. FERC cautioned the		

Organization	Yes or No	Question 5 Comment
industry that acts of sabotage may be "tested" on smaller entities and ultimately on larger entities.		
ISO RTO Council Standards Review Committee	No	The nature of the fact that "gray areas" exists preclude the idea of using a standard to report; particularly a standard for the vague topic of motivation such as sabotage events and the more defined disturbance events.
Response: The DSR SDT thanks you for your comment. We will attempt to clarify and define an approach to assist the industry and stakeholders for reporting impact events.		
Edison Mission Marketing & Trading	No	There are too many special circumstances to try and capture. I feel this would be best delivered as a guideline.
Response: The DSR SDT thanks you for your comment. We are suggesting the term "Impact Event" be substituted to include only events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact reliability of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples.		
Exelon	No	We agree with the direction to identify impact events examples that would trigger reporting and not be limited to sabotage reporting only. It is important to note that when an incident occurs, some level of investigation is required before a determination can be made as to the event is sabotage or not. The focus should be on reporting events when they occur and allow follow-up investigations to make the sabotage determination. That being said, care must be taken in the development of any list of impact events so that it doesn't become or is misinterpreted to be a definitive list. Therefore if it is not on the list, it is not reportable.
Response: The DSR SDT thanks you for your comment. We concur and plan to allow reports to be submitted, edited and re-submitted in the one-stop-shopping reporting tool. We are suggesting the term "Impact Event" be substituted for sabotage andinclude only events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact reliability of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples.		
Midwest ISO Standards Collaborators	No	We agree with the idea of identifying impact events but do not support the requirement for these to be always reported through the hierarchical structure identified in question 2. If an impact event only affects one entity, that entity should have the reporting requirement.
Response: The DSR SDT thanks you for your comment. The DSRSDT will continue to explore the benefits and weaknesses of the hierarchy reporting structure.		
Hydro-Québec TransEnergie (HQT)	No	We believe that physical and cyber events must be investigated before a determination of sabotage or impact event can be made. The purpose of the NERC Standards is to maintain the reliability of the BES. Therefore,

Organization	Yes or No	Question 5 Comment
		impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on 'newsworthy' events or to gather information for trending. It is the law enforcement industry's responsibility to make a determination of "sabotage" or other. This determination cannot definitively be made by industry personnel, there is no expertise or time to investigate causes. It is the industry's job to mitigate effects. Examples would help provide for better guidance/direction. Industry examples would be welcomed to help reinforce developed internal processes for compliance.
Northeast Power Coordinating Council	No	We believe that physical and cyber events must be investigated before a determination of sabotage or impact event can be made. The purpose of the NERC Standards is to maintain the reliability of the BES. Therefore, impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on 'newsworthy' events or to gather information for trending. It is the law enforcement industry's responsibility to make a determination of "sabotage" or other. This determination cannot definitively be made by industry personnel, there is no expertise or time to investigate causes. It is the industry's job to mitigate effects. Examples would help provide for better guidance/direction. Industry examples would be welcomed to help reinforce developed internal processes for compliance.
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "intent" which may not be determined until after a lengthy investigation. We will continue to discuss issues with sabotage for inclusion in a future draft of this project. Timing of the reporting process will be further clarified based upon your comments and those in the industry that have voiced similar concerns.		
American Electric Power	Yes	
Calpine Corp.	Yes	
PacifiCorp	Yes	
Platte River Power Authority	Yes	
Central Lincoln	Yes	An act of vandalism may have impact. An act of sabotage may not be impactful alone, but may be part of a wider coordinated attack. Dictionary definitions speaking of "intent" are not helpful in this regard, since acts of vandalism and sabotage are both generally committed intentionally. Saboteurs, though, work for a higher cause. That cause may be political, social, environmental, etc. We ask that the SDT look beyond dictionary definitions in developing a definition of sabotage.

Organization	Yes or No	Question 5 Comment
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "intent". The term sabotage has created conflict in its meaning among stakeholders as to when its determined and by whom and how long an investigation would take to make that call on the intent of the saboteur. We will strive to meet this challenge with the input on the right language from government agencies and industry experience expertise.		
Bonneville Power Administration	Yes	BPA agrees with providing an industry-wide definition and guideline. We do NOT agree with requiring reports for every instance of every activity. If your definition is good, you'll get what is needed and not much chaff.
Response: The DSR SDT thanks you for your comment.		
Central Hudson Gas & Electric	Yes	Central Hudson agrees with this concept, particularly if the reporting hierarchy through the RC is implemented in order to better identify trends.
Response: The DSR SDT thanks you for your comment. The DSRSDT will continue to explore the benefits and weaknesses of the hierarchy reporting structure.		
Wolverine Power Supply Cooperative, Inc.	Yes	I agree with the concept of focusing on impact instead of the type of event (sabotage, accident, vandalism, etc.)I hope that the reporting proposal that comes out of this project will clearly make a separation between true impact events that must be reported per the standards (enforceable), vs. "other" information that may be (electively - not enforceable) reported, per some set of guidelines.
Response: The DSR SDT thanks you for your comment. We agree reportable items should be based on impact to reliability and with other commenters that expressed a desire to avoid reporting on 'newsworthy' events but to gather meaningful information for trending. We are suggesting the term "Impact Event" be substituted for sabotage to include only events that would impact the reliability of the BES.		
Bandera Electric Cooperative, Inc.	Yes	In principle, I agree with this concept. Would like for the SDT to pursue this further and seek additional comments at that time.
Response: The DSR SDT thanks you for your comment. We will seek further comments on the concept and will prepare the beginnings of the first draft soon.		
Oncor Electric Delivery Company LLC	Yes	Oncor agrees that there are no broadly used guidance documents that detail how an event may be accurately defined.
Response: The DSR SDT thanks you for your comment. We agree that further industry guidance of a clear and understandable standard should be sought under the new Results Based approach. We will attempt to clarify and define an approach to assist the industry and stakeholders in reporting		

Organization	Yes or No	Question 5 Comment
impact events.		
Portland General Electric	Yes	PGE supports the DSR SDT's efforts to bring clarity and guidance to the spectrum of sabotage-type events.
Response: The DSR SDT thanks you for your comment.		
FirstEnergy	Yes	The concept paper makes good progress in this area and the drafting team is on the right track, and agree that better clarity needs to be developed surrounding sabotage events. However, some of the examples stated in the paper are too vague and do not address extenuating circumstances or reasons for the events. One example sighted in the paper is "Bolts removed from transmission line structures." This statement may be too broad. For instance, if the bolts are removed from the tower and the organization is not experiencing a labor dispute, it could be considered a sabotage event with wide area implications. However, if the organization is in the middle of a labor dispute, this would be vandalism and would most likely not be of a wide area concern. Also, the number and location of towers affected could be an important determination related to the risk the event imposes on the Bulk Electric System.
Response: The DSR SDT thanks you for your comment. We concur with your comments that the number and location of the towers affected may have a "local" vs "wide area" concern. However, under the "impact event" reporting that we are proposing, both scenarios above should be reported as impact events as long as it affects the BES.		
Public Service Enterprise Group Companies	Yes	The PSEG Companies agree with the concept, but reserve judgment on the descriptions of the impacts. There is clearly a need to better define what constitutes a sabotage incident versus common theft or vandalism. Moreover, where it may be impossible to determine if any given incident (e.g., several loose bolts on a transmission tower cross brace could be sabotage or could be human error in construction) falls within sabotage, a registered entity should not be second guessed in an audit if the registered entity determines not to report. Excessive unnecessary reporting can mask real incidents.
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees with clearly defining a reportable impact versus common theft. Concern over reporting an incident and the audit process are within the discussions of the DSR SDT and will be fully explored to assist with the 1st Draft. The ability to identify trends could be very important compared to isolated incidents that do not impact the BES. Every effort to explore this balance of reporting will be taken into account.		
SPS Consulting Group Inc.	Yes	The term sabotage was always too narrow a concept for the standards. At times, questionable activities are not confirmed as sabotage events until well after the fact, forcing the registered entity to speculate on whether or not to report an activity that may not be a confirmed sabotage event at the time, and hence encounter another silly violation based on imprecise terminology.

Organization	Yes or No	Question 5 Comment
Response: The DSR SDT thanks you for your comment. We are suggesting the term "Impact Event" be substituted to include all events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact reliability of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples. Tightening the reporting criteria of impact events could possibly address the concern expressed by a "violation based on imprecise terminology."		
USBR	Yes	There should be a clear distinction between a cyber event and a cyber event that has a material impact on the reliability of the bulk electric system. Not all CIP-008 events will carry such a distinction. That being said, CIP 008 cannot be completely incorporated in this process. Denying access to a cyber asset is noteworthy under CIP008 but may not pose a threat to the reliability of the bulk electric system. Consider recognizing the impact on the bulk electric system when modifying definitions of adding the bulk electric system description to the definitions. This will help to clarify that disturbances, as discussed in this effort, are situations that produce an abnormal condition on the electric power system, not necessarily on ancillary or supporting systems, such as SCADA systems or the water-related systems at hydroelectric dams.
Response: The DSR SDT thanks you for your comment. We are suggesting in our discusssion to consolidate the location of reporting into one standard. The industry has demonstrated by comments that it favors streamlining the reporting process to achieve a "one stop shop" approach. We will continue to explore the possibilities to achieve the best results for all stakeholders. A discussion of advantages /disadvantages will continue to discover options and alternatives with input from all stakeholders.		
Western Electricity Coordinating Council	Yes	This will help eliminate regional differences in sabotage reporting. The definition should be broad enough so it covers new types of sabotage that may evolve. Event analysis facilitates situational awareness and if it requires further investigation regarding developing patterns and severity, it should be handled by law enforcement if need be.
Response: The DSR SDT thanks you for your comment. The DSR SDT will continue to explore the "Impact Event" definition to allow for new types of events. Event analysis is clearly a goal of reporting as is situational awareness and hopefully this project will enhance the understanding and clearly define obligations to all stakeholders.		
Manitoba Hydro	Yes	Though there are some specific events already included in this new definition, more could be added to dissolve specific "gray areas" and as new ones come up. Again these examples could be added into the electronic form and could contain a large data base which would be available depending on the event that occurred.
Response: The DSR SDT thanks you for your comment.		

Organization	Yes or No	Question 5 Comment
BGE	Yes	We agree that "the spectrum of all sabotage-type events is not well understood throughout the industry"; however, we feel that the proposed concept of an "Impact Event" falls short of clarifying what constitutes such events. We believe that "Impact Events" needs further clarification to eliminate "gray areas" and to provide more reporting consistency between entities.
Response: The DSR SDT thanks you for your comment. The DSR SDT will continue to clarify the impact events concept and eliminate "gray areas" while including language to give clarity to the reporting process.		
Dynegy Inc.	Yes	We agree with the concept but please provide specific examples. Also, please consider whether there are any penalties for misinterpreting an incident, who would determine if an event was a threat, and whether this could result in over reporting non-threats.
Response: The DSR SDT thanks you for your comment. The DSR SDT may include specific examples of impact events and types of reportables events in the 1st draft of the standard (or in supplemental guidance) to help illustrate reportable criteria.		
Consumers Energy Company	Yes	We agree with the concept, however, based on the information provided, it may be too vague to be of value. Terms such as "potential" and "significant" can be subjective and therefore provide little direction. We would like to see something more specific. Also, inclusion of the destruction of BES assets may be too inclusive and needs to be restricted to BES assets that will cause a specific level of impact on reliability.
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "potential" and "significant". Specific examples of criteria is being explored and discussed. We will strive to meet this challenge with the input on the right language from government agencies and industry experience expertise. Your suggestion of restricting to BES assets that will cause a specific level of impact on reliability will be discussed with the DSR SDT.		
Independent Electricity System Operator	Yes	We agree with the general concept. However, we suggest that the classification of "events" to be compatible if not identical to those which need to be reported in real time as required in CIP-001, for otherwise it will create confusion and unnecessary, extra work. Also, this proposal appears to focus on the sabotage-type events only but the SAR deals with both sabotage and other disturbances (e.g. emergency type of events) reporting. A parallel type of "impact event" is needed for non-sabotage-type of events.
Response: The DSR SDT thanks you for your comment. The DSR SDT notes that impacts events include both sabotage and non-sabotage types of events and these events include CIP-001 events.		
Electric Market Policy	Yes	We believe that physical and cyber events must be investigated before a determination of sabotage or impact

Organization	Yes or No	Question 5 Comment
		event can be made.
Response: The DSR SDT thanks you for your comment. We agree that sabotage requires investigation. The term "impact event" was developed to allow immediate reporting of events based on impact to the BES rather than intent.		
We Energies	Yes	We would prefer to refer to all sabotage, vandalism, cyber attacks, and other criminal behavior as impact events. Focusing more on the event's impact on reliability and its ramifications on the systems seems to be more useful than to try to determine the intent of the perpetrator.
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees with your assessment and will pursue the clarity and criteria examples to achieve reporting.		

6. If you are aware of any regional reporting requirements beyond the scope of CIP-001, CIP-008 and EOP-004 please provide them here.

Summary Consideration: Several commenters provided information on regional reporting. The SDT will consider whether these should be included in the continent-wide standard. These include:

1. NPCC maintains a document and reporting form (Document C-17 - Procedures for Monitoring and Reporting Critical Operating Tool Failures) that outlines the reporting requirements, responsibilities, and obligations of NPCC Reliability Coordinators in response to unforeseen critical operating tool failures.
2. For other events that do not meet the OE-417 and EOP-004 reporting criteria, ReliabilityFirst expects to receive notification of any events involving a sustained outage of multiple BES facilities (buses, lines, generators, and/or transformers, etc.) that are in close proximity (electrically) to one another and occur in a short time frame (such as a few minutes).
3. WECC sets its loss of load criteria for disturbance reporting at 200 MW rather than the 300 MW in the NERC reporting form.
4. SERC and RFC are developing additional requirements at this time.
5. We suggest that reporting be based on impact to reliability, not on ‘newsworthy’ events. We therefore do not agree with such regional efforts and would prefer a continent wide reporting requirements.
6. MISO RC (MISO OP-023) and RFC (PRC-002-RFC-01).

Organization	Question 6 Comment
Central Hudson Gas & Electric	Although not beyond the scope of these standards, NPCC maintains a document and reporting form (Document C-17 - Procedures for Monitoring and Reporting Critical Operating Tool Failures) that outlines the reporting requirements, responsibilities, and obligations of NPCC RCs in response to unforeseen critical operating tool failures.
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard.	
Exelon	At the 2010 RFC Spring Workshop the following disturbance reporting Criteria was rolled out: All events that are required to be reported by the OE-417 and EOP-004 criteria will use those published procedures. For other events that do not meet the OE-417 and EOP-004 reporting criteria, ReliabilityFirst expects to receive notification of any events involving a sustained outage of multiple BES facilities (buses, lines, generators, and/or transformers, etc.) that are in close proximity (electrically) to one another and occur in a short time frame (such as a few minutes).

Organization	Question 6 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard.	
Lands Energy Consulting	I believe WECC sets its loss of load criteria for disturbance reporting at 200 MW rather than the 300 MW in the NERC reporting form.
Response: The DSR SDT thanks you for your comment. The DSR SDT will consider regional criteria when developing reporting thresholds.	
Edison Mission Marketing & Trading	I don't know of any.
Orange and Rockland Utilities, Inc.	NERC's SDT effort requires a clear, consistent, and comprehensive continent-wide approach, thus mitigating any need for regional reporting requirements.
Response: The DSR SDT thanks you for your comment. The SDR SDT feels in many instances that region specific standards may be needed. However, the SDT will provide a clear reporting standard that can be consistently followed continent-wide.	
MRO's NERC Standards Review Subcommittee	No Comment.
Duke Energy	None
Bandera Electric Cooperative, Inc.	No.
Manitoba Hydro	No.CIP-001 contains references to NERC and the DOE.CIP-008 makes exclusions for facilities regulated by US Nuclear Regulatory Commission and Canadian Nuclear Safety Commission. It also contains references to ES ISAC (Electricity Sector Information Sharing and Analysis Center).EOP-004 contains reference to NERC and DOE. There is no reference to Homeland Security, FBI, etc or to Canadian equivalent references in any of these Standards. When NERC is notified of an event, it is likely other organizations will have to be notified. There should be some sort of consistency to cover all these Standards and all notifiable parties at a NERC Standards level.
Response: The DSR SDT thanks you for your comment. The DSR SDT absolutely understands your provided comment and have had detailed conversations surrounding "who" should be notified and "when". Most importantly, a level of consistency should exist when reporting disturbances and sabotage events negatively impacting the BES.	

Organization	Question 6 Comment
Oncor Electric Delivery Company LLC	Oncor is not aware of any regional reporting requirements beyond the scope of CIP-001, CIP-008 and EOP-004.
Response: The DSR SDT thanks you for your comment.	
Dynegy Inc.	Please consider MISO RTO-OP-023.
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard. Please provide a copy of the subject document.	
Electric Market Policy	SERC and RFC are developing additional requirements at this time. We suggest that reporting be based on impact to reliability, not on ‘newsworthy’ events. We therefore do not agree with such regional efforts and would prefer a continent wide reporting requirements.
Hydro-Québec TransEnergie (HQT)	
Northeast Power Coordinating Council	
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard.	
Public Service Enterprise Group Companies	The PSEG Companies believe that RFC is developing a regional disturbance reporting requirement for events not meeting the criteria of current DOE and NERC reports.
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard.	
Western Electricity Coordinating Council	There is a need to learn what reporting requirements are required by the Mexican and Canadian entities.
Response: The DSR SDT thanks you for your comment. The DSR SDT is comprised of international members and we are currently researching requirements that Mexico and Canada may have.	
SERC Reliability Coordinator Sub-committee (RCS)	We are not aware of any regional reporting requirements beyond the requirements of CIP-001, CIP-008 and EOP-004. However, the SERC RRO has shared a list of events of interest that it would like to be made aware of to maintain situation

Organization	Question 6 Comment
	awareness.
Response: The DSR SDT thanks you for your comment. The SDR SDT feels there will always be a need for the Regional Entities to be kept aware of certain "hot topic" issues. However, it is the SDT's intent to provide clear and concise reporting requirements for events impacting the BES.	
BGE	We are not aware of any regional requirements beyond the scope of CIP-001, CIP-008 and EOP-004.
Response: The DSR SDT thanks you for your comment.	
We Energies	What is meant by beyond the scope of the referenced standards? We Energies also has reporting obligations with the MISO RC (MISO OP-023), RFC (PRC-002-RFC-01), and the Wisconsin and Michigan Public Service Commissions.
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard. Please provide a copy of the subject reporting requirements for the SDT to review.	

7. If you have any other comments on the Concepts Paper that you haven't already provided in response to the previous questions, please provide them here.

Summary Consideration: Several stakeholders provided comments in this section. Some stakeholders suggested that the SDT has gone beyond its approved scope to "further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event." Further, there is no requirement to create a Reporting Standard to define sabotage. The SDT contends that the development of impact events and the reporting requirements for them will provide the clarity sought in the directive.

Other stakeholders suggested that the SDT should seek to retire sanctionable requirements that require event reporting in favor of guidelines for reporting.

Several commenters suggested that the introduction of impact events actually expands the reporting requirements. It should be noted that the list of impact events is expected to be explicit as to who is to report what to whom and within certain timelines.

Several stakeholders provided input as to what they believed an electronic reporting tool should contain:

1 If the decision is made to go to a single reporting form, it should be developed to cover any foreseeable event.

2 The SDT should work toward a single form, located in a central location, and submitted to one common entity (NERC)

3 Reports should be forwarded to the ES-ISAC, not NERC, as the infrastructure is already in place for efficient sharing with Federal agencies, with the regional entities and with neighboring asset owners. Reports should flow to all affected entities in parallel, rather than series (timing issues).

Commenters also suggested that the SDT should consider the impacts of the reporting requirements on the small, and very small utilities.

Organization	Question 7 Comment
BGE	1. If we move to a "one size fits all" single reporting form, it is important that the form be properly developed to cover any foreseeable event, which appears to be the intent of the DSR SDT, as outlined on page 4 of the concept document. Such an approach should also incorporate a single point of contact for reporting information, to avoid any confusion. 2. We would like clarification that any proposed CIP-008-related reporting requirement (including any linked reporting requirement between CIP-008 and CIP-001) is only applicable in situations where the incident/event involves a registered entity's Critical Cyber Asset.

<table>
<tr><th>Organization</th><th>Question 7 Comment</th></tr>
<tr><td colspan="2">Response (Questions 3&6): The DSR SDT thanks you for your comment. The drafting team will explore clarification that any proposed CIP-008 related reporting requirement between CIP-008 and CIP-001 is only applicable where the incident/event involves a registered entity's CCA. Note that CIP-002 through CIP-009 are undergoing revision under project 2008-06 – Order 706 SDT. Note that the current CIP-008 has a reporting requirement to the ES-ISAC only.</td></tr>
<tr><td>Electric Market Policy</td><td>a. NERC should focus efforts on developing <u>specific event reporting criteria</u> and not base the requirement on the definition of the term 'sabotage' but on the reporting criteria itself.

b. The "opportunities for efficiency" discussed in the Concept Paper would be best achieved by focusing on those items that are necessary to <u>maintain the reliability of the Bulk Electric System</u>. If there are elements that need to be reported that, do not support this objective, than that reporting should not be required in reliability standards.</td></tr>
<tr><td>Hydro-Québec TransEnergie (HQT)</td><td>a. NERC should focus efforts on developing specific event reporting criteria and not base the requirement on the definition of the term 'sabotage', but on the reporting criteria itself. See comments above.

b. The "opportunities for efficiency" discussed in the Concept Paper would be best achieved by focusing on those items that are necessary to maintain the reliability of the Bulk Electric System. If there are elements that need to be reported that do not support this objective, then that reporting should not be required in reliability standards. Consider making NERC the distributor of reports to other agencies. We recognize that the key is to simplify reporting to a single form, and to the extent possible, to one agency. "Front line" reliability personnel must have the "timely" knowledge to know when a situation warrants local, area, regional, or national involvement. Finally, the SDT should keep in mind the fact that Canadian stakeholders might have some difference in the way reports are made to Security Agencies.</td></tr>
<tr><td>Northeast Power Coordinating Council</td><td>a. NERC should focus efforts on developing specific event reporting criteria and <u>not</u> base the requirement on the definition of the term 'sabotage', but on the reporting criteria itself. See comments above

b. The "opportunities for efficiency" discussed in the Concept Paper would be best achieved by focusing on those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. If there are elements that need to be reported that do not support this objective, then that reporting should not be required in reliability standards. Consider making NERC the distributor of reports to other agencies. We recognize that the key is to simplify reporting to a single form, and to the extent possible, to one agency. "Front line" reliability personnel must have the "timely" knowledge to know when a situation warrants local, area, regional, or national involvement.</td></tr>
<tr><td colspan="2">Response: The DSR SDT thanks you for your comment. The DSR SDT agrees to focus efforts to specific event reporting criteria. SDT believes that by reporting material risks to the Bulk Electrical System using the impact event categorization it will be easier to get the relevant information for mitigation, awareness, and tracking, not based on the requirement of defining "sabotage". The SDT believes that it is the submitter's responsibility to submit OE-417 forms to the DOE, as stated by Public Law for US entities. The DSR SDT does recognize that it may not be possible to eliminate</td></tr>
</table>

Organization	Question 7 Comment
reporting to multiple jurisdictional agencies due to legislative or regulatory requirements.	
SPS Consulting Group Inc.	Again, please consider the unique scope of the entities to which these standards are to comply. Don't dump all the requirements on all the applicable entities and perpetuate the current practice of forcing them to parse the requirements into what is logical or illogical from their perspective. The drafting team should have the expertise to do this. Identify which requirements apply to which applicable entity.
Response: The DSR SDT thanks you for your comment. The DSR SDT will take into consideration what registered entities and thresholds are to be included in the revised standard(s) based on the SAR. The DSR SDT will establish the "requirements necessary for users, owners, and operators of the Bulk-Power-System" as stated in FERC Order 693 and the difference in reporting of events on the BES, as stated in the Purpose statement of EOP-004-1.	
ERCOT ISO	All references to CIP-008 should be removed and we reassert that physical and cyber reporting should be separate. There is documentation available from the CIPC that the drafting team considered CIP-001 related physical sabotage reporting and specified cyber incident reporting requirements in CIP-008.ERCOT ISO requests the DSR SDT to continue to improve its guidelines and to post those guidelines for all to use, but not to create sanctionable standards whose good intentions could result in unintended adverse consequences for the Industry. ERCOT ISO also suggests that all reporting forms and guidance should be located in a central, easily accessible location, eliminating confusion and simplify reporting for system operators thereby directly enhancing reliability during system events. The industry would benefit from a central location or link on the NERC website containing all reporting forms.
Response: The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if the DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). The DSR SDT will take into consideration your comment on keeping cyber and physical events separate. We are suggesting in our discussion to consolidate the location of reporting into one standard. The industry has demonstrated by its comments that it prefers that the reporting process be streamlined to achieve a "one stop shop" approach. We will continue to explore the possibilities to achieve the best results for all stakeholders. A discussion of advantages /disadvantages will continue to discover options and alternatives with input from all stakeholders.	
Western Electricity Coordinating Council	As stated previously, for "One stop shopping" we need "buy in" from the foreign nationals. The way to do this is to engage their opinions and respect their jurisdictional agencies as well.
Response (Question 6): The DSR SDT thanks you for your comment. The DSR SDT does recognize that it may not be possible to eliminate reporting to multiple jurisdictional agencies due to legislative or regulatory requirements. The SDT acknowledges that it is possible to consolidate various reports that ask repetitive questions and through this process can work with foreign nationals to receive their "buy in" for a one report form for all functional entities to submit to NERC.	

Organization	Question 7 Comment
MRO's NERC Standards Review Subcommittee	Confusion often arises in the industry between the CIP standards and other reliability standards based on CIP-001 naming convention. We would suggest the SDT retire CIP-001 and incorporate requirements within the EOP-004 standard or a new EOP-xxx standard to avoid confusion rising from CIP and other NERC Reliability Standards. Additionally, we assume the SDT has been created to specifically address FERC Order 693 directives to the ERO which appears to include the following items: 1. Applicability - “possible revisions to CIP-001-1 that address our concerns regarding the need for wider application of the Reliability Standard... the ERO should consider whether separate, less burdensome requirements for smaller entities may be appropriate” (FERC, 2007, para. 460). 2. Definition of Sabotage - “we direct that the ERO further define the term and provide guidance on triggering events that would cause an entity to report an event... we believe the term sabotage is commonly understood and that common understanding should suffice in most instances... the ERO should consider FirstEnergy’s suggestions to differentiate between cyber and physical sabotage and develop a threshold of materiality.” (FERC, 2007, para. 461-462) 3. Periodic Review and Testing - “directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures.” (FERC, 2007, para. 466) 4. Redundant Reporting - “now direct the ERO to address our underlying concern regarding mandatory reporting of a sabotage event... Regarding the potential for redundant reporting under CIP-001-1 and other government reporting standards, and the need for greater coordination... We direct the ERO to explore ways to address these concerns - including central coordination of sabotage reports and a uniform reporting format... with the appropriate governmental agencies that have levied the reporting requirements.” (FERC, 2007, para. 468-469) 5. Specified Time - “the Commission directs the ERO to modify CIP-001-1 to require an applicable entity to contact appropriate governmental authorities in the event of sabotage within a specified period of time... the ERO should consider suggestions raised... to define the specified period for reporting an incident beginning from when an event is discovered or suspected to be sabotage” (FERC, 2007, para. 470). 6. Summary of CIP-001-1 - “the Commission directs the ERO to develop the following modifications... (1) further define sabotage and provide guidance as to the triggering events... (2) specify baseline requirements regarding... procedures for recognizing sabotage events... (3) incorporate a periodic review... and for the periodic testing... (4) require an applicable specified period of time. In addition... address our concerns regarding applicability to smaller entities... consolidation of the sabotage reporting forms and the sabotage reporting channels with the appropriate governmental authorities to minimize the impact of these reporting requirements on all entities.” (FERC, 2007, para. 471) 7. Analyze Performance - “at a minimum, generator operators and LSEs should analyze the performance of their equipment and provide the data... The Commission directs the ERO to consider this concern in future revisions... that includes any Requirements necessary for users, owners and operators... to provide data that will assist NERC” (FERC,

Organization	Question 7 Comment
	2007, para. 613, 617). 8. Reporting Time Frames - "The Commission directs the ERO to change its Rules of Procedures to assure that the Commission also receives these reports within the same time frames as the DOE." (FERC, 2007, para. 618)
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees with your comments to specifically address FERC Order 693 directives to the ERO and will determine a prudent course of action with respect to these standards and pursue the suggestion to retire CIP-001 and incorporate requirements within the EOP-004 standard to avoid confusion rising from CIP and other NERC Reliability Standards.	
Constellation Power Source Generation	Constellation Power Generation would like clarification that any proposed CIP-008-related reporting requirement (including any linked reporting requirement between CIP-008 and CIP-001) is only applicable in situations where the incident/event involves a registered entity's Critical Cyber Asset. In that vein, we want to emphasize the importance of the DSR SDT working with the CIP SDT on the cyber related events. If the DSR SDT is going to be adding clarity to cyber related events, then coordination with the CIP SDT is needed to ensure the same verbiage is being used. Furthermore, having any duplication of requirements will cause a double jeopardy scenario which would go against the SAR for the DSR SDT. As stated earlier, Constellation Power Generation also questions whether cyber related incidents should fall under the spectrum of sabotage type events, or remain separate and be incorporated in the CIP revisions.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). Note that CIP-002 through CIP-009 are undergoing revision under project 2008-06 – Order 706 SDT.	
We Energies	Give consideration to combining CIP-001 and EOP-004-1 through a common categorization. For example, "System Risk Reporting" could encompass both actual and potential events and would minimize the need to cross reference both standards, and provide one location for event and potential-event reporting. Much of the challenge in this project is in achieving a common understanding of the words sabotage and terrorism. There are nuances of meaning in the words that imply a relationship between the attacker and the victim, or a motive other than simple profit or mischief. This nuance of meaning requires the victim of the damage to discern a relationship or motive which may not be discoverable in the relatively brief time window during which the entity must report the event. In fact, they may never be known. Consequently, We Energies recommends elimination of the words sabotage and terrorism from these standards. We also recommend elimination of the word vandalism since it also implies an ability and duty to discern whether a particular act (barbed wire thrown over transformer bushings) was done out of pure mischief (vandalism) or with intent to destroy equipment for a political purpose (terrorism). And if the act was committed by a disgruntled employee, it becomes sabotage. No wonder there is confusion and indecision. Instead, We Energies recommends using the simple words "criminal damage". One need not be a prosecuting attorney or FBI Special Agent to know what this means. Simply ask, "Does is look like somebody damaged it (or hacked in) intentionally?" and, "Did we give consent?" and you're done. With

Organization	Question 7 Comment
	elimination of sabotage, terrorism and vandalism, and all of their baggage, comes the ability to integrate both CIP 001 and EOP 004. We now have criminal damage (or cyber attack) as just another event to be evaluated against certain pre-defined impact measures. No value judgments, no speculation. Another benefit of using these simple words and tests is that operating personnel, whether in the field or at the console, will not require special awareness training in discerning these nuances of meaning. They already have experience with the equipment or cyber systems and its normal performance. Operating personnel can readily assess whether an impact event is due to equipment failure, weather or animal contact vs. intentionally caused by a person. If it appears to be criminal damage, call the local police agency. Report the event and the impact. Cooperate with the investigation. Share your knowledge of the normal condition of the equipment or performance of the system. Share your experience with similar events. It will be important to highlight that the theft of all the grounding pigtails in a substation is different from the act of simply snipping each of them to leave the equipment electrically floating. The technical condition is the same, but this allows the police to make an inference with respect to motive, suspect profile, sophistication, etc. That's their job. They may ask us to speculate on the motive or skills of the attacker. That's okay. But at least we don't have to know or guess at it for the purpose of determining whether to report the event. No training required. With respect to notification to the FBI, We Energies recommends that the standard merely state that the owner of the damaged asset ensure the local office of the FBI is notified. The standard should permit documentation of either a direct phone call by the asset owner or obtaining an assurance from the local police that they will do so. There should be no need to prove earlier establishment of a relationship with the FBI. There should be no expectation that the entity have a signed letter from the FBI Special Agent in Charge acknowledging his agency's duty. This document means nothing. With respect to reporting within the industry, We Energies recommends that the only events to be reported "up the chain" are those that we choose to characterize as "impact events". That is, the events that meet some measurable threshold with respect to BES impact. We should describe these efficiently to avoid over-reporting of trivial events. It is apparent that we are already over-reporting since DHS HITRAC recently fed back to the industry that copper thieves attacked a substation in San Bernardino, CA taking some of the grounding conductors. The industry should have the option to report non-impact events that are unusual in some respect and which may have some mutual industry benefit in terms of prevention, awareness or recovery. Attack attempts with no impact, or observations of suspicious activity could fall into this optional category. These optional reports could be aggregated by the entity for the purpose of detecting patterns or trends, or be reported ad hoc. The ES-ISAC should be the recipient of the reports. It should be the single point of contact since it has the industry insight, engineering expertise and cross-sector relationships to analyze and return valuable intelligence to the industry. With the ES-ISAC as the recipient of the reports, efficient sharing with Federal agencies, with the regional entities and with neighboring asset owners could be automated and rapid. There is much benefit to be gained from this project, primarily in the area of creating clarity and uniformity. There is some risk that the reporting requirements will become onerous and prescriptive.

Response: The DSR SDT thanks you for your comment. The DSR SDT is proposing to consolidate disturbance and event reporting under a single standard. The DSR SDT believes that reporting material risks to the Bulk Electrical System by using the impact event categorization, it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation by the elimination of the term "sabotage".   The intent is to allow potentially impacted parties to prepare for and possibly mitigate the reliability risk. The NERC Rules of

Organization	Question 7 Comment
Procedure (section 800) provides an overview of the responsibilities of the ERO in regards to analysis and dissemination of information for reliability. The SDT is proposing that the new standard specify who has access to reported information and who should be notified about impact events, because agencies such as the DHS and FBI have other duties and responsibilities - an impact event that is related to copper theft may only need to be reported to the local law enforcement authorities. The goal of the DSR SDT is create clarity and uniformity by developing a single reporting form for all functional entities without regard to nationality (US, Canada, Mexico) to submit to NERC with guidance. Ideally, entities would complete a single form, which could then be distributed to jurisdictional agencies and functional entities as appropriate. The DSR SDT agrees with your assessment that there should be no expectation that the entity have a signed letter from the FBI Special Agent.	
Bandera Electric Cooperative, Inc.	I commend the SDT for working on this effort and wish them success.
Response: The DSR SDT thanks you for your comment.	
Public Service Enterprise Group Companies	If reporting does become the responsibility of the Reliability Coordinators, the RCIS should be made available view-only to registered entities with a notification when RC's have posted new entries. That will enhance the situational awareness of registered entities. The PSEG Companies disagree with inclusion of CIP-008 reporting requirements as part of the CIP-001 and EOP-004 initiative. CIP-008 reporting as part of the cyber security set of NERC standards is usually managed by specialized corporate organizations separate from those involved with the other NERC standards, and with highly specialized cyber skill sets. CIP-008 reporting requirements should remain where they are, and any perceived need for improvement addressed in the ongoing CIP Version 4 development process.
Response: The DSR SDT thanks you for your comment. The RCIS is a real-time communication and reporting tool and is outside the scope of the SDT. The goal of the DSR SDT is to develop a form to expedite report completion, sharing and storage. Ideally, entities would complete a single form, which could then be distributed to jurisdictional agencies and functional entities as appropriate. Functional entities may include the RC, TOP, and BA for situational awareness. The DSR SDT will take into consideration your comment with inclusion to CIP-008 reporting. However, the drafting team will explore clarification that any proposed CIP-008-related reporting requirement between CIP-008 and CIP-001 is only applicable where the incident/event involves a registered entity's CCA. Note that CIP-002 through CIP-009 are undergoing revision under project 2008-06 – Order 706 SDT.	
Independent Electricity System Operator	In the Background Section of the comment form, it is indicated that the SDT "...is NOT seeking input or guidance on the definition of physical or cyber sabotage, what type of disturbances should be reported, who should do reporting, or to whom or what organizations will be receiving the reports." <u>Yet there are proposed definitions, with examples, in the concept paper</u>. The SDT should make it absolutely clear that by supporting the general concept as described in the paper, the commenting entities are not endorsing the proposed definitions, nor the examples as elements to be included in the standard.

Organization	Question 7 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT will continue to clarify the impact events concept and eliminate “gray areas” while including language to give clarity to the reporting process. Standards developed under this project will be posted for comment on specific content.	
Luminant	Luminant disagrees with the direction of utilizing impact events, as this is an expansion in scope beyond the simplification of sabotage and disturbance reporting.
Response: The DSR SDT thanks you for your comment. We are suggesting the term “Impact Event” be substituted to include only events that would impact the reliability of the BES. The DSR SDT has reviewed the existing standards, the SAR; issues from the NERC database and FERC Order 693 Directives and determine this was a prudent course of action with respect to these standards to provide clear criteria for reporting.	
Dynegy Inc.	N/A
Manitoba Hydro	No
Edison Mission Marketing & Trading	No other comments.
SERC Reliability Coordinator Sub-committee (RCS)	None.
USBR	The concept of "threat" evaluation criteria is somewhat vague and a great care is needed to ensure it is clear enough that the most individuals would be able to analyze an event and end up at the same threat. Otherwise it would be almost impossible to ensure compliance with a requirement which cannot accurately describe criteria to be used to ensure that proper evaluation has occurred.
Response: The DSR SDT thanks you for your comment. We are suggesting the term “Impact Event” be substituted to include only events that would impact the reliability of the BES as opposed to requiring a threat evaluation. The DSR SDT intends to develop criteria that will assist entities in determining which events should be reported.	
Wolverine Power Supply Cooperative, Inc.	The concepts of removing duplication, consolidation, and focusing on "impact events" sound logical. I am concerned that the focus may drift to expanded reporting, not reduced reporting.
Response: The DSR SDT thanks you for your comment. The DST SDT discussed the reporting of “impact events” and will consider guidance found in the document, “NERC Guideline: Threat and Incident Reporting” which will include clear criteria to eliminate erroneous or expanded reporting.	

Organization	Question 7 Comment
ISO RTO Council Standards Review Committee	The FERC Order merely asked NERC to “further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event.” There is no requirement to create a Reporting Standard and no mention of Disturbance events. There is a strong need to avoid heavy-handed use of NERC standards particularly for such post event reporting guidelines. The SRC would urge the DSR SDT to continue to improve its guidelines and to post those guidelines for all to use, but not to create sanctionable standards whose good intentions will inevitably result in many unintended adverse consequences for the Industry. Rather, the SDT should seek to retire sanctionable requirements that require event reporting in favor of guidelines for reporting.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted “NERC Guideline: Threat and Incident Reporting” and ask the industry if the DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). The DSR SDT will take into consideration your comment on keeping cyber and physical events separate. We are suggesting in our discussion to consolidate the location of reporting into one standard. The industry has demonstrated by its comments that the reporting process be streamlined to achieve a “one stop shop” approach. We will continue to explore the possibilities to achieve the best results for all stakeholders. A discussion of advantages /disadvantages will continue to discover options and alternatives with input from all stakeholders.	
Lands Energy Consulting	The lack of common sense that leads to a 15 MW loss of load resulting from a 115 kV line outage being categorized as a "reportable disturbance" really hurts the credibility of the entire NERC Compliance Program. The smaller utilities look at application of EOP-004 in particular to their operation and conclude that either the EO/RRO is: a. stupid; or b. Out to persecute the smaller utilities. In reality, EOP-004 was drafted for application to Southern California Edison, where loss of 50% of customers would be 2-3 million customers. Now that's really disturbing!
Response: The DSR SDT thanks you for your comment. The DSR SDT intends to develop criteria that will assist entities in determining which events should be reported. Acts of sabotage may be “tested” on smaller entities before the saboteurs move on the larger entities.	
Central Hudson Gas & Electric	The NERC Guideline: Threat and Incident Reporting Attachment A matrix is an extremely beneficial document that organizes reporting criteria. However, it identifies communications systems failure sub-category under the Equipment And/Or Systems Failure category as reportable with a reference to OE-417 - Schedule 1, Item 10. Item 10 on Schedule 1 addresses only failures due to attacks (not failures for other reasons).
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted “NERC Guideline: Threat and Incident Reporting” and ask the industry if the DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). Loss of communications would be considered an impact event. The reason for the loss of communications is irrelevant.	

Organization	Question 7 Comment
Duke Energy	We don't think CIP-001, EOP-004 and cyber incident reporting aspects of CIP-008 should all be combined into one standard, because of the significant differences between sabotage and disturbances. We have suggested that the drafting team further define sabotage, and we have included a suggested definition in our response to question #5 above. Sabotage is very specific due to the intent (for the purpose of weakening the critical infrastructure), and the potential impact to the BES. We believe that sabotage and cyber incident reporting should remain a part of the CIP Standards due to the emphasis placed on the criticality and vulnerability of the assets needed to support reliable operation of the BES. Cyber Security and Physical Security could be placed together in the same standard (remain in CIP) and other disturbances (i.e., accidental, natural) in a separate standard. "One stop shopping" for reporting is still possible as long as the OE-417 form is included as part of the NERC electronic form. And while we agree with the need for additional clarity in sabotage and disturbance reporting, we believe that the Standards Drafting Team should carefully consider whether there is a reliability-related need for each requirement. Some disturbance reporting requirements are triggered not just to assist in real-time reliability but also to identify lessons-learned opportunities. If disturbance and sabotage reporting continue to be reliability standards, we believe that all linkages to lessons-learned/improvements need to be stripped out. We have other forums to identify lessons-learned opportunities and to follow-up on those opportunities.
Response: The DSR SDT thanks you for your comment. The DSR SDT is still evaluating inclusion of CIP-008 reporting requirements with CIP-001 and EOP-004 requirements, Note that the current CIP-008 has a reporting requirement to the ES-ISAC only. The DSR SDT developed the more inclusive term "impact events" to eliminate using more confusing terms like sabotage (which is not likely to be determined until after a lengthy investigation). These standards may be combined to have all reporting requirements in a single standard, not because the items to be reported are necessarily related.	
FirstEnergy	We fully agree that sabotage events need to be more clearly defined and reporting requirements need to be better coordinated. But as we have stated in previous comments, the drafting team needs to determine if standard requirements need to be developed for this type of reporting or if this is better left to administrative requirements outside the standards arena. Also, while we appreciate the team's effort to simplify reporting requirements for entities, we are concerned with the serial communication offered by the concept paper. As an example, the team proposes to have LSE report the incident to the BA and/or TOP and then have the BA and/or TOP report it to the RC and the RC to report it to NERC and the NERC report to the regulatory agencies. While this simplifies it for each individual organization, this method introduces many opportunities for errors and miscommunications. Since this is after-the-fact reporting, it is difficult to defend this type of communication path when one consistent report could be sent simultaneously to all agencies at the same time from the originating location.
Response: The DSR SDT thanks you for your comment. The Reliability Coordinator's suggested role in this is to allow them to incorporate the relevant data from responsible entities in their footprint for further analysis. We will consider your suggestion of simultaneous submissions as a means to effectively notify the necessary parties. The SDT believes that it is the submitter's responsibility to submit OE-417 forms to the DOE. The DSR SDT does recognize that it may not be possible to eliminate reporting to multiple jurisdictional agencies due to legislative or regulatory	

Organization	Question 7 Comment
requirements.	
Ameren	While we are not opposed to the concept of identifying impact events, we are concerned that the drafting team may actually be expanding reporting requirements. We do not support expansion of reporting requirements unless a clear reliability or legal need is identified. Some of the impact events are almost never sabotage and do not warrant reporting for reliability needs and should not be included. For example, copper theft should not require reporting, in general, because it is almost never sabotage and rarely impacts reliability. If it does, impact reliability because, for example, the protection system is impacted and causes more significant potential contingencies, then reporting could be required. Why is a train derailment near a transmission right of way significant? It would only be significant if an investigation identified sabotage as the reason. Furthermore, what is considered near?
Midwest ISO Standards Collaborators	While we are not opposed to the concept of identifying impact events, we are concerned that the drafting team may actually be expanding reporting requirements. We do not support expansion of reporting requirements unless a clear reliability or legal need is identified. Some of the impact events are almost never sabotage and do not warrant reporting for reliability needs and should not be included. For example, copper theft should not require reporting, in general, because it is almost never sabotage and rarely impacts reliability. If it does impact reliability because, for example, the protection system is impacted and causes more significant potential contingencies, then reporting could be required. Why is a train derailment near a transmission right of way significant? It would only be significant if an investigation identified sabotage as the reason. Furthermore, what is considered near?
Response: The DSR SDT thanks you for your comment. It is not the intent of the DSR SDT to expand reporting requirements but rather to attempt to clarify and define an approach to assist the industry and stakeholders in reporting impact events. Furthermore, impact events should not include copper theft or other conditions that pose no threat to the reliability of the BES. A train derailment is only an impact event if it threatens some element of the power system such as a transmission line corridor - the derailment in itself is not an impact event.	
Exelon	You should consider providing clear and concise instructions as to the expectation on submitting forms, i.e. the DOE 417. There should be no guessing as to when and how reports should be submitted and who should receive them. Specific details on reporting criteria should be included.
Response : The DSR SDT thanks you for your comment. The DSR SDT intends to develop criteria for reporting impact events.	

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SC approved SAR for initial posting (April, 2009).
2. SAR posted for comment (April 22 – May 21, 2009).
3. SC authorized moving the SAR forward to standard development (September 2009).
4. Concepts Paper posted for comment (March 17 – April 16, 2010).

Proposed Action Plan and Description of Current Draft

This is the first posting of the proposed standard in accordance with Results-Based Criteria. The drafting team requests posting for a 30-day formal comment period.

Future Development Plan

Anticipated Actions	Anticipated Date
Initial Comment Period	September 2010
Drafting team considers comments, makes conforming changes, and proceed to second comment	October – December 2010
Comment Period/Initial Ballot	December 2010-January 2011
Successive Comment/Ballot period	February – March 2011
Receive BOT approval	April 2011

Effective Dates

1. USA: First calendar day of the first calendar quarter one year after applicable regulatory authority approval for all requirements

2. Canada and Mexico: First calendar day of the first calendar quarter one year following Board of Trustees adoption unless governmental authority withholds approval

Version History

Version	Date	Action	Change Tracking
2		Merged CIP-001-1 and EOP-004-1 into EOP-004-2; Retired EOP-004-1, R1, R3.2, R3.3, R3.4, R4, R5 and associated measures, evidence retention and VSLs. Added new requirements for ERO – R1, R7, R8.	Revision to entire standard (Project 2009-01)

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Introduction

1. **Title:** Impact Event and Disturbance Assessment, Analysis, and Reporting

2. **Number:** EOP-004-2

3. **Purpose:** Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES).

4. **Applicability**

   4.1. Functional Entities:

   4.1.1. Reliability Coordinator

   4.1.2. Balancing Authority

   4.1.3. Transmission Owner

   4.1.4. Transmission Operator

   4.1.5. Generator Owner

   4.1.6. Generator Operator

   4.1.7. Distribution Provider

   4.1.8. Electric Reliability Organization

5. **Background:**

NERC established a SAR Team in 2009 to investigate revisions to the CIP-001 and EOP-004 Reliability Standards.

1. CIP-001 may be merged with EOP-004 to eliminate redundancies.
2. Acts of sabotage have to be reported to the DOE as part of EOP-004.
3. Specific references to the DOE form need to be eliminated.
4. EOP-004 has some ‘fill-in-the-blank’ components to eliminate.

The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards (see tables for each standard at the end of this SAR for more detailed information).

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC SC in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009. A “concepts paper” was designed to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT has developed.

The concept paper sought comments from stakeholders on the “road map” that will be used by the SDR SDT in updating or revising CIP-001 and EOP-004. The concept paper provided stakeholders the background information and thought process of the SDR SDT.

The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC database and FERC Order 693 Directives in order to determine a prudent course of action with respect to these standards.

The DSR SDT has proposed the following concept for ***impact event***:

> *An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.*

To support this concept, the DSR SDT has provided specific event for reporting including types of impact events and timing thresholds pertaining to the different types of impact events and who’s responsibility for reporting under the different impact events. This information is outlined in Attachment 1 to the proposed standard.

The DSR SDT wishes to make clear that the proposed changes do not include any real-time operating notifications for the types of events covered by CIP-001, EOP-004. This is achieved through the RCIS and is covered in other standards (e.g. TOP). The proposed standard deals exclusively with after-the-fact reporting.

The DSR SDT is proposing to consolidate disturbance and impact event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

Summary of Concepts

- A single form to report disturbances and impact events that threaten the reliability of the bulk electric system
- Other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements
- Clear criteria for reporting
- Consistent reporting timelines
- Clarity around of who will receive the information and how it will be used

Requirements and Measures

R1. The ERO shall establish, maintain and utilize a system for receiving and distributing impact event reports, received pursuant to Requirement R6, to applicable government, provincial or law enforcement agencies and Registered Entities to enhance and support situational awareness.

M1. The ERO shall provide evidence that it established, maintained and utilized a system for the distribution of the reports it receives to the various organizations or agencies. Such evidence could include, but is not limited to, dated records indicating that reports were distributed as shown on the submitted report or electronic logs indicating distribution of reports. (R1)

Rationale for R1

The goal of the DSR SDT is to have a generic reporting form and a system for all functional entities (US, Canada, Mexico) to submit impact event reports to NERC and other entities. Ultimately, it may make sense to develop an electronic version of the form to expedite completion, sharing and storage. Ideally, entities would complete a single electronic form on-line which could then be electronically forwarded or distributed to jurisdictional agencies and functional entities as appropriate using check boxes or other coding within the electronic form. Specific reporting forms that exist today (i.e. - OE-417, etc) could be included as part of the electronic form to accommodate US entities with a requirement to submit the form or may be removed (but still be mandatory for US entities under Public Law 93-275) to streamline the proposed consolidated reliability standard for all North American entities (US, Canada, Mexico). Jurisdictional agencies may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE. Functional entities may include the RC, TOP, and BA for situational awareness. Applicability of the standard will be determined based on the specific requirements.

The DSR SDT recognizes that some regions require reporting of additional information beyond what is in EOP-004. The DSR SDT is planning to update the listing of reportable events from discussions with jurisdictional agencies, NERC, Regional Entities and stakeholder input. There is a possibility that regional differences may still exist.

Responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at the DOE.

R2. Each Applicable Entity identified in Attachment 1 shall have an Operating Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components:

2.1. Method(s) for identifying impact events

2.2. Method(s) for assessing cause(s) of impact events

2.3. Method(s) for making internal and external notifications pursuant to Parts 2.5 and 2.6

2.4. List of internal company personnel responsible for making initial notification(s) pursuant to Parts 2.5.and 2.6.

2.5. List of internal company personnel to notify

2.6. List of external organizations to notify to include but not limited to NERC, Regional Entity, Law Enforcement, and Governmental or Provincial Agencies.

2.7. Method(s) for updating the Operating Plan when there is a component change within 30 days of the notification of the change.

2.8. A provision for updating the Operating Plan based on lessons learned from an exercise or implementation of the Operating Plan within 30 days of identifying the lessons learned.

2.9. A provision for updating the Operating Plan based on applicable lessons learned from the annual NERC report issued pursuant to Requirement R8 within 30 days of NERC publishing lessons learned.

Rationale for R2

Every industry participant that owns or operates elements or devices on the grid has a formal or informal process, procedure, or steps it takes to assess what happened and why it happened when impact events occur. This requirement has the Registered Entity establish documentation on how that procedure, process, or plan is organized.

For the Operating Plan, the DSR SDT envisions that "assessing" includes performing sufficient analysis to be able to complete the report for reportable impact events. The main issue is to make sure an entity can a) identify when an impact event has occurred and b) be able to gather enough information to complete the report.

Parts 3.3 and 3.4 include, but not limited to, operating personnel who could be involved with any aspect of the operating plan.

The Operating Plan may include, but not be limited to, the following: how the entity is notified of event's occurrence, person(s) initially tasked with the overseeing the assessment or analytical study, investigatory steps typically taken, and documentation of the assessment / remedial action plan.

M2. Each Applicable Entity shall provide the current in force Operating Plan to the Compliance Enforcement Authority upon request. (R2)

R3. Each Applicable Entity shall identify and assess initial probable cause of impact events listed in Attachment 1 in accordance with its Operating Plan documented in Requirement R2.

M3. To the extent that an Applicable Entity has an impact event on its Facilities, the Applicable Entity shall provide documentation of its assessment or analysis. Such evidence could include, but is not limited to, operator logs, voice recordings, or power flow analysis cases. (R3)

Rationale for R3

The DSR SDT intends for each Applicable Entity to assess the causes of the reportable impact event and gather enough information to complete the report that is required to be filed.

R4. Each Applicable Entity shall conduct a drill, exercise, or Real-time implementation of its Operating Plan for reporting created pursuant to Requirement R2 at least annually, with no more than 15 months between exercises or actual use.

M4. The Applicable Entity shall provide evidence that it conducted a drill, exercise or Real-time implementation of the Operating Plan for reporting as specified in the requirement. Such evidence could include, but is not limited to, a dated, exercise scenario with notes on the exercise or operator logs, voice recordings, or power flow analysis cases for an actual implementation of the Operating Plan. (R4)

Rationale for R4

The DSR SDT intends for each Applicable Entity to conduct a drill or exercise of it Operating Plan as often as merited but no longer than 15 months from the previous exercise to prevent a long cycle of exercises (i.e., conducting an exercise in January of one year and then December of the next year). Multiple exercises in a 15 month period is not a violation of the requirement and would be encouraged to improve reliability. A drill or exercise may be a table-top exercise, a simulation or an actual implementation of the Operating Plan.

R5. Each Applicable Entity shall provide training to all internal personnel identified in its Operating Plan for reporting pursuant to Requirement R2 subject to the following:

5.1 The training includes the personnel required to respond and their required actions under the Operating Plan.

5.2 Training conducted at least once per calendar year, with no more than 15 months between training sessions for personnel with existing responsibilities.

5.3 If the Operating Plan is revised (with the exception of contact information revisions), training shall be conducted within 30 days of the Operating Plan revisions.

5.4 For internal personnel added to the Operating Plan or those with revised responsibilities under the Operating Plan, training shall be conducted prior to assuming the responsibilities in the plan.

Rationale for R5

The SDT is not prescribing how training is to be conducted and leaves that decision to each Applicable Entity as they best know how to conduct such activities. Conduct of an exercise constitutes training for compliance with this requirement.

For changes to the Operating Plan (5.3), the training may simply consist of a review of the revised responsibilities and a “sign-off” that personnel have reviewed the revisions.

M5. Applicable Entities shall provide the actual training material presented to verify content and the association between the people listed in the plan and those who participated in the training, documentation showing who was trained and when internal personnel were trained on the responsibilities in the Operating Plan as well as dates for personnel changes and evidence that the training was conducted following personnel changes. (R5)

R6. Each Applicable Entity shall report impact events in accordance with its Operating Plan created pursuant to Requirement R2 and the timelines outlined in Attachment 1.

M6. Registered Entities shall provide evidence demonstrating the submission of reports using the Operating Plan created pursuant to Requirement R2 for impact events. Such evidence will include a copy of the original impact event report submitted, evidence to support the type of impact event experienced; the date and time of the impact event ; as well as evidence of report submittal that includes date and time. (R6)

R7. The ERO shall annually review and propose revisions to the impact event table (Attachment 1) if warranted based on its analysis of reported impact events. Revisions to Attachment 1 shall follow the Reliability Standards Development Procedure.

M7. The ERO shall provide evidence that it reviewed the impact event table. If applicable, the ERO shall provide evidence that it followed the Reliability Standards Development Procedure to propose and implement revisions to Attachment 1. Such evidence may include, but not be limited to, documentation that compares or assesses the list of impact events (Attachment 1) against the analysis of reported impact events. (R7)

Rationale for R7-R8

Some of the concepts contained in Requirements R7 and R8 are contained in the NERC Rules of Procedure, section 800. The DSR SDT felt that, in order to have a complete standard for reporting impact events that improved reliability, there needed to be feedback to industry on a regular basis as well as when issues are discovered. The analysis of impact events is crucial and the subsequent dissemination of the results of that analysis must be performed.

In accordance with Sections 401(2) and 405 of the Rules of Procedures, the ERO can be set as an applicable entity in a requirement or standard. After careful consideration, the DSR SDT believes that these requirements (R7-8) are best applicable to the ERO.

R8. The ERO shall publish a quarterly report of the year's reportable impact events subject to the following:

8.1 Issued no later than 30 days following the end of the calendar quarter

8.2 Identifies trends on the BES

8.3 Identifies threats to the BES

8.4 Identifies other vulnerabilities to the BES

8.5 Documents lessons learned

8.6 Includes recommended actions.

Rationale for R8

The ERO will analyze Impact Events that are reported through requirement R6. The DSR SDT envisions the ERO issuing reports identifying trends, threats or other vulnerabilities when available or at least quarterly. The report will include lessons learned and recommended actions (such as mitigation plans) to improve reliability as applicable.

M8. The ERO shall provide evidence that it issued a report identifying trends, threats, or other vulnerabilities on the bulk electric system at least quarterly. Such evidence will include a copy of the report as well as dated evidence of the report's issuance. (R8)

Compliance

Compliance Enforcement Authority

- Regional Entity
- For requirements applicable to the ERO, an entity contracted to perform an audit.

Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

Evidence Retention

Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The ERO shall retain evidence of Requirements 1, 7 and 8, Measures 1, 7, and 8 for three calendar years.

Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator and Distribution Provider shall retain data or evidence of Requirements 2, 3, 4, and 5 and Measures 2, 3, 4, and 5 for three calendar years for the duration of any regional investigation, whichever is longer to show compliance unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator and Distribution Provider shall retain data or evidence of Requirement 6 and Measure 6 for three calendar years for the duration of any regional investigation, whichever is longer to show compliance unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Registered Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Additional Compliance Information

To be determined.

Variances

None

Interpretations

None

EOP-004 - Attachment 1: Impact Events Table

NOTE: Under certain adverse conditions, e.g., severe weather, it may not be possible to assess the damage caused by an impact event and issue a written Impact Event Report within the timing in the table below. In such cases, the affected Applicable Entity shall notify its Regional Entity(ies) and NERC, and verbally provide as much information as is available at that time. The affected Applicable Entity shall then provide periodic verbal updates until adequate information is available to issue a written Preliminary Impact Event Report.

EOP-004 – Attachment 1 - Actual Reliability Impact – Part A			
Event	**Entity with Reporting Responsibility**	**Threshold for Reporting**	**Time to Submit Report**
Energy Emergency requiring Public appeal for load reduction	RC, BA	To reduce consumption in order to maintain the continuity of the BES Each public appeal for load reduction	Within 1 hour of issuing a public appeal
Energy Emergency requiring system-wide voltage reduction	RC, TO, TOP, DP	System wide voltage reduction of 3% or more	Within 1 hour after occurrence is identified
Energy Emergency requiring firm load shedding	RC, BA, TOP, DP	Firm load shedding ≥ 100 MW (manually or via automatic undervoltage or underfrequency load shedding schemes, or SPS/RAS)	Within 24 hours after occurrence
Voltage Deviations	RC, TOP, GOP	± 10% sustained for ≥ 15 minutes	Within 24 hours after 15 minute threshold
Frequency Deviations	RC, BA	± Deviations ≥ than Frequency Trigger Limit (FTL) more than 15 minutes	Within 24 hours after 15 minute threshold
IROL Violation	RC, TOP	Operate outside the IROL for time greater than IROL Tv	Within 24 hours after Tv threshold
Loss of Firm load for ≥ 15 Minutes	RC, BA, TO, TOP, DP	• ≥ 300 MW for entities with previous year's demand ≥ 3000 MW • ≥ 200 MW for all other entities	Within 24 hours after 15 minute thresh
System Separation (Islanding)	RC, BA, TOP, DP	Each separation resulting in an island of generation and load ≥ 100 MW	Within 1 hour after occurrence is identified
Generation loss	RC, BA, GO, GOP	• ≥ 2,000 MW for entities in the Eastern or Western Interconnection	Within 24 hours after occurrence

EOP-004 – Attachment 1 - Actual Reliability Impact – Part A			
Event	**Entity with Reporting Responsibility**	**Threshold for Reporting**	**Time to Submit Report**
		• ≥ 1000 MW for entities in the ERCOT or Quebec Interconnection • An entire generating station of ≥ 5 generators with aggregate capacity of ≥ 500 MW	
Transmission loss	RC, TO, TOP	• An entire DC converter station • Multiple BES transmission elements (simultaneous or common-mode event)	Within 24 hours after occurrence
Damage or destruction of BES equipment[1]	RC, BA, TO, TOP, GO, GOP, DP	Through operational error, equipment failure, or external cause	Within 1 hour after occurrence is identified

Examples:

a. BES equipment that is:
   i. A critical asset
   ii. Affects an IROL
   iii. Significantly affects the reliability margin of the system e.g., has the potential to result in the need for emergency actions
   iv. Damaged or destroyed due to a non-environmental external cause

b. Report copper theft from BES equipment only if it degrades the ability of equipment to operate correctly e.g., removal of grounding straps rendering protective relaying ineffective

EOP-004 – Attachment 1 - Potential Reliability Impact – Part B			
Event	**Entity with Reporting Responsibility**	**Threshold for Reporting**	**Time to Submit Report**
Unplanned Control Center evacuation	RC, BA, TOP	Unplanned evacuation from BES control center facility	report within 1 hour after occurrence
Fuel supply emergency	RC, BA, GO, GOP	Affecting BES reliability[1]	report within 1 hour after occurrence
Loss of off-site power (grid supply)	RC, BA, TO, TOP, GO, GOP	Affecting a nuclear generating station	report within 1 hour after occurrence
Loss of all monitoring or voice communication capability	RC, BA, TOP	Affecting a BES control center for $\geq$ 30 minutes	report within 1 hour after occurrence
Forced intrusion[2]	RC, BA, TO, TOP, GO, GOP	At a BES facility	report within 24 hours after occurrence
Risk to BES equipment[3]	RC, BA, TO, TOP, GO, GOP, DP	From a non-environmental physical threat	report within 24 hours after occurrence
Detection of a cyber intrusion to critical cyber assets	RC, BA, TO, TOP, GO, GOP, DP	That meets the criteria in CIP-008 (or its successor)	report within 24 hours after occurrence

1. Report if problems with the fuel supply chain result in the projected need for emergency actions to manage reliability.
2. Report if you cannot reasonably determine likely motivation (i.e., intrusion to steal copper or spray graffiti is not reportable unless it effects the reliability of the BES).
3. Examples include a train derailment adjacent to BES equipment, that either could have damaged the equipment directly or has the potential to damage the equipment (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a BES facility control center).

EOP-002 - Attachment 2: Impact Event Reporting Form

EOP-004 – Confidential Impact Event Report		
	Task	**Comments**
1.	Entity filing the report (include Compliance Registration ID number):	
2.	Date and Time of impact event. Date: (mm/dd/yy) Time/Zone:	
3.	Name of contact person: Email address: Telephone Number:	
4.	Did the impact event originate in your system?	Yes ☐ No☐
5.	Under which NERC function are you reporting?	
6.	Brief Description of impact event: (More detail should be provided in the Sequence of Events section below.)	

EOP-004 – Confidential Impact Event Report			
	Task	**Comments**	
7.	Generation tripped off-line. MW Total List units tripped		
8.	Frequency. Just prior to impact event (Hz): Immediately after impact event (Hz max): Immediately after impact event (Hz min):		
9.	List transmission facilities (lines, transformers, buses, etc.) tripped and locked-out. (Specify voltage level of each facility listed).		
10.		FIRM	INTERRUPTIBLE
	Demand tripped (MW):		
	Number of affected customers:		
	Demand lost (MW-Minutes):		

EOP-004 – Confidential Impact Event Report			
	Task	**Comments**	
11.	Restoration Time.	INITIAL	FINAL
	Transmission:		
	Generation:		
	Demand:		
12.	Sequence of Events:		
13.	Identify the initial probable cause or known root cause of the impact event:		

EOP-004 – Confidential Impact Event Report		
	Task	**Comments**
14.	Identify any protection system misoperation(s):	
15.	Additional Information that the helps to further explain the event if needed. A one-line diagram may be attached, if readily available, to assist in the evaluation of the event.:	

Guideline and Technical Basis

Disturbance and Sabotage Reporting Standard Drafting Team (Project 2009-01) - Reporting Concepts

Introduction

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009 and is progressing toward developing standards based on the SAR. This concepts paper is designed to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT has developed.

The standards listed under the SAR are:

- CIP-001 — Sabotage Reporting
- EOP-004 — Disturbance Reporting

The DSR SDT also proposed to investigate incorporation of the cyber incident reporting aspects of CIP-008 under this project. This will be coordinated with the Cyber Security - Order 706 SDT (Project 2008-06).

The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC database and FERC Order 693 Directives to determine a prudent course of action with respect to these standards.

This concept paper provides stakeholders with a proposed “road map” that will be used by the DSR SDT in updating or revising CIP-001 and EOP-004. This concept paper provides the background information and thought process of the DSR SDT.

The proposed changes do not include any real-time operating notifications for the types of events covered by CIP-001 and EOP-004. The real-time reporting requirements are achieved through the RCIS and are covered in other standards (e.g. EOP-002-Capacity and Energy Emergencies). The proposed standards deal exclusively with after-the-fact reporting.

The DSR SDT is proposing to consolidate disturbance and event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

Summary of Concepts and Assumptions:

The Standard Will: Require use of a single form to report disturbances and "impact events" that threaten the reliability of the bulk electric system

- Provide clear criteria for reporting
- Include consistent reporting timelines
- Identify appropriate applicability, including a reporting hierarchy in the case of disturbance reporting
- Provide clarity around of who will receive the information

The drafting team will explore other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements

Discussion of Disturbance Reporting

Disturbance reporting requirements currently exist in EOP-004. The current approved definition of Disturbance from the NERC Glossary of Terms is:

1. An unplanned event that produces an abnormal system condition.
2. Any perturbation to the electric system.
3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.

Disturbance reporting requirements and criteria are in the existing EOP-004 standard and its attachments. The DSR SDT discussed the reliability needs for disturbance reporting and developed the list of impact events that are to be reported under this standard (attachment 1).

Discussion of "impact event" Reporting

There are situations worthy of reporting because they have the potential to impact reliability. The DSR SDT proposes calling such incidents 'impact events' with the following concept:

> An impact event is any situation that has the potential to significantly impact the reliability of the Bulk Electric System. Such events may originate from malicious intent, accidental behavior, or natural occurrences.

Impact event reporting facilitates situational awareness, which allows potentially impacted parties to prepare for and possibly mitigate the reliability risk. It also provides the raw material, in the case of certain potential reliability threats, to see emerging patterns.

Examples of impact events include:

- Bolts removed from transmission line structures
- Detection of cyber intrusion that meets criteria of CIP-008 or its successor standard
- Forced intrusion attempt at a substation
- Train derailment near a transmission right-of-way
- Destruction of Bulk Electrical System equipment

What about sabotage?
One thing became clear in the DSR SDT's discussion concerning sabotage: everyone has a different definition. The current standard CIP-001 elicited the following response from FERC in FERC Order 693, paragraph 471 which states in part: *". . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event."*

Often, the underlying reason for an event is unknown or cannot be confirmed. The DSR SDT believes that reporting material risks to the Bulk Electrical System using the impact event categorization, it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.

The DST SDT discussed the reliability needs for impact event reporting and will consider guidance found in the document "NERC Guideline: Threat and Incident Reporting" in the development of requirements, which will include clear criteria for reporting.

Certain types of impact events should be reported to NERC, the Department of Homeland Security (DHS), the Federal Bureau of Investigation (FBI), and/or Provincial or local law enforcement. Other types of impact events may have different reporting requirements. For example, an impact event that is related to copper theft may only need to be reported to the local law enforcement authorities.

Potential Uses of Reportable Information
Event analysis, correlation of data, and trend identification are a few potential uses for the information reported under this standard. As envisioned, the standard will only require Functional entities to report the incidents and provide information or data necessary for these analyses. Other entities (e.g. – NERC, Law Enforcement, etc) will be responsible for performing the analyses. The NERC Rules of Procedure (section 800) provide an overview of the responsibilities of the ERO in regards to analysis and dissemination of information for reliability. Jurisdictional agencies (which may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE) have other duties and responsibilities.

Collection of Reportable Information or "One stop shopping"
The goal of the DSR SDT is to have one reporting form for all functional entities (US, Canada, Mexico) to submit to NERC. Ultimately, it may make sense to develop an electronic version to expedite completion, sharing and storage. Ideally, entities would complete a single form which could then be distributed to jurisdictional agencies and functional entities as appropriate. Specific reporting forms[1] that exist today (i.e. - OE-417, etc) could be included as part of the

[1] The DOE Reporting Form, OE-417 is currently a part of the EOP-004 standard. If this report is removed from the standard, it should be noted that this form is still required by law as noted on the form: NOTICE: This report is mandatory under Public Law 93-275. Failure to comply may result in criminal fines, civil penalties and other sanctions as provided by law. For the sanctions and the provisions concerning the confidentiality of information submitted on this form, see General Information portion of the instructions. Title 18 USC 1001 makes it a criminal

electronic form to accommodate US entities with a requirement to submit the form, or may be removed (but still be mandatory for US entities under Public Law 93-275) to streamline the proposed consolidated reliability standard for all North American entities (US, Canada, Mexico). Jurisdictional agencies may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE. Functional entities may include the RC, TOP, and BA for situational awareness. Applicability of the standard will be determined based on the specific requirements.

The DSR SDT recognizes that some regions require reporting of additional information beyond what is in EOP-004. The DSR SDT is planning to update the listing of reportable events from discussions with jurisdictional agencies, NERC, Regional Entities and stakeholder input. There is a possibility that regional differences may still exist.

The reporting proposed by the DSR SDT is intended to meet the uses and purposes of NERC. The DSR SDT recognizes that other requirements for reporting exist (e.g., DOE-417 reporting), which may duplicate or overlap the information required by NERC. To the extent that other reporting is required, the DSR SDT envisions that duplicate entry of information is not necessary, and the submission of the alternate report will be acceptable to NERC so long as all information required by NERC is submitted. For example, if the NERC Report duplicates information from the DOE form, the DOE report may be included or attached to the NERC report, in lieu of entering that information on the NERC report.

offense for any person knowingly and willingly to make to any Agency or Department of the United States any false, fictitious, or fraudulent statements as to any matter within its jurisdiction.

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Comment Form for the first draft of EOP-004-2 - Impact Event and Disturbance Assessment, Analysis, and Reporting [Project 2009-01]

Please **DO NOT** use this form to submit comments on the proposed reliability standard, EOP-004-2 - Impact Event and Disturbance Assessment, Analysis, and Reporting. Comments must be submitted by **October 15, 2010**. If you have questions please contact Stephen Crutchfield by email at Stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

Background Information:

NERC established a SAR Team in 2009 to investigate revisions to the CIP-001 and EOP-004 Reliability Standards.

1. CIP-001 may be merged with EOP-004 to eliminate redundancies.
2. Acts of sabotage have to be reported to the DOE as part of EOP-004.
3. Specific references to the DOE form need to be eliminated.
4. EOP-004 has some 'fill-in-the-blank' components to eliminate.

The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards (see tables for each standard at the end of this SAR for more detailed information).

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC SC in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009. A "concepts paper" was designed to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT has developed.

The concept paper sought comments from stakeholders on the "road map" that will be used by the SDR SDT in updating or revising CIP-001 and EOP-004. The concept paper provided stakeholders the background information and thought process of the SDR SDT.

The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC database and FERC Order 693 Directives in order to determine a prudent course of action with respect to these standards.

The DSR SDT has proposed the following concept for ***impact event***:

> *An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.*

To support this concept, the DSR SDT has provided specific event for reporting including types of impact events and timing thresholds pertaining to the different types of impact events and who's responsibility for reporting under the different impact events. This information is outlined in Attachment 1 to the proposed standard.
The DSR SDT wishes to make clear that the proposed changes do not include any real-time operating notifications for the types of events covered by CIP-001, EOP-004. This is achieved through the RCIS and is covered in other standards (e.g. TOP). The proposed standard deals exclusively with after-the-fact reporting.

The DSR SDT is proposing to consolidate disturbance and impact event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

Summary of Concepts

- A single form to report disturbances and impact events that threaten the reliability of the bulk electric system
- Other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements
- Clear criteria for reporting
- Consistent reporting timelines
- Clarity around of who will receive the information and how it will be used

You do not have to answer all questions. Enter All Comments in Simple Text Format.

☐ No

Comments:

Mapping Document Showing Translation of CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting, into EOP-004-2 - Impact Event and Disturbance Assessment, Analysis, and Reporting

Standard: CIP-001-1 – Sabotage Reporting		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language in EOP-004-2 - Impact Event and Disturbance Assessment, Analysis, and Reporting**
R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi site sabotage affecting larger portions of the Interconnection.	Moved into EOP-004-2, R2	R2. Each Applicable Entity identified in Attachment 1 shall have an Operating Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components: 2.1. Method(s) for identifying impact events 2.2. Method(s) for assessing cause(s) of impact events 2.3. Method(s) for making internal and external notifications pursuant to Parts 2.5 and 2.6 2.4. List of internal company personnel responsible for making initial notification(s) pursuant to Parts 2.5.and 2.6. 2.5. List of internal company personnel to notify 2.6. List of external organizations to notify to include but not limited to NERC, Regional Entity, Law Enforcement, and Governmental or Provincial Agencies. 2.7. Method(s) for updating the Operating Plan when there is a component change within 30 days of the notification of the change. 2.8. A provision for updating the Operating Plan based on lessons learned from an exercise or implementation of the Operating Plan within 30 days of identifying the lessons learned. 2.9. A provision for updating the Operating Plan based on applicable lessons learned from the annual NERC report issued pursuant to Requirement R8 within 30 days of NERC publishing lessons learned.

R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity shall have procedures for the communication of information concerning sabotage events to appropriate parties in the Interconnection.	Moved into EOP-004-2, R2	
R3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity shall provide its operating personnel with sabotage response guidelines, including personnel to contact, for reporting disturbances due to sabotage events.	Moved into EOP-004-2, R2	
R4. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances.	Moved into EOP-004-2, R2	

Standard: EOP-004-1 – Disturbance Reporting		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language in EOP-004-2 - Impact Event and Disturbance Assessment, Analysis, and Reporting Comments**
R1. Each Regional Reliability Organization shall establish and maintain a Regional reporting procedure to facilitate preparation of preliminary and final disturbance reports.	Retire this fill-in-the-blank requirement. Replace with new reporting procedure developed by NERC EAWG.	*(The NERC EAWG is working to develop continent wide reporting guidelines applicable under the NERC Rules of Procedure.)*
R2. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load-Serving Entity shall promptly analyze Bulk Electric System disturbances on its system or facilities.	Translated into EOP-004-2, R1	R1. Each Applicable Entity shall have a documented Operating Plan for identifying and assessing impact events listed in Attachment 1.
R3. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load-Serving Entity experiencing a reportable incident shall	Translated into EOP-004-2, R6	R6. Each Applicable Entity shall report impact events in accordance with its Operating Plan created pursuant to Requirement R2 and the timelines

Standard: EOP-004-1 – Disturbance Reporting		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language in EOP-004-2 - Impact Event and Disturbance Assessment, Analysis, and Reporting Comments**
provide a preliminary written report to its Regional Reliability Organization and NERC.		outlined in Attachment 1.
R3.1. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load-Serving Entity shall submit within 24 hours of the disturbance or unusual occurrence either a copy of the report submitted to DOE, or, if no DOE report is required, a copy of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report form. Events that are not identified until some time after they occur shall be reported within 24 hours of being recognized.	Translated into EOP-004-2, R6	R6. Each Applicable Entity shall report impact events in accordance with its Operating Plan created pursuant to Requirement R2 and the timelines outlined in Attachment 1.
R3.2. Applicable reporting forms are provided in Attachments 022-1 and 022-2.	Retire – informational statement	
R3.3. Under certain adverse conditions, e.g., severe weather, it may not be possible to assess the damage caused by a disturbance and issue a written Interconnection Reliability Operating Limit and Preliminary Disturbance Report within 24 hours. In such cases, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load-Serving Entity shall promptly notify its Regional Reliability Organization(s) and NERC, and verbally provide as much information as is available at that time. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load-Serving Entity shall then provide timely, periodic verbal updates until adequate information is available to issue a written Preliminary Disturbance Report.	Retire as a requirement. Added as a "Note" to EOP-004-Attachment1-Impact Events Table	*NOTE: Under certain adverse conditions, e.g., severe weather, it may not be possible to assess the damage caused by an impact event and issue a written Impact Event Report within the timing in the table below. In such cases, the affected Applicable Entity shall notify its Regional Entity(ies) and NERC, and verbally provide as much information as is available at that time. The affected Applicable Entity shall then provide periodic verbal updates until adequate information is available to issue a written Preliminary Impact Event Report.*
R3.4. If, in the judgment of the Regional Reliability Organization, after consultation with the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load-Serving Entity in which a disturbance occurred, a final report is required,	Retire this fill-in-the-blank requirement. Replace with new	*(The NERC EAWG is working to develop continent wide reporting guidelines applicable under the NERC Rules of Procedure.)*

Standard: EOP-004-1 – Disturbance Reporting

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

30-Day Informal Comment Period Open
September 15 - October 15, 2010

Now available at: http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Project 2009-01 Disturbance and Sabotage Reporting

The Disturbance and Sabotage Reporting Standard Drafting Team is seeking comments on its preliminary draft of EOP-004-2 – Impact Event and Disturbance Assessment, Analysis, and Reporting **until 8 p.m. EDT on October 15, 2010**.

Transition from Reliability Standards Development Procedure Version 7 – to Standard Processes Manual

In accordance with the Standard Processes Manual approved by FERC on September 3, 2010, the drafting team is using an "informal" comment period to solicit stakeholder feedback. The new standard development process allows drafting teams to use informal comment periods. Unlike formal comment periods where a drafting team provides a response to each comment submitted, with informal comment periods the drafting team provides a summary response to each question asked on its comment form, but the team is not obligated to provide an individual response to each comment submitted. The summary response will indicate whether stakeholders support the proposal and will identify any additional changes made based on stakeholder comments. With informal comment periods drafting teams are not required to provide an individual response to each comment submitted. This change to the process is intended to give drafting teams more time to deliberate on technical issues, as opposed to deliberating on individual responses to comments. Note that while informal comment periods are allowed in the new standard process for preliminary drafts of proposed standards, formal comment periods are still required for the final draft of each standard.

Instructions

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page:
http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Next Steps

The drafting team will draft and post a summary response to the comments received and conforming revisions to the standard. The next will be either another 30-day informal comment period or a 30-day formal comment period on the complete standard.

Project Background

This project involves revising existing standards CIP-001-1 — Sabotage Reporting and EOP-004-1 — Disturbance Reporting to eliminate redundancies and provide clarity on sabotage events. The project will address several issues identified by stakeholders, as well as FERC directives from Order 693, including a directive to provide greater clarity to requirements associated with "sabotage."

EOP-004-2 was drafted using the "results-based" criteria for developing a reliability standard. The results-based approach includes considerably more emphasis on the "concepts and assumptions" underlying the development of requirements and goes beyond the steps most drafting teams have previously used when developing a standard. Accordingly, the "look and feel" of a results-based standard is quite different than NERC's existing standards. However, at the core is a set of mandatory and enforceable requirements with useful guidance supporting these requirements, an approach NERC's legal counsel has reviewed and finds acceptable. More information about results-based standards can be found at: http://www.nerc.com/filez/standards/Project2010-06_Results-based_Reliability_Standards.html

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

The proposed requirements in the standard are not focused on the core industry concern that current requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, “The existing requirements need to be revised to be more specific – and there needs to be more clarity in what sabotage looks like.” Instead this proposed standard includes requirements that are more focused on “how” to report, rather than “what” to report. The draft 2 SAR has never been balloted for approval prior to standard drafting. In fact, the SAR states, “The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.” The scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seems helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting team seems to be ignored: “Consider whether separate, less burdensome requirements for smaller entities may be appropriate.” The requirements for entities to develop Operating Plans and to have training

for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard. The term "impact events" does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC Glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator. This draft standard should not have this high a priority while other standards having a greater impact on Bulk Electric System reliability remain incomplete or unfinished. Regional reporting requirements should be in Regional Standards, and not be included in a NERC Standard.
No
Having the ERO as an applicable entity raises the issue that they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. NERC has also offered the opinion that since NERC is not a "user, owner, or operator" Standards are not enforceable against the ERO. In Attachment 1 the time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to unnecessary and possibly conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, this subject is more complex than this table reveals, and the table needs more clarification. Entities that have information about possible sabotage events should report these to NERC after the fact, and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, it is likely that there is going to be duplicate reporting. Several of the events require filing a written formal report within one hour. For example, system separation is going to require an "all hands on deck" response to the actual event. The paragraph above the table in Attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements. There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements through NERC that cross federal agency jurisdictions.
No
Having the ERO as an applicable entity raises a concern because they are also the Compliance Enforcement Authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of "applicable government, provincial or law enforcement agencies" for distribution as defined in R1. The "rationale for R1" states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. The better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
No
This is an overly prescriptive requirement given that the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan is an unnecessary burden that offers no additional improvements to the reliability of the Bulk Electric System, and this is not, in fact, an Operating Plan. At most, it may be a reporting plan. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject. As proposed, the Operating Plan is not required to ensure Bulk Electric System reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient. Stating reporting requirements directly in the standard would produce a more uniform and effective result across the industry, contributing towards a more reliable Bulk Electric System. R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate, and how will duplicative reporting be addressed (for example, DOE, Nuclear Regulatory Commission)? Also, in the "rationale for R2", please explain the reference to Parts 3.3 and 3.4.
No
"Impact event" needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditable compliance procedures. Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes a considerable amount of time for an actual cause to be determined. The determination process may require a complex root cause analysis. Further, in the case of suspected or potential sabotage, the industry can only say it doesn't know, but it may be possible. Law enforcement agencies make the determination of whether sabotage is involved, and the information may not be made available until an investigation is completed, if indeed it is ever made

available.
No
The need for a periodic drill has not been established, and appears to be overly restrictive given the intent of the standard is the reporting of impact events. Suggest this requirement be eliminated. Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in as short a time frame as may be required for real-time operating conditions notifications.
No
The need for a periodic drill has not been established, and appears to be overly restrictive given that the intent of the standard is reporting of impact events. Suggest this requirement be eliminated. There are training standards in place that cover these requirements. The relevant personnel should be “aware” of the reporting requirements. But there is not a need to have a training program with specific time frames for reporting impact events. Awareness of these reporting requirements can be achieved through whatever means are available for entities to employ to train on any of the NERC standards, and need not be dictated by requirements.
No
Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements for NERC that cross other federal agency jurisdictions. There is no need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations which is implied by the label “Operating Plan".
No
Having the ERO as an applicable entity raises concern as it is also the compliance enforcement authority. Requirement R7 is unnecessary as there are already requirements in place for three year reviews of all Standards. R8 contains requirements to release information that should be protected, such as identification of trends and threats against the Bulk Electric System. This may trigger more threats because it will be published to unwanted persons in the private sector. We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
No
1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable entity to report the event. This is duplicative and would overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004. What are the examples at the bottom of page 14 supposed to illustrate? Critical Asset should have the appropriate capitalization as being a defined term. Is Critical Asset what is intended to be used here? Should the “a” list be read as ANDs or Ors? Does “loss of all monitoring communications” mean “loss of all BES monitoring “communications”? Does “loss of all voice communications” mean “loss of all BES voice communications?” Are the blue boxes footnotes or examples? Does “forced intrusion” mean “physical intrusion” (which is different from “cyber intrusion”)? Regarding “Risk to BES Equipment,” request clarification of “non-environmental”. Regarding the train derailment example, the mixture of BES equipment and facility is confusing. Request clarification for when the clock starts ticking. Regarding “Detection of a cyber intrusion to critical cyber assets”, there is concern that this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. Suggest physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.
No
There is already a DOE requirement to report certain events. There is no need to develop redundant reporting requirements to NERC that cross other federal agency jurisdictions. The heading on page 16 refers to EOP-002, but this is Standard EOP-004. If some questions do not require an answer all of the time, then the form should state that or provide a NA checkbox. While Attachment 1 details some cyber thresholds, Attachment 2 provides no means to report – which is acceptable if cyber incidents are handled by CIP-008 per the comment provided for Question 10. The Event Report Template in Appendix A is different from the most recent version, which is available at: http://www.nerc.com/docs/eawg/Event_Analysis_Process_WORKINGDRAFT_100110-Clean.pdf
No
The use of the term “impact events” has simply replaced the terms “disturbance” and “sabotage”, and has not further defined sabotage as directed by FERC. We do feel that “impact events” needs to be a defined term. While we agree with the SDT’s new direction, the FERC directive has not been met. This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement and other specialized agencies, including international agencies roles in defining acts of sabotage, and not hold the registered entity wholly responsible to do so.
No

Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by the NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity. EOP-004-3 should be EOP-004-2.
No
The effective dates in Canada need to be defined. The first bullet should be sufficient. If the training and Operation Plan requirements are adopted as proposed, this may not allow sufficient time for some entities to comply, particularly those with limited number of staff, but perform functions that have multiple event reporting requirements.
Yes
Request clarification on how RCIS is part of this Standard. The form should be filled out in two stages. First stage would be the immediately available information. The second stage would be the additional information such as one line diagrams. There is concern with burdening the reporting operator on filling out forms instead of operating the Bulk Electric System. Most of the draft requirements are written as administrative in nature, and this is not most effective. Changes need to be made to (or possibly elimination of) R1, R2, R3. The standards should be changed to define what a “disturbance” is for reporting in EOP-004. Sabotage reporting as per CIP-001 should be rescinded as EOP-004 already has such a requirement.

Brian Pillittere
Yes
Yes
Yes
No
We have adequate compliance procedures already in place for the existing CIP-001-1 and EOP-004-1 Standards. The list of required “Operating Plan” components in the proposed R2 is too specific. Maintaining the “Operating Plan” described in R2 would increase the burden on Registered Entities to comply with the Standard and this type of "laundry list" Requirement would make it more difficult to prove compliance with EOP-004-2 during an audit.
No
The probable cause of a reportable event is already required to be submitted on the OE-417 form. This Requirement is redundant.
No
This Requirement is too specific and places additional burdens on Registered Entities.
No
This Requirement is too specific and places additional burdens on Registered Entities.
No
The reporting timelines are currently listed on the OE-417 form. This Requirement is redundant.
Yes
Since the proposed EOP-004-2 Standard does not eliminate the OE-417 reporting requirement, it does not streamline the existing CIP-001-1 and EOP-004-1 reporting requirements for GO/GOP’s. The "laundry list" of components required in the Operating Plan described in R2 is too specific and would make it more difficult to prove compliance during an audit. We prefer that the existing CIP-001-1 and EOP-004-1 Standards remain unchanged.
Individual
Brenda Lyn Truhe
PPL Electric Utilities
Yes
No
While we agree with the applicable entities in the Applicability Section of the revised standard, we would like the SDT to

reconsider the applicable entities identified on Attachment 1, specifically regarding duplication of reporting e.g. should TO and TOP report?
Yes
No
While we agree with documenting our process, we feel the use of the defined term Operating Plan is not required and possibly a misuse of the term. We would like to suggest using the term 'procedure'. Additionally, we would like the SDT to confirm/clarify whether Attachment 1 is a complete list of impact events. Also, please confirm that the Proposed R2.1 language 'Method(s) for identifying impact events' means identifying impact event occurrence as opposed to identifying list of impact events. i.e. does R2.1 mean recognize impact event occurrence?
No
We believe the rationale for R3 is good and provides value. However, we feel the clarity was lost when the rationale was translated to the standards language. Please consider revising language to refocus on rationale of assess and report per Attachment 1 as opposed to identify. We suggest changing the word "identify" to "recognize" and add the Rationale statement to the requirement as follows: "Each Applicable Entity shall assess the causes of the reportable event and gather available information to the complete the report."
Yes
No
We agree with the need for training on one's process. However, we suggest changes to R5.3. Consider expanding the exception criteria to exempt non-substantive changes such as errata changes, minor editorial changes, contact information changes, etc. We also suggest saying '…,training shall be conducted, or notification of changes made, within 30 days of the procedure revisions.'
No
We understand the rationale for this standard and support the project to combine EOP-004 and CIP-001 as well as the reporting requirement in CIP-008. We are concerned that it may be difficult to meet Attachment 1 Part B Potential Reliability Impact submittal times as the time to submit is 1 or 24 hour after occurrence. E.g. Risk to BES equipment, the example given is a major event and easy to conclude. Consider forced intrusion, risk to BES equipment (increased violence in remote area), or cyber intrusion – should Attachment 1 state 'report within 24 hours after detection'?
Yes
No
While we think providing an impact event list is beneficial, we would like to see Attachment 1 revised and/or clarified. Refer to response to Question 2 considering duplicate reporting. Regarding impact event 'Damage or destruction of BES equipment' and considering the first example in the 'Examples' section, does 'example a. i.' mean if the BES equipment that is damaged is not identified as a critical asset per CIP-002 that no reporting is required? Clarify the Part A and Part B, specifically: Attachment 1 Part A is labeled 'Actual Reliability Impact'. Does this title mean that for all events listed that the 'threshold for reporting' is only met if the event occurs AND there is an actual reliability impact? As opposed to Part B where the threshold for reporting is met when the event occurs and there is a potential for reliability impact? This could be broad for event 'risk to BES equipment'. Providing as much clarity as possible on the 'threshold for reporting' is beneficial to the industry and will help eliminate confusion with the existing CIP-001 standard regarding 'potential sabotage'.
Yes
For ease, timeliness, and accuracy of reporting an application with an easy to use interface would be preferred. If the reporting is done via an application, the ability to enter partial data, save and add additional info prior to submission would be helpful. Additionally, an application with drop downs to select from for impact event, NERC function, etc would be helpful. #1 - Is the 'Compliance Registration ID number' the same as the NCR number? If this is required, include as separate entry. #2 – is this the date of occurrence or detection?
Yes
Refer to clarification requested in question 10 comments.
Yes
Yes
Yes
Combining EOP-004, CIP-001 and CIP-008's reporting requirements reduces redundancy and will add clarity to the compliance activities.

The term “impact events” does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator.
No
We find it interesting that the ERO is listed as an applicable entity. The ERO can’t be an applicable entity because they are the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. NERC seems to be attempting to evade FERC jurisdiction by having a standard that enables it to write new rules that don’t pass through the normal standards development process with ultimate approval by FERC. Attachment 1 is troublesome. The time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does an RC have to report an EEA if the BA is going to report it? This will lead to conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, we believe this subject is more complex than this table reveals and the table needs more clarification or it should be eliminated and leave the time frames in the other standards. Several of the events require filing a written formal report within one hour. For example, system separation certainly is going to require an “all hands on deck” response to the actual event. We note that the paragraph above the table in attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements. There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
No
The ERO cannot be subject to a requirement for which it is the compliance enforcement authority. The governance in this situation appears incomplete.
No
This is an overly prescriptive requirement that dictates details of documentation and, as such, has no place in a reliability standard. NERC needs to trust the RCs to do their jobs; this standard and this requirement in particular seems to be attempting to codify the actions that an RC would take in response to an event. The cost and burden of becoming auditably compliant with this requirement is extreme and unrealistic, especially on small entities
No
We think “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditably compliant procedures.
No
We think this requirement is unclear – we think it requires a drill for “reporting”, which seems absurd! We recommend the elimination of this requirement.
No
While we support training on an annual basis for the operating plan, the concept of requiring training on reporting of after-the-fact events does not support or enhance bulk electric system reliability. We recommend the elimination of this requirement.
No
There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
No
The ERO cannot be subject to a requirement for which it is the compliance enforcement authority. The governance in this situation appears incomplete.
No
Will all reporting requirements be removed from other standards to avoid duplication? And will all future standard revisions include revisions to this standard to incorporate associated reporting requirements? There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
No
There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
Yes
We do feel that this needs to be a defined term
No

Yes
Yes
We find it disturbing that NERC is headed down a path of codifying requirements that are redundant to existing DOE requirements. How does redundancy in reporting requirements improve or enhance bulk electric system reliability? Disclaimer: “The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”

Inclusion of both GO and GOP will result in duplicate reporting as both are responsible for reporting resource-related events such as Generation Loss, Fuel Supply Emergencies and Loss of Off-site power (grid supply). Recommend including only the GOP as it is critical that the GOP gather and communicate relevant information to the Reliability Coordinator.
Yes

Yes
Yes
No
We support the requirements outlined in R2 which create significant obligations to maintain and update the required Operating Plan. However, we believe annual drilling for a reporting process seems unnecessary, particularly given the response horizon of 24 hours for the majority of impact events. If drilling is required, the standard should allow actual events to fulfill a drilling requirement as stated in the Rationale for R4 and within the text of M4.
No
Operating Plan revisions communicated through procedure updates and employee acknowledgements of the same are sufficient when coupled with a procedural training program that occurs according to a programmed schedule.
Yes
Yes
Continually refining the Impact Event table to better define which events should be reported would be extremely valuable. Section 802 does not adequately require such refinement, thus R7 and R8 are appropriate inclusions to this standard.
No
The Impact Events Table might be easier to clarify if organized by Reporting Entity rather than Event Type as events vary substantially based on the affected BES component. For example, a GO or GOP cannot adequately determine if an event will significantly affect the reliability margin of the system or if an event results in an IROL. Examples specific to Reporting Entities would assist in more appropriate report submissions. Additionally, the footnote under examples of Damage or Destruction of BES Equipment, cites “A critical asset”. This term must be clarified to indicate whether this refers to a Critical Asset as defined by CIP 002-1. Finally, the Fuel Supply Emergency item requires additional definitions as neither a GO nor a GOP can reasonably project if an individual fuel supply chain problem will result in the need for emergency actions by the RC or BA.
Yes
No
The term “Impact Event” does not adequately replace the term “Sabotage” The Impact Events table seems to provide the definition of the term “Impact Event”. This table does not include sufficient definition for actual sabotage events. Additionally, it does not include any provision for suspected sabotage events. Assuming the Damage or Destruction of BES Equipment event type is intended to cover actual sabotage, the Threshold for Reporting column should include specific levels of materiality that are specific to Functional Entity. For instance, a GO and GOP could have a MW level to define materiality as a GO or GOP cannot assess impact to an IROL or system reliability margin due to equipment damage. A threshold value consistent with “Generation Loss” in the proposed EOP-004 Attachment 1 would be appropriate.
No
CIP-001-1 R3.1 includes instructions associated with the DOE OE-417 form. EOP-004-2 R2.6 should include the DOE as an example of an external organization requiring notification. Additionally, the Rationale for R1 discusses the possibility of one electronic form satisfying US entities with related disturbance reporting requirements but does not include any information about the likelihood of this outcome. Please elaborate on the process required to combine these reports.

Yes
Yes
Yes

No
Highly administrative version of what could accomplish the same thing. A requirement that the applicable entitiy shall make appropriate notificatiions as required by attachment A and B events. I can see the need for review and lessons learned but that needs to be done at a higher level since many entities may be involved in an "event"
No
Actually yes and no... An event may be caused, analyzed and corrected by one entity but most likely it will involve more. Low Voltage or frequency may not be caused by a generator but the generator will see the event and to have the generator assess the probable cause seems inappropriate. I can see reporting the event and duration and making notifications.
No
Another training requirement with what benefit? We must train on all of our NERC requirements now anyway to insure compliance and that's not a requirement, thats implied and I think thats enough.
Same as my comment for question 6
Yes
Now this is an excellent example of all that is needed for this requirement!
Yes
I realize this is another burden for the ERO but the information would be good to know what is going on outside the plant .
Yes
Yes
No
Yes and no ... Yes impact events is an adequit term however since it is restrained by the tables it may be helpful to define the term and scope of the term to be more inclusive of sabotage events.
Yes
With the provision that definition and scope of "impact event" are developed and tables adjusted as needed to address FERCs concerns specifically . "(1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event.”
Yes
Yes
I think the drafting team has done a wonderful job of beginning the task of combining two related standards. I ask them to keep in mind the small generators, and others who do not have the wide view capability, that more than likely react to events that occur wih no knowledge of why they occured, and limited staff to address administrative standard requirements. Many times the KISS approach is the best approach.

Electrical Reliability Organization (ERO) does not appear to be a defined term in the NERC Glossary of Terms on the NERC website. Last updated April 20, 2010.
Yes
Yes
No
Clarity required Does an entity have to report on the cause of every “applicable” impact event they witness even though the event did not originate at their plant, system or region and did not adversely affect them? Essentially this would require every entity that witnessed an “applicable” event to report on its cause. In most cases they will not know the cause if they did not create the event. Measure M3 should reference Attachment 1 to indicate the Time to Submit Report’.
Yes

No
Measure M5 states applicable entities shall provide training material presented… This measure is unclear as to whether the meaning is for internal personnel or to be provided to external entities upon request? Please clarify.
No
R6 should reference Attachment 2 to make it clear that this report form must be used. M6 seems to be requesting evidence that the Confidential Impact Event Report was submitted. TransAlta suggests the submission of the actual report is evidence the report was submitted. Records of this submission can be provided on request. Web Reports Project 2009-01 has indicated online reporting is the direction they are going. If the impact report becomes an online Web report the entity submitting the report has no way of confirming the report ended up at the Compliance Enforcement Authority office after it is submitted. There needs to be some method that demonstrates the report was submitted and received.
Yes
Yes
No
We recommend the ‘time to Submit Report’ to start when the event is recognized verses when it occurred.
Yes
Yes
Yes
Yes
A Confidential Impact Event Report form is included in attachment 2 but nowhere in the standard does it say to use this form. This form appears to be similar to the “Preliminary Disturbance Report” form used in EOP-004-1. Clarity is required.

Statement is broad enough to cover both Standards.
Yes
Yes
No
For 2.7, 2.8, 2.9, 30 days is to stringent. Some changes may not warrant changes until a cumulative amount of changes occur. Suggest making it no later than an annual review.
Yes
No
What is the basis for the drill being annual. This is to stringent. I suggest it be every 3 years.
No
The annual training seems excessive especially if their have been no changes. You have included one exception for contact information revisions; however, it should be expanded to include exceptions for minor/non-substantial changes. Also, make training requirements (after initial training)be required for substantive changes only.
Yes
Yes
No
A 2000 MW loss needs to be more clearly defined by either the BA, ISO, RC, etc. for the applicable enity. Also, what is the distinction between the "damage or destruction of BES equipment" and the generation loss of >= 2000 MWs if it is a Critical Asset which is currently drafted as those greater than 1500 MW in current draft of CIP-002-4. This could lead to 2 events with different thresholds (i.e. 1500 MW and 2000 MWs). Possibly get rid of the 2000MW criteria and let the threshhold level be the same as the Critical Asset MW level. Or remove the Critical Asset threshhold in the footnote to Attachment 1.
Yes
No
The term is fine but FERC wants more specific examples. GO/GOP can't determine the effect on the BES.
Yes
Yes
Yes
This does not address the inability of a GO/GOP to determine effects on the BES. Surrounding BES knowledge is limited for a GO/GOP.

No
Reason 1 Most of this is duplication of existing processes - More “Big Government” and/or “Overhead” is not needed. There are already processes in place to notify “real time” 24 X 7 organizations that take action (RC, BA, TOP, DOE, FBI, Local Law Enforcement, etc) in response to an “impact event”. It is stated in your document on page five (5) “The proposed standard deals exclusively with after-the –fact reporting.” The combining of CIP 001 & EOP 004 should not expand on existing implemented reporting requirements nor should it result in NERC forming a 24 X 7 department to handle 1 hour (near real time) reporting requirements. Reason 2 If this should go forward as drafted, NERC should not establish a “clearing house” for reporting requirements for Registered Entities without also taking legal responsibility for distributing those reports to required entities. It states in at least 2 places (Page 6 & Page 22) in the document that Responsible Entities are ultimately responsible for ensuring that OE-417 is received at the DOE. Thus, a Registered Entity could be penalized for violating this new standard if it did not file the reports with NERC or it could still be penalized (both criminal & civil) if they filed the reports with NERC but NERC (for whatever reason) did not follow through with ensuring the report was properly filed at the DOE.
No
There are 4 “methods” and 2 “provision” required for this requirement – in other words, 6 “paperwork” items that auditors will audit and likely penalize entities for. On page 1, the statement is made “…proposed standard in accordance with Results-Based Criteria.” Having to have 4 methods and 2 provisions to end with a report (all of which is paperwork) is not a “result based” standard. It is like being required to have a "plan to plan on planning on composing and filing a report". Events need to be analyzed, communicated, and reported and should be audited as such (results based) – not audited on whether they have a book filled with methods and provisions.
No
Should be part of R2 or R6 – this is unnecessary duplication
No
Existing CIP 001 and EOP 004 are reporting standards – neither currently requires annual drills or exercises. Combining these two (2) should not entail expanding the requirements to include drills or exercises. There are existing drills / exercises that must be performed annually for compliance with CIP 008 & CIP 009 which require the same basic identifying, assessing, developing lessons learned, responding, and reporting skill sets. Requiring additional drills or exercises for this new combined standard will provide additional “business overhead” that results in basically nothing that is not obtained by the CIP 008 / 009 drills as far as securing or making the BES reliable. It does, however, result in additional audit risk at audit time.
No
This expands beyond the original CIP 001 and EOP 004 – neither explicitly requires training – combining does not mean expanding. In reality, what practical skill are you going to train on? People who perform the analysis on an event are going to have job specific training external to this standard and those same folks will maintain their skill set external to this standard. If it is going to be a results based criteria standard, then let the entities be responsible. Training on methods to fill out and file paper work does not make the BES more reliable. The vast majority of other standards do not have a training requirement section and yet, entities manage to be compliant with those standards. Compared to all the other reliability standards and their requirements, are penalties for training on filling out paper work really making the BES more secure and reliable?
No
1. The reporting requirements should not be expanded beyond CIP 001 and EOP 004-1. The goal for combining the two should be to make the process more efficient – not add on extra requirements for procedures on how to report, drills on reporting, training on reporting, etc. 2. The timelines requiring 1 hour reporting to the ERO are not needed and provide little realtime benefit to the BES. Real time or near real time reporting for “people on the ground” such as the RC, BA, TOP, FBI, Local Law Enforcement, DOE, etc. is necessary. They are in a position to take action in response to an event. On page 5, it states “The proposed standard deals exclusively with after-the-fact reporting. 1 Hour reporting requirements to the ERO in addition to existing reporting are not reasonable “after-the-fact” reporting requirements in the midst of an emergency. Also, there is not a 24X7 ERO center to report events to – why build and staff one when they already exists at the RC, BA, TOP, DOE, FBI, Local Law Enforcement, etc. – An ERO 24X7 center would be extra overhead that would provide no additional benefit in the first hour or hours of an emergency.
Yes
R7 – Yes as long as any changes to attachment 1 follow the “Reliability Standards Development Procedure. R8 - Yes as long as R8.6 is strictly “recommended actions.” They should not become “required actions” as this bypasses the standard development process.
No
This report should follow exactly the OE-417 to avoid redundant, possible conflicting, and overall confusion in reporting. Note: The table has entries that are in conflict with the OE-417 and thus can cause confusion in filing multiple reports potentially causing an entity to violate Federal Law due to the confusion. By submiting the same information on

different timelines, i.e. one hour reporting under OE-417 and 24 hours under this Standard, the reports may be significantly different causing confusion from differing reports of the same event. Although we prfer the events to match the OE-417 events exactly, if the SDT decides to include a seperate events table we make the following suggestions: Energy Emergency requiring system-wide voltage reduction: should be reportable at 5% not 3% voltage reduction. The standard should clearly state this was applicable for BES energy emergency conditions only, not voltage reductions for other reasons. On voltage deviations: it should be clear that this applies to widespread effects on the BES not a single distribution feeder that has a low voltage. For the Frequency deviation: Did not see a definition for the FTL (frequency trigger limit) Generation loss: the reportable loss of generation should be significantly more than 500 MW. The number of units at the locaton is irrelevent. Ten units at 50 MW each is no more critical than a single 500 MW unit. Under this standard, if the plant with ten 50 MW units trips it is reportable but an 800 MW single unit is not reportable. The trip of the 800 MW unit has much more effect on the sytem reliability. Damage or destruction of BES equipment: Should be limited to specific equipment such as a 765 kV autotransformer not a 138 kV lightning arrestor. This needs to be eliminated or significantly limited as to the equipment type that is reportable.
No
The report filed should be the OE-417 ELECTRIC EMERGENCY INCIDENT AND DISTURBANCE REPORT and should be filed only on OE-417 reportable incidents. If this report is implemented as drafted, companies with multiple registration numbers and functions should only have to file one report for all functions and registrations.
No
1 In keeping with a Results Based Standard, the impact event should be a trigger for filing a report. At the time of the event, one may not know if the event was caused by sabotage. Sabotage that does not affect the BES should not be a reportable event. 2. To comply with the Commissoners request to define sabotage, Impact Event does not adequately replace “sabotage”. If someone reports sabotage, people universally have a concept that someone(s) have taken some type of action to purposely harm, disable, cripple, etc something. Impact Event does not convey that same concept. 3. If Sabotage is left as a “trigger,” it should not include minor acts of vandalism but only acts that impact reliability of the BES
No
EOP-004-1 R2 did not get translated to EOP-004-2 R2 - table states it is mapped to R1
No
Do not agree with this proposed draft - instead of combining 2 standards to gain efficiency, this expands the standard with unnecessary paperwork, drills, training, etc.
Yes
Do not agree with this proposed draft - instead of combining 2 standards to gain efficiency, this expands the standard with unnecessary paperwork, drills, training, etc. For reports required under this standard, companies with multiple registration numbers and functions should only have to file one report for all functions and registrations.

Manitoba Hydro
No
Though new purpose greatly clarifies the proposed EOP-004-2 and using “situational awareness” is the key to this purpose, further clarification of specific items should be added to the purpose. “Responsible Entities shall report SIGNIFICANT events to support interconnection situational awareness on events that impact the integrity of the Bulk Electric System, such as islanding, generation, transmission and load losses, load shedding, operation errors, IROL/SOL violations, sustained voltage excursions, equipment and protection failures and on suspected or acts of sabotage.”
No
Since this Standard is to support situational awareness, more entities should be included such as Load Serving Entities (which was removed from EOP-004-1).
Yes
Yes, keeping R1 generic and pointing to “government”, “Provincial”, “law” encompasses all entities in all major interconnections.
Yes
R2 – 2.1 to 2.9 detail what is expected of an Operating Plan for Impact Events. The attachment 1 details the event, the threshold parameters and time line. Though the threshold parameters in the attachment may be questioned, this greatly clarifies the expectations of reporting events. Further events should be added to this list: “Detection of suspected or actual or acts or threats of physical sabotage”
No
Though each local entity should identify and assess initial probable cause of impact events as per their Operating Plan, the creation of this Operating Plan could be labor intensive and also guidelines for consistency within an RC region should be created. So “NO” is entered simply because a large time line would be needed to properly and efficiently implement R3 and R4.

No
Drills and exercise for implementation of the Operating Plan are important and critical, but as in question 5, or Requirement R3, careful and detailed creation of the Operating Plan are crucial to facilitate proper training, drills and exercises. So “NO” is entered simply because a large time line would be needed to properly and efficiently implement R4 and R3.
No
The comments in Question 6 and 7 encompass the training aspect of this requirement.
Yes
Attachment 1 details the impact events and the thresholds of which they should be reported.
No
Rules of Procedure appear to have a different focus then R7 and R8. Briefing on Rules of Procedure 802 Assess, review and report on: 1.1 overall electric operation 1.2 uncertainties and risks 1.3 self assessment of supply and reliability 1.4 projects on customer demand 1.5 impact of evolving electric market practices that could affect the present and future of the BES Briefing on R7 and R8 R7 – ERO shall review and propose revisions to Attachment 1 R8- ERO shall publish quarterly reports on trends, threats, vulnerabilities, lessons learned and recommended actions.
Yes
Though R7 indicated Attachment 1 will be reviewed and revised reguarily the immediate addition of: “Detection of suspected or actual or acts or threats of physical sabotage” should be added.
No
Though a “Confidential Impact Event Report” is much needed the Attachment 2 needs refinement. Provide an explanation for each “task”. Isolate and simplify the “Who, When and What” section. Isolate the description of event. Remove items 7 to 10. Modify Attachment 1, add columns to indicate time of event, quantity, restore time, etc as required. The Attachment 1 can be attached to Attachment 2. This could simply and speed the reporting process.
No
The majority of the items listed in Attachment 1 are typically and historically operating events. Yes these are all “impact events”. Sabotage, cyber and security are typically viewed as separate events. These events are not part of “a typical day of BES operations”. These are outside event and though qualify as “impact events” should still be treated separately.
No
Though CIP-001-1a already contained provisions for sabotage response guidelines, the new EOP-004-2 R2 (2.1 to 2.9) will require reexamination of existing policies to remain compliant. Upon the approval of Attachment 1, the existing disturbance guidelines will also have to be reexamined. With the addition of R3 (Identify and assess), R4 (Drills) and R5 (Training), will also require redevelopment of existing processes.
No

No
The purpose does not need to mention "and the reliability of the Bulk Electric System." This is the Congressional mandate in FPA Section 215, and could be attached to every Standard, guide, notice and direction issued by FERC, NERC and Regional Entities. In addition, the purpose references "Responsible Entities." However, section 4 on "Applicability" references "Functional Entities." These terms should be consistent. Therefore, the purpose statement of the proposed standard should be corrected to read, "Functional Entities identified in Section 4 shall report impact events and their known causes to support situational awareness." CONSIDERATION: Is the phrase "shall report impact events and their known causes" really a purpose of the Proposed Standard, or is it instead merely a means to achieve the purpose of situational awareness? If the latter, the purpose statement can be further shortened to read, "Functional Entities identified in Section 4 shall support situational awareness of impact events and their known causes."
No
Agree with the "Applicability" section functional categories. Agree with the Attachment 1 lists of "Entity with Reporting Responsibility," with the following exceptions: PART A "Damage or Destruction of BES Equipment" - This item has a footnote 1 listed, but nothing at the bottom of the page for a footnote. Assuming the footnote reference is intended to reference the "Examples" at the bottom of the page, the following concerns exist: (i) "critical asset" - Is this term intended to reference a "Critical Asset" identified pursuant to the CIP-002 risk-based assessment methodology? If so, it should be capitalized. If not, who determines what constitutes a lower case "critical asset"? (ii) "Significantly affects the reliability margin of the system…" - If this is intended to be enforceable, several words need significant clarification and definition, such as "Significantly," "reliability margin," "system" (BES?), "potential," and "emergency action." The combined ambiguity of just two of those phrases would most likely result in a court holding this statement as so vague as to be unenforceable. The combined lack of clarity of all the highlighted words or phrases render this sentence meaningless. (iii) "Damaged or destroyed due to a non-environmental external cause" - "Non-environmental external cause" should be a defined term because, as is the case in item (ii) above, it is vague and subject to broad, random or arbitrary interpretation. Part B provides examples of "non-environmental physical threat" for "Risk to BES equipment." Those examples could be referenced here, or different examples included that are more applicable to the Event. The items highlighted in items (ii) and (iii) above are very similar to the unintended string of CIP-001 violations that Registered Entities experienced in 2007 and 2008 for failing to provide their own definition of "sabotage" under a sabotage reporting standard that failed to provide any guidance to the industry within the standard as to what constituted "sabotage." PART B "Detection of a cyber intrusion to critical cyber assets" - Capitalize "Critical Cyber Asset."
Yes
While including the phrase "to enhance and support situational awareness" is a good use of the Results-Based Standards development tools and framework, the phrase is already included in the purpose statement. As such, it is unnecessary in Requirement 1. If it were to be included in Requirement 1, then it would also need to be included in each of the other Requirements 2 through 8. The "Purpose" statement captures this aptly.
No
1. R2 includes the phrase "for identifying, assessing and reporting," followed by R2.1 which states "identifying," R2.2 which states "assessing" and both R2.3 and R2.6 state "notify" or "making internal and external notifications" (i.e., reporting). The language is unnecessarily redundant. RECOMMENDATION: Reword R2 phrase "for identifying, assessing and reporting," to simply state, "for addressing." 2. Rationale for R2 - The rationale section for R2 references in the third paragraph "Parts 3.3 and 3.4." Was this intended to reference R2.3 and R2.4?
No
"Identify and assess" - Auditors are as much in need of clearly worded, unambiguous Reliability Standards are as Registered Entities. This phrase leaves much too wide a range of interpretations, almost guaranteeing regular and frequent disagreements during an audit between Registered Entity and Regional Entity auditor as to what constitutes "identify and assess" sufficient to meet the intent of this Requirement. Compounding this issue is the Rationale for R3 that states an Applicable Entity (which should probably read "applicable Functional Entity") should "gather enough information to complete the report that is required to be filed." While Rationale statements are not technically part of the standard, this emphasizes the current wording of the requirement as subject to random and arbitrary interpretation by auditors and Registered Entities. RECOMMENDATION: Change "identify and assess" to "document," so that the Requirement now reads "Each Applicable Entity shall document initial probable cause of impact events…" including an option for "cause not determined".
No
Every employee in a Registered Entity might potentially have exposure to an impact event, and therefore result in a list

of thousands of employees subject to the EOP-004-2 Operating Plan. Does this mean, for example, an applicable Functional Entity with 3,000 employees, each capable of potentially observing an impact event, must include them in the drill, exercise, or Real-Time implementation? Such an expectation would require a hypothetical email notice to be sent to 3,000 employees, advising them "This is a test - You observe a suspicious vehicle driving around the fence of your power plant. Perform the next action you should take." The result in this hypothetical might be 3,000 phone calls and emails to the responsible employee in the applicable Functional Entity, each needing to be documented and retained for the audit period. As stated above in question 5, auditors need guidance as much as Registered Entities. Otherwise, it is observed that they will seek the most stringent approach they observe from the best of the best practices over the first year of implementation and apply that expectation as the base-case, under which all other approaches will be deemed violations.
No
1. This Requirement is structured to result in the same heavy-handed, zero-tolerance approach that has made CIP-004 one of the top three violated Reliability Standards. The failure in CIP-004 is that, for example, a seven-year background check or annual training program that is tardy by one day results in a violation. There is no margin of error, proviso, or cure scenario. Likewise, the proposed R5 in EOP-004-2 makes it a violation if someone takes their newly established training on the day after the end of 15 months. Systems configurations are often based on quarterly monitoring for individuals needing to take training. In addition, when dealing with potentially thousands of employees, it is inevitable that any one of hundreds of reasons might result in an employee not being included in the tracking system, and rolling past the 15th month. RECOMMENDATION: To avoid further burden to Regional Entity audit and enforcement personnel as has been the case in CIP-004, develop a cure process that allows the Registered Entity to correct the training or background check tardiness with prompt correction, fill out a notification report to submit to NERC, and proceed with protecting the reliable operation of the BES, rather than tying up Registered Entity and Regional Entity staffs with data requests, enforcement paperwork and administrative actions. 2. The proposed R5.3 requires the entire applicable staff to redo the entire training within 30 days of a change to the Operating Plan. These Operating Plans will not be short documents, and formal training will not involve a 5 minute soundbite. However, for such a significant procedure as the Operating Plan, frequent changes and revisions are going to be very common, especially given the likelihood of frequent clarifications, Compliance Action Notices ("CANs"), and lessons learned issued by NERC and Regional Entities over this very detailed set of new obligations. It is not unreasonable to expect a Registered Entity to make three or more revisions to their Operating Plan in a year, which would require training for thousands of employees three times a year, for what might amount to a single sentence revision. Furthermore, the obligation to retrain on the entire training program is not limited in this requirement to only those individuals impacted by the revision. Where a change or revision only impacts 3 possible employees, this standard would require a company with 1,500 employees subject to the Operating Plan to retake the entire training. RECOMMENDATION: Clarify that upon changes to the Operating Plan, the Registered Entity may either require full training, or instead distribute a summary of the change(s) via email to affected personnel only.
No
RECOMMENDATION: Clarify that the reporting of impact events shall be to those entities identified in the Operation Plan section developed specifically in Section 2.6. Reference to Attachment 1 indicates reporting to "external" parties is the intent for R6.
Yes
We support the concept that Reliability Standard requirements and obligations that are subject to violations and penalties should all be contained in the four-corners of the Reliability Standard. If an obligation exists in the Rules of Procedures that creates a stand-alone responsibility that is subject to violation and penalty, it should be removed from the Rules of Procedure and inserted into the appropriate Reliability Standard.
Yes
Yes
Yes
Agree. However, strongly encourage this to be made into a defined term in the Glossary of Terms.
Yes
Assume reference to EOP-004-3 in the question 13 was meant to reference version 2 (EOP-004-2).

Yes
No
R1 With the definition of "Impact Event", are we eliminating the term "Disturbance Reporting"? If we eliminate disturbance reporting, SDT should remove the reference from the Summary of Concepts and from the title, otherwise further definition on the distinction between the two terms is needed. R1. What is the "system" described here? What type of system is anticipated – electronic, programmatic or can it be better described by using “standard reporting form”? M1. Needs to seek evidence that the "system" was used for receiving reports, as well as distributing them. M1. Examples are more appropriately used in guidance documentation than in the standard. Rationale for R1 – Final statement regarding OE-417 needs to be removed. The ERO will establish the requirement in their “system” if the standard remains as is. The Requirement does not require the responsible entities to send OE-417 to DOE.
No
R2.1 Creates the opportunity for differences in identifying impact events. BGE recommends additional clarity in the statement. Are we to use Attachment 1 as a “bright line” or can we use our Operating Plan to identify what an impact event is? R2.4 - 2.6 Does a standard need to specify both internal and external lists? 2.7 – is “component” defined anywhere? Is it a component of the BES or a component of the Operating Plan or a component of the three lists in 2.4 to 2.6? Rationale --- Parts 3.3 and 3.4?? Do you mean 2.3 and 2.4? Is the Operating Plan under scrutiny (mandatory and compensable) for all items in the last paragraph of the rationale?
No
R3. Limits responsibility to Attachment 1 events only and mandates that an “initial probable cause” be identified. Are we at liberty to define “initial probable cause” and define time period for completion in the Operating Plan? BGE believes this could cause wide difference between Operating Plans and the standard should be more prescriptive by relating to a time-table for the life of an impact event, including expected identification time, initial assessment time and analysis time leading to the reporting deadlines. BGE recommends not including examples of evidence in a measure but include it in a Guideline. Including in a measure will be translated as a requirement by an auditor.
No
M4. BGE recommends not including examples of evidence in a measure but include it in a Guideline. Including in a measure will be translated as a requirement by an auditor. Rationale for R4: If multiple exercises are performed are all of them subject to the sub-R2 requirements and to audit/audit findings?
No
Suggested revision to clarify R5: Each Applicable Entity shall provide training to all internal personnel identified in its Operating Plan on the Operating Plan annually. Training is only on Reporting, pursuant to R2, not on the Operating Plan? BGE does not believe the SDT needs to identify sub bullets on this requirement. R5.1 is not logical --- what does it mean?
Yes
Comments for clarification: R6. Use of Capital letters in Operating Plan makes it unnecessary to state "created pursuant to Requirement 2
No
R7. Make Impact Event Table all Capital Letters(it is a title). R8. Is the term "reportable impact events" new or is impact event intended to be capitalized? R8. Does a quarterly report of the year’s reportable impact events include 12 months of "reportable impact events"? This is confusing. R8. In the Rationale for R8 Impact Events appears with Capital letters - why now? Shouldn’t it appear with all Capital letters throughout the document as it is a defined term? R8. There are no previous requirements to report threats (R8.3) or lessons learned (R8.5) or trends (R8.2) to an ERO. Is this information from reports to the ERO or from ERO research?
No
TOP determines "system-wide" voltage reductions; why place this responsibility on a TO or DP? - Load Shedding is automatic load shedding; why 100MW? Does a DP need to provide a Report when directed by the RC, BA or TOP to shed load or reduce voltage? - No examples should be included in the standard! Need to define a "BES Transmission Element". - Table shows multiple entities in "Entity with Reporting Responsibility"; is it one or is it all entities report? - In an audit who determines "reasonably determined likely motivation" - Is it justified to expect to have "motivation" knowledge within one hour of an event? - Why are the Responsible Entities reporting Interruptible Demand tripped / lost?
No
There is considerable difference between this form and OE-417 necessitating that two forms be completed. BGE believes that the purpose of combining the standards was to reduce the number of reporting entities and number of reports to be generated by each entity. BGE believes this fails to accomplish this purpose.
Yes
The defined term “impact events” should be capitalized throughout the document to identify it as a defined term. Additionally, BGE has noted in several comments that another term is used instead of “impact events”. These terms

should be eliminated and use “impact events” instead.
Yes
None.
Yes
None.
Yes
One item that is properly addressed is the removal of Load Serving Entity from the Applicable Functional Entities. There may be a need to provide some guidance to Functional Entities when there are separate Transmission Owners and Transmission Operators or Generation Owners and Generation Operators. If they are separate, there may be redundancy in reporting. From the documentation, it doesn’t seem like the SDT are combining all reports into one form as we would like to see. In the rational for R1 section, it talks of getting both forms (NERC and OE-417) together in one document (however it sounds like the forms within the document are still separate), available electronically, which only seems like a step forward. However, it does not take away the confusing process for the operators of which part of the form would need to be filled, who should be set this form depending on what part is filled, if one part of the form is filled out do the other parts need to be filled, etc. If the forms cannot be consolidated, BGE would rather the forms be separate to reduce confusion. BGE believes all these reports should require one form with one set of recipients, period. This may mean that NERC needs to get DOE to modify their OE-417 form.

CenterPoint Energy
No
CenterPoint Energy does not agree with the purpose statement of the proposed standard. The directive from the Commission in FERC Order 693 and restated in the Guideline and Technical Basis is “…the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: 1) further define sabotage and provide guidance as to the triggering events that would cause and entity to report a sabotage event.” Instead the SDT has introduced another term, impact event, to address concerns regarding different definitions. The term, impact event and its proposed concept is too broad. Specifically the concept that an impact event “…has the potential to impact the reliability of the Bulk Electric System” leaves too much room for an entity and a regulatory body to have a difference of opinion as to whether an event should be reported. Required reporting should be limited to actual events. The reporting to follow could become overwhelming for the Responsible Entities, the ERO, and other various organization and agencies. Furthermore, situational awareness is a term that is associated with aspects of real-time. Given the analysis required before a report can be submitted, the report will not be real-time and will not sustain a purpose of supporting situational awareness. (See also comments on Q10 regarding the “Time to Submit Report”.) A purpose that is more aligned with consolidation of the EOP-004 and CIP-001 standards would be as follows: Responsible Entities shall report disturbance events and acts of sabotage to support the reliability of the BES through industry awareness.
No
CenterPoint Energy does not agree with the addition of Transmission Owner and Distribution Provider to the Applicability section. Transmission Owner and Distribution provider are not currently applicable entities for either CIP-001 or EOP-004 and should not be included in the proposed combined standard. However, CenterPoint Energy does agree that LSE should be removed from the Applicability section. CenterPoint Energy appreciates the SDT’s efforts in assigning entities to each event in Attachment 1. This is an improvement over the existing EOP-004 standard. It is clear, however, that with multiple entities responsible for reporting each event, there is no need to expand the Applicability Section to include Transmission Owner and Distribution Provider.
No
The ERO does not need to establish a “system for receiving reports” as the “system for receiving reports” is inherent given the requirements for reporting. The requirement also seems to add redundancy versus eliminating redundancy in the distribution of reports to applicable government, provincial or law enforcement agencies on matters already reported by Responsible Entities. If an event is suspected to be an intentional criminal act, i.e. “sabotage”, the Responsible Entity would have contacted appropriate provincial or law enforcement agencies. The ERO is not in a position to add meaningful value to these reports as any information the ERO may provide is second hand. CenterPoint Energy recommends R1 and M1 be deleted.
No
CenterPoint Energy does not agree with R2 and M2 as they are focused on process and procedure. Compliance with a reporting requirement should be based on a complete and accurate report submitted in a timely manner. The process an entity uses to accomplish that task is of no consequence. CenterPoint Energy recommends R2 and M2 be deleted. However, if the SDT feels it is necessary to include this process based requirement, CenterPoint Energy believes the SDT, in requiring an overly prescriptive Operating Plan, has expanded the requirement beyond the current CIP-001-1 and EOP-004-1 which only require “…procedures for the recognition of and for making operating personnel aware…” (CIP-001-1) and “…shall promptly analyze…” (EOP-004-1). Specifically, R2.2 is not found in the current Standards. “Methods for assessing causes(s) of impact events” would vary greatly depending upon the type and severity of the

event. Responsible Entities would have a difficult time cataloging these various methods to any specific degree and if they are not specific then CenterPoint Energy questions their value in a documented method. R2.3 is not found in the current Standards and is an unnecessary requirement as the method of notification is irrelevant so long as the notification is made. R2.7, R2.8, and R2.9 are also unnecessary expansions beyond what is currently in CIP-001-1 and EOP-004-1. CIP-001-1 requires the Responsible Entity review its procedures annually and CenterPoint Energy believes this is sufficient. When taken in total, R2 requires seven (7) different processes, provisions, and methods. CenterPoint Energy recommends R2.2, R2.3, R2.7, R2.8 and R2.9 be deleted and believes this will not result in a reliability gap.
No
CenterPoint Energy does not agree with R3 and M3 as written as the Company does not agree with the requirement to have an Operating Plan (see comments to Q4 above). However, if R2 and M2 were to be deleted, and R3 was revised to read; “Each Applicable Entity shall identify and assess initial probable cause of events listed in Attachment 1.”, CenterPoint Energy could agree with this requirement.
No
CenterPoint Energy does not agree with R4 and M4. See comments to Q4 above. In addition to the process vs. results based issue stated above, CenterPoint Energy believes conducting a drill to verify recognition, analysis, and reporting procedures is a waste of valuable resources and time.
No
CenterPoint Energy believes that R5 and M5 are not necessary and should be deleted. CenterPoint Energy supports an entity training its staff in any reporting responsibilities; however, such training should be the responsibility of each entity and such requirements do not belong in a NERC standard. In addition, CenterPoint Energy believes any necessary training requirements are covered in the PER Standards and therefore the addition of this requirement adds redundancy to the Standards. If a majority of the industry supports such a requirement, CenterPoint Energy cannot support R5 and M5 as written as we do not agree with the requirement to develop and maintain an Operating Plan (see comments to Q4 above). CenterPoint Energy offers the following alternate language: “Each Applicable Entity shall provide training concerning reporting requirements contained in this Standard to internal personnel involved in the recognition or analysis of events listed in Attachment 1.
No
CenterPoint Energy does not agree with R6 and M6 as written as we do not agree with the requirement to develop and maintain an Operating Plan (see comments to Q4 above) In addition CenterPoint Energy does not agree with the timelines required in Attachment 1 (see comments on Q10). CenterPoint Energy offers the following alternate language: “Each Applicable Entity shall report events outlined in Attachment 1 to applicable entities including but not limited to; NERC, and appropriate law enforcement agencies."
No
CenterPoint Energy does not believe this requirement is necessary; however, if the SDT insists on keeping this requirement then CenterPoint Energy believes it should remain as written. Any change to Attachment 1 should go through the Reliability Standards Development Procedure.
No
CenterPoint Energy appreciates the efforts of the SDT in identifying the entity with reporting responsibility. This is an improvement to the event table. CenterPoint Energy is concerned with multiple entities being listed as having Reporting Responsibility. CenterPoint Energy recommends the SDT limit this to one entity having responsibility for reporting each event. This would not preclude that entity from coordinating with other entities to gather data necessary to complete the report. In addition, CenterPoint Energy believes there are several events that should be removed from the list. “Transmission Loss” is covered by the TPL standards and does not need to be identified or reported under EOP-004. The loss of a DC converter station or multiple BES transmission elements may or may not disrupt the reliable operation of the BES, i.e. result in blackout, cascading outages, or voltage collapse. Likewise “Damage or destruction of BES equipment” in and of itself should not be the subject of reporting. If the damage or destruction results in true disruption to the reliable operation of the BES, that impact would be reported under one of the other identified events. “Voltage Deviations” is another unnecessary event. CenterPoint Energy believes a voltage event of the proposed magnitude will, more than likely, result in other events identified in Attachment 1 such as; IROL Violation or Generation Loss and would be reported under one of those triggers. Another concern is the threshold trigger of +/- 10% for 15 minutes or more. CenterPoint Energy is unclear as to the starting point to determine the deviation. In other words is the 10% deviation from nominal voltage, such as 138kV or 345kV, or the actual voltage at the time of the event? Additionally, must the deviation occur over a “wide area” or is such a deviation at one buss enough to trigger a report? Based upon these ambiguities and concerns CenterPoint Energy recommends “Voltage Deviations” be deleted from Attachment 1. The examples that follow on page 14 should also be deleted.
No
CenterPoint Energy does not agree that the term “impact event” adequately replaces “disturbances” and “sabotage”. CenterPoint Energy suggests that just as the SDT has come to consensus on a concept for impact event, a definition could be derived for sabotage. “Potential”, as used in the SDT’s concept, is a vague term and indicates an occurrence that hasn’t happened. Required reporting should be limited to actual events. CenterPoint Energy offers the following

definition of “sabotage”: “An actual or attempted act that intentionally disrupts the reliable operation of the BES or results in damage to, destruction or misuse of BES facilities that result in large scale customer outages (i.e. 300MW or more).”
Yes
CenterPoint Energy agrees that there is no reliability gap between the existing standards and the proposed standard. However, CenterPoint Energy believes that the SDT went too far in developing the proposed EOP-004-2 and added additional unnecessary requirements. If the comments made above to Q1 – Q12 were to be incorporated into the proposed Standard, CenterPoint Energy believes the product would be closer to a results based Standard with no reliability gap.
Yes
CenterPoint Energy appreciates the efforts of the SDT in removing outdated and unnecessary language from the existing EOP-004 standard. Additionally, CenterPoint Energy urges the SDT to also remove the proposed “how to” prescriptive requirements. CenterPoint Energy believes the SDT team’s focus should be on drafting a results-based standard for reporting actual system disturbances and acts of sabotage that disrupt the reliable operation of the BES. The SDT should not delve into trying to identify a list of events that have a potential reliability impact. As stated in response to Q10, CenterPoint Energy strongly believes that cyber-related events should not be in the scope of this standard since they are already required to be identified and reported to appropriate entities under CIP-008. Excluding cyber events from this standard further supports the elimination of redundancies within the body of standards.

No
R 2.7, R 2.8 and R 2.9 are creating a requirement to have procedures to update procedures. Having updated procedures should be the requirement, no more.
No
NERC should either standardize on a 12 month year or an annual year for reviews.
No
Again, either 12 month year or annual year, NERC needs to standardize on one or the other. Training should apply only to those that must take action relevant the reliability of the BES. A plan would likely include notification of senior officers, however they don’t need to be included in drills and training if they have no active role.
Individual
Doug White
North Carolina Electric Coops
No
The term “impact event” is not a defined term in the NERC glossary and does not draw a clear boundary or give concise guidance to aid in event recognition.
No
There is a conflict between the ERO being listed as an applicable entity and the fact that the ERO is the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that other applicable entities would be required to meet. Attachment 1 has inconsistent time frames listed for similar events. For example, EEA’s are either reported within one or 24 hours depending on the nuance. Also, having more than one entity reporting an EEA can lead to conflicting information for the same event. Attachment 1 has the RC and the BA both reporting the same EEA event. Attachment 1 consolidates time frames from other standards for reporting purposes. There should either be a separate standard for “reporting” that encompasses reporting requirements for all standards or leave the time frames

and reporting requirements in the original individual standards. Several of the events require filing a written formal report within one hour. For large events like cascading outages or system separation, “all hands on deck” attention will need to be given to the actual event. Although a verbal report would be allowed in certain circumstances, attention to the actual event should take precedence over formal reporting requirements. There is already a DOE requirement to report certain events and no need to develop redundant reporting requirements in the NERC arena when this information is already available at the federal level at other agencies.
No
The ERO cannot be subject to a requirement for which it is the compliance enforcement authority.
No
This requirement dictates details of documentation of after-the-fact reporting of events which cannot impact reliability of the BES and, as such, should not be a reliability standard. The cost and burden of becoming auditably compliant with this requirement can be extreme for small entities.
No
The term “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditably compliant procedures and give guidance on what is proper to report.
No
Requiring a drill for “reporting” is unnecessary and burdensome. Reporting is covered in processes and procedures and during the normal training cycle. We recommend the elimination of this requirement.
No
Requiring training to report of after-the-fact events does not improve the reliability of the BES. We recommend the elimination of this requirement.
No
There is already a DOE requirement to report certain events. NERC should not be developing redundant reporting requirements when this information is already available at the federal level from other agencies.
No
The ERO cannot be subject to a requirement for which it is the compliance enforcement authority.
No
This list is too similar and redundant to the DOE requirements and does not provide any additional clarity on recognition of sabotage.
No
There is already a DOE requirement to report certain events. NERC should not be developing redundant reporting requirements when this information is already available at the federal level from other agencies.
Yes
No
Yes
Yes
Keep in mind that redundancy in reporting requirements from the DOE does not improve or enhance bulk electric system reliability but rather creates more work for the reporting entity.
Individual

Pacific Gas and Electric Company
No
PG&E recognizes this is an after the fact report, however, the purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. If the future intent is for this report to replace current reporting criteria the purpose statement should be expanded to reflect the true intent of the Standard.
No
PG&E recognizes the ERO is in R1, however, it does not see where the ERO’s applicability is applied in Attachment 1.
Yes
No
PG&E would like clarification on whether the 30 days, is calendar days or business days.
Yes

No
PG&E believes the addition of a drill constitutes additional training and should be added to R5. PG&E is concerned as to who the target audience for this annual training would affect.
No
PG&E believes 30 days is too restrictive due to real-time operations schedule requirements. The schedule is six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Suggest extending to 60 days to meet the training criteria which follows the NERC Continuing Education revised submittal date for the Individual Learning Activities (ILA).
No
PG&E believes that if the standard is intended to be an after the fact report, we question the one and/or twenty-four hour reporting criteria and then the 30 day criteria?
Yes
Yes
No
PG&E believes the report is duplicative to the OE-417 reporting criteria.
No
PG&E believes Attachment 1 Part A or B do not clearing specify “sabotage” events, other than “forced entry” and the proposed definition of “impact event” does not meet FERC’s directive to “further define sabotage” nor does it take into consideration their request to address the applicability to smaller entities.
Yes
Yes
Yes
PG&E believes as the training requirements continue to expand, having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues.

Laurie Williams
PNM Resources
No
PNM believes the purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. It is misleading and may have many thinking it is duplicative work.
No
PNM OTS does not see where the ERO’s applicability is applied in Attachment 1.
Yes
No
PNM would like clarification on whether the 30 days, is calendar days or business days.
Yes
No
PNM feels the addition of a drill or exercise constitutes additional training and believes R4 should be added to R5. The WECC OTS also is interested as to what level does the annual training target, for instance, the field personnel. Will they have to complete the exercise/drill?
No
PNM believes 30 days is too restrictive due to real-time operations schedule requirements. Most work schedules are either five or six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Based on the NERC Continuing Education revised submittal date for the Individual Learning Activities (ILA), PNM would recommend 60 days. Creating an Impact Event Report is duplicative and redundant and the WECC OTS feels this is not necessary.
No
PNM believes there seems to be redundancy in reporting based on the time frames in Attachment 1, i.e. OE-417 and other required reports. If this standard is intended to be an after the fact report, why is there one/twenty-four hour

reporting criteria?
Yes
Yes
No
PNM believes the report is duplicative to the OE-417 reporting criteria.
No
PNM believes the proposed definition of “impact event” does not meet FERC’s directive to “further define sabotage” nor does it take into consideration their request to address the applicability to smaller entities. Attachment 1 Part A or B do not clearing specify “sabotage” events, other than “forced entry”.
Yes
Yes
Yes
PNM believes that having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues. This will become even more of an issue as training requirements continue to expand.
Individual
Val Lehner
ATC
Yes
ATC agrees with the purpose statement. However, we do not agree with the implied definition of “impact events” as represented in Attachment 1. (See specific comments about what is included in Attachment 1 for the type of events that qualify as an “impact event”.)
No
The Functional Entities identified in Attachment 1 do not align with the current CIP Standard obligations (e.g. Load Serving Entities are not included).
No
ATC does not agree with R1 for three reasons: 1. The ERO cannot be assigned obligations in NERC Standards. The requirements for the ERO should be addressed by a revision to Section 801 of the Rules of Procedure. 2. This is a fill-in-the-blank requirement. The requirement, positioned as R1, does not allow for the obligations to be clearly defined. It refers to R6 which refers to R2 and Attachment 1. A clearer structure to the Standard would be to simply state that the Functional Entities have to meet the reporting obligations documented in Attachment 1 and delete the current R1.
No
The requirement should be rewritten to simply state that the Functional Entities has to meet the reporting obligations documented in Attachment 1. How the Functional Entity meets the obligations documented in Attachment 1 should be determined by the Functional Entity, not the requirement. The prescriptive nature of this requirement does not support the performance-based Standards that the industry and NERC are striving towards. In addition, requirement 2.9 creates an alternate method for NERC to develop Standards outside of the ANSI process. This requirement dictates that Functional Entities are required to incorporate lessons learned from NERC reports into their Plan, which is a requirement of this Standard.
No
ATC believes that this requirement should be deleted and that the SDT should coordinate its goal with the EAWG. We believe that the lessons learned process and identification of root cause is better covered under that process than through the NERC Mandatory Standards.
No
We do not believe that a drill that exercises a written reporting obligation will add additional reliability to the BES.
No
ATC believes it is an inherent obligation of all Functional Entities to train their appropriate staff to meet all applicable NERC Standards. Including a training requirement in some, but not all, Standards implies that the other Standards do not necessitate training. Although this is an important Standard and one that should be included in a Functional Entities’ training program, ATC does not believe that this Standard is more important than the other NERC Standards and, therefore, requires a separate training provision
Yes
ATC does agree that applicable entities report on events identified in Attachment 1 (See our comments about

Attachment 1), but we do not agree that applicable entities should be required by this standard to have an Operational Plan. Please see our comments to question 4.
No
ATC feels the ERO obligations should be covered in the Rules of Procedure. We do not agree with the requirements assigned to the ERO, but believe that they should be incorporated into the ERO's Rules of Procedure
No
ATC has several areas of concern regarding Attachment 1. 1. The one hour requirement for reporting will take the Functional Entities' focus off of addressing the immediate reliability issues and instead force the FE to devote valuable resources to filling out forms which will potentially reduce reliability. 2. Part A: a. Provide a definition of "system wide" for the Energy Emergency requiring system-wide voltage reduction. b. Add in the clarity that for Energy Emergency requiring firm load shed pertains to a single event, not cumulative events. c. Insert the word "continuous" for Voltage Deviations. d. Take off the TOP for IROL violations. (We believe that an IROL violation should be reported by the RC and not by the TOP based on the nature of the event. Requiring both the RC and TOP to report will only result in multiple reports for a single event. The RC is in the best position to report on an IROL violation for its RC area.) e. Take off the TO, TOP and add the LSE for Loss of Firm Load. (As a transmission only company ATC does not have contracts with end load users. Because of this the Loss of Firm Load should be the reporting obligations of the entity closes to the end load users which is the BA, DP or LSE. Failure to modify this requirement will cause confusion as to which entity has to report Loss of Firm Load. f. Define a timeframe for Generation Loss g. Multiple should be changed to "4 or more" for Transmission Loss.(ATC is concerned that this would require reporting of events that have little or no industry wide benefits but would take up considerable Registered Entity resources.) h. Provide clarity to and tighten the definition of Damage or destruction of BES equipment. The way it is written now would require over-reporting of all damaged or destroyed equipment due to a non-environmental external cause (e.g. broken insulator). 3. Part B: a. Take off the TO and TOP for Loss of off-site power. (The GOP has the responsibility to acquire off-site power and we believe it is the GOP's sole responsibility to report the Loss of off-site power. Failure to correct this would result in multiple reporting for the same event.) b. Take off RC for Risk to BES equipment. (The RC function does not own BES equipment and we believe it is impossible for them to report on risk to BES equipment if they are not the owner or operator of that equipment. This standard should be required of the entity that owns/operates BES equipment. c. Provide guidance to the phrase "reasonably determine" in footnote. d. Examples provided do not provide a clear obligation for an entity to follow. (Question: How close is the train to the substation? (Inches away from the substation fence, ten feet away from the substation fence or 500 feet away from the substation fence.) In addition, this standard is so open to interpretation that no entity can demonstrate compliance with the action. We believe that the only solution is to delete this reporting requirement. Overall: Multiple Functional Entities impacted by the same event are required to report. No lead entity is identified. This will result in multiple reports of the same event. ATC does not believe that this built-in duplicity enhances reliability?
No
No. NERC does not have the authority to absolve the Functional Entities of the reporting obligations for the DOE Form OE-417. Therefore, there will be duplicate reporting requirements and the one hour timeframes required in Attachment 1 will take valuable resources away from mitigating the event to filling out duplicative paperwork. It is ATC's position that the OE-417 report be used as the main reporting template until NERC and the DOE can develop a single reporting template. Task #14 in the report should be modified to say, "Identify any known protection system misoperation(s)." If this report is to be filed within 24 hrs, there will not be enough time to assess all operations to determine any misoperation. As a case in point, it typically takes at least 24 hrs to receive final lightning data; therefore, not all data is available to make a determination.
Yes
Yes, if ATC's recommended changes are made to Attachment 1 and the Standard.
Yes
ATC agrees with this effort and does not currently see a reliability gap
Yes
Yes, if ATC's recommended changes are made to the Standard. However, if the changes are not supported then ATC recommends that the implantation time be changed to two years. Entities will need time to develop both the plan called for in this standard and to train the personnel identified in the plan.
Yes
ATC believes that it is not evident in this draft that the SDT has worked collaboratively with the Events Analysis working group to leverage their work. ATC believes that NERC must coordinate this project and the EAWG efforts. The EAWG is proposing to modify NERC Rules of Procedure but the SDT is suggesting requirement for the ERO be build within the standard. We believe that the Rules of Procedure is the proper course to take to for identifying NERC obligations, but what is clear is that NERC itself does not seem to have an overall plan for event reporting and analysis. Lastly, ATC would like to see the SDT expand the mapping document to include the work of the EAWG. The industry needs to be presented with a clear picture as to how all these things will work together along with their reporting obligations. The definition of an "impact event" needs to be revised. First, if these events are to include any equipment failure or mis-operation that impacts the BES, the standard is requiring more than is intended based upon the reading of the requirements. PRC-004 already covers the reporting of protection system mis-operations, and if reading this definition

verbatim, it would lead one to conclude that those same mis-operations reported under PRC-004 shall also be reported under EOP-004. The definition should be revised to something like: “An impact event is a system disturbance affecting the Bulk Electric System beyond loss of a single element under normal operating conditions and does not include events normally reported under PRC-004. Such events may be caused by…”

Terry L. Blackwell
No
Since this standard is written to report events after-the-fact and not for a System Operator to perform corrective action, we believe the words situational awareness should be removed from the purpose. Situational Awareness is typically used for real-time operations. Also, any events that require reporting should be clearly defined in Attachment 1 and leave no room for interpretation by an entity.
No
Standards cannot be applicable to an ERO because they are the compliance enforcement authority, and the ERO is not a user, owner, or operator of the BES. Since we are reporting events that may affect the BES, why does a DP need to be included as an applicable entity for this standard? If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity. If NERC is going to require a separate reporting of events from DOE, then NERC should look at these events closely to determine if any of the defined events should be eliminated or modified from the current DOE form. (For example: Is shedding 100 MW of firm load really a threat to the BES?) Why does Attachment 1 have multiple entities reporting the same event? An RC should not have to report an EEA if the BA is required to report it. This will lead to conflicting reports for the same event. Attachment 1 is just a consolidation of the time frame from other standards. It appears no review was done for consistency of time frames for similar events.
No
It cannot apply to the ERO.
No
The words “operating plan” should be removed from the requirement. This standard deals exclusively with after-the-fact reporting. This requirement is also overly prescriptive.
No
Does the initial probable cause have to be reported within the timing associated in Attachment 1? Entities may not have enough information that soon to report the initial probable cause. This should be done with events analysis.
No
There is no need to drill for administrative reporting! This requirement should be deleted.
No
The concept of requiring training on reporting of after-the-fact events does not support or enhance bulk electric system reliability. We recommend the elimination of this requirement.
No
If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity
No
Standards cannot be applicable to an ERO because they are the compliance enforcement authority, and the ERO is not a user, owner, or operator of the BES.
No
The SDT should review the list of events closely to determine if the defined events actually impact the BES. (For example: Is shedding 100 MW of firm load really a threat to the BES?)
No
If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity.
No
The term "impact events" needs to be more clearly defined.
No
It is very difficult to assess this question with the standard as currently written.
No
With the proposed training and drill requirements in the current written standard, one year is not enough time.
Yes
We don’t believe that entities should be subjected to duplicate reporting to existing DOE requirements. How does redundancy in reporting requirements improve or enhance bulk electric system reliability?

Individual
Martin Bauer
US Bureau of Reclamation
No
The purpose is more closely related to the concept that "Responsible Entities shall document and analyze impact events and their known causes and disseminate the impact event documentation to support situational awareness". Not all impact events are to be reported. The analysis of the impact events is what is needed to achieve a lessons learned.
Yes
The question is focused on a limited area of Attachment A. There other problematic areas of Attachment 1 will be addressed in subsequent comments.
No
This standard should describe the ERO process of event documentation, analysis, and dissemination. Allowing the ERO to develop a event documentation, analysis, and dissemination process, which becomes a requirement on the Entities, must be derived through the Standards Development Process. The requirement, as it is currently worded, allows the ERO to develop standard requirements. If the intent is to only develop a means of collecting, which does not impose a requirement, the wording should state so. Otherwise, if the ERO wants to require that reports are posted to a specific location by the Entity, then it is a requirement and must go through the Standards Development Process. Secondly, there is already a single reporting form identified. It is not clear why the SDT could not accept that form as the reporting tool.
No
R2 does not reconcile with Attachment A or the sub paragraphs. As an example, the requirement 2.6 states "List of organizations to notify ...." All sub paragraphs use the term notify. Notify as used in Attachment A is when a report cannot be provided in the time frame listed in Attachment A. Therefore there is no requirement in this standard for the Operating Plan to have a provision for reporting. The subparagraph 2.8 indicates that the Entity must update it plan based on the lessons learned published by NERC. It would be appropriate to require a review and update of the plan based on the lessons learned.
Yes
This is provided that the report submitted in Attachment A does not include the probable cause. It is highly unlikely that a probable cause may be determined within the reporting timelines.
No
There is no rationale offered on why 15 months was selected. Without a defined basis the time period is arbitrary. It would be appropriate to let the Entity determine and document the time interval. That would allow the time frame to be sensitive to the complexity of the Operating Plan. Some entities are geographically dispersed and a single Operating Plan may be difficult to test at one time or within 15 months. The allowance for real time events or actual use is a good move and may make it easier to define a suitable time frame by the Entity.
No
The measure is vague and redundant. The Entity is required to provide information to be used to "verify content". The information may be used to demonstrate compliance but who will verify the content is adequate and on what basis. Secondly, the measure requires training information be provided twice, once to demonstrate who participated and then to show who was trained. This is all unnecessary and could be remedied by simply stating that "evidence shall demonstrate that all individuals listed in the plan have received training on their role in the plan"
Yes
No
Requirements 7 and 8 are covered in the Section 801. 801. Objectives of the Reliability Assessment and Performance Analysis Program. The objectives of the NERC reliability assessment and performance analysis program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American bulk power systems, both as existing and as planned; (2) analyze off-normal events on the bulk power system; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the board for publication to the electric industry and the general public.
No
The Attachment is very vague and without modification creates a Pseudo definition of BES equipment in the example provided. The example now indicates that something is BES equipment if it is "Damaged or destroyed due to a non-environmental external cause". Perhaps the example should be reworded to "BES equipment whose operation effects or causes:" and then adjust each of the line items to clarify what was intended. Next, the Attachment A example redefines reportable levels for Risk to BES Equipment - From a non-environmental physical threat as "Report copper theft from BES equipment only if it degrades the ability of equipment to operate correctly". Who makes that

determination? Not all events will be known within 24 hours. As example, Risk to BES Equipment - From a non-environmental physical threat may not be known until more thorough examination or investigation takes place. Also the reportable level appears to be defined by the Entity. While agree with that, we will end up with the same criticism from FERC when the level is set to "high" in FERC's mind. The reporting times are unrealistic for complicated events. Notification is reasonable but not reporting. Many organizations's have internal processes the reports must be vetted through before they become public and subject to compliance scrutiny.
No
There is already a reporting form for disturbances. The SDT should reconcile this standard with all the other reporting that is being requested and not add more.
No
The two are distinctly different. Disturbances are what happened, sabotage is why. We can easily tell what happened. Determining why it happened (e.g. sabotage) takes time.
No
The two could be combined with no realibility gap based on the concept rather than the proposed standard. As the standard is currently written, there is a reliability gap. Consider that after the fact reporting of a sabotage event (other than criminal acts which may have been witnessed) usually take some time to investigate and analyze.
No
There is a 15 month training requirement. If the standard goes into effect in one year, most entities will not have had an opportunity to develop their new Operating Plans and train their staff. The effective date should recognize Operating Plans need to be revised and then training needs to be implemented. The most aggressive schedule is 18 months. Two years would be more appropriate. The implementation date could recognize the Operating Plan development as one phase and the training as the second.
Yes
The SDT should consider that in reality it would be more streamlined to require immediate notification of an event for situational awareness, and then give adequate time for analysis of the cause. Reports that have an arbitrary rush will be diseased with low quality information and not much value in the long run to the BES. The Attachment A should be constructed around notification of situational awareness. The reporting timeline should be constructed around the different levels severity. The more severe the event, usually the more complicated the event is to analyze. Simple events usually do not have a significant impact.

Wayne Pourciau
Georgia System Operations Corporation
Yes
No
This standard should not apply to distribution systems or Distribution Providers. It should apply only to the BES.
Yes
Yes it would reduce duplication of effort and should ensure that the various entities and agencies all have consistent information. It should be simpler and quicker to file than what is needed to meet the current standard. However, the system should allow for partial reporting and hierarchical reporting. Entities up the ladder in a reporting hierarchy may fill in additional info (usually from a wider scope of view) than what lower level entities are aware of. It would be better for information to go up a hierarchy than for bits and pieces to go to the ERO from many entities. Terminology may be different in each of the bits and pieces yet the same idea may be intended. The ERO may mistake multiple reports as being different events when they are all related to one event. The system should give an entity the ability to select the entities that should receive the impact event report. If hierarchical reporting is not enabled by the system, then entities should be allowed to work out a reporting hierarchy as a group and entities at lower levels should not be required to report over the NERC system. Some higher level entity would enter the information on the NERC system as coordinated by the entities within a group.
Yes
An entity-developed Operating Plan will allow the flexibility needed to address different entity relationships around the country, e.g., generating companies, cooperatives, munis, large IOUs, small IOUs, RTOs/ISOs, non-independent market area, and so on. However, all applicable entities should not be required to report directly to NERC or the region. The system should allow for partial reporting and hierarchical reporting. Entities within an area should be allowed to coordinate their plans to define reporting procedures within their area. They could have an entity at some wide scope top level that reports to NERC and the region the information collected from multiple narrow scope lower levels within their wide area. If every small lower level entity directly reported to NERC and the Region, it could create situational confusion rather then situation awareness.
Yes
It directly supports the purpose of the standard.
Yes

We agree with R4 with "… at least annually, with no more than 15 months …" replaced with "… at least once per calendar year, with no more than 15 months …" as in R5.
Yes
Yes
It directly supports the purpose of the standard.
No
It should not be necessary for the ERO to require itself to do these things. NERC's authority should be sufficient to do these things as part of its mission. With quarterly trending and analysis of threats, vulnerabilities, lessons learned, and recommended actions in R8, R7 (an annual review) should not be necessary. The quarterly activity could include proposing revisions to Attachment 1 if warranted. An alternative would be to perform annual trending and analysis of threats, vulnerabilities, lessons learned, recommended actions, and proposed revisions to Attachment 1 if warranted. Also, the Reliability Standards Development Procedure has been replaced with the Standard Processes Manual.
Yes
We support the concept of Impact Events and listing and describing them in a table. However, we have some concerns. Reporting of impact events should not be applicable to a DP. The timelines outlined in Attachment 1 should be targets to try to meet but it should not be a compliance violation of the reporting requirement if it is not met. Regarding the NOTE before the table, verbal reports and updates should be allowed for other than certain adverse conditions like severe weather as well as adverse conditions. The first priority for all entities should be addressing the effects of the impact event. It may not be possible to assess the damage or the cause of an impact event in the allotted time. All entities should make their best effort to quickly report under any circumstances what they know about the event even if it is not complete. They should be allowed to report up through a hierarchy. The written report should not be issued until adequate information is available. Change "Preliminary Impact Event Report" to "Confidential Impact Event Report." Capitalization throughout this table is inconsistent. Sometimes an event is all capitalized. Sometimes not. It is not in synch with the NERC Glossary. All terms that remain capitalized in the next draft (other than when used as a title or heading) should be defined in the Glossary of Terms Used in NERC Reliability Standards. Examples of inconsistencies: Unplanned Control Center evacuation, Loss of off-site power, Voltage Deviations. -Energy Emergency requiring a public appeal or a system-wide voltage reduction: All The NERC Glossary defines Energy Emergency as a condition when a LSE has exhausted all other options and can no longer provide its customers' expected energy requirements. The events should not be described as an Energy Emergency requiring public appeal or system-wide voltage reductions. If public appeal and system-wide voltage reductions are still an option then all options have not been exhausted, the LSE can still provide its customers' energy requirements, and it is not an Energy Emergency. We suggest using "Energy Emergency Alert" rather than "Energy Emergency." -Energy Emergency requiring firm load shedding: load shedding via automatic UFLS or UVLS would not necessarily be due to an Energy Emergency. Other events could cause frequency or voltage to trigger a load shed. Most likely an entity would be seeing the Energy Emergency coming and would be using manual load shedding. -Forced intrusion and detection of cyber intrusion to critical cyber assets: CIP-008 is not referrenced for a forced intrusion. CIP-008 is referenced for a detection of cyber intrusion impact event. Aren't there reportable events per CIP-008 that involve physical intrusion that are not intrusions at a BES facility? -Risk to BES equipment: The threshold states that it is for a non-environmental threat but the examples given are environmental threats. Please clarify.
Yes
We support having one form for reporting however every applicable entity should not be required to fill it out and send it to NERC. See previous comments about hierarchical reporting. The title of the report is "Confidential Impact Event Report." Some suggested modifications: The form could have a blank added to enter the event "description" as described in the first column of Attachment 1. The first seven lines contain information that would most likely be filled out every time. The other lines except line 13 may or may not be applicable every time. It is required (R3) for an entity to access the initial probable cause of all impact events so line 13 will most likely be filled out every time. Please move the probable cause line up to line 7 or 8 (depending on if the event description line is added).
Yes
The new term is much more clear than those two terms. This will improve uncertainty and confusion regarding whether or not something should be reported.
Yes
The new single standard will cover all necessary reporting requirements that are in the current two standards. They are being combined into EOP-004-2 not EOP-004-3.
Yes
Yes
Light years better than the current CIP-001-1 and EOP-004-1! With some changes from this comment period, we should have a clearer set of realistic requirements which could likely pass the ballot. Thanks go out to the drafting team for bringing clarity to this topic. Capitalization throughout this document is inconsistent. It is not in synch with the NERC Glossary. All terms that remain capitalized in the next draft (other than when used as a title or heading) should be

defined in the Glossary of Terms Used in NERC Reliability Standards. Examples of not in synch with the Glossary: Registered Entity, Responsible Entity, Law Enforcement. These are not defined in the Glossary. The requirements that apply to entities should not use the word "analysis." "Assessment" should be used. Analysis is a different process (an ERO process) and is being addressed by another group within NERC (Dave Nevius). This EOP-004 drafting team and the NERC analysis group should closely coordinate such that there are no conflicts and the combined requirements/processes are realistic (mainly regarding timelines).

Suggestion: "Functional Entities identified in Section 4 shall support situational awareness of impact events and their known causes."
No
---ERO should not be included in this or any other standard! FERC can decide whether NERC is doing a good job without having standards requirements to audit to. If NERC needs to be included in a standard, then it should a stand-alone one so that the RSAW for all of the other audits don't need to include those requirements. ---"Loss of off-site power (grid supply)" is important at control centers and other large generators. The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---"Footnote 1. Report if problems with the fuel supply chain result in the projected need for emergency actions to manage reliability." is ambiguous. Everything in the Standards program can "Affecting BES reliability". The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---"Footnote 2. Report if you cannot reasonably determine likely motivation (i.e., intrusion to steal copper or spray graffiti is not reportable unless it effects the reliability of the BES)." is well intentioned but ambiguous. For example, if I know the motivation is to blow up the plant, then by this footnote, I don't have to report. The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---All terms should be used from or added to the Glossary.
No
This standard is an inappropriate place to define this requirement. NERC needs to be held accountable, but it should be independent of the standard. What if NERC fails to do it by the effective date of the standard, all Registered Entities will violate the standard until NERC is done. The effective date needs to be set based on NERC completing the system defined in R1.
No
R2 needs to state that the Operating Plan needs to only those Attachment 1 events applicable to the Registered Entity. The Operating Plan should contain a list of these events so that the other Requirements can reference the Operating Plan and not Attachment 1 for the list of events. For example a GO/GOP <2,000 MW would not need to address this type of event and it wouldn't be listed in its Operating Plan. It would be unnecessarily cumbersome, to describe events which are not covered within the Operating Plan.
No
R3 should reference the events covered by the Operating Plan, as listed in it, rather than in Attachment 1. If the Plan is deficient, it is a violation of R2 and not every other Requirement that references the Plan.
No
In M4, it is suggested that data from a real event would be evidence. R4 should be satisfied if the Operating Plan is used for a real event within 15 months of the last drill or event.
No
It is wholly unreasonable to re-train everyone for each change to the Operating Plan. Suggestion: Clarify that upon changes to the Operating Plan, the Registered Entity may either require full training, or instead distribute a summary of the change to affected personnel only.
No
---This is the first mention of the time lines in Attachment 1. If they are part of the standard, then they should be incorporated to the Operating Plan in R2 and then need not be mentioned again, only compliance with the plan. ---In M6, the last part, "evidence to support the type of impact event experienced; the date and time of the impact event ; as well as evidence of report submittal that includes date and time" is redundant. All of that should be in the report to NERC. If not, then it's not important to keep.
No
Reviewing Attachment 1 annually is unnecessary. Events don't change much and if they do, a SAR is needed to consider the changes. NERC should not be included in any standard!
No
Loss of off-site power is important to more than just nuclear plants--but which ones? Control centers or other large generators. But not small generators! Should there be a common element to Attachment 1, like the potential to cause a Reportable Disturbance, or maybe there need to be multiple criteria like that.

No
The form needs to identify whether it is a preliminary or final report. An identifier should be created to tie the final to the preliminary one. Some fields, 1,2 3 5 & 6, are required for the preliminary report and should be labeled as such. With the 1 hour reporting deadline for some events, the details may not be known. 12 & 13 should be required for the final report. 13 should designate whether the cause is preliminary or final. 7-11 & 14 are optional, and the form should state this, and based on some types of events. It's confusing to have irrelevant blanks on the form.
No
Impact Events is OK. It needs to be balloted as a definition for the Glossary like Protection System.
No
Bomb threat has totally been lost.
Yes
Good start on a unified event reporting standard!

UI suggests adding the phrase: and the ERO shall provide quarterly reports; Responsible Entities shall report impact events and their known causes, and the ERO shall provide quarterly reports, to support situational awareness and the reliability of the Bulk Electric System (BES).
Yes
Yes
No
R2.9 requires provisions to update the Operating Plan based on the annual ERO report developed in R8. The ERO report does not appear to be providing lessons learned to be applied to the Operating Plan for impact event reporting, but more focsed on trends and threats to the BES. Also 30 days after the report is published by NERC is not enough time for the entity to read, and assess the report, and then to administratively update the Operating Plan. UI agrees that the Operating Plan should be reviewed annually and updated subsequent to the review within 30 days.
Yes
Yes
Suggest R4 be improved to state that a Registered Entity is only required to conduct a drill or execute real-time implementation of the Operating Pan for one impact event listed in the attachment. In other words the Registered Entity is not required to drill on reporting each type of impact event on an annual basis.
Yes
R5.3 coupled with the rationale provided is a sensible approach. It is important that the rational is not forgotten.
Yes
No
The rules of procedure adequately cover this.
No
UI agrees but the listing needs to be improved for clarity in certain instances. For example, EOP-004 Attachment 1 Part A – Example iii – uses the phrase “significantly affects the reliability margin of the system.” Significantly is an immeasurable concept and does not provide guidance to the Entity. The phrase “reliability margin” is not defined and is open to interpretation. Perhaps utilize “resource adequacy”, if that is all that intended, or use “adequate level of reliability”.
No
The standard does not appear to require the use of Attachment 2. Placing the form within the Standard may require the use of the Standards Development Process to modify the form. UI suggests the form is maintained outside the Standard to allow it to be adjusted. UI would prefer NERC to establish an internet based reporting tool to convey the initial reports.
Yes
The term impact event can substitute for sabotage and disturbance. The use of Forced Intrusion is a bright line for reporting.
Yes

No
UI believes the implementation should be staged. For R1 and R2: First calendar day of the first calendar quarter one year after applicable regulatory authority approval for all. This provides sufficient time to draft a procedure Then time needs to be provided to provide training prior to implementation of R3 and R6. UI believes two calendar quarters should be provided to complete training; therefore R3and R6 is effective six calendar quarters following regulatory approval. Implementation for R4 should state that the initial calendar year begins on the date R2 is effective and entities have 12 months following that date to complete their first drill. R5 requires training once per calendar year. Implementation for R5 should state that the initial calendar year begins on the date R2 is effective and entities have 12 months following that date to complete their first drill.

Footnote 1 is missing from Part A, although it is referenced in column 1 row 11. Is this the Examples? The purpose of the Examples is unclear. Is it meant to limit the scope to those enumerated? This is not stated, but if not it should be removed since it adds confusion. What is meant by non-environmental? All external causes of damage or destruction come from the environment by definition. Please specify what is intended or remove the word.
No
We found no “Preliminary Impact Event Report” in the posted draft standard, so we assume the question is regarding the “Confidential Impact Report” (Attachment 2). It is unclear what role the form plays, since no requirement refers to it. If this is the form to report impact events per R6, then R6 should reference it. The comment group cautions that the use of the word “confidential” should be carefully considered, since many filled out forms that originally contained the word are now posted on the NERC website for all to see. If there are limits to the extent and/or duration of the confidentiality this should be clearly stated in the form, or the word should be avoided. Protection System misoperation reporting is already covered by PRC-004. Including it here is redundant, and doubly jeopardizes an entity for the same event.
No
The comment group fails to see how changing the words meet the directive. Sabotage implies an organized intentional attack that may or may not result in an electrical disturbance. The distinction between sabotage and vandalism is important since sabotage on a small system may be the first wave of an attack on many entities. The proposed standard asks us to treat insulator damage caused by a frustrated hunter (an act of vandalism) the same as attack by an unfriendly foreign government (an act of sabotage). The comment group does not agree that these should be treated equally.
Yes
The proposed standard has a huge impact on small DPs. DPs that presently do not maintain 24/7 dispatch centers will need to begin doing so to meet the reporting deadlines such as 1 hour after an occurrence is identified (possibly identified by a third party) or 24 hour after an occurrence (regardless of when it was discovered by the DP). The planning, assessing, drilling, training, and reporting requirements (R2-R6), as well as documentation (M2-M6) by small entities will cause utility rates to rise, will reduce local level of service, and will not represent a corresponding increase to the reliability of the BES. The SDT concept of clear criteria for reporting has not been met, since R2 effectively directs the applicable entities to develop their own criteria. The decision of which types of events will be reported to which external organizations has been left up to the applicable entity. The comment group notes that there is no coordination of effort required between the applicable entities and the RCs or TOs that issue reliability directives. Energy Emergencies requiring voltage reduction or load shedding are likely to be communicated to applicable entities via directives. The likely result of this lack of coordination is that entities will plan, drill, and train for an event, but when the directive comes it will not be the one planned, drilled, and trained for. Coordination between those sending and receiving directives would ensure the probable events and directed responses are the ones planned, drilled, and trained for.

NERC Staff
Mallory Huggins
Yes
Yes

No
NERC staff is concerned about this requirement’s applicability to the ERO. We feel that such a responsibility needs mentioning in the Rules of Procedure, the Compliance Monitoring and Enforcement Program (CMEP), or in a guideline document rather than in a standard requirement. Further, the requirement specifies “how” to manage the event data, not “what” should be monitored.
Yes
Yes
Yes
Yes
Yes
No
NERC staff believes that requirements R7 and R8 are not needed because they are intrinsic expectations from its Rules of Procedure. Furthermore, these elements are necessary for analysis in support of the Reliability Metrics efforts NERC is leading under its Reliability Assessment and Performance Analysis program.
No
The SDT should clarify its use of the term “critical asset” in the Examples section under Part A of the table. The term or versions of the term are used in different contexts in the NERC Reliability Standards. For instance, in CIP-002-1, Requirement 1, the Critical Asset Identification Method is used to identify its critical assets. In EOP-008-0, Requirement 1.3, the applicable entity is required to list its “critical facilities” in its contingency plan for the loss of control center functionality. The team should confirm what it is referring to in this proposed standard. To avoid confusion, the SDT may want to consider using a different term here or better clarify its meaning. Further, there exists the potential to have disparate reporting criteria in this proposed standard relative to the criteria being proposed by the Events Analysis Working Group as part of the Events Analysis Process document dated October 1, 2010. In particular, the following areas should be reconciled between the drafting team and the EAWG to ensure a consistent set of threshold criteria: Voltage Deviations --EOP-004-2: Greater than or equal to 15 minutes --EAWG Process: Greater than or equal to 5 minutes System Separation (Islanding) --EOP-004-2: Greater than or equal to 100 MW --EAWG Process: Greater than or equal to 1000 MWs System Separation (Islanding) --EOP-004-2: Does not address intentional islanding as in the case of Alberta, Florida, New Brunswick --EAWG Process: Addresses intentional islanding as in the case of Alberta, Florida, New Brunswick SPS/RAS --EOP-004-2: Does not expressly address proper SPS/RAS operations or failure, degradation, or misoperation of SPS/RAS --EAWG Process: Expressly addresses proper SPS/RAS operations or failure, degradation, or misoperation of SPS/RAS Transmission Loss --EOP-004-2: Identifies Multiple BES transmission elements --EAWG Process: Provides specificity in Category 1a and 1b regarding transmission events Damage or destruction of BES equipment --EOP-004-2: Through operational error, equipment failure, or external cause but not linked to loss of load --EAWG Process: Identifies in Category 2h equipment failures linked to loss of firm system demands Forced intrusion --EOP-004-2: Addressed --EAWG Process: Not addressed Risk to BES equipment --EOP-004-2: Addressed --EAWG Process: Not addressed Detection of a cyber intrusion to critical cyber assets --EOP-004-2: Addressed --EAWG Process: Not addressed
No
Item 15: A one-line diagram should be attached to assist in the understanding and evaluation of the event. Two additional items are recommended: --Ongoing reliability impacts/system vulnerability – this would capture areas where one is not able to meet operating reserves or is in an overload condition, below voltage limits, etc. in real-time --Reliability impacts with next contingency – this would capture potential impacts as outlined above with the next contingency.
No
NERC staff is concerned with the ambiguity of the term “impact event.” The definition of the term is not clear, in part because it includes using the words “impact” and “event” (and thus violates the frowned-up practice of using a word to define the word itself). NERC staff recommends the SDT consider using the term “Event.” The following definition (modified from the one used the INPO Human Performance Fundamentals Desk Reference, P. 11) would apply: Event: “An unwanted, undesirable change in the state of plants, systems or components that leads to undesirable consequences to the safe and reliable operation of the Bulk Electric System.” Supporting statement following the definition: “An event is often driven by deficiencies in barriers and defenses, latent organizational weaknesses and conditions, errors in human performance and factors, and equipment design or maintenance issues.” Further, if this is intended for use in this standard, it should be presented as an addition to Glossary to avoid confusion with the use of the term event in other standards. Of course, this would require an analysis of how the term “Event” as defined herein would affect the other standards to which the term is used. In the end, this is the cleanest manner for the standards.

Yes
No
In order to provide explicit dates, the language should be modified to state: “First calendar day of the first calendar quarter one year after the date of the order providing applicable regulatory authority approval for all requirements.”
Yes
NERC staff commends the SDT on its work so far. Merging CIP-001 and EOP-004 is a significant improvement and eliminates some current redundancies for reporting events. NERC staff believes opportunities to improve the proposed standard still exist. In particular, the team should consider possible redundancies with the Reliability Coordinator Working Group (RCWG) reporting guidelines, the Electricity Sector - Information Sharing and Analysis Center (ES-ISAC) reporting requirements for sharing information across sectors, and the Events Analysis Working Group (EAWG) efforts to develop event reporting processes. Ideally, the SDT and the EAWG should work together to develop a single consistent set of reporting criteria that can be utilized in both the EAWG event reporting process and in the requirements of the EOP-004-2 Reliability Standard.
Group
MRO's NERC Standards Review Subcommittee
Carol Gerou
Yes
Thank you for the clarification of “known causes”, this will allow entities to report what they currently know when submitting an impact report.
Yes
The NSRS believes it is important for the ERO to provide valuable Lessons learned to our electrical industry, thus enhancing the reliability of the BES.
Yes
No
A. As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. R2.8, and R2.9 do not have a correlation to R2’s Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change. The NSRS believes the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in the components of an entity’s Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the words “lessons learned” would be required to be in your Operating Plan. It is solely up to an entity to implement a “Lesson Learned” and not the place for this SDT to require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. B. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. The NSRS recommends to incorporate lessons learned within 12 calendar months if lesson learned are not deleted from the R2.8 & R2.9.
Yes
The NSRS thanks the SDT for stating “initial probable cause” as this is in direct correlation to the Purpose which states “known causes”.
Yes
The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be exercised once per calendar year.
No
R5.2. The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be trained once per calendar year. R5.3 As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. Where, R2.7 states to update the Operating Plan when there is a component change. The NSRS believes the components of this Operating Plan are 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. These components relate to training when the Operating Plan is revised per, R5.3, only. As written, every memo, simulations, blog, etc that contain the words “lessons learned” would be required to be in your Operating Plan and trained on every time one was issued or heard about internally or externally. Recommend that the Operating Plan be revised and training occurs when a change occurs to the entity’s Operating Plan, consisting of 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events, only.
Yes
Yes
Should read “In accordance with Sections 401(2) and 405 of the Rules of Procedures, the ERO can be set as an applicable entity in a requirement or standard”. As stated in the text box.
No

Please provide a phone number and provision within the Note of EOP-004 – Attachment 1: Impact Events table for an entity to contact NERC if unable to contact NERC within the time described. Voltage Deviations – recommend adding the word "(continuous)" after sustained in Threshold column. This could be interpreted as an aggregate value over any length of time. Frequency deviations - recommend adding the word "(continuous)" after 15 minutes' in Threshold column. This could be interpreted as an aggregate value over any length of time. CIP-008 R1.3 states the entity is to report Cyber Security Incidents to the ES_ISAC. Does the EOP-004 Attachment 2 fulfill this requirement?
No
Number 4 of the reporting form does not take into consideration of potential impact events. Recommend that "Did the impact event originate in your system?" to "Did the impact event originate or affect your system?". This will provide clarity to entities.
Yes
As an industry we have looked at sabotage as a sub component of a disturbance. Sabotage is hard to measure since it is based on a perpetrator's intent and thus very hard to determine.
Yes
Within the above question, the SDT is asking about EOP-004-2 not -3.
Yes
Yes
Please provide an e-mail address for the submittal of the report to NERC (and any other parties above a Regional Entity) within this Standard and a fax number as a backup to electronic submittal. EOP-004 Attachment 2: Impact Event Reporting Form (note in the proposed standards it states EOP-002) seems to be written for Actual Impact Events only. Perhaps another section could be added for "Potential" Impact Events.
Individual
Amir Y Hammad
Constellation Power Generation and Constellation Commodities Group
Yes
No
Constellation Power Generation and Constellation Commodities Group disagrees with the inclusion of Generator Owners. Since one of the goals in revising this standard is to streamline impact event reporting obligations, Generator Operators are the appropriate entity to manage event reporting as the entity most aware of events should they arise. At times, the information required to complete a report may warrant input from entities connected to generation, but the operator remains the best entity to fulfill the reporting obligation.
Yes
No
Constellation Power Generation and Constellation Commodities Group has several issues with this requirement, but in general, this requirement is heavily prescriptive, administrative in nature, and is unclear whether it will positively impact BES reliability. As examples of administrative requirements that have no impact on reliability, please consider the following comments: •Listing personnel in R2.4, - merely having a list of personnel does not add to the sufficiency of an Operating Plan, but it does create a burdensome obligation to maintain a list. As well, specifying "personnel" may limit plans from designating job titles or other designations that may more appropriately and consistently carry reporting responsibility in the Operating Plan. •R2.5 is unclear as to the intent of the requirement – what is threshold of notification? Is the list to be those that have a role in the event response or a list of all within the facility who may receive news notification of the event? Also, as explained above for 2.4, a list is not a beneficial to reliability, but is administratively burdensome. •What is the reasoning for the 30 day timeframe in R2.7 R2.8 and R2.9? The timeframe is not based on a specific necessity, and creates an unreasonable time frame for changing the Operating Plan, in particular if lessons learned are either short turn adjustments or comprehensive programmatic changes what warrant more time to properly institute. In addition, coupled with other requirements (R4, R5, R8), the updating requirements of R2.7, R2.8 and R2.8 potentially create a continually updating Operating Plan which could create enough confusion to reduce the effectiveness of the Operating Plan. The updating and time frame requirements do not impact reliability, but again impose significant administrative burden and compliance exposure. •R2.9 is particularly problematic for its connection to R8. R8 requires NERC to create quarterly reports with lessons learned and R2.9 requires the registered entities to amend their Operating Plans? What if NERC doesn't write an annual or quarterly report? Are the registered entities out of compliance? The "summary of concepts" for this latest revision, as written by the SDT, includes the following items: •A single form to report disturbances and impact events that threaten the reliability of the bulk electric system •Other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements •Clear criteria for reporting •Consistent reporting timelines •Clarity around of who will receive the information and how it will be used Many of the sub-requirements in R2 do not address any of these items and do not serve to establish a high quality, enforceable and reliability focused standard. Constellation Power Generation therefore

recommends that R2 be amended to read as follows: R2. Each Applicable Entity identified in Attachment 1 shall have an Operating Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components: 2.1. Method(s) for identifying impact events listed in Attachment 1 2.2. Method(s) for assessing cause(s) of impact events listed in Attachment 1 2.3. Method(s) for making internal and external notifications should an impact event listed in Attachment 1 occur. 2.4. Method(s) for updating the Operating Plan. 2.5 Method(s) for making operation personnel aware of changes to the Operating Plan.
No
This requirement introduces double jeopardy for registered entities. If an entity does not include methods for identifying impact events and for assessing cause per R2.1 and R2.2 in their Operating Plan, they will be out of compliance with R2. Without the methods in R2 the registered entity is out of compliance with R3 as well for failing to identify and assess. Constellation Power Generation therefore recommends that R3 be amended to be incremental to R2 and read as follows: R3. Each Applicable Entity shall implement their Operating Plan(s) to identify and assess cause of impact events listed in Attachment 1.
No
It is not clear how this requirement to conduct drills and exercises relates to the concepts spelled out by the SDT: oA single form to report disturbances and impact events that threaten the reliability of the bulk electric system oOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements oClear criteria for reporting oConsistent reporting timelines oClarity around of who will receive the information and how it will be used R4 does not address any of the above items and should therefore be removed from this standard.
No
Constellation Power Generation questions how R5 relates to the SDT's "summary of concepts": oA single form to report disturbances and impact events that threaten the reliability of the bulk electric system oOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements oClear criteria for reporting oConsistent reporting timelines oClarity around of who will receive the information and how it will be used However, Constellation Power Generation believes that security awareness is an important aspect of personnel security and proposes an annual training similar to what was in the previous standards. Constellation Power Generation therefore recommends two requirement changes that would achieve security awareness without the burdensome administrative aspects. First, as stated earlier, a sub requirement in R2 should be added which reads as follows: R2.5 Method(s) for making operation personnel aware of changes to the Operating Plan. Second, this training requirement should be rewritten as follows: Each Applicable Entity shall provide training to all operation personnel at least annually.
Yes
No
The impact event table (Attachment #1), as part of a standard, would have to be FERC approved every time it is edited. That would cause it to go through NERC's Standard Development Process, and would cause a revision to the standard each time. This will also cause revisions to each and every registered entity's Operating Plan. Overall, this requirement causes a large administrative burden on all entities, and does not improve reliability. As stated earlier, the "summary of concepts" for this latest revision, as written by the SDT, includes the following items: oA single form to report disturbances and impact events that threaten the reliability of the bulk electric system oOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements oClear criteria for reporting oConsistent reporting timelines oClarity around of who will receive the information and how it will be used Requirement 7 and 8 do not address any of these items. Furthermore, for R8, it is requiring NERC to send out quarterly reports, yet entities are supposed to amend their Operating Plans based on an annual NERC report. This requirement is confusing and is not consistent with earlier requirements. Constellation Power Generation believes that these two requirements should be removed.
No
Constellation Power Generation and Constellation Commodities Group questions why the generation loss line item includes generating facilities of 5 or more generators with an aggregate of 500 MW or greater? The number of units makes no difference for reporting, as is evident in the generation thresholds written before this inclusion. The examples of damaged or destroyed BES equipment are confusing, and do not clarify the reporting event. What if a GSU at a small plant (20 MW) were to fail? Is that reportable? Constellation Power Generation believes that equipment failures that are not suspicious do not need to be reported. Finally, Constellation Power Generation and Constellation Commodities Group believes that the "loss of offsite power affecting a nuclear generation station" should be removed for the following reasons: 1)The purpose of this reliability standard is stated as being: "Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES). " While the "situational awareness" portion of the purpose could be interpreted as all-inclusive, the real element deals with BES reliability. Off-site power sources to nuclear units have nothing to do with BES reliability. Why should nuclear units be treated differently? 2)The issue of concern for a loss of offsite power at a nuclear station is continued power supply (other than emergency diesels) to power equipment to cool the reactor core. A nuclear unit automatically shuts down when off-site power supply is lost. Availability of off-site power is a reactor safety concern (i.e., NRC

regulatory concern and a one-hour report to the NRC) – not a reliability concern that FERC/NERC would have jurisdiction over. 3)There is a nuclear-specific reliability standard (NUC-001) that contemplated off-site power availability. That standard contained no reporting requirements outside of those that may be already established in current procedures. Why try to impose one here? 4)A loss of offsite power will result in an emergency declaration at the nuclear facility. Notifications will be made to federal (NRC), state, and local authorities. The control room crew is already overly-burdened with notifications – any additional call to NERC/Regional Reliability orgs will add insult-to-injury for no beneficial reason. If NERC is interested, they should obtain info from NRC. 5)If all else fails and the item is to remain on the table, it needs to be clarified as a “complete” loss of off-site power lasting greater than X minutes (i.e., would we have to report a complete momentary loss that was rectified in short order by an auto-reclose or quick operator action?).
No
It is unclear if an entity has to answer all the questions. In addition, “Preliminary” is not currently included in the report title.
Yes
Yes
No
Based on the drastic differences between the previous revisions to these standards, and this proposed revision, 24 months would be a more reasonable timeframe for an effective date.
Yes
As stated earlier, the “summary of concepts” for this latest revision, as written by the SDT, includes the following items: oA single form to report disturbances and impact events that threaten the reliability of the bulk electric system oOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements oClear criteria for reporting oConsistent reporting timelines oClarity around of who will receive the information and how it will be used Each and every requirement should be mapped to one of these 5 items; otherwise, it should not be included in this standard. Summarizing all of the comments above, Constellation Power Generation proposes the following revision to EOP-004-2: 1. Title: Impact Event and Disturbance Assessment, Analysis, and Reporting 2. Number: EOP-004-2 3. Purpose: Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES). 4. Applicability 4.1. Functional Entities: 4.1.1. Reliability Coordinator 4.1.2. Balancing Authority 4.1.3. Transmission Operator 4.1.4. Generator Operator 4.1.5. Distribution Provider 4.1.6. Electric Reliability Organization Requirements and Measures R1. The ERO shall establish, maintain and utilize a system for receiving and distributing impact event reports, received pursuant to Requirement R6, to applicable government, provincial or law enforcement agencies and Registered Entities to enhance and support situational awareness. R2. Each Applicable Entity identified in Attachment 1 shall have an Operating Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components: 2.1. Method(s) for identifying impact events listed in Attachment 2.2. Method(s) for assessing cause(s) of impact events listed in Attachment 1 2.3. Method(s) for making internal and external notifications should an impact event listed in Attachment 1 occur. 2.4. Method(s) for updating the Operating Plan. 2.5 Method(s) for making operation personnel aware of changes to the Operating Plan. R3. Each Applicable Entity shall implement their Operating Plan(s) to identify and assess cause of impact events listed in Attachment 1. R4. Each Applicable Entity shall provide training to all operation personnel at least annually. R5. Each Applicable Entity shall report impact events in accordance with its Operating Plan created pursuant to Requirement 2 and the timelines outlined in Attachment 1.

FirstEnergy
Sam Ciccone
No
Since this standard is after-the-fact reporting, the phrase "situational awareness" may not be appropriate since that phrase is attributed by a large part of the industry to real-time, minute-to-minute awareness of the system. We suggest the following rewording of the purpose statement: "To ensure Applicable Entities report impact events and their known causes to enhance and support the reliability of the Bulk Electric System (BES)".
No
We do not support the ERO as an applicable entity of a reliability standard because they are not a user, owner or operator of the bulk electric system. Any expectation of the ERO should be defined in the Rules of Procedure.
No
FirstEnergy proposes that requirement R1 and Measure M1 be deleted. A requirement assignment to the ERO is problematic and should not appear in a reliability standard. The team should keep in mind that all requirements will require VSL assignments that form the basis of sanctions. FE does not believe it is appropriate for the ERO to be exposed to a compliance violation investigation as the ERO is not a functional entity as envisioned by the Functional Model. If this "after-the-fact" reporting is truly needed for reliability then the standard must be written in a manner that does not obligate the ERO to reliability requirements. It would be acceptable and appropriate for a requirement to

reference the "ERO Process" desired by R1, however, that process should be reflected in the Rules of Procedure and not a reliability standard.
No
The term Operating Plan(s) is not the appropriate term for this standard. These should be called Reporting Plan(s). Operating Plans are usually designed to be applied during the operating timeframe. Parts 2.2 and 2.6 – We suggest changes to these two subparts as well as a new 2.2.1 and 2.6.1 as follows: 2.2. Method(s) for assessing the initial probable cause(s) of impact events (Add) 2.2.1. Method(s) for assessing the external organizations to be notified. 2.6. List of external organizations to notify in accordance with Part 2.2.1. to include but not limited to NERC, Regional Entity, and Governmental Agencies. (Add) 2.6.1. Method(s) for notifying Law Enforcement as determined by Part 2.2.1. Parts 2.4 and 2.6: This should be a list of job titles for ease of maintenance. An entity may choose to use someone in a job position that is a 24 by 7 operation with several personnel that cover that position over the 24 by 7 period. Listing each person by name should not be required as personnel change while the operating responsibility related to the job title can remain constant. We suggest changing the wording to "2.4. List of the job titles of internal company personnel responsible for making initial notification(s) in accordance with Parts 2.5.and 2.6. 2.5. List of the job titles of internal company personnel to notify." Part 2.6 – We are under the impression that the phrase "include but not limited to" should not be used according to the NEW SDT guidelines. We suggest changing this to say "List of external organizations to notify that includes at a minimum, NERC, Regional Entity, and Governmental Agencies. (A provincial agency is a governmental agency)." Part 2.7. is overly burdensome. FE suggests the team revise to simply reflect annual updates that should consider component changes and updates from lessons learned. This also permits parts 2.8 and 2.9 to be deleted. FE proposes the following text for Requirement R2.7 "Annual review, not to exceed 15 months between reviews, and update as needed of the Reporting Plan that considers component changes and continuous improvement changes from lessons learned." Parts 2.8 and 2.9 - FE proposes to delete part 2.8 and 2.9. We do not see a need for these changes since the plan must be updated annually and will cover lessons learned.
No
M3 – Power flow analysis would be used to assess the impact of the event on the BES, not to determine initial probable cause. It is more likely that DME would provide the data for the initial probable cause evaluation. We suggest rewording M3 as follows: "To the extent that an Applicable Entity has an impact event on its Facilities, the Applicable Entity shall provide documentation of its assessment or analysis. Such evidence could include, but is not limited to, operator logs, voice recordings, or disturbance monitoring equipment reports. (R3)"
No
FE suggests that this requirement be deleted. FE does not see a reliability need for conducting a drill on reporting. This is overly burdensome and should not be included within this reliability standard. Training on the plan and periodic reminder of reporting obligations should suffice.
No
Requirement R5 and Part 5.1 – The wording in Part 5.1 is too prescriptive and shouldnot require training on the specific actions of personnel. Also, R5 should not require training for personnel that may only receive the report and are not required to do anything. Therefore we suggest rewording R5 and 5.1 as follows: "R5. Each Applicable Entity identified in Attachment 1 shall have a Reporting Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components: 5.1 The training includes the personnel required to respond under the Reporting Plan." Part 5.3 – We suggest removing subpart 5.3. This requirement is overly burdensome and not necessary. We believe that the requirements for annual review and update of the plan as well as training sufficiently cover reviews of changes to the plan. Part 5.4 – The last phrase "training shall be conducted prior to assuming the responsibilities in the plan" should account for emergency situations when the entity does not have time to train the replacement before they are to assume a responsibility.
No
M6 – NERC's system should be capable of making this evidence available for the entities and provide a "return-receipt" of the reports that we send them. Also, M6 should be revised to state "Applicable Entities" as opposed to "Registered Entities".
No
FE disagrees with the ERO as an applicable entity within a reliability standard. See our responses to Questions 2 and 3 above. We do not believe the desired ERO process is adequately covered in section 802. Section 802 deals with assessments and not event reporting.
No
1. The table in Att. 1 and the requirements should alleviate the potential for duplicate reporting. For example, If the RC submits a report regarding a Voltage deviation in its footprint, the report should be submitted by the RC on behalf of the RC, TOP, and GOP, and not require the TOP and GOP to submit duplicate reports. 2. Regarding the "Note" before the table – We agree that under certain conditions it is not possible to issue a written report in a given time period. However, the ERO and RE should also be required to confirm receipt of the verbal communication in writing to prove that the entity communicated the event as these verbal notifications may be done by an entity using an unrecorded line. 3. Organizations with many registered entities should be permitted to submit one report to cover multiple entities under one parent company name. We suggest this be made clear in the Tables, the reporting form, and in the requirements. 4. Voltage Deviations Event – We suggest the team provide more clarity with regard to the types and locations of

voltage deviations that constitute an event. 5. Examples of BES Equipment in Part A of "Actual Reliability Impact" Table – Is the phrase "critical asset" referring to the CIP defined term? If so, this should be capitalized. 6. Under the "Time to Submit Report" column of the table, we suggest that all of the phrases end in "after identification of the occurrence". 7. Frequency Trigger Limit (FTL) for the Frequency Deviation event should be replaced with the values the FTL represent. The FTL is part of the BAAL Standards which have not been approved by the industry and are not in effect. It is possible that these terms are not used by those not participating in the field trial of the BAAL standards.
Yes
Although we agree with the report, it should be clear that organizations with many registered entities can submit one report to cover multiple entities under one parent company.
No
For the most part we support this definition of impact events. However, we have the following suggestions: 1. We believe that it warrants an official NERC glossary definition. 2. The term "potential" in the definition should point to the specific events detailed in Attachment 1 Part B. 3. Since the standard does not cover environmental events, the phrase "environmental conditions" in the definition is not an impact event in the context of this standard.

Electric Market Policy
Mike Garton

No
The term “impact events” does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator. As conveyed in Dominion’s comments on NERC Reliability Standards Development Plan 2011 – 2013, Dominion does not see this draft standard as needing to be in the queue while other standards having more impact to bulk electric reliability remain incomplete or unfinished.
No
Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC’s open process. Attachment 1 is troublesome. The time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, we believe this subject is more complex than this table reveals and the table needs more clarification. Several of the events require filing a written formal report within one hour. For example, system separation certainly is going to require an “all hands on deck” response to the actual event. We note that the paragraph above the table in attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements. There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
No
Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC’s open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of “applicable government, provincial or law enforcement agencies” for distribution as defined in R1. The “rationale for R1” states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. It seems like the better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
No
This is an overly prescriptive requirement given the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan lacks continuity with the ERO Event Analysis Process that is currently slated to begin industry field testing on October 25, 2010. Suggest the SDT coordinate EOP-004-2 efforts with this process. R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate and how will duplicative reporting be addressed (for example, DOE, Nuclear Regulatory Commission)? Also, in the “rationale for R2”, please explain the reference to Parts 3.3 and 3.4.
No
We think “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build audit ready compliant procedures.
No
The need for a periodic drill has not been established and appears to be overly restrictive given the intent of the standard is reporting of impact events. Suggest this requirement be eliminated.
No
The need for a periodic training has not been established and appears to be overly restrictive given the intent of the standard is reporting of impact events. Suggest this requirement be eliminated.
No
Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
No
Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority.
No
1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable entity to report the event. This is duplicative and would appear to overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity

at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004.
No
There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
Yes
The use of the term “impact events’ has simply replaced the terms “disturbance” and “sabotage” and has not further defined sabotage as directed by FERC. We do feel that impact events needs to be a defined term.
No
Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity.
Yes
No

No
The purpose states that Responsible Entities SHALL report impact events – this implies that ALL impact events need to be reported regardless of magnitude, suggest rewording to say "… shall report applicable impact events …" to allow for evaluation of each impact for applicability in accordance with Attachment 1).
No
Attachment 1, Part B, footnote 1. A GO is unlikely to know if a fuel supply problem would cause a reliability concern because one GO may not know the demand for an entire region. Attachment 1, Part B, footnote 1. What is the definition of an "emergency" related to problems with a fuel supply chain? What time threshold of projected need would constitute a 1 hour report? Attachment 1, Part A – Voltage Deviations - A GOP may not be able to make the determination of a +/- 10% voltage deviation for ≥ 15 minutes, this should be a TOP RC function only. Attachment 1, Part A – Generation Loss of ≥ 2, 000 MW for a GO/GOP does not provide a time threshold. If the 2, 000 MW is from a combination of units in a single location, what is the time threshold for the combined unit loss? Attachment 1, Part A – Damage or destruction of BES equipment • The event criteria is ambiguous and does not provide clear guidance; specifically, the note needs to provide more explicit criteria related to parts (iii) and (iv) to remove the need for interpretation especially since this is a 1 hour reportable occurrence. In addition, determination of the aggregate impact of damage may not be immediately understood – does the 1 hour report time clock start on initiation of event or following confirmation of event? • The initiating event needs to explicitly state that it is a physical and not cyber. Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security – Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard. • If the damage or destruction is related to a deliberate act, consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security event. Attachment 1, Part B – Loss of off-site power (grid supply) affecting a nuclear generating station – this event classification should be removed from EOP-004. The impact of loss of off-site power on a nuclear generation unit is dependent on the specific plant design and may not result in a loss of generation (i.e., unit trip); furthermore, if a loss of off-site power were to result in a unit trip, an Emergency Notification System (ENS) would be required to the Nuclear Regulatory Commission (NRC). The 1 hour notification in EOP-004 on a loss of off-site power (grid supply) to a nuclear generating station should be commensurate with other federal required notifications. Depending on the unit design, the notification to the NRC may be 1 hour, 8 hours or none at all. Consideration should be given to coordinating such reporting with existing required notifications to the NRC as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential transient on the unit. Attachment 1, Part B – Forced intrusion at a BES facility – Consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security event. Attachment 1, Part B – Risk to BES equipment from a non-environmental physical threat – this event leaves the interpretation of what constitutes a "risk" with the reporting entity. Need more specific criteria for this event. Attachment 1, Part B – Detection of a cyber intrusion to critical cyber assets - Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security – Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard.
No
This requirement should include explicit communications to the NRC (if applicable) of any reports including a nuclear

generating unit as a jurisdictional agency to ensure notifications to other external agencies are coordinated with the NRC. Depending on the event, a nuclear generator operator (NRC licensee) has specific regulatory requirements to notify the NRC for certain notifications to other governmental agencies in accordance with 10 CFR 50.72(b)(2)(xi). In general, the DSR SDT should include discussions with the NRC to ensure communications are coordinated or consider utilizing existing reporting requirements currently required by the NRC for each nuclear generator operator for consistency.
No
R.2.4 and 2.5 - should not be required to have a list of internal personnel. If an entity has an Operating Plan that covers internal and external notifications that should be sufficient. R2.2.7, 2.8, 2.9 – R4 requires an annual drill. Updating the plan if required following an annual drill should be sufficient Why does an entity need to develop a stand alone Operating Plan if there is an existing process to address identification, assessing and reporting certain events? 30 day implementation for a component change or lesson learned does not seem reasonable or commensurate with the potential impact to the BES and should not be a required element of EOP-004. What is the communication protocol for lessons learned outside of the annual NERC report? What process will be followed and who will review, evaluate, and disseminate lessons learned that warrant updating the Operating Plan?
No
: Agree that Each Applicable Entity shall identify and assess initial probable cause of impact events; disagree with aspects and time requirements in Attachment 1.
No
If drills remain as a component of the standard, an effort to consolidate updating an entities plan with a requirement to drill the plan should be made. . Each entity/utility should be able to dictate/determine if they need a drill for a particular event. Is this document implying a drill for every type of event?
No
Exelon doesn’t feel that the 30 day requirement is achievable and recommends an annual review. Training for all participants in a plan should not be required. Many organizations have dozens if not hundreds of procedures that a particular individual must use in the performance of various tasks and roles. Checking a box which states someone read a procedure does not add any value, it is an administrative burden with no contribution to reliability. It is Exelon’s opinion that training requirements should be covered in the PER standards and that the audience to be trained should be identified. R5.4 requires internal personnel that have responsibilities related to the Operating Plan cannot assume the responsibilities unless they have completed training. This requirement places an unnecessary burden on the registered entities to track and maintain a data base of all personnel trained and should not be a requirement for job function. A current procedure and/or operating plan that addresses each threshold for reporting should provide adequate assurance that the notifications will be made per an individual's core job responsibilities.
No
The time durations in the attachment are too short, it would be impossible to collect all the data necessary to report out on an impact event in the defined time to report. The SDT should evaluate each event for the most appropriate entity responsible to ensure there is minimal confusion on who has the responsibility and eliminate duplication of reporting when feasible.
No
The listed Impact Events is lacking specific physical security related events. . In general, all impact events need to be as explicit as possible in threshold criteria to eliminate any interpretation on the part of a reporting entity. Ambiguity in what constitutes an "impact event" and what the definition of "occurrence" is will ultimately lead to confusion and differing interpretations.
No
Exelon agrees with the use of the report but feels that # 5 should consist of check boxes. #12, 13, and 14 will take more time then allotted by the reporting requirements to acquire, cannot be accomplished in an hour. Attachment 2 should have a provision for the reporting entity to enter (N/A) based on function (see below) Check box #8 A GO/GOP may not have the information to determine what the frequency was prior to or immediately after an impact event. This information should be the responsibility of a TOP or RC. Check box #9 A GO/GOP may not have the information to determine what transmission facilities tripped and locked out. This information should be the responsibility of a TO, TOP or RC. Check box #10 A GO/GOP may not have the information to determine the number of affected customers or the demand lost (MW-Minutes). This information should be the responsibility of a TO, TOP, or RC.
No
Need to better define sabotage and provide examples, the term “impact events” create confusions as to what constitutes an event. The definition of impact event is vague and needs to be quantified or qualified with a term such as “significant”. Otherwise, almost any event could be deemed to be an impact event. Attachment 1 needs to clearly define that damage or destruction of BES equipment does not include cyber sabotage. Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security – Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard. In general, all impact events need to be as explicit as possible in threshold criteria to eliminate any interpretation on the part of a reporting entity.

Ambiguity in what constitutes an "impact event" and what the definition of "occurrence" is will ultimately lead to confusion and differing interpretations.
No
Reporting form doesn’t allow for investigations which result in no impact events found or identified.
Yes
Agree with the proposed implementation date. A 12 month implementation will provide adequate time to generate, implement and provide any necessary training by a registered entity.
Yes
The standard is lacking guidance for DOE Form OE-417 reporting as outlined in the current version of EOP-004 and doesn’t contain any non-BES related reporting. What is the governing process for OE-417 reporting?. Need clarification if one entity can respond on behalf to all entities in one company. Need a provision for entities to provide one report for all entities. Radiological sabotage is a defined term within the NRC glossary of terms. It would seem that a deliberate act directed towards a plant would also constitute an "impact event." In general, the DSR SDT should include discussions with the NRC to ensure communications are coordinated or consider utilizing existing reporting requirements currently required by the NRC for each nuclear generator operator for consistency. The definition of sabotage is defined by NRC is as follows: Any deliberate act directed against a plant or transport in which an activity licensed pursuant to 10 CFR Part 73 of NRC's regulations is conducted or against a component of such a plant or transport that could directly or indirectly endanger the public health and safety by exposure to radiation.

No
The purpose talks about reporting impact events and their known causes. We have no problem with this generic intent, but the purpose says nothing about the very burdensome expectation of verbal updates to NERC and Regional Entities (Attachment 1, top of first page), Preliminary Impact Event Reports (Attachment 1, top of first page, are these Attachment 2?), "Actual" Impact Event Reports (Attachment 1 - Part A) and "Potential" Impact Event Reports (Attachment 1 - Part B). These multiple levels of reporting and events need to be greatly reduced.
Yes
Yes
No
While we agree with the intent to list certain minimum requirments for the Operating Plan, the draft list is too lengthy and prescriptive. This merely creates opportunites for failure to comply rather the real purpose of reporting data that can be used to meaningfully increase the reliability of the BES by identifying trends of events that may otherwise be ignored.
No
There are too many missing details on how this will be accomplished. As stated before, this Draft requires too much time be invested in verbal reports, "Preliminary" reports, "Final" reports and even "Confidential" reports (Attachment 2). If the goal is to report ASAP details on events which could impact BES reliability, all of these reports will need to be made at the worst possible time - when Operators are trying to collect data, analyze what they find and correct major problems on the system. And if the reports are wrong or not issued fast enough, the Operators will be keenly aware of potential fines and violations.
No
Establishing a program with trigger actions expected to require reporting several times a year, combined with adequate initial, and on-going, training should preclude the need for mandatory drills as an added compliance burden.
Yes
Yes
No
NERC's current heavy case load should justify reviewing the impact review table only once every 2 years.
No
We have numerous comments about the Attachments. (1) What are the requirements for "verbal" reporting to NERC and Regional entities? (2) What are the requirements for a "Preliminary" Impact Event Report? (3) The Voltage Deviations Event is unclear (a) Are these consecutive minutes? (b) Where is the voltage measured? (generator terminals? Point of Interconnections? Anywhere?) (c) must each Entity report separately? (d) What is the +/- 10% measured against (Generator Voltage Schedule?) (4) For Generation loss events how is an "entity" defined? (a

corporate parent? each registered entity? other?) (5) Are the "Examples" in the Attachment 1 - Part A really Examples, or mandatory situations? (6) Can you define "Damage"? (7) Can you define "external cause"? (8) Can you give examples of "non-environmental external causes"? (9) The footnote 1 reference for "Damage or destruction of BES equipment" doesn't match up with the a. and b. footnotes or the 1. footnote of Attachment A - Part B. (10) How is the Operator supposed to determine what Event affects the reliability of the BES fast enough to decide whether or not to report? (11) is the Loss of off-site power (grid supply) event to a nuclear plant already covered by NUC-001?(12) What are "critcal cyber assets" since CIP-002-4 will eliminate that term? (13) When is Attachment 2 supposed to be used? (14) What is meant by the word "Confidential" in the title of the Attachment 2 report? How would the SDT propose a GO/GOP handle the reporting for the following situation? A CTG unit is dispatched and the unit is started, synchronized and put on the bus. Immediately the Operator receives a high gas alarm from the GSU. The Operator quickly shuts the unit down and de-energizes the GSU. There are no relay targets and no obvious reason for the problem. After several weeks of analysis it's determined there was an internal fault in the GSU and it must be replaced. How would the SDT recommend all the reporting requirments in this situation be addressed with the current draft?
No
It is unclear when this should be used, or why.
Yes
However, the term Impact Event should be a new defined term. When the SDT determines this, it should use the term consistenly on both pages 5 and 21 of the SDT document.
No
It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than in the existing standards.
Yes
Yes
We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting.
Individual
Thad Ness
American Electric Power (AEP)
No
It is unclear what the relationship between this project and the newly revamped NERC Event Analysis Process. We support moving towards one process opposed to separate obligations that may be in conflict. In addition, AEP supports the concept of a central clearinghouse such as the RCIS that is shared by the industry. We support fewer punitive requirements and more prompting for using tools to make multiple entities aware of reliability related issues shortly after the fact.
No
AEP does not agree with the addition of the Generator Owner to the standard. The Generator Owner does not have visibility to the real time operational status of a unit. As a result, the Generator Owner lacks the ability to recognize impact events and report them to the Regional Entity or NERC within the time frames specified in the standard. Reporting requirements for impact events should be the responsibility of the Generator Operator.
Yes
Overall we support the concepts; however, it is unclear if the ERO can be held accountable for compliance with NERC Requirements. If this requirement is removed there needs to be some mechanism for the ERO to establish a single clearinghouse.
No
Component 2.2 “Method(s) of assessing cause(s) of impact events” is very vague. Furthermore, there are concerns whether these methods can be accomplished within one hour as might be required per Attachment 1, in addition to operating the system. Component 2.6 – need to add the statement “as appropriate for type of impact event” Components 2.7 through 2.9 – are good concepts to consider for future inclusion, but at this point in time these appear to be overreaching objectives. We recommend the SDT take smaller increments towards future progress at measure and reasonable pace. Furthermore, if Component 2.9 is retained it should only pertain to lessons learned on the reporting of impact events not all recommendations regarding remediation of the impact events themselves. Furthermore, the 30 day window to update the Operating Plans is aggressive considering the other priorities that may be present day to day.
No
Not clear how this is different from R6 since it relies on the same timetable in Attachment 1.
Yes

Yes
No
It is not clear how this is different from R3 since it relies on the same timetable in Attachment 1.
No
Are the times listed for the initial probable reporting under R3 or the reporting under R6? Many of these items do not constitute emergency conditions. We view many of these as too onerous and would divert operating staff from monitoring and operating the BES. In addition, some terms (i.e. Frequency Trigger Limits) are not currently defined terms. Furthermore, there are existing requirements that have obligations for entities to provide this information to the RC. For example “Detection of a cyber intrusion to critical cyber assets” is already covered under CIP-008. This creates duplicate (and potentially competing) requirements. AEP also contends that some of the timelines are very aggressive and not consummate with perceived need for the information. Transmission loss of multiple BES transmission elements (simultaneous or common-mode event)within 24 hours after occurrence is overly aggressive and should provide more specific criteria.
Yes
Yes
Yes
The standard needs to be modified to allow the ability for one entity to report on behalf of other entities. For example the loss of Generation over the threshold could be reported by the RC opposed to the GO individually, if mutually agreed upon before the fact.
Group
Bonneville Power Administration
Denise Koehn
Yes
Known causes are difficult under 1 hour reporting requirements (Unusual events are even harder to narrow down in 24 hours and may take weeks.) The System Operators and RC’s handle situational awareness and reliability events, this is an extra wide view and learning for reporting only.
Yes
Yes
As long as the 2.4 list is position based, not based on each individual that fills the position. (There is a concern of listing all 2.4 monitoring/reporting personnel in the company that cover the impact event, since there are different function groups and shift work. Documentation trails are difficult with personnel changes.) Because the CIP is being added, it requires an Operating Plan (instead of procedure) with 30 day revision timelines, so it increases the burden for electrical grid event reporting function. R2.9 language refers to R8 “annual” report; however R8 language is “quarterly” reporting of past year. It appears this standard is going to be in an update status 4 times per year, plus any event modifications plus personnel changes. This could be overly burdensome due to the expanding world of cyber security.
Yes
Known causes are difficult under 1 hour reporting requirements. (Unusual events are even harder to narrow down in 24 hours and may take weeks.)
No
There was no drill required for CIP-001 (a drill was in CIP-008, but the purpose did not list combining CIP-008). A drill is not needed for reporting Electrical Grid events, designate it as excluded in the intent of the requirement.
Yes
There was no training required for CIP-001 or in CIP-008. (The proposed EOP-008 purpose did not list incorporating CIP-008). Training was not really needed for reporting Electrical Grid events.
Yes
The requirement needs to specify who (ERO) to report to. Attachment 1 doesn’t say to report to the ERO either. Clarify or remove the difference between the report submitted and evidence of the type of impact event required in the measurement.

Yes
R2.9 language refers to R8 “annual” report; however R8 language is “quarterly” reporting. It appears this standard is going to be in an update status 4 times per year minimum, plus any event modifications plus personnel changes. Overly burdensome.
No
BPA suggests the following: Change loss of multiple BES to 3 or more. Loss of a double circuit configuration due to lightning doesn’t need a report (it’s a studied contingency). Add qualifier to damage/destruction of BES equipment, since a failed PCB or a system transformer normally doesn’t have a MAJOR impact to the grid. Add qualifier to Loss of “ALL” off-site power affecting nuclear… The unplanned evacuation of control center is a busy time for the backup control center, yet this standard requires 1 hour reporting. Suggest changing to 24 hours.
Yes
Item 8: list Hz minimum on the second line prior to Hz max since that is the typical frequency excursion order. The Operating Plan is going to have to include the Compliance Registration ID number, since Operating Personnel don’t carry that information around and it is not readily available.
The definition of an impact event in EOP-004-2 seems clear, however the term "mis-operation" still may imply intent in the action of an individual. The SDT should consider further defining that term.
No
BPA supports the concept behind the revisions to EOP-004-2. Creating a single reporting methodology will improve the processes and lead to more consistency. BPA recommends that the Standards Drafting Team (SDT) coordinate any revisions in the reporting requirements with those found in CIP-008-3 to ensure that there are no conflicts. BPA asks the SDT to consider the impact of these changes on CIP-008-3 and work with the CIP SDT to ensure that the wording of the two requirements is similar and clear. Based on Attachment 1 part A of EOP-004-2, certain cyber security events, intrusions for example, would have to be reported under both EOP-004-2 and CIP-008-3. That puts a burden on a Registered Entity to take additional steps to coordinate reporting or face potential compliance risk for correctly reporting an event under one standard and failing to report it under the other standard. The mapping document had errors: a. CIP-001 R1 to EOP-004 R2.9 (annual vs quarterly). b. EOP-004-1 R2 was translated to R2 & R3 of version 2. c. EOP-004-1 R3 was translated to R6 of version 2 (which doesn’t say to whom to report).
Yes
Yes
The document retention times in EOP-004-3 should be spelled out more clearly. The Compliance summary does so (but needs some punctuation clarification regarding investigation), the SDT should consider making that part of the requirements or clarifying the wording in the requirements.
Group
PSEG Companies
Kenneth D. Brown
No
The following sentence should be added. "This standard is not intended to be for real-time operations reporting."
No
For many items, there are multiple entities listed with reporting obligations. For example, loss of off-site power to a nuclear plant lists RC, BA, TOP, TO, GO and GOP. This appears to result in the potential for the sending of 6 separate reports within the hour for the same event, which in wide area disturbances overload the recipients. The drafting team should consider revising the lists where possible to a single, or absolute minimum number, entity. Those items reportable OE-417 should be removed from Attachment 1. For example, voltage reduction, loss of load for greater than 15 minutes. The trigger for voltage reduction should be the time of issuance of the directive to reduce voltage in an emergency, not when "identified."
No
The top of this form should have the following statement added: "This form is not required if OE-417 is required to be filed."

Group
E.ON U.S. LLC
Brent Ingebrigtson
No
The proposed standard does not list the Load Serving Entity as an Applicable Entity, but the possible events that the standard addresses are within the scope of the LSE. Some functions of the LSE listed within the Functional Model are addressed in the proposed standard. Existing CIP-001-1a and EOP-004-1 are both applicable to the LSE.
No
The Version History contained with EOP-004-2 indicates that CIP-001-1 and EOP-004-1 are “Merged”, however, the actions do not reflect the retirement of CIP-001-1a and therefore, it is unclear if there will be remaining redundancies or potential gaps with the new version EOP-004-2 and CIP-001-1a.
Yes
The new standard should incorporate all other disturbance, sabotage, or “impact event” reporting standards, such as CIP-008-3. At the very least it should reference those other standards that have within their scope same/similar events in order to ensure complete reporting and full compliance. Suggesting that one standard provides the single reporting procedure, when in actuality it does not, is counterproductive. The discussion of “impact event” clearly indicates the SDT’s intent to include sabotage events in the proposed standard EOP-004-2.
Individual
Joe Knight
Great River Energy
Yes
Thank you for the clarification of “known causes”, this will allow entities to report what they currently know when submitting an impact report.
Yes
We believe that it is important for the ERO to provide valuable Lessons learned to our electrical industry, thus enhancing the reliability of the BES.
Yes
No
A. As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. R2.8, and R2.9 do not have a correlation to R2’s Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change. We believe that the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in the components of an entity’s Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the words “lessons learned” would be required to be in your Operating Plan. It is solely up to an entity to implement a “Lesson Learned” and not the place for this SDT to require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. B. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. We suggest that lessons learned should be incorporated within 12 calendar months if lessons learned are not deleted from the R2.8 & R2.9.
Yes
While we agree that it makes sense to report on the cause of an event, we disagree with the need for an Operating

Plan as identified in R2
No
We disagree with the need to conduct a drill for reporting
No
We believe that this task should be incorporated into the Job Task Analysis for the System Operators and that this requirement should be deleted as being redundant.
No
We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
Yes
No
Comments: Please provide a phone number and provision within the Note of EOP-004 – Attachment 1: Impact Events table for an entity to contact NERC if unable to contact NERC within the time described. Voltage Deviations – recommend adding the word "(continuous)" after sustained in Threshold column. This could be interpreted as an aggregate value over any length of time. Frequency deviations - recommend adding the word "(continuous)" after 15 minutes' in Threshold column. This could be interpreted as an aggregate value over any length of time. CIP-008 R1.3 states the entity is to report Cyber Security Incidents to the ES_ISAC. Does the EOP-004 Attachment 2 fulfill this requirement? We request clarification on the Transmission Loss threshold events that constitute reporting. We also want clarification on what constitutes the loss of a DC Converter station and is there a time duration that constitutes the need for reporting or does each trip need to be reported? For example during a commutation spike the DC line could be lost for less than a minute. Does this loss require a report to be submitted? Is the SDT stating that each time a company loses their DC line, they are required to file a report even though it may not have an effect on the bulk system? What is the threshold for this loss? The SDT needs to clarify that duplicative reporting is not required and that only one entity needs to report. For instance, the first three categories regarding energy emergencies could be interpreted to require the BA and RC to both report. The reporting responsibilities in this table should be clarified based on who has primary reporting responsibility for the task per the NERC Functional Model and require only one report. For instance, since balancing load, generation and interchange is the primary function of a BA per the NERC Functional Model, only the BA should be required to provide this report. The term Frequency Trigger Limit (FTL) is not currently defined in the NERC Glossary. The term FTL needs to be introduced at the beginning of the standard and defined as a new term.
No
NERC and the DOE need to coordinate and decide on which report they want to use and whichever report it is needs to include all information required by both entities. The way this standard is currently written there is the potential that two government entities may need to be reported to is a relatively short period of time. It is not clear what benefit providing the Compliance Registration ID number provides. Many of the registered entities employees that will likely have to submit the report, particularly given the one-hour reporting requirement for some impact events, will not be aware of this registration ID. However, they will know for what functions they are registered. We recommend removing the need to enter this compliance registration ID or extending the time frame for reporting to allow back office personnel to complete the form. For item two, please change "Time/Zone:" with "Time (include time zone)". As written it is a little confusing.
No
We believe the SAR scope regarding addressing sabotage has not been addressed at all. It appears that impact event essentially replaces sabotage. This standard needs to make it clear that sabotage, in some cases, cannot be identified until an investigation is performed by the appropriate policing agencies such as the FBI. Intent plays an important role in determining sabotage and only these agencies are equipped to make these assessments.
No
It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than in the existing standards.
Yes
Yes
We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting. Please provide an e-mail address for the submittal of the report to NERC (and any other parties above a Regional Entity) within this Standard and a fax number as a backup to electronic submittal.
Individual
Greg Rowland

Duke Energy
No
The Purpose statement says that reporting under this standard supports situational awareness. However this is in conflict with Section 5. Background, where the DSR SDT makes clear that this standard includes no real-time operating notifications, and that this proposed standard deals exclusively with after-the-fact reporting. We also disagree with the stated concept of “impact event”. Including the phrase “or has the potential to impact” in the concept makes it impossibly broad for practical application and compliance.
Yes
No
The requirement again states the intent is to “enhance and support situational awareness”, which doesn’t sync with “after-the-fact reporting”. We question why NERC needs to create this report and system for distributing impact event reports to various organizations and agencies for after-the-fact reporting, when we are still required to make real-time reports under other standards. For example, the Rational specifically recognizes that this standard won’t release us from the DOE’s OE-417 reporting requirement. We don’t see that this provides value, unless NERC can find a way to eliminate redundancy in reporting.
No
Sections 2.4 and 2.5 should allow identification of responsible positions/job titles rather than specific people. Section 2.9 only allows 30 days for updates to our plan based upon lessons learned coming out of an annual report. 60-90 days would be more appropriate. Also, Section 2.9 says it’s an annual report, while R8 only requires quarterly reports.
Yes
Yes
No
Strike the word “all” in the requirement. All personnel don’t need to be trained – for example, the plan may contain references to some personnel as potential sources of the information that will then be reported. Also, Section 5.3 only allows 30 days for training, which may be impossible with rotating shift personnel and training schedules. 60 days is more appropriate.
Yes
Yes
However, R8 only addresses quarterly reports, and R2 Section 2.9 states that there will be an annual report.
No
• General Comment – many timeframes in Attachment 1 are within one hour. This is inconsistent with the stated aim of the standard, which is after-the-fact reporting, as opposed to real-time operating notifications under RCIS and other standards (e.g. TOP). This standard should not be structured to require another layer of real-time reporting. • Voltage Deviation – Plus or minus 10% of what voltage? • Frequency Deviation – this is Interconnection-wide. Do you really want a report from every RC and BA in the Eastern Interconnection?? • Transmission Loss – “Multiple BES transmission elements” should be changed to “Three or more BES transmission elements”. Also, the time to submit the report should be based upon 24 hours after the occurrence is identified. • Damage or destruction of BES equipment – need clarity on the “Examples”. Is the intent to report an event that meets any one of the four “part a.” sub-bullets? i. – critical asset should be capitalized. Disagree with the phrase “has the potential to result” in section iii. – it should just say “results”. Section iv. is too wide open. It should instead say “Damaged or destroyed with malicious intent to disrupt or adversely affect the reliability of the electric grid.” • Unplanned Control Center evacuation – see our General Comment above. Clearly in this case the reporting individuals are evacuating and cannot report in one hour. 24 hours should be more than adequate for after-the-fact reporting. • Fuel Supply Emergency, Loss of off-site power, and Loss of all monitoring or voice communication capability – see our General Comment above. Time to report should be 24 hours after occurrence is identified. • Forced intrusion, Risk to BES equipment, Detection of a cyber intrusion to critical cyber assets – time to report should be 24 hours after occurrence is identified, and critical cyber assets should be capitalized.
Yes
However, Attachment 2 is titled “Impact Event Reporting Form”.
No
We disagree with the stated concept of “impact event”. Including the phrase “or has the potential to significantly impact” in the concept makes it impossibly broad for practical application and compliance. By not attempting to define “sabotage”, the standard creates a broad reporting requirement. “Disturbance” is already adequately defined. “Sabotage” should be defined as “the malicious destruction of, or damage to assets of the electric industry, with the intention of disrupting or adversely affecting the reliability of the electric grid for the purposes of weakening the critical infrastructure of our nation.”

Yes
Yes
No

Nathan Lovett
Georgia Transmission Corporation
No
These events generally are Operator Functions and should not apply to a TO. 1. Energy Emergency requiring system-wide voltage reduction 2. Loss of firm load greater than 15 min. 3. Transmission loss (multiple BES transmission elements) 4. Damage or destruction to BES equipment (thru operational error or equipment failure) 5. Loss of off-site power affecting a nuclear generating station
No
The only two events that apply to a TO are the ones related to CIP: 1. Forced intrusion (report if motivation cannot be determined, i.e. to steal copper) 2. Detection of a cyber intrusion to critical cyber assets (criteria of CIP-008) Everything in this standard applies to a TOP and therefore E-004-2 and CIP-001 should not be combined

Steve Rueckert
No
The purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. It is misleading and may have many thinking it is duplicative work.
No
The ERO's applicability is not applied in Attachment 1.
R1 is appropriate for after-the-fact reporting. However, as proposed this standard eliminates all real-time notifications, including the CIP-001-1 R3 notice to appropriate parities in the Interconnection. New requirement R2.6 lists external parties to notify but it does not include the Reliability Coordinator. It is important that the RC be notified of suspected sabotage. The RC's wide-area interconnection view and interaction with BAs may help recognize coordinated sabotage actions. Any "impact event" where sabotage is suspected as the root cause should require additional and real-time notifications.
No
Need clarification on whether the 30 days is calendar days or business days. As noted in the comment to question 3, any impact event where sabotage is suspected should be treated differently from those where sabotage is not suspected.
Yes
No
The addition of a drill or exercise constitutes additional training and believes R4 should be added to R5. Clarification is needed as to what level does the annual training target, for instance, the field personnel. Will they have to complete the exercise/drill?
No

Thirty days is too restrictive due to real-time operations schedule requirements. Most work schedules are either five or six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Based on the NERC Continuing Education revised submittal date for the Individual Learning Activities (ILA), the requirement should be changed to require training to be conducted within 60 days.
No
There seems to be redundancy in reporting based on the time frames in Attachment 1, i.e. OE-417 and other required reports. If this standard is intended to be an after the fact report, why is there one/twenty-four hour reporting criteria?
Yes
For strictly after-the-fact reporting the list of Attachment 1 is appropriate. However, as noted in our earlier comments, actual or suspected sabotage events can have a potentially significant impact on reliability and should be treated differently, with additional real-time reporting requirements. It is important that such events be identified and recognized for reliability purposes and that notices include the RC.
No
The report is duplicative to the OE-417 reporting criteria.
No
The proposed definition of “impact event” does not meet FERC’s directive to “further define sabotage” nor does it take into consideration their request to address the applicability to smaller entities. Attachment 1 Part A or B do not clearing specify “sabotage” events, other than “forced entry”. The purpose of CIP-001-1 and its requirements is to address the specific issue of possible sabotage of BES facilities. This is entirely different than a “disturbance” or an “event” on the BES. The proposed definition for “impact events” is essentially any event that has either impacted the BES or has the potential to impact the BES, caused only by three specific things; equipment failure or misoperation, environmental conditions, or human action. Several of these “impact events could be a result of sabotage. Actual or potential sabotage clearly poses a risk to the reliability of the BES. It is important that the risks related to sabotage be reflected in either EOP or CIP
A potential gap may exist. Attacks on BES facilities, via either vandalism or sabotage, are very different events than impact events on the system. From a Compliance standpoint, a revised standard to address the FERC directive on sabotage should be developed as an EOP standard (that is grouped with 693 Standards) rather than as a CIP Standard (CIP-001-1).
Yes
Yes
Having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues. This will become even more of an issue as training requirements continue to expand. CIP-001-1 has surprisingly been one of the most violated standards during the initial period. However, most entities have now developed and demonstrated a decent compliance process. Unless a revised standard to address the FERC directive on sabotage is developed (as suggested in 13 above) this proposed standard appears to eliminate sabotage reporting as a reliability standard to the potential detriment of BES reliability.

No
Comments: The purpose is not clear because it uses the term “impact events”. This term should be a defined in the NERC glossary, and should not include words such as “potential”.
No
Comments: NERC’s role as the Standard enforcement organization for the power industry will be in conflict if NERC is also identified as an applicable entity. What compliance organization will audit NERC’s performance? This is presently not clear.
No
See response to Question 2.
No
Requirement R2 • Lead-in paragraph - Following the words “Attachment 1” add a period and the words “The Operating Plans shall” and then delete “that” and make “includes” singular. • R2.1, 2.2, 2.3, 2.7 - Replace the word “Method(s)” with the word “Procedure(s)”. • 2.6 – After the word “notify” add a period, then insert the words “For example, external organizations may include” and delete the words “to include but not limited to.” • 2.8 – After the words “Operating Plan based on” add the word “applicable”. Rational R2 After the words “Every industry participant that owns or operates,” add the words “Bulk Electric System.” Then delete the words “on the grid.”

Yes
We agree, however, the term “impact event” must be part of the NERC glossary.
Yes
No
Requirement 5 – Training should be targeted only at those responsible for implementing the Operating Plan (OP), not all those mentioned in the OP. R5 – After the words “internal personnel” add the words “responsible for implementing.” The delete the words “identified in” and “for reporting pursuant to Requirement R2.” 5.4 – Following the words “For internal personnel” add the words “responsible for implementing the Operation Plan.” Between the words “revised responsibilities” add the word “implementation.” M5 – After the words “between the people” add the words “responsible for implementing the Operating Plan”
No
R2 requires applicable entities to have an Operating Plan which are company specific procedures and process required to be compliant with EOP-004. Therefore, R6 should be deleted since it is redundant with R2.
No
See response to Question 2 Requirement 7 Delete the words “and propose revisions to” Following the words (Attachment 1) add a period. Following that period add the words “The ERO shall revise the table” Requirement 8 RECOMMEND DELETION OF R8 – CONFIDENTIALITY CONCERNS WILL MAKE ESTABLISHING A PUBLICATION REQUIRMENT EXTREMELY CHALLENGING.
No
It is absolutely essential that the work on EOP-004 and that on the NERC Event Analysis Process (EAP) be fully coordinated. We find that there are a number of inconsistencies between these two documents. The EAP and EOP-004 are not aligned. In order to operate and report effectively entities need consistent requirements. Attachment 1 Frequency Deviations – The term “Frequency Trigger Limit (FTL)” is not defined. Only defined terms should be used, or the term should be defined. If the term is defined in another standard it should be moved to the Glossary of Terms for wider use. Loss of Firm load for 15 Minutes – The text under the rightmost column entitled, Time to Submit Report, appears to be incomplete in our copy. Transmission loss and Damage or destruction of BES equipment – At the end of the wording for both under the column entitled “Threshold for Reporting” add the words “that significantly affects the integrity of interconnected system operations.” Examples – Capitalize “Critical Asset” as this is a defined term.
No
It is not clear why the DOE form cannot be used. NERC should make every effort to minimize paper work for entities responding to system events.
No
The definition is open for interpretation beyond events identified in Attachment 1. In addition, all Standards are supposed to have Rationales. In the Draft Standard, the Rationales do not address the concept of Potential, and how it relates to an actual system event. Additional work needs to be done addressing the meaning of “potential”.
Yes
Yes
Yes
Overriding Comment and Concern: It is absolutely essential that the work on EOP-004 and that on the NERC Event Analysis Process (EAP) be fully coordinated. We find that there are a number of inconsistencies between these two documents. The EAP and EOP-004 are not aligned. In order to operate and report effectively entities need consistent requirements.

No
The proposed requirements in the standard are not focused on the core industry concern that current requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, “The existing requirements need to be revised to be more specific – and there needs to be more clarity in what sabotage looks like.” Instead this proposed standard includes requirements that are more focused on “how” to report, rather than “what” to report. The draft 2 SAR has never been balloted for approval prior to standard drafting. In fact, the SAR states, “The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.” The scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seems helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting team seems to be ignored: “Consider whether separate, less burdensome requirements for smaller entities may be appropriate.” The requirements for entities to develop Operating Plans and to have training for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard. The term “impact events” does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC Glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator. This draft standard should not have this high a priority while other standards having a greater impact on Bulk Electric System reliability remain incomplete or unfinished. Regional reporting requirements should be in Regional Standards, and not be included in a NERC Standard.
No
Having the ERO as an applicable entity raises the issue that they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other

applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. NERC has also offered the opinion that since NERC is not a "user, owner, or operator" Standards are not enforceable against the ERO. In Attachment 1 the time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to unnecessary and possibly conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, this subject is more complex than this table reveals, and the table needs more clarification. Entities that have information about possible sabotage events should report these to NERC after the fact, and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, it is likely that there is going to be duplicate reporting. Several of the events require filing a written formal report within one hour. For example, system separation is going to require an "all hands on deck" response to the actual event. The paragraph above the table in Attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements. There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements through NERC that cross federal agency jurisdictions.
No
Having the ERO as an applicable entity raises a concern because they are also the Compliance Enforcement Authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of "applicable government, provincial or law enforcement agencies" for distribution as defined in R1. The "rationale for R1" states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. The better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
No
This is an overly prescriptive requirement given that the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan is an unnecessary burden that offers no additional improvements to the reliability of the Bulk Electric System, and this is not, in fact, an Operating Plan. At most, it may be a reporting plan. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject. As proposed, the Operating Plan is not required to ensure Bulk Electric System reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient. Stating reporting requirements directly in the standard would produce a more uniform and effective result across the industry, contributing towards a more reliable Bulk Electric System. R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate, and how will duplicative reporting be addressed (for example, DOE, Nuclear Regulatory Commission)? Also, in the "rationale for R2", please explain the reference to Parts 3.3 and 3.4.
No
We think "impact event" needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditable compliance procedures. Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes a considerable amount of time for an actual cause to be determined. The determination process may require a complex root cause analysis. Further, in the case of suspected or potential sabotage, the industry can only say it doesn't know, but it may be possible. Law enforcement agencies make the determination of whether sabotage is involved, and the information may not be made available until an investigation is completed, if indeed it is ever made available.
No
The need for a periodic drill has not been established, and appears to be overly restrictive given the intent of the standard is the reporting of impact events. Suggest this requirement be eliminated. Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in as short a time frame as may be required for real-time operating conditions notifications.
No
The need for a periodic drill has not been established, and appears to be overly restrictive given that the intent of the standard is reporting of impact events. Suggest this requirement be eliminated. There are training standards in place that cover these requirements. We agree the relevant personnel should be "aware" of the reporting requirements. But

there is not a need to have a training program with specific time frames for reporting impact events. Awareness of these reporting requirements can be achieved through whatever means are available for entities to employ to train on any of the NERC standards, and need not be dictated by requirements.
No
Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements for NERC that cross other federal agency jurisdictions. There is no need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations which is implied by the label “Operating Plan.”
No
Having the ERO as an applicable entity raises concern as it is also the compliance enforcement authority. Requirement R7 is unnecessary as there are already requirements in place for three year reviews of all Standards. R8 contains requirements to release information that should be protected, such as identification of trends and threats against the Bulk Electric System. This may trigger more threats because it will be published to unwanted persons in the private sector. We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
No
1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable entity to report the event. This is duplicative and would overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004. What are the examples at the bottom of page 14 supposed to illustrate? Critical Asset should have the appropriate capitalization as being a defined term. Is Critical Asset what is intended to be used here? Should the “a” list be read as ANDs or Ors? Does “loss of all monitoring communications” mean “loss of all BES monitoring “communications”? Does “loss of all voice communications” mean “loss of all BES voice communications?” Are the blue boxes footnotes or examples? Does “forced intrusion” mean “physical intrusion” (which is different from “cyber intrusion”)? Regarding “Risk to BES Equipment,” request clarification of “non-environmental”. Regarding the train derailment example, the mixture of BES equipment and facility is confusing. Request clarification for when the clock starts ticking. Regarding “Detection of a cyber intrusion to critical cyber assets”, there is concern that this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. Suggest physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.
No
There is already a DOE requirement to report certain events. There is no need to develop redundant reporting requirements to NERC that cross other federal agency jurisdictions. The heading on page 16 refers to EOP-002, but this is Standard EOP-004. If some questions do not require an answer all of the time, then the form should state that or provide a NA checkbox. While Attachment 1 details some cyber thresholds, Attachment 2 provides no means to report – which is acceptable if cyber incidents are handled by CIP-008 per the comment provided for Question 10. The Event Report Template in Appendix A is different from the most recent version, which is available at: http://www.nerc.com/docs/eawg/Event_Analysis_Process_WORKINGDRAFT_100110-Clean.pdf
No
The use of the term “impact events” has simply replaced the terms “disturbance” and “sabotage”, and has not further defined sabotage as directed by FERC. We do feel that “impact events” needs to be a defined term. While we agree with the SDT’s new direction, the FERC directive has not been met. This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement and other specialized agencies, including international agencies roles in defining acts of sabotage, and not hold the registered entity wholly responsible to do so.
No
Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by the NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity. EOP-004-3 should be EOP-004-2.
No
If the training and Operation Plan requirements are adopted as proposed, this may not allow sufficient time for some entities to comply, particularly those with limited number of staff, but perform functions that have multiple event reporting requirements.
Yes
Request clarification on how RCIS is part of this Standard. The form should be filled out in two stages. First stage would be the immediately available information. The second stage would be the additional information such as one line diagrams. There is concern with burdening the reporting operator on filling out forms instead of operating the Bulk

Electric System. Most of the draft requirements are written as administrative in nature, and this is not most effective. Changes need to be made to (or possibly elimination of) R1, R2, R3. The standards should be changed to define what a “disturbance” is for reporting in EOP-004. Sabotage reporting as per CIP-001 should be rescinded as EOP-004 already has such a requirement.

We Energies
Howard Rulf
No
Impact event needs to be clarified first, and DP references in Attachment 1 clarified. Distribution is not BES.
No
The need for a DP to be included needs to be clarified. The Purpose points to BES. A DP does not have BES equipment.
Yes
No
R2.3, R2.4: “Part” is not a defined term or used in the NERC Standard Process Manual. R2: Attachments are not mentioned in the NERC Standard Process Manual. Is this a mandatory or informational part of the standard? R2.6 (and possibly R2.5): There does not seem to be discretion in notifications. Are all people or organizations on the notify lists always contacted for every impact event? Even Law Enforcement? R2.7: What is a “component? A Plan component? A BES component? R2.9: There is no annual NERC report issued pursuant to R8. R8 requires quarterly reporting.
No
A DP may not have Facilities (a BES element). See NERC Glossary definition of Facility.
Yes
No
Please clarify who is to be trained. As written, R5 requires any internal personnel identified in the plan, including CEO, Vice Presidents, etc., to be trained.
No
The proposed definition of “impact event” needs to be clarified.
Yes
No
I did not compare this standard to the OE-417 form. Please do not require operators to fill out a second form during an emergency within one hour. Energy Emergency requiring Public appeal…: “Public ” is not a defined term. Energy Emergency requiring system-wide voltage…: DP does not control BES voltage. Energy Emergency requiring firm load shed…: TOP does not have load it would shed for an Energy Emergency. Frequency Deviations: Why is a BA reporting? This will be every BA in the Interconnection reporting the same Frequency Deviation. Frequency Deviations: Frequency Trigger Limit is not a defined term, and is not defined in this standard. Loss of Firm Load…: TO and TOP may coordinate or direct load shed, but they do not serve firm load. Damage or destruction of BES… There is no footnote 1 on this page. I assume it is the examples on the page. Are these “examples” of a larger set or are these all that is required? Critical Asset is a defined term. Forced Intrusion: “facility” or Facility? An RC and BA do not have Facilities.
No
The data required to assess an impact event thoroughly will often not be available or apparent. Immediate reporting should fall to the RE with assistance/information from the affected entities. There do not seem to be provisions for when it is impossible to take the time to fill out a form or when it is impossible to send a form. I did not compare this standard to the OE-417 form. Please do not require operators to fill out a second form during an emergency within one hour.
No
Impact Event could replace disturbance and sabotage but not in its present form. The proposed definition of impact event “An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.” Is too vague. The “potential to impact the reliability” is too broad and open to interpretation. It needs to be specific so entities know what is and is not an impact event and so an auditor clearly knows what it is. Define “impact event” as the items listed in Attachment 1. As you have done, focusing on an event’s impact on reliability is more important than determining an individuals intent (sabotage v.s. theft).
Yes

Yes
Yes
Please be careful to capitalize defined terms. If the intent is to not use the defined term, use another word. "Forced intrusion" (cutting a fence, breaking in a door) may not be discovered for quite some time after it occurs. Should it be reported as soon as discovered? Even if there was no impact event (disturbance)? "Destruction of a Bulk Electric System Component" seems pretty specific. However, if a transformer kicks off line due to criminal damage, yet is considered repairable, is the event reportable?
Group
PPL Supply
Annette M. Bannon
Yes
No
While we agree with the list of functional entities identified in the Applicability Section, we do not agree with assignment of applicable entities noted in Attachment 1. As the functional entities are identified in Attachment 1, there will likely be duplicate reporting for many impact events. By applying reporting responsiblities to both the Gen Owner and Gen Operator, this will result in duplicate reporting for plants with multiple owners. It also increases the burden on the Gen Operator who is required to report the event to NERC and to other Gen Owners in a timely manner to allow other Gen Owners to meet the NERC reporting timeline. We suggest that the reporting requirements associated with generators be applied to the Gen Operator only.
Yes
No
While we agree with concept addressed in R2, we don't agree with use of the defined term Operating Plan. Consider working the requirement as follows: "Each Applicable Entity identified in Attachment 1 shall have a documented process or program that includes the following components:..." Also, please consider changing 2.1 to be"Method(s) for recognizing the occurrence of impact events." The current wording could be interpreted to mean, "create a list of the impact events."
No
Please consider changing the word "identify" to "recognize" and adding the Rationale statement to the requirement as follows: "Each Applicable Entity shall assess the causes of the reportable event and gather available information to complete the report."
Yes
No
We generally agree with R5 but recommend two changes to 5.3. Consider expanding the exception criteria to exempt non-substantive changes such as errata changes, minor editorial changes, contact information changes, etc. Also, consider changing "training shall be conducted" to "training or communication/notification of changes shall be conducted."
No
It may be difficult to meet Attachment 1 Part B Potential Reliability Impact submittal times as the time to submit is 1 or 24 hours after occurrence. Consider changing the Time to Submit Report for Forced intrusion, Risk to BES equipment, and Detection of a cyber intrusion to be "report within 24 hours after detection".
Yes
No
Attachment 1 Part A is labeled "Actual Reliability Impact". Does this title mean that for all events listed the "threshold for reporting" is only met if the event occurs AND there is an actual reliability impact? As opposed to Part B where the threshold for reporting is met when the event occurs and there is a potential for reliability impact? This could be broad for events like "Risk to BES equipment."

Christine Hasha
ERCOT ISO
No
ERCOT ISO believes that according to the timelines allotted in Attachment 1, it may not be possible for the entity to identify the "known cause" of an event. The requirements list identification of "initial probable cause". This is more reasonable under the timelines noted in Attachment 1.
No
ERCOT ISO recommends that the Electric Reliability Organization be removed from the standard. The Electric Reliability Organization should not be responsible for reliability functions and therefore should be excluded from reliability standards.
No
Recommend that requirements for the Electric Reliability Organization be removed. However, if the requirements are

retained, ERCOT ISO recommends the following wording change to be consistent with other standards. “R1. The ERO shall create, implement, and maintain a system for receiving and distributing impact event reports, received pursuant to Requirement R6, to applicable government, provincial or law enforcement agencies and Registered Entities to enhance and support situational awareness.”
No
ERCOT ISO recommends the use of “Registered Entity” in place of “Applicable Entity”. This would provide consistency with other requirements and Attachment 1. Recommend the following changes to the subrequirements. “2.6. List of external organizations to notify to include but not limited to NERC, Regional Entity, relevant entities within the interconnection, Law Enforcement, and Governmental or Provincial Agencies.” “2.7. Process for updating the Operating Plan within 30 days of any changes not of an administrative nature. This includes updates to reflect any lessons learned as a result of an exercise or actual event.” Remove requirement 2.8 and move content to requirement 2.7. “2.8. Process for updating the Operating Plan within 30 days of publication the NERC annual report of lessons learned.” Add “2.9. Process to ensure updates are communicated to personnel responsible for under the Operating Plan within 30 days of the change being completed.”
No
ERCOT ISO recommends the use of “Registered Entity” in place of “Applicable Entity”. This would provide consistency with other requirements and Attachment 1. The measure for this requirement notes the obligation for “documentation”. This is not addressed in the requirement. The measure also notes “on its Facilities”. This clarification of scope should be addressed in the requirement. R3. Each Registered Entity shall identify, assess, and document initial probable cause of impact events on its Facilities listed in Attachment 1.
No
ERCOT ISO believes that a drill or exercise of its Operating Plan is unnecessary. The intent of the drill can be addressed within the training requirements under R5.
Yes
ERCOT ISO believes the content of training can include an exercise or drill.
No
ISO recommends the following changes to the language of the requirement. R6. Each Applicable Entity shall report impact events in accordance with Attachment 1.
No
Recommend that the Electric Reliability Organization be removed. The Electric Reliability Organization should not be responsible for reliability functions and therefore should be excluded from reliability standards.
No
ERCOT ISO requests the reporting timeframes be changed to reflect a 24 hour requirement for all events in Attachment 1. During an impact event, operating personnel are generally involved in event resolution and not available immediately to submit reports. ERCOT ISO requests that the “Detection of a cyber intrusion to a critical cyber asset” be removed. There are established processes defined for incident response supporting CIP-008. By including this element in Attachment 1, the Operating requirement R2 would also require procedure documents for cyber security incident response. This would be redundant and would remove the responsibility away from the subject matter experts for cyber security incident response.
No
ERCOT ISO requests the use of a single report format to meet all requirements from NERC and DOE. There is no value added in requiring different reporting to different agencies.
No
Yes
Yes
Yes
ERCOT ISO supports the comments provided by the SRC. However, if the standard is to be established, ERCOT ISO has offered the comments contained herein as improvements to the requirements proposed. The requirements listed do not take into consideration the hierarchical reporting necessary for events (i.e.: GO to GOP to BA). The current structure will lead to redundant and conflicting reporting from multiple entities. This will lead to confusion in the analysis of the event. Any system developed and used to report impact events must include notification to the other relevant entities (i.e.: Reliability Coordinator, Balancing Authority, Transmission Operator, and Generator Operator). The proposed standard should not rely on a centralized system that does not follow the established hierarchy of dissemination of information.

Yes
No
While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an energy emergency requiring public appeals?
No
No
R2 and R5 coupled with R8 will drive quarterly updates (in addition to drills, etc) and training to the literally hundreds to thousands of people per company for the proper internal operating personnel and management will actually hurt the development of a culture of compliance by overwhelming personnel with constant plan changes and training. The standards drafting team should remove all 30 day references or provide the technical basis of why revising plans and training to “changes and lessons learned” quarterly all within 30 days is the right use of reliability resources to improve the grid. The addition of the 30 day constraints and new vague criteria in Attachment one such as “damage to a BES element through and external cause” or “transmission loss of multiple BES elements which could mean two or more” is the opposite of clear standards writing or results based standards. We disagree with requiring an Operating Plan for identifying, assessing, and reporting impact events. This is an administrative requirement that has no clear reliability benefit. Furthermore, it is questionable that event reporting even meets the basic definition of an Operating Plan. Per the NERC glossary of terms, Operating Plans contain Operating Procedures or Operating Processes which encompass taking action real-time on the BES not reporting on it. As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. R2.8, and R2.9 do not have a correlation to R2’s Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change, the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in the components of an entity’s Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the words “lessons learned” would be required to be in your Operating Plan. It is solely up to an entity to implement a “Lesson Learned” and not the place for this SDT to require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. The NSRS recommends to incorporate lessons learned within 12 calendar months if lesson learned are not deleted from the R2.8 & R2.9.
No
No
No
: R5.2. The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be trained once per calendar year. R5.3 As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. Where, R2.7 states to update the Operating We disagree with the need to provide formal training. We could agree with the need to communicate to System Operators and other pertinent personnel the criteria for reporting so that they know when system events need to be reported.
No
We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
Yes
No
New vague criteria in Attachment one such as “damage to a BES element through and external cause” or “transmission loss of multiple BES elements which could mean two or more” is the opposite of clear standards writing or results based standards.

Michael Gammon
Kansas City Power & Light
Yes
Yes
Consideration should be given to the need for a preliminary impact event report to be filed by the Reliability Coordinator and the Registered Entity. If two reports should be filed, should they both contain the same information.
Yes
Although we support situational awareness for the other registered entities, impact event reports should be distributed anonymously to communicate the information while protecting the registered entity.
No
We agree with the rationale for R8 requiring NERC to analyze Impact Events that are reported through R6 and publish a report that includes lessons learned but disagree with R2.9 obligating an entity to update its Operating Plan based on applicable lessons learned from the report. Whether lessons learned are applicable to an entity is subjective. If an update based on lessons learned from an annual NERC report is required, the requirement should clearly state the necessity of the update is determined by the entity and the entity's Reliability Coordinator or NERC can not make that determination then find the entity in violation of the requirement. In addition, if an update based on lessons learned from a NERC report is required, NERC should publish the year-end report (R8) on approximately the same day annually (i.e. January 31) and allow an entity at least 60 days to analyze the report and incorporate any changes it deems necessary in its Operating Plan. In addition, the language using quarterly and annual as a requirements between R2.9 and R8 is confusing.
No
We believe R3 and M3 are unnecessary as a stand alone requirement and measure and propose combining this requirement and measure with R6 and M6. Identifying and assessing the initial probable cause of an impact event is the obvious starting point in the reporting process and ultimate completion of the required report. Evidence to support the identification and assessment of the impact event and evidence to support the completion and submittal of the report are really one in the same.
No
We believe R4 and M4 are clearly unnecessary. Thoughtful preparation of an Operating Plan per R2 that specifically addresses personnel responsibilities and appropriate evidence gathering combined with the training requirement in R5 is sufficient.
No
We agree with the need for the Operating plan and the provision of formal training to impacted personnel. We believe that the personnel references are too open-ended to be productive and measurable. This leaves all applicable entities open to subjectivity in assessment and may produce a large administrative burden to demonstrate compliance with no associated benefit to improved reliability.
No
We believe R3 and M3 are unnecessary as a stand alone requirement and measure and propose combining these requirements with R6 and M6. Identifying and assessing the initial probable cause of an impact event is the obvious starting point in the reporting process and ultimate completion of the required report. Evidence to support the identification and assessment of the impact event and evidence to support the completion and submittal of the report are really one in the same.
No
We agree with the rationale for R8 requiring NERC to analyze Impact Events that are reported through R6 and publish a report that includes lessons learned but disagree with R2.9 obligating an entity to update its Operating Plan based on applicable lessons learned from the report. Whether lessons learned are applicable to an entity is subjective. If an update based on lessons learned from an annual NERC report is required, the requirement should clearly state the necessity of the update is determined by the entity and the entity's Reliability Coordinator or NERC can not make that determination then find the entity in violation of the requirement. In addition, if an update based on lessons learned from a NERC report is required, NERC should publish the year-end report (R8) on approximately the same day annually (i.e. January 31) and allow an entity at least 60 days to analyze the report and incorporate any changes it deems necessary in its Operating Plan. Again, the language referencing annual and quarterly in these two requirements in confusing.
No

We agree with the event descriptions listed in Attachment 1 and the review and revision of the impact table by the ERO is appropriately addressed in R7 but the time periods allowed to complete the new, longer preliminary report is insufficient. The correlation of this with the timing of the reporting quarterly and annually or pushing information for other entities' situational awareness does not allow the registered entity adequate time to thoughtfully consider the event and proposed root cause.
No
For easier classification and analysis of events for both external reporting to the ERO and internal reporting for the applicable entity, the form should include Event Type. The DSR SDT should code each event type and include the codes as part of Attachment 1.
Yes
Should the word disturbance be removed from the title of EOP004-2 to avoid confusion and simply be called Impact Event and Assessment, Analysis and Reporting.
Yes
No
April 2011 is too soon for considerations applicable to the creation of an Operating Plan.
Yes
The standard addressed a preliminary report it should also address the requirements of a final report.

No
We find it interesting that the ERO is listed as an applicable entity. The ERO is responsible for multiple requirements in this standard that shapes the ultimate actual rules that the other applicable entities would be required to meet. Can the NERC/ERO be accountable for a feedback loop to the industry? Feedback is preferable but would NERC/ERO self-report a violation to the requirement?
Yes
We do have one concern in that we are hopeful that NERC will develop a system that will allow a one stop shop of reporting.
No
The Operating Plan has a different connotation for different operations folks. We suggest that we call it an Impact Event Reporting Plan.
Yes
Yes
No
We suggest that the time frame be changed to 60 or 90 days in 5.3. 5.4 needs to have a time frame associated with it; we suggest that it be 60 or 90 days.
No
The time to submit report column needs to be more flexible with time frames.
Yes
No
The time to submit report column needs to be more flexible with time frames. The Entity with Reporting Responsibility column needs to be more descriptive in which there are multiple entitles with hierarchy reporting.
Yes
Yes
Yes
Yes
Yes

The only concern that we have with the proposed standard is that it feels like it is creating dual, not quite redundant, reporting requirements for cyber intrusions in concert with CIP-008. Hopefully, there will not have to be a redundant reporting requirement if we continue to merge efforts with the CIP Drafting Team. Since we will no longer use the word SABOTAGE in the new EOP-004, we are hoping the industry and the CIP Drafting Team will give us the criteria they wish for us to use in order to report CIP-008 incidents. We will then achieve a “ONE STOP SHOP” reporting standard.
Individual

Nebraska Public Power District
No
The background states there is no real-time reporting requirement in this standard, but the purpose states a purpose is for situational awareness. This implies real-time reporting. The purpose clearly identify the standard is for after the fact reporting to permit analysis of events, trend data, and identify lessons learned.
Yes
Yes
Yes
No
Since the reporting under this standard is for after the fact reporting, the minimum time to report should be the end of the next business day. The combination of the extremely short time periods to file a report and the amount of detail required in attachment 2 will lead to a reduction in the reliability of the BES. System Operators will be forced to take focus off their primary responsibility to respond to the event in order to complete the report within the required timeframe (within an hour for some events). During non-business hours the only personnel available to complete the reports will be those responsible for real-time operation of the BES. Since the background indicates this standard is only for after the fact reporting, the minimum required time to submit the report should be one business day to permit completion of the report without distracting from the real-time operation of the BES. Real-time reporting requirements are covered in other standards and should be to the Reliability Coordinator and from the Reliability Coordinator to NERC. For after the fact reporting, there is absolutely no reliability benefit for requiring reporting to be completed on such a short timeframe. This is especially true due to the amount of data required by Attachment 2.
No
If the standard requires submission of the report within an hour (which is not appropriate), there must be an abbreviated form that can be quickly filled out by checking boxes and not require substantial narrative. The existing form has too much free form text that takes time to enter and with the short timeframe for reporting will distract the entities responsible for real-time reliabiltiy of the BES from that task by forcing them to complete after the fact reports. It is unrealistic to expect entities to staff personnel to complete the reporting 24 x 7 for unlikely events, so the task will fall to System Operators who should be focusing on operating the BES at the time of these events instead of providing after the fact reporting to entities that do not have responsibility for real-time operation of the BES. Real-time reporting to the RC and/or BA is covered under other standards and is necessary for the RC to have situational awareness, but is not covered under this standard. The registered entities may report to the proper law enforcement entities when the situation warrants, but again this form is not the appropriate way to handle that reporting requirement.
Yes
I agree there is a lot of interpretation and confusion as to what sabotage or a Cyber Incident is, so would welcome better clarity. Whether “impact events” can more effectively clarify, is yet to be seen. “it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.” “An impact event is any situation that has the potential to significantly impact the reliability of the Bulk Electric System. Such events may originate from malicious intent, accidental behavior, or natural occurrences.” I do know that Cyber Sabotage may take time or days to become aware so not sure how that might expedite reporting and awareness.
Yes
Appears they only changed R1 for CIP-001 and moving R2-R4 directly over to EOP-004-2. R1 adds much more detail on our part for a company operating plan but would definitely help some of the present confusion.

No
(1) Our understanding of the proposed revision as conveyed in the SAR was to provide clarity and reduce redundancy on reporting the latest and even on-going events on the system that may be caused by system changes and/or sabotage. The intent is to ensure the proper authorities are informed of such events so that they may take appropriate and necessary actions to identify causes and/or mitigate or limit the extent of interruptions. We also supported a suggestion in the SAR to assess the merit of merging CIP-001 and EOP-004 to remove redundancy, although we suggested that this should not be a presumption when revising the standard(s). This posting appears to indicate that only EOP-004 will be revised at this time, and CIP-001 which deals with sabotage reporting will remain in effect. With this assumption, the proposed standard appears to contain a mixture of reporting two types of events of different time frame – the first type being those events that need to be reported soon or immediately after they occur (e.g. impact events that appear to be the result of a sabotage) with an aim to curb/contain these events by the appropriate authorities; the second type being the events that can be reported sometime well after the fact, e.g. system disturbances due to weather or switching or other known causes that are not of malicious nature. Combining the two types of requirement does not appear to be clearly conveyed in the SAR. We therefore suggest the SDT review the main purpose and content in the proposed EOP-004 to ensure consistency with the SAR, and in relation to the purpose and requirements already contained in CIP-004. (2) With respect to disseminating reports and related information after the fact, we wonder if a data collection process, such as RoP 1900, can serve the purpose without having to create a standard or a requirement to achieve this. (3) Most of the requirements appear to be administrative in nature and they stipulate the how but not the what, which in our view does not conform with the Results-based standard concept and does not rise to the level of a reliability standard. (4) A number of requirements proposed in the draft standard are quite vague and cannot be measured. Details of this assessment is provided below.
No
We do not agree with the inclusion of TO and GO. They are not operating entities and do not need to collect or provide information pertaining to impact events, which are the results and phenomena observe under operating conditions in the operation horizon, and such information collection and provision are the responsibility of the TOP and GOP.
No
R1 does not directly convey the need for reporting. The requirement could be written to require the responsible entities to report impact events to the ERO using a process to be described in the standard and according to a set of reporting criteria. Whether or not there is a “system” makes little difference if it complies with the requirement to provide the reports on time. In addition, an ERO established system which, without being included in the standard and posted for public comment and eventually balloted, may not be acceptable to the entities that are responsible for reporting to the ERO. Further, a reliability standard should not need to bother with how the ERO disseminate this information to applicable government, provincial or law enforcement agencies. This is the obligation of the ERO and if required, can be included in the Rules of Procedure.
No
R2 is not needed. An entity does not need to have an “operating plan” to identify and report on impact events; it needs only to report on the events listed in Attachment 1 in a form depicted in Attachment 2. How does the entity do this, and whether or not an operating plan is in place, or whether its staff is trained to provide the report should not need to be included in a reliability standard for so long as the responsible entity provides the report in the required form on time. If the responsible entity fails to report the listed events in the depicted format, it will be found non-compliant, and that’s it – no more and no less. If the “operating plan” really means an established data collection and reporting procedure, then the requirement should be revised to more clearly convey the intent.
No
We agree that the responsible entity needs to identify and assess initial probable cause of impact events but not in accordance with any operating plan in R2. Each operating entity (RC, BA, TOP) has an inherent responsibility to identify the cause of any system events to ensure it complies with a number of related operational standards. R3, in fact, could be revised to require the Responsible Entity to include the probable cause of impact events in its report, rather than asking it to “identify and assess” since this is not measurable. Also, the ERO may be removed from the Applicability Section depending on the response to our comments under Q9.
No
Along the line of our comments on R2 for an operating plan (whose need we do not agree with), a drill, exercise, or Real-time implementation of the Operating Plan for reporting is also not necessary.
No
Along the line of our comments on R2 for an Operating Plan (whose need we do not agree with), any training on developing and providing the report is unnecessary. What matters is that the report is provided to the needed organizations or entities on time and in the required format according to established procedure. How this is accomplished goes outside of the purpose of reliability standard requirements.
No
We agree with having a requirement to report impact events in accordance with the timelines outlined in Attachment 1,

but not with the requirements indicated in R2.
No
We agree with the need to update the list as needed, but it does not have to be the ERO who takes on a reliability standard to do so. It can simply be an annual project in the standards development work plan to review Attachment 1 as part of a standard. The industry will then be provided an opportunity to weigh on the changes. Also, we do not see the reliability results or benefits of R8. The ERO can issue the report quarterly but who are audiences? What reliability purpose does it serve if no further actions are pursued upon receiving the report? Can this be done as a standing item for the ERO at, say, the BoT meeting? Or, can this be a part of the quarterly communication from the ERO to the industry? To make this a reliability standard is an over-kill, and does not conform with the results-based standard concept. From our perspective, both R7 and R8 can be removed, and the ERO can be removed from the Applicability Section as well.
No
We do not support the 1 hour reporting time frames for Emergency Energy, System Separation, unplanned Control Center evacuation, Loss of off-site power, Loss of monitoring or voice communication. Energy emergency is broadcast on the RCIS which also goes to the ERO so its explicit reporting is not necessary (System Operations please verify). During other events listed above, the responsible entities will likely be concentrating its effort in returning the system to a stable and reliable state. Reporting to anyone not having direct actions to control, mitigate and contain the disturbances is secondary to restoring the system to t a reliable state. Since these are after the fact reports for awareness and/or analysis and not for real-time responses, these can be reported at a later time, up to 24 hours after the initial occurrence without any detriment to reliability, or at the very earliest: up to 1 hour after the system has returned to a reliable state, or after the backup control centre is fully functional, or after backup power is restored to the nuclear power plant, or after monitoring or voice communication is restored.
TBD
We do not have a view on what name is assigned to the reportable events for so long they are listed in Attachment 1. However, the heading of the Table contains the words “Actual Reliability Impact”, which does not accurately reflect the content inside the table and which may introduce confusion with the term “impact event”. We suggest to change them to “Reportable Impact Events”. As we read the Summary of Concept and Assumption, there appears to be a slightly different lists at the bottom of P. 21. With these events included, the meaning of “impact event” would seem to be too broad. Rather than calling those events listed in Attachment 1 “impact events”, why not simply call them “reportable events”?
No
We do not agree with the mapping. The proposed mapping attempts to merge the reporting in CIP-001-1 which has more of an on-going awareness nature to alert operating and government authorities of suspected sabotage to prompt investigation with a possible aim to identify the cause and develop remedies to curb the sabotage/events. The proposed EOP-004-2 appears to be more of a post-event reporting for need-to-know purpose only. This is not consistent with the purpose of the SAR.
We do not agree with the proposed standard. We therefore are unable to agree on any implementation plan.
No
Individual
Catherine Koch
Puget Sound Energy
Yes
However, further definition of "known causes" would be helpful as sometime the root cause analysis doesn't uncover the actual cause for sometime after the timeframes outlined in Attachment 1.
Yes
No
The language of R1 and M1 does not support the DSR SDT’s goal of having a single form and system for reporting. The standard should specify the form and system rather than deferring that decision to the ERO. The language of R1 and M1 leaves the form and system to the ERO’s discretion, which could lead to multiple forms and frequent revisions to them. This would lead to difficulties in tracking the reporting requirements. In addition, it is impossible to comment intelligently regarding the overall impact of the proposed standard and its requirements and measures without the reporting form and system being specified in the standard.
No
While the concept of an operating plan is reasonable, the requirements for update in sections 2.7, 2.8 and 2.9 will lead to an immense amount of work for the entities subject to the standard. In addition, constant revisions to the operating plan makes it difficult to cement a habit through this procedure. The proposed update schedule does not strike the appropriate balance between the need to respond to lessons learned and the value of plan continuity.
Yes

However, this requirement doesn't address the timing required for this analysis. This may be intentional and appreciated because at times the analysis can take months when the events are complex in nature.
Yes
No
The fact that proposed requirement R2 will require frequent updates to the operating plan means that the training required under this plan will occur quite frequently as well, leading to operator confusion. Even the comment allowing a review and “sign-off” will not completely mitigate this result.
Yes
It is assumed that for the purposes of M6, NERC and the regions would already have access to these reports.
No
This is adequately covered by section 802 of the Rules of Procedure. There seems to be some conflict between R2.9 and R8 regarding timeframes and the specific elements required.
No
The proposed standard does not adequately ensure that the impact events subject to its requirements are limited to those listed in Attachment 1. In order to ensure that this is true, the term “impact event” should be a defined term and that definition should clearly limit impact events to those listed in Attachment 1.
No
Attachment 2 is not referenced in the requirements of the proposed standard. As a result, it is not clear when its submission would be required.
No
With some of the tight timeframes for reporting, it is reasonable to focus on impact rather than motivation. Requiring further analysis of the event in order to assess the possibility that the event was caused by sabotage, however, may be necessary to address FERC’s concerns with respect to sabotage.
Yes
No
There are no effective dates listed in the proposed standard. The proposed effective date should allow at least one year for entities to implement the requirements of the standard. In addition, if requirement R1 remains, then the requirement to implement an operating plan should only be triggered by the ERO’s finalization of the form and system for reporting impact events and should provide at least six months for the implementation of the operating plan.
Yes
The DSR SDT’s concepts for implementing a new structure for reporting are appropriate. Proper implementation of those concepts is likely to result in a very much improved standard. However, the proposed standard falls well short of implementing the concepts and is not much of an improvement on the current standard.

Jason L. Marshall
Yes
No
While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an energy emergency requiring public appeals?
Yes
No
We disagree with requiring an Operating Plan for identifying, assessing, and reporting impact events. This is an administrative requirement that has no clear reliability benefit. Furthermore, it is questionable that event reporting even meets the basic definition of an Operating Plan. Per the NERC glossary of terms, Operating Plans contain Operating Procedures or Operating Processes which encompass taking action real-time on the BES not reporting on it. What is an impact event? It appears that this undefined, ambiguous term was substituted for sabotage which is also undefined and ambiguous. One of the SARs stated goals was to “provide clarity on sabotage events”. This does not provide clarity.
No
While we agree that it makes sense to report on the cause of an event, we disagree with the need for an Operating Plan as identified in R2.

No
We disagree with the need to conduct a drill for reporting.
No
We disagree with the need to provide formal training. We could agree with the need to communicate to System Operators and other pertinent personnel the criteria for reporting so that they know when system events need to be reported.
No
We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
No
We do not agree with the requirements and we do not believe it is adequately covered in section 802. First, section 802 deals with assessments not event reporting. Secondly, since attachment 1 is part of a standard, it should not be modified outside of the Reliability Standards Development process.
No
Several categories require duplicate reporting. For instance, the first three categories regarding energy emergencies could be interpreted to require the BA and RC to both report. The reporting responsibilities in this table should be clarified based on who has primary reporting responsibility for the task per the NERC Functional Model and require only one report. For instance, since balancing load, generation and interchange is the primary function of a BA per the NERC Functional Model, only the BA should be required to provide this report. As another option, perhaps the registered entity initiating the action should submit the report. If the BA did not take action and the RC had to direct the BA to take action, one could argue that perhaps the RC should submit the report then. However, if the BA takes action appropriately on their own, the BA should submit it. If the TOP reduces voltage for a capacity and energy emergency per a directive of the BA, then the BA should report the event.
No
This form differs from the DOE reporting forms. We do not believe different reporting forms should be required. The DOE form should be sufficient for NERC reporting. It is not clear what benefit providing the Compliance Registration ID number provides. Many of the registered entities employees that will likely have to submit the report, particularly given the one-hour reporting requirement for some impact events, will not be aware of this registration ID. However, they will know for what functions they are registered. We recommend removing the need to enter this compliance registration ID or extending the time frame for reporting to allow back office personnel to complete the form. For item two, please change “Time/Zone:” with “Time (include time zone)”. As written it is a little confusing.
No
We believe the SAR scope regarding addressing sabotage has not been addressed at all. It appears that impact event essentially replaces sabotage. This standard needs to make it clear that sabotage, in some cases, cannot be identified until an investigation is performed by the appropriate policing agencies such as the FBI. Intent plays an important role in determining sabotage and only these agencies are equipped to make these assessments.
No
It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than in the existing standards.
Yes
Yes
We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting.

No
The proposed requirements in the standard are not focused on the core industry concern that current requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, “The existing requirements need to be revised to be more specific – and there needs to be more clarity in what sabotage looks like.” Instead this proposed standard includes requirements that are more focused on “how” to report, rather than “what” to report. The SAR states that: “The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.” The SRC believes the scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of

sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seem helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting team seems to be ignored, “Consider whether separate, less burdensome requirements for smaller entities may be appropriate.” The requirements for entities to develop Operating Plans and to have training for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard.
No
Entities that have information about possible sabotage events should report these to NERC after the fact and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an EEA for example?
Yes
Note that ERCOT does not sign on to this particular comment.
No
The SRC suggests that this is not, in fact, an Operating Plan. At most, it may be a reporting plan or reporting procedure. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject. As proposed, the Operating Plan is not required to ensure bulk power reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. The Operating Plan requirements as proposed seem only to be suitable for real-time notifications. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient. Unlike the real-time operating notifications which have relatively short reporting time frames, there is sufficient time for personnel to make appropriate communications within their organizations to make timely after the fact reports under NERC Section 1600 authority. Would it be feasible for NERC to issue a standing requirement for timely after-the-fact reports under NERC Section 1600 authority?
No
Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes quite some time for an actual cause to be determined. The determination process may require a root cause analysis of some complexity. Further, in the case of suspected or potential sabotage, the industry can only say it doesn’t know, but it may be possible. It really is the law enforcement agencies who make the determination of whether sabotage is involved and the info may not be made available until an investigation is completed, if indeed it is ever made available.
No
Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are really training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in a short time frame as may be required for real-time operating notifications.
No
We do not agree with the need for R5. We do not see the need for a standard requirement that stipulates training the personnel on reporting events. What matters is that the reports are provided to the needed organizations or entities on time and in the required format according to established procedure. Stipulating a training requirement to achieve this reporting is micro-managing and overly prescriptive.
No
There is not a need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations.
No
We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
No
We do not agree with the requirement to report “detection of a cyber intrusion to critical cyber assets” as this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. We suggest that physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.
No
Attachment 2 is not referenced in the standard requirements. Is it a part of the standard that an entity must use to file the impact event reports to a specific recipient. If so, this needs to be referenced in the standard. We question the need for using a fixed format for reports that vary from “shedding firm load” to “damaging equipment”. The nature of impact events varies from one event to another and hence a fixed format or pre-determined form may not be able to provide

the appropriate template that is suitable for use for all events. We urge the SDT to reconsider the use of Attachment 2 for reporting events, with due consideration to the actual intent of the standard (as pointed out in our comments under Q1).
No
This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement’s and other specialized agencies’, including international agencies’, role in defining acts of sabotage and not hold the registered entity wholly responsible to do so.
No
If the training and Operation Plan requirements are adopted as proposed, this may not be sufficient time for some entities to comply, particularly those with limited number of staff but perform functions that have multiple event reporting requirements.
No
The standards should be changed to define what a “disturbance” is for reporting in EOP-004. Also, sabotage reporting requirements in CIP-001 should be rescinded as EOP-004 already has such requirements.

Consideration of Comments on Disturbance and Sabotage Reporting — Project 2009-01

The Disturbance and Sabotage Reporting Drafting Team thanks all commenters who submitted comments on its preliminary draft of EOP-004-2 – Impact Event and Disturbance Assessment, Analysis, and Reporting. This standard was posted for a 30-day informal comment period from September 15, 2010 through October 15, 2010. Stakeholders were asked to provide feedback on the standard through a special Electronic Comment Form. There were 60 sets of comments, including comments from more than 175 different people from approximately 100 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

In this report, the comments have been sorted by question number so that it is easier to see where there is consensus. The comments are posted in their original format on the following project page:

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Based on stakeholder comments, and also on the results of the observations made by the Quality Review team, the drafting team made the following significant changes to the standard following the posting period that ended on October 15, 2011.

Scope: A common thread through most of the comments was that the DSR SDT went beyond the reliability intent of the standard (reporting) and concentrated too much on the analysis of the event. The DSR SDT agrees with this response, and revised the purpose as follows:

Original Purpose: Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES).

Revised Purpose: To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of Impact Events and their causes, if known, by the Responsible Entities.

Definitions:

Impact Event: The DSR SDT had proposed a working definition for “impact events” to support EOP-004 - Attachment 1 as follows:

“An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.”

Many stakeholders indicated that the definition should be added to the NERC Glossary and the DSR SDT adopted this suggestion.

The types of Impact Events that are required to be reported are contained within EOP-004 - Attachment 1. Only the events identified in EOP-004 – Attachment 1 are required to be reported under this Standard.

Sabotage: FERC Order 693, paragraph 471 states in part: “. . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event."

The DSR SDT made a conscious, deliberate decision to exclude a strict definition of sabotage from this standard and sought stakeholder feedback on this issue. Some suggested adopting the NRC definition of the term sabotage, and the DSR SDT did consider adopting the NRC definition shown below but determined that the definition is too narrowly focused.

Any deliberate act directed against a plant or transport in which an activity licensed pursuant to 10 CFR Part 73 of NRC's regulations is conducted or against a component of such a plant or transport that could directly or indirectly endanger the public health and safety by exposure to radiation.

Most respondents agreed that in order to be labeled as an act of sabotage, the intent of the perpetrators must be known. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This would result in further ambiguity with respect to reporting events, and the timeline associated with the reporting requirements does not lend itself to the in-depth analysis required to identify a disturbance (or potential disturbance) as sabotage. The SDT felt that a likely consequence of having to meet this criterion, in the time allotted, would be an under-reporting of events. Accordingly, all references to sabotage have been deleted from the standard.

Instead, the SDT concentrated on providing clear guidance on the events that should trigger a report. The SDT believes that this more than adequately meets the reliability intent of the Commission as expressed in paragraph 471 of Order 693 in an equally efficient and effective manner.

Situational Awareness versus Industry Awareness: Some commenters correctly pointed out that "situational awareness" is a desirable by-product of an effective event reporting system, and not the driver of that system. Accordingly, all references to "situational awareness" have been deleted from the standard. The more generic "industry awareness" has been substituted where appropriate.

Applicability:

The DSR SDT had protracted discussions on the applicability of this standard to the LSE. Per the Functional Model, the LSE does not own assets and therefore should not be an applicable entity (no equipment that could experience a "disturbance"). However, the Registry Criteria contains language that could imply that the LSE does own assets, or is at least responsible for assets. In addition, the DSR SDT modified Attachment 1 to include reporting of damage or destruction of Critical Cyber Assets per CIP-002. The LSE, as well as the Interchange Authority and Transmission Service Provider are applicable entities under CIP-002 and should be included for Impact Events under EOP-004.

There were several comments that the asset owners (GO/TO) would be less likely than the asset operators (GOP/TOP) to be aware of an impact event. The DSR SDT recognizes that this may be true in some cases, but not all. In order to meet the reliability objectives of this requirement, the applicability for GO/TO will remain as per Attachment 1.

Requirement R1:

Based on stakeholder comments, Requirement R1, which assigned the ERO the responsibility for collecting and distributing impact event reports was deleted. There was strong support for a central system for receiving and distributing impact event reports (a/k/a one stop shopping). There was general agreement that NERC was the most likely, logical entity to perform that function. However several respondents expressed their concern that the ERO could not be compelled to do so by a requirement in a Reliability Standard (not a User, Owner or Operator of the BES). In their own comments, NERC did not oppose the concept, but suggested that the more appropriate place to assign this responsibility would be the NERC Rules of Procedure. The DSR SDT concurs. The DSR SDT has removed the requirement from the standard and is proposing to make revisions to the NERC Rules of Procedure as follows:

> 812. NERC will establish a system to collect impact event reports as established for this section, from any Registered Entities, pertaining to data requirements identified in Section 800 of this Procedure. Upon receipt of the submitted report, the system shall then forward the report to the appropriate NERC departments, applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, and regulatory agencies as necessary. These reports shall be forwarded to the Federal Energy Regulatory Commission for impact events that occur in the United States. The ERO shall solicit contact information from Registered Entities appropriate governmental, law enforcement and regulatory agencies for distributing reports.

Requirement R2 (now R1 in the revised standard):

There were objections to the use of the term "Operating Plan" to describe the procedure to identify and report the occurrence of a disturbance. The DSR SDT believes that the use of a defined term is appropriate and has revised Requirement R1 to include Operating Plan, Operating Process and Operating Procedure.

Many commenters felt that the requirements around updating the Operating Plan were too prescriptive, and impossible to comply with during the time frame allowed. The DSR SDT agrees, and Requirement R2, Parts 2.5 through 2.9 have been eliminated. They have been replaced with Requirement R1,Part 1.4 to require updating the Impact Event Operating Plan within 90 days of any change to content.

R1. Each Responsible Entity shall have an Impact Event Operating Plan that includes: *[Violation Risk: Factor Medium] [Time Horizon: Long-term Planning]*:

- 1.1. An Operating Process for identifying Impact Events listed in Attachment 1.
- 1.2. An Operating Procedure for gathering information for Attachment 2 regarding observed Impact Events listed in Attachment 1.
- 1.3. An Operating Process for communicating recognized Impact Events to the following:
  - 1.3.1 Internal company personnel notification(s).

1.3.2. External organizations to notify to include but not limited to the Responsible Entities' Reliability Coordinator, NERC, Responsible Entities' Regional Entity, Law Enforcement, and Governmental or Provincial Agencies.

1.4. Provision(s) for updating the Impact Event Operating Plan within 90 days of any change to its content.

Other requirements reference the Operating Plan as appropriate. The requirements of EOP-004-2 fit precisely into the definition of Operating Plan:

> Operating Plan: A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Requirement R3 (now R2 in the revised standard):

Requirement R3 has been re-written to exclude the requirement to "assess the initial probable cause". The only remaining reference to "cause" is in the Impact Event Reporting Form (Attachment 2). Here, there is no longer a requirement to assess the probable cause. The probable cause only needs to be identified, and only if it is known at the time of the submittal of the report.

> R2. Each Responsible Entity shall implement its Impact Event Operating Plan documented in Requirement R1 for Impact Events listed in Attachment 1 (Parts A and B). *[Violation Risk: Factor Medium] [Time Horizon: Real-time Operations and Same-day Operations]*

Requirement R4 (now R3 in the revised standard):

The DSR SDT did a full review based on comments that were received. R3 now is stream lined to read:

> R3. Each Responsible Entity shall conduct a test of its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3 at least annually, with no more than 15 months between such tests. .

The testing of the Operating Process for communicating recognized Impact Events (as stated in R1) is the main component of this requirement. Several commenters provided input that too much "how" was previously within R3 and the DSR DST should only provide the "what". The DSR SDT did not provide any prescriptive guidance on how to accomplish the required testing within the rewrite. Testing of the entity's procedure (R1) could be by an actual exercise of the process (testing as stated in FERC Order 693 section 471), a formal review process or real time implementation of the procedure. The DSR SDT reviewed Order 693 and section 465 directs that processes are "verify that they achieve the desired result". This is the basis of R3, above.

Requirement R5 (now R4 in the revised standard):

The DSR SDT did a full review based on comments that were received. The major issues that were provided by commenters involved the inclusion of Requirement R5, Part 5.3 and Part 5.4.

5.3 If the Operating Plan is revised (with the exception of contact information revisions), training shall be conducted within 30 days of the Operating Plan revisions.

5.4 For internal personnel added to the Operating Plan or those with revised responsibilities under the Operating Plan, training shall be conducted prior to assuming the responsibilities in the plan.

Upon detailed review the DSR SDT agrees with the majority of comments received regarding Requirement R5, Parts 5.3 and 5.4 and has removed Parts 5.3 and 5.4 completely from the Standard. Training is still the main theme of this requirement (now R4) as it pertains to the personnel required to implement the Impact Event Operating Plan (R1).

R4 now is stream lined to read:

> R4. Each Responsible Entity shall review its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan at least annually with no more than 15 calendar months between review sessions

Requirement R6 (now R5 in the revised standard):

The DSR SDT did a full review based on comments that were received. Many comments received identified concerns on the reporting time lines within Attachment 1., Several commenters wanted the ability to report impact events to their responsible parties via the DOE Form OE-417. Upon discussions with the DOE and NERC, the DSR SDT has added the ability to use the DOE Form OE-417 when the same or similar items are required to be reported to NERC and the DOE. This will reduce the need to file multiple forms when the same or similar events must be reported to the DOE and NERC. The reliability intent of reporting impact events within prescribed guidelines, to provide industry awareness and to start any required analysis processes can be met without duplicate reporting R5 now is stream lined to read:

> R5. Each Responsible Entity shall report Impact Events in accordance with its Impact Event Operating Plan pursuant to Requirement R1 and Attachment 1 using the form in Attachment 2 or the DOE OE-417 reporting form.

Requirements R7 and R8:

The DSR SDT did a full review based on comments that were received. The DSR SDT has determined that R7 and R8 are not required to be within a NERC Standard since Section 800 of the Rules of Procedure already assigns this responsibility to NERC.

Attachment 1:

The DSR SDT did a full review based on comments that were received. The DSR SDT, the Events Analysis Working Group (EAWG), NERC Staff (to include NERC Senior VP and Chief Reliability Officer) had an open discussion involving this topic. The EAWG and the DSR SDT aligned Attachment 1 with the Event Analysis Program category 1 analysis responsibilities. This will assure that impact events in EOP-004-2 reporting requirements are the starting vehicle for any required Event Analysis within the NERC Event Analysis Program. The DSR SDT reviewed the "hierarchy" of reporting within Attachment 1. To reduce multiple entities reporting the same impact event, the DSR SDT has stated that the entity that performs the action or is directly affected by an action will report per EOP-004-2. As an example, during a system emergency, the TOP or RC may request manual load shedding by a DP or TOP. The DP or TOP would have the responsibility to report the action that it took if it meets or exceeds the bright-line criteria established in Attachment 1. Upon reporting, the NERC Event Analysis Program would be made aware of the impact event and start the Event Analysis Process which is outside the scope of this Standard. Several bright-line criteria were removed from Attachment 1. These criteria (DC converter station, 5 generator outages, and frequency trigger limits) were removed after discussions with the EAWG and NERC staff, who concurred that these items should be removed from a reporting standard and analysis process.

Several respondents expressed concern that the reporting requirements were redundant. The general sentiment was that unclear responsibility to report a disturbance could trigger a flood of event reports. Attachment 1 has been modified to assign clear responsibility for reporting, for each category of Impact Event.

Some commenters indicated a concern that the list of events in Attachment 1 isn't as comprehensive as the existing standard since the existing standard includes bomb threats and observations of suspicious activities. Others commented that the impact event list should include deliberate acts against infrastructure. The DSR SDT believes that "observation of suspicious activity" and "bomb threats" are addressed in Attachment 1 Part B – "Risk to BES equipment from a non-environmental physical threat". The SDT has added the phrase, "and report of suspicious device near BES equipment" to note 3 of the "Attachment 1, Potential Reliability – Part B" for additional clarity.

Attachment 2:

The proposed Impact Event Report (Attachment 2) generated comments regarding the duplicative nature of the form when compared to the OE-417. The DSR SDT has added language to the proposed form to clarify that NERC will accept a DOE OE-417 form in lieu of Attachment 2 if the responsible entity is required to submit an OE-417 form.

In collaboration with the NERC Event Analysis Working Group (EAWG) the DSR SDT modified the attachment to eliminate confusion. This revised form will be Attachment 2 of the Standard and collects the only information required to be reported for EOP-004-2. Further information may be requested through the Events Analysis Process (NERC Rules of Procedure), but the collection of this information is outside of the scope of EOP-004.

The DSR SDT has also clarified what the form's purpose with the following addition to the form:

> "This form is to be used to report impact events to the ERO."

Other Standard Issues:

The DSR SDT proposed that combining EOP-004 and CIP-001 would not introduce a reliability gap between the existing standards and the proposed standard and the industry comments received confirms this.

Several entities expressed their concern with the fact that Attachment 1 contained most of the elements already called for in the OE-417. The DSR SDT agrees, and Attachment 1 part 1 has been modified to even more closely mirror the Department of Energy's OE-417 Emergency Incident and Disturbance Report form. Additionally, the standard has been modified to allow for the use of the OE-417.

There was some concern expressed that there could be confusion between the reporting requirements in this standard, and those found in CIP-008. The DSR SDT agrees, and Attachment 1 Part B, has been modified to provide the process for the reporting of a Cyber Security Incident.

The DSR SDT also believes NERC's additional concern about what data is applicable is addressed by the revisions to Attachment 1, and the inclusion of the OE-417 as an acceptable interim vehicle.

Implementation Plan:

The DSR SDT asked stakeholders to provide feedback on the proposed effective date which provided entities at least a year following board approval of the standard. Most stakeholders supported the one year minimum, however based on the revisions made to the requirements, the drafting team is now proposing that this time period be shortened to between six months and nine months. The current CIP-001 plan is adequate for the new EOP-004 and training should be met in the proposed timeline. Note that the Implementation Plan was developed for the revised Requirements, which do not include an electronic "one-stop shopping" tool. The tool for 'one stop shopping' will be addressed in the proposed revisions to the NERC Rules of Procedure.

The industry commented on the need for e-mail addresses and fax numbers for back up purposes. These details were added to the standard and the implementation plan.

The proposed ballot in December was incorrect and has been deleted from the future development plan. The plan was updated with the correct project plan dates.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Index to Questions, Comments, and Responses

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. Do you agree with the purpose statement of the proposed standard? Please explain in the comment box below.

Summary Consideration: Stakeholders who responded to this question were fairly evenly divided on acceptance of the original purpose statement with about half supporting the purpose and half suggesting revisions to the purpose. A common thread through most of the comments was that the DSR SDT went beyond the intent of the standard (reporting) and concentrated too much on the analysis of the event. Based on these comments, the SDT revised the purpose statement. The new purpose is:

> To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of Impact Events and their causes, if known, by the Responsible Entities.

Several commenters noted that the term, "impact event" is not a formally defined term. The DSR SDT has used a working definition for "impact events" to develop Attachment 1 as follows:

> An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.

Many stakeholders indicated that the definition should be added to the NERC Glossary and the DSR SDT adopted this suggestion.

The types of Impact Events that are required to be reported are contained within Attachment 1. Only these events are required to be reported under this Standard.

Some commenters correctly pointed out that "situational awareness" was a desirable by-product of an effective event reporting system, and not driver of that system. Accordingly, all references to "situational awareness" have been deleted from the standard. The more generic "industry awareness" has been substituted where appropriate.

Many commenters noted that the SDT did not define sabotage. FERC Order 693, paragraph 471 states in part: ". . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event." The DSR SDT made a conscious, deliberate decision to exclude a strict definition of sabotage from this standard and sought stakeholder feedback on this issue. Some suggested adopting the NRC definition of the term sabotage, and the DSR SDT did consider adopting the NRC definition shown below but determined that the definition is too narrowly focused.

> Any deliberate act directed against a plant or transport in which an activity licensed pursuant to 10 CFR Part 73 of NRC's regulations is conducted or against a component of such a plant or transport that could directly or indirectly endanger the public health and safety by exposure to radiation.

Most respondents agreed that in order to be labeled as an act of sabotage, the intent of the perpetrators must be known. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This would result in further ambiguity with respect to reporting events, and the timeline associated with the reporting requirements does not lend itself to the in-depth analysis required to identify a disturbance (or potential disturbance) as sabotage. The SDT felt that a likely consequence of having to meet this criterion, in the time allotted, would be an under-reporting of events. Accordingly, all references to sabotage have been deleted from the standard.

Organization	Yes or No	Question 1 Comment
Ameren	No	The purpose talks about reporting impact events and their known causes. We have no problem with this generic intent, but the purpose says nothing about the very burdensome expectation of verbal updates to NERC and Regional Entities (Attachment 1, top of first page), Preliminary Impact Event Reports (Attachment 1, top of first page, are these Attachment 2?), "Actual" Impact Event Reports (Attachment 1 - Part A) and "Potential" Impact Event Reports (Attachment 1 - Part B). These multiple levels of reporting and events need to be greatly reduced.
American Electric Power (AEP)	No	It is unclear what the relationship between this project and the newly revamped NERC Event Analysis Process. We support moving towards one process opposed to separate obligations that may be in conflict.

Organization	Yes or No	Question 1 Comment
		In addition, AEP supports the concept of a central clearinghouse such as the RCIS that is shared by the industry. We support fewer punitive requirements and more prompting for using tools to make multiple entities aware of reliability related issues shortly after the fact.
CenterPoint Energy	No	CenterPoint Energy does not agree with the purpose statement of the proposed standard. The directive from the Commission in FERC Order 693 and restated in the Guideline and Technical Basis is "...the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: 1) further define sabotage and provide guidance as to the triggering events that would cause and entity to report a sabotage event." Instead the SDT has introduced another term, impact event, to address concerns regarding different definitions. The term, impact event and its proposed concept is too broad. Specifically the concept that an impact event "...has the potential to impact the reliability of the Bulk Electric System" leaves too much room for an entity and a regulatory body to have a difference of opinion as to whether an event should be reported. Required reporting should be limited to actual events. The reporting to follow could become overwhelming for the Responsible Entities, the ERO, and other various organization and agencies. Furthermore, situational awareness is a term that is associated with aspects of real-time. Given the analysis required before a report can be submitted, the report will not be real-time and will not sustain a purpose of supporting situational awareness. (See also comments on Q10 regarding the "Time to Submit Report".) A purpose that is more aligned with consolidation of the EOP-004 and CIP-001 standards would be as follows: Responsible Entities shall report disturbance events and acts of sabotage to support the reliability of the BES through industry awareness.
Consolidated Edison Co. of NY, Inc.	No	Comments: The purpose is not clear because it uses the term "impact events". This term should be a defined in the NERC glossary, and should not include words such as "potential".

Organization	Yes or No	Question 1 Comment
Duke Energy	No	The Purpose statement says that reporting under this standard supports situational awareness. However this is in conflict with Section 5. Background, where the DSR SDT makes clear that this standard includes no real-time operating notifications, and that this proposed standard deals exclusively with after-the-fact reporting. We also disagree with the stated concept of “impact event”. Including the phrase “or has the potential to impact” in the concept makes it impossibly broad for practical application and compliance.
Electric Market Policy	No	The term “impact events” does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator. As conveyed in Dominion’s comments on NERC Reliability Standards Development Plan 2011 - 2013, Dominion does not see this draft standard as needing to be in the queue while other standards having more impact to bulk electric reliability remain incomplete or unfinished.
ERCOT ISO	No	ERCOT ISO believes that according to the timelines allotted in Attachment 1, it may not be possible for the entity to identify the “known cause” of an event. The requirements list identification of “initial probable cause”. This is more reasonable under the timelines noted in Attachment 1.
Exelon	No	The purpose states that Responsible Entities SHALL report impact events - this implies that ALL impact events need to be reported regardless of magnitude, suggest rewording to say "... shall report applicable impact events ..." to allow for evaluation of each impact for applicability in accordance with Attachment 1).

Organization	Yes or No	Question 1 Comment
FirstEnergy	No	Since this standard is after-the-fact reporting, the phrase "situational awareness" may not be appropriate since that phrase is attributed by a large part of the industry to real-time, minute-to-minute awareness of the system. We suggest the following rewording of the purpose statement: "To ensure Applicable Entities report impact events and their known causes to enhance and support the reliability of the Bulk Electric System (BES)".
Indeck Energy Services	No	Suggestion: "Functional Entities identified in Section 4 shall support situational awareness of impact events and their known causes."
Independent Electricity System Operator	No	(1) Our understanding of the proposed revision as conveyed in the SAR was to provide clarity and reduce redundancy on reporting the latest and even on-going events on the system that may be caused by system changes and/or sabotage. The intent is to ensure the proper authorities are informed of such events so that they may take appropriate and necessary actions to identify causes and/or mitigate or limit the extent of interruptions. We also supported a suggestion in the SAR to assess the merit of merging CIP-001 and EOP-004 to remove redundancy, although we suggested that this should not be a presumption when revising the standard(s).This posting appears to indicate that only EOP-004 will be revised at this time, and CIP-001 which deals with sabotage reporting will remain in effect. With this assumption, the proposed standard appears to contain a mixture of reporting two types of events of different time frame - the first type being those events that need to be reported soon or immediately after they occur (e.g. impact events that appear to be the result of a sabotage) with an aim to curb/contain these events by the appropriate authorities; the second type being the events that can be reported sometime well after the fact, e.g. system disturbances due to weather or switching or other known causes that are not of malicious nature. Combining the two types of requirement does not appear to be clearly conveyed in the SAR. We therefore suggest the SDT review the main purpose

Organization	Yes or No	Question 1 Comment
		and content in the proposed EOP-004 to ensure consistency with the SAR, and in relation to the purpose and requirements already contained in CIP-004.(2) With respect to disseminating reports and related information after the fact, we wonder if a data collection process, such as RoP 1900, can serve the purpose without having to create a standard or a requirement to achieve this.(3) Most of the requirements appear to be administrative in nature and they stipulate the how but not the what, which in our view does not conform with the Results-based standard concept and does not rise to the level of a reliability standard.(4) A number of requirements proposed in the draft standard are quite vague and cannot be measured. Details of this assessment is provided below.
IRC Standards Review Committee	No	The proposed requirements in the standard are not focused on the core industry concern that current requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, “The existing requirements need to be revised to be more specific - and there needs to be more clarity in what sabotage looks like.” Instead this proposed standard includes requirements that are more focused on “how” to report, rather than “what” to report. The SAR states that: “The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.” The SRC believes the scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seem helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting

Organization	Yes or No	Question 1 Comment
		team seems to be ignored, "Consider whether separate, less burdensome requirements for smaller entities may be appropriate." The requirements for entities to develop Operating Plans and to have training for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard.
ISO New England Inc.	No	The proposed requirements in the standard are not focused on the core industry concern that current requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, "The existing requirements need to be revised to be more specific - and there needs to be more clarity in what sabotage looks like." Instead this proposed standard includes requirements that are more focused on "how" to report, rather than "what" to report. The draft 2 SAR has never been balloted for approval prior to standard drafting. In fact, the SAR states, "The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards." The scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seems helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting team seems to be ignored: "Consider whether separate, less burdensome requirements for smaller entities may be appropriate." The requirements for entities to develop Operating Plans and to have training for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard.The term "impact

Organization	Yes or No	Question 1 Comment
		events" does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC Glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator.This draft standard should not have this high a priority while other standards having a greater impact on Bulk Electric System reliability remain incomplete or unfinished.Regional reporting requirements should be in Regional Standards, and not be included in a NERC Standard.
Manitoba Hydro	No	Though new purpose greatly clarifies the proposed EOP-004-2 and using "situational awareness" is the key to this purpose, further clarification of specific items should be added to the purpose. "Responsible Entities shall report SIGNIFICANT events to support interconnection situational awareness on events that impact the integrity of the Bulk Electric System, such as islanding, generation, transmission and load losses, load shedding, operation errors, IROL/SOL violations, sustained voltage excursions, equipment and protection failures and on suspected or acts of sabotage."
Nebraska Public Power District	No	The background states there is no real-time reporting requirement in this standard, but the purpose states a purpose is for situational awareness. This implies real-time reporting. The purpose clearly identify the standard is for after the fact reporting to permit analysis of events, trend data, and identify lessons learned.
North Carolina Electric Coops	No	The term "impact event" is not a defined term in the NERC glossary and does not draw a clear boundary or give concise guidance to aid in event recognition.
Northeast Power Coordinating	No	The proposed requirements in the standard are not focused on the core industry concern that current

Organization	Yes or No	Question 1 Comment
Council		requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, "The existing requirements need to be revised to be more specific - and there needs to be more clarity in what sabotage looks like." Instead this proposed standard includes requirements that are more focused on "how" to report, rather than "what" to report. The draft 2 SAR has never been balloted for approval prior to standard drafting. In fact, the SAR states, "The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards." The scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seems helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting team seems to be ignored: "Consider whether separate, less burdensome requirements for smaller entities may be appropriate." The requirements for entities to develop Operating Plans and to have training for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard.The term "impact events" does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC Glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator.This draft standard should not have this high a priority while other standards having a greater impact

Organization	Yes or No	Question 1 Comment
		on Bulk Electric System reliability remain incomplete or unfinished.Regional reporting requirements should be in Regional Standards, and not be included in a NERC Standard.
Pacific Gas and Electric Company	No	PG&E recognizes this is an after the fact report, however, the purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. If the future intent is for this report to replace current reporting criteria the purpose statement should be expanded to reflect the true intent of the Standard.
PNM Resources	No	PNM believes the purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. It is misleading and may have many thinking it is duplicative work.
PSEG Companies	No	The following sentence should be added. "This standard is not intended to be for real-time operations reporting."
RRI Energy, Inc.	No	The purpose does not need to mention "and the reliability of the Bulk Electric System." This is the Congressional mandate in FPA Section 215, and could be attached to every Standard, guide, notice and direction issued by FERC, NERC and Regional Entities. In addition, the purpose references "Responsible Entities." However, section 4 on "Applicability" references "Functional Entities." These terms should be consistent. Therefore, the purpose statement of the proposed standard should be corrected to read, "Functional Entities identified in Section 4 shall report impact events and their known causes to support situational awareness."CONSIDERATION: Is the phrase "shall report impact events and their known causes" really a purpose of the Proposed Standard, or is it instead merely a means to achieve the purpose of situational awareness? If the latter, the purpose statement can be further shortened to read, "Functional Entities identified in Section 4 shall support situational awareness of impact events and their known causes."

Organization	Yes or No	Question 1 Comment
Santee Cooper	No	Since this standard is written to report events after-the-fact and not for a System Operator to perform corrective action, we believe the words situational awareness should be removed from the purpose. Situational Awareness is typically used for real-time operations.Also, any events that require reporting should be clearly defined in Attachment 1 and leave no room for interpretation by an entity.
SERC OC Standards Review Group	No	The term "impact events" does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator.
United Illuminating	No	UI suggests adding the phrase: and the ERO shall provide quarterly reports; Responsible Entities shall report impact events and their known causes, and the ERO shall provide quarterly reports, to support situational awareness and the reliability of the Bulk Electric System (BES).
US Bureau of Reclamation	No	The purpose is more closely related to the concept that "Responsible Entities shall document and analyze impact events and their known causes and disseminate the impact event documentation to support situational awareness". Not all impact events are to be reported. The analysis of the impact events is what is needed to achieve a lessons learned.
We Energies	No	Impact event needs to be clarified first, and DP references in Attachment 1 clarified. Distribution is not BES.
WECC	No	The purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. It is

Organization	Yes or No	Question 1 Comment
		misleading and may have many thinking it is duplicative work.
ATC	Yes	ATC agrees with the purpose statement. However, we do not agree with the implied definition of “impact events” as represented in Attachment 1. (See specific comments about what is included in Attachment 1 for the type of events that qualify as an “impact event”.)
Bonneville Power Administration	Yes	Known causes are difficult under 1 hour reporting requirements (Unusual events are even harder to narrow down in 24 hours and may take weeks.) The System Operators and RC’s handle situational awareness and reliability events, this is an extra wide view and learning for reporting only.
Dynegy Inc.	Yes	Statement is broad enough to cover both Standards.
Great River Energy	Yes	Thank you for the clarification of “known causes”, this will allow entities to report what they currently know when submitting an impact report.
MRO's NERC Standards Review Subcommittee	Yes	Thank you for the clarification of “known causes”, this will allow entities to report what they currently know when submitting an impact report.
Puget Sound Energy	Yes	However, further definition of "known causes" would be helpful as sometime the root cause analysis doesn't uncover the actual cause for sometime after the timeframes outlined in Attachment 1.

2. **Do you agree with the applicable entities in the Applicability Section as well as assignment of applicable entities noted in Attachment 1? Please explain in the comment box below.**

Summary Consideration: There was no consensus amongst stakeholders who responded to this question regarding the acceptability of the proposed list of functional entities and the assignment of applicable entities in Attachment 1.

Several respondents replied with their concern that the reporting requirements were redundant. The general sentiment was that unclear responsibility to report a disturbance could trigger a flood of event reports. Attachment 1 has been modified to assign clear responsibility for reporting, for each category of Impact Event. There was some concern expressed that there could be confusion between the reporting requirements in this standard, and those found in CIP-008. The DSR SDT agrees, and Attachment 1 Part B, has been modified to provide the process for the reporting of a Cyber Security Incident.

The DSR SDT had protracted discussions on the applicability of this standard to the LSE. Per the Functional Model the LSE does not own assets and therefore should not be an applicable entity (no equipment that could experience a “disturbance”). However, the Registry Criteria contains language that could imply that the LSE does own assets, or is at least responsible for assets. In addition, the DSR SDT modified Attachment 1 to include reporting of damage or destruction of Critical Cyber Assets per CIP-002. The LSE, as well as the Interchange Authority and Transmission Service Provider are applicable entities under CIP-002 and should be included for Impact Events under EOP-004.

There were several comments that the asset owners (GO/TO) would be less likely than the asset operators (GOP/TOP) to be aware of an impact event. The DSR SDT recognizes that this may be true in some cases, but not all. In order to meet the reliability objectives of this requirement, the applicability for GO/TO will remain as per Attachment 1.

Organization	Yes or No	Question 2 Comment

Organization	Yes or No	Question 2 Comment
American Electric Power (AEP)	No	AEP does not agree with the addition of the Generator Owner to the standard. The Generator Owner does not have visibility to the real time operational status of a unit. As a result, the Generator Owner lacks the ability to recognize impact events and report them to the Regional Entity or NERC within the time frames specified in the standard. Reporting requirements for impact events should be the responsibility of the Generator Operator.
Arizona Public Service Company	No	AZPS recommends excluding 4.1.7 Distribution Providers, as Distribution Providers generally operate at levels below 100kV.
ATC	No	The Functional Entities identified in Attachment 1 do not align with the current CIP Standard obligations (e.g. Load Serving Entities are not included).
CenterPoint Energy	No	CenterPoint Energy does not agree with the addition of Transmission Owner and Distribution Provider to the Applicability section. Transmission Owner and Distribution provider are not currently applicable entities for either CIP-001 or EOP-004 and should not be included in the proposed combined standard. However, CenterPoint Energy does agree that LSE should be removed from the Applicability section. CenterPoint Energy appreciates the SDT's efforts in assigning entities to each event in Attachment 1. This is an improvement over the existing EOP-004 standard. It is clear, however, that with multiple entities responsible for reporting each event, there is no need to expand the Applicability Section to include Transmission Owner and Distribution Provider.
Consolidated Edison Co. of NY, Inc.	No	Comments: NERC's role as the Standard enforcement organization for the power industry will be in conflict if NERC is also identified as an applicable entity. What compliance organization will audit NERC's

Organization	Yes or No	Question 2 Comment
		performance? This is presently not clear.
Constellation Power Generation and Constellation Commodities Group	No	Constellation Power Generation and Constellation Commodities Group disagrees with the inclusion of Generator Owners. Since one of the goals in revising this standard is to streamline impact event reporting obligations, Generator Operators are the appropriate entity to manage event reporting as the entity most aware of events should they arise. At times, the information required to complete a report may warrant input from entities connected to generation, but the operator remains the best entity to fulfill the reporting obligation.
E.ON Climate & Renewables	No	1. Voltage deviation events are too vague for GOP. How does voltage deviations apply to GOP's or specifically renewables i.e., wind farms? 2. Define what an "entity" is. 3. Define what a "generating station" is. 4. Define what a "BES facility" is. 5. Define what a control center is. 6. Renewable energy/generators should be taken into consideration when crafting the events.
E.ON U.S. LLC	No	The proposed standard does not list the Load Serving Entity as an Applicable Entity, but the possible events that the standard addresses are within the scope of the LSE. Some functions of the LSE listed within the Functional Model are addressed in the proposed standard. Existing CIP-001-1a and EOP-004-1 are both applicable to the LSE.
Electric Market Policy	No	Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. Attachment 1 is troublesome. The time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities

Organization	Yes or No	Question 2 Comment
		reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, we believe this subject is more complex than this table reveals and the table needs more clarification.Several of the events require filing a written formal report within one hour. For example, system separation certainly is going to require an “all hands on deck” response to the actual event. We note that the paragraph above the table in attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements.There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
ERCOT ISO	No	ERCOT ISO recommends that the Electric Reliability Organization be removed from the standard. The Electric Reliability Organization should not be responsible for reliability functions and therefore should be excluded from reliability standards.
Exelon	No	Attachment 1, Part B, footnote 1. A GO is unlikely to know if a fuel supply problem would cause a reliability concern because one GO may not know the demand for an entire region. Attachment 1, Part B, footnote 1. What is the definition of an "emergency" related to problems with a fuel supply chain? What time threshold of projected need would constitute a 1 hour report?Attachment 1, Part A - Voltage Deviations - A GOP may not be able to make the determination of a +/- 10% voltage deviation for â‰¥ 15 minutes, this should be a TOP RC function only. Attachment 1, Part A - Generation Loss of â‰¥ 2, 000 MW for a GO/GOP does not provide a time threshold. If the 2, 000 MW is from a combination of units in a single location, what is the time threshold for the combined unit loss? Attachment 1, Part A - Damage or destruction of BES equipment o The

Organization	Yes or No	Question 2 Comment
		event criteria is ambiguous and does not provide clear guidance; specifically, the note needs to provide more explicit criteria related to parts (iii) and (iv) to remove the need for interpretation especially since this is a 1 hour reportable occurrence. In addition, determination of the aggregate impact of damage may not be immediately understood - does the 1 hour report time clock start on initiation of event or following confirmation of event? o The initiating event needs to explicitly state that it is a physical and not cyber. Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security - Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard. o If the damage or destruction is related to a deliberate act, consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security event. Attachment 1, Part B - Loss of off-site power (grid supply) affecting a nuclear generating station - this event classification should be removed from EOP-004. The impact of loss of off-site power on a nuclear generation unit is dependent on the specific plant design and may not result in a loss of generation (i.e., unit trip); furthermore, if a loss of off-site power were to result in a unit trip, an Emergency Notification System (ENS) would be required to the Nuclear Regulatory Commission (NRC). The 1 hour notification in EOP-004 on a loss of off-site power (grid supply) to a nuclear generating station should be commensurate with other federal required notifications. Depending on the unit design, the notification to the NRC may be 1 hour, 8 hours or none at all. Consideration should be given to coordinating such reporting with existing required notifications to the NRC as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential transient on the unit. Attachment 1, Part B - Forced intrusion at a BES facility - Consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security event. Attachment 1, Part B - Risk to BES equipment from a non-environmental physical threat - this event leaves

Organization	Yes or No	Question 2 Comment
		the interpretation of what constitutes a "risk" with the reporting entity. Need more specific criteria for this event.Attachment 1, Part B - Detection of a cyber intrusion to critical cyber assets - Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security - Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard.
FirstEnergy	No	We do not support the ERO as an applicable entity of a reliability standard because they are not a user, owner or operator of the bulk electric system. Any expectation of the ERO should be defined in the Rules of Procedure.
Georgia System Operations Corporation	No	This standard should not apply to distribution systems or Distribution Providers. It should apply only to the BES.
Georgia Transmission Corporation	No	These events generally are Operator Functions and should not apply to a TO.1. Energy Emergency requiring system-wide voltage reduction2. Loss of firm load greater than 15 min.3. Transmission loss (multiple BES transmission elements)4. Damage or destruction to BES equipment (thru operational error or equipment failure)5. Loss of off-site power affecting a nuclear generating station
Indeck Energy Services	No	---ERO should not be included in this or any other standard! FERC can decide whether NERC is doing a good job without having standards requirements to audit to. If NERC needs to be included in a standard, then it should a stand-alone one so that the RSAW for all of the other audits don't need to include those requirements. ---"Loss of off-site power (grid supply)" is important at control centers and other large generators. The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---"Footnote 1. Report if problems with the fuel supply chain result in the projected need for emergency actions to manage reliability." is ambiguous. Everything in the

Organization	Yes or No	Question 2 Comment
		Standards program can "Affecting BES reliability". The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---"Footnote 2. Report if you cannot reasonably determine likely motivation (i.e., intrusion to steal copper or spray graffiti is not reportable unless it effects the reliability of the BES)." is well intentioned but ambiguous. For example, if I know the motivation is to blow up the plant, then by this footnote, I don't have to report. The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---All terms should be used from or added to the Glossary.
Independent Electricity System Operator	No	We do not agree with the inclusion of TO and GO. They are not operating entities and do not need to collect or provide information pertaining to impact events, which are the results and phenomena observe under operating conditions in the operation horizon, and such information collection and provision are the responsibility of the TOP and GOP.
IRC Standards Review Committee	No	Entities that have information about possible sabotage events should report these to NERC after the fact and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an EEA for example?
ISO New England Inc.	No	Having the ERO as an applicable entity raises the issue that they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC’s open process. NERC has also offered the opinion that since NERC is not a “user, owner, or

Organization	Yes or No	Question 2 Comment
		operator" Standards are not enforceable against the ERO. In Attachment 1 the time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to unnecessary and possibly conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, this subject is more complex than this table reveals, and the table needs more clarification.Entities that have information about possible sabotage events should report these to NERC after the fact, and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, it is likely that there is going to be duplicate reporting. Several of the events require filing a written formal report within one hour. For example, system separation is going to require an "all hands on deck" response to the actual event. The paragraph above the table in Attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements.There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements through NERC that cross federal agency jurisdictions.
Luminant Energy	No	Inclusion of both GO and GOP will result in duplicate reporting as both are responsible for reporting resource-related events such as Generation Loss, Fuel Supply Emergencies and Loss of Off-site power (grid supply). Recommend including only the GOP as it is critical that the GOP gather and communicate relevant information to the Reliability Coordinator.
Manitoba Hydro	No	Since this Standard is to support situational awareness, more entities should be included such as Load

Organization	Yes or No	Question 2 Comment
		Serving Entities (which was removed from EOP-004-1).
MidAmerican Energy	No	While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an energy emergency requiring public appeals?
Midwest ISO Standards Collaborators	No	While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an energy emergency requiring public appeals?
North Carolina Electric Coops	No	There is a conflict between the ERO being listed as an applicable entity and the fact that the ERO is the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that other applicable entities would be required to meet.Attachment 1 has inconsistent time frames listed for similar events. For example, EEA's are either reported within one or 24 hours depending on the nuance. Also, having more than one entity reporting an EEA can lead to conflicting information for the same event. Attachment 1 has the RC and the BA both reporting the same EEA event. Attachment 1 consolidates time frames from other standards for reporting purposes. There should either be a separate standard for "reporting" that encompasses reporting requirements for all standards or leave the time frames and reporting requirements in the original individual standards.Several of the events require filing a written formal report within one hour. For large events like cascading outages or system separation, "all hands on deck" attention will need to be given to the actual event. Although a verbal report would be allowed in certain circumstances, attention to the actual event should take precedence over formal reporting requirements.There is already a

Organization	Yes or No	Question 2 Comment
		DOE requirement to report certain events and no need to develop redundant reporting requirements in the NERC arena when this information is already available at the federal level at other agencies.
Northeast Power Coordinating Council	No	Having the ERO as an applicable entity raises the issue that they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. NERC has also offered the opinion that since NERC is not a "user, owner, or operator" Standards are not enforceable against the ERO. In Attachment 1 the time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to unnecessary and possibly conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, this subject is more complex than this table reveals, and the table needs more clarification.Entities that have information about possible sabotage events should report these to NERC after the fact, and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, it is likely that there is going to be duplicate reporting. Several of the events require filing a written formal report within one hour. For example, system separation is going to require an "all hands on deck" response to the actual event. The paragraph above the table in Attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements.There is already a DOE requirement to report certain events. We see no need to develop redundant reporting

Organization	Yes or No	Question 2 Comment
		requirements through NERC that cross federal agency jurisdictions.
Pacific Gas and Electric Company	No	PG&E recognizes the ERO is in R1, however, it does not see where the ERO's applicability is applied in Attachment 1.
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
PNM Resources	No	PNM OTS does not see where the ERO's applicability is applied in Attachment 1.
PPL Electric Utilities	No	While we agree with the applicable entities in the Applicability Section of the revised standard, we would like the SDT to reconsider the applicable entities identified on Attachment 1, specifically regarding duplication of reporting e.g. should TO and TOP report?
PPL Supply	No	While we agree with the list of functional entities identified in the Applicability Section, we do not agree with assignment of applicable entities noted in Attachment 1. As the functional entities are identified in Attachment 1, there will likely be duplicate reporting for many impact events. By applying reporting responsiblities to both the Gen Owner and Gen Operator, this will result in duplicate reporting for plants with multiple owners. It also increases the burden on the Gen Operator who is required to report the event to NERC and to other Gen Owners in a timely manner to allow other Gen Owners to meet the NERC reporting timeline. We suggest that the reporting requirements associated with generators be applied to the Gen Operator only.
RRI Energy, Inc.	No	Agree with the "Applicability" section functional categories.Agree with the Attachment 1 lists of "Entity with Reporting Responsibility," with the following exceptions:PART A"Damage or Destruction of BES Equipment" - This item has a footnote 1 listed, but nothing at the bottom of the page for a footnote. Assuming the footnote

Organization	Yes or No	Question 2 Comment
		reference is intended to reference the "Examples" at the bottom of the page, the following concerns exist:(i) "critical asset" - Is this term intended to reference a "Critical Asset" identified pursuant to the CIP-002 risk-based assessment methodology? If so, it should be capitalized. If not, who determines what constitutes a lower case "critical asset"? (ii) "Significantly affects the reliability margin of the system..." - If this is intended to be enforceable, several words need significant clarification and definition, such as "Significantly," "reliability margin," "system" (BES?), "potential," and "emergency action." The combined ambiguity of just two of those phrases would most likely result in a court holding this statement as so vague as to be unenforceable. The combined lack of clarity of all the highlighted words or phrases render this sentence meaningless.(iii) "Damaged or destroyed due to a non-environmental external cause" - "Non-environmental external cause" should be a defined term because, as is the case in item (ii) above, it is vague and subject to broad, random or arbitrary interpretation. Part B provides examples of "non-environmental physical threat" for "Risk to BES equipment." Those examples could be referenced here, or different examples included that are more applicable to the Event.The items highlighted in items (ii) and (iii) above are very similar to the unintended string of CIP-001 violations that Registered Entities experienced in 2007 and 2008 for failing to provide their own definition of "sabotage" under a sabotage reporting standard that failed to provide any guidance to the industry within the standard as to what constituted "sabotage." PART B"Detection of a cyber intrusion to critical cyber assets" - Capitalize "Critical Cyber Asset."
Santee Cooper	No	Standards cannot be applicable to an ERO because they are the compliance enforcement authority, and the ERO is not a user, owner, or operator of the BES. Since we are reporting events that may affect the BES, why does a DP need to be included as an applicable entity for this standard? If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity. If NERC is going

Organization	Yes or No	Question 2 Comment
		to require a separate reporting of events from DOE, then NERC should look at these events closely to determine if any of the defined events should be eliminated or modified from the current DOE form. (For example: Is shedding 100 MW of firm load really a threat to the BES?)Why does Attachment 1 have multiple entities reporting the same event? An RC should not have to report an EEA if the BA is required to report it. This will lead to conflicting reports for the same event.Attachment 1 is just a consolidation of the time frame from other standards. It appears no review was done for consistency of time frames for similar events.
SERC OC Standards Review Group	No	We find it interesting that the ERO is listed as an applicable entity. The ERO can't be an applicable entity because they are the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. NERC seems to be attempting to evade FERC jurisdiction by having a standard that enables it to write new rules that don't pass through the normal standards development process with ultimate approval by FERC.Attachment 1 is troublesome. The time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does an RC have to report an EEA if the BA is going to report it? This will lead to conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, we believe this subject is more complex than this table reveals and the table needs more clarification or it should be eliminated and leave the time frames in the other standards.Several of the events require filing a written formal report within one hour. For example, system separation certainly is going to require an "all hands on deck" response to the actual event. We note that the paragraph above the table in attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements.There is already a DOE requirement to report

Organization	Yes or No	Question 2 Comment
		certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
Southern Company - Transmission	No	We find it interesting that the ERO is listed as an applicable entity. The ERO is responsible for multiple requirements in this standard that shapes the ultimate actual rules that the other applicable entities would be required to meet. Can the NERC/ERO be accountable for a feedback loop to the industry? Feedback is preferable but would NERC/ERO self-report a violation to the requirement?
We Energies	No	The need for a DP to be included needs to be clarified. The Purpose points to BES. A DP does not have BES equipment.
WECC	No	The ERO's applicability is not applied in Attachment 1.
Great River Energy	Yes	We believe that it is important for the ERO to provide valuable Lessons learned to our electrical industry, thus enhancing the reliability of the BES.
Kansas City Power & Light	Yes	Consideration should be given to the need for a preliminary impact event report to be filed by the Reliability Coordinator and the Registered Entity. If two reports should be filed, should they both contain the same information.
MRO's NERC Standards Review Subcommittee	Yes	The NSRS believes it is important for the ERO to provide valuable Lessons learned to our electrical industry, thus enhancing the reliability of the BES.
TransAlta Corporation	Yes	Electrical Reliability Organization (ERO) does not appear to be a defined term in the NERC Glossary of Terms on the NERC website. Last updated April 20, 2010.

3. Do you agree with the requirement R1 and measure M1? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst stakeholders who responded to this question. There was strong support for a central system for receiving and distributing impact event reports (a/k/a one stop shopping). There was general agreement that NERC was the most likely, logical entity to perform that function. However several respondents expressed their concern that the ERO could not be compelled to do so by a requirement in a Reliability Standard (not a User, Owner or Operator of the BES). In their own comments, NERC did not oppose the concept, but suggested that the more appropriate place to assign this responsibility would be the NERC Rules of Procedure. The DSR SDT concurs. The DSR SDT has removed the requirement from the standard and is proposing to make revisions to the NERC Rules of Procedure as follows:

> 812. NERC will establish a system to collect impact event reports as established for this section, from any Registered Entities, pertaining to data requirements identified in Section 800 of this Procedure. Upon receipt of the submitted report, the system shall then forward the report to the appropriate NERC departments, applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, regulatory agencies as necessary. These reports shall be forwarded to the Federal Energy Regulatory Commission for impact events that occur in the United States. This can include state, federal, and provincial organizations. The ERO shall solicit contact information from Registered Entities appropriate governmental, law enforcement and regulatory agencies contact information for distributing reports.

The DSR SDT also believes NERC's additional concern about what data is applicable is addressed by the revisions to Attachment 1, and the inclusion of the OE-417 as an acceptable interim vehicle.

Organization	Yes or No	Question 3 Comment
WECC		R1 is appropriate for after-the-fact reporting. However, as proposed this standard eliminates all real-time notifications, including the CIP-001-1 R3 notice to appropriate parities in the Interconnection. New requirement R2.6 lists external parties to notify but it does not include the Reliability Coordinator. It is

Organization	Yes or No	Question 3 Comment
		important that the RC be notified of suspected sabotage. The RC's wide-area interconnection view and interaction with BAs may help recognize coordinated sabotage actions. Any "impact event" where sabotage is suspected as the root cause should require additional and real-time notifications.
ATC	No	ATC does not agree with R1 for three reasons:1. The ERO cannot be assigned obligations in NERC Standards. The requirements for the ERO should be addressed by a revision to Section 801 of the Rules of Procedure.2. This is a fill-in-the-blank requirement. The requirement, positioned as R1, does not allow for the obligations to be clearly defined. It refers to R6 which refers to R2 and Attachment 1. A clearer structure to the Standard would be to simply state that the Functional Entities have to meet the reporting obligations documented in Attachment 1 and delete the current R1.
BGE	No	R1 With the definition of "Impact Event", are we eliminating the term "Disturbance Reporting"? If we eliminate disturbance reporting, SDT should remove the reference from the Summary of Concepts and from the title, otherwise further definition on the distinction between the two terms is needed.R1. What is the "system" described here? What type of system is anticipated - electronic, programmatic or can it be better described by using "standard reporting form"?M1. Needs to seek evidence that the "system" was used for receiving reports, as well as distributing them.M1. Examples are more appropriately used in guidance documentation than in the standard. Rationale for R1 - Final statement regarding OE-417 needs to be removed. The ERO will establish the requirement in their "system" if the standard remains as is. The Requirement does not require the responsible entities to send OE-417 to DOE.
CenterPoint Energy	No	The ERO does not need to establish a "system for receiving reports" as the "system for receiving reports" is inherent given the requirements for reporting. The requirement also seems to add redundancy versus eliminating redundancy in the distribution of reports to applicable government, provincial or law enforcement

Organization	Yes or No	Question 3 Comment
		agencies on matters already reported by Responsible Entities. If an event is suspected to be an intentional criminal act, i.e. “sabotage”, the Responsible Entity would have contacted appropriate provincial or law enforcement agencies. The ERO is not in a position to add meaningful value to these reports as any information the ERO may provide is second hand. CenterPoint Energy recommends R1 and M1 be deleted.
City of Garland	No	Reason 1Most of this is duplication of existing processes - More “Big Government” and/or “Overhead” is not needed. There are already processes in place to notify “real time” 24 X 7 organizations that take action (RC, BA, TOP, DOE, FBI, Local Law Enforcement, etc) in response to an “impact event”. It is stated in your document on page five (5) “The proposed standard deals exclusively with after-the -fact reporting.” The combining of CIP 001 & EOP 004 should not expand on existing implemented reporting requirements nor should it result in NERC forming a 24 X 7 department to handle 1 hour (near real time) reporting requirements.Reason 2If this should go forward as drafted, NERC should not establish a “clearing house” for reporting requirements for Registered Entities without also taking legal responsibility for distributing those reports to required entities. It states in at least 2 places (Page 6 & Page 22) in the document that Responsible Entities are ultimately responsible for ensuring that OE-417 is received at the DOE. Thus, a Registered Entity could be penalized for violating this new standard if it did not file the reports with NERC or it could still be penalized (both criminal & civil) if they filed the reports with NERC but NERC (for whatever reason) did not follow through with ensuring the report was properly filed at the DOE.
Consolidated Edison Co. of NY, Inc.	No	See response to Question 2.
Duke Energy	No	The requirement again states the intent is to “enhance and support situational awareness”, which doesn’t sync with “after-the-fact reporting”. We question why NERC needs to create this report and system for

Organization	Yes or No	Question 3 Comment
		distributing impact event reports to various organizations and agencies for after-the-fact reporting, when we are still required to make real-time reports under other standards. For example, the Rational specifically recognizes that this standard won't release us from the DOE's OE-417 reporting requirement. We don't see that this provides value, unless NERC can find a way to eliminate redundancy in reporting.
Electric Market Policy	No	Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of "applicable government, provincial or law enforcement agencies" for distribution as defined in R1. The "rationale for R1" states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. It seems like the better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
ERCOT ISO	No	Recommend that requirements for the Electric Reliability Organization be removed. However, if the requirements are retained, ERCOT ISO recommends the following wording change to be consistent with other standards. "R1. The ERO shall create, implement, and maintain a system for receiving and distributing impact event reports, received pursuant to Requirement R6, to applicable government, provincial or law enforcement agencies and Registered Entities to enhance and support situational awareness."
Exelon	No	This requirement should include explicit communications to the NRC (if applicable) of any reports including a nuclear generating unit as a jurisdictional agency to ensure notifications to other external agencies are

Organization	Yes or No	Question 3 Comment
		coordinated with the NRC. Depending on the event, a nuclear generator operator (NRC licensee) has specific regulatory requirements to notify the NRC for certain notifications to other governmental agencies in accordance with 10 CFR 50.72(b)(2)(xi). In general, the DSR SDT should include discussions with the NRC to ensure communications are coordinated or consider utilizing existing reporting requirements currently required by the NRC for each nuclear generator operator for consistency.
FirstEnergy	No	FirstEnergy proposes that requirement R1 and Measure M1 be deleted.A requirement assignment to the ERO is problematic and should not appear in a reliability standard. The team should keep in mind that all requirements will require VSL assignments that form the basis of sanctions. FE does not believe it is appropriate for the ERO to be exposed to a compliance violation investigation as the ERO is not a functional entity as envisioned by the Functional Model. If this "after-the-fact" reporting is truly needed for reliability then the standard must be written in a manner that does not obligate the ERO to reliability requirements. It would be acceptable and appropriate for a requirement to reference the "ERO Process" desired by R1, however, that process should be reflected in the Rules of Procedure and not a reliability standard.
Indeck Energy Services	No	This standard is an inappropriate place to define this requirement. NERC needs to be held accountable, but it should be independent of the standard. What if NERC fails to do it by the effective date of the standard, all Registered Entities will violate the standard until NERC is done. The effective date needs to be set based on NERC completing the system defined in R1.
Independent Electricity System Operator	No	R1 does not directly convey the need for reporting. The requirement could be written to require the responsible entities to report impact events to the ERO using a process to be described in the standard and according to a set of reporting criteria. Whether or not there is a “system” makes little difference if it complies with the requirement to provide the reports on time. In addition, an ERO established system which, without

Organization	Yes or No	Question 3 Comment
		being included in the standard and posted for public comment and eventually balloted, may not be acceptable to the entities that are responsible for reporting to the ERO. Further, a reliability standard should not need to bother with how the ERO disseminate this information to applicable government, provincial or law enforcement agencies. This is the obligation of the ERO and if required, can be included in the Rules of Procedure.
ISO New England Inc.	No	Having the ERO as an applicable entity raises a concern because they are also the Compliance Enforcement Authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of "applicable government, provincial or law enforcement agencies" for distribution as defined in R1. The "rationale for R1" states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. The better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
MidAmerican Energy	No	
NERC Staff	No	NERC staff is concerned about this requirement's applicability to the ERO. We feel that such a responsibility needs mentioning in the Rules of Procedure, the Compliance Monitoring and Enforcement Program (CMEP), or in a guideline document rather than in a standard requirement. Further, the requirement specifies "how" to manage the event data, not "what" should be monitored.

Organization	Yes or No	Question 3 Comment
North Carolina Electric Coops	No	The ERO cannot be subject to a requirement for which it is the compliance enforcement authority.
Northeast Power Coordinating Council	No	Having the ERO as an applicable entity raises a concern because they are also the Compliance Enforcement Authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of "applicable government, provincial or law enforcement agencies" for distribution as defined in R1. The "rationale for R1" states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. The better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
Puget Sound Energy	No	The language of R1 and M1 does not support the DSR SDT's goal of having a single form and system for reporting. The standard should specify the form and system rather than deferring that decision to the ERO. The language of R1 and M1 leaves the form and system to the ERO's discretion, which could lead to multiple forms and frequent revisions to them. This would lead to difficulties in tracking the reporting requirements. In addition, it is impossible to comment intelligently regarding the overall impact of the proposed standard and its requirements and measures without the reporting form and system being specified in the standard.
Santee Cooper	No	It cannot apply to the ERO.
SERC OC Standards Review	No	The ERO cannot be subject to a requirement for which it is the compliance enforcement authority. The

Organization	Yes or No	Question 3 Comment
Group		governance in this situation appears incomplete.
US Bureau of Reclamation	No	This standard should describe the ERO process of event documentation, analysis, and dissemination. Allowing the ERO to develop a event documentation, analysis, and dissemination process, which becomes a requirement on the Entities, must be derived through the Standards Development Process. The requirement, as it is currently worded, allows the ERO to develop standard requirements. If the intent is to only develop a means of collecting, which does not impose a requirement, the wording should state so. Otherwise, if the ERO wants to require that reports are posted to a specific location by the Entity, then it is a requirement and must go through the Standards Development Process. Secondly, there is already a single reporting form identified. It is not clear why the SDT could not accept that form as the reporting tool.
American Electric Power (AEP)	Yes	Overall we support the concepts; however, it is unclear if the ERO can be held accountable for compliance with NERC Requirements. If this requirement is removed there needs to be some mechanism for the ERO to establish a single clearinghouse.
City of Austin dba Austin Energy	Yes	Austin Energy would like to see OE-417 incorporated into the electronic form This will reduce the callout of EOP-004-2 and OE-417 forms in our checklists / documents and one form can be submitted to NERC and DOE.
E.ON Climate & Renewables	Yes	A generic ERCO approved electronic (form that can be submitted on-line) reporting form will help to add more clarity & consistency to the Impact event reporting process.
Georgia System Operations Corporation	Yes	Yes it would reduce duplication of effort and should ensure that the various entities and agencies all have consistent information. It should be simpler and quicker to file than what is needed to meet the current

Organization	Yes or No	Question 3 Comment
		standard.However, the system should allow for partial reporting and hierarchical reporting. Entities up the ladder in a reporting hierarchy may fill in additional info (usually from a wider scope of view) than what lower level entities are aware of. It would be better for information to go up a hierarchy than for bits and pieces to go to the ERO from many entities. Terminology may be different in each of the bits and pieces yet the same idea may be intended. The ERO may mistake multiple reports as being different events when they are all related to one event.The system should give an entity the ability to select the entities that should receive the impact event report.If hierarchical reporting is not enabled by the system, then entities should be allowed to work out a reporting hierarchy as a group and entities at lower levels should not be required to report over the NERC system. Some higher level entity would enter the information on the NERC system as coordinated by the entities within a group.
Idaho Power Company	Yes	the SDT must ensure that only a single form is required for compliance (such example OE-417)
IRC Standards Review Committee	Yes	Note that ERCOT does not sign on to this particular comment.
Kansas City Power & Light	Yes	Although we support situational awareness for the other registered entities, impact event reports should be distributed anonymously to communicate the information while protecting the registered entity.
Manitoba Hydro	Yes	Yes, keeping R1 generic and pointing to “government”, “Provincial”, “law” encompasses all entities in all major interconnections.
PacifiCorp	Yes	All efforts need to be made to include OE-417 reporting requirements to safeguard against duplicate reporting and / or delinquent reporting.One report for all events is more preferable than multiple reports for one event.

Organization	Yes or No	Question 3 Comment
RRI Energy, Inc.	Yes	While including the phrase "to enhance and support situational awareness" is a good use of the Results-Based Standards development tools and framework, the phrase is already included in the purpose statement. As such, it is unnecessary in Requirement 1. If it were to be included in Requirement 1, then it would also need to be included in each of the other Requirements 2 through 8. The "Purpose" statement captures this aptly.
Southern Company - Transmission	Yes	We do have one concern in that we are hopeful that NERC will develop a system that will allow a one stop shop of reporting.
Avmeren	Yes	
Arizona Public Service Company	Yes

4. Do you agree with the requirement R2 and measure M2? Please explain in the comment box below.

Summary Consideration: Most stakeholders who responded to this question indicated disagreement with Requiremnet R2 and M2 as originally proposed. There were objections to the use of the term "Operating Plan" to describe the procedure to identify and report the occurrence of a disturbance. The DSR SDT concurs, and Operating plan has been replaced with the generic term "procedure" where appropriate believe that the use of a defined term is appropriate and has revised Requirement 1 to include Operating Plan, Operating Process and Operating Procedure.

R1. Each Responsible Entity shall have an Impact Event Operating Plan that includes [Violation Risk: Factor Medium] [Time Horizon: Long-term Planning]:

1.1. An Operating Process for identifying Impact Events listed in Attachment 1.

1.2. An Operating Procedure for gathering information for Attachment 2 regarding observed Impact Events listed in Attachment 1.

1.3. An Operating Process for communicating recognized Impact Events to the following:

1.3.1. Internal company personnel notification(s).

1.3.2. External organizations to notify to include but not limited to the Responsible Entities' Reliability Coordinator, NERC, Responsible Entities' Regional Entity, Law Enforcement, and Governmental or Provincial Agencies.

1.4. Provision(s) for updating the Impact Event Operating Plan within 90 days of any change to its content.

Other requirements reference the Operating Plan as appropriate. The requirements of EOP-004 fit precisely into the definition of Operating Plan:

Operating Plan: A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Note R2 has been moved to R1 due to elimination of original R1. Many commenters felt that the requirements around updating the Operating Plan were too prescriptive, and impossible to comply with during the time frame allowed. The DSR SDT agrees, and Requirement R2 Parts 2.5 through 2.9 have been eliminated. They have been replaced with Requirement R1, Part 1.4 to update the Operating Plan within 90 days of any change to content.

Organization	Yes or No	Question 4 Comment
Bonneville Power Administration		As long as the 2.4 list is position based, not based on each individual that fills the position. (There is a concern of listing all 2.4 monitoring/reporting personnel in the company that cover the impact event, since there are different function groups and shift work. Documentation trails are difficult with personnel changes.) Because the CIP is being added, it requires an Operating Plan (instead of procedure) with 30 day revision timelines, so it increases the burden for electrical grid event reporting function. R2.9 language refers to R8 “annual” report; however R8 language is “quarterly” reporting of past year. It appears this standard is going to be in an update status 4 times per year, plus any event modifications plus personnel changes. This could be overly burdensome due to the expanding world of cyber security.
Ameren	No	While we agree with the intent to list certain minimum requirments for the Operating Plan, the draft list is too lengthy and prescriptive. This merely creates opportunites for failure to comply rather the real purpose of reporting data that can be used to meaningfully increase the reliability of the BES by identifying trends of events that may otherwise be ignored.
American Electric Power (AEP)	No	Component 2.2 “Method(s) of assessing cause(s) of impact events” is very vague. Furthermore, there are concerns whether these methods can be accomplished within one hour as might be required per Attachment

Organization	Yes or No	Question 4 Comment
		1, in addition to operating the system. Component 2.6 - need to add the statement “as appropriate for type of impact event” Components 2.7 through 2.9 - are good concepts to consider for future inclusion, but at this point in time these appear to be overreaching objectives. We recommend the SDT take smaller increments towards future progress at measure and reasonable pace. Furthermore, if Component 2.9 is retained it should only pertain to lessons learned on the reporting of impact events not all recommendations regarding remediation of the impact events themselves. Furthermore, the 30 day window to update the Operating Plans is aggressive considering the other priorities that may be present day to day.
ATC	No	The requirement should be rewritten to simply state that the Functional Entities has to meet the reporting obligations documented in Attachment 1. How the Functional Entity meets the obligations documented in Attachment 1 should be determined by the Functional Entity, not the requirement. The prescriptive nature of this requirement does not support the performance-based Standards that the industry and NERC are striving towards. In addition, requirement 2.9 creates an alternate method for NERC to develop Standards outside of the ANSI process. This requirement dictates that Functional Entities are required to incorporate lessons learned from NERC reports into their Plan, which is a requirement of this Standard.
BGE	No	R2.1 Creates the opportunity for differences in identifying impact events. BGE recommends additional clarity in the statement. Are we to use Attachment 1 as a “bright line” or can we use our Operating Plan to identify what an impact event is?R2.4 - 2.6 Does a standard need to specify both internal and external lists? 2.7 - is “component” defined anywhere? Is it a component of the BES or a component of the Operating Plan or a component of the three lists in 2.4 to 2.6?Rationale --- Parts 3.3 and 3.4?? Do you mean 2.3 and 2.4?Is the Operating Plan under scrutiny (mandatory and compensable) for all items in the last paragraph of the rationale?

Organization	Yes or No	Question 4 Comment
CenterPoint Energy	No	CenterPoint Energy does not agree with R2 and M2 as they are focused on process and procedure. Compliance with a reporting requirement should be based on a complete and accurate report submitted in a timely manner. The process an entity uses to accomplish that task is of no consequence. CenterPoint Energy recommends R2 and M2 be deleted.However, if the SDT feels it is necessary to include this process based requirement, CenterPoint Energy believes the SDT, in requiring an overly prescriptive Operating Plan, has expanded the requirement beyond the current CIP-001-1 and EOP-004-1 which only require "...procedures for the recognition of and for making operating personnel aware..." (CIP-001-1) and "...shall promptly analyze..." (EOP-004-1). Specifically, R2.2 is not found in the current Standards. "Methods for assessing causes(s) of impact events" would vary greatly depending upon the type and severity of the event. Responsible Entities would have a difficult time cataloging these various methods to any specific degree and if they are not specific then CenterPoint Energy questions their value in a documented method. R2.3 is not found in the current Standards and is an unnecessary requirement as the method of notification is irrelevant so long as the notification is made. R2.7, R2.8, and R2.9 are also unnecessary expansions beyond what is currently in CIP-001-1 and EOP-004-1. CIP-001-1 requires the Responsible Entity review its procedures annually and CenterPoint Energy believes this is sufficient. When taken in total, R2 requires seven (7) different processes, provisions, and methods. CenterPoint Energy recommends R2.2, R2.3, R2.7, R2.8 and R2.9 be deleted and believes this will not result in a reliability gap.
City of Garland	No	There are 4 "methods" and 2 "provision" required for this requirement - in other words, 6 "paperwork" items that auditors will audit and likely penalize entities for. On page 1, the statement is made "...proposed standard in accordance with Results-Based Criteria." Having to have 4 methods and 2 provisions to end with a report (all of which is paperwork) is not a "result based" standard. It is like being required to have a "plan to plan on planning on composing and filing a report". Events need to be analyzed, communicated, and reported and

Organization	Yes or No	Question 4 Comment
		should be audited as such (results based) - not audited on whether they have a book filled with methods and provisions.
Consolidated Edison Co. of NY, Inc.	No	Requirement R2 o Lead-in paragraph - Following the words “Attachment 1” add a period and the words “The Operating Plans shall” and then delete “that” and make “includes” singular. o R2.1, 2.2, 2.3, 2.7 - Replace the word “Method(s)” with the word “Procedure(s)”. o 2.6 - After the word “notify” add a period, then insert the words “For example, external organizations may include” and delete the words “to include but not limited to.” o 2.8 - After the words “Operating Plan based on” add the word “applicable”.Rational R2After the words “Every industry participant that owns or operates,” add the words “Bulk Electric System.” Then delete the words “on the grid.”
Constellation Power Generation and Constellation Commodities Group	No	Constellation Power Generation and Constellation Commodities Group has several issues with this requirement, but in general, this requirement is heavily prescriptive, administrative in nature, and is unclear whether it will positively impact BES reliability. As examples of administrative requirements that have no impact on reliability, please consider the following comments: oListing personnel in R2.4, - merely having a list of personnel does not add to the sufficiency of an Operating Plan, but it does create a burdensome obligation to maintain a list. As well, specifying “personnel” may limit plans from designating job titles or other designations that may more appropriately and consistently carry reporting responsibility in the Operating Plan. oR2.5 is unclear as to the intent of the requirement - what is threshold of notification? Is the list to be those that have a role in the event response or a list of all within the facility who may receive news notification of the event? Also, as explained above for 2.4, a list is not a beneficial to reliability, but is administratively burdensome. oWhat is the reasoning for the 30 day timeframe in R2.7 R2.8 and R2.9? The timeframe is not based on a specific necessity, and creates an unreasonable time frame for changing the Operating Plan, in

Organization	Yes or No	Question 4 Comment
		particular if lessons learned are either short turn adjustments or comprehensive programmatic changes what warrant more time to properly institute. In addition, coupled with other requirements (R4, R5, R8), the updating requirements of R2.7, R2.8 and R2.8 potentially create a continually updating Operating Plan which could create enough confusion to reduce the effectiveness of the Operating Plan. The updating and time frame requirements do not impact reliability, but again impose significant administrative burden and compliance exposure. oR2.9 is particularly problematic for its connection to R8. R8 requires NERC to create quarterly reports with lessons learned and R2.9 requires the registered entities to amend their Operating Plans? What if NERC doesn't write an annual or quarterly report? Are the registered entities out of compliance? The "summary of concepts" for this latest revision, as written by the SDT, includes the following items: oA single form to report disturbances and impact events that threaten the reliability of the bulk electric system oOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements oClear criteria for reporting oConsistent reporting timelines oClarity around of who will receive the information and how it will be usedMany of the sub-requirements in R2 do not address any of these items and do not serve to establish a high quality, enforceable and reliability focused standard. Constellation Power Generation therefore recommends that R2 be amended to read as follows:R2. Each Applicable Entity identified in Attachment 1 shall have an Operating Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components: 2.1. Method(s) for identifying impact events listed in Attachment 12.2. Method(s) for assessing cause(s) of impact events listed in Attachment 12.3. Method(s) for making internal and external notifications should an impact event listed in Attachment 1 occur. 2.4. Method(s) for updating the Operating Plan.2.5 Method(s) for making operation personnel aware of changes to the Operating Plan.
Consumers Energy	No	R 2.7, R 2.8 and R 2.9 are creating a requirement to have procedures to update procedures. Having updated

Organization	Yes or No	Question 4 Comment
		procedures should be the requirement, no more.
Duke Energy	No	Sections 2.4 and 2.5 should allow identification of responsible positions/job titles rather than specific people. Section 2.9 only allows 30 days for updates to our plan based upon lessons learned coming out of an annual report. 60-90 days would be more appropriate. Also, Section 2.9 says it's an annual report, while R8 only requires quarterly reports.
Dynegy Inc.	No	For 2.7, 2.8, 2.9, 30 days is to stringent. Some changes may not warrant changes until a cumulative amount of changes occur. Suggest making it no later than an annual review.
E.ON Climate & Renewables	No	Administrative burden to some of the components such as 2.5.
Electric Market Policy	No	This is an overly prescriptive requirement given the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan lacks continuity with the ERO Event Analysis Process that is currently slated to begin industry field testing on October 25, 2010. Suggest the SDT coordinate EOP-004-2 efforts with this process.R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate and how will duplicative reporting be addressed (for example, DOE, Nuclear Regulatory Commission)? Also, in the "rationale for R2", please explain the reference to Parts 3.3 and 3.4.
ERCOT ISO	No	ERCOT ISO recommends the use of "Registered Entity" in place of "Applicable Entity". This would provide consistency with other requirements and Attachment 1. Recommend the following changes to the subrequirements. "2.6. List of external organizations to notify to include but not limited to NERC, Regional

Organization	Yes or No	Question 4 Comment
		Entity, relevant entities within the interconnection, Law Enforcement, and Governmental or Provincial Agencies.""2.7. Process for updating the Operating Plan within 30 days of any changes not of an administrative nature. This includes updates to reflect any lessons learned as a result of an exercise or actual event."Remove requirement 2.8 and move content to requirement 2.7."2.8. Process for updating the Operating Plan within 30 days of publication the NERC annual report of lessons learned."Add "2.9. Process to ensure updates are communicated to personnel responsible for under the Operating Plan within 30 days of the change being completed."
Exelon	No	R.2.4 and 2.5 - should not be required to have a list of internal personnel. If an entity has an Operating Plan that covers internal and external notifications that should be sufficient.R2.2.7, 2.8, 2.9 - R4 requires an annual drill. Updating the plan if required following an annual drill should be sufficientWhy does an entity need to develop a stand alone Operating Plan if there is an existing process to address identification, assessing and reporting certain events?30 day implementation for a component change or lesson learned does not seem reasonable or commensurate with the potential impact to the BES and should not be a required element of EOP-004.What is the communication protocol for lessons learned outside of the annual NERC report? What process will be followed and who will review, evaluate, and disseminate lessons learned that warrant updating the Operating Plan?
FirstEnergy	No	The term Operating Plan(s) is not the appropriate term for this standard. These should be called Reporting Plan(s). Operating Plans are usually designed to be applied during the operating timeframe. Parts 2.2 and 2.6 - We suggest changes to these two subparts as well as a new 2.2.1 and 2.6.1 as follows: 2.2. Method(s) for assessing the initial probable cause(s) of impact events(Add) 2.2.1. Method(s) for assessing the external organizations to be notified.2.6. List of external organizations to notify in accordance with Part 2.2.1. to

Organization	Yes or No	Question 4 Comment
		include but not limited to NERC, Regional Entity, and Governmental Agencies.(Add) 2.6.1. Method(s) for notifying Law Enforcement as determined by Part 2.2.1.Parts 2.4 and 2.6: This should be a list of job titles for ease of maintenance. An entity may choose to use someone in a job position that is a 24 by 7 operation with several personnel that cover that position over the 24 by 7 period. Listing each person by name should not be required as personnel change while the operating responsibility related to the job title can remain constant. We suggest changing the wording to "2.4. List of the job titles of internal company personnel responsible for making initial notification(s) in accordance with Parts 2.5.and 2.6.2.5. List of the job titles of internal company personnel to notify."Part 2.6 - We are under the impression that the phrase "include but not limited to" should not be used according to the NEW SDT guidelines. We suggest changing this to say "List of external organizations to notify that includes at a minimum, NERC, Regional Entity, and Governmental Agencies. (A provincial agency is a governmental agency)."Part 2.7. is overly burdensome. FE suggests the team revise to simply reflect annual updates that should consider component changes and updates from lessons learned. This also permits parts 2.8 and 2.9 to be deleted. FE proposes the following text for Requirement R2.7 "Annual review, not to exceed 15 months between reviews, and update as needed of the Reporting Plan that considers component changes and continuous improvement changes from lessons learned."Parts 2.8 and 2.9 - FE proposes to delete part 2.8 and 2.9. We do not see a need for these changes since the plan must be updated annually and will cover lessons learned.
Great River Energy	No	A. As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. R2.8, and R2.9 do not have a correlation to R2’s Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change. We believe that the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in

Organization	Yes or No	Question 4 Comment
		the components of an entity's Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the words "lessons learned" would be required to be in your Operating Plan. It is solely up to an entity to implement a "Lesson Learned" and not the place for this SDT to require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. B. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. We suggest that lessons learned should be incorporated within 12 calendar months if lessons learned are not deleted from the R2.8 & R2.9.
Green Country Energy	No	Highly administrative version of what could accomplish the same thing. A requirement that the applicable entitiy shall make appropriate notificatiions as required by attachment A and B events. I can see the need for review and lessons learned but that needs to be done at a higher level since many entities may be involved in an "event"
Idaho Power Company	No	The SDT needs to clarify Requirement 2.9 references an annual report issued persuant to requirement R8, however Requirement 8 references a quarterly report. These requirements should have the same time frames.
Indeck Energy Services	No	R2 needs to state that the Operating Plan needs to only those Attachment 1 events applicable to the Registered Entity. The Operating Plan should contain a list of these events so that the other Requirements can reference the Operating Plan and not Attachment 1 for the list of events. For example a GO/GOP <2,000 MW would not need to address this type of event and it wouldn't be listed in its Operating Plan. It would be unnecessarily cumbersome, to describe events which are not covered within the Operating Plan.
Independent Electricity System	No	R2 is not needed. An entity does not need to have an "operating plan" to identify and report on impact events;

Organization	Yes or No	Question 4 Comment
Operator		it needs only to report on the events listed in Attachment 1 in a form depicted in Attachment 2. How does the entity do this, and whether or not an operating plan is in place, or whether its staff is trained to provide the report should not need to be included in a reliability standard for so long as the responsible entity provides the report in the required form on time. If the responsible entity fails to report the listed events in the depicted format, it will be found non-compliant, and that's it - no more and no less. If the "operating plan" really means an established data collection and reporting procedure, then the requirement should be revised to more clearly convey the intent.
IRC Standards Review Committee	No	The SRC suggests that this is not, in fact, an Operating Plan. At most, it may be a reporting plan or reporting procedure. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject.As proposed, the Operating Plan is not required to ensure bulk power reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. The Operating Plan requirements as proposed seem only to be suitable for real-time notifications. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient. Unlike the real-time operating notifications which have relatively short reporting time frames, there is sufficient time for personnel to make appropriate communications within their organizations to make timely after the fact reports under NERC Section 1600 authority. Would it be feasible for NERC to issue a standing requirement for timely after-the-fact reports under NERC Section 1600 authority?
ISO New England Inc.	No	This is an overly prescriptive requirement given that the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan is an unnecessary burden that offers no additional improvements to

Organization	Yes or No	Question 4 Comment
		the reliability of the Bulk Electric System, and this is not, in fact, an Operating Plan. At most, it may be a reporting plan. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject.As proposed, the Operating Plan is not required to ensure Bulk Electric System reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient.Stating reporting requirements directly in the standard would produce a more uniform and effective result across the industry, contributing towards a more reliable Bulk Electric System.R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate, and how will duplicative reporting be addressed (for example, DOE, Nuclear Regulatory Commission)? Also, in the “rationale for R2”, please explain the reference to Parts 3.3 and 3.4.
Kansas City Power & Light	No	We agree with the rationale for R8 requiring NERC to analyze Impact Events that are reported through R6 and publish a report that includes lessons learned but disagree with R2.9 obligating an entity to update its Operating Plan based on applicable lessons learned from the report. Whether lessons learned are applicable to an entity is subjective. If an update based on lessons learned from an annual NERC report is required, the requirement should clearly state the necessity of the update is determined by the entity and the entity’s Reliability Coordinator or NERC can not make that determination then find the entity in violation of the requirement. In addition, if an update based on lessons learned from a NERC report is required, NERC should publish the year-end report (R8) on approximately the same day annually (i.e. January 31) and allow

Organization	Yes or No	Question 4 Comment
		an entity at least 60 days to analyze the report and incorporate any changes it deems necessary in its Operating Plan. In addition, the language using quarterly and annual as a requirements between R2.9 and R8 is confusing.
MidAmerican Energy	No	R2 and R5 coupled with R8 will drive quarterly updates (in addition to drills, etc) and training to the literally hundreds to thousands of people per company for the proper internal operating personnel and management will actually hurt the development of a culture of compliance by overwhelming personnel with constant plan changes and training.The standards drafting team should remove all 30 day references or provide the technical basis of why revising plans and training to “changes and lessons learned” quarterly all within 30 days is the right use of reliability resources to improve the grid.The addition of the 30 day constraints and new vague criteria in Attachment one such as “damage to a BES element through and external cause” or “transmission loss of multiple BES elements which could mean two or more” is the opposite of clear standards writing or results based standards. We disagree with requiring an Operating Plan for identifying, assessing, and reporting impact events. This is an administrative requirement that has no clear reliability benefit. Furthermore, it is questionable that event reporting even meets the basic definition of an Operating Plan. Per the NERC glossary of terms, Operating Plans contain Operating Procedures or Operating Processes which encompass taking action real-time on the BES not reporting on it. As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. R2.8, and R2.9 do not have a correlation to R2’s Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change, the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in the components of an entity’s Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the

Organization	Yes or No	Question 4 Comment
		words “lessons learned” would be required to be in your Operating Plan. It is solely up to an entity to implement a “Lesson Learned” and not the place for this SDT to require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. The NSRS recommends to incorporate lessons learned within 12 calendar months if lesson learned are not deleted from the R2.8 & R2.9.
Midwest ISO Standards Collaborators	No	We disagree with requiring an Operating Plan for identifying, assessing, and reporting impact events. This is an administrative requirement that has no clear reliability benefit. Furthermore, it is questionable that event reporting even meets the basic definition of an Operating Plan. Per the NERC glossary of terms, Operating Plans contain Operating Procedures or Operating Processes which encompass taking action real-time on the BES not reporting on it. What is an impact event? It appears that this undefined, ambiguous term was substituted for sabotage which is also undefined and ambiguous. One of the SARs stated goals was to “provide clarity on sabotage events”. This does not provide clarity.
MRO's NERC Standards Review Subcommittee	No	A. As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. R2.8, and R2.9 do not have a correlation to R2’s Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change. The NSRS believes the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in the components of an entity’s Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the words “lessons learned” would be required to be in your Operating Plan. It is solely up to an entity to implement a “Lesson Learned” and not the place for this SDT to

Organization	Yes or No	Question 4 Comment
		require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. B. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. The NSRS recommends to incorporate lessons learned within 12 calendar months if lesson learned are not deleted from the R2.8 & R2.9.
North Carolina Electric Coops	No	This requirement dictates details of documentation of after-the-fact reporting of events which cannot impact reliability of the BES and, as such, should not be a reliability standard. The cost and burden of becoming auditably compliant with this requirement can be extreme for small entities.
Northeast Power Coordinating Council	No	This is an overly prescriptive requirement given that the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan is an unnecessary burden that offers no additional improvements to the reliability of the Bulk Electric System, and this is not, in fact, an Operating Plan. At most, it may be a reporting plan. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject.As proposed, the Operating Plan is not required to ensure Bulk Electric System reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient.Stating reporting requirements directly in the standard would produce a more uniform and effective result across the industry, contributing towards a more reliable Bulk Electric System.R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate, and how will duplicative reporting be addressed (for example, DOE,

Organization	Yes or No	Question 4 Comment
		Nuclear Regulatory Commission)? Also, in the “rationale for R2”, please explain the reference to Parts 3.3 and 3.4.
Pacific Gas and Electric Company	No	PG&E would like clarification on whether the 30 days, is calendar days or business days.
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
Pepco Holdings, Inc - Affiliates	No	For R 2.7, 2.8 and 2.9, 30 days may be too short a time for large entities with multiple subsidiaries to do the necessary notice and coordination. PHI suggests 90 days.
PNM Resources	No	PNM would like clarification on whether the 30 days, is calendar days or business days.
PPL Electric Utilities	No	While we agree with documenting our process, we feel the use of the defined term Operating Plan is not required and possibly a misuse of the term. We would like to suggest using the term ‘procedure’. Additionally, we would like the SDT to confirm/clarify whether Attachment 1 is a complete list of impact events. Also, please confirm that the Proposed R2.1 language ‘Method(s) for identifying impact events’ means identifying impact event occurrence as opposed to identifying list of impact events. i.e. does R2.1 mean recognize impact event occurrence?
PPL Supply	No	While we agree with concept addressed in R2, we don't agree with use of the defined term Operating Plan. Consider working the requirement as follows: "Each Applicable Entity identified in Attachment 1 shall have a documented process or program that includes the following components:..." Also, please consider changing 2.1 to be"Method(s) for recognizing the occurrence of impact events." The current wording could be

Organization	Yes or No	Question 4 Comment
		interpreted to mean, "create a list of the impact events."
Puget Sound Energy	No	While the concept of an operating plan is reasonable, the requirements for update in sections 2.7, 2.8 and 2.9 will lead to an immense amount of work for the entities subject to the standard. In addition, constant revisions to the operating plan makes it difficult to cement a habit through this procedure. The proposed update schedule does not strike the appropriate balance between the need to respond to lessons learned and the value of plan continuity.
RRI Energy, Inc.	No	1. R2 includes the phrase "for identifying, assessing and reporting," followed by R2.1 which states "identifying," R2.2 which states "assessing" and both R2.3 and R2.6 state "notify" or "making internal and external notifications" (i.e., reporting). The language is unnecessarily redundant. RECOMMENDATION: Reword R2 phrase "for identifying, assessing and reporting," to simply state, "for addressing."2. Rationale for R2 - The rationale section for R2 references in the third paragraph "Parts 3.3 and 3.4." Was this intended to reference R2.3 and R2.4?
Santee Cooper	No	The words “operating plan” should be removed from the requirement. This standard deals exclusively with after-the-fact reporting. This requirement is also overly prescriptive.
SERC OC Standards Review Group	No	This is an overly prescriptive requirement that dictates details of documentation and, as such, has no place in a reliability standard. NERC needs to trust the RCs to do their jobs; this standard and this requirement in particular seems to be attempting to codify the actions that an RC would take in response to an event. The cost and burden of becoming auditably compliant with this requirement is extreme and unrealistic, especially on small entities

Organization	Yes or No	Question 4 Comment
Southern Company - Transmission	No	The Operating Plan has a different connotation for different operations folks. We suggest that we call it an Impact Event Reporting Plan.
Tenaska	No	We have adequate compliance procedures already in place for the existing CIP-001-1 and EOP-004-1 Standards. The list of required “Operating Plan” components in the proposed R2 is too specific. Maintaining the “Operating Plan” described in R2 would increase the burden on Registered Entities to comply with the Standard and this type of "laundry list" Requirement would make it more difficult to prove compliance with EOP-004-2 during an audit.
United Illuminating	No	R2.9 requires provisions to update the Operating Plan based on the annual ERO report developed in R8. The ERO report does not appear to be providing lessons learned to be applied to the Operating Plan for impact event reporting, but more focsed on trends and threats to the BES. Also 30 days after the report is published by NERC is not enough time for the entity to read, and assess the report, and then to administratively update the Operating Plan. UI agrees that the Operating Plan should be reviewed annually and updated subsequent to the review within 30 days.
US Bureau of Reclamation	No	R2 does not reconcile with Attachment A or the sub paragraphs. As an example, the requirement 2.6 states "List of organizations to notify ...." All sub paragraphs use the term notify. Notify as used in Attachment A is when a report cannot be provided in the time frame listed in Attachment A. Therefore there is no requirement in this standard for the Operating Plan to have a provision for reporting.The subparagraph 2.8 indicates that the Entity must update it plan based on the lessons learned published by NERC. It would be appropriate to require a review and update of the plan based on the lessons learned.

Organization	Yes or No	Question 4 Comment
We Energies	No	R2.3, R2.4: “Part” is not a defined term or used in the NERC Standard Process Manual.R2: Attachments are not mentioned in the NERC Standard Process Manual. Is this a mandatory or informational part of the standard?R2.6 (and possibly R2.5): There does not seem to be discretion in notifications. Are all people or organizations on the notify lists always contacted for every impact event? Even Law Enforcement?R2.7: What is a “component? A Plan component? A BES component?R2.9: There is no annual NERC report issued pursuant to R8. R8 requires quarterly reporting.
WECC	No	Need clarification on whether the 30 days is calendar days or business days. As noted in the comment to question 3, any impact event where sabotage is suspected should be treated differently from those where sabotage is not suspected.
Arizona Public Service Company	Yes	AZPS agrees with R2, however, the use of the term "Operating Plan" is confusing. A more accurate term would be "Event Reporting Plan."
ATCO Electric Ltd.	Yes	
City of Austin dba Austin Energy	Yes	
Georgia System Operations Corporation	Yes	An entity-developed Operating Plan will allow the flexibility needed to address different entity relationships around the country, e.g., generating companies, cooperatives, munis, large IOUs, small IOUs, RTOs/ISOs, non-independent market area, and so on.However, all applicable entities should not be required to report directly to NERC or the region. The system should allow for partial reporting and hierarchical reporting. Entities within an area should be allowed to coordinate their plans to define reporting procedures within their area. They could have an entity at some wide scope top level that reports to NERC and the region the

Organization	Yes or No	Question 4 Comment
		information collected from multiple narrow scope lower levels within their wide area. If every small lower level entity directly reported to NERC and the Region, it could create situational confusion rather then situation awareness.
Manitoba Hydro	Yes	R2 - 2.1 to 2.9 detail what is expected of an Operating Plan for Impact Events.The attachment 1 details the event, the threshold parameters and time line. Though the threshold parameters in the attachment may be questioned, this greatly clarifies the expectations of reporting events. Further events should be added to this list:"Detection of suspected or actual or acts or threats of physical sabotage"
Luminant Energy	Yes	
Nebraska Public Power District	Yes	
NERC Staff	Yes	
PacifiCorp	Yes	
PacifiCorp	Yes	
TransAlta Corporation	Yes	

5. Do you agree with the requirement R3 and measure M3? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst stakeholders who responded to this question. Requirement R3 has been re-written to exclude the requirement to "assess the initial probable cause". The only remaining reference to "cause" is in the Impact Event Reporting Form (Attachment 2). Here, there is no longer a requirement to assess the probable cause. The probable cause only needs to identified, and only if it is known at the time of the submittal of the report.

Organization	Yes or No	Question 5 Comment
Ameren	No	There are too many missing details on how this will be accomplished. As stated before, this Draft requires too much time be invested in verbal reports, "Preliminary" reports, "Final" reports and even "Confidential" reports (Attachment 2). If the goal is to report ASAP details on events which could impact BES reliability, all of these reports will need to be made at the worst possible time - when Operators are trying to collect data, analyze what they find and correct major problems on the system. And if the reports are wrong or not issued fast enough, the Operators will be keenly aware of potential fines and violations.
American Electric Power (AEP)	No	Not clear how this is different from R6 since it relies on the same timetable in Attachment 1.
ATC	No	ATC believes that this requirement should be deleted and that the SDT should coordinate its goal with the EAWG. We believe that the lessons learned process and identification of root cause is better covered under that process than through the NERC Mandatory Standards.
BGE	No	R3. Limits responsibility to Attachment 1 events only and mandates that an "initial probable cause" be identified. Are we at liberty to define "initial probable cause" and define time period for completion in the Operating Plan? BGE believes this could cause wide difference between Operating Plans and the standard

Organization	Yes or No	Question 5 Comment
		should be more prescriptive by relating to a time-table for the life of an impact event, including expected identification time, initial assessment time and analysis time leading to the reporting deadlines.BGE recommends not including examples of evidence in a measure but include it in a Guideline. Including in a measure will be translated as a requirement by an auditor.
CenterPoint Energy	No	CenterPoint Energy does not agree with R3 and M3 as written as the Company does not agree with the requirement to have an Operating Plan (see comments to Q4 above). However, if R2 and M2 were to be deleted, and R3 was revised to read; “Each Applicable Entity shall identify and assess initial probable cause of events listed in Attachment 1.”, CenterPoint Energy could agree with this requirement.
City of Garland	No	Should be part of R2 or R6 - this is unnecessary duplication
Constellation Power Generation and Constellation Commodities Group	No	This requirement introduces double jeopardy for registered entities. If an entity does not include methods for identifying impact events and for assessing cause per R2.1 and R2.2 in their Operating Plan, they will be out of compliance with R2. Without the methods in R2 the registered entity is out of compliance with R3 as well for failing to identify and assess. Constellation Power Generation therefore recommends that R3 be amended to be incremental to R2 and read as follows: R3. Each Applicable Entity shall implement their Operating Plan(s) to identify and assess cause of impact events listed in Attachment 1.
Electric Market Policy	No	We think “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build audit ready compliant procedures.
ERCOT ISO	No	ERCOT ISO recommends the use of “Registered Entity” in place of “Applicable Entity”. This would provide consistency with other requirements and Attachment 1. The measure for this requirement notes the obligation

Organization	Yes or No	Question 5 Comment
		for “documentation”. This is not addressed in the requirement. The measure also notes “on its Facilities”. This clarification of scope should be addressed in the requirement. R3. Each Registered Entity shall identify, assess, and document initial probable cause of impact events on its Facilities listed in Attachment 1.
Exelon	No	: Agree that Each Applicable Entity shall identify and assess initial probable cause of impact events; disagree with aspects and time requirements in Attachment 1.
FirstEnergy	No	M3 - Power flow analysis would be used to assess the impact of the event on the BES, not to determine initial probable cause. It is more likely that DME would provide the data for the initial probable cause evaluation. We suggest rewording M3 as follows: "To the extent that an Applicable Entity has an impact event on its Facilities, the Applicable Entity shall provide documentation of its assessment or analysis. Such evidence could include, but is not limited to, operator logs, voice recordings, or disturbance monitoring equipment reports. (R3)"
Green Country Energy	No	Actually yes and no... An event may be caused, analyzed and corrected by one entity but most likely it will involve more. Low Voltage or frequency may not be caused by a generator but the generator will see the event and to have the generator assess the probable cause seems inappropriate. I can see reporting the event and duration and making notifications.
Indeck Energy Services	No	R3 should reference the events covered by the Operating Plan, as listed in it, rather than in Attachment 1. If the Plan is deficient, it is a violation of R2 and not every other Requirement that references the Plan.
Independent Electricity System Operator	No	We agree that the responsible entity needs to identify and assess initial probable cause of impact events but not in accordance with any operating plan in R2. Each operating entity (RC, BA, TOP) has an inherent responsibility to identify the cause of any system events to ensure it complies with a number of related

Organization	Yes or No	Question 5 Comment
		operational standards. R3, in fact, could be revised to require the Responsible Entity to include the probable cause of impact events in its report, rather than asking it to "identify and assess" since this is not measurable. Also, the ERO may be removed from the Applicability Section depending on the response to our comments under Q9.
IRC Standards Review Committee	No	Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes quite some time for an actual cause to be determined. The determination process may require a root cause analysis of some complexity.Further, in the case of suspected or potential sabotage, the industry can only say it doesn't know, but it may be possible. It really is the law enforcement agencies who make the determination of whether sabotage is involved and the info may not be made available until an investigation is completed, if indeed it is ever made available.
ISO New England Inc.	No	We think "impact event" needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditable compliance procedures.Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes a considerable amount of time for an actual cause to be determined. The determination process may require a complex root cause analysis.Further, in the case of suspected or potential sabotage, the industry can only say it doesn't know, but it may be possible. Law enforcement agencies make the determination of whether sabotage is involved, and the information may not be made available until an investigation is completed, if indeed it is ever made available.
Kansas City Power & Light	No	We believe R3 and M3 are unnecessary as a stand alone requirement and measure and propose combining this requirement and measure with R6 and M6. Identifying and assessing the initial probable cause of an

Organization	Yes or No	Question 5 Comment
		impact event is the obvious starting point in the reporting process and ultimate completion of the required report. Evidence to support the identification and assessment of the impact event and evidence to support the completion and submittal of the report are really one in the same.
Manitoba Hydro	No	Though each local entity should identify and assess initial probable cause of impact events as per their Operating Plan, the creation of this Operating Plan could be labor intensive and also guidelines for consistency within an RC region should be created.So “NO” is entered simply because a large time line would be needed to properly and efficiently implement R3 and R4.
MidAmerican Energy	No	
Midwest ISO Standards Collaborators	No	While we agree that it makes sense to report on the cause of an event, we disagree with the need for an Operating Plan as identified in R2.
North Carolina Electric Coops	No	The term “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditably compliant procedures and give guidance on what is proper to report.
Northeast Power Coordinating Council	No	"Impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditable compliance procedures.Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes a considerable amount of time for an actual cause to be determined. The determination process may require a complex root cause analysis.Further, in the case of suspected or potential sabotage, the industry can only say it doesn’t know, but it may be possible. Law enforcement agencies make the determination of whether sabotage is involved, and the information may not be made

Organization	Yes or No	Question 5 Comment
		available until an investigation is completed, if indeed it is ever made available.
Pacific Northwest Small Public Power Utility Comment Group	No	Comments: When applying R3 to row 11 of attachment 1, the comment group notes that applicable entities are expected to assess probable cause of BES equipment damage, including that which may be the result of criminal behavior. At best this would needlessly duplicate the efforts of law enforcement. A more likely result is that entity involvement would interfere with law enforcement and ultimately hinder prosecution of those responsible. Also See #15
PPL Electric Utilities	No	We believe the rationale for R3 is good and provides value. However, we feel the clarity was lost when the rationale was translated to the standards language. Please consider revising language to refocus on rationale of assess and report per Attachment 1 as opposed to identify. We suggest changing the word “identify” to “recognize” and add the Rationale statement to the requirement as follows: “Each Applicable Entity shall assess the causes of the reportable event and gather available information to the complete the report.”
PPL Supply	No	Please consider changing the word "identify" to "recognize" and adding the Rationale statement to the requirement as follows: "Each Applicable Entity shall assess the causes of the reportable event and gather available information to complete the report."
RRI Energy, Inc.	No	"Identify and assess" - Auditors are as much in need of clearly worded, unambiguous Reliability Standards are as Registered Entities. This phrase leaves much too wide a range of interpretations, almost guaranteeing regular and frequent disagreements during an audit between Registered Entity and Regional Entity auditor as to what constitutes "identify and assess" sufficient to meet the intent of this Requirement. Compounding this issue is the Rationale for R3 that states an Applicable Entity (which should probably read "applicable

Organization	Yes or No	Question 5 Comment
		Functional Entity") should "gather enough information to complete the report that is required to be filed." While Rationale statements are not technically part of the standard, this emphasizes the current wording of the requirement as subject to random and arbitrary interpretation by auditors and Registered Entities. RECOMMENDATION: Change "identify and assess" to "document," so that the Requirement now reads "Each Applicable Entity shall document initial probable cause of impact events..." including an option for "cause not determined".
Santee Cooper	No	Does the initial probable cause have to be reported within the timing associated in Attachment 1? Entities may not have enough information that soon to report the initial probable cause. This should be done with events analysis.
SERC OC Standards Review Group	No	We think “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditably compliant procedures.
Tenaska	No	The probable cause of a reportable event is already required to be submitted on the OE-417 form. This Requirement is redundant.
TransAlta Corporation	No	Clarity required Does an entity have to report on the cause of every “applicable” impact event they witness even though the event did not originate at their plant, system or region and did not adversely affect them? Essentially this would require every entity that witnessed an “applicable” event to report on its cause. In most cases they will not know the cause if they did not create the event. Measure M3 should reference Attachment 1 to indicate the Time to Submit Report’.
We Energies	No	A DP may not have Facilities (a BES element). See NERC Glossary definition of Facility.

Organization	Yes or No	Question 5 Comment
Bonneville Power Administration	Yes	Known causes are difficult under 1 hour reporting requirements. (Unusual events are even harder to narrow down in 24 hours and may take weeks.)
Consolidated Edison Co. of NY, Inc.	Yes	We agree, however, the term “impact event” must be part of the NERC glossary.
Georgia System Operations Corporation	Yes	It directly supports the purpose of the standard.
Great River Energy	Yes	While we agree that it makes sense to report on the cause of an event, we disagree with the need for an Operating Plan as identified in R2
MRO's NERC Standards Review Subcommittee	Yes	The NSRS thanks the SDT for stating “initial probable cause” as this is in direct correlation to the Purpose which states “known causes”.
Puget Sound Energy	Yes	However, this requirement doesn't address the timing required for this analysis. This may be intentional and appreciated because at times the analysis can take months when the events are complex in nature.
US Bureau of Reclamation	Yes	This is provided that the report submitted in Attachment A does not include the probable cause. It is highly unlikely that a probable cause may be determined within the reporting timelines.
Arizona Public Service Company	Yes	
ATCO Electric Ltd.	Yes

WECC	Yes	

6. Do you agree with the requirement R4 and measure M4? Please explain in the comment box below.

Summary Consideration: Note R4 has been moved to R3 due to rearranging of requirements. The DSR SDT did a full review based on comments that were received. R3 now is stream lined to read:

R3. Each Responsible Entity shall conduct a test of its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3 at least annually, with no more than 15 months between such tests. The testing of the procedure (as stated in R1) is the main component of this requirement. Several commenters provided input that too much "how" was previously within R3 and the DSR DST should only provide the "what". The DSR SDT did not provide any prescriptive guidance on how to accomplish the required verification within the rewrite. Testing of the entity's Operating Process (R1) could be by an actual exercise of the process (testing as stated in FERC Order 693 section 471), a formal review process or real time implementation of the process. The DSR SDT reviewed Order 693 and section 465 directs that processes "verify that they achieve the desired result". This is the basis of R3, above.

Organization	Yes or No	Question 6 Comment
Ameren	No	Establishing a program with trigger actions expected to require reporting several times a year, combined with adequate initial, and on-going, training should preclude the need for mandatory drills as an added compliance burden.
ATC	No	We do not believe that a drill that exercises a written reporting obligation will add additional reliability to the BES.
BGE	No	M4. BGE recommends not including examples of evidence in a measure but include it in a Guideline. Including in a measure will be translated as a requirement by an auditor.Rationale for R4: If multiple

Organization	Yes or No	Question 6 Comment
		exercises are performed are all of them subject to the sub-R2 requirements and to audit/audit findings?
Bonneville Power Administration	No	There was no drill required for CIP-001 (a drill was in CIP-008, but the purpose did not list combining CIP-008). A drill is not needed for reporting Electrical Grid events, designate it as excluded in the intent of the requirement.
CenterPoint Energy	No	CenterPoint Energy does not agree with R4 and M4. See comments to Q4 above. In addition to the process vs. results based issue stated above, CenterPoint Energy believes conducting a drill to verify recognition, analysis, and reporting procedures is a waste of valuable resources and time.
City of Garland	No	Existing CIP 001 and EOP 004 are reporting standards - neither currently requires annual drills or exercises. Combining these two (2) should not entail expanding the requirements to include drills or exercises. There are existing drills / exercises that must be performed annually for compliance with CIP 008 & CIP 009 which require the same basic identifying, assessing, developing lessons learned, responding, and reporting skill sets. Requiring additional drills or exercises for this new combined standard will provide additional “business overhead” that results in basically nothing that is not obtained by the CIP 008 / 009 drills as far as securing or making the BES reliable. It does, however, result in additional audit risk at audit time.
Constellation Power Generation and Constellation Commodities Group	No	It is not clear how this requirement to conduct drills and exercises relates to the concepts spelled out by the SDT:oA single form to report disturbances and impact events that threaten the reliability of the bulk electric systemoOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirementsoClear criteria for reportingoConsistent reporting timelines oClarity around of who will receive the information and how it will be usedR4 does not address any of the above items and should therefore be removed from this standard.

Organization	Yes or No	Question 6 Comment
Consumers Energy	No	NERC should either standardize on a 12 month year or an annual year for reviews.
Dynegy Inc.	No	What is the basis for the drill being annual. This is to stringent. I suggest it be every 3 years.
Electric Market Policy	No	The need for a periodic drill has not been established and appears to be overly restrictive given the intent of the standard is reporting of impact events. Suggest this requirement be eliminated.
ERCOT ISO	No	ERCOT ISO believes that a drill or exercise of its Operating Plan is unnecessary. The intent of the drill can be addressed within the training requirements under R5.
Exelon	No	If drills remain as a component of the standard, an effort to consolidate updating an entities plan with a requirement to drill the plan should be made. . Each entity/utility should be able to dictate/determine if they need a drill for a particular event. Is this document implying a drill for every type of event?
FirstEnergy	No	FE suggests that this requirement be deleted. FE does not see a reliability need for conducting a drill on reporting. This is overly burdensome and should not be included within this reliability standard. Training on the plan and periodic reminder of reporting obligations should suffice.
Great River Energy	No	We disagree with the need to conduct a drill for reporting
Green Country Energy	No	Another training requirement with what benefit? We must train on all of our NERC requirements now anyway to insure compliance and that's not a requirement, thats implied and I think thats enough.
Indeck Energy Services	No	In M4, it is suggested that data from a real event would be evidence. R4 should be satisfied if the Operating

Organization	Yes or No	Question 6 Comment
		Plan is used for a real event within 15 months of the last drill or event.
Independent Electricity System Operator	No	Along the line of our comments on R2 for an operating plan (whose need we do not agree with), a drill, exercise, or Real-time implementation of the Operating Plan for reporting is also not necessary.
IRC Standards Review Committee	No	Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are really training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in a short time frame as may be required for real-time operating notifications.
ISO New England Inc.	No	The need for a periodic drill has not been established, and appears to be overly restrictive given the intent of the standard is the reporting of impact events. Suggest this requirement be eliminated. Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in as short a time frame as may be required for real-time operating conditions notifications.
Kansas City Power & Light	No	We believe R4 and M4 are clearly unnecessary. Thoughtful preparation of an Operating Plan per R2 that specifically addresses personnel responsibilities and appropriate evidence gathering combined with the training requirement in R5 is sufficient.
Luminant Energy	No	We support the requirements outlined in R2 which create significant obligations to maintain and update the required Operating Plan. However, we believe annual drilling for a reporting process seems unnecessary, particularly given the response horizon of 24 hours for the majority of impact events. If drilling is required, the

Organization	Yes or No	Question 6 Comment
		standard should allow actual events to fulfill a drilling requirement as stated in the Rationale for R4 and within the text of M4.
Manitoba Hydro	No	Drills and exercise for implementation of the Operating Plan are important and critical, but as in question 5, or Requirement R3, careful and detailed creation of the Operating Plan are crucial to facilitate proper training, drills and exercises.So "NO" is entered simply because a large time line would be needed to properly and efficiently implement R4 and R3.
MidAmerican Energy	No	
Midwest ISO Standards Collaborators	No	We disagree with the need to conduct a drill for reporting.
North Carolina Electric Coops	No	Requiring a drill for "reporting" is unnecessary and burdensome. Reporting is covered in processes and procedures and during the normal training cycle. We recommend the elimination of this requirement.
Northeast Power Coordinating Council	No	The need for a periodic drill has not been established, and appears to be overly restrictive given the intent of the standard is the reporting of impact events. Suggest this requirement be eliminated. Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in as short a time frame as may be required for real-time operating conditions notifications.
Pacific Gas and Electric	No	PG&E believes the addition of a drill constitutes additional training and should be added to R5. PG&E is

Organization	Yes or No	Question 6 Comment
Company		concerned as to who the target audience for this annual training would affect.
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
PNM Resources	No	PNM feels the addition of a drill or exercise constitutes additional training and believes R4 should be added to R5. The WECC OTS also is interested as to what level does the annual training target, for instance, the field personnel. Will they have to complete the exercise/drill?
RRI Energy, Inc.	No	Every employee in a Registered Entity might potentially have exposure to an impact event, and therefore result in a list of thousands of employees subject to the EOP-004-2 Operating Plan. Does this mean, for example, an applicable Functional Entity with 3,000 employees, each capable of potentially observing an impact event, must include them in the drill, exercise, or Real-Time implementation? Such an expectation would require a hypothetical email notice to be sent to 3,000 employees, advising them "This is a test - You observe a suspicious vehicle driving around the fence of your power plant. Perform the next action you should take." The result in this hypothetical might be 3,000 phone calls and emails to the responsible employee in the applicable Functional Entity, each needing to be documented and retained for the audit period.As stated above in question 5, auditors need guidance as much as Registered Entities. Otherwise, it is observed that they will seek the most stringent approach they observe from the best of the best practices over the first year of implementation and apply that expectation as the base-case, under which all other approaches will be deemed violations.
Santee Cooper	No	There is no need to drill for administrative reporting! This requirement should be deleted.

Organization	Yes or No	Question 6 Comment
SERC OC Standards Review Group	No	We think this requirement is unclear - we think it requires a drill for “reporting”, which seems absurd! We recommend the elimination of this requirement.
Tenaska	No	This Requirement is too specific and places additional burdens on Registered Entities.
US Bureau of Reclamation	No	There is no rationale offered on why 15 months was selected. Without a defined basis the time period is arbitrary. It would be appropriate to let the Entity determine and document the time interval. That would allow the time frame to be sensitive to the complexity of the Operating Plan. Some entities aregeographically dispersed and a single Operating Plan may be difficult to test atone time or within 15 months.The allowance for real time events or actual use is a good move and maymake it easier to define a suitable time frame by the Entity.
WECC	No	The addition of a drill or exercise constitutes additional training and believes R4 should be added to R5. Clarification is needed as to what level does the annual training target, for instance, the field personnel. Will they have to complete the exercise/drill?
American Electric Power (AEP)	Yes	
Arizona Public Service Company	Yes	AZPS agrees with R4, however, the use of the term "Operating Plan" is confusing and leads one to believe an Operating Drill is necessary for a "reporting plan drill." A more accurate term to use would be "Event Reporting Plan."
Georgia System Operations Corporation	Yes	We agree with R4 with "... at least annually, with no more than 15 months ..." replaced with "... at least once per calendar year, with no more than 15 months ..." as in R5.

Organization	Yes or No	Question 6 Comment
MRO's NERC Standards Review Subcommittee	Yes	The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be exercised once per calendar year.
United Illuminating	Yes	Suggest R4 be improved to state that a Registered Entity is only required to conduct a drill or execute real-time implementation of the Operating Pan for one impact event listed in the attachment. In other words the Registered Entity is not required to drill on reporting each type of impact event on an annual basis.
ATCO Electric Ltd.	Yes	
City of Austin dba Austin Energy	Yes	
Consolidated Edison Co. of NY, Inc.	Yes	
Duke Energy	Yes	
Idaho Power Company	Yes

Puget Sound Energy	Yes	
Southern Company - Transmission	Yes	
TransAlta Corporation	Yes	
We Energies	Yes	

7. Do you agree with the requirement R5 and measure M5? Please explain in the comment box below.

Summary Consideration: Most stakeholders who responded to this question indicated disagreement with the originally proposed Requirement R5 and Measure M5. **(**Note R5 has been moved to R4 in the revised standard.) The DSR SDT did a full review based on comments that were received. The major issues that were provided by commenters was R5.3 and R5.4 and their contents. Upon detailed review the DSR SDT agrees with the majority of comments received with R5.3 and R5.4 and have removed them completely from the Standard. Training is still the main theme of this requirement as it pertains to the personnel in the procedure (R1). R4 now is stream lined to read:

R4. Each Responsible Entity shall review its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan at least annually with no more than 15 calendar months between review sessions

Organization	Yes or No	Question 7 Comment
Green Country Energy		Same as my comment for question 6
Arizona Public Service Company	No	AZPS believes the required training is too restrictive for minor changes/edits to the Event Reporting Plan.
ATC	No	ATC believes it is an inherent obligation of all Functional Entities to train their appropriate staff to meet all applicable NERC Standards. Including a training requirement in some, but not all, Standards implies that the other Standards do not necessitate training. Although this is an important Standard and one that should be included in a Functional Entities' training program, ATC does not believe that this Standard is more important than the other NERC Standards and, therefore, requires a separate training provision
ATCO Electric Ltd.	No	R5.3 requires an entity to conduct training within 30 days of a revision to the Operating Plan. For an entity

Organization	Yes or No	Question 7 Comment
		that covers a wide area, 30 days may not be sufficient to reach all employees.
BGE	No	Suggested revision to clarify R5:Each Applicable Entity shall provide training to all internal personnel identified in its Operating Plan on the Operating Plan annually. Training is only on Reporting, pursuant to R2, not on the Operating Plan?BGE does not believe the SDT needs to identify sub bullets on this requirement. R5.1 is not logical --- what does it mean?
CenterPoint Energy	No	CenterPoint Energy believes that R5 and M5 are not necessary and should be deleted. CenterPoint Energy supports an entity training its staff in any reporting responsibilities; however, such training should be the responsibility of each entity and such requirements do not belong in a NERC standard. In addition, CenterPoint Energy believes any necessary training requirements are covered in the PER Standards and therefore the addition of this requirement adds redundancy to the Standards.If a majority of the industry supports such a requirement, CenterPoint Energy cannot support R5 and M5 as written as we do not agree with the requirement to develop and maintain an Operating Plan (see comments to Q4 above). CenterPoint Energy offers the following alternate language: “Each Applicable Entity shall provide training concerning reporting requirements contained in this Standard to internal personnel involved in the recognition or analysis of events listed in Attachment 1.
City of Garland	No	This expands beyond the original CIP 001 and EOP 004 - neither explicitly requires training - combining does not mean expanding. In reality, what practical skill are you going to train on? People who perform the analysis on an event are going to have job specific training external to this standard and those same folks will maintain their skill set external to this standard. If it is going to be a results based criteria standard, then let the entities be responsible. Training on methods to fill out and file paper work does not make the BES more reliable. The vast majority of other standards do not have a training requirement section and yet, entities manage to be

Organization	Yes or No	Question 7 Comment
		compliant with those standards. Compared to all the other reliability standards and their requirements, are penalties for training on filling out paper work really making the BES more secure and reliable?
Consolidated Edison Co. of NY, Inc.	No	Requirement 5 - Training should be targeted only at those responsible for implementing the Operating Plan (OP), not all those mentioned in the OP.R5 - After the words “internal personnel” add the words “responsible for implementing.” The delete the words “identified in” and “for reporting pursuant to Requirement R2.”5.4 - Following the words “For internal personnel” add the words “responsible for implementing the Operation Plan.” Between the words “revised responsibilities” add the word “implementation.”M5 - After the words “between the people” add the words “responsible for implementing the Operating Plan”
Constellation Power Generation and Constellation Commodities Group	No	Constellation Power Generation questions how R5 relates to the SDT’s “summary of concepts”:oA single form to report disturbances and impact events that threaten the reliability of the bulk electric systemoOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirementsoClear criteria for reportingoConsistent reporting timelines oClarity around of who will receive the information and how it will be usedHowever, Constellation Power Generation believes that security awareness is an important aspect of personnel security and proposes an annual training similar to what was in the previous standards. Constellation Power Generation therefore recommends two requirement changes that would achieve security awareness without the burdensome administrative aspects. First, as stated earlier, a sub requirement in R2 should be added which reads as follows: R2.5 Method(s) for making operation personnel aware of changes to the Operating Plan.Second, this training requirement should be rewritten as follows: Each Applicable Entity shall provide training to all operation personnel at least annually.
Consumers Energy	No	Again, either 12 month year or annual year, NERC needs to standardize on one or the other. Training should apply only to those that must take action relevant the reliability of the BES. A plan would likely include

Organization	Yes or No	Question 7 Comment
		notification of senior officers, however they don't need to be included in drills and training if they have no active role.
Duke Energy	No	Strike the word "all" in the requirement. All personnel don't need to be trained - for example, the plan may contain references to some personnel as potential sources of the information that will then be reported. Also, Section 5.3 only allows 30 days for training, which may be impossible with rotating shift personnel and training schedules. 60 days is more appropriate.
Dynegy Inc.	No	The annual training seems excessive especially if their have been no changes. You have included one exception for contact information revisions; however, it should be expanded to include exceptions for minor/non-substantial changes. Also, make training requirements (after initial training)be required for substantive changes only.
E.ON Climate & Renewables	No	Redundant with R4.
Electric Market Policy	No	The need for a periodic training has not been established and appears to be overly restrictive given the intent of the standard is reporting of impact events. Suggest this requirement be eliminated.
Exelon	No	Exelon doesn't feel that the 30 day requirement is achievable and recommends an annual review. Training for all participants in a plan should not be required. Many organizations have dozens if not hundreds of procedures that a particular individual must use in the performance of various tasks and roles. Checking a box which states someone read a procedure does not add any value, it is an administrative burden with no contribution to reliability. It is Exelon's opinion that training requirements should be covered in the PER standards and that the audience to be trained should be identified. R5.4 requires internal personnel that

Organization	Yes or No	Question 7 Comment
		have responsibilities related to the Operating Plan cannot assume the responsibilities unless they have completed training. This requirement places an unnecessary burden on the registered entities to track and maintain a data base of all personnel trained and should not be a requirement for job function. A current procedure and/or operating plan that addresses each threshold for reporting should provide adequate assurance that the notifications will be made per an individual's core job responsibilities.
FirstEnergy	No	Requirement R5 and Part 5.1 - The wording in Part 5.1 is too prescriptive and shouldnot require training on the specific actions of personnel. Also, R5 should not require training for personnel that may only receive the report and are not required to do anything. Therefore we suggest rewording R5 and 5.1 as follows:"R5. Each Applicable Entity identified in Attachment 1 shall have a Reporting Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components:5.1 The training includes the personnel required to respond under the Reporting Plan."Part 5.3 - We suggest removing subpart 5.3. This requirement is overly burdensome and not necessary. We believe that the requirements for annual review and update of the plan as well as training sufficiently cover reviews of changes to the plan. Part 5.4 - The last phrase "training shall be conducted prior to assuming the responsibilities in the plan" should account for emergency situations when the entity does not have time to train the replacement before they are to assume a responsibility.
Great River Energy	No	We believe that this task should be incorporated into the Job Task Analysis for the System Operators and that this requirement should be deleted as being redundant.
Idaho Power Company	No	The 30 day Requirement is limited with real time operations. Most entities with real time operations utilize a 5 or 6 week rotating schedule to comply with PER-002. the NERC Continuing Education Program allows up to 60 days to comply, this allows the operating shifts to accomadate training within the operating schedule. The

Organization	Yes or No	Question 7 Comment
		requirement 5.3 should allow 60 days to complete the training.
Indeck Energy Services	No	It is wholly unreasonable to re-train everyone for each change to the Operating Plan. Suggestion: Clarify that upon changes to the Operating Plan, the Registered Entity may either require full training, or instead distribute a summary of the change to affected personnel only.
Independent Electricity System Operator	No	Along the line of our comments on R2 for an Operating Plan (whose need we do not agree with), any training on developing and providing the report is unnecessary. What matters is that the report is provided to the needed organizations or entities on time and in the required format according to established procedure. How this is accomplished goes outside of the purpose of reliability standard requirements.
IRC Standards Review Committee	No	We do not agree with the need for R5. We do not see the need for a standard requirement that stipulates training the personnel on reporting events. What matters is that the reports are provided to the needed organizations or entities on time and in the required format according to established procedure. Stipulating a training requirement to achieve this reporting is micro-managing and overly prescriptive.
ISO New England Inc.	No	The need for a periodic drill has not been established, and appears to be overly restrictive given that the intent of the standard is reporting of impact events. Suggest this requirement be eliminated. There are training standards in place that cover these requirements. We agree the relevant personnel should be "aware" of the reporting requirements. But there is not a need to have a training program with specific time frames for reporting impact events. Awareness of these reporting requirements can be achieved through whatever means are available for entities to employ to train on any of the NERC standards, and need not be dictated by requirements.

Organization	Yes or No	Question 7 Comment
Kansas City Power & Light	No	We agree with the need for the Operating plan and the provision of formal training to impacted personnel. We believe that the personnel references are too open-ended to be productive and measurable. This leaves all applicable entities open to subjectivity in assessment and may produce a large administrative burden to demonstrate compliance with no associated benefit to improved reliability.
Luminant Energy	No	Operating Plan revisions communicated through procedure updates and employee acknowledgements of the same are sufficient when coupled with a procedural training program that occurs according to a programmed schedule.
Manitoba Hydro	No	The comments in Question 6 and 7 encompass the training aspect of this requirement.
MidAmerican Energy	No	: R5.2. The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be trained once per calendar year.R5.3 As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. Where, R2.7 states to update the OperatingWe disagree with the need to provide formal training. We could agree with the need to communicate to System Operators and other pertinent personnel the criteria for reporting so that they know when system events need to be reported.
Midwest ISO Standards Collaborators	No	We disagree with the need to provide formal training. We could agree with the need to communicate to System Operators and other pertinent personnel the criteria for reporting so that they know when system events need to be reported.
MRO's NERC Standards Review Subcommittee	No	R5.2. The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be trained once per calendar year.R5.3 As detailed in R2, the Operating Plan shall contain provisions for

Organization	Yes or No	Question 7 Comment
		"identifying, assessing, and reporting impact events". Where, R2.7 states to update the Operating Plan when there is a component change. The NSRS believes the components of this Operating Plan are 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. These components relate to training when the Operating Plan is revised per, R5.3, only. As written, every memo, simulations, blog, etc that contain the words "lessons learned" would be required to be in your Operating Plan and trained on every time one was issued or heard about internally or externally. Recommend that the Operating Plan be revised and training occurs when a change occurs to the entity's Operating Plan, consisting of 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events, only.
North Carolina Electric Coops	No	Requiring training to report of after-the-fact events does not improve the reliability of the BES. We recommend the elimination of this requirement.
Northeast Power Coordinating Council	No	The need for a periodic drill has not been established, and appears to be overly restrictive given that the intent of the standard is reporting of impact events. Suggest this requirement be eliminated. There are training standards in place that cover these requirements. The relevant personnel should be "aware" of the reporting requirements. But there is not a need to have a training program with specific time frames for reporting impact events. Awareness of these reporting requirements can be achieved through whatever means are available for entities to employ to train on any of the NERC standards, and need not be dictated by requirements.
Pacific Gas and Electric Company	No	PG&E believes 30 days is too restrictive due to real-time operations schedule requirements. The schedule is six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Suggest extending to 60 days to meet the training criteria which follows the NERC Continuing Education revised submittal date for the Individual Learning

Organization	Yes or No	Question 7 Comment
		Activities (ILA).
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
PacifiCorp	No	Training required within 30 days of a revision to the Operating Plan is not feasible with 5 or 6 week shift rotations. A sixty day requirement would be more realistic.
Pepco Holdings, Inc - Affiliates	No	30 days may be too short a time for large entities with multiple subsidiaries to do the necessary notice and coordination. PHI suggests 90 days.
PNM Resources	No	PNM believes 30 days is too restrictive due to real-time operations schedule requirements. Most work schedules are either five or six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Based on the NERC Continuing Education revised submittal date for the Individual Learning Activities (ILA), PNM would recommend 60 days.Creating an Impact Event Report is duplicative and redundant and the WECC OTS feels this is not necessary.
PPL Electric Utilities	No	We agree with the need for training on one's process. However, we suggest changes to R5.3. Consider expanding the exception criteria to exempt non-substantive changes such as errata changes, minor editorial changes, contact information changes, etc. We also suggest saying '...,training shall be conducted, or notification of changes made, within 30 days of the procedure revisions.'
PPL Supply	No	We generally agree with R5 but recommend two changes to 5.3. Consider expanding the exception criteria to exempt non-substantive changes such as errata changes, minor editorial changes, contact information

Organization	Yes or No	Question 7 Comment
		changes, etc. Also, consider changing "training shall be conducted" to "training or communication/notification of changes shall be conducted."
Puget Sound Energy	No	The fact that proposed requirement R2 will require frequent updates to the operating plan means that the training required under this plan will occur quite frequently as well, leading to operator confusion. Even the comment allowing a review and “sign-off” will not completely mitigate this result.
RRI Energy, Inc.	No	1. This Requirement is structured to result in the same heavy-handed, zero-tolerance approach that has made CIP-004 one of the top three violated Reliability Standards. The failure in CIP-004 is that, for example, a seven-year background check or annual training program that is tardy by one day results in a violation. There is no margin of error, proviso, or cure scenario. Likewise, the proposed R5 in EOP-004-2 makes it a violation if someone takes their newly established training on the day after the end of 15 months. Systems configurations are often based on quarterly monitoring for individuals needing to take training. In addition, when dealing with potentially thousands of employees, it is inevitable that any one of hundreds of reasons might result in an employee not being included in the tracking system, and rolling past the 15th month. RECOMMENDATION: To avoid further burden to Regional Entity audit and enforcement personnel as has been the case in CIP-004, develop a cure process that allows the Registered Entity to correct the training or background check tardiness with prompt correction, fill out a notification report to submit to NERC, and proceed with protecting the reliable operation of the BES, rather than tying up Registered Entity and Regional Entity staffs with data requests, enforcement paperwork and administrative actions.2. The proposed R5.3 requires the entire applicable staff to redo the entire training within 30 days of a change to the Operating Plan. These Operating Plans will not be short documents, and formal training will not involve a 5 minute soundbite. However, for such a significant procedure as the Operating Plan, frequent changes and revisions are going to

Organization	Yes or No	Question 7 Comment
		be very common, especially given the likelihood of frequent clarifications, Compliance Action Notices ("CANs"), and lessons learned issued by NERC and Regional Entities over this very detailed set of new obligations. It is not unreasonable to expect a Registered Entity to make three or more revisions to their Operating Plan in a year, which would require training for thousands of employees three times a year, for what might amount to a single sentence revision. Furthermore, the obligation to retrain on the entire training program is not limited in this requirement to only those individuals impacted by the revision. Where a change or revision only impacts 3 possible employees, this standard would require a company with 1,500 employees subject to the Operating Plan to retake the entire training. RECOMMENDATION: Clarify that upon changes to the Operating Plan, the Registered Entity may either require full training, or instead distribute a summary of the change(s) via email to affected personnel only.
Santee Cooper	No	The concept of requiring training on reporting of after-the-fact events does not support or enhance bulk electric system reliability. We recommend the elimination of this requirement.
SERC OC Standards Review Group	No	While we support training on an annual basis for the operating plan, the concept of requiring training on reporting of after-the-fact events does not support or enhance bulk electric system reliability. We recommend the elimination of this requirement.
Southern Company - Transmission	No	We suggest that the time frame be changed to 60 or 90 days in 5.3. 5.4 needs to have a time frame associated with it; we suggest that it be 60 or 90 days.
Tenaska	No	This Requirement is too specific and places additional burdens on Registered Entities.
TransAlta Corporation	No	Measure M5 states applicable entities shall provide training material presented... This measure is unclear as

Organization	Yes or No	Question 7 Comment
		to whether the meaning is for internal personnel or to be provided to external entities upon request? Please clarify.
US Bureau of Reclamation	No	The measure is vague and redundant. The Entity is required to provide information to be used to "verify content". The information may be used to demonstrate compliance but who will verify the content is adequate and on what basis. Secondly, the measure requires training information be provided twice, once to demonstrate who participated and then to show who was trained. This is all unnecessary and could be remedied by simply stating that "evidence shall demonstrate that all individuals listed in the plan have received training on their role in the plan"
We Energies	No	Please clarify who is to be trained. As written, R5 requires any internal personnel identified in the plan, including CEO, Vice Presidents, etc., to be trained.
WECC	No	Thirty days is too restrictive due to real-time operations schedule requirements. Most work schedules are either five or six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Based on the NERC Continuing Education revised submittal date for the Individual Learning Activities (ILA), the requirement should be changed to require training to be conducted within 60 days.
Bonneville Power Administration	Yes	There was no training required for CIP-001 or in CIP-008. (The proposed EOP-008 purpose did not list incorporating CIP-008). Training was not really needed for reporting Electrical Grid events.
ERCOT ISO	Yes	ERCOT ISO believes the content of training can include an exercise or drill.

Organization	Yes or No	Question 7 Comment
United Illuminating	Yes	R5.3 coupled with the rationale provided is a sensible approach. It is important that the rational is not forgotten.
Ameren	Yes	
American Electric Power (AEP)	Yes	
City of Austin dba Austin Energy	Yes	
Georgia System Operations Corporation	Yes	
NERC Staff	Yes	
PacifiCorp	Yes	

8. Do you agree with the requirement R6 and measure M6? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst stakeholders who responded to this question regarding agreement with the originally proposed Requirement R6 and Measure M6. **(**Note R6 been moved to R5 in the revised standard.) The DSR SDT did a full review based on comments that were received. Many comments indicated concerns with the reporting timelines within Attachment 1. (The DSR SDT has addressed those comments in response to Question 10).

Several commenters wanted the ability to report impact events to their responsible parties via the DOE Form OE-417. Following discussions with the DOE and NERC, the DSR SDT has added the ability to use of the DOE Form OE-417 when the same or similar items are required to be reported to NERC and the DOE. This will reduce the need to file multiple forms when like items must be reported to the DOE and NERC for the same impact event. The underlying fact is that impact events are to be reported within prescribed guidelines, thus providing industry awareness and starting of any analysis process. R5 now is stream lined to read:

> R5. Each Responsible Entity shall report Impact Events in accordance with the Impact Event Operating Plan pursuant to Requirement R1 and Attachment 1 using the form in Attachment 2 or the DOE OE-417 reporting form.

Organization	Yes or No	Question 8 Comment
American Electric Power (AEP)	No	It is not clear how this is different from R3 since it relies on the same timetable in Attachment 1.
CenterPoint Energy	No	CenterPoint Energy does not agree with R6 and M6 as written as we do not agree with the requirement to develop and maintain an Operating Plan (see comments to Q4 above) In addition CenterPoint Energy does not agree with the timelines required in Attachment 1 (see comments on Q10). CenterPoint Energy offers the following alternate language: “Each Applicable Entity shall report events outlined in Attachment 1 to applicable entities including but not limited to; NERC, and appropriate law enforcement agencies."

Organization	Yes or No	Question 8 Comment
City of Garland	No	1. The reporting requirements should not be expanded beyond CIP 001 and EOP 004-1. The goal for combining the two should be to make the process more efficient - not add on extra requirements for procedures on how to report, drills on reporting, training on reporting, etc. 2. The timelines requiring 1 hour reporting to the ERO are not needed and provide little realtime benefit to the BES. Real time or near real time reporting for “people on the ground” such as the RC, BA, TOP, FBI, Local Law Enforcement, DOE, etc. is necessary. They are in a position to take action in response to an event. On page 5, it states “The proposed standard deals exclusively with after-the-fact reporting. 1 Hour reporting requirements to the ERO in addition to existing reporting are not reasonable “after-the-fact” reporting requirements in the midst of an emergency. Also, there is not a 24X7 ERO center to report events to - why build and staff one when they already exists at the RC, BA, TOP, DOE, FBI, Local Law Enforcement, etc. - An ERO 24X7 center would be extra overhead that would provide no additional benefit in the first hour or hours of an emergency.
Consolidated Edison Co. of NY, Inc.	No	R2 requires applicable entities to have an Operating Plan which are company specific procedures and process required to be compliant with EOP-004. Therefore, R6 should be deleted since it is redundant with R2.
Electric Market Policy	No	Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
ERCOT ISO	No	ISO recommends the following changes to the language of the requirement.R6. Each Applicable Entity shall report impact events in accordance with Attachment 1.
Exelon	No	The time durations in the attachment are too short, it would be impossible to collect all the data necessary to report out on an impact event in the defined time to report.The SDT should evaluate each event for the most

Organization	Yes or No	Question 8 Comment
		appropriate entity responsible to ensure there is minimal confusion on who has the responsibility and eliminate duplication of reporting when feasible.
FirstEnergy	No	M6 - NERC's system should be capable of making this evidence available for the entities and provide a "return-receipt" of the reports that we send them. Also, M6 should be revised to state "Applicable Entities" as opposed to "Registered Entities".
Great River Energy	No	We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
Indeck Energy Services	No	---This is the first mention of the time lines in Attachment 1. If they are part of the standard, then they should be incorporated to the Operating Plan in R2 and then need not be mentioned again, only compliance with the plan. ---In M6, the last part, "evidence to support the type of impact event experienced; the date and time of the impact event ; as well as evidence of report submittal that includes date and time" is redundant. All of that should be in the report to NERC. If not, then it's not important to keep.
Independent Electricity System Operator	No	We agree with having a requirement to report impact events in accordance with the timelines outlined in Attachment 1, but not with the requirements indicated in R2.
IRC Standards Review Committee	No	There is not a need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations.

Organization	Yes or No	Question 8 Comment
ISO New England Inc.	No	Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements for NERC that cross other federal agency jurisdictions.There is no need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations which is implied by the label “Operating Plan.”
Kansas City Power & Light	No	We believe R3 and M3 are unnecessary as a stand alone requirement and measure and propose combining these requirements with R6 and M6. Identifying and assessing the initial probable cause of an impact event is the obvious starting point in the reporting process and ultimate completion of the required report. Evidence to support the identification and assessment of the impact event and evidence to support the completion and submittal of the report are really one in the same.
MidAmerican Energy	No	We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
Midwest ISO Standards Collaborators	No	We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
North Carolina Electric Coops	No	There is already a DOE requirement to report certain events. NERC should not be developing redundant reporting requirements when this information is already available at the federal level from other agencies.

Organization	Yes or No	Question 8 Comment
Northeast Power Coordinating Council	No	Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements for NERC that cross other federal agency jurisdictions.There is no need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations which is implied by the label “Operating Plan".
Pacific Gas and Electric Company	No	PG&E believes that if the standard is intended to be an after the fact report, we question the one and/or twenty-four hour reporting criteria and then the 30 day criteria?
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
PNM Resources	No	PNM believes there seems to be redundancy in reporting based on the time frames in Attachment 1, i.e. OE-417 and other required reports. If this standard is intended to be an after the fact report, why is there one/twenty-four hour reporting criteria?
PPL Electric Utilities	No	We understand the rationale for this standard and support the project to combine EOP-004 and CIP-001 as well as the reporting requirement in CIP-008. We are concerned that it may be difficult to meet Attachment 1 Part B Potential Reliability Impact submittal times as the time to submit is 1 or 24 hour after occurrence. E.g. Risk to BES equipment, the example given is a major event and easy to conclude. Consider forced intrusion, risk to BES equipment (increased violence in remote area), or cyber intrusion - should Attachment 1 state ‘report within 24 hours after detection’?

Organization	Yes or No	Question 8 Comment
PPL Supply	No	It may be difficult to meet Attachment 1 Part B Potential Reliability Impact submittal times as the time to submit is 1 or 24 hours after occurrence. Consider changing the Time to Submit Report for Forced intrusion, Risk to BES equipment, and Detection of a cyber intrusion to be "report within 24 hours after detection".
RRI Energy, Inc.	No	RECOMMENDATION: Clarify that the reporting of impact events shall be to those entities identified in the Operation Plan section developed specifically in Section 2.6. Reference to Attachment 1 indicates reporting to "external" parties is the intent for R6.
Santee Cooper	No	If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity
SERC OC Standards Review Group	No	There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
Southern Company - Transmission	No	The time to submit report column needs to be more flexible with time frames.
Tenaska	No	The reporting timelines are currently listed on the OE-417 form. This Requirement is redundant.
TransAlta Corporation	No	R6 should reference Attachment 2 to make it clear that this report form must be used.M6 seems to be requesting evidence that the Confidential Impact Event Report was submitted. TransAlta suggests the submission of the actual report is evidence the report was submitted.Records of this submission can be provided on request.Web Reports Project 2009-01 has indicated online reporting is the direction they are

Organization	Yes or No	Question 8 Comment
		going.If the impact report becomes an online Web report the entity submitting the report has no way of confirming the report ended up at the Compliance Enforcement Authority office after it is submitted. There needs to be some method that demonstrates the report was submitted and received.
We Energies	No	The proposed definition of “impact event” needs to be clarified.
WECC	No	There seems to be redundancy in reporting based on the time frames in Attachment 1, i.e. OE-417 and other required reports. If this standard is intended to be an after the fact report, why is there one/twenty-four hour reporting criteria?
Arizona Public Service Company	Yes	AZPS believes that Operating Plan should be replaced with "Event Reporting Plan."
ATC	Yes	ATC does agree that applicable entities report on events identified in Attachment 1 (See our comments about Attachment 1), but we do not agree that applicable entities should be required by this standard to have an Operational Plan. Please see our comments to question 4.
BGE	Yes	Comments for clarification:R6. Use of Capital letters in Operating Plan makes it unnecessary to state "created pursuant to Requirement 2
Bonneville Power Administration	Yes	The requirement needs to specify who (ERO) to report to. Attachment 1 doesn’t say to report to the ERO either. Clarify or remove the difference between the report submitted and evidence of the type of impact event required in the measurement.
Georgia System Operations Corporation	Yes	It directly supports the purpose of the standard.

Organization	Yes or No	Question 8 Comment
Green Country Energy	Yes	Now this is an excellent example of all that is needed for this requirement!
Manitoba Hydro	Yes	Attachment 1 details the impact events and the thresholds of which they should be reported.
Puget Sound Energy	Yes	It is assumed that for the purposes of M6, NERC and the regions would already have access to these reports.

9. Do you agree with the requirements for the ERO (R7-R8) or is this adequately covered in the Rules of Procedure (section 802)? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst the commenters who responded to this question. The DSR SDT did a full review based on comments that were received. The DSR SDT has determined that R7 and R8 are not required to be within a NERC Standard since Section 800 of the Rules of Procedure already assigns this responsibility to NERC. The DSR SDT, the Events Analysis Working Group (EAWG), NERC Staff (to include NERC Senior VP and Chief Reliability Officer) had an open discussion with this item being a major topic. The DSR SDT and EAWG are working in coordination with each other to provide NERC Staff with updated language for future inclusion into the Rules of Procedure. NERC Staff, the EAWG and the DSR SDT all supported this new initiative.

Organization	Yes or No	Question 9 Comment
Ameren	No	NERC's current heavy case load should justify reviewing the impact review table only once every 2 years.
ATC	No	ATC feels the ERO obligations should be covered in the Rules of Procedure.We do not agree with the requirements assigned to the ERO, but believe that they should be incorporated into the ERO's Rules of Procedure
BGE	No	R7. Make Impact Event Table all Capital Letters(it is a title). R8. Is the term "reportable impact events" new or is impact event intended to be capitalized? R8. Does a quarterly report of the year's reportable impact events include 12 months of "reportable impact events"? This is confusing. R8. In the Rationale for R8 Impact Events appears with Capital letters - why now? Shouldn't it appear with all Capital letters throughout the document as it is a defined term? R8. There are no previous requirements to report threats (R8.3) or

Organization	Yes or No	Question 9 Comment
		lessons learned (R8.5) or trends (R8.2) to an ERO. Is this information from reports to the ERO or from ERO research?
CenterPoint Energy	No	CenterPoint Energy does not believe this requirement is necessary; however, if the SDT insists on keeping this requirement then CenterPoint Energy believes it should remain as written. Any change to Attachment 1 should go through the Reliability Standards Development Procedure.
Consolidated Edison Co. of NY, Inc.	No	See response to Question 2Requirement 7Delete the words “and propose revisions to”Following the words (Attachment 1) add a period.Following that period add the words “The ERO shall revise the table”Requirement 8RECOMMEND DELETION OF R8 - CONFIDENTIALITY CONCERNS WILL MAKE ESTABLISHING A PUBLICATION REQUIRMENT EXTREMELY CHALLENGING.
Constellation Power Generation and Constellation Commodities Group	No	The impact event table (Attachment #1), as part of a standard, would have to be FERC approved every time it is edited. That would cause it to go through NERC’s Standard Development Process, and would cause a revision to the standard each time. This will also cause revisions to each and every registered entity’s Operating Plan. Overall, this requirement causes a large administrative burden on all entities, and does not improve reliability. As stated earlier, the “summary of concepts” for this latest revision, as written by the SDT, includes the following items:oA single form to report disturbances and impact events that threaten the reliability of the bulk electric systemoOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirementsoClear criteria for reportingoConsistent reporting timelines oClarity around of who will receive the information and how it will be usedRequirement 7 and 8 do not address any of these items. Furthermore, for R8, it is requiring NERC to send out quarterly reports, yet entities are supposed to amend their Operating Plans based on an annual NERC report. This requirement is confusing and is not consistent with earlier requirements. Constellation Power Generation

Organization	Yes or No	Question 9 Comment
		believes that these two requirements should be removed.
Electric Market Policy	No	Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority.
ERCOT ISO	No	Recommend that the Electric Reliability Organization be removed. The Electric Reliability Organization should not be responsible for reliability functions and therefore should be excluded from reliability standards.
FirstEnergy	No	FE disagrees with the ERO as an applicable entity within a reliability standard. See our responses to Questions 2 and 3 above. We do not believe the desired ERO process is adequately covered in section 802. Section 802 deals with assessments and not event reporting.
Georgia System Operations Corporation	No	It should not be necessary for the ERO to require itself to do these things. NERC's authority should be sufficient to do these things as part of its mission.With quarterly trending and analysis of threats, vulnerabilities, lessons learned, and recommended actions in R8, R7 (an annual review) should not be necessary. The quarterly activity could include proposing revisions to Attachment 1 if warranted.An alternative would be to perform annual trending and analysis of threats, vulnerabilities, lessons learned, recommended actions, and proposed revisions to Attachment 1 if warranted.Also, the Reliability Standards Development Procedure has been replaced with the Standard Processes Manual.
Indeck Energy Services	No	Reviewing Attachment 1 annually is unnecessary. Events don't change much and if they do, a SAR is needed to consider the changes. NERC should not be included in any standard!
Independent Electricity System Operator	No	We agree with the need to update the list as needed, but it does not have to be the ERO who takes on a reliability standard to do so. It can simply be an annual project in the standards development work plan to review Attachment 1 as part of a standard. The industry will then be provided an opportunity to weigh on the

Organization	Yes or No	Question 9 Comment
		changes. Also, we do not see the reliability results or benefits of R8. The ERO can issue the report quarterly but who are audiences? What reliability purpose does it serve if no further actions are pursued upon receiving the report? Can this be done as a standing item for the ERO at, say, the BoT meeting? Or, can this be a part of the quarterly communication from the ERO to the industry? To make this a reliability standard is an over-kill, and does not conform with the results-based standard concept.From our perspective, both R7 and R8 can be removed, and the ERO can be removed from the Applicability Section as well.
IRC Standards Review Committee	No	We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
ISO New England Inc.	No	Having the ERO as an applicable entity raises concern as it is also the compliance enforcement authority. Requirement R7 is unnecessary as there are already requirements in place for three year reviews of all Standards. R8 contains requirements to release information that should be protected, such as identification of trends and threats against the Bulk Electric System. This may trigger more threats because it will be published to unwanted persons in the private sector.We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
Kansas City Power & Light	No	We agree with the rationale for R8 requiring NERC to analyze Impact Events that are reported through R6 and publish a report that includes lessons learned but disagree with R2.9 obligating an entity to update its Operating Plan based on applicable lessons learned from the report. Whether lessons learned are applicable

Organization	Yes or No	Question 9 Comment
		to an entity is subjective. If an update based on lessons learned from an annual NERC report is required, the requirement should clearly state the necessity of the update is determined by the entity and the entity's Reliability Coordinator or NERC can not make that determination then find the entity in violation of the requirement. In addition, if an update based on lessons learned from a NERC report is required, NERC should publish the year-end report (R8) on approximately the same day annually (i.e. January 31) and allow an entity at least 60 days to analyze the report and incorporate any changes it deems necessary in its Operating Plan. Again, the language referencing annual and quarterly in these two requirements in confusing.
Manitoba Hydro	No	Rules of Procedure appear to have a different focus then R7 and R8.Briefing on Rules of Procedure 802Assess, review and report on:1.1 overall electric operation1.2 uncertainties and risks1.3 self assessment of supply and reliability1.4 projects on customer demand1.5 impact of evolving electric market practicesthat could affect the present and future of the BESBriefing on R7 and R8R7 - ERO shall review and propose revisions to Attachment 1R8- ERO shall publish quarterly reports on trends, threats, vulnerabilities, lessons learned and recommended actions.
Midwest ISO Standards Collaborators	No	We do not agree with the requirements and we do not believe it is adequately covered in section 802. First, section 802 deals with assessments not event reporting. Secondly, since attachment 1 is part of a standard, it should not be modified outside of the Reliability Standards Development process.
NERC Staff	No	NERC staff believes that requirements R7 and R8 are not needed because they are intrinsic expectations from its Rules of Procedure. Furthermore, these elements are necessary for analysis in support of the Reliability Metrics efforts NERC is leading under its Reliability Assessment and Performance Analysis

Organization	Yes or No	Question 9 Comment
		program.
North Carolina Electric Coops	No	The ERO cannot be subject to a requirement for which it is the compliance enforcement authority.
Northeast Power Coordinating Council	No	Having the ERO as an applicable entity raises concern as it is also the compliance enforcement authority. Requirement R7 is unnecessary as there are already requirements in place for three year reviews of all Standards. R8 contains requirements to release information that should be protected, such as identification of trends and threats against the Bulk Electric System. This may trigger more threats because it will be published to unwanted persons in the private sector.We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
Puget Sound Energy	No	This is adequately covered by section 802 of the Rules of Procedure. There seems to be some conflict between R2.9 and R8 regarding timeframes and the specific elements required.
Santee Cooper	No	Standards cannot be applicable to an ERO because they are the compliance enforcement authority, and the ERO is not a user, owner, or operator of the BES.
SERC OC Standards Review Group	No	The ERO cannot be subject to a requirement for which it is the compliance enforcement authority. The governance in this situation appears incomplete.
United Illuminating	No	The rules of procedure adequately cover this.
US Bureau of Reclamation	No	Requirements 7 and 8 are covered in the Section 801.801. Objectives of the Reliability Assessment and

Organization	Yes or No	Question 9 Comment
		Performance Analysis Program. The objectives of the NERC reliability assessment and performance analysis program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American bulk power systems, both as existing and as planned; (2) analyze off-normal events on the bulk power system; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the board for publication to the electric industry and the general public.
Bonneville Power Administration	Yes	R2.9 language refers to R8 “annual” report; however R8 language is “quarterly” reporting. It appears this standard is going to be in an update status 4 times per year minimum, plus any event modifications plus personnel changes. Overly burdensome.
City of Garland	Yes	R7 - Yes as long as any changes to attachment 1 follow the “Reliability Standards Development Procedure. R8 - Yes as long as R8.6 is strictly “recommended actions.” They should not become “required actions” as this bypasses the standard development process.
Duke Energy	Yes	However, R8 only addresses quarterly reports, and R2 Section 2.9 states that there will be an annual report.
Green Country Energy	Yes	I realize this is another burden for the ERO but the information would be good to know what is going on outside the plant .
Luminant Energy	Yes	Continually refining the Impact Event table to better define which events should be reported would be extremely valuable. Section 802 does not adequately require such refinement, thus R7 and R8 are

Organization	Yes or No	Question 9 Comment
		appropriate inclusions to this standard.
MRO's NERC Standards Review Subcommittee	Yes	Should read "In accordance with Sections 401(2) and 405 of the Rules of Procedures, the ERO can be set as an applicable entity in a requirement or standard". As stated in the text box.
RRI Energy, Inc.	Yes	We support the concept that Reliability Standard requirements and obligations that are subject to violations and penalties should all be contained in the four-corners of the Reliability Standard. If an obligation exists in the Rules of Procedures that creates a stand-alone responsibility that is subject to violation and penalty, it should be removed from the Rules of Procedure and inserted into the appropriate Reliability Standard.

10. Do you agree with the impact event list in Attachment 1? Please explain in the comment box below and provide suggestions for additions to the list of impact events.

Summary Consideration: Most commenters who responded to this question disagreed with some aspect of Attachment 1 – most commenters provided specific suggestions for improvement. The DSR SDT did a full review based on comments that were received. The DSR SDT, the Events Analysis Working Group (EAWG), NERC Staff (to include NERC Senior VP and Chief Reliability Officer) had an open discussion with this item being a major topic. The EAWG and the DSR SDT aligned Attachment 1 with the Event Analysis Program category 1 analysis responsibilities. This will assure that impact events in EOP-004-2 reporting requirements are the starting vehicle for any required Event Analysis within the Event Analysis Program. The DSR SDT agrees that there are similar items in the DOE Form OE 417 and EOP-004-2. DOE, NERC and the DSR SDT are in initial talks to try and reduce duplicate reporting requirements. Until such time in the future that a new process is established between the DOE and NERC, the DSR SDT has revised the standard to indicate that the use of either the DOE Form OE 417 or Attachment 2 is an acceptable reporting form for applicable entities. The DSR SDT reviewed the "hierarchy" of reporting within Attachment 1. To reduce multiple entities reporting the same impact event, the DSR SDT has stated that the entity that performs the action or is directly affected by an action will report per EOP-004-2. As an example, during a system emergency, the TOP or RC may request manual load shedding by a DP or TOP. The DP or TOP would have the responsibility to report the action that they took if they meet or exceed the bright-line criteria established in Attachment 1. Upon reporting, NERC Event Analysis Program would be made aware of the impact event and start the EA Process which is outside the scope of this Standard.

Several bright-line criteria were removed from Attachment 1. These criteria (DC converter station, 5 generator outages, and frequency trigger limits) were removed after discussions with the EAWG and NERC staff, who concurred that these items should be removed from a reporting standard and analysis process.

Organization	Yes or No	Question 10 Comment

Organization	Yes or No	Question 10 Comment
WECC		For strictly after-the-fact reporting the list of Attachment 1 is appropriate. However, as noted in our earlier comments, actual or suspected sabotage events can have a potentially significant impact on reliability and should be treated differently, with additional real-time reporting requirements. It is important that such events be identified and recognized for reliability purposes and that notices include the RC.
Ameren	No	We have numerous comments about the Attachments. (1) What are the requirements for "verbal" reporting to NERC and Regional entities? (2) What are the requirements for a "Preliminary" Impact Event Report? (3) The Voltage Deviations Event is unclear (a) Are these consecutive minutes? (b) Where is the voltage measured? (generator terminals? Point of Interconnections? Anywhere?) (c) must each Entity report separately? (d) What is the +/- 10% measured against (Generator Voltage Schedule?) (4) For Generation loss events how is an "entity" defined? (a corporate parent? each registered entity? other?) (5) Are the "Examples" in the Attachment 1 - Part A really Examples, or mandatory situations? (6) Can you define "Damage"? (7) Can you define "external cause"? (8) Can you give examples of "non-environmental external causes"? (9) The footnote 1 reference for "Damage or destruction of BES equipment" doesn't match up with the a. and b. footnotes or the 1. footnote of Attachment A - Part B. (10) How is the Operator supposed to determine what Event affects the reliability of the BES fast enough to decide whether or not to report? (11) is the Loss of off-site power (grid supply) event to a nuclear plant already covered by NUC-001?(12) What are "critcal cyber assets" since CIP-002-4 will eliminate that term? (13) When is Attachment 2 supposed to be used? (14) What is meant by the word "Confidential" in the title of the Attachment 2 report? How would the SDT propose a GO/GOP handle the reporting for the following situation? A CTG unit is dispatched and the unit is started, synchronized and put on the bus. Immediately the Operator receives a high gas alarm from the GSU. The Operator quickly shuts the unit down and de-energizes the GSU. There are no relay targets and no obvious reason for the problem. After several weeks of analysis it's determined there was an internal fault in the GSU

Organization	Yes or No	Question 10 Comment
		and it must be replaced. How would the SDT recommend all the reporting requirments in this situation be addressed with the current draft?
American Electric Power (AEP)	No	Are the times listed for the initial probable reporting under R3 or the reporting under R6?Many of these items do not constitute emergency conditions. We view many of these as too onerous and would divert operating staff from monitoring and operating the BES. In addition, some terms (i.e. Frequency Trigger Limits) are not currently defined terms. Furthermore, there are existing requirements that have obligations for entities to provide this information to the RC. For example “Detection of a cyber intrusion to critical cyber assets” is already covered under CIP-008. This creates duplicate (and potentially competing) requirements.AEP also contends that some of the timelines are very aggressive and not consummate with perceived need for the information.Transmission loss of multiple BES transmission elements (simultaneous or common-mode event)within 24 hours after occurrence is overly aggressive and should provide more specific criteria.
Arizona Public Service Company	No	AZPS believes that the list in Attachment 1 would be complete, as long as the text box of examples is included. The examples demonstrate what is necessary.
ATC	No	ATC has several areas of concern regarding Attachment 1.1. The one hour requirement for reporting will take the Functional Entities’ focus off of addressing the immediate reliability issues and instead force the FE to devote valuable resources to filling out forms which will potentially reduce reliability.2. Part A:a. Provide a definition of “system wide” for the Energy Emergency requiring system-wide voltage reduction.b. Add in the clarity that for Energy Emergency requiring firm load shed pertains to a single event, not cumulative events.c. Insert the word “continuous” for Voltage Deviations.d. Take off the TOP for IROL violations. (We believe that an IROL violation should be reported by the RC and not by the TOP based on the nature of the event. Requiring both the RC and TOP to report will only result in multiple reports for a single event. The RC is in

Organization	Yes or No	Question 10 Comment
		the best position to report on an IROL violation for its RC area.)e. Take off the TO, TOP and add the LSE for Loss of Firm Load. (As a transmission only company ATC does not have contracts with end load users. Because of this the Loss of Firm Load should be the reporting obligations of the entity closes to the end load users which is the BA, DP or LSE. Failure to modify this requirement will cause confusion as to which entity has to report Loss of Firm Load. f. Define a timeframe for Generation Loss g. Multiple should be changed to “4 or more” for Transmission Loss.(ATC is concerned that this would require reporting of events that have little or no industry wide benefits but would take up considerable Registered Entity resources.)h. Provide clarity to and tighten the definition of Damage or destruction of BES equipment. The way it is written now would require over-reporting of all damaged or destroyed equipment due to a non-environmental external cause (e.g. broken insulator).3. Part B:a. Take off the TO and TOP for Loss of off-site power. (The GOP has the responsibility to acquire off-site power and we believe it is the GOP’s sole responsibility to report the Loss of off-site power. Failure to correct this would result in multiple reporting for the same event.)b. Take off RC for Risk to BES equipment. (The RC function does not own BES equipment and we believe it is impossible for them to report on risk to BES equipment if they are not the owner or operator of that equipment. This standard should be required of the entity that owns/operates BES equipment. c. Provide guidance to the phrase “reasonably determine” in footnote.d. Examples provided do not provide a clear obligation for an entity to follow. (Question: How close is the train to the substation? (Inches away from the substation fence, ten feet away from the substation fence or 500 feet away from the substation fence.) In addition, this standard is so open to interpretation that no entity can demonstrate compliance with the action. We believe that the only solution is to delete this reporting requirement. Overall:Multiple Functional Entities impacted by the same event are required to report. No lead entity is identified. This will result in multiple reports of the same event. ATC does not believe that this built-in duplicity enhances reliability?

Organization	Yes or No	Question 10 Comment
ATCO Electric Ltd.	No	Attachment 1: Part A - Transmission Loss: Only sustained outages should be reportable. Also the reporting threshold needs to be quantified for impact events, for example:a) Size of DC converter Station > 200 MW.b) Impact of loss of Multiples BES transmission elements in terms of significant load (> 200 MW for > 15 min).
BGE	No	TOP determines "system-wide" voltage reductions; why place this responsibility on a TO or DP? - Load Shedding is automatic load shedding; why 100MW? Does a DP need to provide a Report when directed by the RC, BA or TOP to shed load or reduce voltage? - No examples should be included in the standard! Need to define a "BES Transmission Element". - Table shows multiple entities in "Entity with Reporting Responsibility"; is it one or is it all entities report? - In an audit who determines "reasonably determined likely motivation" - Is it justified to expect to have "motivation" knowledge within one hour of an event? - Why are the Responsible Entities reporting Interruptible Demand tripped / lost?
Bonneville Power Administration	No	BPA suggests the following:Change loss of multiple BES to 3 or more. Loss of a double circuit configuration due to lightning doesn't need a report (it's a studied contingency). Add qualifier to damage/destruction of BES equipment, since a failed PCB or a system transformer normally doesn't have a MAJOR impact to the grid.Add qualifier to Loss of "ALL" off-site power affecting nuclear...The unplanned evacuation of control center is a busy time for the backup control center, yet this standard requires 1 hour reporting. Suggest changing to 24 hours.
CenterPoint Energy	No	CenterPoint Energy appreciates the efforts of the SDT in identifying the entity with reporting responsibility. This is an improvement to the event table. CenterPoint Energy is concerned with multiple entities being listed as having Reporting Responsibility. CenterPoint Energy recommends the SDT limit this to one entity having responsibility for reporting each event. This would not preclude that entity from coordinating with other entities

Organization	Yes or No	Question 10 Comment
		to gather data necessary to complete the report. In addition, CenterPoint Energy believes there are several events that should be removed from the list. “Transmission Loss” is covered by the TPL standards and does not need to be identified or reported under EOP-004. The loss of a DC converter station or multiple BES transmission elements may or may not disrupt the reliable operation of the BES, i.e. result in blackout, cascading outages, or voltage collapse. Likewise “Damage or destruction of BES equipment” in and of itself should not be the subject of reporting. If the damage or destruction results in true disruption to the reliable operation of the BES, that impact would be reported under one of the other identified events. “Voltage Deviations” is another unnecessary event. CenterPoint Energy believes a voltage event of the proposed magnitude will, more than likely, result in other events identified in Attachment 1 such as; IROL Violation or Generation Loss and would be reported under one of those triggers. Another concern is the threshold trigger of +/- 10% for 15 minutes or more. CenterPoint Energy is unclear as to the starting point to determine the deviation. In other words is the 10% deviation from nominal voltage, such as 138kV or 345kV, or the actual voltage at the time of the event? Additionally, must the deviation occur over a “wide area” or is such a deviation at one buss enough to trigger a report? Based upon these ambiguities and concerns CenterPoint Energy recommends “Voltage Deviations” be deleted from Attachment 1. The examples that follow on page 14 should also be deleted.
City of Garland	No	This report should follow exactly the OE-417 to avoid redundant, possible conflicting, and overall confusion in reporting.Note: The table has entries that are in conflict with the OE-417 and thus can cause confusion in filing multiple reports potentially causing an entity to violate Federal Law due to the confusion. By submiting the same information on different timelines, i.e. one hour reporting under OE-417 and 24 hours under this Standard, the reports may be significantly different causing confusion from differing reports of the same event.Although we prfer the events to match the OE-417 events exactly, if the SDT decides to include a

Organization	Yes or No	Question 10 Comment
		seperate events table we make the following suggestions: Energy Emergency requiring system-wide voltage reduction: should be reportable at 5% not 3% voltage reduction. The standard should clearly state this was applicable for BES energy emergency conditions only, not voltage reductions for other reasons.On voltage deviations: it should be clear that this applies to widespread effects on the BES not a single distribution feeder that has a low voltage.For the Frequency deviation: Did not see a definition for the FTL (frequency trigger limit)Generation loss: the reportable loss of generation should be significantly more than 500 MW. The number of units at the locaton is irrelevent. Ten units at 50 MW each is no more critical than a single 500 MW unit. Under this standard, if the plant with ten 50 MW units trips it is reportable but an 800 MW single unit is not reportable. The trip of the 800 MW unit has much more effect on the sytem reliability. Damage or destruction of BES equipment: Should be limited to specific equipment such as a 765 kV autotransformer not a 138 kV lightning arrestor. This needs to be eliminated or significantly limited as to the equipment type that is reportable.
Consolidated Edison Co. of NY, Inc.	No	It is absolutely essential that the work on EOP-004 and that on the NERC Event Analysis Process (EAP) be fully coordinated. We find that there are a number of inconsistencies between these two documents. The EAP and EOP-004 are not aligned. In order to operate and report effectively entities need consistent requirements.Attachment 1Frequency Deviations - The term “Frequency Trigger Limit (FTL)” is not defined. Only defined terms should be used, or the term should be defined. If the term is defined in another standard it should be moved to the Glossary of Terms for wider use.Loss of Firm load for 15 Minutes - The text under the rightmost column entitled, Time to Submit Report, appears to be incomplete in our copy.Transmission loss and Damage or destruction of BES equipment - At the end of the wording for both under the column entitled “Threshold for Reporting” add the words “that significantly affects the integrity of interconnected system operations.”Examples - Capitalize “Critical Asset” as this is a defined term.

Organization	Yes or No	Question 10 Comment
Constellation Power Generation and Constellation Commodities Group	No	Constellation Power Generation and Constellation Commodities Group questions why the generation loss line item includes generating facilities of 5 or more generators with an aggregate of 500 MW or greater? The number of units makes no difference for reporting, as is evident in the generation thresholds written before this inclusion. The examples of damaged or destroyed BES equipment are confusing, and do not clarify the reporting event. What if a GSU at a small plant (20 MW) were to fail? Is that reportable? Constellation Power Generation believes that equipment failures that are not suspicious do not need to be reported. Finally, Constellation Power Generation and Constellation Commodities Group believes that the “loss of offsite power affecting a nuclear generation station” should be removed for the following reasons:1)The purpose of this reliability standard is stated as being: “Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES). “ While the “situational awareness” portion of the purpose could be interpreted as all-inclusive, the real element deals with BES reliability. Off-site power sources to nuclear units have nothing to do with BES reliability. Why should nuclear units be treated differently?2)The issue of concern for a loss of offsite power at a nuclear station is continued power supply (other than emergency diesels) to power equipment to cool the reactor core. A nuclear unit automatically shuts down when off-site power supply is lost. Availability of off-site power is a reactor safety concern (i.e., NRC regulatory concern and a one-hour report to the NRC) - not a reliability concern that FERC/NERC would have jurisdiction over.3)There is a nuclear-specific reliability standard (NUC-001) that contemplated off-site power availability. That standard contained no reporting requirements outside of those that may be already established in current procedures. Why try to impose one here?4)A loss of offsite power will result in an emergency declaration at the nuclear facility. Notifications will be made to federal (NRC), state, and local authorities. The control room crew is already overly-burdened with notifications - any additional call to NERC/Regional Reliability orgs will add insult-to-injury for no beneficial reason. If NERC is interested, they should obtain info from NRC.5)If all else fails and the item is to remain on the table, it needs

Organization	Yes or No	Question 10 Comment
		to be clarified as a "complete" loss of off-site power lasting greater than X minutes (i.e., would we have to report a complete momentary loss that was rectified in short order by an auto-reclose or quick operator action?).
Duke Energy	No	o General Comment - many timeframes in Attachment 1 are within one hour. This is inconsistent with the stated aim of the standard, which is after-the-fact reporting, as opposed to real-time operating notifications under RCIS and other standards (e.g. TOP). This standard should not be structured to require another layer of real-time reporting. o Voltage Deviation - Plus or minus 10% of what voltage? o Frequency Deviation - this is Interconnection-wide. Do you really want a report from every RC and BA in the Eastern Interconnection?? o Transmission Loss - "Multiple BES transmission elements" should be changed to "Three or more BES transmission elements". Also, the time to submit the report should be based upon 24 hours after the occurrence is identified. o Damage or destruction of BES equipment - need clarity on the "Examples". Is the intent to report an event that meets any one of the four "part a." sub-bullets? i. - critical asset should be capitalized. Disagree with the phrase "has the potential to result" in section iii. - it should just say "results". Section iv. is too wide open. It should instead say "Damaged or destroyed with malicious intent to disrupt or adversely affect the reliability of the electric grid." o Unplanned Control Center evacuation - see our General Comment above. Clearly in this case the reporting individuals are evacuating and cannot report in one hour. 24 hours should be more than adequate for after-the-fact reporting. o Fuel Supply Emergency, Loss of off-site power, and Loss of all monitoring or voice communication capability - see our General Comment above. Time to report should be 24 hours after occurrence is identified. o Forced intrusion, Risk to BES equipment, Detection of a cyber intrusion to critical cyber assets - time to report should be 24 hours after occurrence is identified, and critical cyber assets should be capitalized.

Organization	Yes or No	Question 10 Comment
Dynegy Inc.	No	A 2000 MW loss needs to be more clearly defined by either the BA, ISO, RC, etc. for the applicable enity.Also, what is the distinction between the "damage or destruction of BES equipment" and the generation loss of >= 2000 MWs if it is a Critical Asset which is currently drafted as those greater than 1500 MW in current draft of CIP-002-4. This could lead to 2 events with different thresholds (i.e. 1500 MW and 2000 MWs). Possibly get rid of the 2000MW criteria and let the threshhold level be the same as the Critical Asset MW level. Or remove the Critical Asset threshhold in the footnote to Attachment 1.
E.ON Climate & Renewables	No	1. Voltage deviation events are too vague for GOP. How does voltage deviations apply to GOP's or specifically renewables i.e., wind farms? 2. Define what an "entity" is. 3. Define what a "generating station" is. 4. Define what a "BES facility" is.6. Define what a control center is.
Electric Market Policy	No	1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable entity to report the event. This is duplicative and would appear to overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004.
ERCOT ISO	No	ERCOT ISO requests the reporting timeframes be changed to reflect a 24 hour requirement for all events in Attachment 1. During an impact event, operating personnel are generally involved in event resolution and not available immediately to submit reports. ERCOT ISO requests that the "Detection of a cyber intrusion to a

Organization	Yes or No	Question 10 Comment
		critical cyber asset" be removed. There are established processes defined for incident response supporting CIP-008. By including this element in Attachment 1, the Operating requirement R2 would also require procedure documents for cyber security incident response. This would be redundant and would remove the responsibility away from the subject matter experts for cyber security incident response.
Exelon	No	The listed Impact Events is lacking specific physical security related events. .In general, all impact events need to be as explicit as possible in threshold criteria to eliminate any interpretation on the part of a reporting entity. Ambiguity in what constitutes an "impact event" and what the definition of "occurrence" is will ultimately lead to confusion and differing interpretations.
FirstEnergy	No	1. The table in Att. 1 and the requirements should alleviate the potential for duplicate reporting. For example, If the RC submits a report regarding a Voltage deviation in its footprint, the report should be submitted by the RC on behalf of the RC, TOP, and GOP, and not require the TOP and GOP to submit duplicate reports.2. Regarding the "Note" before the table - We agree that under certain conditions it is not possible to issue a written report in a given time period. However, the ERO and RE should also be required to confirm receipt of the verbal communication in writing to prove that the entity communicated the event as these verbal notifications may be done by an entity using an unrecorded line.3. Organizations with many registered entities should be permitted to submit one report to cover multiple entities under one parent company name. We suggest this be made clear in the Tables, the reporting form, and in the requirements.4. Voltage Deviations Event - We suggest the team provide more clarity with regard to the types and locations of voltage deviations that constitute an event.5. Examples of BES Equipment in Part A of "Actual Reliability Impact" Table - Is the phrase "critical asset" referring to the CIP defined term? If so, this should be capitalized.6. Under the "Time to Submit Report" column of the table, we suggest that all of the phrases end in "after identification of the

Organization	Yes or No	Question 10 Comment
		occurrence".7. Frequency Trigger Limit (FTL) for the Frequency Deviation event should be replaced with the values the FTL represent. The FTL is part of the BAAL Standards which have not been approved by the industry and are not in effect. It is possible that these terms are not used by those not participating in the field trial of the BAAL standards.
Great River Energy	No	Comments: Please provide a phone number and provision within the Note of EOP-004 - Attachment 1: Impact Events table for an entity to contact NERC if unable to contact NERC within the time described.Voltage Deviations - recommend adding the word “(continuous)” after sustained in Threshold column. This could be interpreted as an aggregate value over any length of time.Frequency deviations - recommend adding the word “(continuous)” after 15 minutes’ in Threshold column. This could be interpreted as an aggregate value over any length of time.CIP-008 R1.3 states the entity is to report Cyber Security Incidents to the ES_ISAC. Does the EOP-004 Attachment 2 fulfill this requirement?We request clarification on the Transmission Loss threshold events that constitute reporting. We also want clarification on what constitutes the loss of a DC Converter station and is there a time duration that constitutes the need for reporting or does each trip need to be reported? For example during a commutation spike the DC line could be lost for less than a minute. Does this loss require a report to be submitted? Is the SDT stating that each time a company loses their DC line, they are required to file a report even though it may not have an effect on the bulk system? What is the threshold for this loss?The SDT needs to clarify that duplicative reporting is not required and that only one entity needs to report. For instance, the first three categories regarding energy emergencies could be interpreted to require the BA and RC to both report. The reporting responsibilities in this table should be clarified based on who has primary reporting responsibility for the task per the NERC Functional Model and require only one report. For instance, since balancing load, generation and interchange is the primary function of a BA per the NERC Functional Model, only the BA should be required to provide this report.The

Organization	Yes or No	Question 10 Comment
		term Frequency Trigger Limit (FTL) is not currently defined in the NERC Glossary. The term FTL needs to be introduced at the beginning of the standard and defined as a new term.
Indeck Energy Services	No	Loss of off-site power is important to more than just nuclear plants--but which ones? Control centers or other large generators. But not small generators! Should there be a common element to Attachment 1, like the potential to cause a Reportable Disturbance, or maybe there need to be multiple criteria like that.
Independent Electricity System Operator	No	We do not support the 1 hour reporting time frames for Emergency Energy, System Separation, unplanned Control Center evacuation, Loss of off-site power, Loss of monitoring or voice communication. Energy emergency is broadcast on the RCIS which also goes to the ERO so its explicit reporting is not necessary (System Operations please verify). During other events listed above, the responsible entities will likely be concentrating its effort in returning the system to a stable and reliable state. Reporting to anyone not having direct actions to control, mitigate and contain the disturbances is secondary to restoring the system to t a reliable state. Since these are after the fact reports for awareness and/or analysis and not for real-time responses, these can be reported at a later time, up to 24 hours after the initial occurrence without any detriment to reliability, or at the very earliest: up to 1 hour after the system has returned to a reliable state, or after the backup control centre is fully functional, or after backup power is restored to the nuclear power plant, or after monitoring or voice communication is restored.
IRC Standards Review Committee	No	We do not agree with the requirement to report “detection of a cyber intrusion to critical cyber assets” as this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. We suggest that physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.
ISO New England Inc.	No	1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable

Organization	Yes or No	Question 10 Comment
		entity to report the event. This is duplicative and would overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004.What are the examples at the bottom of page 14 supposed to illustrate? Critical Asset should have the appropriate capitalization as being a defined term. Is Critical Asset what is intended to be used here? Should the “a” list be read as ANDs or Ors? Does “loss of all monitoring communications” mean “loss of all BES monitoring “communications”? Does “loss of all voice communications” mean “loss of all BES voice communications?”Are the blue boxes footnotes or examples?Does “forced intrusion” mean “physical intrusion” (which is different from “cyber intrusion”)?Regarding “Risk to BES Equipment,” request clarification of “non-environmental”. Regarding the train derailment example, the mixture of BES equipment and facility is confusing. Request clarification for when the clock starts ticking.Regarding “Detection of a cyber intrusion to critical cyber assets”, there is concern that this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. Suggest physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.
Kansas City Power & Light	No	We agree with the event descriptions listed in Attachment 1 and the review and revision of the impact table by the ERO is appropriately addressed in R7 but the time periods allowed to complete the new, longer preliminary report is insufficient. The correlation of this with the timing of the reporting quarterly and annually or pushing information for other entities' situational awareness does not allow the registered entity adequate time to thoughtfully consider the event and proposed root cause.

Organization	Yes or No	Question 10 Comment
Luminant Energy	No	The Impact Events Table might be easier to clarify if organized by Reporting Entity rather than Event Type as events vary substantially based on the affected BES component. For example, a GO or GOP cannot adequately determine if an event will significantly affect the reliability margin of the system or if an event results in an IROL. Examples specific to Reporting Entities would assist in more appropriate report submissions. Additionally, the footnote under examples of Damage or Destruction of BES Equipment, cites "A critical asset". This term must be clarified to indicate whether this refers to a Critical Asset as defined by CIP 002-1.Finally, the Fuel Supply Emergency item requires additional definitions as neither a GO nor a GOP can reasonably project if an individual fuel supply chain problem will result in the need for emergency actions by the RC or BA.
MidAmerican Energy	No	New vague criteria in Attachment one such as "damage to a BES element through and external cause" or "transmission loss of multiple BES elements which could mean two or more" is the opposite of clear standards writing or results based standards.
Midwest ISO Standards Collaborators	No	Several categories require duplicate reporting. For instance, the first three categories regarding energy emergencies could be interpreted to require the BA and RC to both report. The reporting responsibilities in this table should be clarified based on who has primary reporting responsibility for the task per the NERC Functional Model and require only one report. For instance, since balancing load, generation and interchange is the primary function of a BA per the NERC Functional Model, only the BA should be required to provide this report. As another option, perhaps the registered entity initiating the action should submit the report. If the BA did not take action and the RC had to direct the BA to take action, one could argue that perhaps the RC should submit the report then. However, if the BA takes action appropriately on their own, the BA should submit it. If the TOP reduces voltage for a capacity and energy emergency per a directive of the BA, then the

Organization	Yes or No	Question 10 Comment
		BA should report the event.
MRO's NERC Standards Review Subcommittee	No	Please provide a phone number and provision within the Note of EOP-004 - Attachment 1: Impact Events table for an entity to contact NERC if unable to contact NERC within the time described.Voltage Deviations - recommend adding the word “(continuous)” after sustained in Threshold column. This could be interpreted as an aggregate value over any length of time.Frequency deviations - recommend adding the word “(continuous)” after 15 minutes’ in Threshold column. This could be interpreted as an aggregate value over any length of time.CIP-008 R1.3 states the entity is to report Cyber Security Incidents to the ES_ISAC. Does the EOP-004 Attachment 2 fulfill this requirement?
Nebraska Public Power District	No	Since the reporting under this standard is for after the fact reporting, the minimum time to report should be the end of the next business day. The combination of the extremely short time periods to file a report and the amount of detail required in attachment 2 will lead to a reduction in the reliability of the BES. System Operators will be forced to take focus off their primary responsibility to respond to the event in order to complete the report within the required timeframe (within an hour for some events). During non-business hours the only personnel available to complete the reports will be those responsible for real-time operation of the BES. Since the background indicates this standard is only for after the fact reporting, the minimum required time to submit the report should be one business day to permit completion of the report without distracting from the real-time operation of the BES. Real-time reporting requirements are covered in other standards and should be to the Reliability Coordinator and from the Reliability Coordinator to NERC. For after the fact reporting, there is absolutely no reliability benefit for requiring reporting to be completed on such a short timeframe. This is especially true due to the amount of data required by Attachment 2.

Organization	Yes or No	Question 10 Comment
NERC Staff	No	The SDT should clarify its use of the term “critical asset” in the Examples section under Part A of the table. The term or versions of the term are used in different contexts in the NERC Reliability Standards. For instance, in CIP-002-1, Requirement 1, the Critical Asset Identification Method is used to identify its critical assets. In EOP-008-0, Requirement 1.3, the applicable entity is required to list its “critical facilities” in its contingency plan for the loss of control center functionality. The team should confirm what it is referring to in this proposed standard. To avoid confusion, the SDT may want to consider using a different term here or better clarify its meaning. Further, there exists the potential to have disparate reporting criteria in this proposed standard relative to the criteria being proposed by the Events Analysis Working Group as part of the Events Analysis Process document dated October 1, 2010. In particular, the following areas should be reconciled between the drafting team and the EAWG to ensure a consistent set of threshold criteria:Voltage Deviations --EOP-004-2: Greater than or equal to 15 minutes --EAWG Process: Greater than or equal to 5 minutesSystem Separation (Islanding) --EOP-004-2: Greater than or equal to 100 MW --EAWG Process: Greater than or equal to 1000 MWsSystem Separation (Islanding) --EOP-004-2: Does not address intentional islanding as in the case of Alberta, Florida, New Brunswick--EAWG Process: Addresses intentional islanding as in the case of Alberta, Florida, New BrunswickSPS/RAS --EOP-004-2: Does not expressly address proper SPS/RAS operations or failure, degradation, or misoperation of SPS/RAS --EAWG Process: Expressly addresses proper SPS/RAS operations or failure, degradation, or misoperation of SPS/RASTransmission Loss --EOP-004-2: Identifies Multiple BES transmission elements --EAWG Process: Provides specificity in Category 1a and 1b regarding transmission eventsDamage or destruction of BES equipment --EOP-004-2: Through operational error, equipment failure, or external cause but not linked to loss of load--EAWG Process: Identifies in Category 2h equipment failures linked to loss of firm system demandsForced intrusion--EOP-004-2: Addressed --EAWG Process: Not addressedRisk to BES equipment --EOP-004-2: Addressed --EAWG Process: Not addressedDetection of a cyber intrusion to critical cyber assets --EOP-004-2: Addressed --

Organization	Yes or No	Question 10 Comment
		EAWG Process: Not addressed
North Carolina Electric Coops	No	This list is too similar and redundant to the DOE requirements and does not provide any additional clarity on recognition of sabotage.
Northeast Power Coordinating Council	No	1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable entity to report the event. This is duplicative and would overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004.What are the examples at the bottom of page 14 supposed to illustrate? Critical Asset should have the appropriate capitalization as being a defined term. Is Critical Asset what is intended to be used here? Should the “a” list be read as ANDs or Ors? Does “loss of all monitoring communications” mean “loss of all BES monitoring “communications”? Does “loss of all voice communications” mean “loss of all BES voice communications?”Are the blue boxes footnotes or examples?Does “forced intrusion” mean “physical intrusion” (which is different from “cyber intrusion”)?Regarding “Risk to BES Equipment,” request clarification of “non-environmental”. Regarding the train derailment example, the mixture of BES equipment and facility is confusing. Request clarification for when the clock starts ticking.Regarding “Detection of a cyber intrusion to critical cyber assets”, there is concern that this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. Suggest physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.

Organization	Yes or No	Question 10 Comment
Pacific Northwest Small Public Power Utility Comment Group	No	Footnote 1 is missing from Part A, although it is referenced in column 1 row 11. Is this the Examples? The purpose of the Examples is unclear. Is it meant to limit the scope to those enumerated? This is not stated, but if not it should be removed since it adds confusion. What is meant by non-environmental? All external causes of damage or destruction come from the environment by definition. Please specify what is intended or remove the word.
PacifiCorp	No	Energy Emergency requiring firm load shedding - An SPS/RAS could operate shedding firm load but no Energy Emergency may exist. This requires clarification.Transmission Loss - Multiple BES transmission elements. Loss of two transmission lines in the same corridor due to a wildfire could qualify for this reporting. Once again clarification needed.
Pepco Holdings, Inc - Affiliates	No	Some items with one hour reporting (such as Unplanned Control Center evacuation) may be so disruptive to operations that one hour is too short. 4 hours suggested.
PPL Electric Utilities	No	While we think providing an impact event list is beneficial, we would like to see Attachment 1 revised and/or clarified. Refer to response to Question 2 considering duplicate reporting. Regarding impact event 'Damage or destruction of BES equipment' and considering the first example in the 'Examples' section, does 'example a. i.' mean if the BES equipment that is damaged is not identified as a critical asset per CIP-002 that no reporting is required? Clarify the Part A and Part B, specifically:Attachment 1 Part A is labeled 'Actual Reliability Impact'. Does this title mean that for all events listed that the 'threshold for reporting' is only met if the event occurs AND there is an actual reliability impact? As opposed to Part B where the threshold for reporting is met when the event occurs and there is a potential for reliability impact? This could be broad for event 'risk to BES equipment'. Providing as much clarity as possible on the 'threshold for reporting' is

Organization	Yes or No	Question 10 Comment
		beneficial to the industry and will help eliminate confusion with the existing CIP-001 standard regarding ‘potential sabotage’.
PPL Supply	No	Attachment 1 Part A is labeled "Actual Reliability Impact". Does this title mean that for all events listed the "threshold for reporting" is only met if the event occurs AND there is an actual reliability impact? As opposed to Part B where the threshold for reporting is met when the event occurs and there is a potential for reliability impact? This could be broad for events like "Risk to BES equipment."
PSEG Companies	No	For many items, there are multiple entities listed with reporting obligations. For example, loss of off-site power to a nuclear plant lists RC, BA, TOP, TO, GO and GOP. This appears to result in the potential for the sending of 6 separate reports within the hour for the same event, which in wide area disturbances overload the recipients. The drafting team should consider revising the lists where possible to a single, or absolute minimum number, entity.Those items reportable OE-417 should be removed from Attachment 1. For example, voltage reduction, loss of load for greater than 15 minutes.The trigger for voltage reduction should be the time of issuance of the directive to reduce voltage in an emergency, not when "identified."
Puget Sound Energy	No	The proposed standard does not adequately ensure that the impact events subject to its requirements are limited to those listed in Attachment 1. In order to ensure that this is true, the term “impact event” should be a defined term and that definition should clearly limit impact events to those listed in Attachment 1.
Santee Cooper	No	The SDT should review the list of events closely to determine if the defined events actually impact the BES. (For example: Is shedding 100 MW of firm load really a threat to the BES?)
SERC OC Standards Review	No	Will all reporting requirements be removed from other standards to avoid duplication? And will all future

Organization	Yes or No	Question 10 Comment
Group		standard revisions include revisions to this standard to incorporate associated reporting requirements?There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
Southern Company - Transmission	No	The time to submit report column needs to be more flexible with time frames. The Entity with Reporting Responsibility column needs to be more descriptive in which there are multiple entitles with hierarchy reporting.
United Illuminating	No	UI agrees but the listing needs to be improved for clarity in certain instances. For example,EOP-004 Attachment 1 Part A - Example iii - uses the phrase “significantly affects the reliability margin of the system.” Significantly is an immeasurable concept and does not provide guidance to the Entity. The phrase “reliability margin” is not defined and is open to interpretation. Perhaps utilize “resource adequacy”, if that is all that intended, or use “adequate level of reliability”.
US Bureau of Reclamation	No	The Attachment is very vague and without modification creates a Pseudo definition of BES equipment in the example provided. The example now indicates that something is BES equipment if it is "Damaged or destroyed due to a non-environmental external cause". Perhaps the example should be reworded to "BES equipment whose operation effects or causes:" and then adjust each of the line items to clarify what was intended. Next, the Attachment A example redefines reportable levels for Risk to BES Equipment - From a non-environmental physical threat as "Report copper theft from BES equipment only if it degrades the ability of equipment to operate correctly". Who makes that determination? Not all events will be known within 24 hours. As example, Risk to BES Equipment - From a non-environmental physical threat may not be known until more thorough examination or investigation takes place. Also the reportable level appears to be defined by the Entity. While agree with that, we will end up with the same criticism from FERC when the level is set to

Organization	Yes or No	Question 10 Comment
		"high" in FERC's mind. The reporting times are unrealistic for complicated events. Notification is reasonable but not reporting. Many organizations's have internal processes the reports must be vetted through before they become public and subject to compliance scrutiny.
We Energies	No	I did not compare this standard to the OE-417 form. Please do not require operators to fill out a second form during an emergency within one hour.Energy Emergency requiring Public appeal...: "Public " is not a defined term.Energy Emergency requiring system-wide voltage...: DP does not control BES voltage.Energy Emergency requiring firm load shed...: TOP does not have load it would shed for an Energy Emergency.Frequency Deviations: Why is a BA reporting? This will be every BA in the Interconnection reporting the same Frequency Deviation.Frequency Deviations: Frequency Trigger Limit is not a defined term, and is not defined in this standard.Loss of Firm Load...: TO and TOP may coordinate or direct load shed, but they do not serve firm load.Damage or destruction of BES... There is no footnote 1 on this page. I assume it is the examples on the page. Are these "examples" of a larger set or are these all that is required? Critical Asset is a defined term.Forced Intrusion: "facility" or Facility? An RC and BA do not have Facilities.
Georgia System Operations Corporation	Yes	We support the concept of Impact Events and listing and describing them in a table. However, we have some concerns.Reporting of impact events should not be applicable to a DP.The timelines outlined in Attachment 1 should be targets to try to meet but it should not be a compliance violation of the reporting requirement if it is not met. Regarding the NOTE before the table, verbal reports and updates should be allowed for other than certain adverse conditions like severe weather as well as adverse conditions. The first priority for all entities should be addressing the effects of the impact event. It may not be possible to assess the damage or the cause of an impact event in the allotted time. All entities should make their best effort to quickly report under any circumstances what they know about the event even if it is not complete. They should be allowed to

Organization	Yes or No	Question 10 Comment
		report up through a hierarchy. The written report should not be issued until adequate information is available. Change "Preliminary Impact Event Report" to "Confidential Impact Event Report."Capitalization throughout this table is inconsistent. Sometimes an event is all capitalized. Sometimes not. It is not in synch with the NERC Glossary. All terms that remain capitalized in the next draft (other than when used as a title or heading) should be defined in the Glossary of Terms Used in NERC Reliability Standards. Examples of inconsistencies: Unplanned Control Center evacuation, Loss of off-site power, Voltage Deviations.-Energy Emergency requiring a public appeal or a system-wide voltage reduction: All The NERC Glossary defines Energy Emergency as a condition when a LSE has exhausted all other options and can no longer provide its customers' expected energy requirements. The events should not be described as an Energy Emergency requiring public appeal or system-wide voltage reductions. If public appeal and system-wide voltage reductions are still an option then all options have not been exhausted, the LSE can still provide its customers' energy requirements, and it is not an Energy Emergency. We suggest using "Energy Emergency Alert" rather than "Energy Emergency."-Energy Emergency requiring firm load shedding: load shedding via automatic UFLS or UVLS would not necessarily be due to an Energy Emergency. Other events could cause frequency or voltage to trigger a load shed. Most likely an entity would be seeing the Energy Emergency coming and would be using manual load shedding. -Forced intrusion and detection of cyber intrusion to critical cyber assets: CIP-008 is not referrenced for a forced intrusion. CIP-008 is referenced for a detection of cyber intrusion impact event. Aren't there reportable events per CIP-008 that involve physical intrusion that are not intrusions at a BES facility?-Risk to BES equipment: The threshold states that it is for a non-environmental threat but the examples given are environmental threats. Please clarify.
Manitoba Hydro	Yes	Though R7 indicated Attachment 1 will be reviewed and revised reguarily the immediate addition of:"Detection of suspected or actual or acts or threats of physical sabotage"should be added.

Pacific Gas and Electric Company	Yes	
PacifiCorp	Yes	
PNM Resources	Yes	
RRI Energy, Inc.	Yes	
TransAlta Corporation	Yes	

11. Do you agree with the use of the Preliminary Impact Event Report (Attachment 2)? Please explain in the comment box below.

Summary Consideration: Most commenters who responded to this question disagreed with some aspect of the Preliminary Impact Event Report. The proposed Preliminary Impact Event Report (Attachment 2) generated comments regarding the duplicative nature of the form when compared to the OE-417. The DSR SDT has added language to the proposed form to clarify that NERC will accept a DOE OE-417 form in lieu of Attachment 2 if the responsible entity is required to submit an OE-417 form.

In collaboration with the NERC Event Analysis Working Group (EAWG) the DSR SDT proposes to modify the attachment to eliminate confusion. This revised form will be used as Attachment 2 of the Standard and is the only required information for EOP-004-2 reporting. Further information may be requested through Events Analysis Process (NERC Rules of Procedure), but this information is outside of the scope of EOP-004.

The DSR SDT has also clarified what the form is to be used for with the following language added:

> "This form is to be used to report impact events to the ERO."

Organization	Yes or No	Question 11 Comment
City of Austin dba Austin Energy		Austin Energy would like to see OE-417 incorporated into the electronic form This will reduce the callout of EOP-004-2 and OE-417 forms in our checklists / documents and one form can be submitted to NERC and DOE.
Independent Electricity System Operator		TBD
Ameren	No	It is unclear when this should be used, or why.

Organization	Yes or No	Question 11 Comment
ATC	No	No. NERC does not have the authority to absolve the Functional Entities of the reporting obligations for the DOE Form OE-417. Therefore, there will be duplicate reporting requirements and the one hour timeframes required in Attachment 1 will take valuable resources away from mitigating the event to filling out duplicative paperwork. It is ATC's position that the OE-417 report be used as the main reporting template until NERC and the DOE can develop a single reporting template. Task #14 in the report should be modified to say, "Identify any known protection system misoperation(s)." If this report is to be filed within 24 hrs, there will not be enough time to assess all operations to determine any misoperation. As a case in point, it typically takes at least 24 hrs to receive final lightning data; therefore, not all data is available to make a determination.
ATCO Electric Ltd.	No	Attachment 2 Item 4 implies that an entity is required to analyse and report on an impact event that occurred outside its system. This is not practical as the entity will not have access to the necessary information.
BGE	No	There is considerable difference between this form and OE-417 necessitating that two forms be completed. BGE believes that the purpose of combining the standards was to reduce the number of reporting entities and number of reports to be generated by each entity. BGE believes this fails to accomplish this purpose.
City of Garland	No	The report filed should be the OE-417 ELECTRIC EMERGENCY INCIDENT AND DISTURBANCE REPORT and should be filed only on OE-417 reportable incidents. If this report is implemented as drafted, companies with multiple registration numbers and functions should only have to file one report for all functions and registrations.
Consolidated Edison Co. of NY, Inc.	No	It is not clear why the DOE form cannot be used. NERC should make every effort to minimize paper work for entities responding to system events.
Constellation Power Generation and Constellation Commodities Group	No	It is unclear if an entity has to answer all the questions. In addition, "Preliminary" is not currently included in the report title.
Electric Market Policy	No	There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
ERCOT ISO	No	ERCOT ISO requests the use of a single report format to meet all requirements from NERC and DOE. There is no value added in requiring different reporting to different agencies.

Organization	Yes or No	Question 11 Comment
Exelon	No	Exelon agrees with the use of the report but feels that # 5 should consist of check boxes. #12, 13, and 14 will take more time then allotted by the reporting requirements to acquire, cannot be accomplished in an hour.Attachment 2 should have a provision for the reporting entity to enter (N/A) based on function (see below)Check box #8 A GO/GOP may not have the information to determine what the frequency was prior to or immediately after an impact event. This information should be the responsibility of a TOP or RC.Check box #9A GO/GOP may not have the information to determine what transmission facilities tripped and locked out. This information should be the responsibility of a TO, TOP or RC.Check box #10A GO/GOP may not have the information to determine the number of affected customers or the demand lost (MW-Minutes). This information should be the responsibility of a TO, TOP, or RC.
Great River Energy	No	NERC and the DOE need to coordinate and decide on which report they want to use and whichever report it is needs to include all information required by both entities. The way this standard is currently written there is the potential that two government entities may need to be reported to is a relatively short period of time. It is not clear what benefit providing the Compliance Registration ID number provides. Many of the registered entities employees that will likely have to submit the report, particularly given the one-hour reporting requirement for some impact events, will not be aware of this registration ID. However, they will know for what functions they are registered. We recommend removing the need to enter this compliance registration ID or extending the time frame for reporting to allow back office personnel to complete the form. For item two, please change “Time/Zone:” with “Time (include time zone)”. As written it is a little confusing.
Idaho Power Company	No	there should only be on report, utilized OE-417
Indeck Energy Services	No	The form needs to identify whether it is a preliminary or final report. An identifier should be created to tie the final to the preliminary one. Some fields, 1,2 3 5 & 6, are required for the preliminary report and should be labeled as such. With the 1 hour reporting deadline for some events, the details may not be known. 12 & 13 should be required for the final report. 13 should designate whether the cause is preliminary or final. 7-11 & 14 are optional, and the form should state this, and based on some types of events. It's confusing to have irrelevant blanks on the form.
IRC Standards Review Committee	No	Attachment 2 is not referenced in the standard requirements. Is it a part of the standard that an entity must use to file the impact event reports to a specific recipient. If so, this needs to be referenced in the standard.We question the need for using a fixed format for reports that vary from “shedding firm load” to “damaging equipment”. The nature of impact events varies from one event to another and hence a fixed format or pre-determined form may not be able to provide the appropriate template that is suitable for use for

Organization	Yes or No	Question 11 Comment
		all events. We urge the SDT to reconsider the use of Attachment 2 for reporting events, with due consideration to the actual intent of the standard (as pointed out in our comments under Q1).
ISO New England Inc.	No	There is already a DOE requirement to report certain events. There is no need to develop redundant reporting requirements to NERC that cross other federal agency jurisdictions.The heading on page 16 refers to EOP-002, but this is Standard EOP-004. If some questions do not require an answer all of the time, then the form should state that or provide a NA checkbox. While Attachment 1 details some cyber thresholds, Attachment 2 provides no means to report - which is acceptable if cyber incidents are handled by CIP-008 per the comment provided for Question 10.The Event Report Template in Appendix A is different from the most recent version, which is available at: http://www.nerc.com/docs/eawg/Event_Analysis_Process_WORKINGDRAFT_100110-Clean.pdf
Kansas City Power & Light	No	For easier classification and analysis of events for both external reporting to the ERO and internal reporting for the applicable entity, the form should include Event Type. The DSR SDT should code each event type and include the codes as part of Attachment 1.
Manitoba Hydro	No	Though a “Confidential Impact Event Report” is much needed the Attachment 2 needs refinement.Provide an explanation for each “task”.Isolate and simplify the “Who, When and What” section.Isolate the description of event.Remove items 7 to 10. Modify Attachment 1, add columns to indicate time of event, quantity, restore time, etc as required. The Attachment 1 can be attached to Attachment 2. This could simply and speed the reporting process.
MidAmerican Energy	No	
Midwest ISO Standards Collaborators	No	This form differs from the DOE reporting forms. We do not believe different reporting forms should be required. The DOE form should be sufficient for NERC reporting.It is not clear what benefit providing the Compliance Registration ID number provides. Many of the registered entities employees that will likely have to submit the report, particularly given the one-hour reporting requirement for some impact events, will not be aware of this registration ID. However, they will know for what functions they are registered. We recommend removing the need to enter this compliance registration ID or extending the time frame for reporting to allow back office personnel to complete the form. For item two, please change “Time/Zone:” with “Time (include time zone)”. As written it is a little confusing.

Organization	Yes or No	Question 11 Comment
MRO's NERC Standards Review Subcommittee	No	Number 4 of the reporting form does not take into consideration of potential impact events. Recommend that "Did the impact event originate in your system?" to "Did the impact event originate or affect your system?". This will provide clarity to entities.
Nebraska Public Power District	No	If the standard requires submission of the report within an hour (which is not appropriate), there must be an abbreviated form that can be quickly filled out by checking boxes and not require substantial narrative. The existing form has too much free form text that takes time to enter and with the short timeframe for reporting will distract the entities responsible for real-time reliabiltiy of the BES from that task by forcing them to complete after the fact reports. It is unrealistic to expect entities to staff personnel to complete the reporting 24 x 7 for unlikely events, so the task will fall to System Operators who should be focusing on operating the BES at the time of these events instead of providing after the fact reporting to entities that do not have responsibility for real-time operation of the BES. Real-time reporting to the RC and/or BA is covered under other standards and is necessary for the RC to have situational awareness, but is not covered under this standard. The registered entities may report to the proper law enforcement entities when the situation warrants, but again this form is not the appropriate way to handle that reporting requirement.
NERC Staff	No	Item 15: A one-line diagram should be attached to assist in the understanding and evaluation of the event.Two additional items are recommended:--Ongoing reliability impacts/system vulnerability - this would capture areas where one is not able to meet operating reserves or is in an overload condition, below voltage limits, etc. in real-time--Reliability impacts with next contingency - this would capture potential impacts as outlined above with the next contingency.
North Carolina Electric Coops	No	There is already a DOE requirement to report certain events. NERC should not be developing redundant reporting requirements when this information is already available at the federal level from other agencies.
Northeast Power Coordinating Council	No	There is already a DOE requirement to report certain events. There is no need to develop redundant reporting requirements to NERC that cross other federal agency jurisdictions.The heading on page 16 refers to EOP-002, but this is Standard EOP-004. If some questions do not require an answer all of the time, then the form should state that or provide a NA checkbox. While Attachment 1 details some cyber thresholds, Attachment 2 provides no means to report - which is acceptable if cyber incidents are handled by CIP-008 per the comment provided for Question 10.The Event Report Template in Appendix A is different from the most recent version, which is available at: http://www.nerc.com/docs/eawg/Event_Analysis_Process_WORKINGDRAFT_100110-Clean.pdf

Organization	Yes or No	Question 11 Comment
Pacific Gas and Electric Company	No	PG&E believes the report is duplicative to the OE-417 reporting criteria.
Pacific Northwest Small Public Power Utility Comment Group	No	We found no “Preliminary Impact Event Report” in the posted draft standard, so we assume the question is regarding the “Confidential Impact Report” (Attachment 2). It is unclear what role the form plays, since no requirement refers to it. If this is the form to report impact events per R6, then R6 should reference it. The comment group cautions that the use of the word “confidential” should be carefully considered, since many filled out forms that originally contained the word are now posted on the NERC website for all to see. If there are limits to the extent and/or duration of the confidentiality this should be clearly stated in the form, or the word should be avoided.Protection System misoperation reporting is already covered by PRC-004. Including it here is redundant, and doubly jeopardizes an entity for the same event.
PacifiCorp	No	As previously mentioned all effort should be made to ensure duplicate reporting is not required. OE-417 requirements should be covered by this one form.
Pepco Holdings, Inc - Affiliates	No	The list of events misses many items considered as suspicious or potential sabotage, such as suspicious observation of critical facilities.
PNM Resources	No	PNM believes the report is duplicative to the OE-417 reporting criteria.
PSEG Companies	No	The top of this form should have the following statement added: "This form is not required if OE-417 is required to be filed."
Puget Sound Energy	No	Attachment 2 is not referenced in the requirements of the proposed standard. As a result, it is not clear when its submission would be required.
Santee Cooper	No	If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity.
SERC OC Standards Review Group	No	There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.

Organization	Yes or No	Question 11 Comment
TransAlta Corporation	No	We recommend the 'time to Submit Report' to start when the event is recognized verses when it occurred.
United Illuminating	No	The standard does not appear to require the use of Attachment 2. Placing the form within the Standard may require the use of the Standards Development Process to modify the form. UI suggests the form is maintained outside the Standard to allow it to be adjusted. UI would prefer NERC to establish an internet based reporting tool to convey the initial reports.
US Bureau of Reclamation	No	There is already a reporting form for disturbances. The SDT should reconcile this standard with all the other reporting that is being requested and not add more.
We Energies	No	The data required to assess an impact event thoroughly will often not be available or apparent. Immediate reporting should fall to the RE with assistance/information from the affected entities.There do not seem to be provisions for when it is impossible to take the time to fill out a form or when it is impossible to send a form.I did not compare this standard to the OE-417 form. Please do not require operators to fill out a second form during an emergency within one hour.
WECC	No	The report is duplicative to the OE-417 reporting criteria.
Bonneville Power Administration	Yes	Item 8: list Hz minimum on the second line prior to Hz max since that is the typical frequency excursion order.The Operating Plan is going to have to include the Compliance Registration ID number, since Operating Personnel don't carry that information around and it is not readily available.
Duke Energy	Yes	However, Attachment 2 is titled "Impact Event Reporting Form".
E.ON Climate & Renewables	Yes	Suggestions on the form: if an entity has not had time to fully determine the cause of an Impact Event such as for "Question # 4: Did the impact event originate in your system, yes or no?", perhaps more time is needed that 24 hours to determine the cause.
FirstEnergy	Yes	Although we agree with the report, it should be clear that organizations with many registered entities can submit one report to cover multiple entities under one parent company.
Georgia System Operations	Yes	We support having one form for reporting however every applicable entity should not be required to fill it out and send it to NERC. See previous comments about hierarchical reporting.The title of the report is

Organization	Yes or No	Question 11 Comment
Corporation		"Confidential Impact Event Report." Some suggested modifications: The form could have a blank added to enter the event "description" as described in the first column of Attachment 1. The first seven lines contain information that would most likely be filled out every time. The other lines except line 13 may or may not be applicable every time. It is required (R3) for an entity to access the initial probable cause of all impact events so line 13 will most likely be filled out every time. Please move the probable cause line up to line 7 or 8 (depending on if the event description line is added).
PPL Electric Utilities	Yes	For ease, timeliness, and accuracy of reporting an application with an easy to use interface would be preferred. If the reporting is done via an application, the ability to enter partial data, save and add additional info prior to submission would be helpful. Additionally, an application with drop downs to select from for impact event, NERC function, etc would be helpful. #1 - Is the 'Compliance Registration ID number' the same as the NCR number? If this is required, include as separate entry. #2 - is this the date of occurrence or detection?
Arizona Public Service Company	Yes	
Dynegy Inc.	Yes	
Green Country Energy	Yes	
Luminant Energy	Yes	
PacifiCorp	Yes	
PPL Supply	Yes	

Organization	Yes or No	Question 11 Comment
RRI Energy, Inc.	Yes	
Southern Company - Transmission	Yes	

12. The DSR SDT has replaced the terms "disturbance" and "sabotage" with the term "impact events". Do you agree that the term "impact events" adequately replaces the terms "disturbance" and "sabotage" and addresses the FERC directive to "further define sabotage" in an equally efficient and effective manner? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst commenters who responded to this question. Several commenters expressed concern that the definition should be added to the glossary. The DSR SDT has proposed a definition for "Impact Events" to support Attachment 1 as follows:

> "An Impact Event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action."

The DSR SDT has proposed this definition for inclusion in the NERC Glossary for "Impact Event". The types of Impact Events that are required to be reported are contained within Attachment 1. Only these events are required to be reported under this Standard.

Several commenters expressed concern that the team did not define 'Sabotage' and FERC directed that the modifications to this standard include a definition of sabotage. The DSR SDT considered the FERC directive to "further define sabotage" and decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This will result in further ambiguity with respect to reporting events. The term "sabotage" is no longer included in the standard and therefore it is inappropriate to attempt to define it. The Impact Events listed in Attachment 1 provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive.

Some commenters were concerned that some of the events that require reporting that were specifically listed in the previous version of the standard are not included in the revised standard. Attachment 1, Part A is to be used for those actions that have impacted the electric system and in particular the section "Damage or destruction to equipment" clearly defines that all equipment that intentional or non intentional human error be reported. Attachment 1, Part B covers the similar items but the action has not fully occurred but may cause a risk to the electric system and is required to be reported.

Organization	Yes or No	Question 12 Comment
Bonneville Power Administration		The definition of an impact event in EOP-004-2 seems clear, however the term "mis-operation" still may imply intent in the action of an individual. The SDT should consider further defining that term.
Independent Electricity System Operator		We do not have a view on what name is assigned to the reportable events for so long they are listed in Attachment 1. However, the heading of the Table contains the words “Actual Reliability Impact”, which does not accurately reflect the content inside the table and which may introduce confusion with the term “impact event”. We suggest to change them to “Reportable Impact Events”.As we read the Summary of Concept and Assumption, there appears to be a slightly different lists at the bottom of P. 21. With these events included, the meaning of “impact event” would seem to be too broad. Rather than calling those events listed in Attachment 1 “impact events”, why not simply call them “reportable events”?
CenterPoint Energy	No	CenterPoint Energy does not agree that the term “impact event” adequately replaces “disturbances” and “sabotage”. CenterPoint Energy suggests that just as the SDT has come to consensus on a concept for impact event, a definition could be derived for sabotage. “Potential”, as used in the SDT’s concept, is a vague term and indicates an occurrence that hasn’t happened. Required reporting should be limited to actual events. CenterPoint Energy offers the following definition of “sabotage”: “An actual or attempted act that intentionally disrupts the reliable operation of the BES or results in damage to, destruction or misuse of BES facilities that result in large scale customer outages (i.e. 300MW or more).”
City of Garland	No	1 In keeping with a Results Based Standard, the impact event should be a trigger for filing a report. At the time of the event, one may not know if the event was caused by sabotage. Sabotage that does not affect the BES should not be a reportable event. 2. To comply with the Commissioners request to define sabotage, Impact Event does not adequately replace “sabotage”. If someone reports sabotage, people universally have a concept that someone(s) have taken some type of action to purposely harm, disable, cripple, etc something. Impact Event does not convey that same concept. 3. If Sabotage is left as a “trigger,” it should not include minor acts of vandalism but only acts that impact reliability of the BES
Consolidated Edison Co. of NY, Inc.	No	The definition is open for interpretation beyond events identified in Attachment 1. In addition, all Standards are supposed to have Rationales. In the Draft Standard, the Rationales do not address the concept of Potential, and how it relates to an actual system event. Additional work needs to be done addressing the

Organization	Yes or No	Question 12 Comment
		meaning of “potential”.
Duke Energy	No	We disagree with the stated concept of “impact event”. Including the phrase “or has the potential to significantly impact” in the concept makes it impossibly broad for practical application and compliance. By not attempting to define “sabotage”, the standard creates a broad reporting requirement. “Disturbance” is already adequately defined. “Sabotage” should be defined as “the malicious destruction of, or damage to assets of the electric industry, with the intention of disrupting or adversely affecting the reliability of the electric grid for the purposes of weakening the critical infrastructure of our nation.”
Dynegy Inc.	No	The term is fine but FERC wants more specific examples. GO/GOP can't determine the effect on the BES.
E.ON Climate & Renewables	No	Acts of Sabotage is still not defined and if the registered entities are required to reports acts of sabotage, NERC still needs to define this further.
ERCOT ISO	No	
Exelon	No	Need to better define sabotage and provide examples, the term “impact events” create confusions as to what constitutes an event. The definition of impact event is vague and needs to be quantified or qualified with a term such as “significant”. Otherwise, almost any event could be deemed to be an impact event. Attachment 1 needs to clearly define that damage or destruction of BES equipment does not include cyber sabotage. Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security - Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard. In general, all impact events need to be as explicit as possible in threshold criteria to eliminate any interpretation on the part of a reporting entity. Ambiguity in what constitutes an "impact event" and what the definition of "occurrence" is will ultimately lead to confusion and differing interpretations.
FirstEnergy	No	For the most part we support this definition of impact events. However, we have the following suggestions:1. We believe that it warrants an official NERC glossary definition. 2. The term "potential" in the definition should point to the specific events detailed in Attachment 1 Part B.3. Since the standard does not cover environmental events, the phrase "environmental conditions" in the definition is not an impact event in the context of this standard.

Organization	Yes or No	Question 12 Comment
Great River Energy	No	We believe the SAR scope regarding addressing sabotage has not been addressed at all. It appears that impact event essentially replaces sabotage. This standard needs to make it clear that sabotage, in some cases, cannot be identified until an investigation is performed by the appropriate policing agencies such as the FBI. Intent plays an important role in determining sabotage and only these agencies are equipped to make these assessments.
Green Country Energy	No	Yes and no ... Yes impact events is an adequate term however since it is restrained by the tables it may be helpful to define the term and scope of the term to be more inclusive of sabotage events.
Indeck Energy Services	No	Impact Events is OK. It needs to be balloted as a definition for the Glossary like Protection System.
IRC Standards Review Committee	No	This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement’s and other specialized agencies’, including international agencies’, role in defining acts of sabotage and not hold the registered entity wholly responsible to do so.
ISO New England Inc.	No	The use of the term “impact events” has simply replaced the terms “disturbance” and “sabotage”, and has not further defined sabotage as directed by FERC. We do feel that “impact events” needs to be a defined term. While we agree with the SDT’s new direction, the FERC directive has not been met. This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement and other specialized agencies, including international agencies roles in defining acts of sabotage, and not hold the registered entity wholly responsible to do so.
Luminant Energy	No	The term “Impact Event” does not adequately replace the term “Sabotage” The Impact Events table seems to provide the definition of the term “Impact Event”. This table does not include sufficient definition for actual sabotage events. Additionally, it does not include any provision for suspected sabotage events. Assuming the Damage or Destruction of BES Equipment event type is intended to cover actual sabotage, the Threshold for Reporting column should include specific levels of materiality that are specific to Functional Entity. For instance, a GO and GOP could have a MW level to define materiality as a GO or GOP cannot assess impact to an IROL or system reliability margin due to equipment damage. A threshold value consistent with “Generation Loss” in the proposed EOP-004 Attachment 1 would be appropriate.
Manitoba Hydro	No	The majority of the items listed in Attachment 1 are typically and historically operating events. Yes these are all “impact events”. Sabotage, cyber and security are typically viewed as separate events. These events are

Organization	Yes or No	Question 12 Comment
		not part of "a typical day of BES operations". These are outside event and though qualify as "impact events" should still be treated separately.
Midwest ISO Standards Collaborators	No	We believe the SAR scope regarding addressing sabotage has not been addressed at all. It appears that impact event essentially replaces sabotage. This standard needs to make it clear that sabotage, in some cases, cannot be identified until an investigation is performed by the appropriate policing agencies such as the FBI. Intent plays an important role in determining sabotage and only these agencies are equipped to make these assessments.
NERC Staff	No	NERC staff is concerned with the ambiguity of the term "impact event." The definition of the term is not clear, in part because it includes using the words "impact" and "event" (and thus violates the frowned-up practice of using a word to define the word itself). NERC staff recommends the SDT consider using the term "Event." The following definition (modified from the one used the INPO Human Performance Fundamentals Desk Reference, P. 11) would apply: Event: "An unwanted, undesirable change in the state of plants, systems or components that leads to undesirable consequences to the safe and reliable operation of the Bulk Electric System. "Supporting statement following the definition: "An event is often driven by deficiencies in barriers and defenses, latent organizational weaknesses and conditions, errors in human performance and factors, and equipment design or maintenance issues." Further, if this is intended for use in this standard, it should be presented as an addition to Glossary to avoid confusion with the use of the term event in other standards. Of course, this would require an analysis of how the term "Event" as defined herein would affect the other standards to which the term is used. In the end, this is the cleanest manner for the standards.
Northeast Power Coordinating Council	No	The use of the term "impact events" has simply replaced the terms "disturbance" and "sabotage", and has not further defined sabotage as directed by FERC. We do feel that "impact events" needs to be a defined term.While we agree with the SDT's new direction, the FERC directive has not been met.This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement and other specialized agencies, including international agencies roles in defining acts of sabotage, and not hold the registered entity wholly responsible to do so.
Pacific Gas and Electric Company	No	PG&E believes Attachment 1 Part A or B do not clearing specify "sabotage" events, other than "forced entry" and the proposed definition of "impact event" does not meet FERC's directive to "further define sabotage" nor does it take into consideration their request to address the applicability to smaller entities.
Pacific Northwest Small Public	No	The comment group fails to see how changing the words meet the directive. Sabotage implies an organized

Organization	Yes or No	Question 12 Comment
Power Utility Comment Group		intentional attack that may or may not result in an electrical disturbance. The distinction between sabotage and vandalism is important since sabotage on a small system may be the first wave of an attack on many entities. The proposed standard asks us to treat insulator damage caused by a frustrated hunter (an act of vandalism) the same as attack by an unfriendly foreign government (an act of sabotage). The comment group does not agree that these should be treated equally.
Pepco Holdings, Inc - Affiliates	No	The list of events misses many items considered as suspicious or potential sabotage, such as suspicious observation of critical facilities.
PNM Resources	No	PNM believes the proposed definition of “impact event” does not meet FERC’s directive to “further define sabotage” nor does it take into consideration their request to address the applicability to smaller entities. Attachment 1 Part A or B do not clearing specify “sabotage” events, other than “forced entry”.
Puget Sound Energy	No	With some of the tight timeframes for reporting, it is reasonable to focus on impact rather than motivation. Requiring further analysis of the event in order to assess the possibility that the event was caused by sabotage, however, may be necessary to address FERC’s concerns with respect to sabotage.
Santee Cooper	No	The term "impact events" needs to be more clearly defined.
US Bureau of Reclamation	No	The two are distinctly different. Disturbances are what happened, sabotage is why. We can easily tell what happened. Determining why it happened (e.g. sabotage) takes time.
We Energies	No	Impact Event could replace disturbance and sabotage but not in its present form. The proposed definition of impact event “An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.” Is too vague. The “potential to impact the reliability” is too broad and open to interpretation. It needs to be specific so entities know what is and is not an impact event and so an auditor clearly knows what it is. Define “impact event” as the items listed in Attachment 1.As you have done, focusing on an event’s impact on reliability is more important than determining an individuals intent (sabotage v.s. theft).
WECC	No	The proposed definition of “impact event” does not meet FERC’s directive to “further define sabotage” nor does it take into consideration their request to address the applicability to smaller entities. Attachment 1 Part A or B do not clearing specify “sabotage” events, other than “forced entry”. The purpose of CIP-001-1 and its requirements is to address the specific issue of possible sabotage of BES facilities. This is entirely different

Organization	Yes or No	Question 12 Comment
		than a “disturbance” or an “event” on the BES. The proposed definition for “impact events” is essentially any event that has either impacted the BES or has the potential to impact the BES, caused only by three specific things; equipment failure or misoperation, environmental conditions, or human action. Several of these “impact events could be a result of sabotage. Actual or potential sabotage clearly poses a risk to the reliability of the BES. It is important that the risks related to sabotage be reflected in either EOP or CIP
Ameren	Yes	However, the term Impact Event should be a new defined term. When the SDT determines this, it should use the term consistently on both pages 5 and 21 of the SDT document.
ATC	Yes	Yes, if ATC’s recommended changes are made to Attachment 1 and the Standard.
BGE	Yes	The defined term “impact events” should be capitalized throughout the document to identify it as a defined term. Additionally, BGE has noted in several comments that another term is used instead of “impact events”. These terms should be eliminated and use “impact events” instead.
Electric Market Policy	Yes	The use of the term “impact events’ has simply replaced the terms “disturbance” and “sabotage” and has not further defined sabotage as directed by FERC. We do feel that impact events needs to be a defined term.
Georgia System Operations Corporation	Yes	The new term is much more clear than those two terms. This will improve uncertainty and confusion regarding whether or not something should be reported.
Kansas City Power & Light	Yes	Should the word disturbance be removed from the title of EOP004-2 to avoid confusion and simply be called Impact Event and Assessment, Analysis and Reporting.
MRO's NERC Standards Review Subcommittee	Yes	As an industry we have looked at sabotage as a sub component of a disturbance. Sabotage is hard to measure since it is based on a perpetrator’s intent and thus very hard to determine.
Nebraska Public Power District	Yes	I agree there is a lot of interpretation and confusion as to what sabotage or a Cyber Incident is, so would welcome better clarity. Whether “impact events” can more effectively clarify, is yet to be seen. “it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.” “An impact event is any situation that has the potential to significantly impact the reliability of the Bulk Electric System. Such events may originate from malicious intent, accidental behavior, or natural occurrences.” I do know that Cyber Sabotage may take time or days to become aware so not sure

Organization	Yes or No	Question 12 Comment
		how that might expedite reporting and awareness.
PPL Electric Utilities	Yes	Refer to clarification requested in question 10 comments.
RRI Energy, Inc.	Yes	Agree. However, strongly encourage this to be made into a defined term in the Glossary of Terms.
SERC OC Standards Review Group	Yes	We do feel that this needs to be a defined term
United Illuminating	Yes	The term impact event can substitute for sabotage and disturbance. The use of Forced Intrusion is a bright line for reporting.
American Electric Power (AEP)	Yes

13. The DSR SDT has combined EOP-004 and CIP-001 into one standard (please review the mapping document that shows the translation of requirements from the already approved versions of CIP-001 and EOP-004 to the proposed EOP-004), EOP-004-3 and retiring CIP-001. Do you agree that there is no reliability gap between the existing standards and the proposed standard? Please explain in the comment box below.

Summary Consideration: While a majority of commenters who responded to this question support combining the two standards, some commenters suggested that in combining the standards, the team left some gaps in coverage with respect to the types of events that must be reported. The DSR SDT believes that combining EOP-004 and CIP-001 does not introduce a reliability gap between the existing standards and the proposed standard and the industry comments received confirms this. Some events that were specifically identified in the original standard (such as a bomb threat) are covered more generically in the revised standard. This modification encourages entities to focus on the 'types' of events that may be impactive rather than having a finite list that may omit an event that couldn't be anticipated when drafting the requirements.

The decision to eliminate the term sabotage from the standard and the retirement of CIP-001 should alleviate all concerns regarding the term sabotage and its definition. The DSR SDT believes that "observation of suspicious activity" and "bomb threat" is considered to be included in Part B – "Risk to BES equipment from a non-environmental physical threat". We have added "and report of suspicious device near BES equipment" to note 3 of the "Attachment 1, Potential Reliability – Part B".

Organization	Yes or No	Question 13 Comment
WECC		A potential gap may exist. Attacks on BES facilities, via either vandalism or sabotage, are very different events than impact events on the system. From a Compliance standpoint, a revised standard to address the FERC directive on sabotage should be developed as an EOP standard (that is grouped with 693 Standards) rather than as a CIP Standard (CIP-001-1).
Ameren	No	It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than

Organization	Yes or No	Question 13 Comment
		in the existing standards.
Bonneville Power Administration	No	BPA supports the concept behind the revisions to EOP-004-2. Creating a single reporting methodology will improve the processes and lead to more consistency. BPA recommends that the Standards Drafting Team (SDT) coordinate any revisions in the reporting requirements with those found in CIP-008-3 to ensure that there are no conflicts. BPA asks the SDT to consider the impact of these changes on CIP-008-3 and work with the CIP SDT to ensure that the wording of the two requirements is similar and clear. Based on Attachment 1 part A of EOP-004-2, certain cyber security events, intrusions for example, would have to be reported under both EOP-004-2 and CIP-008-3. That puts a burden on a Registered Entity to take additional steps to coordinate reporting or face potential compliance risk for correctly reporting an event under one standard and failing to report it under the other standard. The mapping document had errors: a. CIP-001 R1 to EOP-004 R2.9 (annual vs quarterly). b. EOP-004-1 R2 was translated to R2 & R3 of version 2. c. EOP-004-1 R3 was translated to R6 of version 2 (which doesn't say to whom to report).
City of Garland	No	EOP-004-1 R2 did not get translated to EOP-004-2 R2 - table states it is mapped to R1
E.ON U.S. LLC	No	The Version History contained with EOP-004-2 indicates that CIP-001-1 and EOP-004-1 are "Merged", however, the actions do not reflect the retirement of CIP-001-1a and therefore, it is unclear if there will be remaining redundancies or potential gaps with the new version EOP-004-2 and CIP-001-1a.
Electric Market Policy	No	Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity.
Exelon	No	Reporting form doesn't allow for investigations which result in no impact events found or identified.
Georgia Transmission Corporation	No	The only two events that apply to a TO are the ones related to CIP:1. Forced intrusion (report if motivation cannot be determined, i.e. to steal copper)2. Detection of a cyber intrusion to critical cyber assets (criteria of CIP-008)Everything in this standard applies to a TOP and therefore E-004-2 and CIP-001 should not be combined

Organization	Yes or No	Question 13 Comment
Great River Energy	No	It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than in the existing standards.
Indeck Energy Services	No	Bomb threat has totally been lost.
Independent Electricity System Operator	No	We do not agree with the mapping. The proposed mapping attempts to merge the reporting in CIP-001-1 which has more of an on-going awareness nature to alert operating and government authorities of suspected sabotage to prompt investigation with a possible aim to identify the cause and develop remedies to curb the sabotage/events. The proposed EOP-004-2 appears to be more of a post-event reporting for need-to-know purpose only. This is not consistent with the purpose of the SAR.
ISO New England Inc.	No	Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by the NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity. EOP-004-3 should be EOP-004-2.
Luminant Energy	No	CIP-001-1 R3.1 includes instructions associated with the DOE OE-417 form. EOP-004-2 R2.6 should include the DOE as an example of an external organization requiring notification. Additionally, the Rationale for R1 discusses the possibility of one electronic form satisfying US entities with related disturbance reporting requirements but does not include any information about the likelihood of this outcome. Please elaborate on the process required to combine these reports.
Midwest ISO Standards Collaborators	No	It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than in the existing standards.
North Carolina Electric Coops	No	
Northeast Power Coordinating Council	No	Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by the NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity. EOP-004-3 should be EOP-004-2.

Organization	Yes or No	Question 13 Comment
Pepco Holdings, Inc - Affiliates	No	The list of events misses many items considered as suspicious or potential sabotage, such as suspicious observation of critical facilities.
Santee Cooper	No	It is very difficult to assess this question with the standard as currently written.
SERC OC Standards Review Group	No	
US Bureau of Reclamation	No	The two could be combined with no reliability gap based on the concept rather than the proposed standard. As the standard is currently written, there is a reliability gap. Consider that after the fact reporting of a sabotage event (other than criminal acts which may have been witnessed) usually take some time to investigate and analyze.
ATC	Yes	ATC agrees with this effort and does not currently see a reliability gap
BGE	Yes	None.
CenterPoint Energy	Yes	CenterPoint Energy agrees that there is no reliability gap between the existing standards and the proposed standard. However, CenterPoint Energy believes that the SDT went too far in developing the proposed EOP-004-2 and added additional unnecessary requirements. If the comments made above to Q1 - Q12 were to be incorporated into the proposed Standard, CenterPoint Energy believes the product would be closer to a results based Standard with no reliability gap.
City of Austin dba Austin Energy	Yes	If we can used OE 417 for NERC and DOE we do not perceive a reliability gap.
Georgia System Operations Corporation	Yes	The new single standard will cover all necessary reporting requirements that are in the current two standards. They are being combined into EOP-004-2 not EOP-004-3.

Organization	Yes or No	Question 13 Comment
Green Country Energy	Yes	With the provision that definition and scope of "impact event" are developed and tables adjusted as needed to address FERCs concerns specifically ."(1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event.”
MRO's NERC Standards Review Subcommittee	Yes	Within the above question, the SDT is asking about EOP-004-2 not -3.
Nebraska Public Power District	Yes	Appears they only changed R1 for CIP-001 and moving R2-R4 directly over to EOP-004-2. R1 adds much more detail on our part for a company operating plan but would definitely help some of the present confusion.
RRI Energy, Inc.	Yes	Assume reference to EOP-004-3 in the question 13 was meant to reference version 2 (EOP-004-2).
American Electric Power (AEP)	Yes	
Arizona Public Service Company	Yes

14. Do you agree with the proposed effective dates? Please explain in the comment box below.

Summary Consideration: While most stakeholders who responded to this question supported the 12 months originally proposed for entities to become compliant, the drafting team has revised this to 6 months. The DSR SDT feels that six months and not more than nine months is an adequate time frame. The current CIP-001 plan is adequate for the new EOP-004 and training should be met in the proposed timeline.

The Implementation Plan was developed for the revised Requirements, which do not include an electronic "one-stop shopping" tool. This topic is to be addressed in the proposed revisions to the NERC Rules of Procedure.

Organization	Yes or No	Question 14 Comment
Independent Electricity System Operator		We do not agree with the proposed standard. We therefore are unable to agree on any implementation plan.
City of Garland	No	Do not agree with this proposed draft - instead of combining 2 standards to gain efficiency, this expands the standard with unnecessary paperwork, drills, training, etc.
Constellation Power Generation and Constellation Commodities Group	No	Based on the drastic differences between the previous revisions to these standards, and this proposed revision, 24 months would be a more reasonable timeframe for an effective date.
IRC Standards Review Committee	No	If the training and Operation Plan requirements are adopted as proposed, this may not be sufficient time for some entities to comply, particularly those with limited number of staff but perform functions that have multiple event reporting requirements.
ISO New England Inc.	No	If the training and Operation Plan requirements are adopted as proposed, this may not allow sufficient time for some entities to comply, particularly those with limited number of staff, but perform functions that have multiple event reporting requirements.
Kansas City Power & Light	No	April 2011 is too soon for considerations applicable to the creation of an Operating Plan.

Organization	Yes or No	Question 14 Comment
Manitoba Hydro	No	Though CIP-001-1a already contained provisions for sabotage response guidelines, the new EOP-004-2 R2 (2.1 to 2.9) will require reexamination of existing policies to remain compliant. Upon the approval of Attachment 1, the existing disturbance guidelines will also have to be reexamined. With the addition of R3 (Identify and assess), R4 (Drills) and R5 (Training), will also require redevelopment of existing processes.
NERC Staff	No	In order to provide explicit dates, the language should be modified to state: "First calendar day of the first calendar quarter one year after the date of the order providing applicable regulatory authority approval for all requirements."
Northeast Power Coordinating Council	No	The effective dates in Canada need to be defined. The first bullet should be sufficient. If the training and Operation Plan requirements are adopted as proposed, this may not allow sufficient time for some entities to comply, particularly those with limited number of staff, but perform functions that have multiple event reporting requirements.
Puget Sound Energy	No	There are no effective dates listed in the proposed standard. The proposed effective date should allow at least one year for entities to implement the requirements of the standard. In addition, if requirement R1 remains, then the requirement to implement an operating plan should only be triggered by the ERO's finalization of the form and system for reporting impact events and should provide at least six months for the implementation of the operating plan.
Santee Cooper	No	With the proposed training and drill requirements in the current written standard, one year is not enough time.
United Illuminating	No	UI believes the implementation should be staged. For R1 and R2: First calendar day of the first calendar quarter one year after applicable regulatory authority approval for all. This provides sufficient time to draft a procedure Then time needs to be provided to provide training prior to implementation of R3 and R6. UI believes two calendar quarters should be provided to complete training; therefore R3and R6 is effective six calendar quarters following regulatory approval. Implementation for R4 should state that the initial calendar year begins on the date R2 is effective and entities have 12 months following that date to complete their first drill. R5 requires training once per calendar year. Implementation for R5 should state that the initial calendar year begins on the date R2 is effective and entities have 12 months following that date to complete their first drill.

Organization	Yes or No	Question 14 Comment
US Bureau of Reclamation	No	There is a 15 month training requirement. If the standard goes into effect in one year, most entities will not have had an opportunity to develop their new Operating Plans and train their staff. The effective date should recognize Operating Plans need to be revised and then training needs to be implemented. The most aggressive schedule is 18 months. Two years would be more appropriate. The implementation date could recognize the Operating Plan development as one phase and the training as the second.
ATC	Yes	Yes, if ATC's recommended changes are made to the Standard. However, if the changes are not supported then ATC recommends that the implantation time be changed to two years. Entities will need time to develop both the plan called for in this standard and to train the personnel identified in the plan.
BGE	Yes	None.
Exelon	Yes	Agree with the proposed implementation date. A 12 month implementation will provide adequate time to generate, implement and provide any necessary training by a registered entity.

15. Do you have any other comments that you have not identified above?

Summary Consideration: The DSR SDT has met with the EAWG and has put in place a process to ensure the cooperation and coordination between the DSR SDT and the EAWG. The impact event list is comprehensive and addresses the needs of the EAWG and EOP-004.

There were concerns expressed that the impact event list should include deliberate acts against infrastructure. The impact list includes “Risk to BES equipment from a non-environmental physical threat” the DSR SDT feels that this is inclusive of deliberate acts against infrastructure.

During discussions around the use and definition of the term sabotage, the DSR SDT considered the NRC definition and decided to eliminate the use of the term sabotage from EOP-004 and replaced it with impact events. The DSR SDT has developed a definition for “Impact Events” to support Attachment 1 as follows:

> “An Impact Event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.”

The DSR SDT has proposed this definition for inclusion in the NERC Glossary for “Impact Event”. The types of Impact Events that are required to be reported are contained within Attachment 1. Only these events are required to be reported under this Standard. The DSR SDT considered the FERC directive to “further define sabotage” and decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This will result in further ambiguity with respect to reporting events. The term “sabotage” is no longer included in the standard and therefore it is inappropriate to attempt to define it. The Impact Events listed in Attachment 1 provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive. Attachment 1, Part A is to be used for those actions that have impacted the electric system and in particular the section “Damage or destruction to equipment” clearly defines that all equipment that intentional or non intentional human error be reported. Attachment 1, Part B covers the similar items but the action has not fully occurred but may cause a risk to the electric system and is required to be reported.

The industry commented on the need for e-mail addresses and fax numbers for back up purposes. These details were added to the standard and will also be covered in the implementation plan.

The proposed ballot in December was incorrect and has been deleted from the future development plan. The plan was updated with the correct project plan dates.

Organization	Yes or No	Question 15 Comment
Indeck Energy Services		Good start on a unified event reporting standard!
IRC Standards Review Committee	No	The standards should be changed to define what a “disturbance” is for reporting in EOP-004. Also, sabotage reporting requirements in CIP-001 should be rescinded as EOP-004 already has such requirements.
PSEG Companies		
Arizona Public Service Company	No	
ATCO Electric Ltd.	No	
Duke Energy	No	
Electric Market Policy	No	
FirstEnergy	No	
Independent Electricity System Operator	No	
Luminant Energy	No	

Organization	Yes or No	Question 15 Comment
Manitoba Hydro	No	
PacifiCorp	No	
PPL Supply	No	
RRI Energy, Inc.	No	
United Illuminating	No	
Ameren	Yes	We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting.
American Electric Power (AEP)	Yes	The standard needs to be modified to allow the ability for one entity to report on behalf of other entities. For example the loss of Generation over the threshold could be reported by the RC opposed to the GO individually, if mutually agreed upon before the fact.
ATC	Yes	ATC believes that it is not evident in this draft that the SDT has worked collaboratively with the Events Analysis working group to leverage their work. ATC believes that NERC must coordinate this project and the EAWG efforts. The EAWG is proposing to modify NERC Rules of Procedure but the SDT is suggesting requirement for the ERO be build within the standard. We believe that the Rules of Procedure is the proper course to take to for identifying NERC obligations, but what is clear is that NERC itself does not seem to have an overall plan for event reporting and analysis. Lastly, ATC would like to see the SDT expand the mapping document to include the work of the EAWG. The industry needs to be presented with a clear picture as to how all these things will work together along with their reporting obligations. The definition of an “impact event” needs to be revised. First, if these events are to include any equipment failure or mis-operation that impacts the BES, the standard is requiring more than is intended based upon the reading of the requirements. PRC-004 already covers the reporting of protection system mis-operations, and if reading this definition verbatim, it would lead one to conclude that those same mis-operations reported under PRC-004 shall also be reported under EOP-004. The definition should be revised to something like: “An impact event is a system disturbance affecting the Bulk Electric System beyond loss of a single element under normal operating conditions and does not include events normally reported under PRC-004. Such events may be caused by...”

Organization	Yes or No	Question 15 Comment
BGE	Yes	One item that is properly addressed is the removal of Load Serving Entity from the Applicable Functional Entities. There may be a need to provide some guidance to Functional Entities when there are separate Transmission Owners and Transmission Operators or Generation Owners and Generation Operators. If they are separate, there may be redundancy in reporting.From the documentation, it doesn't seem like the SDT are combining all reports into one form as we would like to see. In the rational for R1 section, it talks of getting both forms (NERC and OE-417) together in one document (however it sounds like the forms within the document are still separate), available electronically, which only seems like a step forward. However, it does not take away the confusing process for the operators of which part of the form would need to be filled, who should be set this form depending on what part is filled, if one part of the form is filled out do the other parts need to be filled, etc. If the forms cannot be consolidated, BGE would rather the forms be separate to reduce confusion.BGE believes all these reports should require one form with one set of recipients, period.This may mean that NERC needs to get DOE to modify their OE-417 form.
Bonneville Power Administration	Yes	The document retention times in EOP-004-3 should be spelled out more clearly. The Compliance summary does so (but needs some punctuation clarification regarding investigation), the SDT should consider making that part of the requirements or clarifying the wording in the requirements.
CenterPoint Energy	Yes	CenterPoint Energy appreciates the efforts of the SDT in removing outdated and unnecessary language from the existing EOP-004 standard. Additionally, CenterPoint Energy urges the SDT to also remove the proposed "how to" prescriptive requirements. CenterPoint Energy believes the SDT team's focus should be on drafting a results-based standard for reporting actual system disturbances and acts of sabotage that disrupt the reliable operation of the BES. The SDT should not delve into trying to identify a list of events that have a potential reliability impact.As stated in response to Q10, CenterPoint Energy strongly believes that cyber-related events should not be in the scope of this standard since they are already required to be identified and reported to appropriate entities under CIP-008. Excluding cyber events from this standard further supports the elimination of redundancies within the body of standards.
City of Garland	Yes	Do not agree with this proposed draft - instead of combining 2 standards to gain efficiency, this expands the standard with unnecessary paperwork, drills, training, etc.For reports required under this standard, companies with multiple registration numbers and functions should only have to file one report for all functions and registrations.
Consolidated Edison Co. of NY, Inc.	Yes	Overriding Comment and Concern: It is absolutely essential that the work on EOP-004 and that on the NERC Event Analysis Process (EAP) be fully coordinated. We find that there are a number of inconsistencies between these two documents. The EAP and EOP-004 are not aligned. In order to operate and report

Organization	Yes or No	Question 15 Comment
		effectively entities need consistent requirements.
Constellation Power Generation and Constellation Commodities Group	Yes	As stated earlier, the “summary of concepts” for this latest revision, as written by the SDT, includes the following items: o A single form to report disturbances and impact events that threaten the reliability of the bulk electric system o Other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements o Clear criteria for reporting o Consistent reporting timelines o Clarity around of who will receive the information and how it will be used. Each and every requirement should be mapped to one of these 5 items; otherwise, it should not be included in this standard. Summarizing all of the comments above, Constellation Power Generation proposes the following revision to EOP-004-2:1. Title: Impact Event and Disturbance Assessment, Analysis, and Reporting 2. Number: EOP-004-2 3. Purpose: Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES). 4. Applicability 4.1. Functional Entities:4.1.1. Reliability Coordinator 4.1.2. Balancing Authority 4.1.3. Transmission Operator 4.1.4. Generator Operator 4.1.5. Distribution Provider 4.1.6. Electric Reliability Organization. Requirements and Measures R1. The ERO shall establish, maintain and utilize a system for receiving and distributing impact event reports, received pursuant to Requirement R6, to applicable government, provincial or law enforcement agencies and Registered Entities to enhance and support situational awareness.R2. Each Applicable Entity identified in Attachment 1 shall have an Operating Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components: 2.1. Method(s) for identifying impact events listed in Attachment 2.2. Method(s) for assessing cause(s) of impact events listed in Attachment 12.3. Method(s) for making internal and external notifications should an impact event listed in Attachment 1 occur. 2.4. Method(s) for updating the Operating Plan.2.5 Method(s) for making operation personnel aware of changes to the Operating Plan.R3. Each Applicable Entity shall implement their Operating Plan(s) to identify and assess cause of impact events listed in Attachment 1.R4. Each Applicable Entity shall provide training to all operation personnel at least annually.R5. Each Applicable Entity shall report impact events in accordance with its Operating Plan created pursuant to Requirement 2 and the timelines outlined in Attachment 1.
Dynegy Inc.	Yes	This does not address the inability of a GO/GOP to determine effects on the BES. Surrounding BES knowledge is limited for a GO/GOP.
E.ON Climate & Renewables	Yes	Refrain from having redundant reporting forms if at all possible. This can create confusion and lead to unnecessary penalty amounts and violations for registered entities. Potential” impacts of an event on the BES need to be clearly defined in the standard.
E.ON U.S. LLC	Yes	The new standard should incorporate all other disturbance, sabotage, or “impact event” reporting standards, such as CIP-008-3. At the very least it should reference those other standards that have within their scope

Organization	Yes or No	Question 15 Comment
		same/similar events in order to ensure complete reporting and full compliance. Suggesting that one standard provides the single reporting procedure, when in actuality it does not, is counterproductive. The discussion of “impact event” clearly indicates the SDT’s intent to include sabotage events in the proposed standard EOP-004-2.
ERCOT ISO	Yes	ERCOT ISO supports the comments provided by the SRC. However, if the standard is to be established, ERCOT ISO has offered the comments contained herein as improvements to the requirements proposed. The requirements listed do not take into consideration the hierarchical reporting necessary for events (i.e.: GO to GOP to BA). The current structure will lead to redundant and conflicting reporting from multiple entities. This will lead to confusion in the analysis of the event. Any system developed and used to report impact events must include notification to the other relevant entities (i.e.: Reliability Coordinator, Balancing Authority, Transmission Operator, and Generator Operator). The proposed standard should not rely on a centralized system that does not follow the established hierarchy of dissemination of information.
Exelon	Yes	The standard is lacking guidance for DOE Form OE-417 reporting as outlined in the current version of EOP-004 and doesn’t contain any non-BES related reporting. What is the governing process for OE-417 reporting?. Need clarification if one entity can respond on behalf to all entities in one company. Need a provision for entities to provide one report for all entities. Radiological sabotage is a defined term within the NRC glossary of terms. It would seem that a deliberate act directed towards a plant would also constitute an "impact event." In general, the DSR SDT should include discussions with the NRC to ensure communications are coordinated or consider utilizing existing reporting requirements currently required by the NRC for each nuclear generator operator for consistency. The definition of sabotage is defined by NRC is as follows: Any deliberate act directed against a plant or transport in which an activity licensed pursuant to 10 CFR Part 73 of NRC's regulations is conducted or against a component of such a plant or transport that could directly or indirectly endanger the public health and safety by exposure to radiation.
Georgia System Operations Corporation	Yes	Light years better than the current CIP-001-1 and EOP-004-1! With some changes from this comment period, we should have a clearer set of realistic requirements which could likely pass the ballot. Thanks go out to the drafting team for bringing clarity to this topic. Capitalization throughout this document is inconsistent. It is not in synch with the NERC Glossary. All terms that remain capitalized in the next draft (other than when used as a title or heading) should be defined in the Glossary of Terms Used in NERC Reliability Standards. Examples of not in synch with the Glossary: Registered Entity, Responsible Entity, Law Enforcement. These are not defined in the Glossary. The requirements that apply to entities should not use the word "analysis." "Assessment" should be used. Analysis is a different process (an ERO process) and is being addressed by

Organization	Yes or No	Question 15 Comment
		another group within NERC (Dave Nevius). This EOP-004 drafting team and the NERC analysis group should closely coordinate such that there are no conflicts and the combined requirements/processes are realistic (mainly regarding timelines).
Great River Energy	Yes	We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting. Please provide an e-mail address for the submittal of the report to NERC (and any other parties above a Regional Entity) within this Standard and a fax number as a backup to electronic submittal.
Green Country Energy	Yes	I think the drafting team has done a wonderful job of beginning the task of combining two related standards. I ask them to keep in mind the small generators, and others who do not have the wide view capability, that more than likely react to events that occur wih no knowledge of why they occured, and limited staff to address administrative standard requirements. Many times the KISS approach is the best approach.
Idaho Power Company	Yes	By including training requirements in each standard, creates confusion and compliance or failure to comply potentian. PER standards are in place for personel training, these standards should be utilized for adding requirements that require training for NERC Standards.
ISO New England Inc.	Yes	Request clarification on how RCIS is part of this Standard. The form should be filled out in two stages. First stage would be the immediately available information. The second stage would be the additional information such as one line diagrams. There is concern with burdening the reporting operator on filling out forms instead of operating the Bulk Electric System. Most of the draft requirements are written as administrative in nature, and this is not most effective. Changes need to be made to (or possibly elimination of) R1, R2, R3.The standards should be changed to define what a “disturbance” is for reporting in EOP-004. Sabotage reporting as per CIP-001 should be rescinded as EOP-004 already has such a requirement.
Kansas City Power & Light	Yes	The standard addressed a preliminary report it should also address the requirements of a final report.
MidAmerican Energy	Yes	This entire standard needs to be revised to consider a results based standard.
Midwest ISO Standards Collaborators	Yes	We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting.

Organization	Yes or No	Question 15 Comment
MRO's NERC Standards Review Subcommittee	Yes	Please provide an e-mail address for the submittal of the report to NERC (and any other parties above a Regional Entity) within this Standard and a fax number as a backup to electronic submittal.EOP-004 Attachment 2: Impact Event Reporting Form (note in the proposed standards it states EOP-002) seems to be written for Actual Impact Events only. Perhaps another section could be added for "Potential" Impact Events.
NERC Staff	Yes	NERC staff commends the SDT on its work so far. Merging CIP-001 and EOP-004 is a significant improvement and eliminates some current redundancies for reporting events. NERC staff believes opportunities to improve the proposed standard still exist. In particular, the team should consider possible redundancies with the Reliability Coordinator Working Group (RCWG) reporting guidelines, the Electricity Sector - Information Sharing and Analysis Center (ES-ISAC) reporting requirements for sharing information across sectors, and the Events Analysis Working Group (EAWG) efforts to develop event reporting processes. Ideally, the SDT and the EAWG should work together to develop a single consistent set of reporting criteria that can be utilized in both the EAWG event reporting process and in the requirements of the EOP-004-2 Reliability Standard.
North Carolina Electric Coops	Yes	Keep in mind that redundancy in reporting requirements from the DOE does not improve or enhance bulk electric system reliability but rather creates more work for the reporting entity.
Northeast Power Coordinating Council	Yes	Request clarification on how RCIS is part of this Standard. The form should be filled out in two stages. First stage would be the immediately available information. The second stage would be the additional information such as one line diagrams. There is concern with burdening the reporting operator on filling out forms instead of operating the Bulk Electric System. Most of the draft requirements are written as administrative in nature, and this is not most effective. Changes need to be made to (or possibly elimination of) R1, R2, R3.The standards should be changed to define what a "disturbance" is for reporting in EOP-004. Sabotage reporting as per CIP-001 should be rescinded as EOP-004 already has such a requirement.
Pacific Gas and Electric Company	Yes	PG&E believes as the training requirements continue to expand, having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues.
Pacific Northwest Small Public Power Utility Comment Group	Yes	The proposed standard has a huge impact on small DPs. DPs that presently do not maintain 24/7 dispatch centers will need to begin doing so to meet the reporting deadlines such as 1 hour after an occurrence is identified (possibly identified by a third party) or 24 hour after an occurrence (regardless of when it was discovered by the DP). The planning, assessing, drilling, training, and reporting requirements (R2-R6), as well as documentation (M2-M6) by small entities will cause utility rates to rise, will reduce local level of service,

Organization	Yes or No	Question 15 Comment
		and will not represent a corresponding increase to the reliability of the BES.The SDT concept of clear criteria for reporting has not been met, since R2 effectively directs the applicable entities to develop their own criteria. The decision of which types of events will be reported to which external organizations has been left up to the applicable entity. The comment group notes that there is no coordination of effort required between the applicable entities and the RCs or TOs that issue reliability directives. Energy Emergencies requiring voltage reduction or load shedding are likely to be communicated to applicable entities via directives. The likely result of this lack of coordination is that entities will plan, drill, and train for an event, but when the directive comes it will not be the one planned, drilled, and trained for. Coordination between those sending and receiving directives would ensure the probable events and directed responses are the ones planned, drilled, and trained for.
PacifiCorp	Yes	This is yet another standard with training requirements not covered under any PER standards.Having different training requirements spread throughout the standards makes it increasingly difficult to ensure all training requirements are met.Developing a "Training Standard" that lists ALL required training would streamline the process and aid greatly in compliance monitoring.
Pepco Holdings, Inc - Affiliates	Yes	The EAWG is developing processes that will be enforced through the Rules of Procedure. It may be inappropriate to reference the EAWG process in the Mapping Document.
PNM Resources	Yes	PNM believes that having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues. This will become even more of an issue as training requirements continue to expand.
PPL Electric Utilities	Yes	Combining EOP-004, CIP-001 and CIP-008's reporting requirements reduces redundancy and will add clarity to the compliance activities.
Puget Sound Energy	Yes	The DSR SDT's concepts for implementing a new structure for reporting are appropriate. Proper implementation of those concepts is likely to result in a very much improved standard. However, the proposed standard falls well short of implementing the concepts and is not much of an improvement on the current standard.
Santee Cooper	Yes	We don't believe that entities should be subjected to duplicate reporting to existing DOE requirements. How does redundancy in reporting requirements improve or enhance bulk electric system reliability?
SERC OC Standards Review	Yes	We find it disturbing that NERC is headed down a path of codifying requirements that are redundant to

Organization	Yes or No	Question 15 Comment
Group		existing DOE requirements. How does redundancy in reporting requirements improve or enhance bulk electric system reliability? Disclaimer:” The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”
Southern Company - Transmission	Yes	The only concern that we have with the proposed standard is that it feels like it is creating dual, not quite redundant, reporting requirements for cyber intrusions in concert with CIP-008. Hopefully, there will not have to be a redundant reporting requirement if we continue to merge efforts with the CIP Drafting Team. Since we will no longer use the word SABOTAGE in the new EOP-004, we are hoping the industry and the CIP Drafting Team will give us the criteria they wish for us to use in order to report CIP-008 incidents. We will then achieve a “ONE STOP SHOP” reporting standard.
Tenaska	Yes	Since the proposed EOP-004-2 Standard does not eliminate the OE-417 reporting requirement, it does not streamline the existing CIP-001-1 and EOP-004-1 reporting requirements for GO/GOP’s. The "laundry list" of components required in the Operating Plan described in R2 is too specific and would make it more difficult to prove compliance during an audit. We prefer that the existing CIP-001-1 and EOP-004-1 Standards remain unchanged.
TransAlta Corporation	Yes	A Confidential Impact Event Report form is included in attachment 2 but nowhere in the standard does it say to use this form. This form appears to be similar to the “Preliminary Disturbance Report” form used in EOP-004-1. Clarity is required.
US Bureau of Reclamation	Yes	The SDT should consider that in reality it would be more streamlined to require immediate notification of an event for situational awareness, and then give adequate time for analysis of the cause. Reports that have an arbitrary rush will be diseased with low quality information and not much value in the long run to the BES. The Attachment A should be constructed around notification of situational awareness. The reporting timeline should be constructed around the different levels severity. The more severe the event, usually the more complicated the event is to analyze. Simple events usually do not have a significant impact.
We Energies	Yes	Please be careful to capitalize defined terms. If the intent is to not use the defined term, use another word."Forced intrusion" (cutting a fence, breaking in a door) may not be discovered for quite some time after it occurs. Should it be reported as soon as discovered? Even if there was no impact event (disturbance)? "Destruction of a Bulk Electric System Component" seems pretty specific. However, if a transformer kicks off line due to criminal damage, yet is considered repairable, is the event reportable?

Organization	Yes or No	Question 15 Comment
WECC	Yes	Having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues. This will become even more of an issue as training requirements continue to expand.CIP-001-1 has surprisingly been one of the most violated standards during the initial period. However, most entities have now developed and demonstrated a decent compliance process. Unless a revised standard to address the FERC directive on sabotage is developed (as suggested in 13 above) this proposed standard appears to eliminate sabotage reporting as a reliability standard to the potential detriment of BES reliability.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SC approved SAR for initial posting (April, 2009).
2. SAR posted for comment (April 22 – May 21, 2009).
3. SC authorized moving the SAR forward to standard development (September 2009).
4. Concepts Paper posted for comment (March 17 – April 16, 2010).
5. Initial Informal Comment Period (September 2010)

Proposed Action Plan and Description of Current Draft

This is the first posting of the proposed standard in accordance with Results-Based Criteria. The drafting team requests posting for a 30-day formal comment period.

Future Development Plan

Anticipated Actions	Anticipated Date
Drafting team considers comments, makes conforming changes, and proceed to second comment	October 2010 – February 2011
Second Comment Period	March – May 2011
Third Comment/Ballot period	June- July 2011
Recirculation Ballot period	July-August 2011
Receive BOT approval	September 2011

Effective Dates

1. The standard shall become effective on the first calendar day of the third calendar quarter after the date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, the standard shall become effective on the first calendar day of the third calendar quarter after Board of Trustees adoption.

Version History

Version	Date	Action	Change Tracking
2		Merged CIP-001-1 Sabotage Reporting and EOP-004-1 Disturbance Reporting into EOP-004-2 Impact Event Reporting; Retire CIP-001-1a Sabotage Reporting and Retired EOP-004-1 Disturbance Reporting.	Revision to entire standard (Project 2009-01)

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Impact Event: Any event which has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

Introduction

1. **Title:** Impact Event Reporting
2. **Number:** EOP-004-2
3. **Purpose:** To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of Impact Events and their causes, if known, by the Responsible Entities.
4. **Applicability**
    4.1. Functional Entities: Within the context of EOP-004-2, the term "Responsible Entity" shall mean:
    4.1.1. Reliability Coordinator
    4.1.2. Balancing Authority
    4.1.3. Interchange Authority
    4.1.4. Transmission Service Provider
    4.1.5. Transmission Owner
    4.1.6. Transmission Operator
    4.1.7. Generator Owner
    4.1.8. Generator Operator
    4.1.9. Distribution Provider
    4.1.10 Load Serving Entity

5. **Background:**

NERC established a SAR Team in 2009 to investigate revisions to the CIP-001 and EOP-004 Reliability Standards.

1. CIP-001 may be merged with EOP-004 to eliminate redundancies.
2. Acts of sabotage have to be reported to the DOE as part of EOP-004.
3. Specific references to the DOE form need to be eliminated.
4. EOP-004 has some 'fill-in-the-blank' components to eliminate.

The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards (see tables for each standard at the end of this SAR for more detailed information).

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC SC in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009. A "concepts paper" was designed to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT has developed.

The concept paper sought comments from stakeholders on the "road map" that will be used by the SDR SDT in updating or revising CIP-001 and EOP-004. The concept paper provided stakeholders the background information and thought process of the SDR SDT.

The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC database and FERC Order 693 Directives in order to determine a prudent course of action with respect to these standards.

The DSR SDT has used a working definition for "Impact Events" to develop Attachment 1 as follows:

> "An Impact Event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action."

The DSR SDT has proposed this definition for inclusion in the NERC Glossary for "Impact Event". The types of Impact Events that are required to be reported are contained within Attachment 1. Only these events are required to be reported under this Standard. The DSR SDT considered the FERC directive to "further define sabotage" and decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This will result in further ambiguity with respect to reporting events. The term "sabotage" is no longer included in the standard and therefore it is inappropriate to attempt to define it. The Impact Events listed in Attachment 1 provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive. Attachment 1, Part A is to be used for those actions that have impacted the electric system and in particular the section "Damage or destruction to equipment" clearly defines that all equipment that intentional or non intentional human error be reported. Attachment 1, Part B covers the similar items but the action has not fully occurred but may cause a risk to the electric system and is required to be reported.

To support this concept, the DSR SDT has provided specific event for reporting including types of Impact Events and timing thresholds pertaining to the different types of Impact Events and who's responsibility for reporting under the different Impact Events. This information is outlined in Attachment 1 to the proposed standard.

The DSR SDT wishes to make clear that the proposed changes do not include any real-time operating notifications for the types of events covered by CIP-001, EOP-004. This is achieved through the RCIS and is covered in other standards (e.g. TOP). The proposed standard deals exclusively with after-the-fact reporting.

The DSR SDT is proposing to consolidate disturbance and Impact Event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

Summary of Concepts

- A single form to report disturbances and Impact Events that threaten the reliability of the bulk electric system
- Other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements
- Clear criteria for reporting
- Consistent reporting timelines
- Clarity around of who will receive the information and how it will be used

Law Enforcement Reporting

The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting Impact Events. Certain outages, such as those due to vandalism and terrorism, are not preventable. Entities rely upon law enforcement agencies to respond and investigate those Impact Events which have the potential of wider area affect upon the industry which enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading involving Impact Events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES.

Stakeholders in the Reporting Process

- Industry
- NERC (ERO)
- FERC
- DOE
- DHS – Federal
- Homeland Security- State
- State Regulators
- Local Law Enforcement
- State Law Enforcement
- FBI

The above stakeholders have an interest in the timely notification, communication and response to an incident at an industry facility. The stakeholders have various levels of accountability and have a vested interest in the protection and response to ensure the reliability of the BES.

Present expectations of the industry under CIP-001:
