Counsel for the North American Electric Reliability Corporation

December 31, 2012

TABLE OF CONTENTS

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

NORTH AMERICAN ELECTRIC	**)**	**Docket No. RD13-____**
RELIABILITY CORPORATION	**)**	

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF PROPOSED RELIABILITY STANDARD
EOP-004-2 – EVENT REPORTING

The North American Electric Reliability Corporation ("NERC")[1] hereby requests the Federal Energy Regulatory Commission ("FERC" or the "Commission") approve, in accordance with Section 215(d)(1) of the Federal Power Act ("FPA")[2] and Section 39.5 of the Commission's regulations, 18 C.F.R. § 39.5 (2012), the proposed Reliability Standard —EOP-004-2—Event Reporting, and find that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest. EOP-004-2 was approved by the NERC Board of Trustees on November 7, 2012.[3]

NERC is hereby requesting approval of the proposed Reliability Standard, the associated implementation plan, Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs"), and retirement of the currently effective Reliability Standard as detailed below. Specifically, NERC requests approval of the following:

- Approval of proposed Reliability Standard EOP-004-2 included in **Exhibit B**, effective the first day of the first calendar quarter that is six months following the effective date of a Final Rule in this docket;

---

1 NERC has been certified by the Commission as the electric reliability organization ("ERO") in accordance with Section 215 of the Federal Power Act. The Commission certified NERC as the ERO in its order issued July 20, 2006 in Docket No. RR06-1-000. *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062 (2006) ("ERO Certification Order").

2 16 U.S.C. § 824o (2012).

3 Unless otherwise designated, all capitalized terms shall have the meaning set forth in the Glossary of Terms Used in NERC Reliability Standards, available here: http://www.nerc.com/files/Glossary_of_Terms.pdf.

- Retirement of the following standards at midnight of the day immediately prior to the effective date of EOP-004-2:[4]
    - EOP-004-1 – Disturbance Reporting
    - CIP-001-2a – Sabotage Reporting

- Approval of the implementation plan for the proposed EOP-004-2 Reliability Standard which is included in **Exhibit C**.

The proposed effective date for the standard is just and reasonable and appropriately balances the urgency in the need to implement the standards against the reasonableness of the time allowed for those who must comply to develop necessary procedures, software, facilities, staffing or other relevant capability. The proposed effective date will allow applicable entities adequate time to ensure compliance with the requirements in accordance with Order No. 672.[5] As required by Section 39.5 of the Commission's regulations, this petition presents the technical basis and purpose of the proposed Reliability Standard EOP-004-2 and a demonstration that the proposed Reliability Standard meets the criteria identified by the Commission in Order No. 672.

I. <u>EXECUTIVE SUMMARY</u>

The proposed Reliability Standard provides a comprehensive approach to reporting disturbances and events that have the potential to impact the reliability of the Bulk Electric System in accordance with several Commission directives. The principal goal of NERC is to promote the reliability of the Bulk-Power System in North America and this goal is directly supported by evaluating events, undertaking appropriate levels of analysis to determine the

---

[4] Note, Compliance Application Notice CAN-0016 CIP-001 R1: Sabotage Reporting Procedure will be deemed to have been retired on midnight of the day immediately prior to the effective date of EOP-004-2.

[5] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204 at P 333, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006) ("In considering whether a proposed Reliability Standard is just and reasonable, FERC will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.").

causes of the events, promptly assuring tracking of corrective actions to prevent recurrence, and providing lessons learned to the industry.

The proposed Reliability Standard requires Responsible Entities to have an Operating Plan for reporting applicable events to NERC and others (*e.g.*, Regional Entities, applicable Reliability Coordinators and law enforcement) within 24 hours of the event according to the procedure specified in their Operating Plan. This requires Responsible Entities to report events in a timely manner to allow governmental authorities and critical infrastructure members the opportunity to react in a meaningful manner to such information[6] which supports reliability principles and ultimately helps protect against future malicious physical attacks. The results-based approach of EOP-004-2 includes clear criteria for reporting, consistent reporting timelines, and encourages the development of an internal corporate culture of compliance that is focused on reliability and communication. The proposed Reliability Standard provides for timely event analysis and ensures that NERC can develop trends and prepare for a possible next event.

The requirements of the proposed Reliability Standard complement the efforts of the NERC Bulk-Power System Awareness group and event analysis programs, and the standard drafting team worked in coordination with the Event Analysis Working Group to develop a list of the events that are required to be reported for reliability purposes.[7] This list is incorporated into the proposed EOP-004-2 standard as Attachment 1. Attachment 2 (or alternatively Department of Energy ("DOE") Form OE-417) is the form to be used by Responsible Entities for reporting when the threshold for an event listed in Attachment 1 is met.

NERC's Bulk-Power System Awareness group seeks to provide timely, accurate and complete information regarding the current status of the Bulk-Power System and threats to its

7 *See e.g.*, Event Analysis Process Document – Version 1 at Appendix E, Categorization of Events, available at: http://www.nerc.com/page.php?cid=5|365.

reliable operation, enabling NERC and the industry to understand and learn from events and ultimately improve the reliability of the Bulk-Power System. The event analysis process also provides valuable input for training and education, reliability trend analysis efforts and reliability standards development, all of which support continued reliability improvement.

Proposed Reliability Standard EOP-004-2 is a result of merging EOP-004-1 and CIP-001-2a and represents a significant improvement in the identification and reporting of events. Successful event analysis depends on a collaborative approach in which registered entities, Regional Entities and NERC work together to achieve a common goal. NERC respectfully requests that the Commission approve the proposed Reliability Standard as just, reasonable, not unduly discriminatory or preferential and in the public interest.

II. NOTICES AND COMMUNICATIONS

8 Persons to be included on the Commission's service list are indicated with an asterisk. NERC requests waiver of the Commission's rules and regulations to permit the inclusion of more than two people on the service list.

III. BACKGROUND

a. Regulatory Framework

By enacting the Energy Policy Act of 2005,[9] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk-Power System, and with the duty of certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215 of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-approved Reliability Standards.[10]

Section 215(d)(5) of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability Standard. Pursuant to Section 215(d)(2) of the FPA and Section 39.5(c)(1) of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard. In Order No. 693, the Commission noted that it would defer to the "technical expertise" of the ERO with respect to the content of a Reliability Standard and explained that, through the use of directives, it provides guidance but does not dictate an outcome. Rather, the Commission will consider an equivalent alternative approach provided that the ERO demonstrates that the alternative will address the Commission's underlying concern or goal as efficiently and effectively as the Commission's proposal, example, or directive.[11]

Section 39.5(a) of the Commission's regulations requires the ERO to file with the Commission for its approval each Reliability Standard that the ERO proposes to become mandatory and enforceable in the United States, and each modification to a Reliability Standard

---

9 16 U.S.C. § 824o (2012).

10 *See* Section 215(b)(1)("All users, owners and operators of the bulk-power system shall comply with reliability standards that take effect under this section.").

11 *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242 at PP 31, 186-187, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

that the ERO proposes to be made effective. The Commission has the regulatory responsibility to approve standards that protect the reliability of the Bulk-Power System and to ensure that such standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest.

b. NERC Reliability Standards Development Procedure

The proposed Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[12] NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC Standard Processes Manual.[13] In its ERO Certification Order, the Commission found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards and thus satisfies certain of the criteria for approving Reliability Standards. The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders, and a vote of stakeholders and the NERC Board of Trustees is required to approve a Reliability Standard before the Reliability Standard is submitted to the Commission for approval.

c. History of Project 2009-01, Disturbance and Sabotage Reporting

Project 2009-01—Disturbance and Sabotage Reporting, was initiated on April 2, 2009, by PJM Interconnection, L.L.C. as a request for revision to existing standards CIP-001-1,

---

[12] Order No. 672 at P 334 ("Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its Commission-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by FERC.").

[13] The NERC Rules of Procedure are available here: http://www.nerc.com/page.php?cid=1%7C8%7C169. The current NERC Standard Processes Manual is available here: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf.

Sabotage Reporting, and EOP-004-1, Disturbance Reporting. The Standard Authorization Request was initiated to provide clarity on an appropriate threshold for reporting potential acts of sabotage as required by CIP-001-1, and to revise several requirements in currently effective EOP-004-1 that reference out-of-date Department of Energy forms and to eliminate "fill-in-the-blank" components.

The Disturbance and Sabotage Reporting drafting team was formed in late 2009. The drafting team developed EOP-004-2, Event Reporting, by combining the requirements of EOP-004-1 and CIP-001-2a into a single reporting standard using the results-based standard development approach.[14] The EOP-004-1 standard contains the requirements for reporting and analyzing disturbances while the CIP-001-2a standard addresses sabotage procedures and reporting. The drafting team used the NERC Security Guideline for the Electricity Sector: Threat and Incident Reporting as a resource.[15] In 2010, the drafting team developed a concept paper that identified the major concepts that the team proposed to be incorporated into the EOP-004-2 standard and posted the paper for comments. Additionally, the drafting team worked in coordination with the Events Analysis Working Group to develop a list of the events that would be required to be reported for reliability purposes and incorporated that list into Attachment 1 of the EOP-004-2 standard.

i. <u>Issues With Respect to Defining the Term "Sabotage"</u>

The drafting team considered the directive by the Commission in Order No. 693 to "further define the term [sabotage] and provide guidance on triggering events that would cause

---

[14] The results-based initiative is intended to focus the collective effort of NERC and industry participants on improving the clarity and quality of NERC Reliability Standards by developing performance, risk and competency-based requirements that accomplish a reliability objective through a defense-in-depth strategy, while eliminating documentation-driven requirements that do not benefit Bulk-Power System reliability.

[15] Available here: http://www.nerc.com/files/Incident-Reporting.pdf.

an entity to report an event."[16] However, there was concern among stakeholders that such a definition could be ambiguous or otherwise subject to interpretation.[17] The drafting team determined that it was almost impossible to determine if a particular act constituted sabotage without the intervention of law enforcement. There is an inherently subjective component to the determination of whether or not any particular event is caused by a malicious act and this determination may vary based on various factors, including the local jurisdiction, given that there is also a legal component to whether or not a particular act is considered to be deliberate or malicious. Further, the definition of the term "sabotage" would have to exclude events such as unintentional operator error, whereas an action by a third party with the same exact consequences or outcome might be considered "sabotage." The drafting team thus determined that attempting to define the term "sabotage" would result in further ambiguity with respect to the reporting of events. Instead, the drafting team developed a list of events included in Attachment 1 to provide guidance for reporting events. The drafting team determined that this method is an equally effective and efficient means of addressing the Commission directive in accordance with Order No. 693.[18]

IV. <u>JUSTIFICATION FOR APPROVAL OF THE PROPOSED RELIABILITY STANDARD</u>

a. Basis and Purpose of Reliability Standard and Improvements in this Revision

[16] Order No. 693 at P 461 (internal citation omitted).

[17] *See e.g.*, Disturbance and Sabotage Reporting Standard Drafting Team (Project 2009-01) Reporting Concepts Paper at 3 ("One thing became clear in the [drafting team's] discussion concerning sabotage: everyone has a different definition."). *Available here*: http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html.

[18] Order No. 693 at P 31 ("we do expect the ERO to respond with an equivalent alternative and adequate support that fully explains how the alternative produces a result that is as effective as or more effective that the Commission's example or directive.").

As noted herein, EOP-004-2 merges CIP-001-2a, which addresses sabotage procedures and reporting, and EOP-004-1,[19] which addresses the reporting and analyzing of disturbances, into a single comprehensive Reliability Standard.[20] EOP-004 is part of the Emergency Preparedness and Operations ("EOP") body of Reliability Standards. The EOP group of Reliability Standards consists of eight Reliability Standards that address preparation for emergencies, necessary actions during emergencies and system restoration and reporting following disturbances.[21] CIP-001 is part of the Critical Infrastructure Protection body of standards.[22]

i. <u>Proposed Reliability Standard, EOP-004-2</u>

Proposed Reliability Standard EOP-004-2 requires reporting of events that impact or may impact the reliability of the Bulk Electric System, provides clear criteria for reporting, includes consistent reporting timelines, including a reporting hierarchy for reporting of disturbances, and

[19] The Commission approved EOP-004-1 in Order No. 693. *See* Order No. 693 at P 617.

[20] Requirement R2 of existing Reliability Standard EOP-004-1, which provides that each Reliability Coordinator, Balancing Authority, Transmission Operator, Generation Operator and Load-Serving Entity must promptly analyze Bulk Electric System disturbances on its system or facilities, is incorporated into Requirement R1 of the proposed EOP-004-2 Reliability Standard and is addressed by the NERC Bulk-Power System Awareness group and the NERC events analysis program. The Requirements of EOP-004-2 specify that certain types of events are to be reported, but do not include explicit provisions to analyze events. However, events reported under EOP-004-2 are incorporated into the real-time understanding of the grid that is maintained by the Bulk-Power System Awareness group. Further, such reports may trigger further scrutiny by the NERC event analysis program. If warranted, the events analysis program personnel may request that more data for certain events be provided by the reporting entity or other entities that may have experienced the event.

[21] EOP-001 is dedicated to Emergency Operations Planning. EOP-002 is dedicated to Capacity and Energy Emergencies. EOP-003 is dedicated to Load Shedding Plans. EOP-004 is dedicated to Event Reporting. EOP-005 is dedicated to System Restoration Plans and Blackstart Resources. EOP-006 is dedicated to System Restoration Coordination, [note there is no EOP-007]. EOP-008 is dedicated to Loss of Control Center Functionality and EOP-009 is dedicated to Documentation of Blackstart Generating Unit Test Results.

[22] The Commission approved CIP-001-1 in Order No. 693. *See* Order No. 693 at P 471. On April 21, 2010, NERC filed a petition for approval of an interpretation to Requirement R2 of CIP-001-1, which was approved in a letter order issued by the Commission on February 2, 2011. *North American Electric Reliability Corporation,* Letter order approving interpretation to CIP-001-1, Docket No. RD10-11-000, (February 2, 2011). On June 21, 2011, NERC submitted a Petition for Approval of Reliability Standards CIP-001-2a – Sabotage Reporting with a Regional Variance for Texas Reliability Entity, which was approved in a letter order issued by the Commission on August 2, 2011. *North American Electric Reliability Corporation*, Letter order approving Petition of the North American Electric Reliability Corporation for Approval of the Reliability Standard CIP-001-2a – Sabotage Reporting with a Regional Variance for Texas Reliability Entity, Docket No. RD11-6-000 (August 2, 2011).

provides clarity regarding who will receive the reported information. The proposed Reliability Standard consists of three Requirements. Requirement R1 mandates that Responsible Entities will have an event reporting Operating Plan for reporting specific types of events. Requirement R2 establishes a timeframe for reporting of events, and Requirement R3 states that Responsible Entities must validate the contact information contained in the Operating Plan each calendar year. The proposed Reliability Standard provides a comprehensive approach to disturbance and event reporting as explained in further detail below.

Proposed Requirements

R1. Each Responsible Entity shall have an event reporting Operating Plan in accordance with EOP-004-2 Attachment 1 that includes the protocol(s) for reporting to the Electric Reliability Organization and other organizations (e.g., the Regional Entity, company personnel, the Responsible Entity's Reliability Coordinator, law enforcement, or governmental authority). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R2. Each Responsible Entity shall report events per their Operating Plan within 24 hours of recognition of meeting an event type threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]*

R3. Each Responsible Entity shall validate all contact information contained in the Operating Plan pursuant to Requirement R1 each calendar year. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Requirement R1

Requirement R1 of proposed Reliability Standard EOP-004-2 requires Responsible Entities to have an event reporting Operating Plan that includes, but is not limited to the protocol(s) for reporting, and each organization identified to receive an event report, for event types specified in Attachment 1 of EOP-004-2. Attachment 1 of EOP-004-2, Reportable Events, lists: (i) events, (ii) the relevant entity with reporting responsibility and (iii) the threshold for reporting the event. In these situations, Responsible Entities are requirement to submit EOP-004-2 (or DOE Form OE-417) Attachment 2, pursuant to Requirements R1 and R2. The last column of Attachment 1, "Threshold for Reporting" is a bright line that, if reached, triggers the obligation for the entity to report that they experienced the applicable event per Requirement 1.

The requirement to have an Operating Plan for reporting specific types of events provides the entity with a method to have its operating personnel recognize events that affect reliability and to be able to report them to appropriate parties; *e.g.*, Regional Entities, applicable Reliability Coordinators, and law enforcement and other jurisdictional agencies when so recognized. In addition, these event reports are an input to the NERC event analysis program. The results-based approach of EOP-004-2 encourages the development of a culture of compliance that is focused on reliability and communication.

It is generally accepted that as a good business practice, every Registered Entity that owns or operates elements or devices on the grid should have a formal or informal process, procedure, or steps it takes to gather information necessary to analyze events.[23] Requirement R1 mandates that the Responsible Entity establish documentation on how that procedure, process, or plan is organized. This documentation may be a single document or a combination of various documents that achieve the reliability objective.

The communication protocol(s) could include a process flowchart, identification of internal and external personnel or entities to be notified, or a list of personnel by name and their associated contact information. An existing procedure that meets the requirements of CIP-001-2a may be included in this Operating Plan along with other processes, procedures or plans to meet this requirement.[24]

---

[23] *See e.g.*, PJM Manual 13, Emergency Operations, available at: http://www.pjm.com/~/media/documents/manuals/m13.ashx; *see also*, Midwest ISO Disturbance Reporting Procedure RTO-OP-023-r9.1, available at: https://www.midwestiso.org/Library/Repository/Procedure/RTO-OP-023-r9%201%20Disturbance%20Reporting%20Procedure.pdf.

[24] Proposed Reliability Standard EOP-004-2 incorporates existing Reliability Standard CIP-001-2a in its entirety. CIP-001-2a requires that each Reliability Coordinator, Balancing Authority, Transmission Operator, Generation Operator and Load-Serving Entity have procedures for recognizing and for making operating personnel

Requirement R2

Requirement R2 of proposed Reliability Standard EOP-004-2 requires Responsible Entities to report events within 24 hours of recognition of meeting an event type threshold for reporting, or, if an event occurs on a weekend, by the end of the next business day.[25] This incorporation of a deadline for reporting satisfies the Commission directive in Order No. 693 to "require an applicable entity to contact appropriate governmental authorities in the event of sabotage within a specified period of time."[26] Requirement R2 is based on "recognition" of meeting an event type threshold because basing the reporting of events on when the events actually occur would be impractical. In practice, an entity may not be immediately aware of destruction or damage to a remote piece of equipment.[27] Further, requiring Responsible Entities to constantly monitor all equipment and property for destruction or damage would be a waste of resources and would not serve the best interests of the reliability of the Bulk Electric System. For these reasons, the drafting team's incorporation of the term "recognition" is reasonable and is consistent with the Commission's support in Order No. 693 for defining the specified period of time for reporting an event based on when an event is discovered or suspected to be sabotage.[28]

---

aware of sabotage events (Requirement R1 of CIP-001-2a), and communicating information concerning sabotage events to appropriate "parties" in the Interconnection (Requirements R2 through R4 of CIP-001-2a). The requirements of CIP-001-2a are encompassed by Requirement R1 of EOP-004-2 and Attachment 1.

[25] Holidays are not specifically recognized in Requirement R2.

[26] Order No. 693 at P 471.

[27] *See e.g., Comments of Xcel Energy Services, Inc.*, Docket No. RM06-16-000 (January 3, 2007) at p. 24 ("The triggering event for disclosure of an act of sabotage often will be unclear. That is, it is often not clear whether an event is the result of an act of sabotage, the result of negligent misconduct by an individual, or by equipment failure for other reasons. The Xcel Energy Operating Companies operate thousands of miles of bulk power transmission facilities, and many of these facilities are in remote locations. For this reason, it may require investigation to determine whether the triggering event was an act of sabotage, or the result of some other cause (such as weather or unintentional vehicle contact). This investigation will take time –especially if the event occurs at an unstaffed and/or remote station or facility.")(internal citation omitted).

[28] Order No. 693 at P 470 ("Thus, the Commission directs the ERO to modify CIP-001-1 to require an applicable entity to contact appropriate governmental authorities in the event of sabotage within a specified period of time, even if it is a preliminary report. The ERO, through its Reliability Standards development process, is directed to determine the proper reporting period. In doing so, the ERO should consider suggestions raised by

Each Responsible Entity must report and communicate events according to its Operating Plan based on the information in Attachment 1 of EOP-004-2. By implementing the event reporting Operating Plan, the Responsible Entity will assure that NERC has situational awareness so that NERC can develop trends and prepare for a possible next event, and mitigate the current event through the event analysis program.

Responsible Entities that have multiple registrations will only have to submit one report for any individual event.[29] For example, if an entity is registered as a Reliability Coordinator, Balancing Authority and Transmission Operator, the entity would only submit one report for a particular event rather submitting three reports as each individual registered entity. However, there may be several reports as a result of any individual event and this is appropriate as it will provide NERC with a better understanding of the depth and breadth of system conditions based on the given event.

Requirement R3 of existing Reliability Standard EOP-004-1, which requires each Reliability Coordinator, Balancing Authority, Transmission Operator, Generation Operator and Load-Serving Entity experiencing a reportable incident to provide a preliminary written report, has been incorporated into Requirement R2 of proposed Reliability Standard EOP-004-2.

Requirement R3

Requirement R3 of proposed Reliability Standard EOP-004-2 calls for the Responsible Entity to validate the contact information contained in the Operating Plan each calendar year. This requirement helps ensure that the event reporting Operating Plan is up to date and

---

commenters such as FirstEnergy and Xcel to define the specified period for reporting an incident beginning from when an event is discovered or suspected to be sabotage, and APPA's concerns regarding events at unstaffed or remote facilities, and triggering events occurring outside staffed hours at small entities.").

[29] *See* Guideline and Technical Basis for EOP-004-2, Multiple Reports for a Single Organization.

Responsible Entities will be able to effectively report events to NERC to assure situational awareness.

The incorporation of this annual validation in Requirement R3 satisfies the Commission directive in Order No. 693 to "incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."[30]

Attachment 1: Reportable Events

Attachment 1 of EOP-004-2, Reportable Events, lists (i) events, (ii) the relevant entity with reporting responsibility and (iii) the threshold for reporting the event. In these situations, entities are required to submit EOP-004-2 Attachment 2, pursuant to Requirements R1 and R2. The events addressed in Attachment 1 include, among others: damage or destruction of a Facility, transmission loss, generation loss and a BES Emergency[31] requiring public appeal for load reduction. Such events and the thresholds identified for reporting these events, are an equivalent alternative approach that ensures that Responsible Entities respond to events. Therefore, Attachment 1 addresses the Commission's underlying concern as efficiently and effectively as the Commission's directive to define the term "sabotage." Collectively, Requirement R1 and Attachment 1 require entities to properly identify and respond to events to minimize the adverse impact on the Bulk Electric System.[32]

In Attachment 1, the drafting team used the term "Facility" as defined in the Glossary of Terms Used in NERC Reliability Standards.[33] A Facility is defined as: "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a

30 Order No. 693 at P 466.

31 "BES Emergency" as used in EOP-004-2 is a defined term set forth in the Glossary of Terms Used in NERC Reliability Standards, available here: http://www.nerc.com/files/Glossary_of_Terms.pdf.

32 This is responsive to the Commission directive at P471 of Order No. 693 requiring NERC to "specify baseline requirements regarding what issues should be addressed in the procedures for recognizing sabotage events and making personnel aware of such events").

33 *Available here*: http://www.nerc.com/files/Glossary_of_Terms.pdf .

shunt compensator, transformer, etc.)" The drafting team does not intend the use of the term "Facility" to mean a substation or any other facility that one might consider in everyday discussions regarding the grid. This is intended to mean *only* a Facility as defined above. The use of the defined term provides greater clarity for entities regarding the specific types of events that are to be reported. Through the use of the term "Facility," all of the equipment within a substation that is critical to reliability is included.

Attachment 2: Event Reporting Form

Attachment 2 (or alternatively DOE Form OE-417) is the form to be used by Responsible Entities for reporting when the threshold for an event listed in Attachment 1 is met.

The DOE Office of Electricity Delivery and Energy Reliability uses Form OE-417, "Emergency Incident and Disturbance Report," to monitor major system incidents on electric power systems. Tracking disturbances that impact the integrated generating and transmission facilities is an important part of DOE's responsibilities, along with examining issues associated with insufficient capacity reserves. The form collects information on electric emergency incidents and disturbances for DOE's use in fulfilling its overall national security and other energy management responsibilities. The form is a mandatory filing whenever an electrical incident or disturbance is sufficiently large enough to cross the reporting thresholds. Reporting coverage for the Form OE-417 includes all 50 States, the District of Columbia, Puerto Rico, the U.S. Virgin Islands, and the U.S. Trust Territories.

In an effort to minimize administrative burden, U.S. entities may use the DOE OE-417 form, rather than Attachment 2, to report under EOP-004.[34] Pursuant to the DOE's new online process, entities may record email addresses associated with their Operating Plan so that when the report is submitted to DOE, it will automatically be forwarded to the posted email addresses,

[34] Canadian entities are required to use Attachment 2 to report events.

thereby eliminating some administrative burden to forward the report to multiple organizations and agencies.[35] This approach is consistent with the Commission's suggestion in Order No. 693 for NERC to "consider consolidation of the sabotage reporting forms and the sabotage reporting channels with the appropriate governmental authorities to minimize the impact of these reporting requirements on all entities."[36]

b. Enforceability of the Proposed Reliability Standard, EOP-004-2

The proposed Reliability Standard contains measures that support each standard requirement by clearly identifying what is required and how the requirement will be enforced. These measures help provide clarity regarding how the requirements will be enforced, and ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.[37] The VSLs also provide further guidance on how NERC will enforce the requirements of the standard.

i. Violation Risk Factors and Violation Severity Levels

There are three requirements in EOP-004-2. Requirement R1 was assigned a Lower VRF while Requirements R2 and R3 were assigned a Medium VRF. The VRFs and VSLs for the proposed standard comport with NERC and Commission guidelines related to their assignment. For a detailed review of the VRFs, the VSLs, and the analysis of how the VRFs and VSLs were determined using these guidelines, please see **Exhibit E**.

V. SUMMARY OF THE RELIABILITY STANDARD DEVELOPMENT PROCEEDINGS

35 *See* http://www.oe.netl.doe.gov/oe417.aspx.

36 Order No. 693 at P 471.

37 Order No. 672 at P 327 ("There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.").

The development record for proposed Reliability Standard EOP-004-2 is summarized below. **Exhibit D** contains the Consideration of Comments Reports created during the development of the Reliability Standards. **Exhibit F** contains the complete record of development for the standards.

a. Overview of the Drafting Team

When evaluating proposed Reliability Standard, the Commission is expected to give “due weight” to the technical expertise of the ERO.[38] The technical expertise of the ERO is derived from the drafting team. For this project, the drafting team consisted of four industry experts with a diversity of experience. A detailed set of biographical information for each of the team members is included along with the drafting team roster in **Exhibit G**. The development record for the proposed EOP-004-2 standard is summarized below.

b. Standard Authorization Request Development

The first draft of the Standard Authorization Request was posted for a 30-day public comment from April 22, 2009 to May 21, 2009. The drafting team received 40 sets of comments from 120 people from more than 60 companies representing 9 of the 10 industry segments. Most commenters agreed on the need for revisions to CIP-001-1 and EOP-004-1, but voiced concerns on issues including:

- The applicability of the final requirements;
- Whether or not the standards should be merged;
- The inclusion of vandalism and the thresholds for defining sabotage; and
- Onerous or duplicative reporting required by the current standards.

[38] Section 215(d)(2) of the Federal Power Act; 16 U.S.C. § 824o(d)(2) (2012).

The Disturbance and Sabotage Reporting drafting team was formed in late 2009. In 2010, the drafting team developed a concept paper that identified the major concepts that the team proposed to be incorporated into the EOP-004-2 standard and posted the paper for a 30-day public comment period from March 17, 2010 to April 16, 2010. NERC received 41 sets of comments from 95 different people from approximately 50 companies representing 8 of the 10 industry segments. Most commenters agreed that the guidance in the concept paper should be used as a foundation for revising the standards. In the concept paper, the drafting team proposed to consolidate disturbance and event reporting under a single standard in EOP-004.

c. The First Posting – Informal Comment Period

The first draft of EOP-004-2 was posted for a 30-day informal comment period from September 15, 2010 to October 15, 2010. A mapping document that showed the translation of CIP-001-1 and EOP-004-1 into EOP-004-2 was posted for guidance with the first draft. There were 60 sets of comments, with comments from more than 175 different people from approximately 100 companies representing 9 of the 10 industry segments. In response to comments, the drafting team made several changes to the draft standard including:

- Revised the purpose statement to address the concern that the drafting team went beyond the reliability intent of the standard by concentrating too much on event analysis;
- Added a proposed working definition for “impact events” to the NERC Glossary of Terms;
- Deleted all references to “situational awareness” and instead using the terms “industry awareness” where appropriate;
- Added Load Serving Entities as applicable entities;
- Deleted Requirement R1 and proposed revisions to the NERC Rules of Procedure to include a central system with responsibility for receiving and distributing impact event reports;
- Revised Requirement R2 to include Operating Plan, Operating Process and Operating Procedure;

- Removed Parts 2.5 through 2.9 of Requirement R2 and replaced with Requirement R1, Part 1.4 to require updates to the Impact Event Operating Plan within 90 days of any change to content;
- Rewrote Requirement R3 to eliminate the need to assess the probable cause of an impact event;
- Rewrote Requirement R4 by taking out prescriptive guidance;
- Removed Requirement 5, Parts 5.3 and 5.4 and removed Requirements R7 and R8;
- Removed several bright-line criteria from Attachment 1, modifying it to assign clear responsibility for reporting for each category of impact event, and clarifying the types of events included in Attachment 1; and
- Clarified that NERC will accept DOE OE-417 form in lieu of Attachment 2 if the responsible entity is required to submit an OE-417 form, and added a process for the reporting of a Cyber Security Incident.

d. The Second Posting – Informal Comment Period

The second draft of the standard was posted with the implementation plan for a public 30-day informal comment period from March 9, 2011 to April 8, 2011. The drafting team received 60 sets of comments from 188 different people from approximately 132 different companies representing all 10 industry segments. Several changes were made to the draft of the EOP-004-2 standard including:

- Deleted proposed definition of "Impact Event";
- Revised the reporting time to 24 hours from 1 hour for most events
- Rewrote Requirement R1 to specify that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1;
- Revised the wording in Requirement R2 and R3 to more closely track the actions that need to be taken for reporting events and communications involving the Operating Plan;
- Rewrote Requirement R4 to more closely match the rationale language on annually verifying the communication process in its Operating Plan to provide better guidance to responsible entities; and
- Added clarity on which entities report and to whom events should be reported to.

e. Third Posting – Formal Comment Period and Initial Ballot and Non-Binding Poll

The third draft of the standard was posted for a public 45-day formal comment period from October 28, 2011 to December 12, 2011, and included an initial ballot and non-binding poll from December 2, 2011 to December 12, 2011. A mapping document and the VRF/VSL justification document were provided to aid in the review. The initial ballot for the draft of EOP-004-2 received a quorum of 87.97% and a 36.21% approval. The non-binding poll received a quorum of 85.28% and a 45% approval. The drafting team received 76 sets of comments from 171 individuals from 140 different companies representing nine of the ten industry segments. As a result of the comments, the drafting team made changes to the draft standard including:

- Revised the purpose statement to remove ambiguous language "with the potential to impact reliability";
- Revised Requirement R1 for clarity and matched the language more closely to FERC Order No. 693, Paragraph 471, and eliminated Part 1.2 and reworded Part 1.3 (now 1.2);
- Removed Part1.4 and made Part 1.5 a new Requirement R4;
- Revised Requirement R4 and made it R3;
- Deleted Requirement R2 and merged with R3 to eliminate redundancy;
- Reformatted the table in Attachment 1 to separate one hour reporting requirements from 24-hour reporting requirements; and
- Revised the language and eliminated redundancy in types of events included in Attachment 1.

In response to comments on the third draft, the drafting team also addressed in depth the different processes and reasons for using either the DOE OE-417 form or EOP-004-2 Attachment 2 to report events, and why it was necessary for standard EOP-004-2 to retain Attachment 2 as a reporting option.

f. Fourth Posting – Formal Comment Period and Successive Ballot and Non-Binding Poll

The fourth draft of the EOP-004-2 standard was posted for a public formal comment period from April 25, 2012 to May 24, 2012 with a ten day successive ballot and non-binding poll held from May 15, 2012 to May 24, 2012. The mapping document, a "Consideration of Issues and Directives" document, a VRF/VSL justification document, and a proposed NERC Rules of Procedure Section 812 document were posted to assist in review. The successive ballot received a quorum of 84.43% and an approval of 46.18%. The non-binding poll results achieved a 79.95% quorum and a 52.67% supportive opinion. The drafting team received 87 sets of comments from 210 different people from approximately 135 different companies representing 9 of the 10 industry segments. Based on the comments received, NERC made the following changes to the draft standard:

- Removed the reporting of Cyber Security Incidents from EOP-004 and directed the team developing CIP-008-5 to retain this reporting;
- Removed Interchange Coordinator, Transmission Service Providers, Load-Serving Entity, Electric Reliability Organization and Regional Entity as Responsible Entities;
- Moved most of the "Background" Section language to the "Guidelines and Technical Basis" Section;
- Made minor language changes to the measures and the data retention section.
- Revised Attachment 2 to list events in the same order in which they appear in Attachment 1;
- Revised requirement R1 to include the Parts in the main body of the Requirement;
- Deleted Requirement R3 and R4 and established a new Requirement R3 to have the Registered Entity "validate" the contact information in the contact list(s) they may have for the events applicable to them;
- Updated Attachment 1 by assigning event titles and entity responsibilities.

In this iteration, the drafting team noted that NERC had initiated a new effort to forward event reports to applicable government authorities, so the proposed Section 812 of the NERC Rules of Procedure was no longer needed and was removed from the project. Due to suggestions received during this comment period to improve the standard, the drafting team decided to post the standard for a second successive ballot period.[39]

g. Fifth Posting – Formal Comment Period and Successive Ballot and Non-Binding Poll

A fifth draft of the EOP-004-2 standard was posted for a 30-day public formal comment period from August 29, 2012 to September 27, 2012, with a second ten-day successive ballot and non-binding poll held during the last ten days of the comment period, from September 18, 2012 to September 27, 2012. The mapping document, the "Consideration of Issues and Directives" document, and the VRF/VSL justification document were posted to assist in review. The second successive ballot received a quorum of 78.54% and an approval of 63.40%, and the non-binding poll received a 72.59% quorum and a 63.05% supportive opinion. The drafting team received 56 sets of comments from 181 different people from 125 companies, representing 9 of the ten industry segments. In response to comments received, the drafting team made several changes:

- Added language to the Guidelines and Technical Basis section to clarify the applicability of Requirement R1 and R3 to Distribution Providers;
- Added language to the Guidelines and Technical Basis section to clarify that only one report per event is necessary for entities that are registered in several different categories of industry segments;
- Added clarifying language to Requirement R2 on 24-hour reporting; and
- Revised the VSL language for Requirement R1 to address the case in which the event reporting Operating Plan fails to include event types.

In response to the fifth round of comments, the drafting team explained that the investigation and analysis portions of the current mandatory and enforceable standards EOP-004-1 and CIP-001-2a will not be incorporated in EOP-004-2. Instead, the analysis provisions will be addressed in the NERC event analysis program upon regulatory approval of EOP-004-2.

---

[39] On July 30, 2012, the drafting team hosted a webinar in order to receive informal feedback and to explain proposed changes to the standard. The slides are available on the project page: http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting_RF.html.

h. Sixth Posting – Recirculation Ballot and Non-Binding Poll

Given that EOP-004-2 failed the second successive ballot with 63.4% support, on October 22, 2012, the drafting team conducted an industry webinar to explain several issues, including the applicability to Distribution Providers, duplicative reporting, the role of the Paragraph 81 project and the reporting burden of the standard.[40]

The sixth and final draft of the EOP-004-2 standard was posted for a recirculation ballot and non-binding poll from October 24, 2012 to November 5, 2012. The standard received a quorum of 85.14% and an approval of 71.39%. The non-binding poll resulted in a quorum of 78.93% and an approval of 71.04%.

i. Board of Trustees Approval of EOP-004-2

The final proposed EOP-004-2 standard was presented to the NERC Board of Trustees on November 7, 2012. NERC staff provided a summary of the proposed standard, as well as a summary of minority issues and associated drafting team responses. The NERC Board of Trustees approved the standard, and NERC staff recommended that it be filed with applicable regulatory authorities.

---

[40] Slides from the webinar are available here: http://www.nerc.com/docs/standards/dt/Disturbance_and_Sabotage_Reporting_Webinar_20121022_final.pdf.

VI. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission:

- approve the proposed EOP-004-2 Reliability Standard included in **Exhibit B,** effective as proposed herein;
- approve the implementation plan included in **Exhibit C**;
- approve the retirement of Reliability Standards, effective as proposed herein.

Respectfully submitted,

/s/ Stacey Tyrewala

Counsel for the North American Electric Reliability Corporation

December 31, 2012

CERTIFICATE OF SERVICE

I hereby certify that I have served a copy of the foregoing document upon all parties listed on the official service list compiled by the Secretary in this proceeding.

Dated at Washington, D.C. this 31st day of December, 2012.

/s/ Stacey Tyrewala
Stacey Tyrewala
Attorney for North American Electric Reliability Corporation

Exhibit A

Order No. 672 Criteria

EXHIBIT A

Order No. 672 Criteria

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standard has met or exceeded the criteria:

1. **Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.**[2]

The proposed standard achieves the specific reliability goal of ensuring that events that may impact the reliability of the Bulk Electric System are reported. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the Bulk Electric System. The

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[2] Order No. 672 at P 321. The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.

Order No. 672 at P 324. The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.

inclusion of reporting to law enforcement enables and supports reliability principles such as protection of Bulk Electric System from malicious physical attack. The proposed Reliability Standard includes clear criteria for reporting and consistent reporting timelines.

2. Proposed Reliability Standards must be applicable only to users, owners and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[3]

The proposed revisions to this Reliability Standard apply to the following Functional Entities: Reliability Coordinators; Balancing Authorities; Transmission Owners; Transmission Operators; Generator Owners; Generator Operators; and Distribution Providers. Section 4.1 of proposed Reliability Standard EOP-004-2 is clear and unambiguous as to who is required to comply, in accordance with Order No. 672. Further, Requirements R1 through R3 are clear and unambiguous as to what is required, in accordance with Order No. 672. Requirements R1 through R3 provide clear criteria for reporting and consistent reporting timelines and provide clarity around who will receive the information.

3. A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation. [4]

The VRFs and VSLs for the proposed standard comport with NERC and Commission guidelines related to their assignment. The assignment of the severity level for each VSL is consistent with the corresponding Requirement and the VSLs should

---

[3] Order No. 672 at P 322. The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.

Order No. 672 at P 325. The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.

[4] Order No. 672 at P 326. The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.

ensure uniformity and consistency in the determination of penalties. The VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standard includes clear and understandable consequences in accordance with Order No. 672.

4. A proposed Reliability Standard must identify clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner. [5]

The proposed Reliability Standard contains measures that support each requirement by clearly identifying what is required and how the requirement will be enforced. These measures help provide clarity regarding how the requirements will be enforced, and ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.

5. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently — but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[6]

The proposed Reliability Standard achieves its reliability goals effectively and efficiently in accordance with Order No. 672. The proposed standard requires Functional Entities to report incidents and provide known information at the time of the report and also includes an illustrated example of a reporting process in an attached flowchart.

6. Proposed Reliability Standards cannot be "lowest common denominator,"

[5] Order No. 672 at P 327. There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.

[6] Order No. 672 at P 328. The proposed Reliability Standard does not necessarily have to reflect the optimal method, or "best practice," for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently.

***i.e.*, cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.**[7]

The proposed Reliability Standard does not reflect a "lowest common denominator" approach. To the contrary, the proposed standard represents a significant improvement over the previous version as described herein. Specifically, Attachment 1 provides greater clarity of the types of events that are to be reported as compared to the previous version of the standard.

7. Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[8]

The proposed Reliability Standard, EOP-004-2, applies throughout North America and does not favor one geographic area or regional model.

---

[7] Order No. 672 at P 329. The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice — the so-called "lowest common denominator" — if such practice does not adequately protect Bulk-Power System reliability. Although FERC will give due weight to the technical expertise of the ERO, we will not hesitate to remand a proposed Reliability Standard if we are convinced it is not adequate to protect reliability.

Order No. 672 at P 330. A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a "lowest common denominator" Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.

[8] Order No. 672 at P 331. A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.

8. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[9]

The proposed Reliability Standard does not restrict the available transmission capability or limit use of the Bulk-Power System in a preferential manner.

9. The implementation time for the proposed Reliability Standard is reasonable.[10]

The proposed effective dates for the standard are just and reasonable and appropriately balance the urgency in the need to implement the standards against the reasonableness of the time allowed for those who must comply to develop necessary procedures, software, facilities, staffing or other relevant capability.

The implementation plan proposes that EOP-004-2 become effective: (i) in those jurisdictions where regulatory approval is required, on the on the first day of the first calendar quarter that is six months after applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities; and (ii) in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is six months beyond the date the standard is approved by the Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

---

[9] Order No. 672 at P 332. As directed by section 215 of the FPA, FERC itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.

[10] Order No. 672 at P 333. In considering whether a proposed Reliability Standard is just and reasonable, FERC will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.

This will allow applicable entities adequate time to ensure compliance with the requirements. The proposed effective dates are explained in the proposed Implementation Plan, attached as **Exhibit C**.

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[11]

The proposed Reliability Standard was developed in accordance with NERC's Commission-approved, ANSI- accredited processes for developing and approving Reliability Standards. Section V, *Summary of the Reliability Standard Development Proceedings,* details the processes followed to develop the standard (for a more thorough review, please see the complete development history included as **Exhibit F**).

These processes included, among other things, multiple comment periods, pre-ballot review periods, and balloting periods. Additionally, all drafting team meetings were properly noticed and open to the public. The initial and recirculation ballots both achieved a quorum and exceeded the required ballot pool approval levels.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[12]

NERC has identified no competing public interests regarding the request for approval of this proposed Reliability Standard. No comments were received that indicated the proposed standard conflicts with other vital public interests.

---

[11] Order No. 672 at P 334. Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its Commission-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by FERC.

[12] Order No. 672 at P 335. Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.

12. Proposed Reliability Standards must consider any other appropriate factors.[13]

No other negative factors relevant to whether the proposed Reliability Standard is just and reasonable were identified.

[13] Order No. 672 at P 323. In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.

Exhibit B

Proposed Reliability Standard EOP-004-2 Submitted for Approval

A. Introduction

1. **Title:** Event Reporting

2. **Number:** EOP-004-2

3. **Purpose:** To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the Requirements and the EOP-004 Attachment 1 contained herein, the following functional entities will be collectively referred to as "Responsible Entity."

   4.1.1. Reliability Coordinator

   4.1.2. Balancing Authority

   4.1.3. Transmission Owner

   4.1.4. Transmission Operator

   4.1.5. Generator Owner

   4.1.6. Generator Operator

   4.1.7. Distribution Provider

5. **Effective Dates:**

The first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

6. **Background:**

NERC established a SAR Team in 2009 to investigate and propose revisions to the CIP-001 and EOP-004 Reliability Standards. The team was asked to consider the following:

1. CIP-001 could be merged with EOP-004 to eliminate redundancies.
2. Acts of sabotage have to be reported to the DOE as part of EOP-004.
3. Specific references to the DOE form need to be eliminated.
4. EOP-004 had some 'fill-in-the-blank' components to eliminate.

The development included other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient Bulk Electric System reliability standards.

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009.

The DSR SDT developed a concept paper to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT had developed. The posting of the concept paper sought comments from stakeholders on the "road map" that will be used by the DSR SDT in updating or revising CIP-001 and EOP-004. The concept paper provided stakeholders the background information and thought process of the DSR SDT. The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC issues database and FERC Order 693 Directives in order to determine a prudent course of action with respect to revision of these standards.

B. Requirements and Measures

R1. Each Responsible Entity shall have an event reporting Operating Plan in accordance with EOP-004-2 Attachment 1 that includes the protocol(s) for reporting to the Electric Reliability Organization and other organizations (e.g., the Regional Entity, company personnel, the Responsible Entity's Reliability Coordinator, law enforcement, or governmental authority). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Each Responsible Entity will have a dated event reporting Operating Plan that includes, but is not limited to the protocol(s) and each organization identified to receive an event report for event types specified in EOP-004-2 Attachment 1 and in accordance with the entity responsible for reporting.

R2. Each Responsible Entity shall report events per their Operating Plan within 24 hours of recognition of meeting an event type threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]*

M2. Each Responsible Entity will have as evidence of reporting an event, copy of the completed EOP-004-2 Attachment 2 form or a DOE-OE-417 form; and evidence of submittal (e.g., operator log or other operating documentation, voice recording, electronic mail message, or confirmation of facsimile) demonstrating the event report was submitted within 24 hours of recognition of meeting the threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). (R2)

R3. Each Responsible Entity shall validate all contact information contained in the Operating Plan pursuant to Requirement R1 each calendar year. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Each Responsible Entity will have dated records to show that it validated all contact information contained in the Operating Plan each calendar year. Such evidence may include, but are not limited to, dated voice recordings and operating logs or other communication documentation. (R3)

C. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2 Evidence Retention

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- Each Responsible Entity shall retain the current Operating Plan plus each version issued since the last audit for Requirements R1, and Measure M1.
- Each Responsible Entity shall retain evidence of compliance since the last audit for Requirements R2, R3 and Measure M2, M3.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4 Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Lower	The Responsible Entity had an Operating Plan, but failed to include one applicable event type.	The Responsible Entity had an Operating Plan, but failed to include two applicable event types.	The Responsible Entity had an Operating Plan, but failed to include three applicable event types.	The Responsible Entity had an Operating Plan, but failed to include four or more applicable event types. OR The Responsible Entity failed to have an event reporting Operating Plan.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R2	Operations Assessment	Medium	The Responsible Entity submitted an event report (e.g., written or verbal) to all required recipients more than 24 hours but less than or equal to 36 hours after meeting an event threshold for reporting. OR The Responsible Entity failed to submit an event report (e.g., written or verbal) to one entity identified in its event reporting Operating Plan within 24 hours.	The Responsible Entity submitted an event report (e.g., written or verbal) to all required recipients more than 36 hours but less than or equal to 48 hours after meeting an event threshold for reporting. OR The Responsible Entity failed to submit an event report (e.g., written or verbal) to two entities identified in its event reporting Operating Plan within 24 hours.	The Responsible Entity submitted an event report (e.g., written or verbal) to all required recipients more than 48 hours but less than or equal to 60 hours after meeting an event threshold for reporting. OR The Responsible Entity failed to submit an event report (e.g., written or verbal) to three entities identified in its event reporting Operating Plan within 24 hours.	The Responsible Entity submitted an event report (e.g., written or verbal) to all required recipients more than 60 hours after meeting an event threshold for reporting. OR The Responsible Entity failed to submit an event report (e.g., written or verbal) to four or more entities identified in its event reporting Operating Plan within 24 hours. OR The Responsible Entity failed to submit a report for an event in EOP-004 Attachment 1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R3	Operations Planning	Medium	The Responsible Entity validated all contact information contained in the Operating Plan but was late by less than one calendar month. OR The Responsible Entity validated 75% but less than 100% of the contact information contained in the Operating Plan.	The Responsible Entity validated all contact information contained in the Operating Plan but was late by one calendar month or more but less than two calendar months. OR The Responsible Entity validated 50% and less than 75% of the contact information contained in the Operating Plan.	The Responsible Entity validated all contact information contained in the Operating Plan but was late by two calendar months or more but less than three calendar months. OR The Responsible Entity validated 25% and less than 50% of the contact information contained in the Operating Plan.	The Responsible Entity validated all contact information contained in the Operating Plan but was late by three calendar months or more. OR The Responsible Entity validated less than 25% of contact information contained in the Operating Plan.

EOP-004 - Attachment 1: Reportable Events

NOTE: Under certain adverse conditions (e.g. severe weather, multiple events) it may not be possible to report the damage caused by an event and issue a written Event Report within the timing in the table below. In such cases, the affected Responsible Entity shall notify parties per Requirement R2 and provide as much information as is available at the time of the notification. Submit reports to the ERO via one of the following: e-mail: systemawareness@nerc.net, Facsimile 404-446-9770 or Voice: 404-446-9780.

Submit EOP-004 Attachment 2 (or DOE-OE-417) pursuant to Requirements R1 and R2.

Event Type	Entity with Reporting Responsibility	Threshold for Reporting
Damage or destruction of a Facility	RC, BA, TOP	Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in actions to avoid a BES Emergency.
Damage or destruction of a Facility	BA, TO, TOP, GO, GOP, DP	Damage or destruction of its Facility that results from actual or suspected intentional human action.
Physical threats to a Facility	BA, TO, TOP, GO, GOP, DP	Physical threat to its Facility excluding weather or natural disaster related threats, which has the potential to degrade the normal operation of the Facility. OR Suspicious device or activity at a Facility. Do not report theft unless it degrades normal operation of a Facility.

Event Type	Entity with Reporting Responsibility	Threshold for Reporting
Physical threats to a BES control center	RC, BA, TOP	Physical threat to its BES control center, excluding weather or natural disaster related threats, which has the potential to degrade the normal operation of the control center. OR Suspicious device or activity at a BES control center.
BES Emergency requiring public appeal for load reduction	Initiating entity is responsible for reporting	Public appeal for load reduction event.
BES Emergency requiring system-wide voltage reduction	Initiating entity is responsible for reporting	System wide voltage reduction of 3% or more.
BES Emergency requiring manual firm load shedding	Initiating entity is responsible for reporting	Manual firm load shedding ≥ 100 MW.
BES Emergency resulting in automatic firm load shedding	DP, TOP	Automatic firm load shedding ≥ 100 MW (via automatic undervoltage or underfrequency load shedding schemes, or SPS/RAS).
Voltage deviation on a Facility	TOP	Observed within its area a voltage deviation of ± 10% of nominal voltage sustained for ≥ 15 continuous minutes.

Event Type	Entity with Reporting Responsibility	Threshold for Reporting
IROL Violation (all Interconnections) or SOL Violation for Major WECC Transfer Paths (WECC only)	RC	Operate outside the IROL for time greater than IROL T_v (all Interconnections) or Operate outside the SOL for more than 30 minutes for Major WECC Transfer Paths (WECC only).
Loss of firm load	BA, TOP, DP	Loss of firm load for ≥ 15 Minutes: ≥ 300 MW for entities with previous year's demand ≥ 3,000 OR ≥ 200 MW for all other entities
System separation (islanding)	RC, BA, TOP	Each separation resulting in an island ≥ 100 MW
Generation loss	BA, GOP	Total generation loss, within one minute, of : ≥ 2,000 MW for entities in the Eastern or Western Interconnection OR ≥ 1,000 MW for entities in the ERCOT or Quebec Interconnection
Complete loss of off-site power to a nuclear generating plant (grid supply)	TO, TOP	Complete loss of off-site power affecting a nuclear generating station per the Nuclear Plant Interface Requirement

Event Type	Entity with Reporting Responsibility	Threshold for Reporting
Transmission loss	TOP	Unexpected loss within its area, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing).
Unplanned BES control center evacuation	RC, BA, TOP	Unplanned evacuation from BES control center facility for 30 continuous minutes or more.
Complete loss of voice communication capability	RC, BA, TOP	Complete loss of voice communication capability affecting a BES control center for 30 continuous minutes or more.
Complete loss of monitoring capability	RC, BA, TOP	Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (i.e., State Estimator or Contingency Analysis) is rendered inoperable.

EOP-004 - Attachment 2: Event Reporting Form

Guideline and Technical Basis

Distribution Provider Applicability Discussion

The DSR SDT has included Distribution Providers (DP) as an applicable entity under this standard. The team realizes that not all DPs will own BES Facilities and will not meet the "Threshold for Reporting" for any event listed in Attachment 1. These DPs will not have any reports to submit under Requirement R2. However, these DPs will be responsible for meeting Requirements R1 and R3. The DSR SDT does not intend for these entities to have a detailed Operating Plan to address events that are not applicable to them. In this instance, the DSR SDT intends for the DP to have a very simple Operating Plan that includes a statement that there are no applicable events in Attachment 1 (to meet R1) and that the DP will review the list of events in Attachment 1 each year (to meet R3). The team does not think this will be a burden on any entity as the development and annual validation of the Operating Plan should not take more that 30 minutes on an annual basis. If a DP discovers applicable events during the annual review, it is expected that the DP will develop a more detailed Operating Plan to comply with the requirements of the standard.

Multiple Reports for a Single Organization

For entities that have multiple registrations, the DSR SDT intends that these entities will only have to submit one report for any individual event. For example, if an entity is registered as a Reliability Coordinator, Balancing Authority and Transmission Operator, the entity would only submit one report for a particular event rather submitting three reports as each individual registered entity.

Summary of Key Concepts

The DSR SDT identified the following principles to assist them in developing the standard:

- Develop a single form to report disturbances and events that threaten the reliability of the Bulk Electric System
- Investigate other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements
- Establish clear criteria for reporting
- Establish consistent reporting timelines
- Provide clarity around who will receive the information and how it will be used

During the development of concepts, the DSR SDT considered the FERC directive to "further define sabotage". There was concern among stakeholders that a definition may be ambiguous and subject to interpretation. Consequently, the DSR SDT decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was sabotage or vandalism without the intervention of law enforcement. The DSR SDT felt that attempting to define sabotage would result in further ambiguity with respect to reporting events. The term “sabotage” is no longer included in the standard. The events listed in EOP-004 Attachment 1 were developed to provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive.

The types of events that are required to be reported are contained within EOP-004 Attachment 1. The DSR SDT has coordinated with the NERC Events Analysis Working Group to develop the list of events that are to be reported under this standard. EOP-004 Attachment 1 pertains to those actions or events that have impacted the Bulk Electric System. These events were previously reported under EOP-004-1, CIP-001-1 or the Department of Energy form OE-417. EOP-004 Attachment 1 covers similar items that may have had an impact on the Bulk Electric System or has the potential to have an impact and should be reported.

The DSR SDT wishes to make clear that the proposed Standard does not include any real-time operating notifications for the events listed in EOP-004 Attachment 1. Real-time communication is achieved is covered in other standards. The proposed standard deals exclusively with after-the-fact reporting.

Data Gathering

The requirements of EOP-004-1 require that entities “promptly analyze Bulk Electric System disturbances on its system or facilities” (Requirement R2). The requirements of EOP-004-2 specify that certain types of events are to be reported but do not include provisions to analyze events. Events reported under EOP-004-2 may trigger further scrutiny by the ERO Events Analysis Program. If warranted, the Events Analysis Program personnel may request that more data for certain events be provided by the reporting entity or other entities that may have experienced the event. Entities are encouraged to become familiar with the Events Analysis Program and the NERC Rules of Procedure to learn more about with the expectations of the program.

Law Enforcement Reporting

The reliability objective of EOP-004-2 is to improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of Bulk Electric System from malicious physical attack. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES.

Stakeholders in the Reporting Process

- Industry

- NERC (ERO), Regional Entity
- FERC
- DOE
- NRC
- DHS – Federal
- Homeland Security- State
- State Regulators
- Local Law Enforcement
- State or Provincial Law Enforcement
- FBI
- Royal Canadian Mounted Police (RCMP)

The above stakeholders have an interest in the timely notification, communication and response to an incident at a Facility. The stakeholders have various levels of accountability and have a vested interest in the protection and response to ensure the reliability of the BES.

Present expectations of the industry under CIP-001-1a:

It has been the understanding by industry participants that an occurrence of sabotage has to be reported to the FBI. The FBI has the jurisdictional requirements to investigate acts of sabotage and terrorism. The CIP-001-1-1a standard requires a liaison relationship on behalf of the industry and the FBI or RCMP. These requirements, under the standard, of the industry have not been clear and have lead to misunderstandings and confusion in the industry as to how to demonstrate that the liaison is in place and effective. As an example of proof of compliance with Requirement R4, Responsible Entities have asked FBI Office personnel to provide, on FBI letterhead, confirmation of the existence of a working relationship to report acts of sabotage, the number of years the liaison relationship has been in existence, and the validity of the telephone numbers for the FBI.

Coordination of Local and State Law Enforcement Agencies with the FBI

The Joint Terrorism Task Force (JTTF) came into being with the first task force being established in 1980. JTTFs are small cells of highly trained, locally based, committed investigators, analysts, linguists, SWAT experts, and other specialists from dozens of U.S. law enforcement and intelligence agencies. The JTTF is a multi-agency effort led by the Justice Department and FBI designed to combine the resources of federal, state, and local law enforcement. Coordination and communications largely through the interagency National Joint Terrorism Task Force, working out of FBI Headquarters, which makes sure that information and intelligence flows freely among the local JTTFs. This information flow can be most beneficial to the industry in analytical intelligence, incident response and investigation. Historically, the most immediate response to an industry incident has been local and state law enforcement agencies to suspected vandalism and criminal damages at industry facilities. Relying upon the JTTF coordination between local, state and FBI law enforcement would be beneficial to effective communications and the appropriate level of investigative response.

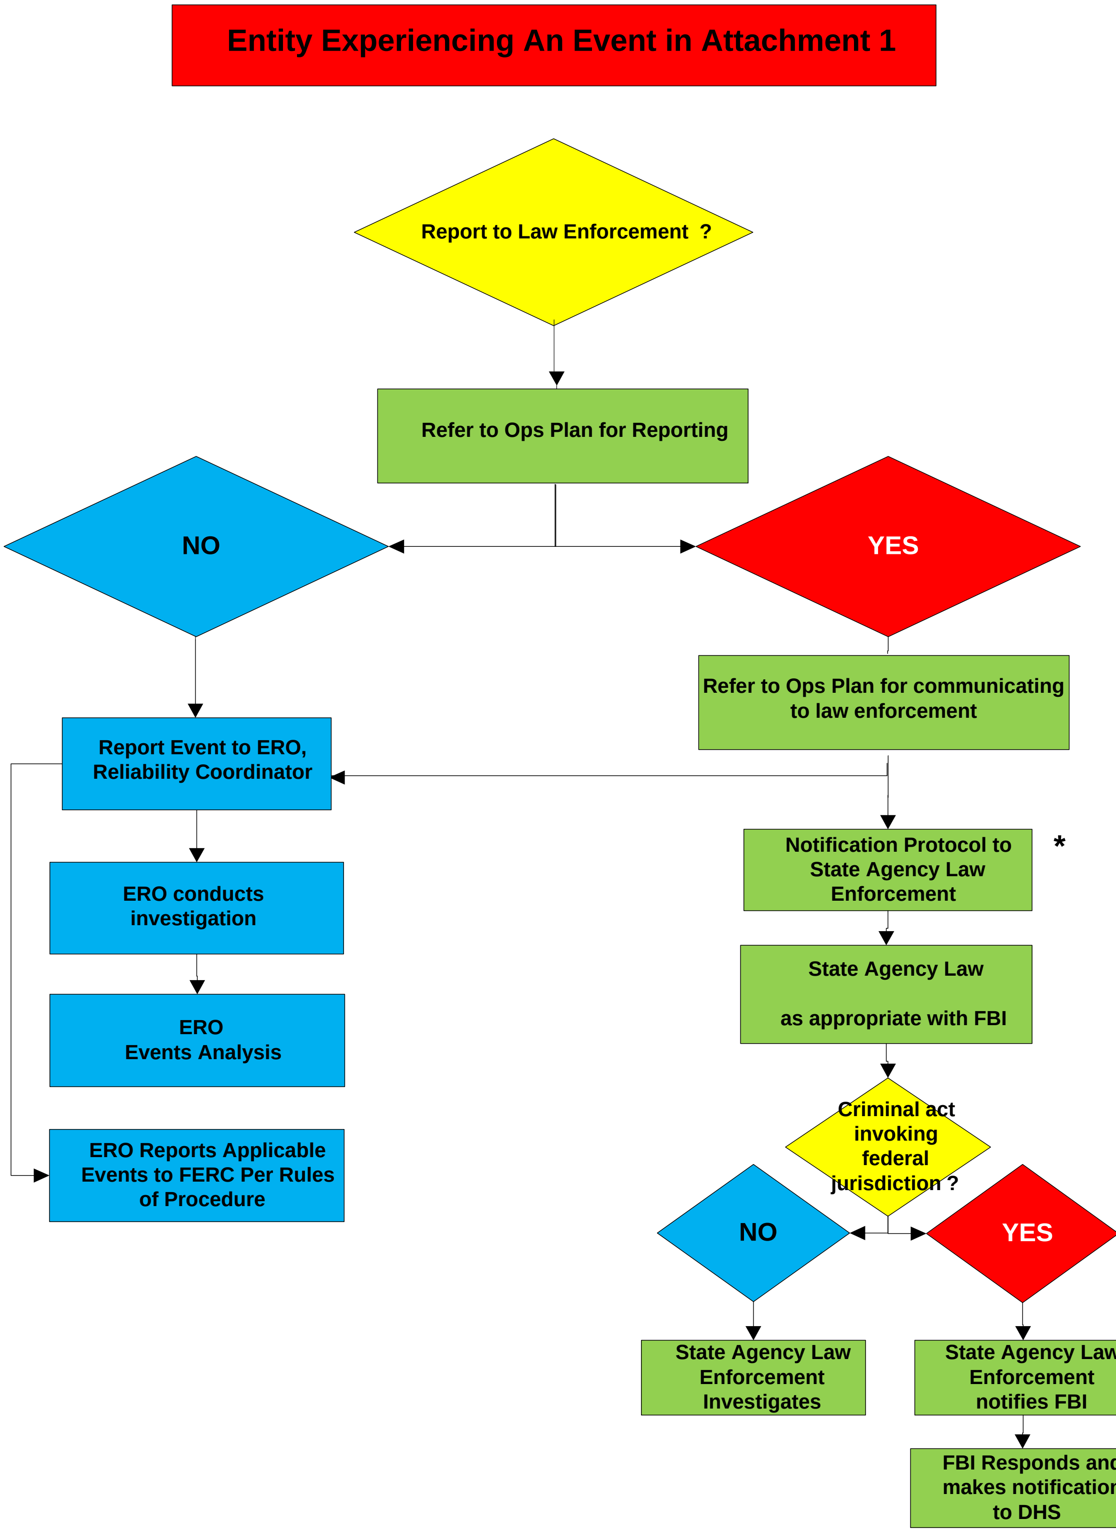
Coordination of Local and Provincial Law Enforcement Agencies with the RCMP

A similar law enforcement coordination hierarchy exists in Canada. Local and Provincial law enforcement coordinate to investigate suspected acts of vandalism and sabotage. The Provincial law enforcement agency has a reporting relationship with the Royal Canadian Mounted Police (RCMP).

A Reporting Process Solution – EOP-004

A proposal discussed with the FBI, FERC Staff, NERC Standards Project Coordinator and the SDT Chair is reflected in the flowchart below (Reporting Hierarchy for Reportable Events). Essentially, reporting an event to law enforcement agencies will only require the industry to notify the state or provincial or local level law enforcement agency. The state or provincial or local level law enforcement agency will coordinate with law enforcement with jurisdiction to investigate. If the state or provincial or local level law enforcement agency decides federal agency law enforcement or the RCMP should respond and investigate, the state or provincial or local level law enforcement agency will notify and coordinate with the FBI or the RCMP.

Example of Reporting Process including Law Enforcement



* Canadian entities will follow law enforcement protocols applicable in their jurisdictions

Disturbance and Sabotage Reporting Standard Drafting Team (Project 2009-01) - Reporting Concepts

Introduction

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009 and has developed updated standards based on the SAR.

The standards listed under the SAR are:

- CIP-001 — Sabotage Reporting
- EOP-004 — Disturbance Reporting

The changes do not include any real-time operating notifications for the types of events covered by CIP-001 and EOP-004. The real-time reporting requirements are achieved through the RCIS and are covered in other standards (e.g. EOP-002-Capacity and Energy Emergencies). These standards deal exclusively with after-the-fact reporting.

The DSR SDT has consolidated disturbance and sabotage event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

Summary of Concepts and Assumptions:

The Standard:

- Requires reporting of "events" that impact or may impact the reliability of the Bulk Electric System
- Provides clear criteria for reporting
- Includes consistent reporting timelines
- Identifies appropriate applicability, including a reporting hierarchy in the case of disturbance reporting
- Provides clarity around of who will receive the information

Discussion of Disturbance Reporting

Disturbance reporting requirements existed in the previous version of EOP-004. The current approved definition of Disturbance from the NERC Glossary of Terms is:

1. An unplanned event that produces an abnormal system condition.
2. Any perturbation to the electric system.

3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.

Disturbance reporting requirements and criteria were in the previous EOP-004 standard and its attachments. The DSR SDT discussed the reliability needs for disturbance reporting and developed the list of events that are to be reported under this standard (EOP-004 Attachment 1).

Discussion of Event Reporting

There are situations worthy of reporting because they have the potential to impact reliability.

Event reporting facilitates industry awareness, which allows potentially impacted parties to prepare for and possibly mitigate any associated reliability risk. It also provides the raw material, in the case of certain potential reliability threats, to see emerging patterns.

Examples of such events include:

- Bolts removed from transmission line structures
- Train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center)
- Destruction of Bulk Electric System equipment

What about sabotage?

One thing became clear in the DSR SDT's discussion concerning sabotage: everyone has a different definition. The current standard CIP-001 elicited the following response from FERC in FERC Order 693, paragraph 471 which states in part: *". . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event."*

Often, the underlying reason for an event is unknown or cannot be confirmed. The DSR SDT believes that by reporting material risks to the Bulk Electric System using the event categorization in this standard, it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.

Certain types of events should be reported to NERC, the Department of Homeland Security (DHS), the Federal Bureau of Investigation (FBI), and/or Provincial or local law enforcement. Other types of events may have different reporting requirements. For example, an event that is related to copper theft may only need to be reported to the local law enforcement authorities.

Potential Uses of Reportable Information

Event analysis, correlation of data, and trend identification are a few potential uses for the information reported under this standard. The standard requires Functional entities to report the incidents and provide known information at the time of the report. Further data gathering necessary for event analysis is provided for under the Events Analysis Program and the NERC Rules of Procedure. Other entities (e.g. – NERC, Law Enforcement, etc) will be responsible for performing the analyses. The NERC Rules of Procedure (section 800) provide an overview of the responsibilities of the ERO in regards to analysis and dissemination of information for reliability. Jurisdictional agencies (which may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE) have other duties and responsibilities.

Collection of Reportable Information or "One stop shopping"

The DSR SDT recognizes that some regions require reporting of additional information beyond what is in EOP-004. The DSR SDT has updated the listing of reportable events in EOP-004 Attachment 1 based on discussions with jurisdictional agencies, NERC, Regional Entities and stakeholder input. There is a possibility that regional differences still exist.

The reporting required by this standard is intended to meet the uses and purposes of NERC. The DSR SDT recognizes that other requirements for reporting exist (e.g., DOE-417 reporting), which may duplicate or overlap the information required by NERC. To the extent that other reporting is required, the DSR SDT envisions that duplicate entry of information should not be necessary, and the submission of the alternate report will be acceptable to NERC so long as all information required by NERC is submitted. For example, if the NERC Report duplicates information from the DOE form, the DOE report may be sent to the NERC in lieu of entering that information on the NERC report.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

The requirement to have an Operating Plan for reporting specific types of events provides the entity with a method to have its operating personnel recognize events that affect reliability and to be able to report them to appropriate parties; e.g., Regional Entities, applicable Reliability Coordinators, and law enforcement and other jurisdictional agencies when so recognized. In addition, these event reports are an input to the NERC Events Analysis Program. These other parties use this information to promote reliability, develop a culture of reliability excellence, provide industry collaboration and promote a learning organization.

Every Registered Entity that owns or operates elements or devices on the grid has a formal or informal process, procedure, or steps it takes to gather information regarding what happened when events occur. This requirement has the Responsible Entity establish documentation on

how that procedure, process, or plan is organized. This documentation may be a single document or a combination of various documents that achieve the reliability objective.
The communication protocol(s) could include a process flowchart, identification of internal and external personnel or entities to be notified, or a list of personnel by name and their associated contact information. An existing procedure that meets the requirements of CIP-001-2a may be included in this Operating Plan along with other processes, procedures or plans to meet this requirement.

Rationale for R2:
Each Responsible Entity must report and communicate events according to its Operating Plan based on the information in EOP-004-2 Attachment 1. By implementing the event reporting Operating Plan the Responsible Entity will assure situational awareness to the Electric Reliability Organization so that they may develop trends and prepare for a possible next event and mitigate the current event. This will assure that the BES remains secure and stable by mitigation actions that the Responsible Entity has within its function. By communicating events per the Operating Plan, the Responsible Entity will assure that people/agencies are aware of the current situation and they may prepare to mitigate current and further events.

Rationale for R3:
Requirement 3 calls for the Responsible Entity to validate the contact information contained in the Operating Plan each calendar year. This requirement helps ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization. If an entity experiences an actual event, communication evidence from the event may be used to show compliance with the validation requirement for the specific contacts used for the event.

Rationale for EOP-004 Attachment 1:
The DSR SDT used the defined term "Facility" to add clarity for several events listed in Attachment 1. A Facility is defined as:

> "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)"

The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.

Effective Dates
In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is six months after applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Retirements

EOP-004-1 – Disturbance Reporting and CIP-001-2a – Sabotage Reporting should be retired at midnight of the day immediately prior to the Effective Date of EOP-004-2 in the particular jurisdiction in which the new standard is becoming effective.

Exhibit D

Consideration of Comments

Project 2009-01
Disturbance and Sabotage Reporting

Related Files

Status:
Adopted by the Board of Trustees on November 6, 2012, pending regulatory approval.

Background:
This project will entail revision to the following existing standards:

- CIP-001-1 – Sabotage Reporting
- EOP-004-1 – Disturbance Reporting

Stakeholders have indicated that identifying potential acts of “sabotage” is difficult to do in real time, and additional clarity is needed to identify thresholds for reporting potential acts of sabotage in CIP-001-1. Stakeholders have also reported that EOP-004-1 has some requirements that reference out-of-date Department of Energy forms, making the requirements ambiguous. EOP-004-1 also has some ‘fill-in-the-blank’ components to eliminate.

The project will include addressing previously identified stakeholder concerns and FERC directives; will bring the standards into conformance with the latest approved version of the ERO Rules of Procedure; and may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Consideration of Comments on Project 2009-01 — SAR for Disturbance and Sabotage Reporting

The Disturbance and Sabotage Reporting SAR Drafting Team (DSR SAR DT) thanks all commenters who submitted comments on the first draft SAR. The SAR was posted for a 30-day public comment period from April 22, 2009 through May 21, 2009. The stakeholders were asked to provide feedback on the documents through a special Electronic Comment Form. There were 40 sets of comments, including comments from more than 120 different people from over 60 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

The majority of stakeholders agree that there is a reliability related need to support modifying CIP-001-1 and EOP-004-1. Of those stakeholders providing comments, they predominantly agreed with the reliability-related reason for the SAR but offered the following concerns:

1) Concerns with applicability of the requirements: The SAR DT notes that applicability will be determined by the final requirements that are written for the standard.
2) Concerns on combining the standards: The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting team to make this determination through the Standard Development Process (with stakeholder input).
3) Concerns with the definition of sabotage and the inclusion of vandalism, thresholds for defining sabotage, etc.
4) Concerns on onerous or duplicative reporting: The Brief Description section of the SAR states "Specific references to the DOE form need to be eliminated". This should address its concerns.

The SAR DT does not feel that the SAR should be revised based on these comments. The SAR DT will forward these comments to the Standard Drafting Team for its consideration in the drafting of the standards.

The majority of stakeholders agree with the scope of the SAR. Several stakeholders offered suggestions for items to include in the SAR, however the SAR DT believes that these comments may be too prescriptive to include with the SAR. The team feels that inclusion of these types of comments would prevent the Standard Drafting Team from having the ability to develop standard(s) based on stakeholder consensus. The SAR DT will forward these comments to the Standard Drafting Team for its consideration. Some of the comments received include:

1) The inclusion of specific definitions in the SAR (operating personnel, sabotage events, obligations): The SAR DT believes that this would be too prescriptive and believe that this should be addressed by the Standard Drafting Team.
2) Consolidate documents covering reporting requirements: The SAR DT agrees and suggests that the Standard Drafting Team investigate a "one-stop-shopping" solution for the various reports required, including the DOE report.

Stakeholders did not identify any associated business practices for consideration under the SAR. One stakeholder identified a related standard that references multi-site sabotage. The team has included a reference to TOP-005, section 2.9 (Appendix 1) in the SAR under Related Standards. Two stakeholders suggested that Business Practices should not be considered in a standard. The SAR DT notes that standard development projects must not invalidate business practices that are already in place and aids in coordination with North American Energy Standards Board (NAESB).

Many stakeholders had comments regarding applicability of the two standards. Based on these comments, the SAR DT has added Transmission Owner, Generator Owner and Distribution Provider to the Applicability section of the SAR as *possible* entities in the standard(s) developed under this SAR as the Standard Drafting team may have a need to include them in the standard(s). The applicability of Load-Serving Entity or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process. The three main comments were:

1) Regional Reliability Organization applicability: Several commenters do not feel the RRO should be in the standards. The DSR SAR DT concurs and notes that the SAR states that "EOP-004 has some 'fill-in-the-blank' components to eliminate". This will remove the RRO from applicability.
2) Load-Serving Entity/Distribution Provider: Several stakeholders do not feel that the standards should be applicable to LSEs, but should apply to Distribution Providers. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process.
3) Transmission Owner/Generator Owner: Several stakeholders have indicated a need to include the TO as an applicable entity. A couple of those would also include the GO. The SAR DT discussed the addition of the TO and GO. The team has a concern that there may be duplication of requirements between the TO/TOP and GO/GOP if the TO and GO are added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process.

Stakeholders provided many good comments that should be considered in the development of the standards under this project. The SAR DT does not believe that these comments require any significant revisions to the SAR, but will forward these comments to the Standard Drafting Team for its consideration in drafting the standard(s). The comments include:

1) Consolidation of reports: The SAR DT agrees with this concept and will forward the comment to the Standard Drafting Team for its consideration.
2) Concerns about pre-determination of combining CIP-001 and EOP-004 into one standard: The SAR states: CIP-001 may be merged with EOP-004 to eliminate redundancies. The two standards may be left separate.

3) Reporting criteria in multiple tables: The team agrees that it would be easier if there were only one table. Part of this scope of this project is to eliminate redundancies and make general improvements to the standard. The team also agrees that the requirements developed should be clear in their reliability objective.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. Do you agree that there is a reliability-related reason to support modifying CIP-001-1 and EOP-004-1? If not, please explain in the comment area.

Summary Consideration: The majority of stakeholders agree that there is a reliability related need to support modifying CIP-001-1 and EOP-004-1. Of those stakeholders providing comments, they predominantly agreed with the reliability-related reason for the SAR but offered the following concerns:

1) Applicability of the requirements: The SAR DT notes that applicability will be determined by the final requirements that are written for the standard.

2) Combining the standards: The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting team to make this determination through the Standard Development Process (with stakeholder input).

3) Definition of sabotage and the inclusion of vandalism, thresholds for defining sabotage, etc.

4) Onerous or duplicative reporting: The Brief Description section of the SAR states "Specific references to the DOE form need to be eliminated". This should address any concerns.

The SAR DT will forward these comments to the Standard Drafting Team for its consideration in the drafting of the standards.

Organization	Yes or No	Question 1 Comment
SERC OC Standards Review Group	No	The EOP-004-1 standard is an unnecessary duplication of existing DOE reporting requirements. This essentially exposes an entity to fines by NERC, enforced by FERC, for failure to comply with a DOE regulation, which seems improper to us. In addition, reporting requirements do not have an impact on the reliability of the BES
Response: The DSR SAR DT thanks you for your comment. The Brief Description section of the SAR states "Specific references to the DOE form need to be eliminated".		
MidAmerican Energy	No	MidAmerican Energy believes only EOP-004-1 is confusing and needs to modified or clarified. There is no need to combine the two standards. Standard EOP-004 could be clarified to eliminate references to sabotage which are already covered by CIP-001-1. Standard EOP-004 should be strictly limited to system events, not sabotage.
Response: The DSR SAR DT thanks you for your comment. The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting Team to make this determination through the Standard Development Process (with stakeholder input).		

Organization	Yes or No	Question 1 Comment
Bonneville Power Administration	No	Eliminating a single standard by consolidating two standards does not improve reliability. All of the defined actions are indeed being taken now.
Response: The DSR SAR DT thanks you for your comment. The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting team to make this determination through the Standard Development Process (with stakeholder input).		
Progress Energy	No	No. It is not clear that the issues listed in a revised standard will improve reliability. Revision based on redundancy is not sufficient reason for combination. Extensive documentation efforts have been made to comply with the current Standards. Unless combining these Standards provides compelling Reliability benefit, it is not worth the industry's resources to revise existing documentation and processes for the sake of eliminating redundancy. Redundancy issues were raised prior to the ERO adopting the initial Standard set into law. We have noted the other issues raised in the SAR, however, it is still unclear where the Reliability benefit of this SAR is evidenced.
Response: The DSR SAR DT thanks you for your comment. Industry consensus indicates that eliminating redundancy between standards is required to avoid potential double jeopardy issues with compliance to the standards. Furthermore, one of the FERC Order 693 directives for CIP-001 is: **Explore ways to reduce redundant reporting, including central coordination of sabotage reports and a uniform reporting format.**		
Kansas City Power & Light	Yes	Agree with the SAR that clarity would be helpful in establishing criteria regarding what constitutes sabotage reporting.
Response: The DSR SAR DT thanks you for your comment. One of the FERC Order 693 directives for CIP-001 is: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.**		
Pepco Holdings, Inc. - Affiliates	Yes	PHI recommends merging these two standards into one.
Response: The DSR SAR DT thanks you for your comment. The SAR DT notes that the Purpose of the SAR indicates that the standards *may* be merged to eliminate redundancy and provide clarity. It will be up to the Standard Drafting team to make this determination through the Standard Development Process (with stakeholder input).		
Electric Market Policy	Yes	Comments: Agree with the statement that sabotage is hard to determine in real time by operations staffs. The determination of sabotage should be left up to law enforcement. They have the knowledge and peer contacts needed to adequately determine whether physical or cyber intrusions are merely malicious acts or coordinated efforts (sabotage).

Organization	Yes or No	Question 1 Comment
		The operators should only be required to report physical and cyber intrusions to law enforcement. All other reporting requirements should apply to law enforcement once a determination of sabotage has been made. If the recommendations above are not to be accepted, then we have the following comments: CIP-001-1 1) R1 states entities shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SAR notes that the industry objects to the multi-site requirement, most likely because the term is ambiguous. If this term remains in the standard, it needs to be clearly defined and responsibilities for obtaining (how do you get this information and from whom?) and distributing need to be included. 2) R1 audits have shown confusion over the requirement to make operating personnel aware of sabotage events. The term operating personnel needs to be defined. Are they the individuals responsible for operating the facility, coordinating with other entities (i.e., RC, BA, TOP, GOP, and LSE)? It has been suggested that notification is required to all personnel at a facility. Keep in mind the purpose of the standard is to ensure sabotage events are properly reported, not to address emergency response. 3) R1 The SAR (NERC Audit and Observation Team) notes that Registered Entities have processes and procedures in place, but not all personnel have been trained. There is no specific training requirement in the standard. 4) R2 & R3 I agree with the SAR that sabotage needs to be defined and these requirements should be more specific with respect to the information to be communicated. It seems to me that the standard should mirror the criteria contained in DOE OE-417. The emphasis should be placed on ensuring that the same information communicated to DOE is shared with the appropriate parties in the Interconnection. 5) R4 I agree with the SAR (NERC Audit and Observation Team) comments regarding the intention of this requirement. There is no language that directs contact with FBI or RCMP although that is what is implied by the Purpose statement. 6) VRF Comments I'm not sure what is intended by the statement Adequate procedures will insure it is unlikely to lead to bulk electric system instability, separation, or cascading failures? The purpose of the standard is that of communication. No operational decisions or actions are directed by this standard, nor does it require entities to address operational aspects resulting from sabotage. 7) The potential exists for overlapping sabotage reporting requirements at nuclear power plants due to multiple regulators (Nuclear Regulatory Commission (NRC) 10 CFR 73 and Federal Energy Regulatory Commission (FERC) NUC-001-1). Some entities may have revised existing NRC driven procedures to accommodate reporting requirements of both regulators. Because of the restrictions placed on NRC driven documents (i.e., procedures are classified as safeguards information), it can be difficult to demonstrate compliance to NERC and/or FERC without ensuring that the individuals are qualified for receipt of such information per 10 CFR 73. Additionally, multiple procedures may have the unintended consequence of delaying appropriate communication.EOP-004-1Consider removing Attachment 2 as the information is

Organization	Yes or No	Question 1 Comment
		duplicated in DOE Form OE-417. A simple reference to the form should suffice.
Response: The DSR SAR DT thanks you for your comment. The team notes that your comments relate directly to potential revisions of the standard requirements. The team will pass your comments along to the Standards Drafting Team for its consideration. For item 4, one of the FERC Order 693 directives for CIP-001 is: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.**		
Lands Energy Consulting	Yes	I have worked with 5 Northwest public utilities on developing procedures related to CIP-001-1 and EOP-004-1. All 5 utilities operate electric systems in fairly remote locations and are embedded in a larger utility's Balancing Authority/Transmission Operator area. A. CIP-001-1 - Developing procedures to unambiguously identify acts of sabotage has been particularly challenging for these systems. In general, it's hard for them to determine whether the most prevalent forms of malicious and intentional system damage that they incur - copper theft and gun shot insulators/equipment - should qualify as acts of sabotage. Although none of the systems consider copper theft to be acts of sabotage, two of the systems consider gun shot insulators/equipment to be acts of sabotage. The other systems look for intent to disrupt electric system operations as a key component of their sabotage identification procedures. Additional guidance from NERC in the form of CIP-001-1 modifications or a companion guidelines document on sabotage identification would provide much needed guidance for these procedures. B. EOP-004-1 - This standard was clearly drafted with the larger electric systems in mind. I have one client that serves 3300 commercial/residential customers from 4-115/13 kV substation transformers and one large industrial customer (80% of its energy load) from a 230/13 kV substation. 75% of the client's load is served from three substations attached to a long, 115 kV transmission line operated by the Bonneville Power Administration. Whenever the line relays open on a permanent fault (which happens 2-3 times per year), the client loses over 50% of its customers (but no more than 10-15 MW during winter peak), thereby necessitating the preparation of a Disturbance Report. To allow utilities to concentrate on operating their systems, without fear of violating EOP-004-1 for failure to report trivial outages, I would remove LSEs from the obligation to report disturbances - leave the reporting to the BA/TOP for large outages in their footprint.
Response: The DSR SAR DT thanks you for your comment. **A. The team notes that your comments relate directly to potential revisions of the standard requirements. The team will pass your comments along to the Standards Drafting Team for its consideration.** **B. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process. The team**		

Organization	Yes or No	Question 1 Comment
will pass your comments along to the Standards Drafting Team for its consideration.		
Calpine Corporation	Yes	Communication of facility status or emergencies between merchant generators registered as GOP and the RC, BA, GOP, or LSE in which the facility resides should be coordinated for EOP -004 reporting. The reporting to NERC/DOE should come from the RC, BA, GOP, or LSE.
Response: The DSR SAR DT thanks you for your comment. The team concurs that reporting should be coordinated and will pass your comments along to the Standards Drafting Team for its consideration.		
Covanta	Yes	Yes - the key to Sabotage reporting requirements is identifying what the 'definition' is of an actual or potential 'Sabotage' event. Like any other standard, if FERC/NERC leave it up to 2000+ entities to establish their own definitions of 'Sabotage', you may likely get 2000+ answers. That is not a controlled and coordinated approach. I offer the following definition, "Sabotage - Deliberate or malicious destruction of property, obstruction of normal operations, or injury to personnel by outside agents." Examples of sabotage events could include, but are not limited to, suspicious packages left near site electrical generating or electrical transmission assets, identified destruction of generating assets, telephone/e mail received threats to destroy or interrupt electrical generating efforts, etc." These have passed multiple NERC regional audits and reviews to date.
Response: The DSR SAR DT thanks you for your comment. One of the FERC Order 693 directives for CIP-001 is: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.** **The team will pass your comments along to the Standards Drafting Team for its consideration.**		
Cowlitz County PUD	Yes	The standards as written now create reporting on local customer quality of service outage events not related to BPS disturbances. Sabotage reporting has degenerated into reporting of mischievous vandalism and minor theft occurences. This creates compliance documentation overburden and waste of limited funds needed for true BPS reliability concerns, and also adds nuisance calls to the FBI and Homeland Security.
Response: The DSR SAR DT thanks you for your comment. One of the FERC Order 693 directives for CIP-001 is: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.** **This should address the concern of sabotage vs. vandalism/theft reporting.**		
Reliant Energy	Yes	EOP-004-1 indicates that Generators should analyze disturbances on the bulk electrical system or their facilities. Generators do not have the capability of analyzing the bulk electrical system other than Frequency. Even so, generators can not unilaterally respond to what it thinks are disturbances. In the case of CAISO The Participating Generator

Organization	Yes or No	Question 1 Comment
		Agreement prevents me from making any unilateral moves save for the direst frequency emergencies. If the System operator or Reliability Coordinator informs the generator that there is a disturbance and that logs and readouts etc. are required then the generator should respond with all available information for the subject hours or time. Clearer responsibilities provide clearer results.
Response: The DSR SAR DT thanks you for your comment. While the team agrees that generators may not have the capability to analyze events, the team note that you concern is regarding applicability of requirements. The final wording of the requirements developed by the Standard Drafting Team will determine the applicability.		
Georgia System Operations Corp.	Yes	There is a need to eliminate burdensome reporting deadlines which interfere with the reliable operations or recovery of the BES. There is also a need to move requirements for reporting to NERC or Regional Entities (except for reporting of threats to physical or cyber security) from the Requirements section of Reliability Standards to elsewhere.
Response: The DSR SAR DT thanks you for your comment. Specific revisions to the requirements will be vetted during the standard development process.		
Illinois Municipal Electric Agency	Yes	Simplification of reporting requirements should facilitate reliability.
Response: The DSR SAR DT thanks you for your comment.		
Duke Energy	Yes	We agree that additional clarity is needed regarding sabotage and disturbance reporting. Requirements should be tightened up and triggering events/thresholds of materiality need to be better defined.
Response: The DSR SAR DT thanks you for your comment. One of the FERC Order 693 directives for this project is: Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.

2. Do you agree with the scope of the proposed SAR? If not, please explain what should be added or deleted to the proposed scope.

Summary Consideration: The majority of stakeholders agree with the scope of the SAR. Several stakeholders offered suggestions for items to include in the SAR, however the SAR DT believes that these comments may be too prescriptive to include with the SAR. The team feels that inclusion of these types of comments would prevent the Standard Drafting Team from having the ability to develop standard(s) based on stakeholder consensus. The SAR DT will forward these comments to the Standard Drafting Team for its consideration. Some of the comments received include:

1 The inclusion of specific definitions in the SAR (operating personnel, sabotage events, obligations): The SAR DT believes that this would be too prescriptive and believe that this should be addressed by the Standard Drafting Team.

2 Consolidate documents covering reporting requirements: The SAR DT agrees and suggests that the Standard Drafting Team investigate a "one-stop-shopping" solution for the various reports required, including the DOE report.

Organization	Yes or No	Question 2 Comment
Project 2007-02 Operating Personnel Comms Protocols SDT	No	The Operating Personnel Communication Protocols standard drafting team respectfully requests that the Sabotage Reporting SAR Drafting Team incorporate the following into your proposed SAR: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have procedures for the communication of information concerning the Cyber and Physical emergency alerts in accordance with the conditions described in "Attachment 1 Security Emergency Alerts." The Operating Personnel Communications Protocols Project 2007-02 was initiated to ensure that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The SDT developed a new COM-003-1 Standard that has yet to be posted and is dependent upon revising at least two other standards (CIP-001 and TOP Standard). COM-003 contains requirements that specify: 1. Use of three-part communication; 2. English language; 3. Common time zone; 4. NATO alpha-numeric alphabet; 5. Mutually agreed line identifiers; 6. The use of pre-defined system condition terminology such as those contained in the RCWG Alert Level Guide and EOP-002-2.

Organization	Yes or No	Question 2 Comment
		This request is based on recent NERC Standards Committee direction to our team to incorporate the Reliability Coordinator Working Group's (RCWG) Alert Level Guide into a Standard. The consensus of our team is that a TOP Standard is the most appropriate location for the Transmission Emergency Alert language from the Guide as the energy emergency alert language is currently described in EOP-002-2. The RCWG Guide proposes the se of pre-defined system condition descriptions for use during emergencies for reliability related formation. This guide was developed in response to a Blackout Report recommendation. Our team placed the Transmission Emergency Alert language into a TOP standard. Since the Sabotage Reporting SAR DT intends to modify CIP-001, we seek your consent to incorporate the cyber and physical security alert language to comply with the wishes of the Standards Committee. We believe that the CIP-001 Standard is the most appropriate location for this language for the following reasons: • The levels of emergency conditions related to the cyber and physical security of the electric system is directly related to Critical Infrastructure Protection. • The current version of CIP-001 already requires the timely reporting of actual and suspected security emergency conditions and the use of pre-defined terminology supports the efficient haring of such information. The OPCP SDT includes the following text for the record. It is a proposed draft revision of CIP-001. **A. Introduction** 1. Title: Security Incidents 2. Number: CIP-001-2 3. Purpose: To ensure the recognition, communication and response to cyber and physical security incidents suspected or determined to be caused by sabotage. 4. Applicability 4.1. Reliability Coordinators. 4.2. Balancing Authorities. 4.3. Transmission Operators. 4.4. Generator Operators. 4.5. Load Serving Entities. 5. Effective Date: The standard is effective the first day of the first calendar quarter after applicable regulatory approvals (or the standard otherwise becomes effective the first day of the first calendar quarter after NERC OT adoption in those jurisdictions where regulatory approval is not required).

Organization	Yes or No	Question 2 Comment
		B. Requirements R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of security threats on its facilities and multi site security threats affecting larger portions of the Interconnection. R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning the physical and cyber security status of their facilities in accordance with the conditions described in Attachment 1-CIP-001-1. R3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall provide its operating personnel with security threat or incident response guidelines, including personnel to contact, for reporting security threats and incidents. R4. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances. **C. Measures** M1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request a procedure (either electronic or hard copy) as defined in Requirement 1 M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request the procedures or guidelines that will be used to confirm that it meets Requirements 2 and 3. M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request evidence that could include, but is not limited o procedures, policies, a letter of understanding, communication records, or other equivalent evidence that will be used to confirm that it has established communications contacts with the applicable, local FBI or CMP officials to communicate sabotage events (Requirement 4). **D. Compliance** 1. Compliance Monitoring Process 1.1. Compliance Enforcement Authority Regional Entity 1.2. Compliance Monitoring Period and Reset One or more of the following methods will be used to verify compliance: - Compliance Audits

Organization	Yes or No	Question 2 Comment
		- Self-Certifications - Spot Checking - Compliance Violation Investigations - Self-Reporting - Complaints 1.3. Data Retention The Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: o The Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator and Distribution Provider shall retain its current, in force document and any documents in force since the last compliance audit. o If a Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant. o The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records. 1.4. Additional Compliance Information None. 2. Levels of Non-Compliance: 2.1. Level 1: There shall be a separate Level 1 non-compliance, for every one of the following requirements that is in violation: 2.1.1 Does not have procedures for the recognition of and for making its operating personnel aware of sabotage events (R1). 2.1.2 Does not have procedures or guidelines for the communication of information concerning sabotage events to appropriate parties in the Interconnection (R2). 2.1.3 Has not established communications contacts, as specified in R4. 2.2. Level 2: Not applicable.

Organization	Yes or No	Question 2 Comment
		2.3. Level 3: Has not provided its operating personnel with sabotage response procedures or guidelines (R3). 2.4. Level 4:.Not applicable. E. Regional Differences None. Version History Version Date Action Change Tracking 0 April 1, 2005 Effective Date New 0 August 8, 2005 Removed “Proposed” from Effective ate Errata 1 November 1, 2006 Adopted by Board of Trustees Amended 1 April 4, 2007 Regulatory approval — Effective Date New 2 March 2009 Added SEA attachment and updates to Effective Date and compliance sections. New **Attachment 1-CIP-001-2 Physical Security Emergency Alerts** General requirements 1. Initiation by Reliability Coordinator. A Physical Security Emergency Alert may be initiated only by a Reliability Coordinator at: a. The Reliability Coordinator’s own decision, b. By request from a Transmission Operator, c. By request from a Balancing Authority, or d. By request from federal, state, or cal Law Enforcement Officials. 2. Situations for initiating alert. An Alert may be initiated for the following reasons: a. A physical threat affecting a control center, grid or generator asset has been identified, or b. A physical attack affecting a control center, grid or generator asset has occurred or is imminent. 3. Notification. A Reliability Coordinator who initiates a Physical Security Emergency Alert shall notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify other Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) using the “CIP” category. Additionally, conference calls between Reliability Coordinators shall be held as necessary to communicate system conditions. The Reliability Coordinator shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area and other Reliability Coordinators hen the alert has changed levels or ended.

Organization	Yes or No	Question 2 Comment
		Physical Security Emergency Alert Levels To ensure that all Reliability Coordinators clearly understand potential and actual Physical Security Emergency Alerts, NERC as established three levels of Security Emergency Alerts. The Reliability Coordinators will use these terms hen explaining security alerts to each other. The Reliability Coordinator may declare whatever alert level is necessary, and need not proceed through the alerts sequentially. 1. Alert 1 – “Control Center / Bulk Electric system asset threat identified” Circumstances: A credible threat of physical attack on a Bulk Electric System asset has been communicated to the Reliability Coordinator. No physical attack has occurred at this point. Determining the credibility of any threat is a subjective process, but the following factors should be considered: a. The nature and specificity of the threat, b. The timing of the threat, c. Mode of threat communication, and d. The criticality of the threatened asset. During a Physical Security Emergency Alert Level 1, Reliability Coordinators, Transmission Operators and Balancing Authorities shall have the following responsibilities: i. Notification: The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The declaring Entity shall update the reliability Coordinator of any changes in the situation until the Alert Level 1 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 2. Alert 2 – “Verified Physical attack at a single site” circumstances: A Reliability Coordinator, Transmission Operator, or Balancing Authority has identified a physical attack upon a control center, generator asset, or other bulk electric system asset. During a Physical Security Emergency Alert Level 2, Reliability Coordinators, Transmission Operators and Balancing Authorities shall have the following responsibilities: i. Notification: The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The Declaring Entity shall update the Reliability Coordinator of the situation a minimum of once per hour until the Alert Level 2 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 3. Alert 3– “Verified Physical attack at multiple sites” Circumstances: Multiple attacks have been confirmed on control centers, generator assets or other bulk electric system assets. A Reliability Coordinator shall declare Physical Security

Organization	Yes or No	Question 2 Comment
		Emergency Alert 3 whenever: a. A Transmission Operator or Balancing Authority reports multiple physical attacks on bulk electric system assets, b. Multiple Transmission Operators or Balancing authorities report one or more physical attacks on their bulk electric system assets. i. Notification: The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP” and notify all Transmission Operators and Balancing Authorities in its Reliability Area. ii. Updating Status during the Physical Security Emergency Alert The declaring Entity(ies) shall update the Reliability Coordinator of the situation a minimum of once per hour until the Alert Level 3 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 4. Alert 0 – “Termination of Alert Level” Circumstances: The threat which prompted the Physical Security Emergency Alert Level has diminished or has been removed. i. Notification The Reliability Coordinator responsible for initiating the Physical Security Emergency Alert shall notify all other Reliability Coordinators via the RCIS, and it shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area that the Alert Level has been terminated. Cyber Security Emergency Alerts Cyber Assets – Those programmable electronic devices and communication networks, including hardware, software, and data, associated with bulk electric system assets. Cyber Security Incident - Any malicious act or suspicious event that compromises, or attempts to compromise, the electronic or physical security perimeter of a critical cyber asset or disrupts or attempts to disrupt the operation of a critical cyber asset. Critical Cyber Asset – Those cyber assets essential to the reliable operation of critical assets. Electronic Security Perimeter – The logical border surrounding the network or group of sub-networks to which the critical cyber assets are connected, and for which access is controlled. Physical Security Perimeter – The physical border surrounding computer rooms, telecommunications rooms, operations centers and other locations in which critical cyber assets are housed and for which access is controlled. General Requirements 1. Initiation - A Cyber Security Emergency Alert shall be initiated by: a. The Reliability Coordinator’s analysis, b. By request from any NERC functional Model entity that Com-003-0 is applicable to.

Organization	Yes or No	Question 2 Comment
		c. By request from federal, state, or local Law Enforcement Officials. 2. Situations for initiating alert. An Alert shall be initiated for the following reasons: a. A cyber threat affecting a control center or bulk electric system asset has been identified, or b. A cyber attack affecting a control center or bulk electric system has occurred or is imminent. 3. Notification. An entity who initiates a Cyber Security Emergency Alert shall make notification as per the NERC Functional model or as Regional / local instruction. The Reliability Coordinator shall notify FBI local office, Electricity Sector Information Sharing Analysis Center ESISAC) and Department of Homeland Security. The Reliability Coordinator shall also notify as necessary other Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) sing the “CIP” category. The Reliability Coordinator shall notify all Transmission Operators and Balancing Authorities in its Reliability Area and other Reliability Coordinators when the alert has changed levels or ended. Cyber Security Emergency Alert Levels To ensure that all applicable entities clearly understand potential and actual Cyber Security Emergency Alerts, three levels of Security Emergency Alerts shall be sed. The Reliability Coordinators will use these terms when communicating security alerts to each other. When declaring the applicable alert level it is important to note that the applicable level can be determined without sequentially proceeding through levels. As an example given circumstances an Alert Level 3 could be called without previously being in an Alert Level 1 or Level 2 state. 1. Alert 1 – “Verified Control Center / Bulk Electric System Cyber Asset threat identified or imminent” What is “verified” - unknown or unauthorized access to a cyber device, unknown or unauthorized change to a cyber device (i,e., config file, /S, firmware change. ‘Verified’ could mean the elimination of a false positive in your security monitoring system. ‘Verified’ could also be the differentiation between malicious and non-malicious (ie human error, not following policy, etc) intent. What is a “threat” - A threat can be perceived as any action or event that occurs where the monitoring authority was not previously made aware that that action would occur. With flimsy change control or access controls, field staff or technical staff performing troubleshooting or other maintenance may access or change devices without notifying the monitoring entity. The monitoring entity would have to treat this as a threat and take appropriate action to either isolate that device from the rest of the system, notify appropriate authority, dispatch a crew, etc. Examples of threats - Over and above the examples above, another threat example could be a notification from DHS or other security agency that they have reason to believe a hack, virus or other cyber terrorism activity could occur. Also, noticing a distinct change in network traffic which could imply someone has intercepted your data and can manipulate

Organization	Yes or No	Question 2 Comment
		before sending it from the control room to the device being controlled or manipulating the data coming from the device before a controller seeing it and forcing them to perform an incorrect control event in reaction to erroneous data. Circumstances: A credible threat of Cyber attack on a Control Center or Bulk Electric System asset has been communicated to the Reliability Coordinator. No cyber attack has occurred t this point. Determining the credibility of any threat is a subjective process, but the following factors should be considered: a. The nature and specificity of the threat, b. The timing of the threat, c. Mode of threat communication, and d. The criticality of the threatened asset. During a Cyber Security Emergency Alert Level 1, applicable entities shall have the following responsibilities: i. Notification An entity who initiates a Cyber Security Emergency Alert Level 1 shall make notification as per the NERC Functional model r as Regional / local instruction. The Reliability Coordinator shall post the declaration of the alert level long with the location of the affected facility on the RCIS under "CIP" and notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify as necessary the BI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity shall update those applicable entities of any changes in the situation until the Alert Level 1 is terminated. The Reliability Coordinator shall update the RCIS as changes occur. 2. Alert 2 – "Verified Cyber attack on a Control Center or Bulk Electric System asset" Circumstances: An applicable entity has identified a cyber attack upon a control center or bulk electric system asset. During a Cyber Security Emergency Alert Level 2, applicable entities shall have the following responsibilities: i. Notification An entity who initiates a Cyber Security Emergency Alert Level 2 shall make notification as per the NERC Functional model or as Regional / cal instruction. The Reliability Coordinator responsible shall post the declaration of the alert level along with the location of the affected facility on the RCIS under "CIP" and notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify the FBI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity shall provide updates of the situation a minimum of once per hour until the Alert Level 2 is terminated. The Reliability Coordinator shall update the RCIS as changes occur.

Organization	Yes or No	Question 2 Comment
		3. Alert 3 – "Verified Cyber attack at one or more Control Center or Bulk Electric System cyber asset" Circumstances: An applicable entity has identified a cyber attack upon a control center or bulk electric system asset and shall declare a Cyber Security Emergency Alert 3 whenever: a. A Transmission Operator or Balancing Authority reports one or more cyber attacks on bulk electric system that render an asset(s) unavailable. i. Notification An entity who initiates a Cyber Security Emergency Alert Level 3 shall make notification as per the NERC Functional model or as Regional / local instruction. The Reliability Coordinator shall post the declaration of the alert level along with the location of the affected facility on the RCIS under "CIP" and notify all Transmission Operators and Balancing Authorities its Reliability Area. The Reliability Coordinator shall also notify the FBI local office, Electricity Sector Information Sharing Analysis Center (ESISAC) and Department of Homeland Security. ii. Updating Status during the Cyber Security Emergency Alert The declaring Entity(ies) shall provide an update of the situation minimum of once per hour until the Alert Level 3 is terminated. The Reliability Coordinator shall update he RCIS as changes occur. 4. Alert 0 – "Termination of Alert Level" Circumstances: The threat which prompted the Cyber Security Emergency Alert Level has diminished or has been removed. i. Notification An entity who initiates a Cyber Security Emergency Alert shall make notification as per the NERC Functional model or as Regional / local instruction when situation has diminished or returned to normal. The Reliability Coordinator shall notify all other Reliability Coordinators via the RCIS, and it shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area that the Alert Level has been terminated.
Response: The DSR SAR DT thanks you for your comment. The standards in this Project 2009-01 SAR are designed to specify reporting requirements for disturbance and sabotage events. The DSR SAR DT believes that the suggested additions go beyond the intended scope of the revisions to the standards, and do not feel that communications protocols belong in these reporting standards. The proposed revisions and Alert Levels are real-time requirements, and the team feels that these would be more appropriately addressed in an IRO or COM standard.		
Northeast Power Coordinating Council	No	The SAR needs to be more specific in defining its objectives. CIP-001Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms "operating personnel" and "sabotage events." The definition of "operating personnel," should be clarified and limited to staff at BES facilities. Operating personnel should report only those events

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 2 Comment</th></tr>
<tr><td></td><td></td><td>which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term “sabotage event” needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined.

2. Define the obligations of Registered Entity operating personnel - who are required to be aware of such “sabotage events,” e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term “aware” in the standard. “Aware” can be interpreted in accordance with its largely passive, dictionary-based meaning, where being “aware” simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of “aware” could refer to more active wording, involving more than mere awareness, e.g., “alert and quick to respond,” pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies.

EOP-004 - The SDT needs to work on the following areas.

1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction “The entity on whose system a reportable disturbance occurs shall notify NERC ... 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance - The sense of Attachment 1 is internally inconsistent between the introduction (“occurs”) and the required actions in 6c (could have resulted in a system disturbance). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase “or could have resulted in” a potential system disturbance. This inconsistency should be clarified.</td></tr>
<tr><td colspan="3">Response: The DSR SAR DT thanks you for your comment.

CIP-001: The inclusion of specific definitions in the SAR as you suggest (operating personnel, sabotage events, obligations) are too prescriptive and could prevent better definitions from being developed during the Standards Development stage of the project. The team will pass your comments along to the standard drafting team for its consideration.

EOP-004: Your comment addresses specific revisions to the standard. The team will pass your comments along to the standard drafting team for its consideration.</td></tr>
<tr><td>Kansas City Power & Light</td><td>No</td><td>Agree with the scope of the SAR except for the applicable entities. See response to question #4.</td></tr>
<tr><td colspan="3">Response: The DSR SAR DT thanks you for your comment. Please see response to Q4.</td></tr>
</table>

Organization	Yes or No	Question 2 Comment
MRO NERC Standards Review Subcommittee	No	The MRO NSRS would like to keep the references to the DOE reporting form.
Response: The DSR SAR DT thanks you for your comment. The DSR SAR DT understands your comment to indicate that you would like to see a "one stop" reporting form for disturbances and sabotage events. The DSR SAR DT agrees with you and will pass this comment along to the standard drafting team for its consideration in developing the standard(s).		
Lands Energy Consulting	No	I would like to see the SAR expanded to cover the issues I mentioned in my prior comment. Otherwise, the scope of the SAR looks fine to me.
Response: The DSR SAR DT thanks you for your comment. Please see response to Q1 on other issues.		
Bonneville Power Administration	No	Leave as is, all requirements for reporting are now covered. A common definition of sabotage is already widely available.
Response: The DSR SAR DT thanks you for your comment. Most stakeholders desire more clarity around the definition of sabotage as well as examples of what is and is not sabotage as opposed to vandalism.		
Cowlitz County PUD	No	Added to the scope: For EOP-004 add a provision for a reporting flow rather than everything going to the RE and NERC. That is something going like the DP and TOP reports to the BA, the BA to the RE, and the RE to NERC. This would allow for multiple related reports to be combined into a single coherent report as the reporting goes up the chain. For CIP-001 consider reporting flow as above with local law enforcement notification. Let an upper entity in the reporting chain decide when to contact Federal Agencies such as the BA or the RC.
Response: The DSR SAR DT thanks you for your comment. The DSR SAR DT feels that your comments are "how" comments that should be addressed in standard drafting stage. The team will pass this comment along to the standard drafting team for its consideration.		
Reliant Energy	No	I think Generator operators should be excluded except to provide requested information from the System Operator or Reliability coordinator.
Response: The DSR SAR DT thanks you for your comment. Other commenters have questioned the ability of Generator Operators to have a wide area view and to be able to analyze disturbances on the system. The team agrees that generators may not have a wide area view and the capability to analyze system events. The final wording of the requirements (i.e. reporting vs. data provision) developed by the Standard Drafting Team will		

Organization	Yes or No	Question 2 Comment
determine the applicability to GOPs. The team will pass your comment on to the Standard Drafting Team for its consideration.		
ERCOT ISO	No	The scope should be modified to provide for a different treatment of reporting requirements that are administrative in nature, or that are after-the-fact (thus cannot impact reliability unless analysis and follow-up is not performed; even then, the impact would be at some future time). Reporting requirements which are of the nature to assist in identification of system concerns or which serve to prevent or mitigate on-going system problems (including, but not limited to, actual or attempted sabotage activity) should remain in standards, but should be separate and apart from the administrative reporting.
Response: The DSR SAR DT thanks you for your comment. The team concurs with the concepts on reporting as you suggest, however the team does not feel that this should be addressed in the SAR. The team suggests that this is more appropriately addressed in the standard drafting process, and the team will pass your comment along to the standard drafting team for its consideration in drafting the standard.		
MidAmerican Energy	No	See the responses to questions 1 and 5.
Response: The DSR SAR DT thanks you for your comment. Please see responses to Q1 and Q5.		
We Energies	No	Consider including the sabotage issues in IRO-014-1 R 1.1.1 footnote 1 and TOP-005-1 Attachment 1, 2.9.
Response: The DSR SAR DT thanks you for your comment. The team has added references to these two standards in the "Related Standards" section for the SAR.		
NextEra Energy Resources, LLC	No	The scope of the SAR should not include Generator Operators.
Response: The DSR SAR DT thanks you for your comment. Other commenters have questioned the ability of Generator Operators to have a wide area view and to be able to analyze disturbances on the system. The team agrees that generators may not have a wide area view and the capability to analyze system events. The final wording of the requirements (i.e. reporting vs. data provision) developed by the Standard Drafting Team will determine the applicability to GOPs. The team will pass your comment on to the Standards Drafting Team for its consideration.		
Progress Energy	No	No. If this SAR moves forward other standards may need to be considered. For example, in CIP-008, incident reporting for cyber incidents leads to filing of the OE-417 form.
Response: The DSR SAR DT thanks you for your comment. The SAR states "Specific references to the DOE form need to be eliminated." **This will remove the linkage that you identify between CIP-001 and CIP-008. There is also a directive from FERC Order 693 in the SAR that states:**		

Organization	Yes or No	Question 2 Comment
Consider FirstEnergy's suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality. **This allows the standard drafting team to delineate physical and cyber assets. The DSR SAR DT also notes that CIP-008 might be a good framework for drafting the standard requirements pertaining to sabotage and disturbance reporting of physical assets.**		
Ameren	No	There seems to be an open slate including the following language in the scope. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards (see tables for each standard at the end of this SAR for more detailed information). The unnamed improvements should be limited to those requirements that relate only to Disturbance and Sabotage NOT a general wish list (or witch hunt).
Response: The DSR SAR DT thanks you for your comment. The passage that you mention is the intent of each SAR and is a stock statement that is included in almost every SAR. The SAR is limited to the standards listed in the SAR which is approved by the NERC SC to move to standards development.		
Consolidated Edison Co. of New York, Inc.	No	GENERAL CECONY and ORU support the general objectives of the SAR to merge existing standards CIP-001-1 Sabotage Reporting and EOP-004-1 Disturbance Reporting to improve clarity and remove redundancy. However, the SAR needs to be more specific in defining its objectives. CIP-001Requirement R1 currently states: R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection. The SDT needs to include the following objectives: 1. Develop clear definitions for the terms operating personnel and sabotage events. The definition of operating personnel, should be clarified and limited to staff at BES facilities. Operating personnel should report only those events which meet a clear, recognizable threshold as reportable potential sabotage events. There should be a consistent continent-wide list of examples or typical reportable and non-reportable events to help guide operating personnel. The term sabotage event needs to be defined. Clarification is required regarding when the determination of a sabotage event is made, e.g., upon first observation (requiring operating personnel be educated in discerning sabotage events), or upon later investigation by trained security personnel and law enforcement individuals. The terms potential or suspected sabotage event for reporting purposes should be clarified or defined. 2. Define the obligations of Registered Entity operating personnel - who are required to be aware of such sabotage events, e.g., who, what, where, when, why and how, and what they are to do in response to this awareness. The SDT should clarify the use of the term aware in the standard. Aware can be interpreted in accordance with its largely passive, dictionary-

Organization	Yes or No	Question 2 Comment
		based meaning, where being aware simply means knowing about something, such as a sabotage event. Alternatively, the Reliability Standard meaning of aware could refer to more active wording, involving more than mere awareness, e.g., alert and quick to respond, pointing to and requiring a specific affirmative response, i.e., reporting to the appropriate systems, governmental agencies, and regulatory bodies. EOP-004 - The SDT needs to work on the following areas. 1. NERC reporting needs to be clarified. For example, Attachment 1 paragraph 6c states: Introduction The entity on whose system a reportable disturbance occurs shall notify NERC ... 6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in: ?c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance. The sense of Attachment 1 is internally inconsistent between the introduction (occurs) and the required actions in 6c (could have resulted in a system disturbance). The initial intent appears to be only to report actual system disturbances. Yet, paragraph 6c adds the phrase or could have resulted in a potential system disturbance. This inconsistency should be clarified.
Response: The DSR SAR DT thanks you for your comment. **CIP-001: The inclusion of specific definitions in the SAR as you suggest (operating personnel, sabotage events, obligations) are too prescriptive and could prevent better definitions from being developed during the standard drafting stage of the project. The team will pass your comments along to the standard drafting team for its consideration.** **EOP-004: Your comment addresses specific revisions to the standard. The team will pass your comments along to the standard drafting team for its consideration.**		
Georgia System Operations Corp.	No	The scope of the SAR should be to move all requirements to report to NERC or Regional Entities out of the Requirements section of all Reliability Standards to elsewhere. This does not include reporting, communicating, or coordinating between reliability entities. The NERC/Region reporting requirements could be consolidated in another document and referenced in the Supporting References section of the Reliability Standards. The deadlines for reporting should be changed to realistic timeframes that do not interfere with operating the BES or responding to incidents yet still allow NERC and the Regions to accomplish their missions.
Response: The DSR SAR DT thanks you for your comment. The team does not feel that this should be addressed explicitly in the SAR, but suggests that this is more appropriately addressed in the standard drafting stage for full industry vetting of the concepts. The team will pass your comment along to the standard drafting team for its consideration in developing the standard.		

Organization	Yes or No	Question 2 Comment
AEP	No	Sabotage is a term of intent that is often determined after the fact by the registered entity and/or law enforcement officials. In fact, it is often difficult to determine in real-time the intent of a suspicious event. We would suggest that suspicious events become reportable at the point that the event is determined to have had sabotage intent. The entities should have a methodology to collect evidence, to have the evidence analyzed, and to report those events that are determined to have had the intent of sabotage.
Response: The DSR SAR DT thanks you for your comment. The team concurs that it is difficult to determine sabotage in real-time. The teamdoes not feel that this should be addressed explicitly in the SAR and suggests that this is more appropriately addressed in the standard drafting stage for full industry vetting of the concepts. The team will pass your comment along to the standard drafting team for its consideration in developing the standard.		
Duke Energy	No	While we agree with the need for clarity in sabotage and disturbance reporting, we believe that the Standards Drafting Team should carefully consider whether there is a reliability-related need for each requirement. Some disturbance reporting requirements are triggered not just to assist in real-time reliability but also to identify lessons-learned opportunities. If disturbance and sabotage reporting continue to be reliability standards, we believe that all linkages to lessons-learned/improvements need to be stripped out. We have other forums to identify lessons-learned opportunities and to follow-up on those opportunities. Also, requirements to report possible non-compliances should be eliminated. We strongly support voluntary self-reporting, but not mandatory self-reporting.
Response: The DSR SAR DT thanks you for your comment. The team concurs that each requirement should be evaluated for its reliability need, and the team will pass your comment along to the standard drafting team for its consideration in the drafting stage of the standard.		
FirstEnergy	Yes	We agree with the scope but would also like to see the following considered: 1. References to the DOE reporting process in EOP-004 need to be revised. They currently refer to the old EIA form. 2. Besides "sabotage", it may be helpful to clearly define "vandalism". It is vaguely written in the standards. Also, the process of "public appeals" for the DOE reportable requirements needs to be more clearly defined. 3. Consolidate documents covering reporting requirements. There are currently several documents that require reporting (EOP-004, CIP-001, DOE oe-417, and NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting). NERC also has the "Bulk Power System Disturbance Classification Scale" that does not completely align with all the reporting requirements. Therefore we recommend keeping this as simple as possible by combining all the reporting requirements into one standard. It would be beneficial to not require operators to have to go to 4 different documents to determine what to report on.
Response: The DSR SAR DT thanks you for your comment.		

Organization	Yes or No	Question 2 Comment
The Brief Description of the SAR states: Specific references to the DOE form need to be eliminated. **The team will pass your comment along to the standard drafting team for its consideration.** **The team concurs that this should be considered in drafting the standards. The team will pass your comment along to the standard drafting team for its consideration.**		
Exelon	Yes	Consolidation of redundant requirements and clarifications of difficult to follow / interpret standards should be a high priority at NERC.
Response: The DSR SAR DT thanks you for your comment. One of the FERC directives for CIP-001 is: Explore ways to reduce redundant reporting, including central coordination of sabotage reports and a uniform reporting format.

3. Are you aware of any associated business practices that we should consider with this SAR? If yes, please explain in the comment area.

Summary Consideration: Stakeholders did not identify any associated business practices for consideration under the SAR. One stakeholder identified a related standard that references multi-site sabotage. The team has included a reference to TOP-005, section 2.9 (Appendix 1) in the SAR under Related Standards. Two stakeholders suggested that Business Practices should not be considered in a standard. The SAR DT notes that standard development projects must not invalidate business practices that are already in place. This question is required to be asked per the Standard Drafting Team Guidelines (page 8) and aids in coordination with North American Energy Standards Board. One stakeholder suggested a "one-stop-shopping" solution. The SAR DT agrees with this approach and will forward this comment to the Standard Drafting Team.

Organization	Yes or No	Question 3 Comment
MRO NERC Standards Review Subcommittee	Yes	
Luminant Power	Yes	The SAR drafting team should include in the SAR scope a review of the NRC sabotage and event reporting requirements to ensure there are no overlapping or conflicting requirements between NERC, FERC, and the NRC. The SAR scope should include a review of the CIP Cyber Security Standards and coordination with the CIP SDT to ensure that cyber sabotage reporting definitions are in concert, and ensure that cyber sabotage reporting requirements are not duplicated in multiple standards.
Response: The DSR SAR DT thanks you for your comment. The team notes that your comments relate directly to potential revisions of the standard itself. Part of this SAR is to eliminate redundancies as well. The team will pass your comments along to the Standards Drafting Team for its consideration. This project is designed to address physical asset reporting, not cyber assets. Therefore, cyber assets will not be included in this SAR.		
MidAmerican Energy	Yes	Attachment TOP-005, section 2.9 speaks of "Multi-site sabotage" with no definition. The ES-ISAC 2008 advisory is an associated standard or practice on sabotage. All references to sabotage should be eliminated or retired except for CIP-001.
Response: The DSR SAR DT thanks you for your comment. The team has included a reference to TOP-005, section 2.9 (Appendix 1) in the SAR under Related Standards. Project 2009-01 is designed to address physical asset reporting, not cyber asset sabotage and disturbance reporting. The standard drafting team will remove redundancies per the SAR.		

Organization	Yes or No	Question 3 Comment
Illinois Municipal Electric Agency	Yes	A one-stop reporting tool/site would facilitate efficient reporting and compliance; e.g., further development of the ES-ISAC/CIPIS to include all reportable categories and automatic notification of required parties. A single report form would be best.
Response: The DSR SAR DT thanks you for your comment. The team agrees with your suggestion and will pass this along to the Standard Drafting Team for its consideration in developing standards.		
AEP	Yes	The current reporting process necessitates multiple reports be sent to multiple parties, which is inefficient and may, inadvertently, result in alignment issues between the separate reports. We would recommend that a single report that combines NERC (CIPIS) and NERC ESISAC information be provided to NERC (CIPIS) that is systematically (programmatically) forwarded to all necessary entities. Further, updates to incidents would also go through NERC with the same electronic processing. Currently, we are not aware of a formal method to report incidents to the FBI, which should be also included in the distribution. The current reporting mechanism to the FBI JTTF is by telephone and the NERC platform described would provide more consistent reporting.
Response: The DSR SAR DT thanks you for your comment. The team agrees with your suggestion and will pass this along to the Standard Drafting Team for its consideration in developing standards. This project is designed to address physical asset reporting, not cyber assets.		
Progress Energy	Yes	Yes. If this SAR moves forward other practices such as those required by CIP-008 (cyber incident reporting via the OE-417 form) may need to be considered.
Response: The DSR SAR DT thanks you for your comment. The SAR states “Specific references to the DOE form need to be eliminated.” **This will remove the linkage that you identify between CIP-001 and CIP-008. There is also a directive from FERC Order 693 in the SAR that states:** **Consider FirstEnergy’s suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality.** **This allows the standard drafting team to delineate physical and cyber assets. The DSR SAR DT also notes that the general layout and sequencing of requirements in CIP-008 might be a good framework for drafting the standard requirements pertaining to sabotage and disturbance reporting of physical assets.**		
Exelon	No	We are not sure what this question means. Who's Associated Business practices, NERC, Applicable Entities in the Standard, our business practices?
Response: The DSR SAR DT thanks you for your comment. “Business practices” refers to any business practice of any stakeholder (e.g. North American Energy Standards Board business practices).		

Organization	Yes or No	Question 3 Comment
SERC OC Standards Review Group	No	Business practices should not be considered in a standard.
Response: The DSR SAR DT thanks you for your comment. Standard development projects must not invalidate business practices that are already in place. This question is required to be asked per the Standard Drafting Team Guidelines (page 8) and aids in coordination with North American Energy Standards Board.		
FirstEnergy	No	Although we are not aware of any NAESB business practices that need to be reviewed in conjunction with these proposed revisions, the SDT should consider reviewing current RTO procedures and practices that may require the need for variances in the revised standards.
Response: The DSR SAR DT thanks you for your comment. The Standard Drafting Team will review any procedures or practices that are identified for potential variances.		
Georgia System Operations Corp.	No	Business practices should not be part of a Reliability Standard. Neither should NERC/Region reporting requirements (except for reporting of threats to physical or cyber security). NERC may need to take some action in the case of threats but does not and cannot take any operational action for most of the reporting requirements that are presently in the Requirements section of the Reliability Standards.
Response: The DSR SAR DT thanks you for your comment. Standard development projects must not invalidate business practices that are already in place. This question is required to be asked per the Standard Drafting Team Guidelines (page 8) and aids in coordination with North American Energy Standards Board. The team disagrees with your assertion about reporting. Instances of sabotage are often not identified until after the fact, and these should be reported to alert other entities of the sabotage and for "lessons learned".		
PSEG Enterprise Group Inc Companies	No	
Northeast Power Coordinating Council	No

4. CIP-001-1 applies to the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and the Load-serving Entity. EOP-004-1 applies to the same entities, plus the Regional Reliability Organization. Do you agree with the applicability of the existing CIP-001-1 and the existing EOP-004-1? If no, please identify what you believe should be modified.

Summary Consideration: Many stakeholders had comments regarding applicability of the two standards. The three main concerns were:

1 Regional Reliability Organization applicability: Many commenters do not feel the RRO should be in the standards. The DSR SAR DT concurs and notes that the SAR states that "EOP-004 has some 'fill-in-the-blank' components to eliminate". This will remove the RRO from applicability.

2 Load-Serving Entity/Distribution Provider: Many stakeholders do not feel that the standards should be applicable to LSEs, but should apply to Distribution Providers. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process.

3 Transmission Owner/Generator Owner: Many stakeholders have indicated a need to include the TO as an applicable entity. A couple of those would also include the GO. The SAR DT discussed the addition of both the TO and GO. The team has a concern that there will be duplication of requirements between the TO/TOP and GO/GOP if the TO and GO are added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the Standard Development Process.

Organization	Yes or No	Question 4 Comment
SERC OC Standards Review Group	No	The EOP-004-1 standard should not apply to the RRO.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. This will remove the RRO from applicability.		
Kansas City Power &	No	Do not agree Load Serving Entities need to continue to be included for sabotage. According the NERC Functional Model,

Organization	Yes or No	Question 4 Comment
Light		an LSE provides for estimating customer load and provides for the acquisition of transmission and energy to meet customer load demand. An LSE has no real impact on maintaining the reliability of electric network short of their planning function. Unfortunately, an LSE needs to be included for disturbance reporting to the DOE under certain conditions for loss of customer load. This may be a reason to maintain a separation of CIP-001 and EOP-004 so as not to unnecessarily include an LSE when it is not needed.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements through the standard drafting stage of the process. The team will pass your comment along to the Standard Drafting Team for its consideration.		
IRC Standards Review Committee	No	We agree with the applicability of CIP-001-1 but question the need to include the RRO in EOP-004-1. Requirement R1 of EOP-004-1 can be turned into an industry developed and approved procedural requirement with details included in an appendix; whereas R5 can be changed to a requirement for the responsible entities to act on recommendations and to self-report compliance. Tracking and reviewing status of recommendation do not need to be performed by the RRO, or any entity for that matter, if a self-reporting mechanism is developed.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. This will remove the RRO from applicability.		
Pepco Holdings, Inc. - Affiliates	No	As specified in Order 693, Regional Reliability Organizations are not to be assigned applicability. The revised standard(s) should contain the reporting form either directly or by reference and the RRO should be removed. The other EOP-004 requirements for RROs are now considered normal monitoring activities of the Regional Entities.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. This will remove the RRO from applicability.		
FirstEnergy	No	The Regional Reliability Organization should be removed from the applicability of EOP-004-1. Any report they receive would be from the other entities listed. For consistency, the entities should report to the appropriate law enforcement agency. A report to the Reliability Entity should also be made for that entities information only.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. This will remove the RRO from applicability.		
Electric Market Policy	No	Applicability should not apply to LSE unless they have physical assets. If they do not have such assets, they are unable to

Organization	Yes or No	Question 4 Comment
		determine how many customers are out, how much load was lost or the duration of an outage. We continue to question the need for the LSE entity in reliability standards. End use customer load is either connected to transmission or distribution facilities. So, the applicable planner has to plan for that load when designing its facilities or the load will not have reliable service. To the extent that energy and capacity for that load is supplied by an entity other than the TO or DP, the TO or DP should have interconnection requirements that compel the supplier to provide any and all data necessary to meet the requirements of reliability standards.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The team will pass your comment along to the Standard Drafting Team for its consideration.		
MRO NERC Standards Review Subcommittee	No	As FERC has directed, the RRO should be removed since they are not owners or operators of the BES.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. **This will remove the RRO from applicability.**		
Lands Energy Consulting	No	CIP-001-1 - Yes. In many cases, the staff of an LSE embedded in another entity's BA/TOP area is more likely to discover an act of sabotage directed toward a BA/TOP-owned facility that could affect the BES than the asset owner. This is because the LSE likely has more operating staff in the area. I have included a requirement in my clients' Sabotage Identification and Reporting Procedures that the client treat acts of sabotage to a third party's system discovered by client employees as though the act was directed toward client facilities. EOP-004-1 - As mentioned before, I would eliminate the LSE from the applicability list and leave the responsibility for disturbance reporting and response to the TOP/BA. However, I would retain a responsibility for the LSEs to cooperate (when requested) with any disturbance investigation.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the standard as the Standard Drafting team may have a need to include them in the standard(s). The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The team will pass your comment along to the Standard Drafting Team for its consideration.		
Calpine Corporation	No	The reporting requirements of EOP - 004 are needed for the RC, BA, LSE and the GOP that operates or controls generation in a system as defined by NERC. (System - A combination of generation, transmission, and distribution components). A disturbance is described as an unplanned event that produces and abnormal system condition, any

Organization	Yes or No	Question 4 Comment
		perturbation to the electric system, and the unexpected change in ACE that is caused by the sudden failure of generation or interruption of load. The GOP operating/controlling generation within a system has the ability to analyze system conditions to determine if reporting is necessary. A NERC registered GOP that is a merchant generator within another company's system does not have the ability for a wide area view and cannot analyze system conditions beyond the interconnection point of the facility. Moreover, in most cases the reporting requirements outlined in the Interconnection Reliability Operating Limits and Preliminary Disturbance Report do not apply to the merchant generator that is not a generation only BA. The applicability of the standard does encompass the true merchant generation entities required to register as GOP. Similarly, the OE-417 table 1 reporting requirements generally do not apply to a true merchant generating entity that is required to register as a GOP.
Response: The DSR SAR DT thanks you for your comment. The team agrees that generators may not have a wide area view and the capability to analyze events. The final wording of the requirements developed by the Standard Drafting Team will determine the applicability. The team will pass your comment on to the Standards Drafting Team for its consideration. The SAR calls for the removal of references to the DOE form OE-417.		
Cowlitz County PUD	No	Replace LSE with DP, and the Regional Reliability Organization with the Regional Entity.
Response: The DSR SAR DT thanks you for your comment. The team has added DP to the applicability of the SAR. The SAR calls for removing the fill-in-the-blank standard elements which will remove the RRO.		
United Illuminating	No	Add Distribution Provider
Response: The DSR SAR DT thanks you for your comment. The team has added DP to the applicability of the SAR.		
Reliant Energy	No	EOOP-004-1 should exclude the generator operator from disturbance reporting except providing the system operator or reliability coordinator with appropriate unit operation information upon request. Acts of sabotage should be identified clearly and reported to the indicated authorities.
Response: The DSR SAR DT thanks you for your comment. Other commenters have questioned the ability of Generator Operators to have a wide area view and to be able to analyze disturbances on the system. The team agrees that generators may not have a wide area view and the capability to analyze system events. The final wording of the requirements (i.e. reporting vs. data provision) developed by the Standard Drafting Team will determine the applicability to GOPs. The team will pass your comment on to the Standards Drafting Team for its consideration.		
Texas Regional Entity	No	Add GO and TO to the list of applicability. The intent of CIP-001-1 when it was first written was to have the proper and most likely entities associated directly with operations to be the ones to begin the reporting process in the case of sabotage on the system. In the ERCOT Region and other regions in the US, the GOP may not be physically located at the site. The GOP is often removed from the minute-by-minute responsibilities of plant operations and, therefore, may be less

Organization	Yes or No	Question 4 Comment
		able to react to physical sabotage at the location/plant/facility in a timely manner. The concern is that, in the case of an actual sabotage event, the failure to report to the appropriate authorities in a timely manner may jeopardize the reliability of the BPS. Therefore, the Generator Owner (GO) should be added to the list of applicability for CIP-001-1, because it is the GO that is more likely to be on location at the generation site and thus aware of sabotage when it first occurs. This would disallow for any possible communication gap and put responsibility on all of the appropriate entities to report such an event. Additionally, and for the same reasons as adding the GO, the Transmission Owner (TO) should also be added to the list of applicability for reporting sabotage on its facilities.
Response: The DSR SAR DT thanks you for your comment. The SAR DT discussed the addition of the TO and GO. The team was concerned that there may be duplication of requirements between the TO/TOP and GO/GOP if the TO and GO are added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the standard drafting Process. The team will pass your comment along to the Standard Drafting Team for its consideration concerning applicability.		
NextEra Energy Resources, LLC	No	The scope of the proposed SAR should not include the Generator Operator.
Response: The DSR SAR DT thanks you for your comment. Other commenters have questioned the ability of Generator Operators to have a wide area view and to be able to analyze disturbances on the system. The team agrees that generators may not have a wide area view and the capability to analyze system events. The final wording of the requirements (i.e. reporting vs. data provision) developed by the Standard Drafting Team will determine the applicability to GOPs. The team will pass your comment on to the Standards Drafting Team for its consideration.		
Exelon	No	CIP-001, remove LSE's from the standard for the reasons identified in the FERC LSE order. Ad TO and DP. EOP-004, remove LSE's from the standard for the reasons identified in the FERC LSE order. Remove RRO's, they are not a user, owner, operator of the BES. Add DP or TO. Consider conditional applicability as in the UFLS standards, " the TO or DP who performs the functions specified in the standard..."
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the SAR. The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The SAR DT discussed the addition of the TO. The team is concerned that there may be duplication of requirements between the TO/TOP if the TO is added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the standard drafting Process. The SAR calls for elimination of fill in the blanks elements, which will remove the RRO from the standard. The team will pass your comment along to the Standard Drafting Team for its consideration concerning conditional applicability.		

Organization	Yes or No	Question 4 Comment
ERCOT ISO	No	The Regional Reliability Organization is not a registered Functional Entity in the NERC registry. The applicability must be revised to more appropriately assign the requirements to registered functional entities. Also, the industry needs to recognize that there are other resources than generation for which the operators need to be included. Perhaps a demand-side resource should have a resource operator. This particular SAR may not be the appropriate venue for this, but control of resources which can be used to mitigate sabotage events or disturbance events may need to be addressed.
Response: The DSR SAR DT thanks you for your comment. The SAR calls for elimination of fill-in-the-blank elements, which will remove the RRO from the standard. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The team will pass your comment along to the Standard Drafting Team for its consideration concerning conditional applicability. This SAR is for reporting rather than control actions as you mention.		
Brazos Electric Power Cooperative, Inc.	No	May need to consider adding Transmission Owner. I don't see a need for the RRO to be included as they are not owner/operators of grid facilities.
Response: The DSR SAR DT thanks you for your comment. The SAR DT discussed the addition of the TO. The team is concerned that there may be duplication of requirements between the TO/TOP if the TO is added to the SAR. That being said, the TO has been added to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The SAR calls for elimination of fill in the blank elements, which will remove the RRO from the standard. The team will pass your comment along to the Standard Drafting Team for its consideration concerning conditional applicability.		
PacifiCorp	No	LSE's don't generally own/operate facilities/systems that would experience a logical or physical sabotage event.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the SAR. The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process.		
MidAmerican Energy	No	MidAmerican Energy believes the requirement for the Regional Reliability Organization should be removed from EOP-004-1 since the RRO is a holdover from making the standards enforceable. It is no longer appropriate for the regions to be named as responsible entities within the standards.
Response: The DSR SAR DT thanks you for your comment. The SAR calls for elimination of fill-in-the-blank elements, which will remove the RRO from the standard.		

Organization	Yes or No	Question 4 Comment
Georgia System Operations Corp.	No	EOP-004 should be retired. CIP-001 should not apply to LSEs other than those that are retail marketers.
Response: The DSR SAR DT thanks you for your comment. The SAR calls for EOP-004 to be revised. The Standard Drafting Team may, with stakeholder approval, retire it. CIP-001: NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the SAR. The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting process.		
AEP	No	We would recommend that the Load Serving Entity (LSE) be removed from both standards, and that the Generator Owner and Transmission Owner be added to the resulting standard.
Response: The DSR SAR DT thanks you for your comment. NERC has recognized, through its Compliance Registry, that there are asset owning LSEs and non-asset owning LSEs. The SAR DT believes that an asset owning LSE may be a Distribution Provider based on the Functional Model v4. The team has added DP to the applicability of the SAR. The applicability of LSE or Distribution Provider will ultimately be determined by the Standard Drafting Team as it develops the requirements in the standard drafting stage of the process. The SAR DT discussed the addition of the TO and GO. The team has a concern that there may be duplication of requirements between the TO/TOP and GO/GOP if the TO and GO are added to the SAR. That being said, the team added the TO and GO to the applicability of the SAR so that the Standard Drafting team may consider these entities for applicability. The applicability of requirements will ultimately be determined by the Standard Drafting Team as it develops the requirements through the standard drafting Process. The team will pass your comment along to the Standard Drafting Team for its consideration concerning applicability.		
Duke Energy	No	It's unclear to us that the RRO should continue to be an applicable entity.
Response: The DSR SAR DT thanks you for your comment. The team concurs and notes that the SAR states: EOP-004 has some 'fill-in-the-blank' components to eliminate. **This will remove the RRO from applicability.**		
Covanta	Yes	It would be a welcome enhancement to the end users to understand to communication link between all "appropriate parties" who shall be notified of potential or actual sabotage events.... which also needs to be defined.
Response: The DSR SAR DT thanks you for your comment. The team concurs, and will pass this comment on to the standard drafting team for its consideration.

5. If you have any other comments on the SAR or proposed modifications to CIP-001-1 and EOP-004-1 that you haven't provided in response to the previous questions, please provide them here.

Summary Consideration: Stakeholders provided many good comments that should be considered in the development of the standards under this project. The SAR DT does not believe that these require any revisions to the SAR and will forward these comments to the Standard Drafting Team for its consideration in developing the standard(s). These include:

1 Consolidation of reports: The SAR DT agrees with this concept and will forward the comment to the Standard Drafting Team for its consideration.

2 Concerns about pre-determination of combining CIP-001 and EOP-004 into one standard: The SAR states: CIP-001 *may* be merged with EOP-004 to eliminate redundancies. The two standards may be left separate.

3 Reporting criteria in multiple tables: The team agrees that it would be easier if there were only one table. Part of this SAR is to eliminate redundancies and make general improvements to the standard. The team also agrees that the requirements developed should be clear in their reliability objective.

Organization	Question 5 Comment
PSEG Enterprise Group Inc Companies	The PSEG Companies ask that the drafting team allow sufficient flexibility for sabotage recognition and reporting requirements such that nothing precludes utilizing a single corporate-wide program for both bulk electric system assets and other businesses. PSEG's Sabotage Recognition, Response and Reporting Program is directed to all business areas which are directed to follow the same internal protocol that also satisfies the NERC Standards requirements. For example, for gas assets, PSEG's gas distribution business follows the PSEG corporate-wide program for sabotage recognition and response. PSEG agrees that some modifications should be made to CIP-001 (ex. better define or give examples of sabotage) and EOP-004 to make them clearer? If they are merged, then Sabotage will not be in the title (or the primary focus) because several of the Disturbances that reporting is required for in EOP-004 have nothing to do with sabotage. EOP-004 has criteria listed in 4 places to determine when to send a report: o Criteria listed in EOP-004 Attachment 1 o Criteria listed in EOP-004 Attachment 2 o Criteria listed in top portion of Table 1-EOP-004 o Criteria listed in bottom potion of Table 1-EOP-004 Therefore, it would be much easier if there was one table of criteria for reference that addressed all of the reportable conditions and all of the applicable reports. If the 2 standards are merged as suggested in the SAR, any differences in the reporting obligation for actual or attempted sabotage and reporting of disturbances must be clear.

Organization	Question 5 Comment
Response: The DSR SAR DT thanks you for your comment. The team agrees that it would be easier if there were only one table. Part of this project is to eliminate redundancies and make general improvements to the standard. The team also agrees that the requirements developed should be clear in their reliability objective. The team will forward your comment to the standard drafting team for its consideration in the drafting of the standard.	
Kansas City Power & Light	If it is desirable to keep CIP-001 and EOP-004 separate, it is recommended the SDT consider adding a reference in CIP-001 to the DOE reporting form either by name or by internet link in the standard.
Response: The DSR SAR DT thanks you for your comment. The SAR SDT recommends eliminating all references to the DOE report, so there won't be a reference to it in CIP-001.	
IRC Standards Review Committee	We suggest that the revision not be conducted with a preconceived notion that the two standards must be combined since there are some differences between sabotage and emergency system conditions, and in the communication and reporting processes and channels. We suggest the SDT start off with a neutral position to focus on improving the standards, then assess the pros and cons of merging the two based on technical merit only.
Response: The DSR SAR DT thanks you for your comment. The SAR states: CIP-001 may be merged with EOP-004 to eliminate redundancies. The two standards may be left separate.	
Pepco Holdings, Inc. - Affiliates	Consider CIP-008-2 as potentially having overlaps with the proposed standard
Response: The DSR SAR DT thanks you for your comment. The SAR states "Specific references to the DOE form need to be eliminated." This will remove the linkage that you identify between CIP-001 and CIP-008. There is also a directive from FERC Order 693 in the SAR that states: **Consider FirstEnergy's suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality.** **This allows the standard drafting team to delineate physical and cyber assets. The DSR SAR DT also notes that CIP-008 might be a good framework for drafting the standard requirements pertaining to sabotage and disturbance reporting of physical assets.**	
FirstEnergy	1. Under Industry Need it states: "The existing requirements need to be revised to be more specific and there needs to be more clarity in what sabotage looks like." The use of the phrase "more specific" should be qualified by adding "while not being too prescriptive". As with other reliability standards, we do not want a standard that causes unwarranted and unnecessary additional work and costs to an entity to comply. 2. As pointed out by the NERC Audit and Observation Team in the "Issues to be considered" for CIP-001, clarification is needed regarding contacting the FBI. Prior audits dwelled heavily on FBI notification. For example, our policy states that Corporate Security notifies the FBI. In recent events it appears that local law enforcement handles day to day activities. The notification process for

<table>
<tr><th>Organization</th><th>Question 5 Comment</th></tr>
<tr><td></td><td>contacting the FBI needs clarification along with specific instances in which to call them. Who should make the call to the FBI? It appears that a protocol needs to be developed to clarify what events require notifying the FBI. It could be as simple as after an incident a standard form is completed and forwarded to the FBI, letting them decide if follow up is needed.

3. We suggest aligning all reporting requirements for consistency. The items requiring reporting and the timelines to report are very inconsistent between NERC and the DOE. NERC's timelines are also not consistent with their own Security Guideline for the Electricity Sector: Threat and Incident Reporting.</td></tr>
<tr><td colspan="2">Response: The DSR SAR DT thanks you for your comment.

The team concurs that the standards should provide the “what” without the “how”. The standard drafting team will develop the standards using the NERC Standard Development Process that includes stakeholder consensus. The team does not feel it is necessary to add the “not too prescriptive” qualifier to the SAR.

The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).

The team concurs with your comment and notes that other commenters have suggested “one stop shopping” reporting for disturbances and sabotage. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).</td></tr>
<tr><td>Electric Market Policy</td><td>CIP-008-1 Incident Reporting and Response Planning include some requirements that require coordination with the requirements addressed in this project.</td></tr>
<tr><td colspan="2">Response: The DSR SAR DT thanks you for your comment. The SAR states “Specific references to the DOE form need to be eliminated.” This will remove the linkage that you identify between CIP-001 and CIP-008. There is also a directive from FERC Order 693 in the SAR that states:

Consider FirstEnergy’s suggestions to differentiate between cyber and physical security sabotage and develop a threshold of materiality.

This allows the standard drafting team to delineate physical and cyber assets. The DSR SAR DT also notes that CIP-008 might be a good framework for drafting the standard requirements pertaining to sabotage and disturbance reporting of physical assets.</td></tr>
<tr><td>MRO NERC Standards Review Subcommittee</td><td>A. The SAR states that there may be impact on a related standard, COM-003-1 (page SAR-5). Is the SDT referring to Project 2007-02, Operating Personnel Communication Protocols? If so, this is a SAR too and should not be used as a reference.

B. CIP-001-1 and EOP-004-1 should be combined into one EOP Standard.

C. Within EOP-004-1 there is industry confusion on what form to submit in the event of an event. There should only be one form for the new combination Standard eliminating the need for reporting form attachments. It should be the DOE Form, OE-417. Although it is beyond the scope of this SAR, it would greatly benefit industry if there was a central location on the NERC website containing ALL reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable the System Operators to efficiently locate the most current version of the appropriate form in order to report events.</td></tr>
</table>

Organization	Question 5 Comment
	D. The word Disturbance is primarily used in other Standards as in, Disturbance Control Standard or system separation due to a disturbance. Should the NERC definition be updated? Should the word “Sabotage” be defined by NERC? Additionally, we recommend that one definition of “Sabotage” be utilized industry-wide, instead of varying definitions by multiple groups like the DOE, ESIAC, etc.
Response: The DSR SAR DT thanks you for your comment. **A. It does reference project 2007-02, and it has been noted in the SAR.** **B. Will forward this comment to the standard drafting team for its consideration in developing the standard(s).** **C. The team concurs with your comment and notes that other commenters have suggested “one stop shopping” reporting for disturbances and sabotage. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).** **D. References to DOE are to be removed from the standards per the SAR. FERC Order 693 directives include definition of sabotage for CIP-001.**	
Lands Energy Consulting	One final comment on CIP-001-1. My clients received universally rude treatment from the FBI field offices when they attempted to establish the contacts required by the Standard. If the FBI doesn't see value in establishing these contacts, remove the requirement from the Standard. Making sure the LSE knows the FBI field office phone number is probably all the Standard should require.
Response: The DSR SAR DT thanks you for your comment. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).	
Colmac Clarion	Need single report for Sabotage so whatever is required results in notification of all parties (State Emergency Management, Homeland Security, FBI, Grid Reliability Chain of Command). Any and all of these can 'expand' knowledge later but all seem to require 'instant' notification.
Response: The DSR SAR DT thanks you for your comment. The team concur with your comment and notes that other commenters have suggested “one stop shopping” reporting for disturbances and sabotage. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).	
Cowlitz County PUD	Local Law enforcement agencies often are not friendly to Federal involvement with smaller problems they consider their "turf." Need to make sure the small stuff stays with them, however have a system of internal reporting that will catch coordinated sabotage efforts (multiple attacks on DPs and small BAs) at the RC or RE level who then can report to the Federal agencies. Currently EOP-004-1 requires small entities to report a "disturbance" if half of their firm customer load is lost. For some entities, this can be one small substation going down due to a bird. The "50% of total demand" requirement should be removed or improved to better define a true BPS disturbance.

Organization	Question 5 Comment
Response: The DSR SAR DT thanks you for your comment. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).	
Exelon	Exelon agrees this is a worthwhile project and that reliability will be enhanced and the compliance process will be simplified by clarifying terminology and reporting requirements in these standards. If nothing else, defining "Sabotage" so as to end interpretations of this term and the related requirements is necessary.
Response: The DSR SAR DT thanks you for your comment.	
ERCOT ISO	Due to the fact that both the CIP-001-1 and EOP-004-1 have similar reporting standards, initially combining the two sounds like a correct analysis. However, after further consideration and due to the critical nature of its intended function involving Security aspects, the CIP-001 should be intensely evaluated to determine if its intended purpose meets the threshold or criteria to stand alone. The existing standards for CIP-001-1 Sabotage Reporting may help prevent future mitigation actions caused by sabotage events. EOP-004-1 Disturbance Reporting is administrative in nature, thus the jeopardy of the Bulk Electric System reliability is impacted only if analysis is not performed or if corrective follow-up actions are not implemented. Combining EOP-004 Standard requirements under the umbrella of the CIP -001 Standard would create a high profile Disturbance Reporting Standard. The industry would be better served if information defining sabotage was provided as well as a technical reference document on recognizing sabotage that would also clarify or state any personnel training requirements. All aspects of the intended functions must be reviewed before merging the two standards. At a minimum, we must consider modification that provides improved understanding of the reporting standards and implications as they are currently written.
Response: The DSR SAR DT thanks you for your comment. The SAR states: CIP-001 *may* be merged with EOP-004 to eliminate redundancies. The two standards may be left separate. One of the FERC Order 693 directives for CIP-001 states: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.** **The Standard Drafting Team will follow the NERC Standard Development Process in making revisions under this SAR, including a thorough review of the requirements of both standards. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).**	
MidAmerican Energy	Conflicting time frames exist from document updates. Reporting should be consolidated to one form and / or site to minimize conflicts, confusion, and errors. 1) Reporting requirements for the outage of 50,000 or more customers in EOP-004-1 requires a report to be made within one hour while the form OE-417 requires a report be made within six hours of the outage. The six hour reference on the updated OE-417 form is the correct reference. 2) Reporting for either CIP-001 or EOP-004 should center on the DOE Form OE-417. This would eliminate confusion and simplify reporting for system operators thereby directly enhancing reliability during system events. This would also eliminate much of the duplicate material and attachments in EOP-004. 3) Although it is beyond the scope of this SAR, the industry would benefit if there was a central location or link on the NERC website containing all

Organization	Question 5 Comment
	reporting forms, including FERC, NERC, DOE, and ESIAC. This would enable System Operators to more efficiently locate and report events.
Response: The DSR SAR DT thanks you for your comment. The team notes that other commenters have suggested "one stop shopping" reporting for disturbances and sabotage. The team concurs that timeframes for similar reports should be the same. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s).	
Georgia System Operations Corp.	Entity reporting to NERC/Regions is needed by NERC and the Regions to accomplish their missions of overseeing the reliability of the BES and enforcing compliance with Reliability Standards. An entity not reporting as quickly as possible does not harm the integrity of the Interconnection. In fact, it increases the risk to the BES to be investigating details and filling out forms during a time when attention should be on correcting or mitigating an incident.
Response: The DSR SAR DT thanks you for your comment. The team agrees that non-reporting, in the administrative sense, may not harm the integrity of the Interconnection. The team suggests that the appropriate avenue for addressing this concern is through the development of Violation Risk Factors and Violation Severity Levels for each requirement. These compliance elements will be developed during the standard drafting stage of the development process.	
Illinois Municipal Electric Agency	IMEA recommends the following considerations: Simplification of reportable events and the reporting process should be the overriding objective. NERC's Security Guideline for the Electricity Sector: Threat and Incident Reporting (Version 2.0) should be updated to support this standards development initiative. At some point in the process, it may help if examples are given of events actually reported that did not need to be reported.
Response: The DSR SAR DT thanks you for your comment. The team notes that other commenters have suggested "one stop shopping" reporting for disturbances and sabotage. The team agrees that NERC's Security Guide should be in sync with the standards. The team will forward this comment to the standard drafting team for its consideration in developing the standard(s). One of the FERC Order 693 directives for CIP-001 states: **Define "sabotage" and provide guidance on triggering events that would cause an entity to report an event.** **Events that were reported, but didn't need to be, may be identified in "lessons learned".**

Consideration of Comments on Disturbance and Sabotage Reporting — Project 2009-01

The Disturbance and Sabotage Reporting Standard Drafting Team thanks all commenters who submitted comments on the proposed Concepts Paper for Disturbance and Sabotage Reporting. The document was posted for a 30-day public comment period from March 17, 2010 through April 16, 2010. Stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 41 sets of comments, including comments from more than 95 different people from approximately 50 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

The comments have been sorted and organized by question number in this report; the comments are shown in the original format on the following project web page:

http://www.nerc.com/filez/standards/Project2009-1_Disturbance_Sabotage_Reporting.html

Summary Consideration:

Use of "NERC Guideline: Threat and Incident Reporting"
Most stakeholders agree that existing guidance should be used as the foundation for disturbance reporting. Most commenters felt that the "NERC Guideline: Threat and Incident Reporting" document contains a lot of detailed information which greatly assists in determining reporting events and weaning out non important events. The most common desire was one, common form to be used for reporting and the OE-417 was considered to be a good starting point. Most respondents thought the form could be streamlined. The DSR SDT was urged to focus on applicable events and reporting timelines which are not clear now and to report items that are clearly essential to the reliability of the BES. There was some concern expressed about "over-reporting", out of fear of non-compliance rather than the over the reliability of the BES. There was also a clear desire to separate out vandalism & copper theft from reporting requirements.

Hierarchy for Reporting Disturbances
Most stakeholders (about 2/3) agree with the concept of developing a reporting hierarchy for disturbances. Stakeholders who disagreed believed that the RC should be one of many to receive information on impact events (DOE, RRO, etc.). Such a hierarchy would lead to reporting delays (leading to lack of situational awareness), be cumbersome and complicated and clouds responsibility for who is to report what to whom. Other negative comments believed that a hierarchy would distract the RC's focus from its primary responsibility. Those stakeholders who agreed commented that the RC should be the collection point for reports and information and take the responsibility to forward as required. This is from the concept that the RC has the "wider view" and can recognize patterns, and has the ability to "escalate" the reporting process. This would also minimize duplication of reports and information.

Single Form for All Agencies
Most stakeholders agreed with the concept of having one reporting form for all entities. Several commenters suggested that there is no need for a standard on reporting as they considered it administrative in nature. Most dissenters thought there should be a guideline, rather than an enforceable standard. There is widespread agreement that the one-size-fits-all approach would be very difficult to get agreement on, given the different countries and

agencies involved. Many stakeholders pointed out that consistency and simplification were drivers for one report form. Having multiple recipients, with different information requirements, seems to support an electronic format that would guide information only to those who need it. The concept of an electronic reporting tool will need to be further vetted and developed.

Supplements to NERC Form
Most stakeholders agreed with the concept of entities being able to use information from other sources such as the OE-417 form, to supplement the NERC report form. Some thought that duplicate reports were acceptable, as long as the information was not duplicated (if # of customers lost is required on form A, don't ask on forms B & C). Several stakeholders commented on the need for an electronic, one stop reporting tool. This would avoid duplication while ensuring that the information reported goes only to intended recipients. With an electronic, one stop reporting tool, reports can be updated/corrected instantly, without repeating previously submitted information. Some stakeholders cautioned that the OE-417 can change every three years and this should be taken into account when developing an electronic reporting tool. Again, such a reporting tool would need to be vetted and developed to meet reliability needs.

Impact Events
The majority of stakeholders agreed with the concept of "impact events." Some stakeholders felt that the introduction of impact events increased the risk that some items will go unreported. However, most felt that impact events would dramatically increase the number of reports being submitted, and it would be difficult to separate important information from background noise. Several respondents felt that the SDT ignored the FERC Directive, and did not define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event. Many respondents supplied the SDT with their own definition of "Sabotage". The DSR SDT believes that the concept of impact events and the specificity of what needs to be reported in the standard will be an equally efficient and effective means of address the FERC directive regarding sabotage. Some stakeholders felt that impact events add another layer of uncertainty to the reporting. Even with the switch from sabotage to impact events, several felt that "intent" was still key to determining reportability.

Regional Differences
Several commenters provided information on regional reporting. The SDT will consider whether these should be included in the continent-wide standard. These include:

1. NPCC maintains a document and reporting form (Document C-17 - Procedures for Monitoring and Reporting Critical Operating Tool Failures) that outlines the reporting requirements, responsibilities, and obligations of NPCC RCs in response to unforeseen critical operating tool failures.

2. For other events that do not meet the OE-417 and EOP-004 reporting criteria, ReliabilityFirst expects to receive notification of any events involving a sustained outage of multiple BES facilities (buses, lines, generators, and/or transformers, etc.) that are in close proximity (electrically) to one another and occur in a short time frame (such as a few minutes).

3. WECC sets its loss of load criteria for disturbance reporting at 200 MW rather than the 300 MW in the NERC reporting form.

4. SERC and RFC are developing additional requirements at this time. We suggest that reporting be based on impact to reliability, not on 'newsworthy'

events. We therefore do not agree with such regional efforts and would prefer a continent wide reporting requirements.

5. Some entities identified some in-force Regional Standards and other regional reporting requirements.

Project Scope

Some stakeholders suggested that the SDT has gone beyond its approved scope to "further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event." Further, there is no requirement to create a Reporting Standard to define sabotage. The SDT contends that the development of impact events and the reporting requirements for them will provide the clarity sought in the directive. Other stakeholders suggested that the SDT should seek to retire sanctionable requirements that require event reporting in favor of guidelines for reporting. Several commenters suggested that the introduction of impact events actually expands the reporting requirements. It should be noted that the list of impact events is expected to be explicit as to who is to report what to whom and within certain timelines.

Electronic Tool

Several stakeholders provided input as to what they believed an electronic reporting tool should contain:

1 If the decision is made to go to a single reporting form, it should be developed to cover any foreseeable event.

2 The SDT should work toward a single form, located in a central location, and submitted to one common entity (NERC)

3 Reports should be forwarded to the ES-ISAC, not NERC, as the infrastructure is already in place for efficient sharing with Federal agencies, with the regional entities and with neighboring asset owners. Reports should flow to all affected entities in parallel, rather than series (timing issues).

Commenters also suggested that the SDT should consider the impacts of the reporting requirements on the small and very small utilities.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herbert Schrayshuen, at 609-452-8060 or at Herb.Schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. **The details of reporting requirements and criteria are in the existing EOP-004 standard and its attachments. The DSR SDT discussed the reliability needs for disturbance reporting and will consider guidance found in the document "NERC Guideline: Threat and Incident Reporting" in the development of requirements. Do you agree with using the existing guidance as the foundation for disturbance reporting? Please explain your response (yes or no) in the comment area.**

Summary Consideration: Most stakeholders agree that existing guidance should be used as the foundation for disturbance reporting. Most commenters felt that the "NERC Guideline: Threat and Incident Reporting" document contains a lot of detailed information which greatly assists in determining reporting events and weaning out non important events. The most common desire expressed was to have one common form for all reporting, and the OE-417 was suggested as a good starting point. Most respondents thought the form could be streamlined. The DSR SDT was urged to focus on applicable events and reporting timelines which are not clear now and to report items that are clearly essential to the reliability of the BES. There was some concern expressed about "over-reporting", out of fear of non-compliance rather reporting based on the reliability of the BES. There was also a clear desire to exclude vandalism & copper theft from reporting requirements.

Several specific suggestions were made to modify existing reporting requirements, and the drafting team will consider these when developing the proposed requirements.

Organization	Yes or No	Question 1 Comment
ERCOT ISO	Possible Yes	Parts of the Guideline are helpful, but the guideline goes beyond the scope of the requirements of the current standards, which could pose potential audit concerns. ERCOT ISO strongly feels this approach for reporting should be focused on physical events only and cyber event reporting should be contained within CIP-008 only. Continue to keep physical separate from cyber.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). The DSR SDT will take into consideration your comment on keeping cyber and physical events separate.		
Arizona Public Service Company	No Then Yes	APS supports standard revisions which streamline the reporting process for security incidents with a single form, which aligns both with EIA reporting and NERC Standards requirements, particularly those identified in the NERC Threat and Incident Reporting Guidelines. This would eliminate users issuing reports to multiple locations/government entities without a standard form or format. The DOE 417 form which is currently utilized

Organization	Yes or No	Question 1 Comment
		for reporting purposes is out-dated and does not account for the types of incidents as identified in the NERC Threat and Incident Reporting Guidelines. The guidelines state that an entity can report security incidents to the ESISAC , through CIPIS (Critical Infrastructure Protection Information System), and or RCIS (Reliability Coordinator Information Center). CIPIS refers an entity to the NICC and to the WECC. Additionally, APS proposes that the terms and timelines of reporting security incidents be clearly identified. Events are often detected quickly or immediately. Determining whether or not the event was sabotage and/or a reportable event; however, typically takes much longer. There is no time allowance for an entity to investigate the event to determine what actually occurred. Currently, DOE 417 provides that acts of sabotage should be reported within one hour of detection if the impact could affect the reliable operation of the bulk power system. This may affect the accuracy of the information being provided by an entity on it's initial reporting. Finally, provisions should be incorporated to address the privacy of information being submitted, including handling and storage.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s) which should streamline the reporting process (what events and what timeline should be used). c		
SPS Consulting Group Inc.	No	At least not exclusively. The current standards and the guidance fail to consider that different registered entities will have different scopes of awareness for when disturbances may take place. We want to avoid the situation where a generator (for example) is cited for failure to report a disturbance of which they have way of knowing occurred.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT will take into consideration what Registered Entities are to be included within the yet to be written standard(s) based on the SAR and the facilities each type of Registered Entity is required to have.		
Bonneville Power Administration	No Then Yes	BPA likes the idea of consolidating information and eliminating duplication of reported information. In the report, don't include every detail possible found in the "Threat Guideline". TOP's are supposed to be operating the electrical system, not doing investigative work for copper theft incidents (see comment on #5).
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). We will consider your specific suggestion for not requiring reporting of incidents such as copper threat, when we develop the proposed requirements.		

Organization	Yes or No	Question 1 Comment
Lands Energy Consulting	No	My firm provides compliance consulting services to a number of smaller (50-700 MW peak load) LSE/DP registered entities. EOP-004 creates an obligation for LSEs to report "disturbances" that affect their systems. A few of the smaller of these systems receive service from Bonneville-owned transmission lines that serve only 4-6 substations. The NERC Form establishes loss of 50% of the LSE's retail customers as a reportable disturbances. One of my clients receives service from BPA at 5 substations. A single industrial customer with a substantially dedicated substation comprises 90% of the utility's MWH load. Were it not for this customer, the utility would have been well below the registration requirement for a DP/LSE. The balance of the load, about 15 MW of peak and 4000 retail customers, is served from 5 substations. Four of these substations serving 3000 customers are served from a long Bonneville 115 kV BES transmission line that runs through a heavily treed right of way. Every time this single line experiences a permanent outage (which will happen a few times a year), the utility loses less than 10 MW of load, but 75% of its retail customers. Under the disturbance reporting criteria, this outage would constitute a reportable disturbance for the utility. When the NERC disturbance reporting criteria were adopted, I doubt that anyone conceived that they would apply to cases like I just described. Reporting trivial events like I've just described constitutes a nuisance to the entity making the report and NERC/WECC for having to process the report. The outage has no earthly effect on the reliability of the BES and certainly doesn't warrant preparation of any kind of disturbance report.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT will take into consideration what Registered Entities are to be included within the yet to be written standard(s) based on the NERC Standards Committee approved SAR. The DSR SDT will review the Commissions concern that, an adversary might determine that a small LSE is the appropriate target when the adversary aims at a particular population or facility, as stated in FERC Order 693, paragraph 459. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
SERC Reliability Coordinator Sub-committee (RCS)	No	Routine minor incidents such as copper theft and gun shots to insulators should not be reported. These types of minor events do not affect the reliability of the BPS. Existing reporting requirements are satisfactory. The focus of reporting should be on reliability related incidents and not incidents related to vandalism as such.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). Reporting threasholds will be determined during the next step of the Standards Development process. The DSR SDT agrees with your comments on vandalism but a balance must be further explored to meet industry and regulatory requirements specifically under FERC Order 693.		
Consumers Energy Company	No	The existing guidelines ignore the fact that there are currently three overlapping and inconsistent reporting requirements for disturbances of various types: CIP-001, EOP-004, and DOE OE-417. The reporting should be such that any single event type needs to be reported only once, and to only a single agency, for any

Organization	Yes or No	Question 1 Comment
		disturbance. First, CIP-001 events should be reported to the ES-ISAC under one specific requirement (or set of requirements) and removed from OE-417 and EOP-004, such that all interested agencies obtain their information from only that one source. Second, OE-417 events should be reportable ONLY to DOE, and, again, other agencies should obtain their information from only that one source. If NERC wishes to make such reporting mandatory and enforceable, the NERC requirements should indicate ONLY that such reporting should be made in accordance with OE-417. Finally, EOP-004 (or similar requirements) should require reporting to NERC ONLY in the case of events that don't fit under CIP-001 or OE-417 requirements. Alternatively, OE-417 should be submitted ONLY to NERC and they should disseminate the information.EOP-004 has several issues and inconsistencies: a. EOP-004 requires that the entity that submits form DOE-417 to provide copies to NERC. The DOE-417 form intermixes NERC entity definitions (e.g. BA, LSE, TO) with generic terms such as "Electric Utilities" and "Generating Entities". Is it the Generator Owner or Generator Operator that is required to submit the information? There should be one form or at least well defined definitions that apply to both forms. b. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-0 which purports to summarize the standard appears to change this requirement to 1 hour for several disturbances. Additionally, it incorrectly summaries the reporting time for 50,000 customers, which is 6 hours in DOE-417 and summarized in Table 1-EOP-004-0 as 1-hour. An attachment to a standard should not be allowed to supersede the standard or create additional rules. c. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-0 which purports to summarize the standard appears to change the standard. R3.1 clearly states that events are to be reported within 24 hours of identification, however Table 1-EOP-004-0 state that the events are to be reported on the basis of the start of the disturbance. An attachment to a standard should not be allowed to supersede the standard or create additional rules. d. EOP-004-1 R3.1 requires submittal within 24 hours, however Table 1-EOP-004-0 which purports to summarize the standard appears to change the standard. R3.1 clearly states that events are to be reported within 24 hours of identification, however Table 1-EOP-004-0 states that copies of DOE-417 are required to be submitted "simultaneously". It also states that schedules 1 and 2 are due within 24 hours of start of the event instead of 48 hours for per DOE-417 for schedule 2. An attachment to a standard should not be allowed to supersede the standard or create additional rules. e. The requirement of loss of customers should be scaled based on customers served. Loss of 50,000 customers to a utility that serves 100,000 customers is different than loss of 50,000 customers to a utility that serves 2,000,000 customers.

Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and

Organization	Yes or No	Question 1 Comment
ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT agrees that present Reliability Standards can be complicated and lead to confusion when working on maintaining system reliability in the area of reporting per CIP-001-1 and EOP-004-1. We will consider the disagreements you've identified in existing reporting requirements when we develop the proposed requirements.		
Central Lincoln	No	The guidance document makes no distinction between entities that operate 24/7 dispatch and those that don't. The 1 hour and even the 24 hour reporting requirements in some cases will be impossible for entities without 24/7 dispatch to meet without changing business practices. These are the same entities that present little or no risk to the BES.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT will take into consideration what Registered Entities are to be included within the yet to be written standard(s) based on the SAR. The DSR SDT will establish the "requirements necessary for users, owners, and operators of the Bulk-Power-System" as stated in FERC Order 693, paragraph 617 and the difference in reporting of events on the BES, as stated in the Purpose statement of EOP-004-1. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
MRO's NERC Standards Review Subcommittee	No Then Yes	We agree with using the present documentation but would like just one reporting form. We are concerned that the guidelines and reporting periods specified within the DOE OE-417 report conflict with the NERC Guidelines. For example. DOE OE-417 report requires "Suspected Physical or Cyber Impairment" to be reported within 6 hours. The NERC guidelines indicate "Suspected Activities" are to be reported within 1 hour. We recommend the SDT use the DOE OE-417 report as a guiding document, and then determine additional reporting requirements using guidance from the NERC Guideline. FERC Order 693 appears to indicate conflicts and confusion with NERC reporting requirements and DOE reporting requirements should be eliminated.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT is looking to streamline required reporting actions and remove any redundant reporting requirements if at all possible. The DOE Form OE-417 is currently mandatory under Public Law 93-275 for entities within the juristicion of the U.S Department of Energy. We will consider the disagreements you've identified in existing reporting requirements when we develop the proposed requirements.		
Luminant	No Then Yes	While the guidance is generally ok in the "NERC Guideline: Threat and Incidence Reporting", the reporting timelines include 1 hour, 2 hours, 4 hours, 6 hours, 8 hours, 24 hours, and 48 hours. Please simplify and reduce the variation in timelines. When it comes to Sabotage reporting, some time requirements start with detection, some start with determination of sabotage and some events do not specify the trigger for the reporting clock to start. Again, please provide clarity and consistency around the start of the timeline for

Organization	Yes or No	Question 1 Comment
		reporting. Generally, the reporting timing should start with the recognition or determination that a suspected or known sabotage event occurred.
Response: The DSR SDT thanks you for your comment. The DSR SDT is looking to streamline required reporting actions and remove any redundant reporting requirements if at all possible. The DSR SDT agrees that present Reliability Standards can be complicated and lead to confusion when working on maintaining system reliability in the area of reporting per CIP-001-1 and EOP-004-1. We will consider your specific suggestion for less variation in reporting timeframes, when we develop the proposed requirements.		
We Energies	No Then Yes	While the NERC Guideline includes readily discernible information (and we would like to see that format carried forward into any future documentation), utilize OE-417 as the foundation document in order to eliminate reporting redundancies. If supplemental references are necessary for the proposed resolution, list the document as an official attachment to the standard. Minimize the need to search in multiple locations for guideline information - some may not be aware supporting documentation exists without explicit reference within the standard.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT is looking to streamline required reporting actions and remove any redundant reporting requirements if at all possible. The DSR SDT agrees that present Reliability Standards can be complicated and lead to confusion when working on maintaining system reliabiltiy in the area of reporting per CIP-001-1 and EOP-004-1. The DOE Form OE-417 is currently mandatory under Public Law 93-275 for entities within the juristicion of the U.S Department of Energy. We will consider your recommendation regarding listing supplemental references within the body of the standard when we draft the proposed standard(s).		
American Electric Power	Yes	
Bandera Electric Cooperative, Inc.	Yes	
Calpine Corp.	Yes	
Duke Energy	Yes	
Edison Mission Marketing & Trading	Yes	

Organization	Yes or No	Question 1 Comment
Exelon	Yes	
Independent Electricity System Operator	Yes	
PacifiCorp	Yes	
Platte River Power Authority	Yes	
Central Hudson Gas & Electric	Yes	Central Hudson agrees with using the “NERC Guideline: Threat and Incident Reporting” in the development of requirements. Central Hudson has currently in place a NERC-DOE Threat and Incident Reporting Table developed from this NERC Guideline that allows for a quick-reference to all threat and incident reporting criteria (arranged by category)with a cross-reference to the specfic reporting form (NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report, DOE Form OE-417, or NERC ES-ISAC Threat and Incident Report Form). Central Hudson recommends maintaining the option of utilizing only 1 form, the DOE Form OE-417, for incidents that require reporting to the DOE and NERC to maintain the streamlined approach to this reporting process.
Response: The DSR SDT thanks you for your comment. The DSR SDT is looking to have a single reporting report form (per question 3) and streamline the reporting processes that may be developed within ~~a~~ yet to be written requirement(s).		
E.ON U.S. LLC	Yes	E.ON U.S. believe that the guidelines provide greater clarity for reporting forced outages caused by disturbances and sabotage but there remains issues that in need of further clarification. For example, there remains too much subjectivity on the reporting of forced outages when there is “identification of valuable lessons learned”
Response: The DSR SDT thanks you for your comment. The DSR SDT concurs that further clarification is required with the ambigious statement “identification of valuable lessons learned” contained in the guideline – use of this phrase does not meet the technical writing threshold required for inclusion in a NERC Standard. The DSR SDT’s intent was to look at the posted NERC Guideline and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). Recommendation of changes to the “NERC Guideline: Threat and Incident Reporting” should be submitted to NERC via the Critical Infrastructure Protection Committee. I		
Public Service Enterprise Group Companies	Yes	EOP reportable disturbances are familiar concepts in the industry.

Organization	Yes or No	Question 1 Comment
Response: The DSR SDT thanks you for your comment and support.		
Orange and Rockland Utilities, Inc.	Yes	However, the SDT needs to maintain clear demarcation for the criteria for reporting events, and only those events that directly effect the reliability of the BES.
Response: The DSR SDT thanks you for your comment. The DSR SDT has been directed to review all disturbance type activities and submit to the industry a well thought out set of requirements that clearly define disturbance events and what information is required to enhance an entity'ssituational awareness. Clear demarcation for the criteria for reporting will be determined in the near future based on the approved SAR and industry feedback. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
Wolverine Power Supply Cooperative, Inc.	Yes	I agree with referencing existing guidelines - However: My concern is that, until all reportable incidents are analyzed by the parties to which they are reported, their "impact" on the BES will not be quantified. Therefore, the tendency to want to "report all events so that their impact can be determined" or "report all events because the information can be utilized for informational purposes, regardless of impact on BES" might lead to expanded reporting requirements, some of which may have questionable value from a reliability standpoint.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if the DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has been directed to review all disturbance type activities and submit to the industry a well thought out set of requirements that clearly define reportable events and what information is required to enhance an entity's situational awareness. Clear demarcation for the criteria for reporting will be determined in the near future based on the approved SAR and industry feedback. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
Hydro-Québec TransEnergie (HQT)	Yes	In considering guidance found in the document "NERC Guideline: Threat and Incident Reporting", the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
Northeast Power Coordinating Council	Yes	In considering guidance found in the document "NERC Guideline: Threat and Incident Reporting", the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
Response: The DSR SDT thanks you for your comment. The DSR SDT will establish the "requirements necessary for users, owners, and operators of		

Organization	Yes or No	Question 1 Comment
the Bulk-Power-System" as stated in FERC Order 693, paragraph 617 and the difference in reporting of events on the BES, as stated in the Purpose statement of EOP-004-1. The intent of the proposed standard(s) is to address reporting needed for after-the-fact analyses of events as well as reporting necessary for situational awareness.		
Western Electricity Coordinating Council	Yes	It is comprehensive; however, we must keep in mind that the OE-417 is required under Public Law 93-275 and needs to be attached if applicable in the US.
Response: The DSR SDT thanks you for your comment.		
Oncor Electric Delivery Company LLC	Yes	NERC Guideline: Threat and Incident Reporting" document should be used for guidance as it identifies best practices for reporting.
Response: The DSR SDT thanks you for your comment.		
Manitoba Hydro	Yes	The "Threat and Incident Reporting" document contains a lot of detailed information which greatly assists in determining reporting events and weaning out non important events. The document contains some examples and expected reporting time lines. Attachment 1-EOP-004, though considerably smaller and condensed it does contain some detail not mentioned in "Threat and Incident Reporting". Integrating the "Threat and Incident Reporting" into Attachment 1-EOP-004, though large in size, has lots of information and is easy to follow would be a large improvement to existing protocol OR SEE QUESTION 3 COMMENTS. Incidences we have experienced on our system, in past were difficult to delineate as reportable, who to report to and when. An improvement to this Standard is welcome.
Response: The DSR SDT thanks you for your comment. The DSR SDT is looking to streamline and remove any redundancies within the NERC Standard's requirements.		
Constellation Power Source Generation	Yes	The existing guidance is an excellent base on which to build changes to EOP-004 and CIP-001. However, the SDT must challenge each item in the different event categories and clarify or omit bullet points that are seemingly vague. For example, under System Disturbances, a forced outage report is needed when "a generation asset of 500 MW or above is on a forced outage for unknown reasons, or a forced outage of generation of 2,000 MW occurs..." Simply removing the 500 MW criteria would make this criterion less vague. There are other examples of this in the guideline.
Response: The DSR SDT thanks you for your comment. The DSR SDT is looking to streamline and remove any redundancies within the NERC Standard's requirements. It is the intent of the SDT to carefully review the different event categories and provide clarity where needed to remove ambiguity.		

Organization	Yes or No	Question 1 Comment
ISO RTO Council Standards Review Committee	Yes	The guidelines in EOP-004 and its attachments should be retained as the foundation for reporting disturbances. One would note that such EOP Disturbances are relatively well defined reliability impacts. Thus EOP-004 disturbances are based on HOW certain events impacted the BES. [Sabotage on the other hand requires an implication of WHY an event occurred.]The original EOP-004 represents a common sense approach to defining reliability events that may be useful to analyze on a regional basis. In the current environment, Regions are not sanctionable entities but they still are valuable sources to collect, analyze and trend the few disturbances that occur in each region. To make use of Regions, however, precludes the use of sanctionable NERC standards. EOP-004 as written does not meet the NERC requirements for standards but it does meet the Industry needs for a guideline for reporting events that deserve to be reviewed. The SDT should propose deleting EOP-004 and use it as a Disturbance Reporting Guideline.
Response: The DSR SDT thanks you for your comment. Regions are required to comply with requirements in NERC Reliability Standards – however Regions are not sanctioned the same way as users, owners and operators of the bulk power system – if a Region fails to comply with a NERC Reliability Standard, it can be fined for failure to comply under the ERO's Rules of Procedure.		
USBR	Yes	The reporting outlined in the proposed plan does not include a clear indication of how NERC will use the information they collect from the entities. Care needs to be taken in addressing the reporting requirements to not create a more confusing or onerous reporting process.
Response: The DSR SDT thanks you for your comment. It is anticipated that NERC will analyze events to assess trends and identify lessons learned for industry feedback and reliability improvement.		
FirstEnergy	Yes	This guideline appears to be a good starting point for developing consistency in reporting. However, we believe that after-the-fact event reporting is administrative in nature and seldom rises to the level of mandated reliability standard requirements. It is not clear what reporting would be made through this effort and how it differs from reporting made through the NERC Reliability Coordinator Information System (RCIS). With the initiative for more results-based standards being the goal of NERC, true after the fact reporting-type requirements should become administrative procedures and only be included in standards if they are truly required for preserving an Adequate Level of Reliability. If there are aspects that rise to be retained in a mandatory and enforceable reliability standard, we propose that those associated with sabotage be moved to CIP-001 and that EOP-004 be focused on operational disturbances that warrant wide-area knowledge. However, if the RCIS is the mechanism to convey real-time information and that is presently occurring outside of reliability standards, it is unclear what the delta improvement this project aims to achieve.
Response: The DSR SDT thanks you for your comment. As stated in FERC Order, 693, paragraph 611, "Complete and timely data is essential for analyzing system disturbances" and in paragraph 617, "the Commission directs the ERO to develop a modification to EOP-004-1 through the		

Organization	Yes or No	Question 1 Comment
Reliabiloity Standards development process that includes any requirements necessary for users, owners, and operators of the Bulk-Power-System to provide data that will assist NERC in the investigation of a blackout or disturbance". Some data is needed, therefore, for after-the-fact analyses. In addition, some data is needed much more quickly for situational awareness. The DSR SDT will analize and determine what constitues a reportable event and what information is required for situational awareness as opposed to after the fact analyses of events.		
Portland General Electric	Yes	This process is in place and utilities are familiar with it. This is a good place to start.
Response: The DSR SDT thanks you for your comment and support.		
Ameren	Yes	We agree that it makes sense to build upon existing documentation. However, we do not believe it is necessary to require event reporting to be in an enforceable standard. Rather the drafting team should consider developing a reporting guideline document and retiring the EOP-004 standard.
Response: The DSR SDT thanks you for your comment. As stated in FERC Order, 693, paragraph 611, "Complete and timely data is essential for analyzing system disturbances" and in paragraph 617, "the Commission directs the ERO to develop a modification to EOP-004-1 through the Reliabiloity Standards development process that includes any requirements necessary for users, owners, and operators of the Bulk-Power-System to provide data that will assist NERC in the investigation of a blackout or disturbance". Some data is needed, therefore, for after-the-fact analyses. In addition, some data is needed much more quickly for situational awareness. As envisioned, the requirements developed under this project will address both types of reporting requirements.		
Midwest ISO Standards Collaborators	Yes	We agree that it makes sense to build upon existing documentation. However, we do not believe it is necessary to require event reporting to be in an enforceable standard. Rather the drafting team should consider developing a reporting guideline document and retiring the EOP-004 standard. This is further supported by the fact that there is a role in the existing standard for the Regional Entities even though these requirements can't be enforced against the Regional Entities because they are not a user, owner or operator of the system.
Response: The DSR SDT thanks you for your comment. As stated in FERC Order, 693, paragraph 611, "Complete and timely data is essential for analyzing system disturbances" and in paragraph 617, "the Commission directs the ERO to develop a modification to EOP-004-1 through the Reliabiloity Standards development process that includes any requirements necessary for users, owners, and operators of the Bulk-Power-System to provide data that will assist NERC in the investigation of a blackout or disturbance". Some data is needed, therefore, for after-the-fact analyses. In addition, some data is needed much more quickly for situational awareness. As envisioned, the requirements developed under this project will address both types of reporting requirements.		
Dynegy Inc.	Yes	We agree with using the guidance; however, please consider revising the NERC Guideline: Threat and Incident Reporting document to (i) lengthen the reporting timelines related to attempted sabotage to allow for

Organization	Yes or No	Question 1 Comment
		additional time to deem the threat credible, (ii) expand the description of forced outage of generation greater than 2000 MW to include whether it is at the BA or GO level and if GO level, whether it is for one site or the combined GO's sites in a Region, and (iii) add a Responsible Party column to the Appendix A matrix.
Response: The DSR SDT thanks you for your comment. Recommendation of changes to the "NERC Guideline: Threat and Incident Reporting" should submitted to NERC via the Critical Infrastructure Protection Committee since that falls outside the scope of the SAR. We will consider your specific suggestions for revisions to reporting requirements when we develop the proposed requirements.		
BGE	Yes	We have no problem with NERC using the existing guidance as the foundation for disturbance reporting; however, since this project proposes to investigate incorporation of the Cyber Incident reporting aspects of CIP-008, we feel that if adopted, this concept should be added to the NERC Guideline document "Threat and Incident Reporting".
Response: The DSR SDT thanks you for your comment. Recommendation of changes to the "NERC Guideline: Threat and Incident Reporting" should submitted to NERC via the Critical Infrastructure Protection Committee since that falls outside the scope of the SAR.		
Electric Market Policy	Yes	Yes; however, in considering guidance found in the document "NERC Guideline: Threat and Incident Reporting" the SDT should maintain focus on only those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. In fact, the purpose of reporting per EOP-004 is that disturbances... need to be studied and understood to minimize the likelihood of similar events in the future.
Response: The DSR SDT thanks you for your comment. The DSR SDT will establish the "requirements necessary for users, owners, and operators of the Bulk-Power-System" as stated in FERC Order 693, paragraph 617 and the difference in reporting of events on the BES, as stated in the Purpose statement of EOP-004-1. As envisioned, the requirements developed under this project will address reporting requirements that are used for after-the-fact analyses as well as reporting requirements that are associated with situational awareness.		

2. The DSR SDT is considering developing a reporting hierarchy for disturbances that requires entities to submit information to the Reliability Coordinator and then for the Reliability Coordinator to submit the report. Do you agree with this hierarchy concept? Please explain your response (yes or no) in the comment area.

Summary Consideration: Most stakeholders (about 2/3) agree with the concept of developing a reporting hierarchy for disturbances. Stakeholders who disagreed believed that the RC should be one of many to receive information on impact events (DOE, RRO, etc.). Such a hierarchy would lead to reporting delays (leading to lack of situational awareness), be cumbersome and complicated and clouds responsibility for who is to report what to whom. Other negative comments believed that a hierarchy would distract the RC's focus from its primary responsibility. Thos stakeholders who agreed commented that the RC should be the collection point for reports and information and take the responsibility to forward as required. This is from the concept that the RC has the "wider view" and can recognize patterns, and has the ability to "escalate" the reporting process. This would also minimize duplication of reports and information.

Organization	Yes or No	Question 2 Comment
BGE	No	As currently worded, BGE opposes the reporting hierarchy concept, since insufficient guidelines were proposed to prevent translation errors between the responsible entity (RE) and the RC. In addition to creating possible reporting errors, this also opens a risk that the RC could misrepresent the true intent of an RE's report contents if called upon to explain/justify a submitted report. Reporting delays are another concern with this proposal because the RE would basically be relinquishing control of the reporting process to the RC, while ultimately retaining the responsibility for ensuring the report gets submitted within the required timeframe. However, BGE recognizes that avoiding duplication and conflicting reports as well as encouraging communication are valuable. To make the reporting hierarchy concept acceptable to BGE, the DSR SDT must develop proper controls to ensure the RE has the ability to control or approve the information submitted and/or subsequently discussed with the respective authorities, and that it is done within the permissible timeframe to satisfy compliance requirements.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk is not transferred, and a mechansim to ensure the Responsible Entity's reported information remains as submitted.		

Organization	Yes or No	Question 2 Comment
Consumers Energy Company	No	It would be inefficient for RC's to accumulate ALL disturbance data and submit it, and to bifurcate the reporting based on type of disturbance above and beyond OE-417 data (which should go ONLY to DOE) would make a standard very involved for an entity to comply with. We're discussing after-event data here, not data needed for current operations - and there's no reason to make it any more complicated than necessary.
Response: The DSR SDT thanks you for your comment. In order for a reporting hierarchy concept to be adopted, it will result in real effiency gains by eliminating duplication of reports. It will not be pursued if the result is a complicated or burdensome process for responsible entities.		
Exelon	No	Some of the DOE related reporting is driven by distribution events, i.e. outages greater then 50,000 customers, is it realistic to expect the RC, whose focus is on the transmission system to perform distribution related reporting?
Response: The DSR SDT thanks you for your comment. The DOE Reporting Form OE 417 is currently mandatory by Public Law and only applies to US entities and contains reporting thresholds that are not required by NERC. Our goal is to derive reporting thresholds that meet NERC's needs for information on bulk electric system disturbances and real-time events, not distribution level-only problems.		
USBR	No	The existing reporting methods collect reports of disturbances and analyze them by committees of the respective coordinating councils. The new process would introduce a duplicate layer and associated staffing. It would be better to ensure communication between the existing committees of the respective coordinating councils and the RC rather than creating a new layer of review tracking and analysis. While the layered reporting hierarchy discussed in the Disturbance Reporting section of the paper will eventually help with overall event awareness, the additional delays the hierarchical approach could result in a decrease in situational (timely) awareness. Having more comprehensive information as a result of the potential enhancements each layer adds to the chain of reporting may not be more valuable than timely and well disseminated information in an actual disturbance situation. We would suggest the SDT give careful consideration to this proposed direction. It may be appropriate to consider that expedited reporting of operational impacts would outweigh the benefit of administratively intensive reporting procedures. The events reported through the existing process have not yielded material feedback other than statistical analysis. Statistical analysis is not as sensitive to timely reporting. Operational impacts which may be the result of possible sabotage may be evident through assessment of widespread outage patterns or following event analysis. Comprehensive event analysis can take anywhere from 15 days to 90 days depending on the event.
Response: The DSR SDT thanks you for your comment. We agree that reporting timeliness must be weighed against the percieved benefits of a reporting hierarchy. If the reporting hierarchy concept is adopted, it should include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and a process to ensure the responsible entities' reported information remains as submitted. Also it must result in real effiency gains and support the reliability of the bulk electric system.		

Organization	Yes or No	Question 2 Comment
ISO RTO Council Standards Review Committee	No	The idea of a reporting hierarchy provides an easy to follow pro forma approach. But disturbance reports should not always follow a common reporting path. A disturbance on the transmission system for example need not be routed through an "if applicable" Balancing Authority. To mandate that a BA be in the path is inappropriate. To leave the applicability open is to create a subjective compliance problem for the impacted BA. Copper theft is another example that should not require reporting up through the RC. It is a local issue and the Transmission Owner should be able to report this directly to the appropriate parties. How would a DP, LSE or GO know if an event is an "impact event"? The posed impact events are a series of conditions for sabotage but not for EOP-type disturbances. The aforementioned entities have no requirement to monitor and analyze the BES, which then means every event would be an impact event for those entities (not an EOP disturbance but an impact event). Thus every theft of copper is an impact event mandating a Disturbance Report even though the SDT notes the RC only has to send it to the "local authorities". This seems to be a misuse of the RC resources; every train derailment is an impact event requiring a Disturbance report (is that a commercial train, regional rail line a local trolley car); every teenage prank would also generate an impact event mandating a disturbance report. The SDT defined impact events are not appropriate for use in defining disturbances. There is a big difference from creating a set of guidelines to follow as opposed to creating sanctionable standards
Response: The DSR SDT thanks you for your comment. Furthermore, impact events should not include copper theft or other conditions that pose no threat to the reliability of the BES. A train derailment is only an impact event if it threatens some element of the bulk electric system such as a transmission line corridor - the deraillment in itself is not an impact event. See more on impact events under the responses to Question 3.		
Bonneville Power Administration	No	The RC is made aware of these type of incidents and goes right back to incorporating that in their awareness and to focusing on system reliability. If the RC is the recipient for further distribution of information of this type they will be forever going back for more information. Eliminate the middleman in whatever concept you propose, folks have plenty to do now. Let people make good judgments with the direct field people on the seriousness of the breach with their security personnel contacting the appropriate law enforcement agency. (Or are you looking to do a simple RE reports to the RC who marks various category items on a secure website Yes/No category item indicator that can be rolled up in ES-ISAC map board?)
Response: The DSR SDT thanks you for your comment. The Reliability Coordinator's suggested role in this is to allow them to incorporate the relevant data from responsible entities in their footprint for further analysis.		
Duke Energy	No	The RC should not be responsible for submitting the report to FERC, NERC or the RRO. The RC may not have the necessary first hand information concerning the facts of the event. Situation awareness can be maintained by including the RC in the distribution of any sabotage related reporting.

Organization	Yes or No	Question 2 Comment
SERC Reliability Coordinator Sub-committee (RCS)	No	The RC should not be responsible for submitting the report to FERC, NERC or the RRO. The RC may not have the necessary first hand information concerning the facts of the event. Situation awareness can be maintained by including the RC in the distribution of any sabotage related reporting.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and a process to ensure the responsible entities' reported information remains as submitted. Also it must result in real effiency gains and support the reliability of the bulk electric system.		
ERCOT ISO	No	There are some events that are truly local and should be handled by local entities and reported to local authorities (i.e. theft). If there is an impact or potential to have an impact to the BES or to the region, then hierarchical reporting would be appropriate.
Response: The DSR SDT thanks you for your comment. We agree - a clearly defined impact event criteria would do just as you suggest - leave local issues on the local level.		
Northeast Power Coordinating Council	No	This is not a standards issue, and NERC should not dictate the reporting structure. It should be left to the RCs and their members.
Response: The DSR SDT thanks you for your comment. In defining a disturbance reporting hierarchy we sought to realize efficencies. If the reporting hierarchy concept is adopted, it must result in real effiency gains and support the reliability of the bulk electric system. It will not be adopted if the result in a complicated or burdensome process for responsible entities.		
MRO's NERC Standards Review Subcommittee	No	We agree a coordinated reporting process is beneficial for the entity and the Reliability Coordinator (RC). However, a hierarchy would likely lengthen the reporting timeframe, or reduce the allotted time for each entity to provide notification to the RC in order to meet DOE or NERC timelines. Communication and coordination with the RC would likely provide more accurate and complete data submissions within a timely process and create shared accountability for the report being submitted.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and some mechansim to ensure the responsible entities's reported information remains as submitted.		

Organization	Yes or No	Question 2 Comment
Midwest ISO Standards Collaborators	No	We do not agree with developing a hierarchy for reporting for all disturbances and impacting events. For instance, copper theft is an example of an item that should be reported to the appropriate entities directly by the Transmission Owner. The RC does not need to be made aware of every copper theft unless it has a direct impact on reliability (affects rating, protection system, etc.) and the RC should not be burdened with expending resources for this reporting. A further example in which the hierarchy is not needed would be the case in which only one entity is impacted. If a significant event occurs on one TOP's system, then the TOP should be able to handle the reporting of all entities under its purview. If more than one TOP is involved, then it would be necessary to involve the RC in the reporting.
Response: The DSR SDT thanks you for your comment. The reporting hierarchy concept is meant to apply only to disturbance reporting. We agree that copper theft and other situations that do not pose a direct threat to reliability shouldn't be reported to NERC through this standard.		
FirstEnergy	No	While we appreciate the team's effort to serialize the reporting process, with the electronic communication methods available today, it seems that reporting can be accomplished simultaneously to multiple entities without shifting the burden of reporting to others along the communications path. This is particularly true if the reporting format is standardized to a one-size-fits-all report. Additionally, it would be a great burden to the Reliability Coordinator to review all events perceived by entities to be malicious sabotage events.
Response: The DSR SDT thanks you for your comment. The reporting hierarchy concept would only apply to disturbance reporting, not impact events. The Reliability Coordinator's suggested role in this to allow them to incorporate the relevent datea from responsible entities in their footprint for further analysis. We will consider your suggestion of simulataneous submissions as a means to effectively notify the necessary parties.		
Edison Mission Marketing & Trading	Yes	
PacifiCorp	Yes	
SPS Consulting Group Inc.	Yes	
Calpine Corp.	Yes	A Functional Entity such as a Generator Owner/Operator is not always aware that an event, such as a plant trip, is part of a wider system disturbance that rises to the level of a reportable event under EOP-004. A reporting hierarchy that allows a Generator to report the facts to its Transmission Operator and have that entity take a wider view to determine whether there is a disturbance should facilitate the reporting of actual disturbances. The SDT needs to ensure that some thought goes into the flow of information within the hierarchy and what triggers are needed to drive the reporting up the hierarchy.

Organization	Yes or No	Question 2 Comment
Response: The DSR SDT thanks you for your comment. A reporting hierarchy process must include clear triggers for reporting and provide an efficient, well-defined information flow.		
We Energies	Yes	A hierarchical approach in conjunction with a single, electronic form would provide consistent reporting timelines, provide clarity in the reporting process, and provide more accurate and meaningful data submissions while having shared accountability. Confusion in the current method could be alleviated while providing more consistency in the reporting of an "impact event".
Response: The DSR SDT thanks you for your comment.		
Arizona Public Service Company	Yes	All disturbance reporting should go through the RC.
Response: The DSR SDT thanks you for your comment.		
Constellation Power Source Generation	Yes	As stated in the concept paper, a hierarchy ensures proper communications, but it has the added benefit of reducing redundancy on the Registered Entities, so long as responsibilities and accountability are clearly established.
Response: The DSR SDT thanks you for your comment.		
Central Hudson Gas & Electric	Yes	Central Hudson agrees with this reporting hierarchy for disturbances given the "wider-view" of the Reliability Coordinator as opposed to an entity such as a Transmission Owner or Load-Serving Entity. While, based on past experience, the current process works if reports are filed to the DOE, RRO, and RC simultaneously via email for example. However, the RC is in a better position to identify multi-site incidents and escalate the reporting process if necessary.
Response: The DSR SDT thanks you for your comment.		
Wolverine Power Supply Cooperative, Inc.	Yes	From the perspective of a TOP, this seems to alleviate reporting burden and move it up line. I can understand the logic in wanting the reporting to flow through the RC for awareness purposes, but I can understand the RC's reluctance to bear the additional potential burden. Again, a focused effort to minimize the necessary reporting to 'true impact events" should be kept in mind, regardless of who has to report. Collecting reams of data and figuring out what impact it has later should not be the goal.

Organization	Yes or No	Question 2 Comment
Response: The DSR SDT thanks you for your comment. We agree that regardless of any reporting hierarchy, the goal is to report on disturbances and events with meaningful impact on the bulk electric system. See Question 3 responses for more information on how we view impact events.		
Electric Market Policy	Yes	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System.
Hydro-Québec TransEnergie (HQT)	Yes	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System. The reporting hierarchy should be to submit the information to the Reliability Coordinator, and to have the RC submit the report. This would eliminate the duplication of information.
Orange and Rockland Utilities, Inc.	Yes	Having the reporting flow through the Reliability Coordinator supports the reliability objective of assessing, monitoring, and maintaining a wide-area view of the reliability of the Bulk Electric System. The reporting hierarchy should be to submit the information to the Reliability Coordinator, and to have the RC submit the report. This would eliminate the duplication of information.
Response: The DSR SDT thanks you for your comment.		
Lands Energy Consulting	Yes	I would give the RC the authority to establish impact thresholds for reporting. Consistent with my earlier comment, I would set the materiality threshold for disturbance reporting purposes at LSEs (or a combination of LSEs in the case of BPA) serving at least 90,000 customers.
Response: The DSR SDT thanks you for your comment. Reporting thresholds in the standard will meet NERC requirements: Reliability Coordinator's may have different reporting criteria to meet Regional requirements, but they will not appear in this yet to be written Standard.		
Central Lincoln	Yes	In the west at least, this hierarchy should be extended to include BA's as indicated in the Concepts Paper. See: http://www.bpa.gov/corporate/business/reliability/Docs/2007/PNSC_RE_Data_Letter_2_070723.pdf for the RC's policy on which entities it chooses to communicate with.

Organization	Yes or No	Question 2 Comment
Response: The DSR SDT thanks you for your comment. The hierarchy concept includes BAs as appropriate in the reporting structure.		
Luminant	Yes	Luminant believes that one report should be filed with the Reliability Coordinator or one responsible entity, who then files the report with all applicable entities.
Response: The DSR SDT thanks you for your comment.		
Oncor Electric Delivery Company LLC	Yes	Oncor agrees that with this reporting hierarchy, in that dual reporting should be eliminated
Response: The DSR SDT thanks you for your comment.		
Portland General Electric	Yes	PGE is familiar with and works closely with WECC today so the hierarchial consideration makes sense.
Response: The DSR SDT thanks you for your comment.		
Platte River Power Authority	Yes	Situational awareness would be enhanced. All affected entities would be aware of the disturbance and relevant information. Also, the flow of information between entities would be enhanced and a more comprehensive report could be developed.
Response: The DSR SDT thanks you for your comment.		
Ameren	Yes	The hierarchy is appealing in the fact that the TOP/BA will be kept in the loop and receive critical information from the Generators, Distribution, LSE, etc. But there will be an inherent delay in reporting due to the fact that at every hand-off of information there will be questions for additional and/or clarified information, and there is always a possibility for the loss of information due to the transfer from one entity to the next. Further, this reporting through a hierarchy could also take away from the operators ability to respond to system events due to being tied to an information transfer ladder.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and some process to ensure the responsible entities' reported information remains as submitted. It must also ensure that it does not place any extra burden on operators that could create an additional risk to reliability.		

Organization	Yes or No	Question 2 Comment
E.ON U.S. LLC	Yes	The hierarchy will simplify reporting from the entity in that the RC is always notified and then the RC notifies other parties as required, (with the exception of OE-417, which still has to be filled out per law) E.ON U.S. recommends that the drafting team pay particular attention to the report process to make sure that duplicate reports are not being required. Currently information on forced outages is already communicated to the RC so formalizing a requirement to provide data to the RC may represent duplication to reports already provided.
Response: The DSR SDT thanks you for your comment. Avoiding duplication is a key goal of the drafting team.		
Public Service Enterprise Group Companies	Yes	The PSEG Companies believe that all entities with a reportable disturbance should report to the RC. The RC is best positioned to evaluate the impact of the event and forward the information to the appropriate entities. There should not be any intermediate entities to relay information to the RC as that can introduce delay and has the potential to introduce transcription errors. Sabotage events should be reported to the RC as well as to law enforcement. CIP-008 reporting is highly specialized and should be retained in the set of cyber security standards, not merged with CIP-001 and EOP-004.
Response: The DSR SDT thanks you for your comment. Detection of cyber events may be specialized but report of them is not. Threats to reliability must be reported no matter what the cause. The DSR SDT proposes using the thresholds found in CIP-008 - this standard would provide a one stop form to submit the information. Note that the current CIP-008 has a reporting requirement to the ES-ISAC only.		
Manitoba Hydro	Yes	The Reporting Concept states that the new hierarchy is, “Affected entity to TOP/ BA to RC. Then the RC will then submit to NERC and DOE (if required)”.This will enhance the existing requirement EOP-004-1 R4 which states that the RC shall assist the affected entity by providing representatives to assist in the investigation (this is also all reiterated in Attachment 1-EOP-004) .In an disturbance, the local resources would be tied up in the rectification of the problem. Analyzing and reporting the event (is it reportable, who to report to, what is the timeline) is distracting and time consuming. By leaving the final upper level steps of reporting to NERC/DOE by the RC would be efficient.
Response: The DSR SDT thanks you for your comment.		
Western Electricity Coordinating Council	Yes	There should be an established time sequence that allows the RC to review the entities material prior to forwarding to NERC. By channeling all reports through the RC situational awareness will be enhanced. Instead of "submit information", it should be clarified that entities submit complete written reports to RC in electronic format.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and a process to ensure the responsible entities’ reported information remains as submitted.		

Organization	Yes or No	Question 2 Comment
American Electric Power	Yes	This approach may work as long as there is a uniform process across all of the Reliability Coordinators. AEP owns and operates BES facilities under three separate RCs and having differing rules and processes would create confusion and additional burdens. There are some concerns about the time lag of reporting the information and this might not work well in all cases especially if the information and knowledge are at the local level. AEP recommends that the standard could have a default hierarchy, but this should not prohibit any entity from reporting directly.
Response: The DSR SDT thanks you for your comment. Our goal is uniform reporting criteria to meet specified requirements. We will consider the risks and benefits of allowing a default hierarchical reporting structure with the ability for responsible entities to report directly to NERC.		
Bandera Electric Cooperative, Inc.	Yes	This approach, while I suspect will not be universally agreed to, should provide some definitive guidance in reporting.
Response: The DSR SDT thanks you for your comment.		
Dynegy Inc.	Yes	This seems to be straightforward approach in that the RC is the best judge of threats to the overall system and could eliminate multiple reports of a single event.
Response: The DSR SDT thanks you for your comment.		
Independent Electricity System Operator	Yes	We do not agree with the need of such a hierarchy setup solely for the purpose of making reports to the need-to-know entities. All responsible entities (RC, BA, TOP, etc.) need to file a report. With the proposed set up noted under Q3, which we support, these reports should go directly to NERC. The RC should not be held responsible for forwarding other entities' reports to NERC, and in doing so subject itself to potential non-compliance.
Response: The DSR SDT thanks you for your comment. If the reporting hierarchy concept is adopted, it will include controls to ensure timely reporting, clear accountability so that risk of a violation of the standard is not transferred, and a process to ensure the responsible entities' reported information remains as submitted.		

3. The goal of the DSR SDT is to have one report form for all functional entities (US, Canada, Mexico) to submit to NERC. Do you agree with this change? Please explain your response (yes or no) in the comment area.

Summary Consideration: Most stakeholders agreed with the concept of having one reporting form for all entities.

Several commenters suggested that there is no need for a standard on reporting as they considered it administrative in nature. Most thought it should be a guideline, rather than an enforceable standard.

There is widespread agreement that the one-size-fits-all approach would be very difficult to get agreement on, given the different countries and agencies involved. Many stakeholders pointed out that consistency and simplification were drivers for one report form.

Having multiple recipients, with different information requirements, seem to support an electronic format that would guide information only to those who need it. The concept of an electronic reporting tool would need to be further vetted and developed.

Organization	Yes or No	Question 3 Comment
Bandera Electric Cooperative, Inc.		No preference in this area.
ISO RTO Council Standards Review Committee	No	The SRC supports NERC's initiative for Results Based Standards. The SRC understood RBS to mean the results were reliability based quantities not administrative quantities. There is no need for a NERC Reliability standard on reporting. The idea that all functional entities in each of the said countries will use one form would be a good idea if and only if all the countries and all of their agencies were willing to accept that form. The SRC does not believe that those agencies will be willing to cede what information they ask for to NERC; nor that NERC will be able to create a single form that all such agencies will accept.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements. The set of results-based standards is intended to provide a 'defense-in-depth' approach to protecting reliability of the bulk power system. While many reports are administrative and are only used to assess compliance with specific requirements, the reporting addressed in this project is focused on providing data needed to support		

Organization	Yes or No	Question 3 Comment
after-the-fact analyses of events, and reporting information needed to maintain situaitional awareness. As such, the SDT believes that these reporting requirements do need to be enforceable.		
FirstEnergy	No	While one consistent form for reporting may simplify reporting requirements, it would be very difficult to get all governmental agencies to agree to a one-size-fits all approach.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Public Service Enterprise Group Companies	No	While simplification and consistency is a laudable goal, it should not be applied to different governmental agencies (USA, Canada, Mexico) which may have different structures and processes. Moreover, results based standards should not include administrative matters such as reporting forms.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements. The set of results-based standards is intended to provide a 'defense-in-depth' approach to protecting reliability of the bulk power system. While many reports are administrative and are only used to assess compliance with specific requirements, the reporting addressed in this project is focused on providing data needed to support after-the-fact analyses of events, and reporting information needed to maintain situaitional awareness. As such, the SDT believes that these reporting requirements do need to be enforceable.		
American Electric Power	Yes	
Constellation Power Source Generation	Yes	
Exelon	Yes	
PacifiCorp	Yes	
Platte River Power Authority	Yes	

Organization	Yes or No	Question 3 Comment
Calpine Corp.	Yes	A single approach is desirable, particularly for those entities that find themselves in multiple regions or countries.
Response: The DSR SDT thanks you for your comment.		
We Energies	Yes	Agree in conjunction with proposed concept that DOE OE-417 will be allowed to supplement the NERC report in lieu of duplicating entries.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Consumers Energy Company	Yes	Agreed - to the extent that it's consistent with the concept that any specific type of data is submitted to ONLY one entity.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Arizona Public Service Company	Yes	APS supports the standardization of the form for consistency and format.
Response: The DSR SDT thanks you for your comment.		
Bonneville Power Administration	Yes	As long as we don't make one form that requires extraneous information for the sake of having agreement.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		

Organization	Yes or No	Question 3 Comment
Western Electricity Coordinating Council	Yes	Canadian and Mexican entities should be consulted on content of report form to assure their "buy in".
Response: The DSR SDT thanks you for your comment. It is DSR SDT's intent to discuss the need for information with appropriate jurisdictional agencies.		
Central Hudson Gas & Electric	Yes	Central Hudson agrees with this goal if the intent is to develop and implement an electronic version that would meet DOE requirements as well.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
E.ON U.S. LLC	Yes	E.ON U.S. supports the proposal.
Response: The DSR SDT thanks you for your comment.		
MRO's NERC Standards Review Subcommittee	Yes	However, We believe the primary goal should focus on "each entity" being able to submit one report for all functional requirements. Entities in the US that are required to submit the DOE OE-417 form should not be required to submit an additional form developed for other entities (Canada & Mexico). One approach to satisfy this goal is for NERC to require all entities (US, Canada, & Mexico) to complete the DOE OE-417 form as their report.
Response: The DSR SDT thanks you for your comment.		
Wolverine Power Supply Cooperative, Inc.	Yes	I can't see how anyone would disagree with this concept - However - I question how practical it will be to implement, since various agencies would have to collaborate and coordinate to accomplish this task.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		

Organization	Yes or No	Question 3 Comment
Lands Energy Consulting	Yes	I think that the impact approach makes sense and that EOP-004 and CIP-001 are logically connected. Many entities of which I am aware link Sabotage Reporting Training to Disturbance Reporting obligation awareness already.
Response: The DSR SDT thanks you for your comment.		
Oncor Electric Delivery Company LLC	Yes	Oncor agrees that by using the same type reporting format, there should be consistency in regard to each functional entity's expectations.
Response: The DSR SDT thanks you for your comment.		
BGE	Yes	One form makes sense to us; less is better is the sense that it makes filing reports easier by not creating unnecessary complications.
Response: The DSR SDT thanks you for your comment.		
Ameren	Yes	One report would be great for this standard. While this standard needs simplification and automation, we strongly suggest developing a guideline for reporting rather than enforceable standards.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question “Describe the event” or “What steps did you take” on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements. The set of results-based standards is intended to provide a ‘defense-in-depth’ approach to protecting reliability of the bulk power system. While many reports are administrative and are only used to assess compliance with specific requirements, the reporting addressed in this project is focused on providing data needed to support after-the-fact analyses of events, and reporting information needed to maintain situaitional awareness. As such, the SDT believes that these reporting requirements do need to be enforceable.		
Portland General Electric	Yes	PGE supports the efforts of the Standards Drafting Team on the SAR for Project 2009-01 to consolidate the disturbance and sabotage reporting processes as outlined in the concept paper.
Response: The DSR SDT thanks you for your comment.		
Dynegy Inc.	Yes	Please keep it short and simple.

Organization	Yes or No	Question 3 Comment
Response: The DSR SDT thanks you for your comment.		
ERCOT ISO	Yes	Standardization ensures consistency and relevance of the information received.
Response: The DSR SDT thanks you for your comment.		
USBR	Yes	The Bureau of Reclamation utilizes a form for tracking unexpected events. This form contains information which the agency considers important for its one reliability improvement program. The form is also used to meet NERC standard requirements for protection system operations analysis. This form contains most of information required by DOE. The SDT should consider requiring the submission of specific information rather than lock responses in one specific form. In this manner the agency would be avoid duplicate forms, one for NERC, the other for agency purposes.
Response: The DSR SDT thanks you for your comment.		
Central Lincoln	Yes	The existing reporting is needlessly complex. We appreciate the SDT's goal.
Response: The DSR SDT thanks you for your comment.		
SPS Consulting Group Inc.	Yes	There should have probably been one report all along.
Response: The DSR SDT thanks you for your comment.		
Duke Energy	Yes	There should only be one report for all functional entities to submit to NERC.
Response: The DSR SDT thanks you for your comment.		
SERC Reliability Coordinator Sub-committee (RCS)	Yes	There should only be one report for all functional entities.
Response: The DSR SDT thanks you for your comment.		
Manitoba Hydro	Yes	This is a promising idea, though there would be different requirements for the three countries, this could easily be rectified with "drop down menus". This electronic form could contain a lot of information without distracting clutter as you "tree" down the menu depending on the event that occurred. This could also contain electronic

Organization	Yes or No	Question 3 Comment
		references to information located in Attachment 1-EOP-004 and Threat and Incident Reporting.
Response: The DSR SDT thanks you for your comment. We will consider your specific suggestions when we develop the reporting requirements.		
Hydro-Québec TransEnergie (HQT)	Yes	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
Response: The DSR SDT thanks you for your comment.		
Northeast Power Coordinating Council	Yes	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
Response: The DSR SDT thanks you for your comment.		
Orange and Rockland Utilities, Inc.	Yes	We agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC. This would provide for a consistent reporting format across the continent.
Response: The DSR SDT thanks you for your comment.		
Midwest ISO Standards Collaborators	Yes	We agree with the goal of having a single report form but believe there will be a significant challenge to get varying governmental agencies to agree on single report format.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question “Describe the event” or “What steps did you take” on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Edison Mission Marketing & Trading	Yes	With the realization that having a common report form may be difficult to coordinate between differen agencies.
Response: The DSR SDT thanks you for your comment. The DSR SDT acknowledges the difficulty in attempting to present a single form. However, the DSR SDT believes it may be possible to achieve consolidation since the various reports ask repetitive questions. For example, having to provide		

Organization	Yes or No	Question 3 Comment
contact names, telephone numbers, email addresses on multiple forms is not an effective use of time or resources. Similarly, answering the question "Describe the event" or "What steps did you take" on multiple reporting forms is also not effective. The DSR SDT does recongnize that it may not be possible to eliminate reporting to multiple jurisdicational agencies due to legislative or regulatory requirements.		
Independent Electricity System Operator	Yes	Yes, this will simplify the reporting effort. NERC may forward the reports to the other need-to-know entities.
Response: The DSR SDT thanks you for your comment.		
Electric Market Policy	Yes	Yes, we agree with the concept that there should be one report form for all functional entities (whether located in the US, Canada, Mexico) for use in reporting to NERC.
Response: The DSR SDT thanks you for your comment.		

4. The goal of the DSR SDT is to eliminate the need to file duplicate reports. The standards will specify information required by NERC for reliability. To the extent that this information is also required for other reports (e.g. DOE OE-417), those reports will be allowed to supplement the NERC report in lieu of duplicating the entries in the NERC report. Do you agree with this concept? Please explain your response (yes or no) in the comment area.

Summary Consideration: Most stakeholders agreed with the concept of entities being able to use information from other sources such as the OE-417 form, to supplement the NERC report form. Some thought that duplicate reports were acceptable, as long as the information was not duplicated (if # of customers lost is required on form A, don't ask on forms B & C). Several stakeholders commented on the need for an electronic, one stop reporting tool. This would avoid duplication while ensuring that the information reported goes only to intended recipients. With an electronic, one stop reporting tool, reports can be updated/corrected instantly, without repeating previously submitted information. Some stakeholders cautioned that the OE-417 can change every three years and this should be taken into account when developing an electronic reporting tool. Again, such a reporting tool would need to be vetted and developed to meet reliability needs.

Organization	Yes or No	Question 4 Comment
ERCOT ISO		ERCOT ISO agrees with the concept of eliminating the need to file duplicate reports, but as stated in the Concept Paper, the DOE form (OE-417) is required by law. Based on this, the elimination of EOP-004 (after the fact reporting) is essential, since the OE-417 is mandatory and all-inclusive.
Response: The DSR SDT thanks you for your comment. We agree that the OE-417 compiles a baseline set of information for disturbances, however, it does not function as an all-inclusive report of sabotage and cyber security incidents. The DSR SDT certainly seeks to gain effienciencies through the modification of EOP-004 and CIP-001, which may include the elimination of one or both. Further, the OE-417 is only mandatory for US entities.		
Midwest ISO Standards Collaborators	No	It certainly makes sense to eliminate duplication in reporting and to allow supplemental information to be submitted in other reports. However, it does not make sense to require reporting to other governmental agencies through NERC enforceable NERC standards. Those governmental agencies already have legal authority to compel reporting. Again, we support developing a guideline for reporting rather than enforceable standards. The guideline could certainly explain the various reporting requirements and supplemental reporting requirements mentioned in the question without causing the issues we have identified in our comments.
Response: The DSR SDT thanks you for your comment. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE, which is mandatory under Public Law for US entities. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an		

Organization	Yes or No	Question 4 Comment
option to have the report submitted to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements.		
Consumers Energy Company	No	NERC should either coordinate with DOE for a single reporting process or simply adopt the DOE's standard.
Response: The DSR SDT thanks you for your comment. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE, which is mandatory under Public Law for US entities. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an option to have the report submitted to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements. The DOE report does not collect all the information that NERC needs.		
E.ON U.S. LLC	No	Reliability standards are federal law enforced by fines that can reach up to $1,000,000 per day of violation. There is no reason to deliberately include ambiguity, i.e. "gray areas," in requirements such that registered entities are left unable to determine what it is they must do or refrain from doing to remain compliant. "Sabotage" for the purposes of these standards must be defined.
Response: The DSR SDT thanks you for your comment. The intent of the DSR SDT is to develop requirements for reporting that will be clear and unambiguous with respect to compliance issues. Sabotage will be included in the reporting for "impact events", but may not be called 'sabotage' as there are many different interpretations of "sabotage".		
ISO RTO Council Standards Review Committee	No	The concept of eliminating duplication is laudable, but the idea of writing a standard to mandate reporting that involves reporting to governmental areas does not make sense unless NERC will do all of the reporting for the Industry. A governmental agency is as likely as not to change the forms they require which would then mean two different reports (one for NERC and one for the given agency) or that the standard would have to be re-written every time there is a change.
Response: The DSR SDT thanks you for your comment. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE, which is mandatory under Public Law for US entities. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an option to have the report submitted to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements.		
Ameren	No	The DOE OE-417 report should not supplement the NERC report due to the fact that the majority of reportable events are defined in/come from the OE-417 report. The NERC reporting form should be based on the OE-417 report and then include additional reporting requirements defined by NERC. However, it does not make sense to require reporting to the governmental agencies through enforceable NERC standards. The governmental agencies already have legal authority to compel reporting.

Organization	Yes or No	Question 4 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE, which is mandatory under Public Law for US entities. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an option to have the report submitted to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements.		
SERC Reliability Coordinator Sub-committee (RCS)	No	The requirement should be a single report that satisfies the need for all US governmental agencies as well as NERC and the RRO's.
Response: The DSR SDT thanks you for your comment. The intent of the DSR SDT is to develop standards to address the reliability needs for NERC and not governmental agency reporting criteria.		
Western Electricity Coordinating Council	No	This will work well for the USA entities to save us time in re-entering the same information. We believe that FERC and NERC and the Regions should have one common reporting form for North America. The OE-417 is not required by law outside of the United States. Canadian and Mexican entities may feel that US DOE has no jurisdiction in these countries, and therefore no right to required reporting as is stated on the OE-417.
Response: The DSR SDT thanks you for your comment. We agree that the OE-417 report is not required for Canadian or Mexican entities. The DSR SDT does not envision a NERC standard mandating submission of reports to DOE. If the DSR SDT is able to develop a one-stop-shopping electronic form, we plan to develop an option to have the report submitted (or not) to NERC, DOE and FERC simultaneously. If an entity chooses to submit the report manually, they will then also be responsible for following DOE regulations and other mandatory requirements.		
American Electric Power	Yes	
Edison Mission Marketing & Trading	Yes	
Exelon	Yes	
Orange and Rockland Utilities, Inc.	Yes	
PacifiCorp	Yes	
Platte River Power Authority	Yes	

Organization	Yes or No	Question 4 Comment
Arizona Public Service Company	Yes	APS supports eliminating the need to file duplicate reports. This standardized form should generate and send the DOE OE-417 report, totally eliminating duplicate work. Streamline the process.
Response: The DSR SDT thanks you for your comment.		
Central Hudson Gas & Electric	Yes	Central Hudson agrees with this concept and, as stated in a previous response, recommends that the ability of utilizing the DOE OE-417 to supplement the NERC report be maintained.
Response: The DSR SDT thanks you for your comment.		
Calpine Corp.	Yes	Clarification, simplicity and the removal of duplicate reporting is beneficial.
Response: The DSR SDT thanks you for your comment.		
Constellation Power Source Generation	Yes	Constellation agrees with the concept of eliminating the need to file duplicate reports. If the single NERC reporting form is both comprehensive and easy to use, then using a single report should not be an issue. It is essential that all elements of DOE OE-417, and any similar documents, be incorporated into this single report. Not incorporating all elements will result in gaps in reporting for all Registered Entities.
Response: The DSR SDT thanks you for your comment.		
SPS Consulting Group Inc.	Yes	Duplication is inefficient and casts the whole reporting mechanism in a questionable light.
Response: The DSR SDT thanks you for your comment.		
We Energies	Yes	However, also evaluate whether or not DOE OE-417 is sufficient in lieu of a NERC report. If additional information is required, duplicate format of DOE-OE-417 with additional NERC information listed at the end of the form.
Response: The DSR SDT thanks you for your comment.		
Wolverine Power Supply Cooperative, Inc.	Yes	I agree with the concept of minimizing duplication - See previous question 3 for concerns.
Response: The DSR SDT thanks you for your comment.		

Organization	Yes or No	Question 4 Comment
USBR	Yes	It should be clear what information is to be supplemented. The fewer times the information has to be handled the more efficient the process becomes. If the information exists on a required form, that legal form should be allowed. Also, if the form is already submitted, then reference to it should be sufficient rather than requiring resubmission of the form. That would require handling the information again. As explained in the previous answer, the SDT should recognize that responsible entities have already developed internal reporting processes which utilize forms for consistent responses. Those forms may contain more information than is needed by the new standard to be proposed. The entity should be allowed to submit the internal form or else duplication would be created, which may reduce the effectiveness of an entities reliability improvement program.
Response: The DSR SDT thanks you for your comment. The DSR SDT envisions a one-stop-shopping form that allows reports to be saved, revised and resubmitted at a later date without re-entry of data or information. However, as a caution the DSR SDT cannot guarantee the possibility to submit custom forms.		
Lands Energy Consulting	Yes	Less paperwork and fewer requirements to keep in mind during what may be once in a lifetime events are always good.
Response: The DSR SDT thanks you for your comment.		
Luminant	Yes	Luminant agrees with the concept of reducing reporting requirements, but asks the SDT to go even further. In the concept paper, the SDT discussed that information would not be duplicated on the NERC report and the DOE OE-417 report. The concept paper described a process where one report would simply supplement the other, but two reports would still be filed when required. Can the NERC SDT work with the DOE to develop one report to meet the needs of NERC and the DOE?
Response: The DSR SDT thanks you for your comment. We will consult with the DOE to see if it one report will meet the reporting needs for NERC and the DOE. NERC reliability needs will take precedence.		
Bonneville Power Administration	Yes	Minimizing the number of reports is a good thing. The concept of actually sharing information should be utilized as much as practical.
Response: The DSR SDT thanks you for your comment.		
Oncor Electric Delivery Company LLC	Yes	Oncor agrees that this effort should eliminate file duplication

Organization	Yes or No	Question 4 Comment
Response: The DSR SDT thanks you for your comment.		
Bandera Electric Cooperative, Inc.	Yes	One can only assume the number of reports required in this area will continue to increase in terms of scope and to which agency wants this data. The SDT is encouraged to attempt to find a reporting format and scope that does not needlessly duplicate or complicate overall reporting obligations.
Response: The DSR SDT thanks you for your comment. We will consult with the DOE and FERC to see if it one report will meet the reporting needs for NERC, FERC and the DOE. NERC reliability needs will take precedence.		
Portland General Electric	Yes	PGE supports reducing the duplication of reporting.
Response: The DSR SDT thanks you for your comment.		
Dynegy Inc.	Yes	Short and simple should be the goal.
Response: The DSR SDT thanks you for your comment.		
Duke Energy	Yes	Since the OE-417 is a DOE required report, it must be submitted. Including the OE-417 as part of the NERC electronic form will facilitate reporting to NERC.
Response: The DSR SDT thanks you for your comment. We will consult with the DOE to see if it one report will meet the reporting needs for NERC and the DOE. NERC reliability needs will take precedence.		
Central Lincoln	Yes	The existing reporting is needlessly complex. We appreciate the SDT's goal.
Response: The DSR SDT thanks you for your comment.		
Public Service Enterprise Group Companies	Yes	The PSEG Companies agree with the avoidance of duplicate reports. NERC report forms should not include anything in the DOE form, and NERC Regional report forms should not include anything in the DOE or NERC forms. Hence, a DOE report should not "supplement" a NERC form, but rather replace it unless the NERC form calls for other information for the same reportable incident, and likewise for the DOE - NERC - Regional form structure. DOE forms would be filed with DOE, NERC and the Regional Entity where the event originated. NERC forms would be filed with NERC and the region where the event originated and the Regional form filed only with the Region. In designing the NERC and Regional forms, the need to file multiple reports should be minimized, and in no event should any of the three (DOE, NERC, Region) forms contain

Organization	Yes or No	Question 4 Comment
		duplicative information requests.
Response: The DSR SDT thanks you for your comment. We will consider your comment in the development of the reporting structure / forms.		
Manitoba Hydro	Yes	This could be easily incorporated into the electronic form. You could be prompted for information required immediately, and notified for information that could be entered later. This form could contain all the enterable data that all agencies could require. If the form is live and on line, all entities could be notified (depending on the entries) of an going event immediately. Form could be web based similar to ARS program or even integrated into the ARS program.
Response: The DSR SDT thanks you for your comment. We will consider your comment in the development of the reporting structure / forms.		
FirstEnergy	Yes	We agree that the simplification and consistency of reporting will improve the reporting of this information. We support the drafting team's efforts in this area and hope that all regulatory agencies will as well. However, as we have mentioned in our other comments, the reporting requirements should not be in a reliability standard unless they are proven to be necessary to maintain an Adequate Level of Reliability of the BES. Reporting of these events should be required by NERC in arenas outside of the standards.
Response: The DSR SDT thanks you for your comment. The information provided in the reports is either used after the fact for analyses or used to maintain situational awareness, and is needed for reliability.		
MRO's NERC Standards Review Subcommittee	Yes	We agree with the concept to eliminate duplicate reports. However, we are concerned with the reference of the DOE OE-417 report being a “supplement” of the NERC report rather than “accepted” as the NERC report.
Response: The DSR SDT thanks you for your comment. Future NERC reliability reporting needs may not totally align with DOE report information. Therefore, the OE-417 report would not necessarily substitute for the NERC report. The DOE Reporting Form OE 417 is currently mandatory by Public for US entities.		
Hydro-Québec TransEnergie (HQT)	Yes	We agree with the objective of eliminating duplicate reporting. However, EOP-004 currently allows substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today. We agree with the recommendation to eliminate the need for filing duplicate reports such as the DOE form OE-417. There is no benefit with regard to CIP-001 in filing separate reports. Duplicate reports introduce the potential for incomplete information to be supplied to responsible parties.

Organization	Yes or No	Question 4 Comment
		Removing jurisdictional agencies from the Standard, and having NERC provide either query or situational awareness to those agencies being considered, might not be easy to achieve. There is an obligation under law to require entities to report to the DOE on the OE-417 form as amended or modified. This might drive the "omitted" agencies to have reporting laws enacted as well.
Northeast Power Coordinating Council	Yes	We agree with the objective of eliminating duplicate reporting. However, EOP-004 currently allows substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today. We agree with the recommendation to eliminate the need for filing duplicate reports such as the DOE form OE-417. There is no benefit with regard to CIP-001 in filing separate reports. Duplicate reports introduce the potential for incomplete information to be supplied to responsible parties. Removing jurisdictional agencies from the Standard, and having NERC provide either query or situational awareness to those agencies being considered, might not be easy to achieve. There is an obligation under law to require entities to report to the DOE on the OE-417 form as amended or modified. This might drive the "omitted" agencies to have reporting laws enacted as well.
Response: The DSR SDT thanks you for your comment. The DSR SDT has discussed the possibility of consolidating CIP-001 and EOP-004 to create a single reporting standard. FERC directives require modifications to the standards which also may impose additional reporting requirements (see paragraph 470 of Order 693). **We concur with your comments regarding the legal obligations to submit certain reports. The DSR SDT is attempting to consult with appropriate governmental aencies to address this.**		
BGE	Yes	We agree with this approach, as long as the latest version of the DOE OE-417 form is fully incorporated in the new single-reporting form, so that it maintains its credibility with the DOE.
Response: The DSR SDT thanks you for your comment. The intent is to maintain credibility with the DOE reporting requirements.		
Independent Electricity System Operator	Yes	We support this concept since it works well for those entities that are not required to file reports with the US agencies, e.g. the DOE.
Response: The DSR SDT thanks you for your comment.		
Electric Market Policy	Yes	Yes, we agree with the objective of eliminating duplicate reporting; however, EOP-004 currently allows

Organization	Yes or No	Question 4 Comment
		substitution of DOE OE-417 in place of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report. As suggested in the Concept Paper, entities meeting the criteria of OE-417 are still obligated to file a report with DOE. Given that and the fact that CIP-001 requires no actual reporting, it is not clear where duplication exists today.
Response: The DSR SDT thanks you for your comment. The DSR SDT has discussed the possibility of consolidating CIP-001 and EOP-004 to create a single reporting standard. FERC directives require modifications to the standards which also may impose additional reporting requirements (see paragraph 470 of Order 693).		

5. In its discussion concerning sabotage, the DSR SDT has determined that the spectrum of all sabotage-type events is not well understood throughout the industry. In an effort to provide clarity and guidance, the DSR SDT developed the concept of an impact event. By developing impact events, it allows us to identify situations in the "gray area" where sabotage is not clearly defined. Other types of events may need to be reported for situational awareness and trend identification. Do you agree with this concept? Please explain your response (yes or no) in the comment area.

Summary Consideration: The majority of stakeholders agreed with the concept of impact events. Some stakeholders felt that the introduction of impact events increased the risk that some items will go unreported. However, most felt that impact events would dramatically increase the number of reports being submitted, and it would be difficult to separate important information from background noise. Several respondents felt that the SDT ignored the FERC Directive, and did not define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event. Many respondents supplied the SDT with their own definition of "Sabotage". The DSR SDT believes that the concept of impact events and the specificity of what needs to be reported in the standard will be an equally efficient and effective means of addressing the FERC directive regarding sabotage. Some stakeholders felt that impact events add another layer of uncertainty to the reporting. Even with the switch from sabotage to impact events, several felt that "intent" was still key to determining reportability.

Organization	Yes or No	Question 5 Comment
ERCOT ISO		ERCOT ISO recognizes the risks associated with "gray areas" not being clarified. While "gray areas" pose compliance risk due to differing interpretations, a risk remains that some items will go unreported. A more prescriptive approach raises an even greater risk of events not being reported. People will not report events that are not specifically listed, and will not use judgment in determining the need for reporting.
Response: The DSR SDT thanks you for your comment. We agree that a more prescriptive approach could pose greater risks but we will attempt to clarify and define an approach to assist the industry and stakeholders for reporting impact events.		
Constellation Power Source Generation	No	Although defining an impact event would bring clarity to defining sabotage events, adding another situation would further complicate things. Furthermore, the examples of impact events used all fall under the Sabotage category in the Threat and Incident Reporting Guideline. Constellation Power Generation suggests the SDT further clarifies the items in the Sabotage category to ensure all grey area situations are included. Clarification is also needed in how a Cyber Security Incident (CIP-008) would map into the categories of Disturbance/Impact Events (CIP-001). To that point, Constellation Power Generation questions whether cyber related incidents should fall under the spectrum of sabotage type events, or remain separate and be incorporated in the CIP revisions. Having cyber related incidents separate from other sabotage events would

Organization	Yes or No	Question 5 Comment
		provide the clarity and guidance that the DSR SDT is striving to achieve.
Response: The DSR SDT thanks you for your comment. We are suggesting the term "Impact Event" be substituted to include all events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact the reliability of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples.		
Duke Energy	No	As FERC ordered in Order No. 693, the drafting team should further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event. Suggested definition: "Sabotage - the malicious destruction of, or damage to assets of the electric industry, with the intention of disrupting or adversely affecting the reliability of the electric grid for the purposes of weakening the critical infrastructure of our nation."
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "intent" which may not be determined until after a lengthy investigation. We will continue to discuss for inclusion in a future draft of this project. The DSR SDT believes that the concept of impact events and the specificity of what needs to be reported in the standard will be an equally efficient and effective means of addressing the FERC directive regarding sabotage.		
Kootenai Electric Cooperative	No	Impact events seems to add another layer of uncertainty to the reporting. Define a transmission line. Our transmission lines have very little impact on the grid. It is possible for our lines to cause a local area outage on our transmission provider - but neither is of national security interest or even regional interest. There is no power flow going on across the lines other than local power delivery supply. It seems you run more risk of losing the important reports in the snow of reporting - similar to what we have to avoid on our SCADA systems for our operators to see the key information.
Response: The DSR SDT thanks you for your comment. The DSR SDT understands your concern and this was discussed a great deal. It is our belief that criteria of the "impact events" to be reported will be properly defined and discriminated from local events that have no impact on the reliability of the BES.		
SERC Reliability Coordinator Sub-committee (RCS)	No	Impact events that do not affect reliability should not be reported.
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees but a balance must be further explored to meet industry and regulatory requirements specifically under FERC Order 693.		
Luminant	No	Luminant would prefer to report disturbances and sabotage events. The reporting of impact events could lead to unnecessary reporting. A definition of an "impact event" may be even more confusing than sabotage

Organization	Yes or No	Question 5 Comment
		events.
Response: The DSR SDT thanks you for your comment. The DSR SDT understands your concern and this was discussed a great deal. It is our belief that criteria of the "impact events" to be reported will be properly defined and discriminated from local events that have no impact on the reliability of the BES. We are suggesting the term "Impact Event" be substituted to include only events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact reliabiltiy of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples.		
Orange and Rockland Utilities, Inc.	No	Physical and cyber events must be investigated before a determination of sabotage or impact event can be made. Impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on 'newsworthy' events or to gather information for trending. It is the law enforcement industry's responsibility to make a determination of "sabotage" or other. This determination cannot definitively be made by industry (operating) personnel. If NERC's definition is expanded for CIP-001 and/or EOP-004, responsibility and timing of reporting needs to addressed so that appropriate agencies conduct the investigation and assessment. Operating personnel need to remain focused on the primary responsibility of mitigating the effects.
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "intent" which may not be determined until after a lengthy investigation. We will continue to discuss these ideas for inclusion in a future draft of this project. Timing of the reporting process will be further clarified based upon your comments and those in the industry that have voiced similar concerns.		
MRO's NERC Standards Review Subcommittee	No	Rather than attempting to define a new term (impact event), we suggest that the concept of impact event be replaced with further defining sabotage and providing guidance on trigger events (impact event) that would cause an entity to report.
Response: The DSR SDT thanks you for your comment. We will continue to discuss the FERC "Clarification of sabotage" directive and seek further guidance to meet this directive. The term sabotage has created conflict in its meaning among stakeholders as to when its determined and by whom and how long an investigation would take to make that call on the intent of the saboteur. The DSR SDT is reviewing what a reportable disturbance actually is and sabotage may be a sub component of a reportable disturbance event.		
Lands Energy Consulting	No	The level of complexity described will overwhelm the 20-200 employee utilities that have yet to see - and will never see - the kind of sabotage event that scares the Department of Homeland Security.
Response: The DSR SDT thanks you for your comment. The DSR SDT does not intend for the reporting of impact events to overwhelm smaller entities. If events do not affect the reliability of the BES, then it is our intent that they will be excluded from reporting requirements under our proposal. We will attempt to clarify and define an approach to assist the industry and stakeholders for reporting impact events. FERC cautioned the		

Organization	Yes or No	Question 5 Comment
industry that acts of sabotage may be "tested" on smaller entities and ultimately on larger entities.		
ISO RTO Council Standards Review Committee	No	The nature of the fact that "gray areas" exists preclude the idea of using a standard to report; particularly a standard for the vague topic of motivation such as sabotage events and the more defined disturbance events.
Response: The DSR SDT thanks you for your comment. We will attempt to clarify and define an approach to assist the industry and stakeholders for reporting impact events.		
Edison Mission Marketing & Trading	No	There are too many special circumstances to try and capture. I feel this would be best delivered as a guideline.
Response: The DSR SDT thanks you for your comment. We are suggesting the term "Impact Event" be substituted to include only events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact reliability of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples.		
Exelon	No	We agree with the direction to identify impact events examples that would trigger reporting and not be limited to sabotage reporting only. It is important to note that when an incident occurs, some level of investigation is required before a determination can be made as to the event is sabotage or not. The focus should be on reporting events when they occur and allow follow-up investigations to make the sabotage determination. That being said, care must be taken in the development of any list of impact events so that it doesn't become or is misinterpreted to be a definitive list. Therefore if it is not on the list, it is not reportable.
Response: The DSR SDT thanks you for your comment. We concur and plan to allow reports to be submitted, edited and re-submitted in the one-stop-shopping reporting tool. We are suggesting the term "Impact Event" be substituted for sabotage andinclude only events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact reliability of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples.		
Midwest ISO Standards Collaborators	No	We agree with the idea of identifying impact events but do not support the requirement for these to be always reported through the hierarchical structure identified in question 2. If an impact event only affects one entity, that entity should have the reporting requirement.
Response: The DSR SDT thanks you for your comment. The DSRSDT will continue to explore the benefits and weaknesses of the hierarchy reporting structure.		
Hydro-Québec TransEnergie (HQT)	No	We believe that physical and cyber events must be investigated before a determination of sabotage or impact event can be made. The purpose of the NERC Standards is to maintain the reliability of the BES. Therefore,

Organization	Yes or No	Question 5 Comment
		impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on 'newsworthy' events or to gather information for trending. It is the law enforcement industry's responsibility to make a determination of "sabotage" or other. This determination cannot definitively be made by industry personnel, there is no expertise or time to investigate causes. It is the industry's job to mitigate effects. Examples would help provide for better guidance/direction. Industry examples would be welcomed to help reinforce developed internal processes for compliance.
Northeast Power Coordinating Council	No	We believe that physical and cyber events must be investigated before a determination of sabotage or impact event can be made. The purpose of the NERC Standards is to maintain the reliability of the BES. Therefore, impact events should define or clarify the circumstances that would or could affect reliability. Reportable items should be based on impact to reliability, not on 'newsworthy' events or to gather information for trending. It is the law enforcement industry's responsibility to make a determination of "sabotage" or other. This determination cannot definitively be made by industry personnel, there is no expertise or time to investigate causes. It is the industry's job to mitigate effects. Examples would help provide for better guidance/direction. Industry examples would be welcomed to help reinforce developed internal processes for compliance.
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "intent" which may not be determined until after a lengthy investigation. We will continue to discuss issues with sabotage for inclusion in a future draft of this project. Timing of the reporting process will be further clarified based upon your comments and those in the industry that have voiced similar concerns.		
American Electric Power	Yes	
Calpine Corp.	Yes	
PacifiCorp	Yes	
Platte River Power Authority	Yes	
Central Lincoln	Yes	An act of vandalism may have impact. An act of sabotage may not be impactful alone, but may be part of a wider coordinated attack. Dictionary definitions speaking of "intent" are not helpful in this regard, since acts of vandalism and sabotage are both generally committed intentionally. Saboteurs, though, work for a higher cause. That cause may be political, social, environmental, etc. We ask that the SDT look beyond dictionary definitions in developing a definition of sabotage.

Organization	Yes or No	Question 5 Comment
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "intent". The term sabotage has created conflict in its meaning among stakeholders as to when its determined and by whom and how long an investigation would take to make that call on the intent of the saboteur. We will strive to meet this challenge with the input on the right language from government agencies and industry experience expertise.		
Bonneville Power Administration	Yes	BPA agrees with providing an industry-wide definition and guideline. We do NOT agree with requiring reports for every instance of every activity. If your definition is good, you'll get what is needed and not much chaff.
Response: The DSR SDT thanks you for your comment.		
Central Hudson Gas & Electric	Yes	Central Hudson agrees with this concept, particularly if the reporting hierarchy through the RC is implemented in order to better identify trends.
Response: The DSR SDT thanks you for your comment. The DSRSDT will continue to explore the benefits and weaknesses of the hierarchy reporting structure.		
Wolverine Power Supply Cooperative, Inc.	Yes	I agree with the concept of focusing on impact instead of the type of event (sabotage, accident, vandalism, etc.)I hope that the reporting proposal that comes out of this project will clearly make a separation between true impact events that must be reported per the standards (enforceable), vs. "other" information that may be (electively - not enforceable) reported, per some set of guidelines.
Response: The DSR SDT thanks you for your comment. We agree reportable items should be based on impact to reliability and with other commenters that expressed a desire to avoid reporting on 'newsworthy' events but to gather meaningful information for trending. We are suggesting the term "Impact Event" be substituted for sabotage to include only events that would impact the reliability of the BES.		
Bandera Electric Cooperative, Inc.	Yes	In principle, I agree with this concept. Would like for the SDT to pursue this further and seek additional comments at that time.
Response: The DSR SDT thanks you for your comment. We will seek further comments on the concept and will prepare the beginnings of the first draft soon.		
Oncor Electric Delivery Company LLC	Yes	Oncor agrees that there are no broadly used guidance documents that detail how an event may be accurately defined.
Response: The DSR SDT thanks you for your comment. We agree that further industry guidance of a clear and understandable standard should be sought under the new Results Based approach. We will attempt to clarify and define an approach to assist the industry and stakeholders in reporting		

Organization	Yes or No	Question 5 Comment
impact events.		
Portland General Electric	Yes	PGE supports the DSR SDT's efforts to bring clarity and guidance to the spectrum of sabotage-type events.
Response: The DSR SDT thanks you for your comment.		
FirstEnergy	Yes	The concept paper makes good progress in this area and the drafting team is on the right track, and agree that better clarity needs to be developed surrounding sabotage events. However, some of the examples stated in the paper are too vague and do not address extenuating circumstances or reasons for the events. One example sighted in the paper is "Bolts removed from transmission line structures." This statement may be too broad. For instance, if the bolts are removed from the tower and the organization is not experiencing a labor dispute, it could be considered a sabotage event with wide area implications. However, if the organization is in the middle of a labor dispute, this would be vandalism and would most likely not be of a wide area concern. Also, the number and location of towers affected could be an important determination related to the risk the event imposes on the Bulk Electric System.
Response: The DSR SDT thanks you for your comment. We concur with your comments that the number and location of the towers affected may have a "local" vs "wide area" concern. However, under the "impact event" reporting that we are proposing, both scenarios above should be reported as impact events as long as it affects the BES.		
Public Service Enterprise Group Companies	Yes	The PSEG Companies agree with the concept, but reserve judgment on the descriptions of the impacts. There is clearly a need to better define what constitutes a sabotage incident versus common theft or vandalism. Moreover, where it may be impossible to determine if any given incident (e.g., several loose bolts on a transmission tower cross brace could be sabotage or could be human error in construction) falls within sabotage, a registered entity should not be second guessed in an audit if the registered entity determines not to report. Excessive unnecessary reporting can mask real incidents.
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees with clearly defining a reportable impact versus common theft. Concern over reporting an incident and the audit process are within the discussions of the DSR SDT and will be fully explored to assist with the 1st Draft. The ability to identify trends could be very important compared to isolated incidents that do not impact the BES. Every effort to explore this balance of reporting will be taken into account.		
SPS Consulting Group Inc.	Yes	The term sabotage was always too narrow a concept for the standards. At times, questionable activities are not confirmed as sabotage events until well after the fact, forcing the registered entity to speculate on whether or not to report an activity that may not be a confirmed sabotage event at the time, and hence encounter another silly violation based on imprecise terminology.

Organization	Yes or No	Question 5 Comment
Response: The DSR SDT thanks you for your comment. We are suggesting the term "Impact Event" be substituted to include all events that would impact the reliability of the BES. Events now included in reporting requirements that do not impact reliability of the BES would be excluded from the reporting unless the DSR SDT clarifies why it should be included and under what specific instances or examples. Tightening the reporting criteria of impact events could possibly address the concern expressed by a "violation based on imprecise terminology."		
USBR	Yes	There should be a clear distinction between a cyber event and a cyber event that has a material impact on the reliability of the bulk electric system. Not all CIP-008 events will carry such a distinction. That being said, CIP 008 cannot be completely incorporated in this process. Denying access to a cyber asset is noteworthy under CIP008 but may not pose a threat to the reliability of the bulk electric system. Consider recognizing the impact on the bulk electric system when modifying definitions of adding the bulk electric system description to the definitions. This will help to clarify that disturbances, as discussed in this effort, are situations that produce an abnormal condition on the electric power system, not necessarily on ancillary or supporting systems, such as SCADA systems or the water-related systems at hydroelectric dams.
Response: The DSR SDT thanks you for your comment. We are suggesting in our discusssion to consolidate the location of reporting into one standard. The industry has demonstrated by comments that it favors streamlining the reporting process to achieve a "one stop shop" approach. We will continue to explore the possibilities to achieve the best results for all stakeholders. A discussion of advantages /disadvantages will continue to discover options and alternatives with input from all stakeholders.		
Western Electricity Coordinating Council	Yes	This will help eliminate regional differences in sabotage reporting. The definition should be broad enough so it covers new types of sabotage that may evolve. Event analysis facilitates situational awareness and if it requires further investigation regarding developing patterns and severity, it should be handled by law enforcement if need be.
Response: The DSR SDT thanks you for your comment. The DSR SDT will continue to explore the "Impact Event" definition to allow for new types of events. Event analysis is clearly a goal of reporting as is situational awareness and hopefully this project will enhance the understanding and clearly define obligations to all stakeholders.		
Manitoba Hydro	Yes	Though there are some specific events already included in this new definition, more could be added to dissolve specific "gray areas" and as new ones come up. Again these examples could be added into the electronic form and could contain a large data base which would be available depending on the event that occurred.
Response: The DSR SDT thanks you for your comment.		

Organization	Yes or No	Question 5 Comment
BGE	Yes	We agree that "the spectrum of all sabotage-type events is not well understood throughout the industry"; however, we feel that the proposed concept of an "Impact Event" falls short of clarifying what constitutes such events. We believe that "Impact Events" needs further clarification to eliminate "gray areas" and to provide more reporting consistency between entities.
Response: The DSR SDT thanks you for your comment. The DSR SDT will continue to clarify the impact events concept and eliminate "gray areas" while including language to give clarity to the reporting process.		
Dynegy Inc.	Yes	We agree with the concept but please provide specific examples. Also, please consider whether there are any penalties for misinterpreting an incident, who would determine if an event was a threat, and whether this could result in over reporting non-threats.
Response: The DSR SDT thanks you for your comment. The DSR SDT may include specific examples of impact events and types of reportables events in the 1st draft of the standard (or in supplemental guidance) to help illustrate reportable criteria.		
Consumers Energy Company	Yes	We agree with the concept, however, based on the information provided, it may be too vague to be of value. Terms such as "potential" and "significant" can be subjective and therefore provide little direction. We would like to see something more specific. Also, inclusion of the destruction of BES assets may be too inclusive and needs to be restricted to BES assets that will cause a specific level of impact on reliability.
Response: The DSR SDT thanks you for your comment. The SDR SDT struggles with terms that deal with determing "potential" and "significant". Specific examples of criteria is being explored and discussed. We will strive to meet this challenge with the input on the right language from government agencies and industry experience expertise. Your suggestion of restricting to BES assets that will cause a specific level of impact on reliability will be discussed with the DSR SDT.		
Independent Electricity System Operator	Yes	We agree with the general concept. However, we suggest that the classification of "events" to be compatible if not identical to those which need to be reported in real time as required in CIP-001, for otherwise it will create confusion and unnecessary, extra work. Also, this proposal appears to focus on the sabotage-type events only but the SAR deals with both sabotage and other disturbances (e.g. emergency type of events) reporting. A parallel type of "impact event" is needed for non-sabotage-type of events.
Response: The DSR SDT thanks you for your comment. The DSR SDT notes that impacts events include both sabotage and non-sabotage types of events and these events include CIP-001 events.		
Electric Market Policy	Yes	We believe that physical and cyber events must be investigated before a determination of sabotage or impact

Organization	Yes or No	Question 5 Comment
		event can be made.
Response: The DSR SDT thanks you for your comment. We agree that sabotage requires investigation. The term "impact event" was developed to allow immediate reporting of events based on impact to the BES rather than intent.		
We Energies	Yes	We would prefer to refer to all sabotage, vandalism, cyber attacks, and other criminal behavior as impact events. Focusing more on the event's impact on reliability and its ramifications on the systems seems to be more useful than to try to determine the intent of the perpetrator.
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees with your assessment and will pursue the clarity and criteria examples to achieve reporting.		

6. If you are aware of any regional reporting requirements beyond the scope of CIP-001, CIP-008 and EOP-004 please provide them here.

Summary Consideration: Several commenters provided information on regional reporting. The SDT will consider whether these should be included in the continent-wide standard. These include:

1. NPCC maintains a document and reporting form (Document C-17 - Procedures for Monitoring and Reporting Critical Operating Tool Failures) that outlines the reporting requirements, responsibilities, and obligations of NPCC Reliability Coordinators in response to unforeseen critical operating tool failures.
2. For other events that do not meet the OE-417 and EOP-004 reporting criteria, ReliabilityFirst expects to receive notification of any events involving a sustained outage of multiple BES facilities (buses, lines, generators, and/or transformers, etc.) that are in close proximity (electrically) to one another and occur in a short time frame (such as a few minutes).
3. WECC sets its loss of load criteria for disturbance reporting at 200 MW rather than the 300 MW in the NERC reporting form.
4. SERC and RFC are developing additional requirements at this time.
5. We suggest that reporting be based on impact to reliability, not on 'newsworthy' events. We therefore do not agree with such regional efforts and would prefer a continent wide reporting requirements.
6. MISO RC (MISO OP-023) and RFC (PRC-002-RFC-01).

Organization	Question 6 Comment
Central Hudson Gas & Electric	Although not beyond the scope of these standards, NPCC maintains a document and reporting form (Document C-17 - Procedures for Monitoring and Reporting Critical Operating Tool Failures) that outlines the reporting requirements, responsibilities, and obligations of NPCC RCs in response to unforeseen critical operating tool failures.
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard.	
Exelon	At the 2010 RFC Spring Workshop the following disturbance reporting Criteria was rolled out: All events that are required to be reported by the OE-417 and EOP-004 criteria will use those published procedures. For other events that do not meet the OE-417 and EOP-004 reporting criteria, ReliabilityFirst expects to receive notification of any events involving a sustained outage of multiple BES facilities (buses, lines, generators, and/or transformers, etc.) that are in close proximity (electrically) to one another and occur in a short time frame (such as a few minutes).

Organization	Question 6 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard.	
Lands Energy Consulting	I believe WECC sets its loss of load criteria for disturbance reporting at 200 MW rather than the 300 MW in the NERC reporting form.
Response: The DSR SDT thanks you for your comment. The DSR SDT will consider regional criteria when developing reporting thresholds.	
Edison Mission Marketing & Trading	I don't know of any.
Orange and Rockland Utilities, Inc.	NERC's SDT effort requires a clear, consistent, and comprehensive continent-wide approach, thus mitigating any need for regional reporting requirements.
Response: The DSR SDT thanks you for your comment. The SDR SDT feels in many instances that region specific standards may be needed. However, the SDT will provide a clear reporting standard that can be consistently followed continent-wide.	
MRO's NERC Standards Review Subcommittee	No Comment.
Duke Energy	None
Bandera Electric Cooperative, Inc.	No.
Manitoba Hydro	No.CIP-001 contains references to NERC and the DOE.CIP-008 makes exclusions for facilities regulated by US Nuclear Regulatory Commission and Canadian Nuclear Safety Commission. It also contains references to ES ISAC (Electricity Sector Information Sharing and Analysis Center).EOP-004 contains reference to NERC and DOE. There is no reference to Homeland Security, FBI, etc or to Canadian equivalent references in any of these Standards. When NERC is notified of an event, it is likely other organizations will have to be notified. There should be some sort of consistency to cover all these Standards and all notifiable parties at a NERC Standards level.
Response: The DSR SDT thanks you for your comment. The DSR SDT absolutely understands your provided comment and have had detailed conversations surrounding "who" should be notified and "when". Most importantly, a level of consistency should exist when reporting disturbances and sabotage events negatively impacting the BES.

Organization	Question 6 Comment
	awareness.
Response: The DSR SDT thanks you for your comment. The SDR SDT feels there will always be a need for the Regional Entities to be kept aware of certain "hot topic" issues. However, it is the SDT's intent to provide clear and concise reporting requirements for events impacting the BES.	
BGE	We are not aware of any regional requirements beyond the scope of CIP-001, CIP-008 and EOP-004.
Response: The DSR SDT thanks you for your comment.	
We Energies	What is meant by beyond the scope of the referenced standards? We Energies also has reporting obligations with the MISO RC (MISO OP-023), RFC (PRC-002-RFC-01), and the Wisconsin and Michigan Public Service Commissions.
Response: The DSR SDT thanks you for your comment. The DSR SDT will examine regional reporting criteria and requirements to determine whether it should be included in a continent wide standard. Please provide a copy of the subject reporting requirements for the SDT to review.	

7. If you have any other comments on the Concepts Paper that you haven't already provided in response to the previous questions, please provide them here.

Summary Consideration: Several stakeholders provided comments in this section. Some stakeholders suggested that the SDT has gone beyond its approved scope to "further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event." Further, there is no requirement to create a Reporting Standard to define sabotage. The SDT contends that the development of impact events and the reporting requirements for them will provide the clarity sought in the directive.

Other stakeholders suggested that the SDT should seek to retire sanctionable requirements that require event reporting in favor of guidelines for reporting.

Several commenters suggested that the introduction of impact events actually expands the reporting requirements. It should be noted that the list of impact events is expected to be explicit as to who is to report what to whom and within certain timelines.

Several stakeholders provided input as to what they believed an electronic reporting tool should contain:

1 If the decision is made to go to a single reporting form, it should be developed to cover any foreseeable event.

2 The SDT should work toward a single form, located in a central location, and submitted to one common entity (NERC)

3 Reports should be forwarded to the ES-ISAC, not NERC, as the infrastructure is already in place for efficient sharing with Federal agencies, with the regional entities and with neighboring asset owners. Reports should flow to all affected entities in parallel, rather than series (timing issues).

Commenters also suggested that the SDT should consider the impacts of the reporting requirements on the small, and very small utilities.

Organization	Question 7 Comment
BGE	1. If we move to a "one size fits all" single reporting form, it is important that the form be properly developed to cover any foreseeable event, which appears to be the intent of the DSR SDT, as outlined on page 4 of the concept document. Such an approach should also incorporate a single point of contact for reporting information, to avoid any confusion. 2. We would like clarification that any proposed CIP-008-related reporting requirement (including any linked reporting requirement between CIP-008 and CIP-001) is only applicable in situations where the incident/event involves a registered entity's Critical Cyber Asset.

Organization	Question 7 Comment
Response (Questions 3&6): The DSR SDT thanks you for your comment. The drafting team will explore clarification that any proposed CIP-008 related reporting requirement between CIP-008 and CIP-001 is only applicable where the incident/event involves a registered entity's CCA. Note that CIP-002 through CIP-009 are undergoing revision under project 2008-06 – Order 706 SDT. Note that the current CIP-008 has a reporting requirement to the ES-ISAC only.	
Electric Market Policy	a. NERC should focus efforts on developing specific event reporting criteria and not base the requirement on the definition of the term 'sabotage' but on the reporting criteria itself. b. The "opportunities for efficiency" discussed in the Concept Paper would be best achieved by focusing on those items that are necessary to maintain the reliability of the Bulk Electric System. If there are elements that need to be reported that, do not support this objective, than that reporting should not be required in reliability standards.
Hydro-Québec TransEnergie (HQT)	a. NERC should focus efforts on developing specific event reporting criteria and not base the requirement on the definition of the term 'sabotage', but on the reporting criteria itself. See comments above. b. The "opportunities for efficiency" discussed in the Concept Paper would be best achieved by focusing on those items that are necessary to maintain the reliability of the Bulk Electric System. If there are elements that need to be reported that do not support this objective, then that reporting should not be required in reliability standards. Consider making NERC the distributor of reports to other agencies. We recognize that the key is to simplify reporting to a single form, and to the extent possible, to one agency. "Front line" reliability personnel must have the "timely" knowledge to know when a situation warrants local, area, regional, or national involvement. Finally, the SDT should keep in mind the fact that Canadian stakeholders might have some difference in the way reports are made to Security Agencies.
Northeast Power Coordinating Council	a. NERC should focus efforts on developing specific event reporting criteria and not base the requirement on the definition of the term 'sabotage', but on the reporting criteria itself. See comments above b. The "opportunities for efficiency" discussed in the Concept Paper would be best achieved by focusing on those items that are absolutely necessary to maintain the reliability of the Bulk Electric System. If there are elements that need to be reported that do not support this objective, then that reporting should not be required in reliability standards. Consider making NERC the distributor of reports to other agencies. We recognize that the key is to simplify reporting to a single form, and to the extent possible, to one agency. "Front line" reliability personnel must have the "timely" knowledge to know when a situation warrants local, area, regional, or national involvement.
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees to focus efforts to specific event reporting criteria. SDT believes that by reporting material risks to the Bulk Electrical System using the impact event categorization it will be easier to get the relevant information for mitigation, awareness, and tracking, not based on the requirement of defining "sabotage". The SDT believes that it is the submitter's responsibility to submit OE-417 forms to the DOE, as stated by Public Law for US entities. The DSR SDT does recognize that it may not be possible to eliminate	

Organization	Question 7 Comment
reporting to multiple jurisdictional agencies due to legislative or regulatory requirements.	
SPS Consulting Group Inc.	Again, please consider the unique scope of the entities to which these standards are to comply. Don't dump all the requirements on all the applicable entities and perpetuate the current practice of forcing them to parse the requirements into what is logical or illogical from their perspective. The drafting team should have the expertise to do this. Identify which requirements apply to which applicable entity.
Response: The DSR SDT thanks you for your comment. The DSR SDT will take into consideration what registered entities and thresholds are to be included in the revised standard(s) based on the SAR. The DSR SDT will establish the "requirements necessary for users, owners, and operators of the Bulk-Power-System" as stated in FERC Order 693 and the difference in reporting of events on the BES, as stated in the Purpose statement of EOP-004-1.	
ERCOT ISO	All references to CIP-008 should be removed and we reassert that physical and cyber reporting should be separate. There is documentation available from the CIPC that the drafting team considered CIP-001 related physical sabotage reporting and specified cyber incident reporting requirements in CIP-008.ERCOT ISO requests the DSR SDT to continue to improve its guidelines and to post those guidelines for all to use, but not to create sanctionable standards whose good intentions could result in unintended adverse consequences for the Industry. ERCOT ISO also suggests that all reporting forms and guidance should be located in a central, easily accessible location, eliminating confusion and simplify reporting for system operators thereby directly enhancing reliability during system events. The industry would benefit from a central location or link on the NERC website containing all reporting forms.
Response: The intent was to look at the posted "NERC Guideline: Threat and Incident Reporting" and ask the industry if the DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). The DSR SDT will take into consideration your comment on keeping cyber and physical events separate. We are suggesting in our discussion to consolidate the location of reporting into one standard. The industry has demonstrated by its comments that it prefers that the reporting process be streamlined to achieve a "one stop shop" approach. We will continue to explore the possibilities to achieve the best results for all stakeholders. A discussion of advantages /disadvantages will continue to discover options and alternatives with input from all stakeholders.	
Western Electricity Coordinating Council	As stated previously, for "One stop shopping" we need "buy in" from the foreign nationals. The way to do this is to engage their opinions and respect their jurisdictional agencies as well.
Response (Question 6): The DSR SDT thanks you for your comment. The DSR SDT does recognize that it may not be possible to eliminate reporting to multiple jurisdictional agencies due to legislative or regulatory requirements. The SDT acknowledges that it is possible to consolidate various reports that ask repetitive questions and through this process can work with foreign nationals to receive their "buy in" for a one report form for all functional entities to submit to NERC.	

Organization	Question 7 Comment
MRO's NERC Standards Review Subcommittee	Confusion often arises in the industry between the CIP standards and other reliability standards based on CIP-001 naming convention. We would suggest the SDT retire CIP-001 and incorporate requirements within the EOP-004 standard or a new EOP-xxx standard to avoid confusion rising from CIP and other NERC Reliability Standards. Additionally, we assume the SDT has been created to specifically address FERC Order 693 directives to the ERO which appears to include the following items: 1. Applicability - "possible revisions to CIP-001-1 that address our concerns regarding the need for wider application of the Reliability Standard... the ERO should consider whether separate, less burdensome requirements for smaller entities may be appropriate" (FERC, 2007, para. 460). 2. Definition of Sabotage - "we direct that the ERO further define the term and provide guidance on triggering events that would cause an entity to report an event... we believe the term sabotage is commonly understood and that common understanding should suffice in most instances... the ERO should consider FirstEnergy's suggestions to differentiate between cyber and physical sabotage and develop a threshold of materiality." (FERC, 2007, para. 461-462) 3. Periodic Review and Testing - "directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures." (FERC, 2007, para. 466) 4. Redundant Reporting - "now direct the ERO to address our underlying concern regarding mandatory reporting of a sabotage event... Regarding the potential for redundant reporting under CIP-001-1 and other government reporting standards, and the need for greater coordination... We direct the ERO to explore ways to address these concerns - including central coordination of sabotage reports and a uniform reporting format... with the appropriate governmental agencies that have levied the reporting requirements." (FERC, 2007, para. 468-469) 5. Specified Time - "the Commission directs the ERO to modify CIP-001-1 to require an applicable entity to contact appropriate governmental authorities in the event of sabotage within a specified period of time... the ERO should consider suggestions raised... to define the specified period for reporting an incident beginning from when an event is discovered or suspected to be sabotage" (FERC, 2007, para. 470). 6. Summary of CIP-001-1 - "the Commission directs the ERO to develop the following modifications... (1) further define sabotage and provide guidance as to the triggering events... (2) specify baseline requirements regarding... procedures for recognizing sabotage events... (3) incorporate a periodic review... and for the periodic testing... (4) require an applicable specified period of time. In addition... address our concerns regarding applicability to smaller entities... consolidation of the sabotage reporting forms and the sabotage reporting channels with the appropriate governmental authorities to minimize the impact of these reporting requirements on all entities." (FERC, 2007, para. 471) 7. Analyze Performance - "at a minimum, generator operators and LSEs should analyze the performance of their equipment and provide the data... The Commission directs the ERO to consider this concern in future revisions... that includes any Requirements necessary for users, owners and operators... to provide data that will assist NERC" (FERC,

Organization	Question 7 Comment
	2007, para. 613, 617). 8. Reporting Time Frames - “The Commission directs the ERO to change its Rules of Procedures to assure that the Commission also receives these reports within the same time frames as the DOE.” (FERC, 2007, para. 618)
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees with your comments to specifically address FERC Order 693 directives to the ERO and will determine a prudent course of action with respect to these standards and pursue the suggestion to retire CIP-001 and incorporate requirements within the EOP-004 standard to avoid confusion rising from CIP and other NERC Reliability Standards.	
Constellation Power Source Generation	Constellation Power Generation would like clarification that any proposed CIP-008-related reporting requirement (including any linked reporting requirement between CIP-008 and CIP-001) is only applicable in situations where the incident/event involves a registered entity’s Critical Cyber Asset. In that vein, we want to emphasize the importance of the DSR SDT working with the CIP SDT on the cyber related events. If the DSR SDT is going to be adding clarity to cyber related events, then coordination with the CIP SDT is needed to ensure the same verbiage is being used. Furthermore, having any duplication of requirements will cause a double jeopardy scenario which would go against the SAR for the DSR SDT. As stated earlier, Constellation Power Generation also questions whether cyber related incidents should fall under the spectrum of sabotage type events, or remain separate and be incorporated in the CIP revisions.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted “NERC Guideline: Threat and Incident Reporting” and ask the industry if DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). Note that CIP-002 through CIP-009 are undergoing revision under project 2008-06 – Order 706 SDT.	
We Energies	Give consideration to combining CIP-001 and EOP-004-1 through a common categorization. For example, “System Risk Reporting” could encompass both actual and potential events and would minimize the need to cross reference both standards, and provide one location for event and potential-event reporting. Much of the challenge in this project is in achieving a common understanding of the words sabotage and terrorism. There are nuances of meaning in the words that imply a relationship between the attacker and the victim, or a motive other than simple profit or mischief. This nuance of meaning requires the victim of the damage to discern a relationship or motive which may not be discoverable in the relatively brief time window during which the entity must report the event. In fact, they may never be known. Consequently, We Energies recommends elimination of the words sabotage and terrorism from these standards. We also recommend elimination of the word vandalism since it also implies an ability and duty to discern whether a particular act (barbed wire thrown over transformer bushings) was done out of pure mischief (vandalism) or with intent to destroy equipment for a political purpose (terrorism). And if the act was committed by a disgruntled employee, it becomes sabotage. No wonder there is confusion and indecision. Instead, We Energies recommends using the simple words “criminal damage”. One need not be a prosecuting attorney or FBI Special Agent to know what this means. Simply ask, “Does is look like somebody damaged it (or hacked in) intentionally?” and, “Did we give consent?” and you’re done. With

Organization	Question 7 Comment
	elimination of sabotage, terrorism and vandalism, and all of their baggage, comes the ability to integrate both CIP 001 and EOP 004. We now have criminal damage (or cyber attack) as just another event to be evaluated against certain pre-defined impact measures. No value judgments, no speculation. Another benefit of using these simple words and tests is that operating personnel, whether in the field or at the console, will not require special awareness training in discerning these nuances of meaning. They already have experience with the equipment or cyber systems and its normal performance. Operating personnel can readily assess whether an impact event is due to equipment failure, weather or animal contact vs. intentionally caused by a person. If it appears to be criminal damage, call the local police agency. Report the event and the impact. Cooperate with the investigation. Share your knowledge of the normal condition of the equipment or performance of the system. Share your experience with similar events. It will be important to highlight that the theft of all the grounding pigtails in a substation is different from the act of simply snipping each of them to leave the equipment electrically floating. The technical condition is the same, but this allows the police to make an inference with respect to motive, suspect profile, sophistication, etc. That's their job. They may ask us to speculate on the motive or skills of the attacker. That's okay. But at least we don't have to know or guess at it for the purpose of determining whether to report the event. No training required. With respect to notification to the FBI, We Energies recommends that the standard merely state that the owner of the damaged asset ensure the local office of the FBI is notified. The standard should permit documentation of either a direct phone call by the asset owner or obtaining an assurance from the local police that they will do so. There should be no need to prove earlier establishment of a relationship with the FBI. There should be no expectation that the entity have a signed letter from the FBI Special Agent in Charge acknowledging his agency's duty. This document means nothing. With respect to reporting within the industry, We Energies recommends that the only events to be reported "up the chain" are those that we choose to characterize as "impact events". That is, the events that meet some measurable threshold with respect to BES impact. We should describe these efficiently to avoid over-reporting of trivial events. It is apparent that we are already over-reporting since DHS HITRAC recently fed back to the industry that copper thieves attacked a substation in San Bernardino, CA taking some of the grounding conductors. The industry should have the option to report non-impact events that are unusual in some respect and which may have some mutual industry benefit in terms of prevention, awareness or recovery. Attack attempts with no impact, or observations of suspicious activity could fall into this optional category. These optional reports could be aggregated by the entity for the purpose of detecting patterns or trends, or be reported ad hoc. The ES-ISAC should be the recipient of the reports. It should be the single point of contact since it has the industry insight, engineering expertise and cross-sector relationships to analyze and return valuable intelligence to the industry. With the ES-ISAC as the recipient of the reports, efficient sharing with Federal agencies, with the regional entities and with neighboring asset owners could be automated and rapid. There is much benefit to be gained from this project, primarily in the area of creating clarity and uniformity. There is some risk that the reporting requirements will become onerous and prescriptive.

Response: The DSR SDT thanks you for your comment. The DSR SDT is proposing to consolidate disturbance and event reporting under a single standard. The DSR SDT believes that reporting material risks to the Bulk Electrical System by using the impact event categorization, it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation by the elimination of the term "sabotage". The intent is to allow potentially impacted parties to prepare for and possibly mitigate the reliability risk. The NERC Rules of

Organization	Question 7 Comment
Procedure (section 800) provides an overview of the responsibilities of the ERO in regards to analysis and dissemination of information for reliability. The SDT is proposing that the new standard specify who has access to reported information and who should be notified about impact events, because agencies such as the DHS and FBI have other duties and responsibilities - an impact event that is related to copper theft may only need to be reported to the local law enforcement authorities. The goal of the DSR SDT is create clarity and uniformity by developing a single reporting form for all functional entities without regard to nationality (US, Canada, Mexico) to submit to NERC with guidance. Ideally, entities would complete a single form, which could then be distributed to jurisdictional agencies and functional entities as appropriate. The DSR SDT agrees with your assessment that there should be no expectation that the entity have a signed letter from the FBI Special Agent.	
Bandera Electric Cooperative, Inc.	I commend the SDT for working on this effort and wish them success.
Response: The DSR SDT thanks you for your comment.	
Public Service Enterprise Group Companies	If reporting does become the responsibility of the Reliability Coordinators, the RCIS should be made available view-only to registered entities with a notification when RC's have posted new entries. That will enhance the situational awareness of registered entities. The PSEG Companies disagree with inclusion of CIP-008 reporting requirements as part of the CIP-001 and EOP-004 initiative. CIP-008 reporting as part of the cyber security set of NERC standards is usually managed by specialized corporate organizations separate from those involved with the other NERC standards, and with highly specialized cyber skill sets. CIP-008 reporting requirements should remain where they are, and any perceived need for improvement addressed in the ongoing CIP Version 4 development process.
Response: The DSR SDT thanks you for your comment. The RCIS is a real-time communication and reporting tool and is outside the scope of the SDT. The goal of the DSR SDT is to develop a form to expedite report completion, sharing and storage. Ideally, entities would complete a single form, which could then be distributed to jurisdictional agencies and functional entities as appropriate. Functional entities may include the RC, TOP, and BA for situational awareness. The DSR SDT will take into consideration your comment with inclusion to CIP-008 reporting. However, the drafting team will explore clarification that any proposed CIP-008-related reporting requirement between CIP-008 and CIP-001 is only applicable where the incident/event involves a registered entity's CCA. Note that CIP-002 through CIP-009 are undergoing revision under project 2008-06 – Order 706 SDT.	
Independent Electricity System Operator	In the Background Section of the comment form, it is indicated that the SDT "...is NOT seeking input or guidance on the definition of physical or cyber sabotage, what type of disturbances should be reported, who should do reporting, or to whom or what organizations will be receiving the reports." <u>Yet there are proposed definitions, with examples, in the concept paper</u>. The SDT should make it absolutely clear that by supporting the general concept as described in the paper, the commenting entities are not endorsing the proposed definitions, nor the examples as elements to be included in the standard.

Organization	Question 7 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT will continue to clarify the impact events concept and eliminate "gray areas" while including language to give clarity to the reporting process. Standards developed under this project will be posted for comment on specific content.	
Luminant	Luminant disagrees with the direction of utilizing impact events, as this is an expansion in scope beyond the simplification of sabotage and disturbance reporting.
Response: The DSR SDT thanks you for your comment. We are suggesting the term "Impact Event" be substituted to include only events that would impact the reliability of the BES. The DSR SDT has reviewed the existing standards, the SAR; issues from the NERC database and FERC Order 693 Directives and determine this was a prudent course of action with respect to these standards to provide clear criteria for reporting.	
Dynegy Inc.	N/A
Manitoba Hydro	No
Edison Mission Marketing & Trading	No other comments.
SERC Reliability Coordinator Sub-committee (RCS)	None.
USBR	The concept of "threat" evaluation criteria is somewhat vague and a great care is needed to ensure it is clear enough that the most individuals would be able to analyze an event and end up at the same threat. Otherwise it would be almost impossible to ensure compliance with a requirement which cannot accurately describe criteria to be used to ensure that proper evaluation has occurred.
Response: The DSR SDT thanks you for your comment. We are suggesting the term "Impact Event" be substituted to include only events that would impact the reliability of the BES as opposed to requiring a threat evaluation. The DSR SDT intends to develop criteria that will assist entities in determining which events should be reported.	
Wolverine Power Supply Cooperative, Inc.	The concepts of removing duplication, consolidation, and focusing on "impact events" sound logical. I am concerned that the focus may drift to expanded reporting, not reduced reporting.
Response: The DSR SDT thanks you for your comment. The DST SDT discussed the reporting of "impact events" and will consider guidance found in the document, "NERC Guideline: Threat and Incident Reporting" which will include clear criteria to eliminate erroneous or expanded reporting.	

Organization	Question 7 Comment
ISO RTO Council Standards Review Committee	The FERC Order merely asked NERC to “further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event.” There is no requirement to create a Reporting Standard and no mention of Disturbance events. There is a strong need to avoid heavy-handed use of NERC standards particularly for such post event reporting guidelines. The SRC would urge the DSR SDT to continue to improve its guidelines and to post those guidelines for all to use, but not to create sanctionable standards whose good intentions will inevitably result in many unintended adverse consequences for the Industry. Rather, the SDT should seek to retire sanctionable requirements that require event reporting in favor of guidelines for reporting.
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted “NERC Guideline: Threat and Incident Reporting” and ask the industry if the DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). The DSR SDT will take into consideration your comment on keeping cyber and physical events separate. We are suggesting in our discussion to consolidate the location of reporting into one standard. The industry has demonstrated by its comments that the reporting process be streamlined to achieve a “one stop shop” approach. We will continue to explore the possibilities to achieve the best results for all stakeholders. A discussion of advantages /disadvantages will continue to discover options and alternatives with input from all stakeholders.	
Lands Energy Consulting	The lack of common sense that leads to a 15 MW loss of load resulting from a 115 kV line outage being categorized as a "reportable disturbance" really hurts the credibility of the entire NERC Compliance Program. The smaller utilities look at application of EOP-004 in particular to their operation and conclude that either the EO/RRO is: a. stupid; or b. Out to persecute the smaller utilities. In reality, EOP-004 was drafted for application to Southern California Edison, where loss of 50% of customers would be 2-3 million customers. Now that's really disturbing!
Response: The DSR SDT thanks you for your comment. The DSR SDT intends to develop criteria that will assist entities in determining which events should be reported. Acts of sabotage may be “tested” on smaller entities before the saboteurs move on the larger entities.	
Central Hudson Gas & Electric	The NERC Guideline: Threat and Incident Reporting Attachment A matrix is an extremely beneficial document that organizes reporting criteria. However, it identifies communications systems failure sub-category under the Equipment And/Or Systems Failure category as reportable with a reference to OE-417 - Schedule 1, Item 10. Item 10 on Schedule 1 addresses only failures due to attacks (not failures for other reasons).
Response: The DSR SDT thanks you for your comment. The intent was to look at the posted “NERC Guideline: Threat and Incident Reporting” and ask the industry if the DSR SDT should consider existing guidelines for possible inclusion into the yet to be written requirement(s). The DSR SDT has not determined at this time what bright line will be used for the yet to be drafted Standard(s). Loss of communications would be considered an impact event. The reason for the loss of communications is irrelevant.	

Organization	Question 7 Comment
Duke Energy	We don't think CIP-001, EOP-004 and cyber incident reporting aspects of CIP-008 should all be combined into one standard, because of the significant differences between sabotage and disturbances. We have suggested that the drafting team further define sabotage, and we have included a suggested definition in our response to question #5 above. Sabotage is very specific due to the intent (for the purpose of weakening the critical infrastructure), and the potential impact to the BES. We believe that sabotage and cyber incident reporting should remain a part of the CIP Standards due to the emphasis placed on the criticality and vulnerability of the assets needed to support reliable operation of the BES. Cyber Security and Physical Security could be placed together in the same standard (remain in CIP) and other disturbances (i.e., accidental, natural) in a separate standard. "One stop shopping" for reporting is still possible as long as the OE-417 form is included as part of the NERC electronic form. And while we agree with the need for additional clarity in sabotage and disturbance reporting, we believe that the Standards Drafting Team should carefully consider whether there is a reliability-related need for each requirement. Some disturbance reporting requirements are triggered not just to assist in real-time reliability but also to identify lessons-learned opportunities. If disturbance and sabotage reporting continue to be reliability standards, we believe that all linkages to lessons-learned/improvements need to be stripped out. We have other forums to identify lessons-learned opportunities and to follow-up on those opportunities.
Response: The DSR SDT thanks you for your comment. The DSR SDT is still evaluating inclusion of CIP-008 reporting requirements with CIP-001 and EOP-004 requirements, Note that the current CIP-008 has a reporting requirement to the ES-ISAC only. The DSR SDT developed the more inclusive term "impact events" to eliminate using more confusing terms like sabotage (which is not likely to be determined until after a lengthy investigation). These standards may be combined to have all reporting requirements in a single standard, not because the items to be reported are necessarily related.	
FirstEnergy	We fully agree that sabotage events need to be more clearly defined and reporting requirements need to be better coordinated. But as we have stated in previous comments, the drafting team needs to determine if standard requirements need to be developed for this type of reporting or if this is better left to administrative requirements outside the standards arena. Also, while we appreciate the team's effort to simplify reporting requirements for entities, we are concerned with the serial communication offered by the concept paper. As an example, the team proposes to have LSE report the incident to the BA and/or TOP and then have the BA and/or TOP report it to the RC and the RC to report it to NERC and the NERC report to the regulatory agencies. While this simplifies it for each individual organization, this method introduces many opportunities for errors and miscommunications. Since this is after-the-fact reporting, it is difficult to defend this type of communication path when one consistent report could be sent simultaneously to all agencies at the same time from the originating location.
Response: The DSR SDT thanks you for your comment. The Reliability Coordinator's suggested role in this is to allow them to incorporate the relevant data from responsible entities in their footprint for further analysis. We will consider your suggestion of simultaneous submissions as a means to effectively notify the necessary parties. The SDT believes that it is the submitter's responsibility to submit OE-417 forms to the DOE. The DSR SDT does recognize that it may not be possible to eliminate reporting to multiple jurisdictional agencies due to legislative or regulatory	

Organization	Question 7 Comment
requirements.	
Ameren	While we are not opposed to the concept of identifying impact events, we are concerned that the drafting team may actually be expanding reporting requirements. We do not support expansion of reporting requirements unless a clear reliability or legal need is identified. Some of the impact events are almost never sabotage and do not warrant reporting for reliability needs and should not be included. For example, copper theft should not require reporting, in general, because it is almost never sabotage and rarely impacts reliability. If it does, impact reliability because, for example, the protection system is impacted and causes more significant potential contingencies, then reporting could be required. Why is a train derailment near a transmission right of way significant? It would only be significant if an investigation identified sabotage as the reason. Furthermore, what is considered near?
Midwest ISO Standards Collaborators	While we are not opposed to the concept of identifying impact events, we are concerned that the drafting team may actually be expanding reporting requirements. We do not support expansion of reporting requirements unless a clear reliability or legal need is identified. Some of the impact events are almost never sabotage and do not warrant reporting for reliability needs and should not be included. For example, copper theft should not require reporting, in general, because it is almost never sabotage and rarely impacts reliability. If it does impact reliability because, for example, the protection system is impacted and causes more significant potential contingencies, then reporting could be required. Why is a train derailment near a transmission right of way significant? It would only be significant if an investigation identified sabotage as the reason. Furthermore, what is considered near?
Response: The DSR SDT thanks you for your comment. It is not the intent of the DSR SDT to expand reporting requirements but rather to attempt to clarify and define an approach to assist the industry and stakeholders in reporting impact events. Furthermore, impact events should not include copper theft or other conditions that pose no threat to the reliability of the BES. A train derailment is only an impact event if it threatens some element of the power system such as a transmission line corridor - the derailment in itself is not an impact event.	
Exelon	You should consider providing clear and concise instructions as to the expectation on submitting forms, i.e. the DOE 417. There should be no guessing as to when and how reports should be submitted and who should receive them. Specific details on reporting criteria should be included.
Response : The DSR SDT thanks you for your comment. The DSR SDT intends to develop criteria for reporting impact events.	

Consideration of Comments on Disturbance and Sabotage Reporting — Project 2009-01

The Disturbance and Sabotage Reporting Drafting Team thanks all commenters who submitted comments on its preliminary draft of EOP-004-2 – Impact Event and Disturbance Assessment, Analysis, and Reporting. This standard was posted for a 30-day informal comment period from September 15, 2010 through October 15, 2010. Stakeholders were asked to provide feedback on the standard through a special Electronic Comment Form. There were 60 sets of comments, including comments from more than 175 different people from approximately 100 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

In this report, the comments have been sorted by question number so that it is easier to see where there is consensus. The comments are posted in their original format on the following project page:

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

Based on stakeholder comments, and also on the results of the observations made by the Quality Review team, the drafting team made the following significant changes to the standard following the posting period that ended on October 15, 2011.

Scope: A common thread through most of the comments was that the DSR SDT went beyond the reliability intent of the standard (reporting) and concentrated too much on the analysis of the event. The DSR SDT agrees with this response, and revised the purpose as follows:

Original Purpose: Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES).

Revised Purpose: To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of Impact Events and their causes, if known, by the Responsible Entities.

Definitions:

Impact Event: The DSR SDT had proposed a working definition for "impact events" to support EOP-004 - Attachment 1 as follows:

"An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action."

Many stakeholders indicated that the definition should be added to the NERC Glossary and the DSR SDT adopted this suggestion.

The types of Impact Events that are required to be reported are contained within EOP-004 - Attachment 1. Only the events identified in EOP-004 – Attachment 1 are required to be reported under this Standard.

Sabotage: FERC Order 693, paragraph 471 states in part: ". . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event."

The DSR SDT made a conscious, deliberate decision to exclude a strict definition of sabotage from this standard and sought stakeholder feedback on this issue. Some suggested adopting the NRC definition of the term sabotage, and the DSR SDT did consider adopting the NRC definition shown below but determined that the definition is too narrowly focused.

Any deliberate act directed against a plant or transport in which an activity licensed pursuant to 10 CFR Part 73 of NRC's regulations is conducted or against a component of such a plant or transport that could directly or indirectly endanger the public health and safety by exposure to radiation.

Most respondents agreed that in order to be labeled as an act of sabotage, the intent of the perpetrators must be known. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This would result in further ambiguity with respect to reporting events, and the timeline associated with the reporting requirements does not lend itself to the in-depth analysis required to identify a disturbance (or potential disturbance) as sabotage. The SDT felt that a likely consequence of having to meet this criterion, in the time allotted, would be an under-reporting of events. Accordingly, all references to sabotage have been deleted from the standard.

Instead, the SDT concentrated on providing clear guidance on the events that should trigger a report. The SDT believes that this more than adequately meets the reliability intent of the Commission as expressed in paragraph 471 of Order 693 in an equally efficient and effective manner.

Situational Awareness versus Industry Awareness: Some commenters correctly pointed out that "situational awareness" is a desirable by-product of an effective event reporting system, and not the driver of that system. Accordingly, all references to "situational awareness" have been deleted from the standard. The more generic "industry awareness" has been substituted where appropriate.

Applicability:

The DSR SDT had protracted discussions on the applicability of this standard to the LSE. Per the Functional Model, the LSE does not own assets and therefore should not be an applicable entity (no equipment that could experience a "disturbance"). However, the Registry Criteria contains language that could imply that the LSE does own assets, or is at least responsible for assets. In addition, the DSR SDT modified Attachment 1 to include reporting of damage or destruction of Critical Cyber Assets per CIP-002. The LSE, as well as the Interchange Authority and Transmission Service Provider are applicable entities under CIP-002 and should be included for Impact Events under EOP-004.

There were several comments that the asset owners (GO/TO) would be less likely than the asset operators (GOP/TOP) to be aware of an impact event. The DSR SDT recognizes that this may be true in some cases, but not all. In order to meet the reliability objectives of this requirement, the applicability for GO/TO will remain as per Attachment 1.

Requirement R1:

Based on stakeholder comments, Requirement R1, which assigned the ERO the responsibility for collecting and distributing impact event reports was deleted. There was strong support for a central system for receiving and distributing impact event reports (a/k/a one stop shopping). There was general agreement that NERC was the most likely, logical entity to perform that function. However several respondents expressed their concern that the ERO could not be compelled to do so by a requirement in a Reliability Standard (not a User, Owner or Operator of the BES). In their own comments, NERC did not oppose the concept, but suggested that the more appropriate place to assign this responsibility would be the NERC Rules of Procedure. The DSR SDT concurs. The DSR SDT has removed the requirement from the standard and is proposing to make revisions to the NERC Rules of Procedure as follows:

> 812. NERC will establish a system to collect impact event reports as established for this section, from any Registered Entities, pertaining to data requirements identified in Section 800 of this Procedure. Upon receipt of the submitted report, the system shall then forward the report to the appropriate NERC departments, applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, and regulatory agencies as necessary. These reports shall be forwarded to the Federal Energy Regulatory Commission for impact events that occur in the United States. The ERO shall solicit contact information from Registered Entities appropriate governmental, law enforcement and regulatory agencies for distributing reports.

Requirement R2 (now R1 in the revised standard):

There were objections to the use of the term “Operating Plan” to describe the procedure to identify and report the occurrence of a disturbance. The DSR SDT believes that the use of a defined term is appropriate and has revised Requirement R1 to include Operating Plan, Operating Process and Operating Procedure.

Many commenters felt that the requirements around updating the Operating Plan were too prescriptive, and impossible to comply with during the time frame allowed. The DSR SDT agrees, and Requirement R2, Parts 2.5 through 2.9 have been eliminated. They have been replaced with Requirement R1,Part 1.4 to require updating the Impact Event Operating Plan within 90 days of any change to content.

R1. Each Responsible Entity shall have an Impact Event Operating Plan that includes: *[Violation Risk: Factor Medium] [Time Horizon: Long-term Planning]*:

- 1.1. An Operating Process for identifying Impact Events listed in Attachment 1.
- 1.2. An Operating Procedure for gathering information for Attachment 2 regarding observed Impact Events listed in Attachment 1.
- 1.3. An Operating Process for communicating recognized Impact Events to the following:
  - 1.3.1 Internal company personnel notification(s).

1.3.2. External organizations to notify to include but not limited to the Responsible Entities' Reliability Coordinator, NERC, Responsible Entities' Regional Entity, Law Enforcement, and Governmental or Provincial Agencies.

1.4. Provision(s) for updating the Impact Event Operating Plan within 90 days of any change to its content.

Other requirements reference the Operating Plan as appropriate. The requirements of EOP-004-2 fit precisely into the definition of Operating Plan:

> Operating Plan: A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Requirement R3 (now R2 in the revised standard):

Requirement R3 has been re-written to exclude the requirement to "assess the initial probable cause". The only remaining reference to "cause" is in the Impact Event Reporting Form (Attachment 2). Here, there is no longer a requirement to assess the probable cause. The probable cause only needs to be identified, and only if it is known at the time of the submittal of the report.

> R2. Each Responsible Entity shall implement its Impact Event Operating Plan documented in Requirement R1 for Impact Events listed in Attachment 1 (Parts A and B). *[Violation Risk: Factor Medium] [Time Horizon: Real-time Operations and Same-day Operations]*

Requirement R4 (now R3 in the revised standard):

The DSR SDT did a full review based on comments that were received. R3 now is stream lined to read:

> R3. Each Responsible Entity shall conduct a test of its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3 at least annually, with no more than 15 months between such tests. .

The testing of the Operating Process for communicating recognized Impact Events (as stated in R1) is the main component of this requirement. Several commenters provided input that too much "how" was previously within R3 and the DSR DST should only provide the "what". The DSR SDT did not provide any prescriptive guidance on how to accomplish the required testing within the rewrite. Testing of the entity's procedure (R1) could be by an actual exercise of the process (testing as stated in FERC Order 693 section 471), a formal review process or real time implementation of the procedure. The DSR SDT reviewed Order 693 and section 465 directs that processes are "verify that they achieve the desired result". This is the basis of R3, above.

Requirement R5 (now R4 in the revised standard):

The DSR SDT did a full review based on comments that were received. The major issues that were provided by commenters involved the inclusion of Requirement R5, Part 5.3 and Part 5.4.

5.3 If the Operating Plan is revised (with the exception of contact information revisions), training shall be conducted within 30 days of the Operating Plan revisions.

5.4 For internal personnel added to the Operating Plan or those with revised responsibilities under the Operating Plan, training shall be conducted prior to assuming the responsibilities in the plan.

Upon detailed review the DSR SDT agrees with the majority of comments received regarding Requirement R5, Parts 5.3 and 5.4 and has removed Parts 5.3 and 5.4 completely from the Standard. Training is still the main theme of this requirement (now R4) as it pertains to the personnel required to implement the Impact Event Operating Plan (R1).

R4 now is stream lined to read:

> R4. Each Responsible Entity shall review its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan at least annually with no more than 15 calendar months between review sessions

Requirement R6 (now R5 in the revised standard):

The DSR SDT did a full review based on comments that were received. Many comments received identified concerns on the reporting time lines within Attachment 1., Several commenters wanted the ability to report impact events to their responsible parties via the DOE Form OE-417. Upon discussions with the DOE and NERC, the DSR SDT has added the ability to use the DOE Form OE-417 when the same or similar items are required to be reported to NERC and the DOE. This will reduce the need to file multiple forms when the same or similar events must be reported to the DOE and NERC. The reliability intent of reporting impact events within prescribed guidelines, to provide industry awareness and to start any required analysis processes can be met without duplicate reporting R5 now is stream lined to read:

> R5. Each Responsible Entity shall report Impact Events in accordance with its Impact Event Operating Plan pursuant to Requirement R1 and Attachment 1 using the form in Attachment 2 or the DOE OE-417 reporting form.

Requirements R7 and R8:

The DSR SDT did a full review based on comments that were received. The DSR SDT has determined that R7 and R8 are not required to be within a NERC Standard since Section 800 of the Rules of Procedure already assigns this responsibility to NERC.

Attachment 1:

The DSR SDT did a full review based on comments that were received. The DSR SDT, the Events Analysis Working Group (EAWG), NERC Staff (to include NERC Senior VP and Chief Reliability Officer) had an open discussion involving this topic. The EAWG and the DSR SDT aligned Attachment 1 with the Event Analysis Program category 1 analysis responsibilities. This will assure that impact events in EOP-004-2 reporting requirements are the starting vehicle for any required Event Analysis within the NERC Event Analysis Program. The DSR SDT reviewed the “hierarchy” of reporting within Attachment 1. To reduce multiple entities reporting the same impact event, the DSR SDT has stated that the entity that performs the action or is directly affected by an action will report per EOP-004-2. As an example, during a system emergency, the TOP or RC may request manual load shedding by a DP or TOP. The DP or TOP would have the responsibility to report the action that it took if it meets or exceeds the bright-line criteria established in Attachment 1. Upon reporting, the NERC Event Analysis Program would be made aware of the impact event and start the Event Analysis Process which is outside the scope of this Standard. Several bright-line criteria were removed from Attachment 1. These criteria (DC converter station, 5 generator outages, and frequency trigger limits) were removed after discussions with the EAWG and NERC staff, who concurred that these items should be removed from a reporting standard and analysis process.

Several respondents expressed concern that the reporting requirements were redundant. The general sentiment was that unclear responsibility to report a disturbance could trigger a flood of event reports. Attachment 1 has been modified to assign clear responsibility for reporting, for each category of Impact Event.

Some commenters indicated a concern that the list of events in Attachment 1 isn't as comprehensive as the existing standard since the existing standard includes bomb threats and observations of suspicious activities. Others commented that the impact event list should include deliberate acts against infrastructure. The DSR SDT believes that "observation of suspicious activity" and "bomb threats" are addressed in Attachment 1 Part B – "Risk to BES equipment from a non-environmental physical threat". The SDT has added the phrase, "and report of suspicious device near BES equipment" to note 3 of the "Attachment 1, Potential Reliability – Part B" for additional clarity.

Attachment 2:

The proposed Impact Event Report (Attachment 2) generated comments regarding the duplicative nature of the form when compared to the OE-417. The DSR SDT has added language to the proposed form to clarify that NERC will accept a DOE OE-417 form in lieu of Attachment 2 if the responsible entity is required to submit an OE-417 form.

In collaboration with the NERC Event Analysis Working Group (EAWG) the DSR SDT modified the attachment to eliminate confusion. This revised form will be Attachment 2 of the Standard and collects the only information required to be reported for EOP-004-2. Further information may be requested through the Events Analysis Process (NERC Rules of Procedure), but the collection of this information is outside of the scope of EOP-004.

The DSR SDT has also clarified what the form's purpose with the following addition to the form:

> "This form is to be used to report impact events to the ERO."

Other Standard Issues:

The DSR SDT proposed that combining EOP-004 and CIP-001 would not introduce a reliability gap between the existing standards and the proposed standard and the industry comments received confirms this.

Several entities expressed their concern with the fact that Attachment 1 contained most of the elements already called for in the OE-417. The DSR SDT agrees, and Attachment 1 part 1 has been modified to even more closely mirror the Department of Energy's OE-417 Emergency Incident and Disturbance Report form. Additionally, the standard has been modified to allow for the use of the OE-417.

There was some concern expressed that there could be confusion between the reporting requirements in this standard, and those found in CIP-008. The DSR SDT agrees, and Attachment 1 Part B, has been modified to provide the process for the reporting of a Cyber Security Incident.

The DSR SDT also believes NERC's additional concern about what data is applicable is addressed by the revisions to Attachment 1, and the inclusion of the OE-417 as an acceptable interim vehicle.

Implementation Plan:

The DSR SDT asked stakeholders to provide feedback on the proposed effective date which provided entities at least a year following board approval of the standard. Most stakeholders supported the one year minimum, however based on the revisions made to the requirements, the drafting team is now proposing that this time period be shortened to between six months and nine months. The current CIP-001 plan is adequate for the new EOP-004 and training should be met in the proposed timeline. Note that the Implementation Plan was developed for the revised Requirements, which do not include an electronic "one-stop shopping" tool. The tool for 'one stop shopping' will be addressed in the proposed revisions to the NERC Rules of Procedure.

The industry commented on the need for e-mail addresses and fax numbers for back up purposes. These details were added to the standard and the implementation plan.

The proposed ballot in December was incorrect and has been deleted from the future development plan. The plan was updated with the correct project plan dates.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Index to Questions, Comments, and Responses

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. Do you agree with the purpose statement of the proposed standard? Please explain in the comment box below.

Summary Consideration: Stakeholders who responded to this question were fairly evenly divided on acceptance of the original purpose statement with about half supporting the purpose and half suggesting revisions to the purpose. A common thread through most of the comments was that the DSR SDT went beyond the intent of the standard (reporting) and concentrated too much on the analysis of the event. Based on these comments, the SDT revised the purpose statement. The new purpose is:

> To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of Impact Events and their causes, if known, by the Responsible Entities.

Several commenters noted that the term, "impact event" is not a formally defined term. The DSR SDT has used a working definition for "impact events" to develop Attachment 1 as follows:

> An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.

Many stakeholders indicated that the definition should be added to the NERC Glossary and the DSR SDT adopted this suggestion.

The types of Impact Events that are required to be reported are contained within Attachment 1. Only these events are required to be reported under this Standard.

Some commenters correctly pointed out that "situational awareness" was a desirable by-product of an effective event reporting system, and not driver of that system. Accordingly, all references to "situational awareness" have been deleted from the standard. The more generic "industry awareness" has been substituted where appropriate.

Many commenters noted that the SDT did not define sabotage. FERC Order 693, paragraph 471 states in part: ". . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event." The DSR SDT made a conscious, deliberate decision to exclude a strict definition of sabotage from this standard and sought stakeholder feedback on this issue. Some suggested adopting the NRC definition of the term sabotage, and the DSR SDT did consider adopting the NRC definition shown below but determined that the definition is too narrowly focused.

> Any deliberate act directed against a plant or transport in which an activity licensed pursuant to 10 CFR Part 73 of NRC's regulations is conducted or against a component of such a plant or transport that could directly or indirectly endanger the public health and safety by exposure to radiation.

Most respondents agreed that in order to be labeled as an act of sabotage, the intent of the perpetrators must be known. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This would result in further ambiguity with respect to reporting events, and the timeline associated with the reporting requirements does not lend itself to the in-depth analysis required to identify a disturbance (or potential disturbance) as sabotage. The SDT felt that a likely consequence of having to meet this criterion, in the time allotted, would be an under-reporting of events. Accordingly, all references to sabotage have been deleted from the standard.

Organization	Yes or No	Question 1 Comment
Ameren	No	The purpose talks about reporting impact events and their known causes. We have no problem with this generic intent, but the purpose says nothing about the very burdensome expectation of verbal updates to NERC and Regional Entities (Attachment 1, top of first page), Preliminary Impact Event Reports (Attachment 1, top of first page, are these Attachment 2?), "Actual" Impact Event Reports (Attachment 1 - Part A) and "Potential" Impact Event Reports (Attachment 1 - Part B). These multiple levels of reporting and events need to be greatly reduced.
American Electric Power (AEP)	No	It is unclear what the relationship between this project and the newly revamped NERC Event Analysis Process. We support moving towards one process opposed to separate obligations that may be in conflict.

Organization	Yes or No	Question 1 Comment
		In addition, AEP supports the concept of a central clearinghouse such as the RCIS that is shared by the industry. We support fewer punitive requirements and more prompting for using tools to make multiple entities aware of reliability related issues shortly after the fact.
CenterPoint Energy	No	CenterPoint Energy does not agree with the purpose statement of the proposed standard. The directive from the Commission in FERC Order 693 and restated in the Guideline and Technical Basis is "...the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: 1) further define sabotage and provide guidance as to the triggering events that would cause and entity to report a sabotage event." Instead the SDT has introduced another term, impact event, to address concerns regarding different definitions. The term, impact event and its proposed concept is too broad. Specifically the concept that an impact event "...has the potential to impact the reliability of the Bulk Electric System" leaves too much room for an entity and a regulatory body to have a difference of opinion as to whether an event should be reported. Required reporting should be limited to actual events. The reporting to follow could become overwhelming for the Responsible Entities, the ERO, and other various organization and agencies. Furthermore, situational awareness is a term that is associated with aspects of real-time. Given the analysis required before a report can be submitted, the report will not be real-time and will not sustain a purpose of supporting situational awareness. (See also comments on Q10 regarding the "Time to Submit Report".) A purpose that is more aligned with consolidation of the EOP-004 and CIP-001 standards would be as follows: Responsible Entities shall report disturbance events and acts of sabotage to support the reliability of the BES through industry awareness.
Consolidated Edison Co. of NY, Inc.	No	Comments: The purpose is not clear because it uses the term "impact events". This term should be a defined in the NERC glossary, and should not include words such as "potential".

Organization	Yes or No	Question 1 Comment
Duke Energy	No	The Purpose statement says that reporting under this standard supports situational awareness. However this is in conflict with Section 5. Background, where the DSR SDT makes clear that this standard includes no real-time operating notifications, and that this proposed standard deals exclusively with after-the-fact reporting. We also disagree with the stated concept of “impact event”. Including the phrase “or has the potential to impact” in the concept makes it impossibly broad for practical application and compliance.
Electric Market Policy	No	The term “impact events” does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator. As conveyed in Dominion’s comments on NERC Reliability Standards Development Plan 2011 - 2013, Dominion does not see this draft standard as needing to be in the queue while other standards having more impact to bulk electric reliability remain incomplete or unfinished.
ERCOT ISO	No	ERCOT ISO believes that according to the timelines allotted in Attachment 1, it may not be possible for the entity to identify the “known cause” of an event. The requirements list identification of “initial probable cause”. This is more reasonable under the timelines noted in Attachment 1.
Exelon	No	The purpose states that Responsible Entities SHALL report impact events - this implies that ALL impact events need to be reported regardless of magnitude, suggest rewording to say "... shall report applicable impact events ..." to allow for evaluation of each impact for applicability in accordance with Attachment 1).

Organization	Yes or No	Question 1 Comment
FirstEnergy	No	Since this standard is after-the-fact reporting, the phrase "situational awareness" may not be appropriate since that phrase is attributed by a large part of the industry to real-time, minute-to-minute awareness of the system. We suggest the following rewording of the purpose statement: "To ensure Applicable Entities report impact events and their known causes to enhance and support the reliability of the Bulk Electric System (BES)".
Indeck Energy Services	No	Suggestion: "Functional Entities identified in Section 4 shall support situational awareness of impact events and their known causes."
Independent Electricity System Operator	No	(1) Our understanding of the proposed revision as conveyed in the SAR was to provide clarity and reduce redundancy on reporting the latest and even on-going events on the system that may be caused by system changes and/or sabotage. The intent is to ensure the proper authorities are informed of such events so that they may take appropriate and necessary actions to identify causes and/or mitigate or limit the extent of interruptions. We also supported a suggestion in the SAR to assess the merit of merging CIP-001 and EOP-004 to remove redundancy, although we suggested that this should not be a presumption when revising the standard(s).This posting appears to indicate that only EOP-004 will be revised at this time, and CIP-001 which deals with sabotage reporting will remain in effect. With this assumption, the proposed standard appears to contain a mixture of reporting two types of events of different time frame - the first type being those events that need to be reported soon or immediately after they occur (e.g. impact events that appear to be the result of a sabotage) with an aim to curb/contain these events by the appropriate authorities; the second type being the events that can be reported sometime well after the fact, e.g. system disturbances due to weather or switching or other known causes that are not of malicious nature. Combining the two types of requirement does not appear to be clearly conveyed in the SAR. We therefore suggest the SDT review the main purpose

Organization	Yes or No	Question 1 Comment
		and content in the proposed EOP-004 to ensure consistency with the SAR, and in relation to the purpose and requirements already contained in CIP-004.(2) With respect to disseminating reports and related information after the fact, we wonder if a data collection process, such as RoP 1900, can serve the purpose without having to create a standard or a requirement to achieve this.(3) Most of the requirements appear to be administrative in nature and they stipulate the how but not the what, which in our view does not conform with the Results-based standard concept and does not rise to the level of a reliability standard.(4) A number of requirements proposed in the draft standard are quite vague and cannot be measured. Details of this assessment is provided below.
IRC Standards Review Committee	No	The proposed requirements in the standard are not focused on the core industry concern that current requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, “The existing requirements need to be revised to be more specific - and there needs to be more clarity in what sabotage looks like.” Instead this proposed standard includes requirements that are more focused on “how” to report, rather than “what” to report. The SAR states that: “The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.” The SRC believes the scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seem helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting

Organization	Yes or No	Question 1 Comment
		team seems to be ignored, "Consider whether separate, less burdensome requirements for smaller entities may be appropriate." The requirements for entities to develop Operating Plans and to have training for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard.
ISO New England Inc.	No	The proposed requirements in the standard are not focused on the core industry concern that current requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, "The existing requirements need to be revised to be more specific - and there needs to be more clarity in what sabotage looks like." Instead this proposed standard includes requirements that are more focused on "how" to report, rather than "what" to report. The draft 2 SAR has never been balloted for approval prior to standard drafting. In fact, the SAR states, "The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards." The scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seems helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting team seems to be ignored: "Consider whether separate, less burdensome requirements for smaller entities may be appropriate." The requirements for entities to develop Operating Plans and to have training for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard.The term "impact

Organization	Yes or No	Question 1 Comment
		events" does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC Glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator.This draft standard should not have this high a priority while other standards having a greater impact on Bulk Electric System reliability remain incomplete or unfinished.Regional reporting requirements should be in Regional Standards, and not be included in a NERC Standard.
Manitoba Hydro	No	Though new purpose greatly clarifies the proposed EOP-004-2 and using "situational awareness" is the key to this purpose, further clarification of specific items should be added to the purpose. "Responsible Entities shall report SIGNIFICANT events to support interconnection situational awareness on events that impact the integrity of the Bulk Electric System, such as islanding, generation, transmission and load losses, load shedding, operation errors, IROL/SOL violations, sustained voltage excursions, equipment and protection failures and on suspected or acts of sabotage."
Nebraska Public Power District	No	The background states there is no real-time reporting requirement in this standard, but the purpose states a purpose is for situational awareness. This implies real-time reporting. The purpose clearly identify the standard is for after the fact reporting to permit analysis of events, trend data, and identify lessons learned.
North Carolina Electric Coops	No	The term "impact event" is not a defined term in the NERC glossary and does not draw a clear boundary or give concise guidance to aid in event recognition.
Northeast Power Coordinating	No	The proposed requirements in the standard are not focused on the core industry concern that current

Organization	Yes or No	Question 1 Comment
Council		requirements are unclear as to what types of events warrant entities to report. Per draft 2 of the SAR, “The existing requirements need to be revised to be more specific - and there needs to be more clarity in what sabotage looks like.” Instead this proposed standard includes requirements that are more focused on “how” to report, rather than “what” to report. The draft 2 SAR has never been balloted for approval prior to standard drafting. In fact, the SAR states, “The development may include other improvements to the standards deemed appropriate by the drafting team, with consensus on the stakeholders (emphasis added), consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.” The scope of the SAR, and likewise the proposed standard, is inappropriate to the fundamental reliability purpose of what events need to be reported. The proposed administrative requirements are difficult to interpret, implement and measure, and do not clarify what type of sabotage information entities need to report. Although the use of procedures and an understanding by those personnel accountable seems helpful for ensuring reports are made, the fundamental purpose of clarifying what types of events should be reported and more importantly what types do not have to be reported, is lacking in the standard. Also, one of the first issues identified in the SAR for consideration by the drafting team seems to be ignored: “Consider whether separate, less burdensome requirements for smaller entities may be appropriate.” The requirements for entities to develop Operating Plans and to have training for those plans, further adds uncertainty and increases complexity of how entities, large and small, will have to comply with this standard.The term “impact events” does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC Glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator.This draft standard should not have this high a priority while other standards having a greater impact

Organization	Yes or No	Question 1 Comment
		on Bulk Electric System reliability remain incomplete or unfinished.Regional reporting requirements should be in Regional Standards, and not be included in a NERC Standard.
Pacific Gas and Electric Company	No	PG&E recognizes this is an after the fact report, however, the purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. If the future intent is for this report to replace current reporting criteria the purpose statement should be expanded to reflect the true intent of the Standard.
PNM Resources	No	PNM believes the purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. It is misleading and may have many thinking it is duplicative work.
PSEG Companies	No	The following sentence should be added. "This standard is not intended to be for real-time operations reporting."
RRI Energy, Inc.	No	The purpose does not need to mention "and the reliability of the Bulk Electric System." This is the Congressional mandate in FPA Section 215, and could be attached to every Standard, guide, notice and direction issued by FERC, NERC and Regional Entities. In addition, the purpose references "Responsible Entities." However, section 4 on "Applicability" references "Functional Entities." These terms should be consistent. Therefore, the purpose statement of the proposed standard should be corrected to read, "Functional Entities identified in Section 4 shall report impact events and their known causes to support situational awareness."CONSIDERATION: Is the phrase "shall report impact events and their known causes" really a purpose of the Proposed Standard, or is it instead merely a means to achieve the purpose of situational awareness? If the latter, the purpose statement can be further shortened to read, "Functional Entities identified in Section 4 shall support situational awareness of impact events and their known causes."

Organization	Yes or No	Question 1 Comment
Santee Cooper	No	Since this standard is written to report events after-the-fact and not for a System Operator to perform corrective action, we believe the words situational awareness should be removed from the purpose. Situational Awareness is typically used for real-time operations.Also, any events that require reporting should be clearly defined in Attachment 1 and leave no room for interpretation by an entity.
SERC OC Standards Review Group	No	The term “impact events” does not draw a clear boundary around those events that are affected by this standard. Since this is not a defined term, nor is intended to be a defined term in the NERC glossary, this standard lacks clarity and is likely to produce significant conflict as an applicable entity attempts to establish procedures to assure compliance. It appears that situational awareness could not be improved with this standard since it is only dealing with events after-the-fact, not within the time frame to allow corrective action by the system operator.
United Illuminating	No	UI suggests adding the phrase: and the ERO shall provide quarterly reports; Responsible Entities shall report impact events and their known causes, and the ERO shall provide quarterly reports, to support situational awareness and the reliability of the Bulk Electric System (BES).
US Bureau of Reclamation	No	The purpose is more closely related to the concept that "Responsible Entities shall document and analyze impact events and their known causes and disseminate the impact event documentation to support situational awareness". Not all impact events are to be reported. The analysis of the impact events is what is needed to achieve a lessons learned.
We Energies	No	Impact event needs to be clarified first, and DP references in Attachment 1 clarified. Distribution is not BES.
WECC	No	The purpose statement should reflect the fact that this proposed standard is for after-the-fact reporting. It is

Organization	Yes or No	Question 1 Comment
		misleading and may have many thinking it is duplicative work.
ATC	Yes	ATC agrees with the purpose statement. However, we do not agree with the implied definition of “impact events” as represented in Attachment 1. (See specific comments about what is included in Attachment 1 for the type of events that qualify as an “impact event”.)
Bonneville Power Administration	Yes	Known causes are difficult under 1 hour reporting requirements (Unusual events are even harder to narrow down in 24 hours and may take weeks.) The System Operators and RC’s handle situational awareness and reliability events, this is an extra wide view and learning for reporting only.
Dynegy Inc.	Yes	Statement is broad enough to cover both Standards.
Great River Energy	Yes	Thank you for the clarification of “known causes”, this will allow entities to report what they currently know when submitting an impact report.
MRO's NERC Standards Review Subcommittee	Yes	Thank you for the clarification of “known causes”, this will allow entities to report what they currently know when submitting an impact report.
Puget Sound Energy	Yes	However, further definition of "known causes" would be helpful as sometime the root cause analysis doesn't uncover the actual cause for sometime after the timeframes outlined in Attachment 1.
Arizona Public Service Company	Yes	
ATCO Electric Ltd.	Yes

2. **Do you agree with the applicable entities in the Applicability Section as well as assignment of applicable entities noted in Attachment 1? Please explain in the comment box below.**

Summary Consideration: There was no consensus amongst stakeholders who responded to this question regarding the acceptability of the proposed list of functional entities and the assignment of applicable entities in Attachment 1.

Several respondents replied with their concern that the reporting requirements were redundant. The general sentiment was that unclear responsibility to report a disturbance could trigger a flood of event reports. Attachment 1 has been modified to assign clear responsibility for reporting, for each category of Impact Event. There was some concern expressed that there could be confusion between the reporting requirements in this standard, and those found in CIP-008. The DSR SDT agrees, and Attachment 1 Part B, has been modified to provide the process for the reporting of a Cyber Security Incident.

The DSR SDT had protracted discussions on the applicability of this standard to the LSE. Per the Functional Model the LSE does not own assets and therefore should not be an applicable entity (no equipment that could experience a “disturbance”). However, the Registry Criteria contains language that could imply that the LSE does own assets, or is at least responsible for assets. In addition, the DSR SDT modified Attachment 1 to include reporting of damage or destruction of Critical Cyber Assets per CIP-002. The LSE, as well as the Interchange Authority and Transmission Service Provider are applicable entities under CIP-002 and should be included for Impact Events under EOP-004.

There were several comments that the asset owners (GO/TO) would be less likely than the asset operators (GOP/TOP) to be aware of an impact event. The DSR SDT recognizes that this may be true in some cases, but not all. In order to meet the reliability objectives of this requirement, the applicability for GO/TO will remain as per Attachment 1.

Organization	Yes or No	Question 2 Comment

Organization	Yes or No	Question 2 Comment
American Electric Power (AEP)	No	AEP does not agree with the addition of the Generator Owner to the standard. The Generator Owner does not have visibility to the real time operational status of a unit. As a result, the Generator Owner lacks the ability to recognize impact events and report them to the Regional Entity or NERC within the time frames specified in the standard. Reporting requirements for impact events should be the responsibility of the Generator Operator.
Arizona Public Service Company	No	AZPS recommends excluding 4.1.7 Distribution Providers, as Distribution Providers generally operate at levels below 100kV.
ATC	No	The Functional Entities identified in Attachment 1 do not align with the current CIP Standard obligations (e.g. Load Serving Entities are not included).
CenterPoint Energy	No	CenterPoint Energy does not agree with the addition of Transmission Owner and Distribution Provider to the Applicability section. Transmission Owner and Distribution provider are not currently applicable entities for either CIP-001 or EOP-004 and should not be included in the proposed combined standard. However, CenterPoint Energy does agree that LSE should be removed from the Applicability section. CenterPoint Energy appreciates the SDT's efforts in assigning entities to each event in Attachment 1. This is an improvement over the existing EOP-004 standard. It is clear, however, that with multiple entities responsible for reporting each event, there is no need to expand the Applicability Section to include Transmission Owner and Distribution Provider.
Consolidated Edison Co. of NY, Inc.	No	Comments: NERC's role as the Standard enforcement organization for the power industry will be in conflict if NERC is also identified as an applicable entity. What compliance organization will audit NERC's

Organization	Yes or No	Question 2 Comment
		performance? This is presently not clear.
Constellation Power Generation and Constellation Commodities Group	No	Constellation Power Generation and Constellation Commodities Group disagrees with the inclusion of Generator Owners. Since one of the goals in revising this standard is to streamline impact event reporting obligations, Generator Operators are the appropriate entity to manage event reporting as the entity most aware of events should they arise. At times, the information required to complete a report may warrant input from entities connected to generation, but the operator remains the best entity to fulfill the reporting obligation.
E.ON Climate & Renewables	No	1. Voltage deviation events are too vague for GOP. How does voltage deviations apply to GOP's or specifically renewables i.e., wind farms? 2. Define what an "entity" is. 3. Define what a "generating station" is. 4. Define what a "BES facility" is. 5. Define what a control center is. 6. Renewable energy/generators should be taken into consideration when crafting the events.
E.ON U.S. LLC	No	The proposed standard does not list the Load Serving Entity as an Applicable Entity, but the possible events that the standard addresses are within the scope of the LSE. Some functions of the LSE listed within the Functional Model are addressed in the proposed standard. Existing CIP-001-1a and EOP-004-1 are both applicable to the LSE.
Electric Market Policy	No	Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. Attachment 1 is troublesome. The time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities

Organization	Yes or No	Question 2 Comment
		reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, we believe this subject is more complex than this table reveals and the table needs more clarification.Several of the events require filing a written formal report within one hour. For example, system separation certainly is going to require an “all hands on deck” response to the actual event. We note that the paragraph above the table in attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements.There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
ERCOT ISO	No	ERCOT ISO recommends that the Electric Reliability Organization be removed from the standard. The Electric Reliability Organization should not be responsible for reliability functions and therefore should be excluded from reliability standards.
Exelon	No	Attachment 1, Part B, footnote 1. A GO is unlikely to know if a fuel supply problem would cause a reliability concern because one GO may not know the demand for an entire region. Attachment 1, Part B, footnote 1. What is the definition of an "emergency" related to problems with a fuel supply chain? What time threshold of projected need would constitute a 1 hour report?Attachment 1, Part A - Voltage Deviations - A GOP may not be able to make the determination of a +/- 10% voltage deviation for â‰¥ 15 minutes, this should be a TOP RC function only. Attachment 1, Part A - Generation Loss of â‰¥ 2, 000 MW for a GO/GOP does not provide a time threshold. If the 2, 000 MW is from a combination of units in a single location, what is the time threshold for the combined unit loss? Attachment 1, Part A - Damage or destruction of BES equipment o The

Organization	Yes or No	Question 2 Comment
		event criteria is ambiguous and does not provide clear guidance; specifically, the note needs to provide more explicit criteria related to parts (iii) and (iv) to remove the need for interpretation especially since this is a 1 hour reportable occurrence. In addition, determination of the aggregate impact of damage may not be immediately understood - does the 1 hour report time clock start on initiation of event or following confirmation of event? o The initiating event needs to explicitly state that it is a physical and not cyber. Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security - Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard. o If the damage or destruction is related to a deliberate act, consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security event. Attachment 1, Part B - Loss of off-site power (grid supply) affecting a nuclear generating station - this event classification should be removed from EOP-004. The impact of loss of off-site power on a nuclear generation unit is dependent on the specific plant design and may not result in a loss of generation (i.e., unit trip); furthermore, if a loss of off-site power were to result in a unit trip, an Emergency Notification System (ENS) would be required to the Nuclear Regulatory Commission (NRC). The 1 hour notification in EOP-004 on a loss of off-site power (grid supply) to a nuclear generating station should be commensurate with other federal required notifications. Depending on the unit design, the notification to the NRC may be 1 hour, 8 hours or none at all. Consideration should be given to coordinating such reporting with existing required notifications to the NRC as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential transient on the unit. Attachment 1, Part B - Forced intrusion at a BES facility - Consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security event. Attachment 1, Part B - Risk to BES equipment from a non-environmental physical threat - this event leaves

Organization	Yes or No	Question 2 Comment
		the interpretation of what constitutes a "risk" with the reporting entity. Need more specific criteria for this event.Attachment 1, Part B - Detection of a cyber intrusion to critical cyber assets - Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security - Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard.
FirstEnergy	No	We do not support the ERO as an applicable entity of a reliability standard because they are not a user, owner or operator of the bulk electric system. Any expectation of the ERO should be defined in the Rules of Procedure.
Georgia System Operations Corporation	No	This standard should not apply to distribution systems or Distribution Providers. It should apply only to the BES.
Georgia Transmission Corporation	No	These events generally are Operator Functions and should not apply to a TO.1. Energy Emergency requiring system-wide voltage reduction2. Loss of firm load greater than 15 min.3. Transmission loss (multiple BES transmission elements)4. Damage or destruction to BES equipment (thru operational error or equipment failure)5. Loss of off-site power affecting a nuclear generating station
Indeck Energy Services	No	---ERO should not be included in this or any other standard! FERC can decide whether NERC is doing a good job without having standards requirements to audit to. If NERC needs to be included in a standard, then it should a stand-alone one so that the RSAW for all of the other audits don't need to include those requirements. ---"Loss of off-site power (grid supply)" is important at control centers and other large generators. The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---"Footnote 1. Report if problems with the fuel supply chain result in the projected need for emergency actions to manage reliability." is ambiguous. Everything in the

Organization	Yes or No	Question 2 Comment
		Standards program can "Affecting BES reliability". The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---"Footnote 2. Report if you cannot reasonably determine likely motivation (i.e., intrusion to steal copper or spray graffiti is not reportable unless it effects the reliability of the BES)." is well intentioned but ambiguous. For example, if I know the motivation is to blow up the plant, then by this footnote, I don't have to report. The SDT must use a well-defined standard such as potentially cause a Reportable Disturbance, to differentiate significant events from others. ---All terms should be used from or added to the Glossary.
Independent Electricity System Operator	No	We do not agree with the inclusion of TO and GO. They are not operating entities and do not need to collect or provide information pertaining to impact events, which are the results and phenomena observe under operating conditions in the operation horizon, and such information collection and provision are the responsibility of the TOP and GOP.
IRC Standards Review Committee	No	Entities that have information about possible sabotage events should report these to NERC after the fact and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an EEA for example?
ISO New England Inc.	No	Having the ERO as an applicable entity raises the issue that they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. NERC has also offered the opinion that since NERC is not a "user, owner, or

Organization	Yes or No	Question 2 Comment
		operator" Standards are not enforceable against the ERO. In Attachment 1 the time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to unnecessary and possibly conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, this subject is more complex than this table reveals, and the table needs more clarification.Entities that have information about possible sabotage events should report these to NERC after the fact, and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, it is likely that there is going to be duplicate reporting. Several of the events require filing a written formal report within one hour. For example, system separation is going to require an "all hands on deck" response to the actual event. The paragraph above the table in Attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements.There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements through NERC that cross federal agency jurisdictions.
Luminant Energy	No	Inclusion of both GO and GOP will result in duplicate reporting as both are responsible for reporting resource-related events such as Generation Loss, Fuel Supply Emergencies and Loss of Off-site power (grid supply). Recommend including only the GOP as it is critical that the GOP gather and communicate relevant information to the Reliability Coordinator.
Manitoba Hydro	No	Since this Standard is to support situational awareness, more entities should be included such as Load

Organization	Yes or No	Question 2 Comment
		Serving Entities (which was removed from EOP-004-1).
MidAmerican Energy	No	While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an energy emergency requiring public appeals?
Midwest ISO Standards Collaborators	No	While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, there is likely going to be duplicate reporting. Why should both the RC and BA submit a report for an energy emergency requiring public appeals?
North Carolina Electric Coops	No	There is a conflict between the ERO being listed as an applicable entity and the fact that the ERO is the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that other applicable entities would be required to meet.Attachment 1 has inconsistent time frames listed for similar events. For example, EEA's are either reported within one or 24 hours depending on the nuance. Also, having more than one entity reporting an EEA can lead to conflicting information for the same event. Attachment 1 has the RC and the BA both reporting the same EEA event. Attachment 1 consolidates time frames from other standards for reporting purposes. There should either be a separate standard for "reporting" that encompasses reporting requirements for all standards or leave the time frames and reporting requirements in the original individual standards.Several of the events require filing a written formal report within one hour. For large events like cascading outages or system separation, "all hands on deck" attention will need to be given to the actual event. Although a verbal report would be allowed in certain circumstances, attention to the actual event should take precedence over formal reporting requirements.There is already a

Organization	Yes or No	Question 2 Comment
		DOE requirement to report certain events and no need to develop redundant reporting requirements in the NERC arena when this information is already available at the federal level at other agencies.
Northeast Power Coordinating Council	No	Having the ERO as an applicable entity raises the issue that they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. For example, establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. NERC has also offered the opinion that since NERC is not a "user, owner, or operator" Standards are not enforceable against the ERO. In Attachment 1 the time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does a RC have to report an EEA if the BA is going to report it? This will lead to unnecessary and possibly conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, this subject is more complex than this table reveals, and the table needs more clarification.Entities that have information about possible sabotage events should report these to NERC after the fact, and the standard should simply reflect that. While we agree with the list of functional entities identified in the Applicability Section, we do not agree with their application in Attachment 1. As the functional entities are identified in Attachment 1, it is likely that there is going to be duplicate reporting. Several of the events require filing a written formal report within one hour. For example, system separation is going to require an "all hands on deck" response to the actual event. The paragraph above the table in Attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements.There is already a DOE requirement to report certain events. We see no need to develop redundant reporting

Organization	Yes or No	Question 2 Comment
		requirements through NERC that cross federal agency jurisdictions.
Pacific Gas and Electric Company	No	PG&E recognizes the ERO is in R1, however, it does not see where the ERO's applicability is applied in Attachment 1.
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
PNM Resources	No	PNM OTS does not see where the ERO's applicability is applied in Attachment 1.
PPL Electric Utilities	No	While we agree with the applicable entities in the Applicability Section of the revised standard, we would like the SDT to reconsider the applicable entities identified on Attachment 1, specifically regarding duplication of reporting e.g. should TO and TOP report?
PPL Supply	No	While we agree with the list of functional entities identified in the Applicability Section, we do not agree with assignment of applicable entities noted in Attachment 1. As the functional entities are identified in Attachment 1, there will likely be duplicate reporting for many impact events. By applying reporting responsiblities to both the Gen Owner and Gen Operator, this will result in duplicate reporting for plants with multiple owners. It also increases the burden on the Gen Operator who is required to report the event to NERC and to other Gen Owners in a timely manner to allow other Gen Owners to meet the NERC reporting timeline. We suggest that the reporting requirements associated with generators be applied to the Gen Operator only.
RRI Energy, Inc.	No	Agree with the "Applicability" section functional categories.Agree with the Attachment 1 lists of "Entity with Reporting Responsibility," with the following exceptions:PART A"Damage or Destruction of BES Equipment" - This item has a footnote 1 listed, but nothing at the bottom of the page for a footnote. Assuming the footnote

Organization	Yes or No	Question 2 Comment
		reference is intended to reference the "Examples" at the bottom of the page, the following concerns exist:(i) "critical asset" - Is this term intended to reference a "Critical Asset" identified pursuant to the CIP-002 risk-based assessment methodology? If so, it should be capitalized. If not, who determines what constitutes a lower case "critical asset"? (ii) "Significantly affects the reliability margin of the system..." - If this is intended to be enforceable, several words need significant clarification and definition, such as "Significantly," "reliability margin," "system" (BES?), "potential," and "emergency action." The combined ambiguity of just two of those phrases would most likely result in a court holding this statement as so vague as to be unenforceable. The combined lack of clarity of all the highlighted words or phrases render this sentence meaningless.(iii) "Damaged or destroyed due to a non-environmental external cause" - "Non-environmental external cause" should be a defined term because, as is the case in item (ii) above, it is vague and subject to broad, random or arbitrary interpretation. Part B provides examples of "non-environmental physical threat" for "Risk to BES equipment." Those examples could be referenced here, or different examples included that are more applicable to the Event.The items highlighted in items (ii) and (iii) above are very similar to the unintended string of CIP-001 violations that Registered Entities experienced in 2007 and 2008 for failing to provide their own definition of "sabotage" under a sabotage reporting standard that failed to provide any guidance to the industry within the standard as to what constituted "sabotage." PART B"Detection of a cyber intrusion to critical cyber assets" - Capitalize "Critical Cyber Asset."
Santee Cooper	No	Standards cannot be applicable to an ERO because they are the compliance enforcement authority, and the ERO is not a user, owner, or operator of the BES. Since we are reporting events that may affect the BES, why does a DP need to be included as an applicable entity for this standard? If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity. If NERC is going

Organization	Yes or No	Question 2 Comment
		to require a separate reporting of events from DOE, then NERC should look at these events closely to determine if any of the defined events should be eliminated or modified from the current DOE form. (For example: Is shedding 100 MW of firm load really a threat to the BES?)Why does Attachment 1 have multiple entities reporting the same event? An RC should not have to report an EEA if the BA is required to report it. This will lead to conflicting reports for the same event.Attachment 1 is just a consolidation of the time frame from other standards. It appears no review was done for consistency of time frames for similar events.
SERC OC Standards Review Group	No	We find it interesting that the ERO is listed as an applicable entity. The ERO can't be an applicable entity because they are the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. NERC seems to be attempting to evade FERC jurisdiction by having a standard that enables it to write new rules that don't pass through the normal standards development process with ultimate approval by FERC.Attachment 1 is troublesome. The time frames listed are not consistent for similar events. For example, EEAs are either reported within one or 24 hours depending on the nuance. Having multiple entities reporting the same event is troublesome, i.e., why does an RC have to report an EEA if the BA is going to report it? This will lead to conflicting reports for the same event. Attachment 1 seems to be consolidating time frames from other standards into one for reporting. However, we believe this subject is more complex than this table reveals and the table needs more clarification or it should be eliminated and leave the time frames in the other standards.Several of the events require filing a written formal report within one hour. For example, system separation certainly is going to require an "all hands on deck" response to the actual event. We note that the paragraph above the table in attachment 1 indicates that a verbal report would be allowed in certain circumstances, but this is the same issue with the formal report in that the system operators are concerned with the event and not the reporting requirements.There is already a DOE requirement to report

Organization	Yes or No	Question 2 Comment
		certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
Southern Company - Transmission	No	We find it interesting that the ERO is listed as an applicable entity. The ERO is responsible for multiple requirements in this standard that shapes the ultimate actual rules that the other applicable entities would be required to meet. Can the NERC/ERO be accountable for a feedback loop to the industry? Feedback is preferable but would NERC/ERO self-report a violation to the requirement?
We Energies	No	The need for a DP to be included needs to be clarified. The Purpose points to BES. A DP does not have BES equipment.
WECC	No	The ERO's applicability is not applied in Attachment 1.
Great River Energy	Yes	We believe that it is important for the ERO to provide valuable Lessons learned to our electrical industry, thus enhancing the reliability of the BES.
Kansas City Power & Light	Yes	Consideration should be given to the need for a preliminary impact event report to be filed by the Reliability Coordinator and the Registered Entity. If two reports should be filed, should they both contain the same information.
MRO's NERC Standards Review Subcommittee	Yes	The NSRS believes it is important for the ERO to provide valuable Lessons learned to our electrical industry, thus enhancing the reliability of the BES.
TransAlta Corporation	Yes	Electrical Reliability Organization (ERO) does not appear to be a defined term in the NERC Glossary of Terms on the NERC website. Last updated April 20, 2010.

3. Do you agree with the requirement R1 and measure M1? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst stakeholders who responded to this question. There was strong support for a central system for receiving and distributing impact event reports (a/k/a one stop shopping). There was general agreement that NERC was the most likely, logical entity to perform that function. However several respondents expressed their concern that the ERO could not be compelled to do so by a requirement in a Reliability Standard (not a User, Owner or Operator of the BES). In their own comments, NERC did not oppose the concept, but suggested that the more appropriate place to assign this responsibility would be the NERC Rules of Procedure. The DSR SDT concurs. The DSR SDT has removed the requirement from the standard and is proposing to make revisions to the NERC Rules of Procedure as follows:

> 812. NERC will establish a system to collect impact event reports as established for this section, from any Registered Entities, pertaining to data requirements identified in Section 800 of this Procedure. Upon receipt of the submitted report, the system shall then forward the report to the appropriate NERC departments, applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, regulatory agencies as necessary. These reports shall be forwarded to the Federal Energy Regulatory Commission for impact events that occur in the United States. This can include state, federal, and provincial organizations. The ERO shall solicit contact information from Registered Entities appropriate governmental, law enforcement and regulatory agencies contact information for distributing reports.

The DSR SDT also believes NERC's additional concern about what data is applicable is addressed by the revisions to Attachment 1, and the inclusion of the OE-417 as an acceptable interim vehicle.

Organization	Yes or No	Question 3 Comment
WECC		R1 is appropriate for after-the-fact reporting. However, as proposed this standard eliminates all real-time notifications, including the CIP-001-1 R3 notice to appropriate parities in the Interconnection. New requirement R2.6 lists external parties to notify but it does not include the Reliability Coordinator. It is

Organization	Yes or No	Question 3 Comment
		important that the RC be notified of suspected sabotage. The RC's wide-area interconnection view and interaction with BAs may help recognize coordinated sabotage actions. Any "impact event" where sabotage is suspected as the root cause should require additional and real-time notifications.
ATC	No	ATC does not agree with R1 for three reasons:1. The ERO cannot be assigned obligations in NERC Standards. The requirements for the ERO should be addressed by a revision to Section 801 of the Rules of Procedure.2. This is a fill-in-the-blank requirement. The requirement, positioned as R1, does not allow for the obligations to be clearly defined. It refers to R6 which refers to R2 and Attachment 1. A clearer structure to the Standard would be to simply state that the Functional Entities have to meet the reporting obligations documented in Attachment 1 and delete the current R1.
BGE	No	R1 With the definition of "Impact Event", are we eliminating the term "Disturbance Reporting"? If we eliminate disturbance reporting, SDT should remove the reference from the Summary of Concepts and from the title, otherwise further definition on the distinction between the two terms is needed.R1. What is the "system" described here? What type of system is anticipated - electronic, programmatic or can it be better described by using "standard reporting form"?M1. Needs to seek evidence that the "system" was used for receiving reports, as well as distributing them.M1. Examples are more appropriately used in guidance documentation than in the standard. Rationale for R1 - Final statement regarding OE-417 needs to be removed. The ERO will establish the requirement in their "system" if the standard remains as is. The Requirement does not require the responsible entities to send OE-417 to DOE.
CenterPoint Energy	No	The ERO does not need to establish a "system for receiving reports" as the "system for receiving reports" is inherent given the requirements for reporting. The requirement also seems to add redundancy versus eliminating redundancy in the distribution of reports to applicable government, provincial or law enforcement

Organization	Yes or No	Question 3 Comment
		agencies on matters already reported by Responsible Entities. If an event is suspected to be an intentional criminal act, i.e. “sabotage”, the Responsible Entity would have contacted appropriate provincial or law enforcement agencies. The ERO is not in a position to add meaningful value to these reports as any information the ERO may provide is second hand. CenterPoint Energy recommends R1 and M1 be deleted.
City of Garland	No	Reason 1Most of this is duplication of existing processes - More “Big Government” and/or “Overhead” is not needed. There are already processes in place to notify “real time” 24 X 7 organizations that take action (RC, BA, TOP, DOE, FBI, Local Law Enforcement, etc) in response to an “impact event”. It is stated in your document on page five (5) “The proposed standard deals exclusively with after-the -fact reporting.” The combining of CIP 001 & EOP 004 should not expand on existing implemented reporting requirements nor should it result in NERC forming a 24 X 7 department to handle 1 hour (near real time) reporting requirements.Reason 2If this should go forward as drafted, NERC should not establish a “clearing house” for reporting requirements for Registered Entities without also taking legal responsibility for distributing those reports to required entities. It states in at least 2 places (Page 6 & Page 22) in the document that Responsible Entities are ultimately responsible for ensuring that OE-417 is received at the DOE. Thus, a Registered Entity could be penalized for violating this new standard if it did not file the reports with NERC or it could still be penalized (both criminal & civil) if they filed the reports with NERC but NERC (for whatever reason) did not follow through with ensuring the report was properly filed at the DOE.
Consolidated Edison Co. of NY, Inc.	No	See response to Question 2.
Duke Energy	No	The requirement again states the intent is to “enhance and support situational awareness”, which doesn’t sync with “after-the-fact reporting”. We question why NERC needs to create this report and system for

Organization	Yes or No	Question 3 Comment
		distributing impact event reports to various organizations and agencies for after-the-fact reporting, when we are still required to make real-time reports under other standards. For example, the Rational specifically recognizes that this standard won't release us from the DOE's OE-417 reporting requirement. We don't see that this provides value, unless NERC can find a way to eliminate redundancy in reporting.
Electric Market Policy	No	Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of "applicable government, provincial or law enforcement agencies" for distribution as defined in R1. The "rationale for R1" states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. It seems like the better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
ERCOT ISO	No	Recommend that requirements for the Electric Reliability Organization be removed. However, if the requirements are retained, ERCOT ISO recommends the following wording change to be consistent with other standards. "R1. The ERO shall create, implement, and maintain a system for receiving and distributing impact event reports, received pursuant to Requirement R6, to applicable government, provincial or law enforcement agencies and Registered Entities to enhance and support situational awareness."
Exelon	No	This requirement should include explicit communications to the NRC (if applicable) of any reports including a nuclear generating unit as a jurisdictional agency to ensure notifications to other external agencies are

Organization	Yes or No	Question 3 Comment
		coordinated with the NRC. Depending on the event, a nuclear generator operator (NRC licensee) has specific regulatory requirements to notify the NRC for certain notifications to other governmental agencies in accordance with 10 CFR 50.72(b)(2)(xi). In general, the DSR SDT should include discussions with the NRC to ensure communications are coordinated or consider utilizing existing reporting requirements currently required by the NRC for each nuclear generator operator for consistency.
FirstEnergy	No	FirstEnergy proposes that requirement R1 and Measure M1 be deleted.A requirement assignment to the ERO is problematic and should not appear in a reliability standard. The team should keep in mind that all requirements will require VSL assignments that form the basis of sanctions. FE does not believe it is appropriate for the ERO to be exposed to a compliance violation investigation as the ERO is not a functional entity as envisioned by the Functional Model. If this "after-the-fact" reporting is truly needed for reliability then the standard must be written in a manner that does not obligate the ERO to reliability requirements. It would be acceptable and appropriate for a requirement to reference the "ERO Process" desired by R1, however, that process should be reflected in the Rules of Procedure and not a reliability standard.
Indeck Energy Services	No	This standard is an inappropriate place to define this requirement. NERC needs to be held accountable, but it should be independent of the standard. What if NERC fails to do it by the effective date of the standard, all Registered Entities will violate the standard until NERC is done. The effective date needs to be set based on NERC completing the system defined in R1.
Independent Electricity System Operator	No	R1 does not directly convey the need for reporting. The requirement could be written to require the responsible entities to report impact events to the ERO using a process to be described in the standard and according to a set of reporting criteria. Whether or not there is a “system” makes little difference if it complies with the requirement to provide the reports on time. In addition, an ERO established system which, without

Organization	Yes or No	Question 3 Comment
		being included in the standard and posted for public comment and eventually balloted, may not be acceptable to the entities that are responsible for reporting to the ERO. Further, a reliability standard should not need to bother with how the ERO disseminate this information to applicable government, provincial or law enforcement agencies. This is the obligation of the ERO and if required, can be included in the Rules of Procedure.
ISO New England Inc.	No	Having the ERO as an applicable entity raises a concern because they are also the Compliance Enforcement Authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of "applicable government, provincial or law enforcement agencies" for distribution as defined in R1. The "rationale for R1" states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. The better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
MidAmerican Energy	No	
NERC Staff	No	NERC staff is concerned about this requirement's applicability to the ERO. We feel that such a responsibility needs mentioning in the Rules of Procedure, the Compliance Monitoring and Enforcement Program (CMEP), or in a guideline document rather than in a standard requirement. Further, the requirement specifies "how" to manage the event data, not "what" should be monitored.

Organization	Yes or No	Question 3 Comment
North Carolina Electric Coops	No	The ERO cannot be subject to a requirement for which it is the compliance enforcement authority.
Northeast Power Coordinating Council	No	Having the ERO as an applicable entity raises a concern because they are also the Compliance Enforcement Authority. The ERO is responsible for multiple requirements in this standard that shape the ultimate actual rules that the other applicable entities would be required to meet. Establishing and maintaining a system for receiving and distributing impact events, per R1, would be done solely by the ERO, outside of NERC's open process. At this stage it is not clear how the ERO will develop or effectively maintain a list of "applicable government, provincial or law enforcement agencies" for distribution as defined in R1. The "rationale for R1" states that OE-417 could be included as part of the electronic form, but responsible entities will ultimately be responsible for ensuring that OE-417 reports are received at DOE. This requirement needs to be more definitive with respect to OE-417. The better approach would be for the entities to complete OE-417 form and this standard simply require a copy.
Puget Sound Energy	No	The language of R1 and M1 does not support the DSR SDT's goal of having a single form and system for reporting. The standard should specify the form and system rather than deferring that decision to the ERO. The language of R1 and M1 leaves the form and system to the ERO's discretion, which could lead to multiple forms and frequent revisions to them. This would lead to difficulties in tracking the reporting requirements. In addition, it is impossible to comment intelligently regarding the overall impact of the proposed standard and its requirements and measures without the reporting form and system being specified in the standard.
Santee Cooper	No	It cannot apply to the ERO.
SERC OC Standards Review	No	The ERO cannot be subject to a requirement for which it is the compliance enforcement authority. The

Organization	Yes or No	Question 3 Comment
Group		governance in this situation appears incomplete.
US Bureau of Reclamation	No	This standard should describe the ERO process of event documentation, analysis, and dissemination. Allowing the ERO to develop a event documentation, analysis, and dissemination process, which becomes a requirement on the Entities, must be derived through the Standards Development Process. The requirement, as it is currently worded, allows the ERO to develop standard requirements. If the intent is to only develop a means of collecting, which does not impose a requirement, the wording should state so. Otherwise, if the ERO wants to require that reports are posted to a specific location by the Entity, then it is a requirement and must go through the Standards Development Process. Secondly, there is already a single reporting form identified. It is not clear why the SDT could not accept that form as the reporting tool.
American Electric Power (AEP)	Yes	Overall we support the concepts; however, it is unclear if the ERO can be held accountable for compliance with NERC Requirements. If this requirement is removed there needs to be some mechanism for the ERO to establish a single clearinghouse.
City of Austin dba Austin Energy	Yes	Austin Energy would like to see OE-417 incorporated into the electronic form This will reduce the callout of EOP-004-2 and OE-417 forms in our checklists / documents and one form can be submitted to NERC and DOE.
E.ON Climate & Renewables	Yes	A generic ERCO approved electronic (form that can be submitted on-line) reporting form will help to add more clarity & consistency to the Impact event reporting process.
Georgia System Operations Corporation	Yes	Yes it would reduce duplication of effort and should ensure that the various entities and agencies all have consistent information. It should be simpler and quicker to file than what is needed to meet the current

Organization	Yes or No	Question 3 Comment
		standard.However, the system should allow for partial reporting and hierarchical reporting. Entities up the ladder in a reporting hierarchy may fill in additional info (usually from a wider scope of view) than what lower level entities are aware of. It would be better for information to go up a hierarchy than for bits and pieces to go to the ERO from many entities. Terminology may be different in each of the bits and pieces yet the same idea may be intended. The ERO may mistake multiple reports as being different events when they are all related to one event.The system should give an entity the ability to select the entities that should receive the impact event report.If hierarchical reporting is not enabled by the system, then entities should be allowed to work out a reporting hierarchy as a group and entities at lower levels should not be required to report over the NERC system. Some higher level entity would enter the information on the NERC system as coordinated by the entities within a group.
Idaho Power Company	Yes	the SDT must ensure that only a single form is required for compliance (such example OE-417)
IRC Standards Review Committee	Yes	Note that ERCOT does not sign on to this particular comment.
Kansas City Power & Light	Yes	Although we support situational awareness for the other registered entities, impact event reports should be distributed anonymously to communicate the information while protecting the registered entity.
Manitoba Hydro	Yes	Yes, keeping R1 generic and pointing to “government”, “Provincial”, “law” encompasses all entities in all major interconnections.
PacifiCorp	Yes	All efforts need to be made to include OE-417 reporting requirements to safeguard against duplicate reporting and / or delinquent reporting.One report for all events is more preferable than multiple reports for one event.

Organization	Yes or No	Question 3 Comment
RRI Energy, Inc.	Yes	While including the phrase "to enhance and support situational awareness" is a good use of the Results-Based Standards development tools and framework, the phrase is already included in the purpose statement. As such, it is unnecessary in Requirement 1. If it were to be included in Requirement 1, then it would also need to be included in each of the other Requirements 2 through 8. The "Purpose" statement captures this aptly.
Southern Company - Transmission	Yes	We do have one concern in that we are hopeful that NERC will develop a system that will allow a one stop shop of reporting.
Avmeren	Yes

4. Do you agree with the requirement R2 and measure M2? Please explain in the comment box below.

Summary Consideration: Most stakeholders who responded to this question indicated disagreement with Requiremnet R2 and M2 as originally proposed. There were objections to the use of the term "Operating Plan" to describe the procedure to identify and report the occurrence of a disturbance. The DSR SDT concurs, and Operating plan has been replaced with the generic term "procedure" where appropriate believe that the use of a defined term is appropriate and has revised Requirement 1 to include Operating Plan, Operating Process and Operating Procedure.

R1. Each Responsible Entity shall have an Impact Event Operating Plan that includes [Violation Risk: Factor Medium] [Time Horizon: Long-term Planning]:

1.1. An Operating Process for identifying Impact Events listed in Attachment 1.

1.2. An Operating Procedure for gathering information for Attachment 2 regarding observed Impact Events listed in Attachment 1.

1.3. An Operating Process for communicating recognized Impact Events to the following:

1.3.1. Internal company personnel notification(s).

1.3.2. External organizations to notify to include but not limited to the Responsible Entities' Reliability Coordinator, NERC, Responsible Entities' Regional Entity, Law Enforcement, and Governmental or Provincial Agencies.

1.4. Provision(s) for updating the Impact Event Operating Plan within 90 days of any change to its content.

Other requirements reference the Operating Plan as appropriate. The requirements of EOP-004 fit precisely into the definition of Operating Plan:

Operating Plan: A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Note R2 has been moved to R1 due to elimination of original R1. Many commenters felt that the requirements around updating the Operating Plan were too prescriptive, and impossible to comply with during the time frame allowed. The DSR SDT agrees, and Requirement R2 Parts 2.5 through 2.9 have been eliminated. They have been replaced with Requirement R1, Part 1.4 to update the Operating Plan within 90 days of any change to content.

Organization	Yes or No	Question 4 Comment
Bonneville Power Administration		As long as the 2.4 list is position based, not based on each individual that fills the position. (There is a concern of listing all 2.4 monitoring/reporting personnel in the company that cover the impact event, since there are different function groups and shift work. Documentation trails are difficult with personnel changes.) Because the CIP is being added, it requires an Operating Plan (instead of procedure) with 30 day revision timelines, so it increases the burden for electrical grid event reporting function. R2.9 language refers to R8 "annual" report; however R8 language is "quarterly" reporting of past year. It appears this standard is going to be in an update status 4 times per year, plus any event modifications plus personnel changes. This could be overly burdensome due to the expanding world of cyber security.
Ameren	No	While we agree with the intent to list certain minimum requirments for the Operating Plan, the draft list is too lengthy and prescriptive. This merely creates opportunites for failure to comply rather the real purpose of reporting data that can be used to meaningfully increase the reliability of the BES by identifying trends of events that may otherwise be ignored.
American Electric Power (AEP)	No	Component 2.2 "Method(s) of assessing cause(s) of impact events" is very vague. Furthermore, there are concerns whether these methods can be accomplished within one hour as might be required per Attachment

Organization	Yes or No	Question 4 Comment
		1, in addition to operating the system. Component 2.6 - need to add the statement "as appropriate for type of impact event" Components 2.7 through 2.9 - are good concepts to consider for future inclusion, but at this point in time these appear to be overreaching objectives. We recommend the SDT take smaller increments towards future progress at measure and reasonable pace. Furthermore, if Component 2.9 is retained it should only pertain to lessons learned on the reporting of impact events not all recommendations regarding remediation of the impact events themselves. Furthermore, the 30 day window to update the Operating Plans is aggressive considering the other priorities that may be present day to day.
ATC	No	The requirement should be rewritten to simply state that the Functional Entities has to meet the reporting obligations documented in Attachment 1. How the Functional Entity meets the obligations documented in Attachment 1 should be determined by the Functional Entity, not the requirement. The prescriptive nature of this requirement does not support the performance-based Standards that the industry and NERC are striving towards. In addition, requirement 2.9 creates an alternate method for NERC to develop Standards outside of the ANSI process. This requirement dictates that Functional Entities are required to incorporate lessons learned from NERC reports into their Plan, which is a requirement of this Standard.
BGE	No	R2.1 Creates the opportunity for differences in identifying impact events. BGE recommends additional clarity in the statement. Are we to use Attachment 1 as a "bright line" or can we use our Operating Plan to identify what an impact event is?R2.4 - 2.6 Does a standard need to specify both internal and external lists? 2.7 - is "component" defined anywhere? Is it a component of the BES or a component of the Operating Plan or a component of the three lists in 2.4 to 2.6?Rationale --- Parts 3.3 and 3.4?? Do you mean 2.3 and 2.4?Is the Operating Plan under scrutiny (mandatory and compensable) for all items in the last paragraph of the rationale?

Organization	Yes or No	Question 4 Comment
CenterPoint Energy	No	CenterPoint Energy does not agree with R2 and M2 as they are focused on process and procedure. Compliance with a reporting requirement should be based on a complete and accurate report submitted in a timely manner. The process an entity uses to accomplish that task is of no consequence. CenterPoint Energy recommends R2 and M2 be deleted.However, if the SDT feels it is necessary to include this process based requirement, CenterPoint Energy believes the SDT, in requiring an overly prescriptive Operating Plan, has expanded the requirement beyond the current CIP-001-1 and EOP-004-1 which only require "...procedures for the recognition of and for making operating personnel aware..." (CIP-001-1) and "...shall promptly analyze..." (EOP-004-1). Specifically, R2.2 is not found in the current Standards. "Methods for assessing causes(s) of impact events" would vary greatly depending upon the type and severity of the event. Responsible Entities would have a difficult time cataloging these various methods to any specific degree and if they are not specific then CenterPoint Energy questions their value in a documented method. R2.3 is not found in the current Standards and is an unnecessary requirement as the method of notification is irrelevant so long as the notification is made. R2.7, R2.8, and R2.9 are also unnecessary expansions beyond what is currently in CIP-001-1 and EOP-004-1. CIP-001-1 requires the Responsible Entity review its procedures annually and CenterPoint Energy believes this is sufficient. When taken in total, R2 requires seven (7) different processes, provisions, and methods. CenterPoint Energy recommends R2.2, R2.3, R2.7, R2.8 and R2.9 be deleted and believes this will not result in a reliability gap.
City of Garland	No	There are 4 "methods" and 2 "provision" required for this requirement - in other words, 6 "paperwork" items that auditors will audit and likely penalize entities for. On page 1, the statement is made "...proposed standard in accordance with Results-Based Criteria." Having to have 4 methods and 2 provisions to end with a report (all of which is paperwork) is not a "result based" standard. It is like being required to have a "plan to plan on planning on composing and filing a report". Events need to be analyzed, communicated, and reported and

Organization	Yes or No	Question 4 Comment
		should be audited as such (results based) - not audited on whether they have a book filled with methods and provisions.
Consolidated Edison Co. of NY, Inc.	No	Requirement R2 o Lead-in paragraph - Following the words “Attachment 1” add a period and the words “The Operating Plans shall” and then delete “that” and make “includes” singular. o R2.1, 2.2, 2.3, 2.7 - Replace the word “Method(s)” with the word “Procedure(s)”. o 2.6 - After the word “notify” add a period, then insert the words “For example, external organizations may include” and delete the words “to include but not limited to.” o 2.8 - After the words “Operating Plan based on” add the word “applicable”.Rational R2After the words “Every industry participant that owns or operates,” add the words “Bulk Electric System.” Then delete the words “on the grid.”
Constellation Power Generation and Constellation Commodities Group	No	Constellation Power Generation and Constellation Commodities Group has several issues with this requirement, but in general, this requirement is heavily prescriptive, administrative in nature, and is unclear whether it will positively impact BES reliability. As examples of administrative requirements that have no impact on reliability, please consider the following comments: oListing personnel in R2.4, - merely having a list of personnel does not add to the sufficiency of an Operating Plan, but it does create a burdensome obligation to maintain a list. As well, specifying “personnel” may limit plans from designating job titles or other designations that may more appropriately and consistently carry reporting responsibility in the Operating Plan. oR2.5 is unclear as to the intent of the requirement - what is threshold of notification? Is the list to be those that have a role in the event response or a list of all within the facility who may receive news notification of the event? Also, as explained above for 2.4, a list is not a beneficial to reliability, but is administratively burdensome. oWhat is the reasoning for the 30 day timeframe in R2.7 R2.8 and R2.9? The timeframe is not based on a specific necessity, and creates an unreasonable time frame for changing the Operating Plan, in

Organization	Yes or No	Question 4 Comment
		particular if lessons learned are either short turn adjustments or comprehensive programmatic changes what warrant more time to properly institute. In addition, coupled with other requirements (R4, R5, R8), the updating requirements of R2.7, R2.8 and R2.8 potentially create a continually updating Operating Plan which could create enough confusion to reduce the effectiveness of the Operating Plan. The updating and time frame requirements do not impact reliability, but again impose significant administrative burden and compliance exposure. oR2.9 is particularly problematic for its connection to R8. R8 requires NERC to create quarterly reports with lessons learned and R2.9 requires the registered entities to amend their Operating Plans? What if NERC doesn't write an annual or quarterly report? Are the registered entities out of compliance? The "summary of concepts" for this latest revision, as written by the SDT, includes the following items: oA single form to report disturbances and impact events that threaten the reliability of the bulk electric system oOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements oClear criteria for reporting oConsistent reporting timelines oClarity around of who will receive the information and how it will be usedMany of the sub-requirements in R2 do not address any of these items and do not serve to establish a high quality, enforceable and reliability focused standard. Constellation Power Generation therefore recommends that R2 be amended to read as follows:R2. Each Applicable Entity identified in Attachment 1 shall have an Operating Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components: 2.1. Method(s) for identifying impact events listed in Attachment 12.2. Method(s) for assessing cause(s) of impact events listed in Attachment 12.3. Method(s) for making internal and external notifications should an impact event listed in Attachment 1 occur. 2.4. Method(s) for updating the Operating Plan.2.5 Method(s) for making operation personnel aware of changes to the Operating Plan.
Consumers Energy	No	R 2.7, R 2.8 and R 2.9 are creating a requirement to have procedures to update procedures. Having updated

Organization	Yes or No	Question 4 Comment
		procedures should be the requirement, no more.
Duke Energy	No	Sections 2.4 and 2.5 should allow identification of responsible positions/job titles rather than specific people. Section 2.9 only allows 30 days for updates to our plan based upon lessons learned coming out of an annual report. 60-90 days would be more appropriate. Also, Section 2.9 says it's an annual report, while R8 only requires quarterly reports.
Dynegy Inc.	No	For 2.7, 2.8, 2.9, 30 days is to stringent. Some changes may not warrant changes until a cumulative amount of changes occur. Suggest making it no later than an annual review.
E.ON Climate & Renewables	No	Administrative burden to some of the components such as 2.5.
Electric Market Policy	No	This is an overly prescriptive requirement given the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan lacks continuity with the ERO Event Analysis Process that is currently slated to begin industry field testing on October 25, 2010. Suggest the SDT coordinate EOP-004-2 efforts with this process.R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate and how will duplicative reporting be addressed (for example, DOE, Nuclear Regulatory Commission)? Also, in the "rationale for R2", please explain the reference to Parts 3.3 and 3.4.
ERCOT ISO	No	ERCOT ISO recommends the use of "Registered Entity" in place of "Applicable Entity". This would provide consistency with other requirements and Attachment 1. Recommend the following changes to the subrequirements. "2.6. List of external organizations to notify to include but not limited to NERC, Regional

Organization	Yes or No	Question 4 Comment
		Entity, relevant entities within the interconnection, Law Enforcement, and Governmental or Provincial Agencies.””2.7. Process for updating the Operating Plan within 30 days of any changes not of an administrative nature. This includes updates to reflect any lessons learned as a result of an exercise or actual event.”Remove requirement 2.8 and move content to requirement 2.7.”2.8. Process for updating the Operating Plan within 30 days of publication the NERC annual report of lessons learned.”Add “2.9. Process to ensure updates are communicated to personnel responsible for under the Operating Plan within 30 days of the change being completed.”
Exelon	No	R.2.4 and 2.5 - should not be required to have a list of internal personnel. If an entity has an Operating Plan that covers internal and external notifications that should be sufficient.R2.2.7, 2.8, 2.9 - R4 requires an annual drill. Updating the plan if required following an annual drill should be sufficientWhy does an entity need to develop a stand alone Operating Plan if there is an existing process to address identification, assessing and reporting certain events?30 day implementation for a component change or lesson learned does not seem reasonable or commensurate with the potential impact to the BES and should not be a required element of EOP-004.What is the communication protocol for lessons learned outside of the annual NERC report? What process will be followed and who will review, evaluate, and disseminate lessons learned that warrant updating the Operating Plan?
FirstEnergy	No	The term Operating Plan(s) is not the appropriate term for this standard. These should be called Reporting Plan(s). Operating Plans are usually designed to be applied during the operating timeframe. Parts 2.2 and 2.6 - We suggest changes to these two subparts as well as a new 2.2.1 and 2.6.1 as follows: 2.2. Method(s) for assessing the initial probable cause(s) of impact events(Add) 2.2.1. Method(s) for assessing the external organizations to be notified.2.6. List of external organizations to notify in accordance with Part 2.2.1. to

Organization	Yes or No	Question 4 Comment
		include but not limited to NERC, Regional Entity, and Governmental Agencies.(Add) 2.6.1. Method(s) for notifying Law Enforcement as determined by Part 2.2.1.Parts 2.4 and 2.6: This should be a list of job titles for ease of maintenance. An entity may choose to use someone in a job position that is a 24 by 7 operation with several personnel that cover that position over the 24 by 7 period. Listing each person by name should not be required as personnel change while the operating responsibility related to the job title can remain constant. We suggest changing the wording to "2.4. List of the job titles of internal company personnel responsible for making initial notification(s) in accordance with Parts 2.5.and 2.6.2.5. List of the job titles of internal company personnel to notify."Part 2.6 - We are under the impression that the phrase "include but not limited to" should not be used according to the NEW SDT guidelines. We suggest changing this to say "List of external organizations to notify that includes at a minimum, NERC, Regional Entity, and Governmental Agencies. (A provincial agency is a governmental agency)."Part 2.7. is overly burdensome. FE suggests the team revise to simply reflect annual updates that should consider component changes and updates from lessons learned. This also permits parts 2.8 and 2.9 to be deleted. FE proposes the following text for Requirement R2.7 "Annual review, not to exceed 15 months between reviews, and update as needed of the Reporting Plan that considers component changes and continuous improvement changes from lessons learned."Parts 2.8 and 2.9 - FE proposes to delete part 2.8 and 2.9. We do not see a need for these changes since the plan must be updated annually and will cover lessons learned.
Great River Energy	No	A. As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. R2.8, and R2.9 do not have a correlation to R2’s Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change. We believe that the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in

Organization	Yes or No	Question 4 Comment
		the components of an entity's Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the words "lessons learned" would be required to be in your Operating Plan. It is solely up to an entity to implement a "Lesson Learned" and not the place for this SDT to require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. B. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. We suggest that lessons learned should be incorporated within 12 calendar months if lessons learned are not deleted from the R2.8 & R2.9.
Green Country Energy	No	Highly administrative version of what could accomplish the same thing. A requirement that the applicable entitiy shall make appropriate notificatiions as required by attachment A and B events. I can see the need for review and lessons learned but that needs to be done at a higher level since many entities may be involved in an "event"
Idaho Power Company	No	The SDT needs to clarify Requirement 2.9 references an annual report issued persuant to requirement R8, however Requirement 8 references a quarterly report. These requirements should have the same time frames.
Indeck Energy Services	No	R2 needs to state that the Operating Plan needs to only those Attachment 1 events applicable to the Registered Entity. The Operating Plan should contain a list of these events so that the other Requirements can reference the Operating Plan and not Attachment 1 for the list of events. For example a GO/GOP <2,000 MW would not need to address this type of event and it wouldn't be listed in its Operating Plan. It would be unnecessarily cumbersome, to describe events which are not covered within the Operating Plan.
Independent Electricity System	No	R2 is not needed. An entity does not need to have an "operating plan" to identify and report on impact events;

Organization	Yes or No	Question 4 Comment
Operator		it needs only to report on the events listed in Attachment 1 in a form depicted in Attachment 2. How does the entity do this, and whether or not an operating plan is in place, or whether its staff is trained to provide the report should not need to be included in a reliability standard for so long as the responsible entity provides the report in the required form on time. If the responsible entity fails to report the listed events in the depicted format, it will be found non-compliant, and that's it - no more and no less. If the "operating plan" really means an established data collection and reporting procedure, then the requirement should be revised to more clearly convey the intent.
IRC Standards Review Committee	No	The SRC suggests that this is not, in fact, an Operating Plan. At most, it may be a reporting plan or reporting procedure. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject.As proposed, the Operating Plan is not required to ensure bulk power reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. The Operating Plan requirements as proposed seem only to be suitable for real-time notifications. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient. Unlike the real-time operating notifications which have relatively short reporting time frames, there is sufficient time for personnel to make appropriate communications within their organizations to make timely after the fact reports under NERC Section 1600 authority. Would it be feasible for NERC to issue a standing requirement for timely after-the-fact reports under NERC Section 1600 authority?
ISO New England Inc.	No	This is an overly prescriptive requirement given that the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan is an unnecessary burden that offers no additional improvements to

Organization	Yes or No	Question 4 Comment
		the reliability of the Bulk Electric System, and this is not, in fact, an Operating Plan. At most, it may be a reporting plan. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject.As proposed, the Operating Plan is not required to ensure Bulk Electric System reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient.Stating reporting requirements directly in the standard would produce a more uniform and effective result across the industry, contributing towards a more reliable Bulk Electric System.R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate, and how will duplicative reporting be addressed (for example, DOE, Nuclear Regulatory Commission)? Also, in the “rationale for R2”, please explain the reference to Parts 3.3 and 3.4.
Kansas City Power & Light	No	We agree with the rationale for R8 requiring NERC to analyze Impact Events that are reported through R6 and publish a report that includes lessons learned but disagree with R2.9 obligating an entity to update its Operating Plan based on applicable lessons learned from the report. Whether lessons learned are applicable to an entity is subjective. If an update based on lessons learned from an annual NERC report is required, the requirement should clearly state the necessity of the update is determined by the entity and the entity’s Reliability Coordinator or NERC can not make that determination then find the entity in violation of the requirement. In addition, if an update based on lessons learned from a NERC report is required, NERC should publish the year-end report (R8) on approximately the same day annually (i.e. January 31) and allow

Organization	Yes or No	Question 4 Comment
		an entity at least 60 days to analyze the report and incorporate any changes it deems necessary in its Operating Plan. In addition, the language using quarterly and annual as a requirements between R2.9 and R8 is confusing.
MidAmerican Energy	No	R2 and R5 coupled with R8 will drive quarterly updates (in addition to drills, etc) and training to the literally hundreds to thousands of people per company for the proper internal operating personnel and management will actually hurt the development of a culture of compliance by overwhelming personnel with constant plan changes and training.The standards drafting team should remove all 30 day references or provide the technical basis of why revising plans and training to “changes and lessons learned” quarterly all within 30 days is the right use of reliability resources to improve the grid.The addition of the 30 day constraints and new vague criteria in Attachment one such as “damage to a BES element through and external cause” or “transmission loss of multiple BES elements which could mean two or more” is the opposite of clear standards writing or results based standards. We disagree with requiring an Operating Plan for identifying, assessing, and reporting impact events. This is an administrative requirement that has no clear reliability benefit. Furthermore, it is questionable that event reporting even meets the basic definition of an Operating Plan. Per the NERC glossary of terms, Operating Plans contain Operating Procedures or Operating Processes which encompass taking action real-time on the BES not reporting on it. As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. R2.8, and R2.9 do not have a correlation to R2’s Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change, the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in the components of an entity’s Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the

Organization	Yes or No	Question 4 Comment
		words "lessons learned" would be required to be in your Operating Plan. It is solely up to an entity to implement a "Lesson Learned" and not the place for this SDT to require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. The NSRS recommends to incorporate lessons learned within 12 calendar months if lesson learned are not deleted from the R2.8 & R2.9.
Midwest ISO Standards Collaborators	No	We disagree with requiring an Operating Plan for identifying, assessing, and reporting impact events. This is an administrative requirement that has no clear reliability benefit. Furthermore, it is questionable that event reporting even meets the basic definition of an Operating Plan. Per the NERC glossary of terms, Operating Plans contain Operating Procedures or Operating Processes which encompass taking action real-time on the BES not reporting on it. What is an impact event? It appears that this undefined, ambiguous term was substituted for sabotage which is also undefined and ambiguous. One of the SARs stated goals was to "provide clarity on sabotage events". This does not provide clarity.
MRO's NERC Standards Review Subcommittee	No	A. As detailed in R2, the Operating Plan shall contain provisions for "identifying, assessing, and reporting impact events". R2.8, and R2.9 do not have a correlation to R2's Operating Plan. Where, R2.7 states to update the Operating Plan when there is a component change. The NSRS believes the components of this Operating Plan are only 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. R2.8 and R2.9 are based on Lessons Learned (from internal and external sources) and do not fit in the components of an entity's Operating Plan. R2.7 requires the Operating Plan to be updated. As written, every memo, simulations, blog, etc that contain the words "lessons learned" would be required to be in your Operating Plan. It is solely up to an entity to implement a "Lesson Learned" and not the place for this SDT to

Organization	Yes or No	Question 4 Comment
		require an Operating Plan to contain Lessons Learned. Recommend that R2.8 and R2.9 be deleted for this requirement. If R2.8 and R2.9 are not removed, R5.3 will be in a constant state of change. B. In R2.8 & R2.9, It may be difficult to implement lessons learned within 30 days. The NSRS recommends to incorporate lessons learned within 12 calendar months if lesson learned are not deleted from the R2.8 & R2.9.
North Carolina Electric Coops	No	This requirement dictates details of documentation of after-the-fact reporting of events which cannot impact reliability of the BES and, as such, should not be a reliability standard. The cost and burden of becoming auditably compliant with this requirement can be extreme for small entities.
Northeast Power Coordinating Council	No	This is an overly prescriptive requirement given that the intent of this standard is after-the-fact reporting. The requirement to create an Operating Plan is an unnecessary burden that offers no additional improvements to the reliability of the Bulk Electric System, and this is not, in fact, an Operating Plan. At most, it may be a reporting plan. Most of these requirements are administrative and procedural in nature and, therefore, do not belong as requirements in a Reliability Standard. Perhaps they could be characterized as a best practice and have an associated set of Guidelines developed and posted on the subject.As proposed, the Operating Plan is not required to ensure Bulk Electric System reliability. As stated in the purpose of this standard, it does not cover any real-time operating notifications for the types of events covered by CIP-001, EOP-004. Since these incidents are meant to be reportable after-the-fact, familiarity with the reporting requirements and time frames is sufficient.Stating reporting requirements directly in the standard would produce a more uniform and effective result across the industry, contributing towards a more reliable Bulk Electric System.R2.6 establishes an external organization list for Applicable Entity reporting, yet R1 suggests that external reporting will be accomplished via submittal of impact event reports. How will the two requirements be coordinated? What governmental agencies are appropriate, and how will duplicative reporting be addressed (for example, DOE,

Organization	Yes or No	Question 4 Comment
		Nuclear Regulatory Commission)? Also, in the “rationale for R2”, please explain the reference to Parts 3.3 and 3.4.
Pacific Gas and Electric Company	No	PG&E would like clarification on whether the 30 days, is calendar days or business days.
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
Pepco Holdings, Inc - Affiliates	No	For R 2.7, 2.8 and 2.9, 30 days may be too short a time for large entities with multiple subsidiaries to do the necessary notice and coordination. PHI suggests 90 days.
PNM Resources	No	PNM would like clarification on whether the 30 days, is calendar days or business days.
PPL Electric Utilities	No	While we agree with documenting our process, we feel the use of the defined term Operating Plan is not required and possibly a misuse of the term. We would like to suggest using the term ‘procedure’. Additionally, we would like the SDT to confirm/clarify whether Attachment 1 is a complete list of impact events. Also, please confirm that the Proposed R2.1 language ‘Method(s) for identifying impact events’ means identifying impact event occurrence as opposed to identifying list of impact events. i.e. does R2.1 mean recognize impact event occurrence?
PPL Supply	No	While we agree with concept addressed in R2, we don't agree with use of the defined term Operating Plan. Consider working the requirement as follows: "Each Applicable Entity identified in Attachment 1 shall have a documented process or program that includes the following components:..." Also, please consider changing 2.1 to be"Method(s) for recognizing the occurrence of impact events." The current wording could be

Organization	Yes or No	Question 4 Comment
		interpreted to mean, "create a list of the impact events."
Puget Sound Energy	No	While the concept of an operating plan is reasonable, the requirements for update in sections 2.7, 2.8 and 2.9 will lead to an immense amount of work for the entities subject to the standard. In addition, constant revisions to the operating plan makes it difficult to cement a habit through this procedure. The proposed update schedule does not strike the appropriate balance between the need to respond to lessons learned and the value of plan continuity.
RRI Energy, Inc.	No	1. R2 includes the phrase "for identifying, assessing and reporting," followed by R2.1 which states "identifying," R2.2 which states "assessing" and both R2.3 and R2.6 state "notify" or "making internal and external notifications" (i.e., reporting). The language is unnecessarily redundant. RECOMMENDATION: Reword R2 phrase "for identifying, assessing and reporting," to simply state, "for addressing."2. Rationale for R2 - The rationale section for R2 references in the third paragraph "Parts 3.3 and 3.4." Was this intended to reference R2.3 and R2.4?
Santee Cooper	No	The words "operating plan" should be removed from the requirement. This standard deals exclusively with after-the-fact reporting. This requirement is also overly prescriptive.
SERC OC Standards Review Group	No	This is an overly prescriptive requirement that dictates details of documentation and, as such, has no place in a reliability standard. NERC needs to trust the RCs to do their jobs; this standard and this requirement in particular seems to be attempting to codify the actions that an RC would take in response to an event. The cost and burden of becoming auditably compliant with this requirement is extreme and unrealistic, especially on small entities

Organization	Yes or No	Question 4 Comment
Southern Company - Transmission	No	The Operating Plan has a different connotation for different operations folks. We suggest that we call it an Impact Event Reporting Plan.
Tenaska	No	We have adequate compliance procedures already in place for the existing CIP-001-1 and EOP-004-1 Standards. The list of required "Operating Plan" components in the proposed R2 is too specific. Maintaining the "Operating Plan" described in R2 would increase the burden on Registered Entities to comply with the Standard and this type of "laundry list" Requirement would make it more difficult to prove compliance with EOP-004-2 during an audit.
United Illuminating	No	R2.9 requires provisions to update the Operating Plan based on the annual ERO report developed in R8. The ERO report does not appear to be providing lessons learned to be applied to the Operating Plan for impact event reporting, but more focsed on trends and threats to the BES. Also 30 days after the report is published by NERC is not enough time for the entity to read, and assess the report, and then to administratively update the Operating Plan. UI agrees that the Operating Plan should be reviewed annually and updated subsequent to the review within 30 days.
US Bureau of Reclamation	No	R2 does not reconcile with Attachment A or the sub paragraphs. As an example, the requirement 2.6 states "List of organizations to notify ...." All sub paragraphs use the term notify. Notify as used in Attachment A is when a report cannot be provided in the time frame listed in Attachment A. Therefore there is no requirement in this standard for the Operating Plan to have a provision for reporting.The subparagraph 2.8 indicates that the Entity must update it plan based on the lessons learned published by NERC. It would be appropriate to require a review and update of the plan based on the lessons learned.

Organization	Yes or No	Question 4 Comment
We Energies	No	R2.3, R2.4: “Part” is not a defined term or used in the NERC Standard Process Manual.R2: Attachments are not mentioned in the NERC Standard Process Manual. Is this a mandatory or informational part of the standard?R2.6 (and possibly R2.5): There does not seem to be discretion in notifications. Are all people or organizations on the notify lists always contacted for every impact event? Even Law Enforcement?R2.7: What is a “component? A Plan component? A BES component?R2.9: There is no annual NERC report issued pursuant to R8. R8 requires quarterly reporting.
WECC	No	Need clarification on whether the 30 days is calendar days or business days. As noted in the comment to question 3, any impact event where sabotage is suspected should be treated differently from those where sabotage is not suspected.
Arizona Public Service Company	Yes	AZPS agrees with R2, however, the use of the term "Operating Plan" is confusing. A more accurate term would be "Event Reporting Plan."
ATCO Electric Ltd.	Yes	
City of Austin dba Austin Energy	Yes	
Georgia System Operations Corporation	Yes	An entity-developed Operating Plan will allow the flexibility needed to address different entity relationships around the country, e.g., generating companies, cooperatives, munis, large IOUs, small IOUs, RTOs/ISOs, non-independent market area, and so on.However, all applicable entities should not be required to report directly to NERC or the region. The system should allow for partial reporting and hierarchical reporting. Entities within an area should be allowed to coordinate their plans to define reporting procedures within their area. They could have an entity at some wide scope top level that reports to NERC and the region the

Organization	Yes or No	Question 4 Comment
		information collected from multiple narrow scope lower levels within their wide area. If every small lower level entity directly reported to NERC and the Region, it could create situational confusion rather then situation awareness.
Manitoba Hydro	Yes	R2 - 2.1 to 2.9 detail what is expected of an Operating Plan for Impact Events.The attachment 1 details the event, the threshold parameters and time line. Though the threshold parameters in the attachment may be questioned, this greatly clarifies the expectations of reporting events. Further events should be added to this list:"Detection of suspected or actual or acts or threats of physical sabotage"
Luminant Energy	Yes	
Nebraska Public Power District	Yes	
NERC Staff	Yes	
PacifiCorp	Yes	
PacifiCorp	Yes	
TransAlta Corporation	Yes	

5. Do you agree with the requirement R3 and measure M3? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst stakeholders who responded to this question. Requirement R3 has been re-written to exclude the requirement to "assess the initial probable cause". The only remaining reference to "cause" is in the Impact Event Reporting Form (Attachment 2). Here, there is no longer a requirement to assess the probable cause. The probable cause only needs to identified, and only if it is known at the time of the submittal of the report.

Organization	Yes or No	Question 5 Comment
Ameren	No	There are too many missing details on how this will be accomplished. As stated before, this Draft requires too much time be invested in verbal reports, "Preliminary" reports, "Final" reports and even "Confidential" reports (Attachment 2). If the goal is to report ASAP details on events which could impact BES reliability, all of these reports will need to be made at the worst possible time - when Operators are trying to collect data, analyze what they find and correct major problems on the system. And if the reports are wrong or not issued fast enough, the Operators will be keenly aware of potential fines and violations.
American Electric Power (AEP)	No	Not clear how this is different from R6 since it relies on the same timetable in Attachment 1.
ATC	No	ATC believes that this requirement should be deleted and that the SDT should coordinate its goal with the EAWG. We believe that the lessons learned process and identification of root cause is better covered under that process than through the NERC Mandatory Standards.
BGE	No	R3. Limits responsibility to Attachment 1 events only and mandates that an "initial probable cause" be identified. Are we at liberty to define "initial probable cause" and define time period for completion in the Operating Plan? BGE believes this could cause wide difference between Operating Plans and the standard

Organization	Yes or No	Question 5 Comment
		should be more prescriptive by relating to a time-table for the life of an impact event, including expected identification time, initial assessment time and analysis time leading to the reporting deadlines.BGE recommends not including examples of evidence in a measure but include it in a Guideline. Including in a measure will be translated as a requirement by an auditor.
CenterPoint Energy	No	CenterPoint Energy does not agree with R3 and M3 as written as the Company does not agree with the requirement to have an Operating Plan (see comments to Q4 above). However, if R2 and M2 were to be deleted, and R3 was revised to read; “Each Applicable Entity shall identify and assess initial probable cause of events listed in Attachment 1.”, CenterPoint Energy could agree with this requirement.
City of Garland	No	Should be part of R2 or R6 - this is unnecessary duplication
Constellation Power Generation and Constellation Commodities Group	No	This requirement introduces double jeopardy for registered entities. If an entity does not include methods for identifying impact events and for assessing cause per R2.1 and R2.2 in their Operating Plan, they will be out of compliance with R2. Without the methods in R2 the registered entity is out of compliance with R3 as well for failing to identify and assess. Constellation Power Generation therefore recommends that R3 be amended to be incremental to R2 and read as follows: R3. Each Applicable Entity shall implement their Operating Plan(s) to identify and assess cause of impact events listed in Attachment 1.
Electric Market Policy	No	We think “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build audit ready compliant procedures.
ERCOT ISO	No	ERCOT ISO recommends the use of “Registered Entity” in place of “Applicable Entity”. This would provide consistency with other requirements and Attachment 1. The measure for this requirement notes the obligation

Organization	Yes or No	Question 5 Comment
		for “documentation”. This is not addressed in the requirement. The measure also notes “on its Facilities”. This clarification of scope should be addressed in the requirement. R3. Each Registered Entity shall identify, assess, and document initial probable cause of impact events on its Facilities listed in Attachment 1.
Exelon	No	: Agree that Each Applicable Entity shall identify and assess initial probable cause of impact events; disagree with aspects and time requirements in Attachment 1.
FirstEnergy	No	M3 - Power flow analysis would be used to assess the impact of the event on the BES, not to determine initial probable cause. It is more likely that DME would provide the data for the initial probable cause evaluation. We suggest rewording M3 as follows: "To the extent that an Applicable Entity has an impact event on its Facilities, the Applicable Entity shall provide documentation of its assessment or analysis. Such evidence could include, but is not limited to, operator logs, voice recordings, or disturbance monitoring equipment reports. (R3)"
Green Country Energy	No	Actually yes and no... An event may be caused, analyzed and corrected by one entity but most likely it will involve more. Low Voltage or frequency may not be caused by a generator but the generator will see the event and to have the generator assess the probable cause seems inappropriate. I can see reporting the event and duration and making notifications.
Indeck Energy Services	No	R3 should reference the events covered by the Operating Plan, as listed in it, rather than in Attachment 1. If the Plan is deficient, it is a violation of R2 and not every other Requirement that references the Plan.
Independent Electricity System Operator	No	We agree that the responsible entity needs to identify and assess initial probable cause of impact events but not in accordance with any operating plan in R2. Each operating entity (RC, BA, TOP) has an inherent responsibility to identify the cause of any system events to ensure it complies with a number of related

Organization	Yes or No	Question 5 Comment
		operational standards. R3, in fact, could be revised to require the Responsible Entity to include the probable cause of impact events in its report, rather than asking it to "identify and assess" since this is not measurable. Also, the ERO may be removed from the Applicability Section depending on the response to our comments under Q9.
IRC Standards Review Committee	No	Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes quite some time for an actual cause to be determined. The determination process may require a root cause analysis of some complexity.Further, in the case of suspected or potential sabotage, the industry can only say it doesn't know, but it may be possible. It really is the law enforcement agencies who make the determination of whether sabotage is involved and the info may not be made available until an investigation is completed, if indeed it is ever made available.
ISO New England Inc.	No	We think "impact event" needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditable compliance procedures.Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes a considerable amount of time for an actual cause to be determined. The determination process may require a complex root cause analysis.Further, in the case of suspected or potential sabotage, the industry can only say it doesn't know, but it may be possible. Law enforcement agencies make the determination of whether sabotage is involved, and the information may not be made available until an investigation is completed, if indeed it is ever made available.
Kansas City Power & Light	No	We believe R3 and M3 are unnecessary as a stand alone requirement and measure and propose combining this requirement and measure with R6 and M6. Identifying and assessing the initial probable cause of an

Organization	Yes or No	Question 5 Comment
		impact event is the obvious starting point in the reporting process and ultimate completion of the required report. Evidence to support the identification and assessment of the impact event and evidence to support the completion and submittal of the report are really one in the same.
Manitoba Hydro	No	Though each local entity should identify and assess initial probable cause of impact events as per their Operating Plan, the creation of this Operating Plan could be labor intensive and also guidelines for consistency within an RC region should be created.So “NO” is entered simply because a large time line would be needed to properly and efficiently implement R3 and R4.
MidAmerican Energy	No	
Midwest ISO Standards Collaborators	No	While we agree that it makes sense to report on the cause of an event, we disagree with the need for an Operating Plan as identified in R2.
North Carolina Electric Coops	No	The term “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditably compliant procedures and give guidance on what is proper to report.
Northeast Power Coordinating Council	No	"Impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditable compliance procedures.Although it is useful for entities to make an initial assessment of a probable cause of an event, this requirement should stand alone and does not need to be tied to requirement R2, Operating Plan. Quite often, it takes a considerable amount of time for an actual cause to be determined. The determination process may require a complex root cause analysis.Further, in the case of suspected or potential sabotage, the industry can only say it doesn’t know, but it may be possible. Law enforcement agencies make the determination of whether sabotage is involved, and the information may not be made

Organization	Yes or No	Question 5 Comment
		available until an investigation is completed, if indeed it is ever made available.
Pacific Northwest Small Public Power Utility Comment Group	No	Comments: When applying R3 to row 11 of attachment 1, the comment group notes that applicable entities are expected to assess probable cause of BES equipment damage, including that which may be the result of criminal behavior. At best this would needlessly duplicate the efforts of law enforcement. A more likely result is that entity involvement would interfere with law enforcement and ultimately hinder prosecution of those responsible. Also See #15
PPL Electric Utilities	No	We believe the rationale for R3 is good and provides value. However, we feel the clarity was lost when the rationale was translated to the standards language. Please consider revising language to refocus on rationale of assess and report per Attachment 1 as opposed to identify. We suggest changing the word “identify” to “recognize” and add the Rationale statement to the requirement as follows: “Each Applicable Entity shall assess the causes of the reportable event and gather available information to the complete the report.”
PPL Supply	No	Please consider changing the word "identify" to "recognize" and adding the Rationale statement to the requirement as follows: "Each Applicable Entity shall assess the causes of the reportable event and gather available information to complete the report."
RRI Energy, Inc.	No	"Identify and assess" - Auditors are as much in need of clearly worded, unambiguous Reliability Standards are as Registered Entities. This phrase leaves much too wide a range of interpretations, almost guaranteeing regular and frequent disagreements during an audit between Registered Entity and Regional Entity auditor as to what constitutes "identify and assess" sufficient to meet the intent of this Requirement. Compounding this issue is the Rationale for R3 that states an Applicable Entity (which should probably read "applicable

Organization	Yes or No	Question 5 Comment
		Functional Entity") should "gather enough information to complete the report that is required to be filed." While Rationale statements are not technically part of the standard, this emphasizes the current wording of the requirement as subject to random and arbitrary interpretation by auditors and Registered Entities. RECOMMENDATION: Change "identify and assess" to "document," so that the Requirement now reads "Each Applicable Entity shall document initial probable cause of impact events..." including an option for "cause not determined".
Santee Cooper	No	Does the initial probable cause have to be reported within the timing associated in Attachment 1? Entities may not have enough information that soon to report the initial probable cause. This should be done with events analysis.
SERC OC Standards Review Group	No	We think “impact event” needs to be defined in the NERC Glossary to provide the clarity the industry needs to build auditably compliant procedures.
Tenaska	No	The probable cause of a reportable event is already required to be submitted on the OE-417 form. This Requirement is redundant.
TransAlta Corporation	No	Clarity required Does an entity have to report on the cause of every “applicable” impact event they witness even though the event did not originate at their plant, system or region and did not adversely affect them? Essentially this would require every entity that witnessed an “applicable” event to report on its cause. In most cases they will not know the cause if they did not create the event. Measure M3 should reference Attachment 1 to indicate the Time to Submit Report’.
We Energies	No	A DP may not have Facilities (a BES element). See NERC Glossary definition of Facility.

Organization	Yes or No	Question 5 Comment
Bonneville Power Administration	Yes	Known causes are difficult under 1 hour reporting requirements. (Unusual events are even harder to narrow down in 24 hours and may take weeks.)
Consolidated Edison Co. of NY, Inc.	Yes	We agree, however, the term “impact event” must be part of the NERC glossary.
Georgia System Operations Corporation	Yes	It directly supports the purpose of the standard.
Great River Energy	Yes	While we agree that it makes sense to report on the cause of an event, we disagree with the need for an Operating Plan as identified in R2
MRO's NERC Standards Review Subcommittee	Yes	The NSRS thanks the SDT for stating “initial probable cause” as this is in direct correlation to the Purpose which states “known causes”.
Puget Sound Energy	Yes	However, this requirement doesn't address the timing required for this analysis. This may be intentional and appreciated because at times the analysis can take months when the events are complex in nature.
US Bureau of Reclamation	Yes	This is provided that the report submitted in Attachment A does not include the probable cause. It is highly unlikely that a probable cause may be determined within the reporting timelines.
Arizona Public Service Company	Yes	
ATCO Electric Ltd.	Yes

6. Do you agree with the requirement R4 and measure M4? Please explain in the comment box below.

Summary Consideration: Note R4 has been moved to R3 due to rearranging of requirements. The DSR SDT did a full review based on comments that were received. R3 now is stream lined to read:

R3. Each Responsible Entity shall conduct a test of its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3 at least annually, with no more than 15 months between such tests. The testing of the procedure (as stated in R1) is the main component of this requirement. Several commenters provided input that too much "how" was previously within R3 and the DSR DST should only provide the "what". The DSR SDT did not provide any prescriptive guidance on how to accomplish the required verification within the rewrite. Testing of the entity's Operating Process (R1) could be by an actual exercise of the process (testing as stated in FERC Order 693 section 471), a formal review process or real time implementation of the process. The DSR SDT reviewed Order 693 and section 465 directs that processes "verify that they achieve the desired result". This is the basis of R3, above.

Organization	Yes or No	Question 6 Comment
Ameren	No	Establishing a program with trigger actions expected to require reporting several times a year, combined with adequate initial, and on-going, training should preclude the need for mandatory drills as an added compliance burden.
ATC	No	We do not believe that a drill that exercises a written reporting obligation will add additional reliability to the BES.
BGE	No	M4. BGE recommends not including examples of evidence in a measure but include it in a Guideline. Including in a measure will be translated as a requirement by an auditor.Rationale for R4: If multiple

Organization	Yes or No	Question 6 Comment
		exercises are performed are all of them subject to the sub-R2 requirements and to audit/audit findings?
Bonneville Power Administration	No	There was no drill required for CIP-001 (a drill was in CIP-008, but the purpose did not list combining CIP-008). A drill is not needed for reporting Electrical Grid events, designate it as excluded in the intent of the requirement.
CenterPoint Energy	No	CenterPoint Energy does not agree with R4 and M4. See comments to Q4 above. In addition to the process vs. results based issue stated above, CenterPoint Energy believes conducting a drill to verify recognition, analysis, and reporting procedures is a waste of valuable resources and time.
City of Garland	No	Existing CIP 001 and EOP 004 are reporting standards - neither currently requires annual drills or exercises. Combining these two (2) should not entail expanding the requirements to include drills or exercises. There are existing drills / exercises that must be performed annually for compliance with CIP 008 & CIP 009 which require the same basic identifying, assessing, developing lessons learned, responding, and reporting skill sets. Requiring additional drills or exercises for this new combined standard will provide additional "business overhead" that results in basically nothing that is not obtained by the CIP 008 / 009 drills as far as securing or making the BES reliable. It does, however, result in additional audit risk at audit time.
Constellation Power Generation and Constellation Commodities Group	No	It is not clear how this requirement to conduct drills and exercises relates to the concepts spelled out by the SDT:oA single form to report disturbances and impact events that threaten the reliability of the bulk electric systemoOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirementsoClear criteria for reportingoConsistent reporting timelines oClarity around of who will receive the information and how it will be usedR4 does not address any of the above items and should therefore be removed from this standard.

Organization	Yes or No	Question 6 Comment
Consumers Energy	No	NERC should either standardize on a 12 month year or an annual year for reviews.
Dynegy Inc.	No	What is the basis for the drill being annual. This is to stringent. I suggest it be every 3 years.
Electric Market Policy	No	The need for a periodic drill has not been established and appears to be overly restrictive given the intent of the standard is reporting of impact events. Suggest this requirement be eliminated.
ERCOT ISO	No	ERCOT ISO believes that a drill or exercise of its Operating Plan is unnecessary. The intent of the drill can be addressed within the training requirements under R5.
Exelon	No	If drills remain as a component of the standard, an effort to consolidate updating an entities plan with a requirement to drill the plan should be made. . Each entity/utility should be able to dictate/determine if they need a drill for a particular event. Is this document implying a drill for every type of event?
FirstEnergy	No	FE suggests that this requirement be deleted. FE does not see a reliability need for conducting a drill on reporting. This is overly burdensome and should not be included within this reliability standard. Training on the plan and periodic reminder of reporting obligations should suffice.
Great River Energy	No	We disagree with the need to conduct a drill for reporting
Green Country Energy	No	Another training requirement with what benefit? We must train on all of our NERC requirements now anyway to insure compliance and that's not a requirement, thats implied and I think thats enough.
Indeck Energy Services	No	In M4, it is suggested that data from a real event would be evidence. R4 should be satisfied if the Operating

Organization	Yes or No	Question 6 Comment
		Plan is used for a real event within 15 months of the last drill or event.
Independent Electricity System Operator	No	Along the line of our comments on R2 for an operating plan (whose need we do not agree with), a drill, exercise, or Real-time implementation of the Operating Plan for reporting is also not necessary.
IRC Standards Review Committee	No	Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are really training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in a short time frame as may be required for real-time operating notifications.
ISO New England Inc.	No	The need for a periodic drill has not been established, and appears to be overly restrictive given the intent of the standard is the reporting of impact events. Suggest this requirement be eliminated. Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in as short a time frame as may be required for real-time operating conditions notifications.
Kansas City Power & Light	No	We believe R4 and M4 are clearly unnecessary. Thoughtful preparation of an Operating Plan per R2 that specifically addresses personnel responsibilities and appropriate evidence gathering combined with the training requirement in R5 is sufficient.
Luminant Energy	No	We support the requirements outlined in R2 which create significant obligations to maintain and update the required Operating Plan. However, we believe annual drilling for a reporting process seems unnecessary, particularly given the response horizon of 24 hours for the majority of impact events. If drilling is required, the

Organization	Yes or No	Question 6 Comment
		standard should allow actual events to fulfill a drilling requirement as stated in the Rationale for R4 and within the text of M4.
Manitoba Hydro	No	Drills and exercise for implementation of the Operating Plan are important and critical, but as in question 5, or Requirement R3, careful and detailed creation of the Operating Plan are crucial to facilitate proper training, drills and exercises.So “NO” is entered simply because a large time line would be needed to properly and efficiently implement R4 and R3.
MidAmerican Energy	No	
Midwest ISO Standards Collaborators	No	We disagree with the need to conduct a drill for reporting.
North Carolina Electric Coops	No	Requiring a drill for “reporting” is unnecessary and burdensome. Reporting is covered in processes and procedures and during the normal training cycle. We recommend the elimination of this requirement.
Northeast Power Coordinating Council	No	The need for a periodic drill has not been established, and appears to be overly restrictive given the intent of the standard is the reporting of impact events. Suggest this requirement be eliminated. Similar to our comments on R2 for an Operating Plan, a drill, exercise, or Real-time implementation of its Operating Plan for reporting is unnecessary. Such things are training practices. There are already existing standards requirements regarding training. There is no imminent threat to reliability that requires these events to be reported in as short a time frame as may be required for real-time operating conditions notifications.
Pacific Gas and Electric	No	PG&E believes the addition of a drill constitutes additional training and should be added to R5. PG&E is

Organization	Yes or No	Question 6 Comment
Company		concerned as to who the target audience for this annual training would affect.
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
PNM Resources	No	PNM feels the addition of a drill or exercise constitutes additional training and believes R4 should be added to R5. The WECC OTS also is interested as to what level does the annual training target, for instance, the field personnel. Will they have to complete the exercise/drill?
RRI Energy, Inc.	No	Every employee in a Registered Entity might potentially have exposure to an impact event, and therefore result in a list of thousands of employees subject to the EOP-004-2 Operating Plan. Does this mean, for example, an applicable Functional Entity with 3,000 employees, each capable of potentially observing an impact event, must include them in the drill, exercise, or Real-Time implementation? Such an expectation would require a hypothetical email notice to be sent to 3,000 employees, advising them "This is a test - You observe a suspicious vehicle driving around the fence of your power plant. Perform the next action you should take." The result in this hypothetical might be 3,000 phone calls and emails to the responsible employee in the applicable Functional Entity, each needing to be documented and retained for the audit period.As stated above in question 5, auditors need guidance as much as Registered Entities. Otherwise, it is observed that they will seek the most stringent approach they observe from the best of the best practices over the first year of implementation and apply that expectation as the base-case, under which all other approaches will be deemed violations.
Santee Cooper	No	There is no need to drill for administrative reporting! This requirement should be deleted.

Organization	Yes or No	Question 6 Comment
SERC OC Standards Review Group	No	We think this requirement is unclear - we think it requires a drill for “reporting”, which seems absurd! We recommend the elimination of this requirement.
Tenaska	No	This Requirement is too specific and places additional burdens on Registered Entities.
US Bureau of Reclamation	No	There is no rationale offered on why 15 months was selected. Without a defined basis the time period is arbitrary. It would be appropriate to let the Entity determine and document the time interval. That would allow the time frame to be sensitive to the complexity of the Operating Plan. Some entities aregeographically dispersed and a single Operating Plan may be difficult to test atone time or within 15 months.The allowance for real time events or actual use is a good move and maymake it easier to define a suitable time frame by the Entity.
WECC	No	The addition of a drill or exercise constitutes additional training and believes R4 should be added to R5. Clarification is needed as to what level does the annual training target, for instance, the field personnel. Will they have to complete the exercise/drill?
American Electric Power (AEP)	Yes	
Arizona Public Service Company	Yes	AZPS agrees with R4, however, the use of the term "Operating Plan" is confusing and leads one to believe an Operating Drill is necessary for a "reporting plan drill." A more accurate term to use would be "Event Reporting Plan."
Georgia System Operations Corporation	Yes	We agree with R4 with "... at least annually, with no more than 15 months ..." replaced with "... at least once per calendar year, with no more than 15 months ..." as in R5.

Organization	Yes or No	Question 6 Comment
MRO's NERC Standards Review Subcommittee	Yes	The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be exercised once per calendar year.
United Illuminating	Yes	Suggest R4 be improved to state that a Registered Entity is only required to conduct a drill or execute real-time implementation of the Operating Pan for one impact event listed in the attachment. In other words the Registered Entity is not required to drill on reporting each type of impact event on an annual basis.
ATCO Electric Ltd.	Yes

7. Do you agree with the requirement R5 and measure M5? Please explain in the comment box below.

Summary Consideration: Most stakeholders who responded to this question indicated disagreement with the originally proposed Requirement R5 and Measure M5. **(**Note R5 has been moved to R4 in the revised standard.) The DSR SDT did a full review based on comments that were received. The major issues that were provided by commenters was R5.3 and R5.4 and their contents. Upon detailed review the DSR SDT agrees with the majority of comments received with R5.3 and R5.4 and have removed them completely from the Standard. Training is still the main theme of this requirement as it pertains to the personnel in the procedure (R1). R4 now is stream lined to read:

R4. Each Responsible Entity shall review its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan at least annually with no more than 15 calendar months between review sessions

Organization	Yes or No	Question 7 Comment
Green Country Energy		Same as my comment for question 6
Arizona Public Service Company	No	AZPS believes the required training is too restrictive for minor changes/edits to the Event Reporting Plan.
ATC	No	ATC believes it is an inherent obligation of all Functional Entities to train their appropriate staff to meet all applicable NERC Standards. Including a training requirement in some, but not all, Standards implies that the other Standards do not necessitate training. Although this is an important Standard and one that should be included in a Functional Entities' training program, ATC does not believe that this Standard is more important than the other NERC Standards and, therefore, requires a separate training provision
ATCO Electric Ltd.	No	R5.3 requires an entity to conduct training within 30 days of a revision to the Operating Plan. For an entity

Organization	Yes or No	Question 7 Comment
		that covers a wide area, 30 days may not be sufficient to reach all employees.
BGE	No	Suggested revision to clarify R5:Each Applicable Entity shall provide training to all internal personnel identified in its Operating Plan on the Operating Plan annually. Training is only on Reporting, pursuant to R2, not on the Operating Plan?BGE does not believe the SDT needs to identify sub bullets on this requirement. R5.1 is not logical --- what does it mean?
CenterPoint Energy	No	CenterPoint Energy believes that R5 and M5 are not necessary and should be deleted. CenterPoint Energy supports an entity training its staff in any reporting responsibilities; however, such training should be the responsibility of each entity and such requirements do not belong in a NERC standard. In addition, CenterPoint Energy believes any necessary training requirements are covered in the PER Standards and therefore the addition of this requirement adds redundancy to the Standards.If a majority of the industry supports such a requirement, CenterPoint Energy cannot support R5 and M5 as written as we do not agree with the requirement to develop and maintain an Operating Plan (see comments to Q4 above). CenterPoint Energy offers the following alternate language: “Each Applicable Entity shall provide training concerning reporting requirements contained in this Standard to internal personnel involved in the recognition or analysis of events listed in Attachment 1.
City of Garland	No	This expands beyond the original CIP 001 and EOP 004 - neither explicitly requires training - combining does not mean expanding. In reality, what practical skill are you going to train on? People who perform the analysis on an event are going to have job specific training external to this standard and those same folks will maintain their skill set external to this standard. If it is going to be a results based criteria standard, then let the entities be responsible. Training on methods to fill out and file paper work does not make the BES more reliable. The vast majority of other standards do not have a training requirement section and yet, entities manage to be

Organization	Yes or No	Question 7 Comment
		compliant with those standards. Compared to all the other reliability standards and their requirements, are penalties for training on filling out paper work really making the BES more secure and reliable?
Consolidated Edison Co. of NY, Inc.	No	Requirement 5 - Training should be targeted only at those responsible for implementing the Operating Plan (OP), not all those mentioned in the OP.R5 - After the words “internal personnel” add the words “responsible for implementing.” The delete the words “identified in” and “for reporting pursuant to Requirement R2.”5.4 - Following the words “For internal personnel” add the words “responsible for implementing the Operation Plan.” Between the words “revised responsibilities” add the word “implementation.”M5 - After the words “between the people” add the words “responsible for implementing the Operating Plan”
Constellation Power Generation and Constellation Commodities Group	No	Constellation Power Generation questions how R5 relates to the SDT’s “summary of concepts”:oA single form to report disturbances and impact events that threaten the reliability of the bulk electric systemoOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirementsoClear criteria for reportingoConsistent reporting timelines oClarity around of who will receive the information and how it will be usedHowever, Constellation Power Generation believes that security awareness is an important aspect of personnel security and proposes an annual training similar to what was in the previous standards. Constellation Power Generation therefore recommends two requirement changes that would achieve security awareness without the burdensome administrative aspects. First, as stated earlier, a sub requirement in R2 should be added which reads as follows: R2.5 Method(s) for making operation personnel aware of changes to the Operating Plan.Second, this training requirement should be rewritten as follows: Each Applicable Entity shall provide training to all operation personnel at least annually.
Consumers Energy	No	Again, either 12 month year or annual year, NERC needs to standardize on one or the other. Training should apply only to those that must take action relevant the reliability of the BES. A plan would likely include

Organization	Yes or No	Question 7 Comment
		notification of senior officers, however they don't need to be included in drills and training if they have no active role.
Duke Energy	No	Strike the word "all" in the requirement. All personnel don't need to be trained - for example, the plan may contain references to some personnel as potential sources of the information that will then be reported. Also, Section 5.3 only allows 30 days for training, which may be impossible with rotating shift personnel and training schedules. 60 days is more appropriate.
Dynegy Inc.	No	The annual training seems excessive especially if their have been no changes. You have included one exception for contact information revisions; however, it should be expanded to include exceptions for minor/non-substantial changes. Also, make training requirements (after initial training)be required for substantive changes only.
E.ON Climate & Renewables	No	Redundant with R4.
Electric Market Policy	No	The need for a periodic training has not been established and appears to be overly restrictive given the intent of the standard is reporting of impact events. Suggest this requirement be eliminated.
Exelon	No	Exelon doesn't feel that the 30 day requirement is achievable and recommends an annual review. Training for all participants in a plan should not be required. Many organizations have dozens if not hundreds of procedures that a particular individual must use in the performance of various tasks and roles. Checking a box which states someone read a procedure does not add any value, it is an administrative burden with no contribution to reliability. It is Exelon's opinion that training requirements should be covered in the PER standards and that the audience to be trained should be identified. R5.4 requires internal personnel that

Organization	Yes or No	Question 7 Comment
		have responsibilities related to the Operating Plan cannot assume the responsibilities unless they have completed training. This requirement places an unnecessary burden on the registered entities to track and maintain a data base of all personnel trained and should not be a requirement for job function. A current procedure and/or operating plan that addresses each threshold for reporting should provide adequate assurance that the notifications will be made per an individual's core job responsibilities.
FirstEnergy	No	Requirement R5 and Part 5.1 - The wording in Part 5.1 is too prescriptive and shouldnot require training on the specific actions of personnel. Also, R5 should not require training for personnel that may only receive the report and are not required to do anything. Therefore we suggest rewording R5 and 5.1 as follows:"R5. Each Applicable Entity identified in Attachment 1 shall have a Reporting Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components:5.1 The training includes the personnel required to respond under the Reporting Plan."Part 5.3 - We suggest removing subpart 5.3. This requirement is overly burdensome and not necessary. We believe that the requirements for annual review and update of the plan as well as training sufficiently cover reviews of changes to the plan. Part 5.4 - The last phrase "training shall be conducted prior to assuming the responsibilities in the plan" should account for emergency situations when the entity does not have time to train the replacement before they are to assume a responsibility.
Great River Energy	No	We believe that this task should be incorporated into the Job Task Analysis for the System Operators and that this requirement should be deleted as being redundant.
Idaho Power Company	No	The 30 day Requirement is limited with real time operations. Most entities with real time operations utilize a 5 or 6 week rotating schedule to comply with PER-002. the NERC Continuing Education Program allows up to 60 days to comply, this allows the operating shifts to accomadate training within the operating schedule. The

Organization	Yes or No	Question 7 Comment
		requirement 5.3 should allow 60 days to complete the training.
Indeck Energy Services	No	It is wholly unreasonable to re-train everyone for each change to the Operating Plan. Suggestion: Clarify that upon changes to the Operating Plan, the Registered Entity may either require full training, or instead distribute a summary of the change to affected personnel only.
Independent Electricity System Operator	No	Along the line of our comments on R2 for an Operating Plan (whose need we do not agree with), any training on developing and providing the report is unnecessary. What matters is that the report is provided to the needed organizations or entities on time and in the required format according to established procedure. How this is accomplished goes outside of the purpose of reliability standard requirements.
IRC Standards Review Committee	No	We do not agree with the need for R5. We do not see the need for a standard requirement that stipulates training the personnel on reporting events. What matters is that the reports are provided to the needed organizations or entities on time and in the required format according to established procedure. Stipulating a training requirement to achieve this reporting is micro-managing and overly prescriptive.
ISO New England Inc.	No	The need for a periodic drill has not been established, and appears to be overly restrictive given that the intent of the standard is reporting of impact events. Suggest this requirement be eliminated. There are training standards in place that cover these requirements. We agree the relevant personnel should be “aware” of the reporting requirements. But there is not a need to have a training program with specific time frames for reporting impact events. Awareness of these reporting requirements can be achieved through whatever means are available for entities to employ to train on any of the NERC standards, and need not be dictated by requirements.

Organization	Yes or No	Question 7 Comment
Kansas City Power & Light	No	We agree with the need for the Operating plan and the provision of formal training to impacted personnel. We believe that the personnel references are too open-ended to be productive and measurable. This leaves all applicable entities open to subjectivity in assessment and may produce a large administrative burden to demonstrate compliance with no associated benefit to improved reliability.
Luminant Energy	No	Operating Plan revisions communicated through procedure updates and employee acknowledgements of the same are sufficient when coupled with a procedural training program that occurs according to a programmed schedule.
Manitoba Hydro	No	The comments in Question 6 and 7 encompass the training aspect of this requirement.
MidAmerican Energy	No	: R5.2. The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be trained once per calendar year.R5.3 As detailed in R2, the Operating Plan shall contain provisions for “identifying, assessing, and reporting impact events”. Where, R2.7 states to update the OperatingWe disagree with the need to provide formal training. We could agree with the need to communicate to System Operators and other pertinent personnel the criteria for reporting so that they know when system events need to be reported.
Midwest ISO Standards Collaborators	No	We disagree with the need to provide formal training. We could agree with the need to communicate to System Operators and other pertinent personnel the criteria for reporting so that they know when system events need to be reported.
MRO's NERC Standards Review Subcommittee	No	R5.2. The NSRS agrees that to enhance reliability and situational awareness of the BES, the Operating Plan be trained once per calendar year.R5.3 As detailed in R2, the Operating Plan shall contain provisions for

Organization	Yes or No	Question 7 Comment
		"identifying, assessing, and reporting impact events". Where, R2.7 states to update the Operating Plan when there is a component change. The NSRS believes the components of this Operating Plan are 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events. These components relate to training when the Operating Plan is revised per, R5.3, only. As written, every memo, simulations, blog, etc that contain the words "lessons learned" would be required to be in your Operating Plan and trained on every time one was issued or heard about internally or externally. Recommend that the Operating Plan be revised and training occurs when a change occurs to the entity's Operating Plan, consisting of 1) indentifying impact events, 2) assessing impact events, and 3) reporting impact events, only.
North Carolina Electric Coops	No	Requiring training to report of after-the-fact events does not improve the reliability of the BES. We recommend the elimination of this requirement.
Northeast Power Coordinating Council	No	The need for a periodic drill has not been established, and appears to be overly restrictive given that the intent of the standard is reporting of impact events. Suggest this requirement be eliminated. There are training standards in place that cover these requirements. The relevant personnel should be "aware" of the reporting requirements. But there is not a need to have a training program with specific time frames for reporting impact events. Awareness of these reporting requirements can be achieved through whatever means are available for entities to employ to train on any of the NERC standards, and need not be dictated by requirements.
Pacific Gas and Electric Company	No	PG&E believes 30 days is too restrictive due to real-time operations schedule requirements. The schedule is six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Suggest extending to 60 days to meet the training criteria which follows the NERC Continuing Education revised submittal date for the Individual Learning

Organization	Yes or No	Question 7 Comment
		Activities (ILA).
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
PacifiCorp	No	Training required within 30 days of a revision to the Operating Plan is not feasible with 5 or 6 week shift rotations. A sixty day requirement would be more realistic.
Pepco Holdings, Inc - Affiliates	No	30 days may be too short a time for large entities with multiple subsidiaries to do the necessary notice and coordination. PHI suggests 90 days.
PNM Resources	No	PNM believes 30 days is too restrictive due to real-time operations schedule requirements. Most work schedules are either five or six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Based on the NERC Continuing Education revised submittal date for the Individual Learning Activities (ILA), PNM would recommend 60 days.Creating an Impact Event Report is duplicative and redundant and the WECC OTS feels this is not necessary.
PPL Electric Utilities	No	We agree with the need for training on one's process. However, we suggest changes to R5.3. Consider expanding the exception criteria to exempt non-substantive changes such as errata changes, minor editorial changes, contact information changes, etc. We also suggest saying '...,training shall be conducted, or notification of changes made, within 30 days of the procedure revisions.'
PPL Supply	No	We generally agree with R5 but recommend two changes to 5.3. Consider expanding the exception criteria to exempt non-substantive changes such as errata changes, minor editorial changes, contact information

Organization	Yes or No	Question 7 Comment
		changes, etc. Also, consider changing "training shall be conducted" to "training or communication/notification of changes shall be conducted."
Puget Sound Energy	No	The fact that proposed requirement R2 will require frequent updates to the operating plan means that the training required under this plan will occur quite frequently as well, leading to operator confusion. Even the comment allowing a review and “sign-off” will not completely mitigate this result.
RRI Energy, Inc.	No	1. This Requirement is structured to result in the same heavy-handed, zero-tolerance approach that has made CIP-004 one of the top three violated Reliability Standards. The failure in CIP-004 is that, for example, a seven-year background check or annual training program that is tardy by one day results in a violation. There is no margin of error, proviso, or cure scenario. Likewise, the proposed R5 in EOP-004-2 makes it a violation if someone takes their newly established training on the day after the end of 15 months. Systems configurations are often based on quarterly monitoring for individuals needing to take training. In addition, when dealing with potentially thousands of employees, it is inevitable that any one of hundreds of reasons might result in an employee not being included in the tracking system, and rolling past the 15th month. RECOMMENDATION: To avoid further burden to Regional Entity audit and enforcement personnel as has been the case in CIP-004, develop a cure process that allows the Registered Entity to correct the training or background check tardiness with prompt correction, fill out a notification report to submit to NERC, and proceed with protecting the reliable operation of the BES, rather than tying up Registered Entity and Regional Entity staffs with data requests, enforcement paperwork and administrative actions.2. The proposed R5.3 requires the entire applicable staff to redo the entire training within 30 days of a change to the Operating Plan. These Operating Plans will not be short documents, and formal training will not involve a 5 minute soundbite. However, for such a significant procedure as the Operating Plan, frequent changes and revisions are going to

Organization	Yes or No	Question 7 Comment
		be very common, especially given the likelihood of frequent clarifications, Compliance Action Notices ("CANs"), and lessons learned issued by NERC and Regional Entities over this very detailed set of new obligations. It is not unreasonable to expect a Registered Entity to make three or more revisions to their Operating Plan in a year, which would require training for thousands of employees three times a year, for what might amount to a single sentence revision. Furthermore, the obligation to retrain on the entire training program is not limited in this requirement to only those individuals impacted by the revision. Where a change or revision only impacts 3 possible employees, this standard would require a company with 1,500 employees subject to the Operating Plan to retake the entire training. RECOMMENDATION: Clarify that upon changes to the Operating Plan, the Registered Entity may either require full training, or instead distribute a summary of the change(s) via email to affected personnel only.
Santee Cooper	No	The concept of requiring training on reporting of after-the-fact events does not support or enhance bulk electric system reliability. We recommend the elimination of this requirement.
SERC OC Standards Review Group	No	While we support training on an annual basis for the operating plan, the concept of requiring training on reporting of after-the-fact events does not support or enhance bulk electric system reliability. We recommend the elimination of this requirement.
Southern Company - Transmission	No	We suggest that the time frame be changed to 60 or 90 days in 5.3. 5.4 needs to have a time frame associated with it; we suggest that it be 60 or 90 days.
Tenaska	No	This Requirement is too specific and places additional burdens on Registered Entities.
TransAlta Corporation	No	Measure M5 states applicable entities shall provide training material presented... This measure is unclear as

Organization	Yes or No	Question 7 Comment
		to whether the meaning is for internal personnel or to be provided to external entities upon request? Please clarify.
US Bureau of Reclamation	No	The measure is vague and redundant. The Entity is required to provide information to be used to "verify content". The information may be used to demonstrate compliance but who will verify the content is adequate and on what basis. Secondly, the measure requires training information be provided twice, once to demonstrate who participated and then to show who was trained. This is all unnecessary and could be remedied by simply stating that "evidence shall demonstrate that all individuals listed in the plan have received training on their role in the plan"
We Energies	No	Please clarify who is to be trained. As written, R5 requires any internal personnel identified in the plan, including CEO, Vice Presidents, etc., to be trained.
WECC	No	Thirty days is too restrictive due to real-time operations schedule requirements. Most work schedules are either five or six weeks and individuals may be on either long change or vacation and therefore unable to complete the training within 30 days of the identification of the need. Based on the NERC Continuing Education revised submittal date for the Individual Learning Activities (ILA), the requirement should be changed to require training to be conducted within 60 days.
Bonneville Power Administration	Yes	There was no training required for CIP-001 or in CIP-008. (The proposed EOP-008 purpose did not list incorporating CIP-008). Training was not really needed for reporting Electrical Grid events.
ERCOT ISO	Yes	ERCOT ISO believes the content of training can include an exercise or drill.

Organization	Yes or No	Question 7 Comment
United Illuminating	Yes	R5.3 coupled with the rationale provided is a sensible approach. It is important that the rational is not forgotten.
Ameren	Yes	
American Electric Power (AEP)	Yes	
City of Austin dba Austin Energy	Yes	
Georgia System Operations Corporation	Yes	
NERC Staff	Yes	
PacifiCorp	Yes	

8. Do you agree with the requirement R6 and measure M6? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst stakeholders who responded to this question regarding agreement with the originally proposed Requirement R6 and Measure M6. **(**Note R6 been moved to R5 in the revised standard.) The DSR SDT did a full review based on comments that were received. Many comments indicated concerns with the reporting timelines within Attachment 1. (The DSR SDT has addressed those comments in response to Question 10).

Several commenters wanted the ability to report impact events to their responsible parties via the DOE Form OE-417. Following discussions with the DOE and NERC, the DSR SDT has added the ability to use of the DOE Form OE-417 when the same or similar items are required to be reported to NERC and the DOE. This will reduce the need to file multiple forms when like items must be reported to the DOE and NERC for the same impact event. The underlying fact is that impact events are to be reported within prescribed guidelines, thus providing industry awareness and starting of any analysis process. R5 now is stream lined to read:

> R5. Each Responsible Entity shall report Impact Events in accordance with the Impact Event Operating Plan pursuant to Requirement R1 and Attachment 1 using the form in Attachment 2 or the DOE OE-417 reporting form.

Organization	Yes or No	Question 8 Comment
American Electric Power (AEP)	No	It is not clear how this is different from R3 since it relies on the same timetable in Attachment 1.
CenterPoint Energy	No	CenterPoint Energy does not agree with R6 and M6 as written as we do not agree with the requirement to develop and maintain an Operating Plan (see comments to Q4 above) In addition CenterPoint Energy does not agree with the timelines required in Attachment 1 (see comments on Q10). CenterPoint Energy offers the following alternate language: “Each Applicable Entity shall report events outlined in Attachment 1 to applicable entities including but not limited to; NERC, and appropriate law enforcement agencies."

Organization	Yes or No	Question 8 Comment
City of Garland	No	1. The reporting requirements should not be expanded beyond CIP 001 and EOP 004-1. The goal for combining the two should be to make the process more efficient - not add on extra requirements for procedures on how to report, drills on reporting, training on reporting, etc. 2. The timelines requiring 1 hour reporting to the ERO are not needed and provide little realtime benefit to the BES. Real time or near real time reporting for "people on the ground" such as the RC, BA, TOP, FBI, Local Law Enforcement, DOE, etc. is necessary. They are in a position to take action in response to an event. On page 5, it states "The proposed standard deals exclusively with after-the-fact reporting. 1 Hour reporting requirements to the ERO in addition to existing reporting are not reasonable "after-the-fact" reporting requirements in the midst of an emergency. Also, there is not a 24X7 ERO center to report events to - why build and staff one when they already exists at the RC, BA, TOP, DOE, FBI, Local Law Enforcement, etc. - An ERO 24X7 center would be extra overhead that would provide no additional benefit in the first hour or hours of an emergency.
Consolidated Edison Co. of NY, Inc.	No	R2 requires applicable entities to have an Operating Plan which are company specific procedures and process required to be compliant with EOP-004. Therefore, R6 should be deleted since it is redundant with R2.
Electric Market Policy	No	Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
ERCOT ISO	No	ISO recommends the following changes to the language of the requirement.R6. Each Applicable Entity shall report impact events in accordance with Attachment 1.
Exelon	No	The time durations in the attachment are too short, it would be impossible to collect all the data necessary to report out on an impact event in the defined time to report.The SDT should evaluate each event for the most

Organization	Yes or No	Question 8 Comment
		appropriate entity responsible to ensure there is minimal confusion on who has the responsibility and eliminate duplication of reporting when feasible.
FirstEnergy	No	M6 - NERC's system should be capable of making this evidence available for the entities and provide a "return-receipt" of the reports that we send them. Also, M6 should be revised to state "Applicable Entities" as opposed to "Registered Entities".
Great River Energy	No	We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
Indeck Energy Services	No	---This is the first mention of the time lines in Attachment 1. If they are part of the standard, then they should be incorporated to the Operating Plan in R2 and then need not be mentioned again, only compliance with the plan. ---In M6, the last part, "evidence to support the type of impact event experienced; the date and time of the impact event ; as well as evidence of report submittal that includes date and time" is redundant. All of that should be in the report to NERC. If not, then it's not important to keep.
Independent Electricity System Operator	No	We agree with having a requirement to report impact events in accordance with the timelines outlined in Attachment 1, but not with the requirements indicated in R2.
IRC Standards Review Committee	No	There is not a need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations.

Organization	Yes or No	Question 8 Comment
ISO New England Inc.	No	Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements for NERC that cross other federal agency jurisdictions.There is no need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations which is implied by the label “Operating Plan.”
Kansas City Power & Light	No	We believe R3 and M3 are unnecessary as a stand alone requirement and measure and propose combining these requirements with R6 and M6. Identifying and assessing the initial probable cause of an impact event is the obvious starting point in the reporting process and ultimate completion of the required report. Evidence to support the identification and assessment of the impact event and evidence to support the completion and submittal of the report are really one in the same.
MidAmerican Energy	No	We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
Midwest ISO Standards Collaborators	No	We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will particularly difficult when support personnel are not present such as during nights, holidays and weekends.
North Carolina Electric Coops	No	There is already a DOE requirement to report certain events. NERC should not be developing redundant reporting requirements when this information is already available at the federal level from other agencies.

Organization	Yes or No	Question 8 Comment
Northeast Power Coordinating Council	No	Entities are already required by other agencies (e.g., DOE, NRC) to report certain events. We see no need to develop redundant reporting requirements for NERC that cross other federal agency jurisdictions.There is no need for an Operating Plan as proposed. This is not truly an Operating Plan. There are already other standards which create the requirements for an Operating Plan. This is an administrative reporting plan and any associated impact upon reliability is far beyond real-time operations which is implied by the label “Operating Plan".
Pacific Gas and Electric Company	No	PG&E believes that if the standard is intended to be an after the fact report, we question the one and/or twenty-four hour reporting criteria and then the 30 day criteria?
Pacific Northwest Small Public Power Utility Comment Group	No	See #15
PNM Resources	No	PNM believes there seems to be redundancy in reporting based on the time frames in Attachment 1, i.e. OE-417 and other required reports. If this standard is intended to be an after the fact report, why is there one/twenty-four hour reporting criteria?
PPL Electric Utilities	No	We understand the rationale for this standard and support the project to combine EOP-004 and CIP-001 as well as the reporting requirement in CIP-008. We are concerned that it may be difficult to meet Attachment 1 Part B Potential Reliability Impact submittal times as the time to submit is 1 or 24 hour after occurrence. E.g. Risk to BES equipment, the example given is a major event and easy to conclude. Consider forced intrusion, risk to BES equipment (increased violence in remote area), or cyber intrusion - should Attachment 1 state ‘report within 24 hours after detection’?

Organization	Yes or No	Question 8 Comment
PPL Supply	No	It may be difficult to meet Attachment 1 Part B Potential Reliability Impact submittal times as the time to submit is 1 or 24 hours after occurrence. Consider changing the Time to Submit Report for Forced intrusion, Risk to BES equipment, and Detection of a cyber intrusion to be "report within 24 hours after detection".
RRI Energy, Inc.	No	RECOMMENDATION: Clarify that the reporting of impact events shall be to those entities identified in the Operation Plan section developed specifically in Section 2.6. Reference to Attachment 1 indicates reporting to "external" parties is the intent for R6.
Santee Cooper	No	If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity
SERC OC Standards Review Group	No	There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
Southern Company - Transmission	No	The time to submit report column needs to be more flexible with time frames.
Tenaska	No	The reporting timelines are currently listed on the OE-417 form. This Requirement is redundant.
TransAlta Corporation	No	R6 should reference Attachment 2 to make it clear that this report form must be used.M6 seems to be requesting evidence that the Confidential Impact Event Report was submitted. TransAlta suggests the submission of the actual report is evidence the report was submitted.Records of this submission can be provided on request.Web Reports Project 2009-01 has indicated online reporting is the direction they are

Organization	Yes or No	Question 8 Comment
		going.If the impact report becomes an online Web report the entity submitting the report has no way of confirming the report ended up at the Compliance Enforcement Authority office after it is submitted. There needs to be some method that demonstrates the report was submitted and received.
We Energies	No	The proposed definition of “impact event” needs to be clarified.
WECC	No	There seems to be redundancy in reporting based on the time frames in Attachment 1, i.e. OE-417 and other required reports. If this standard is intended to be an after the fact report, why is there one/twenty-four hour reporting criteria?
Arizona Public Service Company	Yes	AZPS believes that Operating Plan should be replaced with "Event Reporting Plan."
ATC	Yes	ATC does agree that applicable entities report on events identified in Attachment 1 (See our comments about Attachment 1), but we do not agree that applicable entities should be required by this standard to have an Operational Plan. Please see our comments to question 4.
BGE	Yes	Comments for clarification:R6. Use of Capital letters in Operating Plan makes it unnecessary to state "created pursuant to Requirement 2
Bonneville Power Administration	Yes	The requirement needs to specify who (ERO) to report to. Attachment 1 doesn’t say to report to the ERO either. Clarify or remove the difference between the report submitted and evidence of the type of impact event required in the measurement.
Georgia System Operations Corporation	Yes	It directly supports the purpose of the standard.

Organization	Yes or No	Question 8 Comment
Green Country Energy	Yes	Now this is an excellent example of all that is needed for this requirement!
Manitoba Hydro	Yes	Attachment 1 details the impact events and the thresholds of which they should be reported.
Puget Sound Energy	Yes	It is assumed that for the purposes of M6, NERC and the regions would already have access to these reports.

9. Do you agree with the requirements for the ERO (R7-R8) or is this adequately covered in the Rules of Procedure (section 802)? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst the commenters who responded to this question. The DSR SDT did a full review based on comments that were received. The DSR SDT has determined that R7 and R8 are not required to be within a NERC Standard since Section 800 of the Rules of Procedure already assigns this responsibility to NERC. The DSR SDT, the Events Analysis Working Group (EAWG), NERC Staff (to include NERC Senior VP and Chief Reliability Officer) had an open discussion with this item being a major topic. The DSR SDT and EAWG are working in coordination with each other to provide NERC Staff with updated language for future inclusion into the Rules of Procedure. NERC Staff, the EAWG and the DSR SDT all supported this new initiative.

Organization	Yes or No	Question 9 Comment
Ameren	No	NERC's current heavy case load should justify reviewing the impact review table only once every 2 years.
ATC	No	ATC feels the ERO obligations should be covered in the Rules of Procedure.We do not agree with the requirements assigned to the ERO, but believe that they should be incorporated into the ERO's Rules of Procedure
BGE	No	R7. Make Impact Event Table all Capital Letters(it is a title). R8. Is the term "reportable impact events" new or is impact event intended to be capitalized? R8. Does a quarterly report of the year's reportable impact events include 12 months of "reportable impact events"? This is confusing. R8. In the Rationale for R8 Impact Events appears with Capital letters - why now? Shouldn't it appear with all Capital letters throughout the document as it is a defined term? R8. There are no previous requirements to report threats (R8.3) or

Organization	Yes or No	Question 9 Comment
		lessons learned (R8.5) or trends (R8.2) to an ERO. Is this information from reports to the ERO or from ERO research?
CenterPoint Energy	No	CenterPoint Energy does not believe this requirement is necessary; however, if the SDT insists on keeping this requirement then CenterPoint Energy believes it should remain as written. Any change to Attachment 1 should go through the Reliability Standards Development Procedure.
Consolidated Edison Co. of NY, Inc.	No	See response to Question 2Requirement 7Delete the words “and propose revisions to”Following the words (Attachment 1) add a period.Following that period add the words “The ERO shall revise the table”Requirement 8RECOMMEND DELETION OF R8 - CONFIDENTIALITY CONCERNS WILL MAKE ESTABLISHING A PUBLICATION REQUIRMENT EXTREMELY CHALLENGING.
Constellation Power Generation and Constellation Commodities Group	No	The impact event table (Attachment #1), as part of a standard, would have to be FERC approved every time it is edited. That would cause it to go through NERC’s Standard Development Process, and would cause a revision to the standard each time. This will also cause revisions to each and every registered entity’s Operating Plan. Overall, this requirement causes a large administrative burden on all entities, and does not improve reliability. As stated earlier, the “summary of concepts” for this latest revision, as written by the SDT, includes the following items:oA single form to report disturbances and impact events that threaten the reliability of the bulk electric systemoOther opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirementsoClear criteria for reportingoConsistent reporting timelines oClarity around of who will receive the information and how it will be usedRequirement 7 and 8 do not address any of these items. Furthermore, for R8, it is requiring NERC to send out quarterly reports, yet entities are supposed to amend their Operating Plans based on an annual NERC report. This requirement is confusing and is not consistent with earlier requirements. Constellation Power Generation

Organization	Yes or No	Question 9 Comment
		believes that these two requirements should be removed.
Electric Market Policy	No	Having the ERO as an applicable entity is concerning as they are also the compliance enforcement authority.
ERCOT ISO	No	Recommend that the Electric Reliability Organization be removed. The Electric Reliability Organization should not be responsible for reliability functions and therefore should be excluded from reliability standards.
FirstEnergy	No	FE disagrees with the ERO as an applicable entity within a reliability standard. See our responses to Questions 2 and 3 above. We do not believe the desired ERO process is adequately covered in section 802. Section 802 deals with assessments and not event reporting.
Georgia System Operations Corporation	No	It should not be necessary for the ERO to require itself to do these things. NERC's authority should be sufficient to do these things as part of its mission.With quarterly trending and analysis of threats, vulnerabilities, lessons learned, and recommended actions in R8, R7 (an annual review) should not be necessary. The quarterly activity could include proposing revisions to Attachment 1 if warranted.An alternative would be to perform annual trending and analysis of threats, vulnerabilities, lessons learned, recommended actions, and proposed revisions to Attachment 1 if warranted.Also, the Reliability Standards Development Procedure has been replaced with the Standard Processes Manual.
Indeck Energy Services	No	Reviewing Attachment 1 annually is unnecessary. Events don't change much and if they do, a SAR is needed to consider the changes. NERC should not be included in any standard!
Independent Electricity System Operator	No	We agree with the need to update the list as needed, but it does not have to be the ERO who takes on a reliability standard to do so. It can simply be an annual project in the standards development work plan to review Attachment 1 as part of a standard. The industry will then be provided an opportunity to weigh on the

Organization	Yes or No	Question 9 Comment
		changes. Also, we do not see the reliability results or benefits of R8. The ERO can issue the report quarterly but who are audiences? What reliability purpose does it serve if no further actions are pursued upon receiving the report? Can this be done as a standing item for the ERO at, say, the BoT meeting? Or, can this be a part of the quarterly communication from the ERO to the industry? To make this a reliability standard is an over-kill, and does not conform with the results-based standard concept.From our perspective, both R7 and R8 can be removed, and the ERO can be removed from the Applicability Section as well.
IRC Standards Review Committee	No	We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
ISO New England Inc.	No	Having the ERO as an applicable entity raises concern as it is also the compliance enforcement authority. Requirement R7 is unnecessary as there are already requirements in place for three year reviews of all Standards. R8 contains requirements to release information that should be protected, such as identification of trends and threats against the Bulk Electric System. This may trigger more threats because it will be published to unwanted persons in the private sector.We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
Kansas City Power & Light	No	We agree with the rationale for R8 requiring NERC to analyze Impact Events that are reported through R6 and publish a report that includes lessons learned but disagree with R2.9 obligating an entity to update its Operating Plan based on applicable lessons learned from the report. Whether lessons learned are applicable

Organization	Yes or No	Question 9 Comment
		to an entity is subjective. If an update based on lessons learned from an annual NERC report is required, the requirement should clearly state the necessity of the update is determined by the entity and the entity's Reliability Coordinator or NERC can not make that determination then find the entity in violation of the requirement. In addition, if an update based on lessons learned from a NERC report is required, NERC should publish the year-end report (R8) on approximately the same day annually (i.e. January 31) and allow an entity at least 60 days to analyze the report and incorporate any changes it deems necessary in its Operating Plan. Again, the language referencing annual and quarterly in these two requirements in confusing.
Manitoba Hydro	No	Rules of Procedure appear to have a different focus then R7 and R8.Briefing on Rules of Procedure 802Assess, review and report on:1.1 overall electric operation1.2 uncertainties and risks1.3 self assessment of supply and reliability1.4 projects on customer demand1.5 impact of evolving electric market practicesthat could affect the present and future of the BESBriefing on R7 and R8R7 - ERO shall review and propose revisions to Attachment 1R8- ERO shall publish quarterly reports on trends, threats, vulnerabilities, lessons learned and recommended actions.
Midwest ISO Standards Collaborators	No	We do not agree with the requirements and we do not believe it is adequately covered in section 802. First, section 802 deals with assessments not event reporting. Secondly, since attachment 1 is part of a standard, it should not be modified outside of the Reliability Standards Development process.
NERC Staff	No	NERC staff believes that requirements R7 and R8 are not needed because they are intrinsic expectations from its Rules of Procedure. Furthermore, these elements are necessary for analysis in support of the Reliability Metrics efforts NERC is leading under its Reliability Assessment and Performance Analysis

Organization	Yes or No	Question 9 Comment
		program.
North Carolina Electric Coops	No	The ERO cannot be subject to a requirement for which it is the compliance enforcement authority.
Northeast Power Coordinating Council	No	Having the ERO as an applicable entity raises concern as it is also the compliance enforcement authority. Requirement R7 is unnecessary as there are already requirements in place for three year reviews of all Standards. R8 contains requirements to release information that should be protected, such as identification of trends and threats against the Bulk Electric System. This may trigger more threats because it will be published to unwanted persons in the private sector.We do not support an annual time frame to update the events list. The list should be updated as needed through the Reliability Standards Development Process. Any changes to a standard must be made through the standards development process, and may not be done at the direction of the ERO without going through the process.
Puget Sound Energy	No	This is adequately covered by section 802 of the Rules of Procedure. There seems to be some conflict between R2.9 and R8 regarding timeframes and the specific elements required.
Santee Cooper	No	Standards cannot be applicable to an ERO because they are the compliance enforcement authority, and the ERO is not a user, owner, or operator of the BES.
SERC OC Standards Review Group	No	The ERO cannot be subject to a requirement for which it is the compliance enforcement authority. The governance in this situation appears incomplete.
United Illuminating	No	The rules of procedure adequately cover this.
US Bureau of Reclamation	No	Requirements 7 and 8 are covered in the Section 801.801. Objectives of the Reliability Assessment and

Organization	Yes or No	Question 9 Comment
		Performance Analysis Program. The objectives of the NERC reliability assessment and performance analysis program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American bulk power systems, both as existing and as planned; (2) analyze off-normal events on the bulk power system; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the board for publication to the electric industry and the general public.
Bonneville Power Administration	Yes	R2.9 language refers to R8 “annual” report; however R8 language is “quarterly” reporting. It appears this standard is going to be in an update status 4 times per year minimum, plus any event modifications plus personnel changes. Overly burdensome.
City of Garland	Yes	R7 - Yes as long as any changes to attachment 1 follow the “Reliability Standards Development Procedure. R8 - Yes as long as R8.6 is strictly “recommended actions.” They should not become “required actions” as this bypasses the standard development process.
Duke Energy	Yes	However, R8 only addresses quarterly reports, and R2 Section 2.9 states that there will be an annual report.
Green Country Energy	Yes	I realize this is another burden for the ERO but the information would be good to know what is going on outside the plant .
Luminant Energy	Yes	Continually refining the Impact Event table to better define which events should be reported would be extremely valuable. Section 802 does not adequately require such refinement, thus R7 and R8 are

Organization	Yes or No	Question 9 Comment
		appropriate inclusions to this standard.
MRO's NERC Standards Review Subcommittee	Yes	Should read "In accordance with Sections 401(2) and 405 of the Rules of Procedures, the ERO can be set as an applicable entity in a requirement or standard". As stated in the text box.
RRI Energy, Inc.	Yes	We support the concept that Reliability Standard requirements and obligations that are subject to violations and penalties should all be contained in the four-corners of the Reliability Standard. If an obligation exists in the Rules of Procedures that creates a stand-alone responsibility that is subject to violation and penalty, it should be removed from the Rules of Procedure and inserted into the appropriate Reliability Standard.

10. **Do you agree with the impact event list in Attachment 1? Please explain in the comment box below and provide suggestions for additions to the list of impact events.**

Summary Consideration: Most commenters who responded to this question disagreed with some aspect of Attachment 1 – most commenters provided specific suggestions for improvement. The DSR SDT did a full review based on comments that were received. The DSR SDT, the Events Analysis Working Group (EAWG), NERC Staff (to include NERC Senior VP and Chief Reliability Officer) had an open discussion with this item being a major topic. The EAWG and the DSR SDT aligned Attachment 1 with the Event Analysis Program category 1 analysis responsibilities. This will assure that impact events in EOP-004-2 reporting requirements are the starting vehicle for any required Event Analysis within the Event Analysis Program. The DSR SDT agrees that there are similar items in the DOE Form OE 417 and EOP-004-2. DOE, NERC and the DSR SDT are in initial talks to try and reduce duplicate reporting requirements. Until such time in the future that a new process is established between the DOE and NERC, the DSR SDT has revised the standard to indicate that the use of either the DOE Form OE 417 or Attachment 2 is an acceptable reporting form for applicable entities. The DSR SDT reviewed the "hierarchy" of reporting within Attachment 1. To reduce multiple entities reporting the same impact event, the DSR SDT has stated that the entity that performs the action or is directly affected by an action will report per EOP-004-2. As an example, during a system emergency, the TOP or RC may request manual load shedding by a DP or TOP. The DP or TOP would have the responsibility to report the action that they took if they meet or exceed the bright-line criteria established in Attachment 1. Upon reporting, NERC Event Analysis Program would be made aware of the impact event and start the EA Process which is outside the scope of this Standard.

Several bright-line criteria were removed from Attachment 1. These criteria (DC converter station, 5 generator outages, and frequency trigger limits) were removed after discussions with the EAWG and NERC staff, who concurred that these items should be removed from a reporting standard and analysis process.

Organization	Yes or No	Question 10 Comment

Organization	Yes or No	Question 10 Comment
WECC		For strictly after-the-fact reporting the list of Attachment 1 is appropriate. However, as noted in our earlier comments, actual or suspected sabotage events can have a potentially significant impact on reliability and should be treated differently, with additional real-time reporting requirements. It is important that such events be identified and recognized for reliability purposes and that notices include the RC.
Ameren	No	We have numerous comments about the Attachments. (1) What are the requirements for "verbal" reporting to NERC and Regional entities? (2) What are the requirements for a "Preliminary" Impact Event Report? (3) The Voltage Deviations Event is unclear (a) Are these consecutive minutes? (b) Where is the voltage measured? (generator terminals? Point of Interconnections? Anywhere?) (c) must each Entity report separately? (d) What is the +/- 10% measured against (Generator Voltage Schedule?) (4) For Generation loss events how is an "entity" defined? (a corporate parent? each registered entity? other?) (5) Are the "Examples" in the Attachment 1 - Part A really Examples, or mandatory situations? (6) Can you define "Damage"? (7) Can you define "external cause"? (8) Can you give examples of "non-environmental external causes"? (9) The footnote 1 reference for "Damage or destruction of BES equipment" doesn't match up with the a. and b. footnotes or the 1. footnote of Attachment A - Part B. (10) How is the Operator supposed to determine what Event affects the reliability of the BES fast enough to decide whether or not to report? (11) is the Loss of off-site power (grid supply) event to a nuclear plant already covered by NUC-001?(12) What are "critcal cyber assets" since CIP-002-4 will eliminate that term? (13) When is Attachment 2 supposed to be used? (14) What is meant by the word "Confidential" in the title of the Attachment 2 report? How would the SDT propose a GO/GOP handle the reporting for the following situation? A CTG unit is dispatched and the unit is started, synchronized and put on the bus. Immediately the Operator receives a high gas alarm from the GSU. The Operator quickly shuts the unit down and de-energizes the GSU. There are no relay targets and no obvious reason for the problem. After several weeks of analysis it's determined there was an internal fault in the GSU

Organization	Yes or No	Question 10 Comment
		and it must be replaced. How would the SDT recommend all the reporting requirments in this situation be addressed with the current draft?
American Electric Power (AEP)	No	Are the times listed for the initial probable reporting under R3 or the reporting under R6?Many of these items do not constitute emergency conditions. We view many of these as too onerous and would divert operating staff from monitoring and operating the BES. In addition, some terms (i.e. Frequency Trigger Limits) are not currently defined terms. Furthermore, there are existing requirements that have obligations for entities to provide this information to the RC. For example "Detection of a cyber intrusion to critical cyber assets" is already covered under CIP-008. This creates duplicate (and potentially competing) requirements.AEP also contends that some of the timelines are very aggressive and not consummate with perceived need for the information.Transmission loss of multiple BES transmission elements (simultaneous or common-mode event)within 24 hours after occurrence is overly aggressive and should provide more specific criteria.
Arizona Public Service Company	No	AZPS believes that the list in Attachment 1 would be complete, as long as the text box of examples is included. The examples demonstrate what is necessary.
ATC	No	ATC has several areas of concern regarding Attachment 1.1. The one hour requirement for reporting will take the Functional Entities' focus off of addressing the immediate reliability issues and instead force the FE to devote valuable resources to filling out forms which will potentially reduce reliability.2. Part A:a. Provide a definition of "system wide" for the Energy Emergency requiring system-wide voltage reduction.b. Add in the clarity that for Energy Emergency requiring firm load shed pertains to a single event, not cumulative events.c. Insert the word "continuous" for Voltage Deviations.d. Take off the TOP for IROL violations. (We believe that an IROL violation should be reported by the RC and not by the TOP based on the nature of the event. Requiring both the RC and TOP to report will only result in multiple reports for a single event. The RC is in

Organization	Yes or No	Question 10 Comment
		the best position to report on an IROL violation for its RC area.)e. Take off the TO, TOP and add the LSE for Loss of Firm Load. (As a transmission only company ATC does not have contracts with end load users. Because of this the Loss of Firm Load should be the reporting obligations of the entity closes to the end load users which is the BA, DP or LSE. Failure to modify this requirement will cause confusion as to which entity has to report Loss of Firm Load. f. Define a timeframe for Generation Loss g. Multiple should be changed to "4 or more" for Transmission Loss.(ATC is concerned that this would require reporting of events that have little or no industry wide benefits but would take up considerable Registered Entity resources.)h. Provide clarity to and tighten the definition of Damage or destruction of BES equipment. The way it is written now would require over-reporting of all damaged or destroyed equipment due to a non-environmental external cause (e.g. broken insulator).3. Part B:a. Take off the TO and TOP for Loss of off-site power. (The GOP has the responsibility to acquire off-site power and we believe it is the GOP's sole responsibility to report the Loss of off-site power. Failure to correct this would result in multiple reporting for the same event.)b. Take off RC for Risk to BES equipment. (The RC function does not own BES equipment and we believe it is impossible for them to report on risk to BES equipment if they are not the owner or operator of that equipment. This standard should be required of the entity that owns/operates BES equipment. c. Provide guidance to the phrase "reasonably determine" in footnote.d. Examples provided do not provide a clear obligation for an entity to follow. (Question: How close is the train to the substation? (Inches away from the substation fence, ten feet away from the substation fence or 500 feet away from the substation fence.) In addition, this standard is so open to interpretation that no entity can demonstrate compliance with the action. We believe that the only solution is to delete this reporting requirement. Overall:Multiple Functional Entities impacted by the same event are required to report. No lead entity is identified. This will result in multiple reports of the same event. ATC does not believe that this built-in duplicity enhances reliability?

Organization	Yes or No	Question 10 Comment
ATCO Electric Ltd.	No	Attachment 1: Part A - Transmission Loss: Only sustained outages should be reportable. Also the reporting threshold needs to be quantified for impact events, for example:a) Size of DC converter Station > 200 MW.b) Impact of loss of Multiples BES transmission elements in terms of significant load (> 200 MW for > 15 min).
BGE	No	TOP determines "system-wide" voltage reductions; why place this responsibility on a TO or DP? - Load Shedding is automatic load shedding; why 100MW? Does a DP need to provide a Report when directed by the RC, BA or TOP to shed load or reduce voltage? - No examples should be included in the standard! Need to define a "BES Transmission Element". - Table shows multiple entities in "Entity with Reporting Responsibility"; is it one or is it all entities report? - In an audit who determines "reasonably determined likely motivation" - Is it justified to expect to have "motivation" knowledge within one hour of an event? - Why are the Responsible Entities reporting Interruptible Demand tripped / lost?
Bonneville Power Administration	No	BPA suggests the following:Change loss of multiple BES to 3 or more. Loss of a double circuit configuration due to lightning doesn’t need a report (it’s a studied contingency). Add qualifier to damage/destruction of BES equipment, since a failed PCB or a system transformer normally doesn’t have a MAJOR impact to the grid.Add qualifier to Loss of “ALL” off-site power affecting nuclear...The unplanned evacuation of control center is a busy time for the backup control center, yet this standard requires 1 hour reporting. Suggest changing to 24 hours.
CenterPoint Energy	No	CenterPoint Energy appreciates the efforts of the SDT in identifying the entity with reporting responsibility. This is an improvement to the event table. CenterPoint Energy is concerned with multiple entities being listed as having Reporting Responsibility. CenterPoint Energy recommends the SDT limit this to one entity having responsibility for reporting each event. This would not preclude that entity from coordinating with other entities

Organization	Yes or No	Question 10 Comment
		to gather data necessary to complete the report. In addition, CenterPoint Energy believes there are several events that should be removed from the list. “Transmission Loss” is covered by the TPL standards and does not need to be identified or reported under EOP-004. The loss of a DC converter station or multiple BES transmission elements may or may not disrupt the reliable operation of the BES, i.e. result in blackout, cascading outages, or voltage collapse. Likewise “Damage or destruction of BES equipment” in and of itself should not be the subject of reporting. If the damage or destruction results in true disruption to the reliable operation of the BES, that impact would be reported under one of the other identified events. “Voltage Deviations” is another unnecessary event. CenterPoint Energy believes a voltage event of the proposed magnitude will, more than likely, result in other events identified in Attachment 1 such as; IROL Violation or Generation Loss and would be reported under one of those triggers. Another concern is the threshold trigger of +/- 10% for 15 minutes or more. CenterPoint Energy is unclear as to the starting point to determine the deviation. In other words is the 10% deviation from nominal voltage, such as 138kV or 345kV, or the actual voltage at the time of the event? Additionally, must the deviation occur over a “wide area” or is such a deviation at one buss enough to trigger a report? Based upon these ambiguities and concerns CenterPoint Energy recommends “Voltage Deviations” be deleted from Attachment 1. The examples that follow on page 14 should also be deleted.
City of Garland	No	This report should follow exactly the OE-417 to avoid redundant, possible conflicting, and overall confusion in reporting.Note: The table has entries that are in conflict with the OE-417 and thus can cause confusion in filing multiple reports potentially causing an entity to violate Federal Law due to the confusion. By submiting the same information on different timelines, i.e. one hour reporting under OE-417 and 24 hours under this Standard, the reports may be significantly different causing confusion from differing reports of the same event.Although we prfer the events to match the OE-417 events exactly, if the SDT decides to include a

Organization	Yes or No	Question 10 Comment
		seperate events table we make the following suggestions: Energy Emergency requiring system-wide voltage reduction: should be reportable at 5% not 3% voltage reduction. The standard should clearly state this was applicable for BES energy emergency conditions only, not voltage reductions for other reasons.On voltage deviations: it should be clear that this applies to widespread effects on the BES not a single distribution feeder that has a low voltage.For the Frequency deviation: Did not see a definition for the FTL (frequency trigger limit)Generation loss: the reportable loss of generation should be significantly more than 500 MW. The number of units at the locaton is irrelevent. Ten units at 50 MW each is no more critical than a single 500 MW unit. Under this standard, if the plant with ten 50 MW units trips it is reportable but an 800 MW single unit is not reportable. The trip of the 800 MW unit has much more effect on the sytem reliability. Damage or destruction of BES equipment: Should be limited to specific equipment such as a 765 kV autotransformer not a 138 kV lightning arrestor. This needs to be eliminated or significantly limited as to the equipment type that is reportable.
Consolidated Edison Co. of NY, Inc.	No	It is absolutely essential that the work on EOP-004 and that on the NERC Event Analysis Process (EAP) be fully coordinated. We find that there are a number of inconsistencies between these two documents. The EAP and EOP-004 are not aligned. In order to operate and report effectively entities need consistent requirements.Attachment 1Frequency Deviations - The term “Frequency Trigger Limit (FTL)” is not defined. Only defined terms should be used, or the term should be defined. If the term is defined in another standard it should be moved to the Glossary of Terms for wider use.Loss of Firm load for 15 Minutes - The text under the rightmost column entitled, Time to Submit Report, appears to be incomplete in our copy.Transmission loss and Damage or destruction of BES equipment - At the end of the wording for both under the column entitled “Threshold for Reporting” add the words “that significantly affects the integrity of interconnected system operations.”Examples - Capitalize “Critical Asset” as this is a defined term.

Organization	Yes or No	Question 10 Comment
Constellation Power Generation and Constellation Commodities Group	No	Constellation Power Generation and Constellation Commodities Group questions why the generation loss line item includes generating facilities of 5 or more generators with an aggregate of 500 MW or greater? The number of units makes no difference for reporting, as is evident in the generation thresholds written before this inclusion. The examples of damaged or destroyed BES equipment are confusing, and do not clarify the reporting event. What if a GSU at a small plant (20 MW) were to fail? Is that reportable? Constellation Power Generation believes that equipment failures that are not suspicious do not need to be reported. Finally, Constellation Power Generation and Constellation Commodities Group believes that the “loss of offsite power affecting a nuclear generation station” should be removed for the following reasons:1)The purpose of this reliability standard is stated as being: “Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES). “ While the “situational awareness” portion of the purpose could be interpreted as all-inclusive, the real element deals with BES reliability. Off-site power sources to nuclear units have nothing to do with BES reliability. Why should nuclear units be treated differently?2)The issue of concern for a loss of offsite power at a nuclear station is continued power supply (other than emergency diesels) to power equipment to cool the reactor core. A nuclear unit automatically shuts down when off-site power supply is lost. Availability of off-site power is a reactor safety concern (i.e., NRC regulatory concern and a one-hour report to the NRC) - not a reliability concern that FERC/NERC would have jurisdiction over.3)There is a nuclear-specific reliability standard (NUC-001) that contemplated off-site power availability. That standard contained no reporting requirements outside of those that may be already established in current procedures. Why try to impose one here?4)A loss of offsite power will result in an emergency declaration at the nuclear facility. Notifications will be made to federal (NRC), state, and local authorities. The control room crew is already overly-burdened with notifications - any additional call to NERC/Regional Reliability orgs will add insult-to-injury for no beneficial reason. If NERC is interested, they should obtain info from NRC.5)If all else fails and the item is to remain on the table, it needs

Organization	Yes or No	Question 10 Comment
		to be clarified as a “complete” loss of off-site power lasting greater than X minutes (i.e., would we have to report a complete momentary loss that was rectified in short order by an auto-reclose or quick operator action?).
Duke Energy	No	o General Comment - many timeframes in Attachment 1 are within one hour. This is inconsistent with the stated aim of the standard, which is after-the-fact reporting, as opposed to real-time operating notifications under RCIS and other standards (e.g. TOP). This standard should not be structured to require another layer of real-time reporting. o Voltage Deviation - Plus or minus 10% of what voltage? o Frequency Deviation - this is Interconnection-wide. Do you really want a report from every RC and BA in the Eastern Interconnection?? o Transmission Loss - “Multiple BES transmission elements” should be changed to “Three or more BES transmission elements”. Also, the time to submit the report should be based upon 24 hours after the occurrence is identified. o Damage or destruction of BES equipment - need clarity on the “Examples”. Is the intent to report an event that meets any one of the four “part a.” sub-bullets? i. - critical asset should be capitalized. Disagree with the phrase “has the potential to result” in section iii. - it should just say “results”. Section iv. is too wide open. It should instead say “Damaged or destroyed with malicious intent to disrupt or adversely affect the reliability of the electric grid.” o Unplanned Control Center evacuation - see our General Comment above. Clearly in this case the reporting individuals are evacuating and cannot report in one hour. 24 hours should be more than adequate for after-the-fact reporting. o Fuel Supply Emergency, Loss of off-site power, and Loss of all monitoring or voice communication capability - see our General Comment above. Time to report should be 24 hours after occurrence is identified. o Forced intrusion, Risk to BES equipment, Detection of a cyber intrusion to critical cyber assets - time to report should be 24 hours after occurrence is identified, and critical cyber assets should be capitalized.

Organization	Yes or No	Question 10 Comment
Dynegy Inc.	No	A 2000 MW loss needs to be more clearly defined by either the BA, ISO, RC, etc. for the applicable enity.Also, what is the distinction between the "damage or destruction of BES equipment" and the generation loss of >= 2000 MWs if it is a Critical Asset which is currently drafted as those greater than 1500 MW in current draft of CIP-002-4. This could lead to 2 events with different thresholds (i.e. 1500 MW and 2000 MWs). Possibly get rid of the 2000MW criteria and let the threshhold level be the same as the Critical Asset MW level. Or remove the Critical Asset threshhold in the footnote to Attachment 1.
E.ON Climate & Renewables	No	1. Voltage deviation events are too vague for GOP. How does voltage deviations apply to GOP's or specifically renewables i.e., wind farms? 2. Define what an "entity" is. 3. Define what a "generating station" is. 4. Define what a "BES facility" is.6. Define what a control center is.
Electric Market Policy	No	1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable entity to report the event. This is duplicative and would appear to overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004.
ERCOT ISO	No	ERCOT ISO requests the reporting timeframes be changed to reflect a 24 hour requirement for all events in Attachment 1. During an impact event, operating personnel are generally involved in event resolution and not available immediately to submit reports. ERCOT ISO requests that the "Detection of a cyber intrusion to a

Organization	Yes or No	Question 10 Comment
		critical cyber asset" be removed. There are established processes defined for incident response supporting CIP-008. By including this element in Attachment 1, the Operating requirement R2 would also require procedure documents for cyber security incident response. This would be redundant and would remove the responsibility away from the subject matter experts for cyber security incident response.
Exelon	No	The listed Impact Events is lacking specific physical security related events. .In general, all impact events need to be as explicit as possible in threshold criteria to eliminate any interpretation on the part of a reporting entity. Ambiguity in what constitutes an "impact event" and what the definition of "occurrence" is will ultimately lead to confusion and differing interpretations.
FirstEnergy	No	1. The table in Att. 1 and the requirements should alleviate the potential for duplicate reporting. For example, If the RC submits a report regarding a Voltage deviation in its footprint, the report should be submitted by the RC on behalf of the RC, TOP, and GOP, and not require the TOP and GOP to submit duplicate reports.2. Regarding the "Note" before the table - We agree that under certain conditions it is not possible to issue a written report in a given time period. However, the ERO and RE should also be required to confirm receipt of the verbal communication in writing to prove that the entity communicated the event as these verbal notifications may be done by an entity using an unrecorded line.3. Organizations with many registered entities should be permitted to submit one report to cover multiple entities under one parent company name. We suggest this be made clear in the Tables, the reporting form, and in the requirements.4. Voltage Deviations Event - We suggest the team provide more clarity with regard to the types and locations of voltage deviations that constitute an event.5. Examples of BES Equipment in Part A of "Actual Reliability Impact" Table - Is the phrase "critical asset" referring to the CIP defined term? If so, this should be capitalized.6. Under the "Time to Submit Report" column of the table, we suggest that all of the phrases end in "after identification of the

Organization	Yes or No	Question 10 Comment
		occurrence".7. Frequency Trigger Limit (FTL) for the Frequency Deviation event should be replaced with the values the FTL represent. The FTL is part of the BAAL Standards which have not been approved by the industry and are not in effect. It is possible that these terms are not used by those not participating in the field trial of the BAAL standards.
Great River Energy	No	Comments: Please provide a phone number and provision within the Note of EOP-004 - Attachment 1: Impact Events table for an entity to contact NERC if unable to contact NERC within the time described.Voltage Deviations - recommend adding the word “(continuous)” after sustained in Threshold column. This could be interpreted as an aggregate value over any length of time.Frequency deviations - recommend adding the word “(continuous)” after 15 minutes’ in Threshold column. This could be interpreted as an aggregate value over any length of time.CIP-008 R1.3 states the entity is to report Cyber Security Incidents to the ES_ISAC. Does the EOP-004 Attachment 2 fulfill this requirement?We request clarification on the Transmission Loss threshold events that constitute reporting. We also want clarification on what constitutes the loss of a DC Converter station and is there a time duration that constitutes the need for reporting or does each trip need to be reported? For example during a commutation spike the DC line could be lost for less than a minute. Does this loss require a report to be submitted? Is the SDT stating that each time a company loses their DC line, they are required to file a report even though it may not have an effect on the bulk system? What is the threshold for this loss?The SDT needs to clarify that duplicative reporting is not required and that only one entity needs to report. For instance, the first three categories regarding energy emergencies could be interpreted to require the BA and RC to both report. The reporting responsibilities in this table should be clarified based on who has primary reporting responsibility for the task per the NERC Functional Model and require only one report. For instance, since balancing load, generation and interchange is the primary function of a BA per the NERC Functional Model, only the BA should be required to provide this report.The

Organization	Yes or No	Question 10 Comment
		term Frequency Trigger Limit (FTL) is not currently defined in the NERC Glossary. The term FTL needs to be introduced at the beginning of the standard and defined as a new term.
Indeck Energy Services	No	Loss of off-site power is important to more than just nuclear plants--but which ones? Control centers or other large generators. But not small generators! Should there be a common element to Attachment 1, like the potential to cause a Reportable Disturbance, or maybe there need to be multiple criteria like that.
Independent Electricity System Operator	No	We do not support the 1 hour reporting time frames for Emergency Energy, System Separation, unplanned Control Center evacuation, Loss of off-site power, Loss of monitoring or voice communication. Energy emergency is broadcast on the RCIS which also goes to the ERO so its explicit reporting is not necessary (System Operations please verify). During other events listed above, the responsible entities will likely be concentrating its effort in returning the system to a stable and reliable state. Reporting to anyone not having direct actions to control, mitigate and contain the disturbances is secondary to restoring the system to t a reliable state. Since these are after the fact reports for awareness and/or analysis and not for real-time responses, these can be reported at a later time, up to 24 hours after the initial occurrence without any detriment to reliability, or at the very earliest: up to 1 hour after the system has returned to a reliable state, or after the backup control centre is fully functional, or after backup power is restored to the nuclear power plant, or after monitoring or voice communication is restored.
IRC Standards Review Committee	No	We do not agree with the requirement to report “detection of a cyber intrusion to critical cyber assets” as this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. We suggest that physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.
ISO New England Inc.	No	1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable

Organization	Yes or No	Question 10 Comment
		entity to report the event. This is duplicative and would overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004.What are the examples at the bottom of page 14 supposed to illustrate? Critical Asset should have the appropriate capitalization as being a defined term. Is Critical Asset what is intended to be used here? Should the “a” list be read as ANDs or Ors? Does “loss of all monitoring communications” mean “loss of all BES monitoring “communications”? Does “loss of all voice communications” mean “loss of all BES voice communications?”Are the blue boxes footnotes or examples?Does “forced intrusion” mean “physical intrusion” (which is different from “cyber intrusion”)?Regarding “Risk to BES Equipment,” request clarification of “non-environmental”. Regarding the train derailment example, the mixture of BES equipment and facility is confusing. Request clarification for when the clock starts ticking.Regarding “Detection of a cyber intrusion to critical cyber assets”, there is concern that this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. Suggest physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.
Kansas City Power & Light	No	We agree with the event descriptions listed in Attachment 1 and the review and revision of the impact table by the ERO is appropriately addressed in R7 but the time periods allowed to complete the new, longer preliminary report is insufficient. The correlation of this with the timing of the reporting quarterly and annually or pushing information for other entities' situational awareness does not allow the registered entity adequate time to thoughtfully consider the event and proposed root cause.

Organization	Yes or No	Question 10 Comment
Luminant Energy	No	The Impact Events Table might be easier to clarify if organized by Reporting Entity rather than Event Type as events vary substantially based on the affected BES component. For example, a GO or GOP cannot adequately determine if an event will significantly affect the reliability margin of the system or if an event results in an IROL. Examples specific to Reporting Entities would assist in more appropriate report submissions. Additionally, the footnote under examples of Damage or Destruction of BES Equipment, cites “A critical asset”. This term must be clarified to indicate whether this refers to a Critical Asset as defined by CIP 002-1.Finally, the Fuel Supply Emergency item requires additional definitions as neither a GO nor a GOP can reasonably project if an individual fuel supply chain problem will result in the need for emergency actions by the RC or BA.
MidAmerican Energy	No	New vague criteria in Attachment one such as “damage to a BES element through and external cause” or “transmission loss of multiple BES elements which could mean two or more” is the opposite of clear standards writing or results based standards.
Midwest ISO Standards Collaborators	No	Several categories require duplicate reporting. For instance, the first three categories regarding energy emergencies could be interpreted to require the BA and RC to both report. The reporting responsibilities in this table should be clarified based on who has primary reporting responsibility for the task per the NERC Functional Model and require only one report. For instance, since balancing load, generation and interchange is the primary function of a BA per the NERC Functional Model, only the BA should be required to provide this report. As another option, perhaps the registered entity initiating the action should submit the report. If the BA did not take action and the RC had to direct the BA to take action, one could argue that perhaps the RC should submit the report then. However, if the BA takes action appropriately on their own, the BA should submit it. If the TOP reduces voltage for a capacity and energy emergency per a directive of the BA, then the

Organization	Yes or No	Question 10 Comment
		BA should report the event.
MRO's NERC Standards Review Subcommittee	No	Please provide a phone number and provision within the Note of EOP-004 - Attachment 1: Impact Events table for an entity to contact NERC if unable to contact NERC within the time described.Voltage Deviations - recommend adding the word “(continuous)” after sustained in Threshold column. This could be interpreted as an aggregate value over any length of time.Frequency deviations - recommend adding the word “(continuous)” after 15 minutes’ in Threshold column. This could be interpreted as an aggregate value over any length of time.CIP-008 R1.3 states the entity is to report Cyber Security Incidents to the ES_ISAC. Does the EOP-004 Attachment 2 fulfill this requirement?
Nebraska Public Power District	No	Since the reporting under this standard is for after the fact reporting, the minimum time to report should be the end of the next business day. The combination of the extremely short time periods to file a report and the amount of detail required in attachment 2 will lead to a reduction in the reliability of the BES. System Operators will be forced to take focus off their primary responsibility to respond to the event in order to complete the report within the required timeframe (within an hour for some events). During non-business hours the only personnel available to complete the reports will be those responsible for real-time operation of the BES. Since the background indicates this standard is only for after the fact reporting, the minimum required time to submit the report should be one business day to permit completion of the report without distracting from the real-time operation of the BES. Real-time reporting requirements are covered in other standards and should be to the Reliability Coordinator and from the Reliability Coordinator to NERC. For after the fact reporting, there is absolutely no reliability benefit for requiring reporting to be completed on such a short timeframe. This is especially true due to the amount of data required by Attachment 2.

Organization	Yes or No	Question 10 Comment
NERC Staff	No	The SDT should clarify its use of the term “critical asset” in the Examples section under Part A of the table. The term or versions of the term are used in different contexts in the NERC Reliability Standards. For instance, in CIP-002-1, Requirement 1, the Critical Asset Identification Method is used to identify its critical assets. In EOP-008-0, Requirement 1.3, the applicable entity is required to list its “critical facilities” in its contingency plan for the loss of control center functionality. The team should confirm what it is referring to in this proposed standard. To avoid confusion, the SDT may want to consider using a different term here or better clarify its meaning. Further, there exists the potential to have disparate reporting criteria in this proposed standard relative to the criteria being proposed by the Events Analysis Working Group as part of the Events Analysis Process document dated October 1, 2010. In particular, the following areas should be reconciled between the drafting team and the EAWG to ensure a consistent set of threshold criteria:Voltage Deviations --EOP-004-2: Greater than or equal to 15 minutes --EAWG Process: Greater than or equal to 5 minutesSystem Separation (Islanding) --EOP-004-2: Greater than or equal to 100 MW --EAWG Process: Greater than or equal to 1000 MWsSystem Separation (Islanding) --EOP-004-2: Does not address intentional islanding as in the case of Alberta, Florida, New Brunswick--EAWG Process: Addresses intentional islanding as in the case of Alberta, Florida, New BrunswickSPS/RAS --EOP-004-2: Does not expressly address proper SPS/RAS operations or failure, degradation, or misoperation of SPS/RAS --EAWG Process: Expressly addresses proper SPS/RAS operations or failure, degradation, or misoperation of SPS/RASTransmission Loss --EOP-004-2: Identifies Multiple BES transmission elements --EAWG Process: Provides specificity in Category 1a and 1b regarding transmission eventsDamage or destruction of BES equipment --EOP-004-2: Through operational error, equipment failure, or external cause but not linked to loss of load--EAWG Process: Identifies in Category 2h equipment failures linked to loss of firm system demandsForced intrusion--EOP-004-2: Addressed --EAWG Process: Not addressedRisk to BES equipment --EOP-004-2: Addressed --EAWG Process: Not addressedDetection of a cyber intrusion to critical cyber assets --EOP-004-2: Addressed --

Organization	Yes or No	Question 10 Comment
		EAWG Process: Not addressed
North Carolina Electric Coops	No	This list is too similar and redundant to the DOE requirements and does not provide any additional clarity on recognition of sabotage.
Northeast Power Coordinating Council	No	1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable entity to report the event. This is duplicative and would overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004.What are the examples at the bottom of page 14 supposed to illustrate? Critical Asset should have the appropriate capitalization as being a defined term. Is Critical Asset what is intended to be used here? Should the "a" list be read as ANDs or Ors? Does "loss of all monitoring communications" mean "loss of all BES monitoring "communications"? Does "loss of all voice communications" mean "loss of all BES voice communications?"Are the blue boxes footnotes or examples?Does "forced intrusion" mean "physical intrusion" (which is different from "cyber intrusion")?Regarding "Risk to BES Equipment," request clarification of "non-environmental". Regarding the train derailment example, the mixture of BES equipment and facility is confusing. Request clarification for when the clock starts ticking.Regarding "Detection of a cyber intrusion to critical cyber assets", there is concern that this creates a double jeopardy situation between CIP-008 and EOP-004-2 R2.6. Suggest physical incident reporting be part of EOP-004 and cyber security reporting be part of CIP-008.

Organization	Yes or No	Question 10 Comment
Pacific Northwest Small Public Power Utility Comment Group	No	Footnote 1 is missing from Part A, although it is referenced in column 1 row 11. Is this the Examples? The purpose of the Examples is unclear. Is it meant to limit the scope to those enumerated? This is not stated, but if not it should be removed since it adds confusion. What is meant by non-environmental? All external causes of damage or destruction come from the environment by definition. Please specify what is intended or remove the word.
PacifiCorp	No	Energy Emergency requiring firm load shedding - An SPS/RAS could operate shedding firm load but no Energy Emergency may exist. This requires clarification.Transmission Loss - Multiple BES transmission elements. Loss of two transmission lines in the same corridor due to a wildfire could qualify for this reporting. Once again clarification needed.
Pepco Holdings, Inc - Affiliates	No	Some items with one hour reporting (such as Unplanned Control Center evacuation) may be so disruptive to operations that one hour is too short. 4 hours suggested.
PPL Electric Utilities	No	While we think providing an impact event list is beneficial, we would like to see Attachment 1 revised and/or clarified. Refer to response to Question 2 considering duplicate reporting. Regarding impact event ‘Damage or destruction of BES equipment’ and considering the first example in the ‘Examples’ section, does ‘example a. i.’ mean if the BES equipment that is damaged is not identified as a critical asset per CIP-002 that no reporting is required? Clarify the Part A and Part B, specifically:Attachment 1 Part A is labeled ‘Actual Reliability Impact’. Does this title mean that for all events listed that the ‘threshold for reporting’ is only met if the event occurs AND there is an actual reliability impact? As opposed to Part B where the threshold for reporting is met when the event occurs and there is a potential for reliability impact? This could be broad for event ‘risk to BES equipment’. Providing as much clarity as possible on the ‘threshold for reporting’ is

Organization	Yes or No	Question 10 Comment
		beneficial to the industry and will help eliminate confusion with the existing CIP-001 standard regarding ‘potential sabotage’.
PPL Supply	No	Attachment 1 Part A is labeled "Actual Reliability Impact". Does this title mean that for all events listed the "threshold for reporting" is only met if the event occurs AND there is an actual reliability impact? As opposed to Part B where the threshold for reporting is met when the event occurs and there is a potential for reliability impact? This could be broad for events like "Risk to BES equipment."
PSEG Companies	No	For many items, there are multiple entities listed with reporting obligations. For example, loss of off-site power to a nuclear plant lists RC, BA, TOP, TO, GO and GOP. This appears to result in the potential for the sending of 6 separate reports within the hour for the same event, which in wide area disturbances overload the recipients. The drafting team should consider revising the lists where possible to a single, or absolute minimum number, entity.Those items reportable OE-417 should be removed from Attachment 1. For example, voltage reduction, loss of load for greater than 15 minutes.The trigger for voltage reduction should be the time of issuance of the directive to reduce voltage in an emergency, not when "identified."
Puget Sound Energy	No	The proposed standard does not adequately ensure that the impact events subject to its requirements are limited to those listed in Attachment 1. In order to ensure that this is true, the term “impact event” should be a defined term and that definition should clearly limit impact events to those listed in Attachment 1.
Santee Cooper	No	The SDT should review the list of events closely to determine if the defined events actually impact the BES. (For example: Is shedding 100 MW of firm load really a threat to the BES?)
SERC OC Standards Review	No	Will all reporting requirements be removed from other standards to avoid duplication? And will all future

Organization	Yes or No	Question 10 Comment
Group		standard revisions include revisions to this standard to incorporate associated reporting requirements?There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
Southern Company - Transmission	No	The time to submit report column needs to be more flexible with time frames. The Entity with Reporting Responsibility column needs to be more descriptive in which there are multiple entitles with hierarchy reporting.
United Illuminating	No	UI agrees but the listing needs to be improved for clarity in certain instances. For example,EOP-004 Attachment 1 Part A - Example iii - uses the phrase “significantly affects the reliability margin of the system.” Significantly is an immeasurable concept and does not provide guidance to the Entity. The phrase “reliability margin” is not defined and is open to interpretation. Perhaps utilize “resource adequacy”, if that is all that intended, or use “adequate level of reliability”.
US Bureau of Reclamation	No	The Attachment is very vague and without modification creates a Pseudo definition of BES equipment in the example provided. The example now indicates that something is BES equipment if it is "Damaged or destroyed due to a non-environmental external cause". Perhaps the example should be reworded to "BES equipment whose operation effects or causes:" and then adjust each of the line items to clarify what was intended. Next, the Attachment A example redefines reportable levels for Risk to BES Equipment - From a non-environmental physical threat as "Report copper theft from BES equipment only if it degrades the ability of equipment to operate correctly". Who makes that determination? Not all events will be known within 24 hours. As example, Risk to BES Equipment - From a non-environmental physical threat may not be known until more thorough examination or investigation takes place. Also the reportable level appears to be defined by the Entity. While agree with that, we will end up with the same criticism from FERC when the level is set to

Organization	Yes or No	Question 10 Comment
		"high" in FERC's mind. The reporting times are unrealistic for complicated events. Notification is reasonable but not reporting. Many organizations's have internal processes the reports must be vetted through before they become public and subject to compliance scrutiny.
We Energies	No	I did not compare this standard to the OE-417 form. Please do not require operators to fill out a second form during an emergency within one hour.Energy Emergency requiring Public appeal...: "Public " is not a defined term.Energy Emergency requiring system-wide voltage...: DP does not control BES voltage.Energy Emergency requiring firm load shed...: TOP does not have load it would shed for an Energy Emergency.Frequency Deviations: Why is a BA reporting? This will be every BA in the Interconnection reporting the same Frequency Deviation.Frequency Deviations: Frequency Trigger Limit is not a defined term, and is not defined in this standard.Loss of Firm Load...: TO and TOP may coordinate or direct load shed, but they do not serve firm load.Damage or destruction of BES... There is no footnote 1 on this page. I assume it is the examples on the page. Are these "examples" of a larger set or are these all that is required? Critical Asset is a defined term.Forced Intrusion: "facility" or Facility? An RC and BA do not have Facilities.
Georgia System Operations Corporation	Yes	We support the concept of Impact Events and listing and describing them in a table. However, we have some concerns.Reporting of impact events should not be applicable to a DP.The timelines outlined in Attachment 1 should be targets to try to meet but it should not be a compliance violation of the reporting requirement if it is not met. Regarding the NOTE before the table, verbal reports and updates should be allowed for other than certain adverse conditions like severe weather as well as adverse conditions. The first priority for all entities should be addressing the effects of the impact event. It may not be possible to assess the damage or the cause of an impact event in the allotted time. All entities should make their best effort to quickly report under any circumstances what they know about the event even if it is not complete. They should be allowed to

Organization	Yes or No	Question 10 Comment
		report up through a hierarchy. The written report should not be issued until adequate information is available. Change "Preliminary Impact Event Report" to "Confidential Impact Event Report."Capitalization throughout this table is inconsistent. Sometimes an event is all capitalized. Sometimes not. It is not in synch with the NERC Glossary. All terms that remain capitalized in the next draft (other than when used as a title or heading) should be defined in the Glossary of Terms Used in NERC Reliability Standards. Examples of inconsistencies: Unplanned Control Center evacuation, Loss of off-site power, Voltage Deviations.-Energy Emergency requiring a public appeal or a system-wide voltage reduction: All The NERC Glossary defines Energy Emergency as a condition when a LSE has exhausted all other options and can no longer provide its customers' expected energy requirements. The events should not be described as an Energy Emergency requiring public appeal or system-wide voltage reductions. If public appeal and system-wide voltage reductions are still an option then all options have not been exhausted, the LSE can still provide its customers' energy requirements, and it is not an Energy Emergency. We suggest using "Energy Emergency Alert" rather than "Energy Emergency."-Energy Emergency requiring firm load shedding: load shedding via automatic UFLS or UVLS would not necessarily be due to an Energy Emergency. Other events could cause frequency or voltage to trigger a load shed. Most likely an entity would be seeing the Energy Emergency coming and would be using manual load shedding. -Forced intrusion and detection of cyber intrusion to critical cyber assets: CIP-008 is not referrenced for a forced intrusion. CIP-008 is referenced for a detection of cyber intrusion impact event. Aren't there reportable events per CIP-008 that involve physical intrusion that are not intrusions at a BES facility?-Risk to BES equipment: The threshold states that it is for a non-environmental threat but the examples given are environmental threats. Please clarify.
Manitoba Hydro	Yes	Though R7 indicated Attachment 1 will be reviewed and revised reguarily the immediate addition of:”Detection of suspected or actual or acts or threats of physical sabotage”should be added.

Organization	Yes or No	Question 10 Comment
City of Austin dba Austin Energy	Yes

PNM Resources	Yes	
RRI Energy, Inc.	Yes	
TransAlta Corporation	Yes	

11. Do you agree with the use of the Preliminary Impact Event Report (Attachment 2)? Please explain in the comment box below.

Summary Consideration: Most commenters who responded to this question disagreed with some aspect of the Preliminary Impact Event Report. The proposed Preliminary Impact Event Report (Attachment 2) generated comments regarding the duplicative nature of the form when compared to the OE-417. The DSR SDT has added language to the proposed form to clarify that NERC will accept a DOE OE-417 form in lieu of Attachment 2 if the responsible entity is required to submit an OE-417 form.

In collaboration with the NERC Event Analysis Working Group (EAWG) the DSR SDT proposes to modify the attachment to eliminate confusion. This revised form will be used as Attachment 2 of the Standard and is the only required information for EOP-004-2 reporting. Further information may be requested through Events Analysis Process (NERC Rules of Procedure), but this information is outside of the scope of EOP-004.

The DSR SDT has also clarified what the form is to be used for with the following language added:

> "This form is to be used to report impact events to the ERO."

Organization	Yes or No	Question 11 Comment
City of Austin dba Austin Energy		Austin Energy would like to see OE-417 incorporated into the electronic form This will reduce the callout of EOP-004-2 and OE-417 forms in our checklists / documents and one form can be submitted to NERC and DOE.
Independent Electricity System Operator		TBD
Ameren	No	It is unclear when this should be used, or why.

Organization	Yes or No	Question 11 Comment
ATC	No	No. NERC does not have the authority to absolve the Functional Entities of the reporting obligations for the DOE Form OE-417. Therefore, there will be duplicate reporting requirements and the one hour timeframes required in Attachment 1 will take valuable resources away from mitigating the event to filling out duplicative paperwork. It is ATC's position that the OE-417 report be used as the main reporting template until NERC and the DOE can develop a single reporting template. Task #14 in the report should be modified to say, "Identify any known protection system misoperation(s)." If this report is to be filed within 24 hrs, there will not be enough time to assess all operations to determine any misoperation. As a case in point, it typically takes at least 24 hrs to receive final lightning data; therefore, not all data is available to make a determination.
ATCO Electric Ltd.	No	Attachment 2 Item 4 implies that an entity is required to analyse and report on an impact event that occurred outside its system. This is not practical as the entity will not have access to the necessary information.
BGE	No	There is considerable difference between this form and OE-417 necessitating that two forms be completed. BGE believes that the purpose of combining the standards was to reduce the number of reporting entities and number of reports to be generated by each entity. BGE believes this fails to accomplish this purpose.
City of Garland	No	The report filed should be the OE-417 ELECTRIC EMERGENCY INCIDENT AND DISTURBANCE REPORT and should be filed only on OE-417 reportable incidents. If this report is implemented as drafted, companies with multiple registration numbers and functions should only have to file one report for all functions and registrations.
Consolidated Edison Co. of NY, Inc.	No	It is not clear why the DOE form cannot be used. NERC should make every effort to minimize paper work for entities responding to system events.
Constellation Power Generation and Constellation Commodities Group	No	It is unclear if an entity has to answer all the questions. In addition, "Preliminary" is not currently included in the report title.
Electric Market Policy	No	There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.
ERCOT ISO	No	ERCOT ISO requests the use of a single report format to meet all requirements from NERC and DOE. There is no value added in requiring different reporting to different agencies.

Organization	Yes or No	Question 11 Comment
Exelon	No	Exelon agrees with the use of the report but feels that # 5 should consist of check boxes. #12, 13, and 14 will take more time then allotted by the reporting requirements to acquire, cannot be accomplished in an hour.Attachment 2 should have a provision for the reporting entity to enter (N/A) based on function (see below)Check box #8 A GO/GOP may not have the information to determine what the frequency was prior to or immediately after an impact event. This information should be the responsibility of a TOP or RC.Check box #9A GO/GOP may not have the information to determine what transmission facilities tripped and locked out. This information should be the responsibility of a TO, TOP or RC.Check box #10A GO/GOP may not have the information to determine the number of affected customers or the demand lost (MW-Minutes). This information should be the responsibility of a TO, TOP, or RC.
Great River Energy	No	NERC and the DOE need to coordinate and decide on which report they want to use and whichever report it is needs to include all information required by both entities. The way this standard is currently written there is the potential that two government entities may need to be reported to is a relatively short period of time. It is not clear what benefit providing the Compliance Registration ID number provides. Many of the registered entities employees that will likely have to submit the report, particularly given the one-hour reporting requirement for some impact events, will not be aware of this registration ID. However, they will know for what functions they are registered. We recommend removing the need to enter this compliance registration ID or extending the time frame for reporting to allow back office personnel to complete the form. For item two, please change “Time/Zone:” with “Time (include time zone)”. As written it is a little confusing.
Idaho Power Company	No	there should only be on report, utilized OE-417
Indeck Energy Services	No	The form needs to identify whether it is a preliminary or final report. An identifier should be created to tie the final to the preliminary one. Some fields, 1,2 3 5 & 6, are required for the preliminary report and should be labeled as such. With the 1 hour reporting deadline for some events, the details may not be known. 12 & 13 should be required for the final report. 13 should designate whether the cause is preliminary or final. 7-11 & 14 are optional, and the form should state this, and based on some types of events. It's confusing to have irrelevant blanks on the form.
IRC Standards Review Committee	No	Attachment 2 is not referenced in the standard requirements. Is it a part of the standard that an entity must use to file the impact event reports to a specific recipient. If so, this needs to be referenced in the standard.We question the need for using a fixed format for reports that vary from “shedding firm load” to “damaging equipment”. The nature of impact events varies from one event to another and hence a fixed format or pre-determined form may not be able to provide the appropriate template that is suitable for use for

Organization	Yes or No	Question 11 Comment
		all events. We urge the SDT to reconsider the use of Attachment 2 for reporting events, with due consideration to the actual intent of the standard (as pointed out in our comments under Q1).
ISO New England Inc.	No	There is already a DOE requirement to report certain events. There is no need to develop redundant reporting requirements to NERC that cross other federal agency jurisdictions.The heading on page 16 refers to EOP-002, but this is Standard EOP-004. If some questions do not require an answer all of the time, then the form should state that or provide a NA checkbox. While Attachment 1 details some cyber thresholds, Attachment 2 provides no means to report - which is acceptable if cyber incidents are handled by CIP-008 per the comment provided for Question 10.The Event Report Template in Appendix A is different from the most recent version, which is available at: http://www.nerc.com/docs/eawg/Event_Analysis_Process_WORKINGDRAFT_100110-Clean.pdf
Kansas City Power & Light	No	For easier classification and analysis of events for both external reporting to the ERO and internal reporting for the applicable entity, the form should include Event Type. The DSR SDT should code each event type and include the codes as part of Attachment 1.
Manitoba Hydro	No	Though a “Confidential Impact Event Report” is much needed the Attachment 2 needs refinement.Provide an explanation for each “task”.Isolate and simplify the “Who, When and What” section.Isolate the description of event.Remove items 7 to 10. Modify Attachment 1, add columns to indicate time of event, quantity, restore time, etc as required. The Attachment 1 can be attached to Attachment 2. This could simply and speed the reporting process.
MidAmerican Energy	No	
Midwest ISO Standards Collaborators	No	This form differs from the DOE reporting forms. We do not believe different reporting forms should be required. The DOE form should be sufficient for NERC reporting.It is not clear what benefit providing the Compliance Registration ID number provides. Many of the registered entities employees that will likely have to submit the report, particularly given the one-hour reporting requirement for some impact events, will not be aware of this registration ID. However, they will know for what functions they are registered. We recommend removing the need to enter this compliance registration ID or extending the time frame for reporting to allow back office personnel to complete the form. For item two, please change “Time/Zone:” with “Time (include time zone)”. As written it is a little confusing.

Organization	Yes or No	Question 11 Comment
MRO's NERC Standards Review Subcommittee	No	Number 4 of the reporting form does not take into consideration of potential impact events. Recommend that "Did the impact event originate in your system?" to "Did the impact event originate or affect your system?". This will provide clarity to entities.
Nebraska Public Power District	No	If the standard requires submission of the report within an hour (which is not appropriate), there must be an abbreviated form that can be quickly filled out by checking boxes and not require substantial narrative. The existing form has too much free form text that takes time to enter and with the short timeframe for reporting will distract the entities responsible for real-time reliabiltiy of the BES from that task by forcing them to complete after the fact reports. It is unrealistic to expect entities to staff personnel to complete the reporting 24 x 7 for unlikely events, so the task will fall to System Operators who should be focusing on operating the BES at the time of these events instead of providing after the fact reporting to entities that do not have responsibility for real-time operation of the BES. Real-time reporting to the RC and/or BA is covered under other standards and is necessary for the RC to have situational awareness, but is not covered under this standard. The registered entities may report to the proper law enforcement entities when the situation warrants, but again this form is not the appropriate way to handle that reporting requirement.
NERC Staff	No	Item 15: A one-line diagram should be attached to assist in the understanding and evaluation of the event.Two additional items are recommended:--Ongoing reliability impacts/system vulnerability - this would capture areas where one is not able to meet operating reserves or is in an overload condition, below voltage limits, etc. in real-time--Reliability impacts with next contingency - this would capture potential impacts as outlined above with the next contingency.
North Carolina Electric Coops	No	There is already a DOE requirement to report certain events. NERC should not be developing redundant reporting requirements when this information is already available at the federal level from other agencies.
Northeast Power Coordinating Council	No	There is already a DOE requirement to report certain events. There is no need to develop redundant reporting requirements to NERC that cross other federal agency jurisdictions.The heading on page 16 refers to EOP-002, but this is Standard EOP-004. If some questions do not require an answer all of the time, then the form should state that or provide a NA checkbox. While Attachment 1 details some cyber thresholds, Attachment 2 provides no means to report - which is acceptable if cyber incidents are handled by CIP-008 per the comment provided for Question 10.The Event Report Template in Appendix A is different from the most recent version, which is available at: http://www.nerc.com/docs/eawg/Event_Analysis_Process_WORKINGDRAFT_100110-Clean.pdf

Organization	Yes or No	Question 11 Comment
Pacific Gas and Electric Company	No	PG&E believes the report is duplicative to the OE-417 reporting criteria.
Pacific Northwest Small Public Power Utility Comment Group	No	We found no “Preliminary Impact Event Report” in the posted draft standard, so we assume the question is regarding the “Confidential Impact Report” (Attachment 2). It is unclear what role the form plays, since no requirement refers to it. If this is the form to report impact events per R6, then R6 should reference it. The comment group cautions that the use of the word “confidential” should be carefully considered, since many filled out forms that originally contained the word are now posted on the NERC website for all to see. If there are limits to the extent and/or duration of the confidentiality this should be clearly stated in the form, or the word should be avoided.Protection System misoperation reporting is already covered by PRC-004. Including it here is redundant, and doubly jeopardizes an entity for the same event.
PacifiCorp	No	As previously mentioned all effort should be made to ensure duplicate reporting is not required. OE-417 requirements should be covered by this one form.
Pepco Holdings, Inc - Affiliates	No	The list of events misses many items considered as suspicious or potential sabotage, such as suspicious observation of critical facilities.
PNM Resources	No	PNM believes the report is duplicative to the OE-417 reporting criteria.
PSEG Companies	No	The top of this form should have the following statement added: "This form is not required if OE-417 is required to be filed."
Puget Sound Energy	No	Attachment 2 is not referenced in the requirements of the proposed standard. As a result, it is not clear when its submission would be required.
Santee Cooper	No	If the DOE form is going to continue to be required by DOE, then NERC should accept this form. Entities do not have time to fill out duplicate forms within the time limits allowed for an event. This is burdensome on an entity.
SERC OC Standards Review Group	No	There is already a DOE requirement to report certain events. We see no need to develop redundant reporting requirements in the NERC arena that cross other federal agency jurisdictions.

Organization	Yes or No	Question 11 Comment
TransAlta Corporation	No	We recommend the 'time to Submit Report' to start when the event is recognized verses when it occurred.
United Illuminating	No	The standard does not appear to require the use of Attachment 2. Placing the form within the Standard may require the use of the Standards Development Process to modify the form. UI suggests the form is maintained outside the Standard to allow it to be adjusted. UI would prefer NERC to establish an internet based reporting tool to convey the initial reports.
US Bureau of Reclamation	No	There is already a reporting form for disturbances. The SDT should reconcile this standard with all the other reporting that is being requested and not add more.
We Energies	No	The data required to assess an impact event thoroughly will often not be available or apparent. Immediate reporting should fall to the RE with assistance/information from the affected entities.There do not seem to be provisions for when it is impossible to take the time to fill out a form or when it is impossible to send a form.I did not compare this standard to the OE-417 form. Please do not require operators to fill out a second form during an emergency within one hour.
WECC	No	The report is duplicative to the OE-417 reporting criteria.
Bonneville Power Administration	Yes	Item 8: list Hz minimum on the second line prior to Hz max since that is the typical frequency excursion order.The Operating Plan is going to have to include the Compliance Registration ID number, since Operating Personnel don't carry that information around and it is not readily available.
Duke Energy	Yes	However, Attachment 2 is titled "Impact Event Reporting Form".
E.ON Climate & Renewables	Yes	Suggestions on the form: if an entity has not had time to fully determine the cause of an Impact Event such as for "Question # 4: Did the impact event originate in your system, yes or no?", perhaps more time is needed that 24 hours to determine the cause.
FirstEnergy	Yes	Although we agree with the report, it should be clear that organizations with many registered entities can submit one report to cover multiple entities under one parent company.
Georgia System Operations	Yes	We support having one form for reporting however every applicable entity should not be required to fill it out and send it to NERC. See previous comments about hierarchical reporting.The title of the report is

Organization	Yes or No	Question 11 Comment
Corporation		"Confidential Impact Event Report." Some suggested modifications: The form could have a blank added to enter the event "description" as described in the first column of Attachment 1. The first seven lines contain information that would most likely be filled out every time. The other lines except line 13 may or may not be applicable every time. It is required (R3) for an entity to access the initial probable cause of all impact events so line 13 will most likely be filled out every time. Please move the probable cause line up to line 7 or 8 (depending on if the event description line is added).
PPL Electric Utilities	Yes	For ease, timeliness, and accuracy of reporting an application with an easy to use interface would be preferred. If the reporting is done via an application, the ability to enter partial data, save and add additional info prior to submission would be helpful. Additionally, an application with drop downs to select from for impact event, NERC function, etc would be helpful. #1 - Is the 'Compliance Registration ID number' the same as the NCR number? If this is required, include as separate entry. #2 - is this the date of occurrence or detection?
Arizona Public Service Company	Yes	
Dynegy Inc.	Yes	
Green Country Energy	Yes	
Luminant Energy	Yes	
PacifiCorp	Yes	
PPL Supply	Yes	

Organization	Yes or No	Question 11 Comment
RRI Energy, Inc.	Yes	
Southern Company - Transmission	Yes	

12. The DSR SDT has replaced the terms “disturbance” and “sabotage” with the term “impact events”. Do you agree that the term “impact events” adequately replaces the terms “disturbance” and “sabotage” and addresses the FERC directive to “further define sabotage” in an equally efficient and effective manner? Please explain in the comment box below.

Summary Consideration: There was no consensus amongst commenters who responded to this question. Several commenters expressed concern that the definition should be added to the glossary. The DSR SDT has proposed a definition for “Impact Events” to support Attachment 1 as follows:

> “An Impact Event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.”

The DSR SDT has proposed this definition for inclusion in the NERC Glossary for “Impact Event”. The types of Impact Events that are required to be reported are contained within Attachment 1. Only these events are required to be reported under this Standard.

Several commenters expressed concern that the team did not define ‘Sabotage’ and FERC directed that the modifications to this standard include a definition of sabotage. The DSR SDT considered the FERC directive to “further define sabotage” and decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This will result in further ambiguity with respect to reporting events. The term “sabotage” is no longer included in the standard and therefore it is inappropriate to attempt to define it. The Impact Events listed in Attachment 1 provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive.

Some commenters were concerned that some of the events that require reporting that were specifically listed in the previous version of the standard are not included in the revised standard. Attachment 1, Part A is to be used for those actions that have impacted the electric system and in particular the section “Damage or destruction to equipment” clearly defines that all equipment that intentional or non intentional human error be reported. Attachment 1, Part B covers the similar items but the action has not fully occurred but may cause a risk to the electric system and is required to be reported.

Organization	Yes or No	Question 12 Comment
Bonneville Power Administration		The definition of an impact event in EOP-004-2 seems clear, however the term "mis-operation" still may imply intent in the action of an individual. The SDT should consider further defining that term.
Independent Electricity System Operator		We do not have a view on what name is assigned to the reportable events for so long they are listed in Attachment 1. However, the heading of the Table contains the words “Actual Reliability Impact”, which does not accurately reflect the content inside the table and which may introduce confusion with the term “impact event”. We suggest to change them to “Reportable Impact Events”.As we read the Summary of Concept and Assumption, there appears to be a slightly different lists at the bottom of P. 21. With these events included, the meaning of “impact event” would seem to be too broad. Rather than calling those events listed in Attachment 1 “impact events”, why not simply call them “reportable events”?
CenterPoint Energy	No	CenterPoint Energy does not agree that the term “impact event” adequately replaces “disturbances” and “sabotage”. CenterPoint Energy suggests that just as the SDT has come to consensus on a concept for impact event, a definition could be derived for sabotage. “Potential”, as used in the SDT’s concept, is a vague term and indicates an occurrence that hasn’t happened. Required reporting should be limited to actual events. CenterPoint Energy offers the following definition of “sabotage”: “An actual or attempted act that intentionally disrupts the reliable operation of the BES or results in damage to, destruction or misuse of BES facilities that result in large scale customer outages (i.e. 300MW or more).”
City of Garland	No	1 In keeping with a Results Based Standard, the impact event should be a trigger for filing a report. At the time of the event, one may not know if the event was caused by sabotage. Sabotage that does not affect the BES should not be a reportable event. 2. To comply with the Commissioners request to define sabotage, Impact Event does not adequately replace “sabotage”. If someone reports sabotage, people universally have a concept that someone(s) have taken some type of action to purposely harm, disable, cripple, etc something. Impact Event does not convey that same concept. 3. If Sabotage is left as a “trigger,” it should not include minor acts of vandalism but only acts that impact reliability of the BES
Consolidated Edison Co. of NY, Inc.	No	The definition is open for interpretation beyond events identified in Attachment 1. In addition, all Standards are supposed to have Rationales. In the Draft Standard, the Rationales do not address the concept of Potential, and how it relates to an actual system event. Additional work needs to be done addressing the

Organization	Yes or No	Question 12 Comment
		meaning of “potential”.
Duke Energy	No	We disagree with the stated concept of “impact event”. Including the phrase “or has the potential to significantly impact” in the concept makes it impossibly broad for practical application and compliance. By not attempting to define “sabotage”, the standard creates a broad reporting requirement. “Disturbance” is already adequately defined. “Sabotage” should be defined as “the malicious destruction of, or damage to assets of the electric industry, with the intention of disrupting or adversely affecting the reliability of the electric grid for the purposes of weakening the critical infrastructure of our nation.”
Dynegy Inc.	No	The term is fine but FERC wants more specific examples. GO/GOP can't determine the effect on the BES.
E.ON Climate & Renewables	No	Acts of Sabotage is still not defined and if the registered entities are required to reports acts of sabotage, NERC still needs to define this further.
ERCOT ISO	No	
Exelon	No	Need to better define sabotage and provide examples, the term “impact events” create confusions as to what constitutes an event. The definition of impact event is vague and needs to be quantified or qualified with a term such as “significant”. Otherwise, almost any event could be deemed to be an impact event. Attachment 1 needs to clearly define that damage or destruction of BES equipment does not include cyber sabotage. Events related to cyber sabotage are reported in accordance with CIP-008, "Cyber Security - Incident Reporting and Response Planning," and therefore any type of event that is cyber initiated should be removed from this Standard. In general, all impact events need to be as explicit as possible in threshold criteria to eliminate any interpretation on the part of a reporting entity. Ambiguity in what constitutes an "impact event" and what the definition of "occurrence" is will ultimately lead to confusion and differing interpretations.
FirstEnergy	No	For the most part we support this definition of impact events. However, we have the following suggestions:1. We believe that it warrants an official NERC glossary definition. 2. The term "potential" in the definition should point to the specific events detailed in Attachment 1 Part B.3. Since the standard does not cover environmental events, the phrase "environmental conditions" in the definition is not an impact event in the context of this standard.

Organization	Yes or No	Question 12 Comment
Great River Energy	No	We believe the SAR scope regarding addressing sabotage has not been addressed at all. It appears that impact event essentially replaces sabotage. This standard needs to make it clear that sabotage, in some cases, cannot be identified until an investigation is performed by the appropriate policing agencies such as the FBI. Intent plays an important role in determining sabotage and only these agencies are equipped to make these assessments.
Green Country Energy	No	Yes and no ... Yes impact events is an adequate term however since it is restrained by the tables it may be helpful to define the term and scope of the term to be more inclusive of sabotage events.
Indeck Energy Services	No	Impact Events is OK. It needs to be balloted as a definition for the Glossary like Protection System.
IRC Standards Review Committee	No	This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement's and other specialized agencies', including international agencies', role in defining acts of sabotage and not hold the registered entity wholly responsible to do so.
ISO New England Inc.	No	The use of the term "impact events" has simply replaced the terms "disturbance" and "sabotage", and has not further defined sabotage as directed by FERC. We do feel that "impact events" needs to be a defined term. While we agree with the SDT's new direction, the FERC directive has not been met. This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement and other specialized agencies, including international agencies roles in defining acts of sabotage, and not hold the registered entity wholly responsible to do so.
Luminant Energy	No	The term "Impact Event" does not adequately replace the term "Sabotage" The Impact Events table seems to provide the definition of the term "Impact Event". This table does not include sufficient definition for actual sabotage events. Additionally, it does not include any provision for suspected sabotage events. Assuming the Damage or Destruction of BES Equipment event type is intended to cover actual sabotage, the Threshold for Reporting column should include specific levels of materiality that are specific to Functional Entity. For instance, a GO and GOP could have a MW level to define materiality as a GO or GOP cannot assess impact to an IROL or system reliability margin due to equipment damage. A threshold value consistent with "Generation Loss" in the proposed EOP-004 Attachment 1 would be appropriate.
Manitoba Hydro	No	The majority of the items listed in Attachment 1 are typically and historically operating events. Yes these are all "impact events". Sabotage, cyber and security are typically viewed as separate events. These events are

Organization	Yes or No	Question 12 Comment
		not part of “a typical day of BES operations”. These are outside event and though qualify as “impact events” should still be treated separately.
Midwest ISO Standards Collaborators	No	We believe the SAR scope regarding addressing sabotage has not been addressed at all. It appears that impact event essentially replaces sabotage. This standard needs to make it clear that sabotage, in some cases, cannot be identified until an investigation is performed by the appropriate policing agencies such as the FBI. Intent plays an important role in determining sabotage and only these agencies are equipped to make these assessments.
NERC Staff	No	NERC staff is concerned with the ambiguity of the term “impact event.” The definition of the term is not clear, in part because it includes using the words “impact” and “event” (and thus violates the frowned-up practice of using a word to define the word itself). NERC staff recommends the SDT consider using the term “Event.” The following definition (modified from the one used the INPO Human Performance Fundamentals Desk Reference, P. 11) would apply: Event: “An unwanted, undesirable change in the state of plants, systems or components that leads to undesirable consequences to the safe and reliable operation of the Bulk Electric System. ”Supporting statement following the definition: “An event is often driven by deficiencies in barriers and defenses, latent organizational weaknesses and conditions, errors in human performance and factors, and equipment design or maintenance issues.” Further, if this is intended for use in this standard, it should be presented as an addition to Glossary to avoid confusion with the use of the term event in other standards. Of course, this would require an analysis of how the term “Event” as defined herein would affect the other standards to which the term is used. In the end, this is the cleanest manner for the standards.
Northeast Power Coordinating Council	No	The use of the term “impact events” has simply replaced the terms “disturbance” and “sabotage”, and has not further defined sabotage as directed by FERC. We do feel that “impact events” needs to be a defined term.While we agree with the SDT’s new direction, the FERC directive has not been met.This term and the FERC directive do not recognize limitations in what a registered entity can do to determine whether an act of sabotage has been committed. This term should recognize law enforcement and other specialized agencies, including international agencies roles in defining acts of sabotage, and not hold the registered entity wholly responsible to do so.
Pacific Gas and Electric Company	No	PG&E believes Attachment 1 Part A or B do not clearing specify “sabotage” events, other than “forced entry” and the proposed definition of “impact event” does not meet FERC’s directive to “further define sabotage” nor does it take into consideration their request to address the applicability to smaller entities.
Pacific Northwest Small Public	No	The comment group fails to see how changing the words meet the directive. Sabotage implies an organized

Organization	Yes or No	Question 12 Comment
Power Utility Comment Group		intentional attack that may or may not result in an electrical disturbance. The distinction between sabotage and vandalism is important since sabotage on a small system may be the first wave of an attack on many entities. The proposed standard asks us to treat insulator damage caused by a frustrated hunter (an act of vandalism) the same as attack by an unfriendly foreign government (an act of sabotage). The comment group does not agree that these should be treated equally.
Pepco Holdings, Inc - Affiliates	No	The list of events misses many items considered as suspicious or potential sabotage, such as suspicious observation of critical facilities.
PNM Resources	No	PNM believes the proposed definition of “impact event” does not meet FERC’s directive to “further define sabotage” nor does it take into consideration their request to address the applicability to smaller entities. Attachment 1 Part A or B do not clearing specify “sabotage” events, other than “forced entry”.
Puget Sound Energy	No	With some of the tight timeframes for reporting, it is reasonable to focus on impact rather than motivation. Requiring further analysis of the event in order to assess the possibility that the event was caused by sabotage, however, may be necessary to address FERC’s concerns with respect to sabotage.
Santee Cooper	No	The term "impact events" needs to be more clearly defined.
US Bureau of Reclamation	No	The two are distinctly different. Disturbances are what happened, sabotage is why. We can easily tell what happened. Determining why it happened (e.g. sabotage) takes time.
We Energies	No	Impact Event could replace disturbance and sabotage but not in its present form. The proposed definition of impact event “An impact event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.” Is too vague. The “potential to impact the reliability” is too broad and open to interpretation. It needs to be specific so entities know what is and is not an impact event and so an auditor clearly knows what it is. Define “impact event” as the items listed in Attachment 1.As you have done, focusing on an event’s impact on reliability is more important than determining an individuals intent (sabotage v.s. theft).
WECC	No	The proposed definition of “impact event” does not meet FERC’s directive to “further define sabotage” nor does it take into consideration their request to address the applicability to smaller entities. Attachment 1 Part A or B do not clearing specify “sabotage” events, other than “forced entry”. The purpose of CIP-001-1 and its requirements is to address the specific issue of possible sabotage of BES facilities. This is entirely different

Organization	Yes or No	Question 12 Comment
		than a “disturbance” or an “event” on the BES. The proposed definition for “impact events” is essentially any event that has either impacted the BES or has the potential to impact the BES, caused only by three specific things; equipment failure or misoperation, environmental conditions, or human action. Several of these “impact events could be a result of sabotage. Actual or potential sabotage clearly poses a risk to the reliability of the BES. It is important that the risks related to sabotage be reflected in either EOP or CIP
Ameren	Yes	However, the term Impact Event should be a new defined term. When the SDT determines this, it should use the term consistently on both pages 5 and 21 of the SDT document.
ATC	Yes	Yes, if ATC’s recommended changes are made to Attachment 1 and the Standard.
BGE	Yes	The defined term “impact events” should be capitalized throughout the document to identify it as a defined term. Additionally, BGE has noted in several comments that another term is used instead of “impact events”. These terms should be eliminated and use “impact events” instead.
Electric Market Policy	Yes	The use of the term “impact events’ has simply replaced the terms “disturbance” and “sabotage” and has not further defined sabotage as directed by FERC. We do feel that impact events needs to be a defined term.
Georgia System Operations Corporation	Yes	The new term is much more clear than those two terms. This will improve uncertainty and confusion regarding whether or not something should be reported.
Kansas City Power & Light	Yes	Should the word disturbance be removed from the title of EOP004-2 to avoid confusion and simply be called Impact Event and Assessment, Analysis and Reporting.
MRO's NERC Standards Review Subcommittee	Yes	As an industry we have looked at sabotage as a sub component of a disturbance. Sabotage is hard to measure since it is based on a perpetrator’s intent and thus very hard to determine.
Nebraska Public Power District	Yes	I agree there is a lot of interpretation and confusion as to what sabotage or a Cyber Incident is, so would welcome better clarity. Whether “impact events” can more effectively clarify, is yet to be seen. “it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.” “An impact event is any situation that has the potential to significantly impact the reliability of the Bulk Electric System. Such events may originate from malicious intent, accidental behavior, or natural occurrences.” I do know that Cyber Sabotage may take time or days to become aware so not sure

Organization	Yes or No	Question 12 Comment
		how that might expedite reporting and awareness.
PPL Electric Utilities	Yes	Refer to clarification requested in question 10 comments.
RRI Energy, Inc.	Yes	Agree. However, strongly encourage this to be made into a defined term in the Glossary of Terms.
SERC OC Standards Review Group	Yes	We do feel that this needs to be a defined term
United Illuminating	Yes	The term impact event can substitute for sabotage and disturbance. The use of Forced Intrusion is a bright line for reporting.

13. The DSR SDT has combined EOP-004 and CIP-001 into one standard (please review the mapping document that shows the translation of requirements from the already approved versions of CIP-001 and EOP-004 to the proposed EOP-004), EOP-004-3 and retiring CIP-001. Do you agree that there is no reliability gap between the existing standards and the proposed standard? Please explain in the comment box below.

Summary Consideration: While a majority of commenters who responded to this question support combining the two standards, some commenters suggested that in combining the standards, the team left some gaps in coverage with respect to the types of events that must be reported. The DSR SDT believes that combining EOP-004 and CIP-001 does not introduce a reliability gap between the existing standards and the proposed standard and the industry comments received confirms this. Some events that were specifically identified in the original standard (such as a bomb threat) are covered more generically in the revised standard. This modification encourages entities to focus on the 'types' of events that may be impactive rather than having a finite list that may omit an event that couldn't be anticipated when drafting the requirements.

The decision to eliminate the term sabotage from the standard and the retirement of CIP-001 should alleviate all concerns regarding the term sabotage and its definition. The DSR SDT believes that "observation of suspicious activity" and "bomb threat" is considered to be included in Part B – "Risk to BES equipment from a non-environmental physical threat". We have added "and report of suspicious device near BES equipment" to note 3 of the "Attachment 1, Potential Reliability – Part B".

Organization	Yes or No	Question 13 Comment
WECC		A potential gap may exist. Attacks on BES facilities, via either vandalism or sabotage, are very different events than impact events on the system. From a Compliance standpoint, a revised standard to address the FERC directive on sabotage should be developed as an EOP standard (that is grouped with 693 Standards) rather than as a CIP Standard (CIP-001-1).
Ameren	No	It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than

Organization	Yes or No	Question 13 Comment
		in the existing standards.
Bonneville Power Administration	No	BPA supports the concept behind the revisions to EOP-004-2. Creating a single reporting methodology will improve the processes and lead to more consistency. BPA recommends that the Standards Drafting Team (SDT) coordinate any revisions in the reporting requirements with those found in CIP-008-3 to ensure that there are no conflicts. BPA asks the SDT to consider the impact of these changes on CIP-008-3 and work with the CIP SDT to ensure that the wording of the two requirements is similar and clear. Based on Attachment 1 part A of EOP-004-2, certain cyber security events, intrusions for example, would have to be reported under both EOP-004-2 and CIP-008-3. That puts a burden on a Registered Entity to take additional steps to coordinate reporting or face potential compliance risk for correctly reporting an event under one standard and failing to report it under the other standard. The mapping document had errors: a. CIP-001 R1 to EOP-004 R2.9 (annual vs quarterly). b. EOP-004-1 R2 was translated to R2 & R3 of version 2. c. EOP-004-1 R3 was translated to R6 of version 2 (which doesn't say to whom to report).
City of Garland	No	EOP-004-1 R2 did not get translated to EOP-004-2 R2 - table states it is mapped to R1
E.ON U.S. LLC	No	The Version History contained with EOP-004-2 indicates that CIP-001-1 and EOP-004-1 are "Merged", however, the actions do not reflect the retirement of CIP-001-1a and therefore, it is unclear if there will be remaining redundancies or potential gaps with the new version EOP-004-2 and CIP-001-1a.
Electric Market Policy	No	Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity.
Exelon	No	Reporting form doesn't allow for investigations which result in no impact events found or identified.
Georgia Transmission Corporation	No	The only two events that apply to a TO are the ones related to CIP:1. Forced intrusion (report if motivation cannot be determined, i.e. to steal copper)2. Detection of a cyber intrusion to critical cyber assets (criteria of CIP-008)Everything in this standard applies to a TOP and therefore E-004-2 and CIP-001 should not be combined

Organization	Yes or No	Question 13 Comment
Great River Energy	No	It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than in the existing standards.
Indeck Energy Services	No	Bomb threat has totally been lost.
Independent Electricity System Operator	No	We do not agree with the mapping. The proposed mapping attempts to merge the reporting in CIP-001-1 which has more of an on-going awareness nature to alert operating and government authorities of suspected sabotage to prompt investigation with a possible aim to identify the cause and develop remedies to curb the sabotage/events. The proposed EOP-004-2 appears to be more of a post-event reporting for need-to-know purpose only. This is not consistent with the purpose of the SAR.
ISO New England Inc.	No	Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by the NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity. EOP-004-3 should be EOP-004-2.
Luminant Energy	No	CIP-001-1 R3.1 includes instructions associated with the DOE OE-417 form. EOP-004-2 R2.6 should include the DOE as an example of an external organization requiring notification. Additionally, the Rationale for R1 discusses the possibility of one electronic form satisfying US entities with related disturbance reporting requirements but does not include any information about the likelihood of this outcome. Please elaborate on the process required to combine these reports.
Midwest ISO Standards Collaborators	No	It appears that all requirements have been addressed from the existing standards. However, we believe there is a reliability gap that continues from the existing standards because sabotage is not defined any better than in the existing standards.
North Carolina Electric Coops	No	
Northeast Power Coordinating Council	No	Per the mapping document, some of the existing requirements are awaiting a new reporting procedure being developed by the NERC EAWG. For those requirements that were transferred over, the resulting standard seems overly complex and lacks clarity. EOP-004-3 should be EOP-004-2.

Organization	Yes or No	Question 13 Comment
Pepco Holdings, Inc - Affiliates	No	The list of events misses many items considered as suspicious or potential sabotage, such as suspicious observation of critical facilities.
Santee Cooper	No	It is very difficult to assess this question with the standard as currently written.
SERC OC Standards Review Group	No	
US Bureau of Reclamation	No	The two could be combined with no reliability gap based on the concept rather than the proposed standard. As the standard is currently written, there is a reliability gap. Consider that after the fact reporting of a sabotage event (other than criminal acts which may have been witnessed) usually take some time to investigate and analyze.
ATC	Yes	ATC agrees with this effort and does not currently see a reliability gap
BGE	Yes	None.
CenterPoint Energy	Yes	CenterPoint Energy agrees that there is no reliability gap between the existing standards and the proposed standard. However, CenterPoint Energy believes that the SDT went too far in developing the proposed EOP-004-2 and added additional unnecessary requirements. If the comments made above to Q1 - Q12 were to be incorporated into the proposed Standard, CenterPoint Energy believes the product would be closer to a results based Standard with no reliability gap.
City of Austin dba Austin Energy	Yes	If we can used OE 417 for NERC and DOE we do not perceive a reliability gap.
Georgia System Operations Corporation	Yes	The new single standard will cover all necessary reporting requirements that are in the current two standards. They are being combined into EOP-004-2 not EOP-004-3.

Organization	Yes or No	Question 13 Comment
Green Country Energy	Yes	With the provision that definition and scope of "impact event" are developed and tables adjusted as needed to address FERCs concerns specifically ."(1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event.”
MRO's NERC Standards Review Subcommittee	Yes	Within the above question, the SDT is asking about EOP-004-2 not -3.
Nebraska Public Power District	Yes	Appears they only changed R1 for CIP-001 and moving R2-R4 directly over to EOP-004-2. R1 adds much more detail on our part for a company operating plan but would definitely help some of the present confusion.
RRI Energy, Inc.	Yes	Assume reference to EOP-004-3 in the question 13 was meant to reference version 2 (EOP-004-2).

14. Do you agree with the proposed effective dates? Please explain in the comment box below.

Summary Consideration: While most stakeholders who responded to this question supported the 12 months originally proposed for entities to become compliant, the drafting team has revised this to 6 months. The DSR SDT feels that six months and not more than nine months is an adequate time frame. The current CIP-001 plan is adequate for the new EOP-004 and training should be met in the proposed timeline.

The Implementation Plan was developed for the revised Requirements, which do not include an electronic “one-stop shopping” tool. This topic is to be addressed in the proposed revisions to the NERC Rules of Procedure.

Organization	Yes or No	Question 14 Comment
Independent Electricity System Operator		We do not agree with the proposed standard. We therefore are unable to agree on any implementation plan.
City of Garland	No	Do not agree with this proposed draft - instead of combining 2 standards to gain efficiency, this expands the standard with unnecessary paperwork, drills, training, etc.
Constellation Power Generation and Constellation Commodities Group	No	Based on the drastic differences between the previous revisions to these standards, and this proposed revision, 24 months would be a more reasonable timeframe for an effective date.
IRC Standards Review Committee	No	If the training and Operation Plan requirements are adopted as proposed, this may not be sufficient time for some entities to comply, particularly those with limited number of staff but perform functions that have multiple event reporting requirements.
ISO New England Inc.	No	If the training and Operation Plan requirements are adopted as proposed, this may not allow sufficient time for some entities to comply, particularly those with limited number of staff, but perform functions that have multiple event reporting requirements.
Kansas City Power & Light	No	April 2011 is too soon for considerations applicable to the creation of an Operating Plan.

Organization	Yes or No	Question 14 Comment
Manitoba Hydro	No	Though CIP-001-1a already contained provisions for sabotage response guidelines, the new EOP-004-2 R2 (2.1 to 2.9) will require reexamination of existing policies to remain compliant. Upon the approval of Attachment 1, the existing disturbance guidelines will also have to be reexamined. With the addition of R3 (Identify and assess), R4 (Drills) and R5 (Training), will also require redevelopment of existing processes.
NERC Staff	No	In order to provide explicit dates, the language should be modified to state: "First calendar day of the first calendar quarter one year after the date of the order providing applicable regulatory authority approval for all requirements."
Northeast Power Coordinating Council	No	The effective dates in Canada need to be defined. The first bullet should be sufficient. If the training and Operation Plan requirements are adopted as proposed, this may not allow sufficient time for some entities to comply, particularly those with limited number of staff, but perform functions that have multiple event reporting requirements.
Puget Sound Energy	No	There are no effective dates listed in the proposed standard. The proposed effective date should allow at least one year for entities to implement the requirements of the standard. In addition, if requirement R1 remains, then the requirement to implement an operating plan should only be triggered by the ERO's finalization of the form and system for reporting impact events and should provide at least six months for the implementation of the operating plan.
Santee Cooper	No	With the proposed training and drill requirements in the current written standard, one year is not enough time.
United Illuminating	No	UI believes the implementation should be staged. For R1 and R2: First calendar day of the first calendar quarter one year after applicable regulatory authority approval for all. This provides sufficient time to draft a procedure Then time needs to be provided to provide training prior to implementation of R3 and R6. UI believes two calendar quarters should be provided to complete training; therefore R3and R6 is effective six calendar quarters following regulatory approval. Implementation for R4 should state that the initial calendar year begins on the date R2 is effective and entities have 12 months following that date to complete their first drill. R5 requires training once per calendar year. Implementation for R5 should state that the initial calendar year begins on the date R2 is effective and entities have 12 months following that date to complete their first drill.

Organization	Yes or No	Question 14 Comment
US Bureau of Reclamation	No	There is a 15 month training requirement. If the standard goes into effect in one year, most entities will not have had an opportunity to develop their new Operating Plans and train their staff. The effective date should recognize Operating Plans need to be revised and then training needs to be implemented. The most aggressive schedule is 18 months. Two years would be more appropriate. The implementation date could recognize the Operating Plan development as one phase and the training as the second.
ATC	Yes	Yes, if ATC's recommended changes are made to the Standard. However, if the changes are not supported then ATC recommends that the implantation time be changed to two years. Entities will need time to develop both the plan called for in this standard and to train the personnel identified in the plan.
BGE	Yes	None.
Exelon	Yes	Agree with the proposed implementation date. A 12 month implementation will provide adequate time to generate, implement and provide any necessary training by a registered entity.
Ameren	Yes

15. Do you have any other comments that you have not identified above?

Summary Consideration: The DSR SDT has met with the EAWG and has put in place a process to ensure the cooperation and coordination between the DSR SDT and the EAWG. The impact event list is comprehensive and addresses the needs of the EAWG and EOP-004.

There were concerns expressed that the impact event list should include deliberate acts against infrastructure. The impact list includes "Risk to BES equipment from a non-environmental physical threat" the DSR SDT feels that this is inclusive of deliberate acts against infrastructure.

During discussions around the use and definition of the term sabotage, the DSR SDT considered the NRC definition and decided to eliminate the use of the term sabotage from EOP-004 and replaced it with impact events. The DSR SDT has developed a definition for "Impact Events" to support Attachment 1 as follows:

> "An Impact Event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action."

The DSR SDT has proposed this definition for inclusion in the NERC Glossary for "Impact Event". The types of Impact Events that are required to be reported are contained within Attachment 1. Only these events are required to be reported under this Standard. The DSR SDT considered the FERC directive to "further define sabotage" and decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was that of sabotage or merely vandalism without the intervention of law enforcement after the fact. This will result in further ambiguity with respect to reporting events. The term "sabotage" is no longer included in the standard and therefore it is inappropriate to attempt to define it. The Impact Events listed in Attachment 1 provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive. Attachment 1, Part A is to be used for those actions that have impacted the electric system and in particular the section "Damage or destruction to equipment" clearly defines that all equipment that intentional or non intentional human error be reported. Attachment 1, Part B covers the similar items but the action has not fully occurred but may cause a risk to the electric system and is required to be reported.

The industry commented on the need for e-mail addresses and fax numbers for back up purposes. These details were added to the standard and will also be covered in the implementation plan.

The proposed ballot in December was incorrect and has been deleted from the future development plan. The plan was updated with the correct project plan dates.

Organization	Yes or No	Question 15 Comment
Indeck Energy Services		Good start on a unified event reporting standard!
IRC Standards Review Committee	No	The standards should be changed to define what a “disturbance” is for reporting in EOP-004. Also, sabotage reporting requirements in CIP-001 should be rescinded as EOP-004 already has such requirements.
PSEG Companies		
Arizona Public Service Company	No	
ATCO Electric Ltd.	No	
Duke Energy	No	
Electric Market Policy	No	
FirstEnergy	No	
Independent Electricity System Operator	No	
Luminant Energy	No	

Organization	Yes or No	Question 15 Comment
Manitoba Hydro	No	
PacifiCorp	No	
PPL Supply	No	
RRI Energy, Inc.	No	
United Illuminating	No	
Ameren	Yes	We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting.
American Electric Power (AEP)	Yes	The standard needs to be modified to allow the ability for one entity to report on behalf of other entities. For example the loss of Generation over the threshold could be reported by the RC opposed to the GO individually, if mutually agreed upon before the fact.
ATC	Yes	ATC believes that it is not evident in this draft that the SDT has worked collaboratively with the Events Analysis working group to leverage their work. ATC believes that NERC must coordinate this project and the EAWG efforts. The EAWG is proposing to modify NERC Rules of Procedure but the SDT is suggesting requirement for the ERO be build within the standard. We believe that the Rules of Procedure is the proper course to take to for identifying NERC obligations, but what is clear is that NERC itself does not seem to have an overall plan for event reporting and analysis. Lastly, ATC would like to see the SDT expand the mapping document to include the work of the EAWG. The industry needs to be presented with a clear picture as to how all these things will work together along with their reporting obligations. The definition of an “impact event” needs to be revised. First, if these events are to include any equipment failure or mis-operation that impacts the BES, the standard is requiring more than is intended based upon the reading of the requirements. PRC-004 already covers the reporting of protection system mis-operations, and if reading this definition verbatim, it would lead one to conclude that those same mis-operations reported under PRC-004 shall also be reported under EOP-004. The definition should be revised to something like: “An impact event is a system disturbance affecting the Bulk Electric System beyond loss of a single element under normal operating conditions and does not include events normally reported under PRC-004. Such events may be caused by...”

Organization	Yes or No	Question 15 Comment
BGE	Yes	One item that is properly addressed is the removal of Load Serving Entity from the Applicable Functional Entities. There may be a need to provide some guidance to Functional Entities when there are separate Transmission Owners and Transmission Operators or Generation Owners and Generation Operators. If they are separate, there may be redundancy in reporting.From the documentation, it doesn't seem like the SDT are combining all reports into one form as we would like to see. In the rational for R1 section, it talks of getting both forms (NERC and OE-417) together in one document (however it sounds like the forms within the document are still separate), available electronically, which only seems like a step forward. However, it does not take away the confusing process for the operators of which part of the form would need to be filled, who should be set this form depending on what part is filled, if one part of the form is filled out do the other parts need to be filled, etc. If the forms cannot be consolidated, BGE would rather the forms be separate to reduce confusion.BGE believes all these reports should require one form with one set of recipients, period.This may mean that NERC needs to get DOE to modify their OE-417 form.
Bonneville Power Administration	Yes	The document retention times in EOP-004-3 should be spelled out more clearly. The Compliance summary does so (but needs some punctuation clarification regarding investigation), the SDT should consider making that part of the requirements or clarifying the wording in the requirements.
CenterPoint Energy	Yes	CenterPoint Energy appreciates the efforts of the SDT in removing outdated and unnecessary language from the existing EOP-004 standard. Additionally, CenterPoint Energy urges the SDT to also remove the proposed "how to" prescriptive requirements. CenterPoint Energy believes the SDT team's focus should be on drafting a results-based standard for reporting actual system disturbances and acts of sabotage that disrupt the reliable operation of the BES. The SDT should not delve into trying to identify a list of events that have a potential reliability impact.As stated in response to Q10, CenterPoint Energy strongly believes that cyber-related events should not be in the scope of this standard since they are already required to be identified and reported to appropriate entities under CIP-008. Excluding cyber events from this standard further supports the elimination of redundancies within the body of standards.
City of Garland	Yes	Do not agree with this proposed draft - instead of combining 2 standards to gain efficiency, this expands the standard with unnecessary paperwork, drills, training, etc.For reports required under this standard, companies with multiple registration numbers and functions should only have to file one report for all functions and registrations.
Consolidated Edison Co. of NY, Inc.	Yes	Overriding Comment and Concern: It is absolutely essential that the work on EOP-004 and that on the NERC Event Analysis Process (EAP) be fully coordinated. We find that there are a number of inconsistencies between these two documents. The EAP and EOP-004 are not aligned. In order to operate and report

Organization	Yes or No	Question 15 Comment
		effectively entities need consistent requirements.
Constellation Power Generation and Constellation Commodities Group	Yes	As stated earlier, the “summary of concepts” for this latest revision, as written by the SDT, includes the following items: o A single form to report disturbances and impact events that threaten the reliability of the bulk electric system o Other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements o Clear criteria for reporting o Consistent reporting timelines o Clarity around of who will receive the information and how it will be used. Each and every requirement should be mapped to one of these 5 items; otherwise, it should not be included in this standard. Summarizing all of the comments above, Constellation Power Generation proposes the following revision to EOP-004-2:1. Title: Impact Event and Disturbance Assessment, Analysis, and Reporting 2. Number: EOP-004-2 3. Purpose: Responsible Entities shall report impact events and their known causes to support situational awareness and the reliability of the Bulk Electric System (BES). 4. Applicability 4.1. Functional Entities:4.1.1. Reliability Coordinator 4.1.2. Balancing Authority 4.1.3. Transmission Operator 4.1.4. Generator Operator 4.1.5. Distribution Provider 4.1.6. Electric Reliability Organization. Requirements and Measures R1. The ERO shall establish, maintain and utilize a system for receiving and distributing impact event reports, received pursuant to Requirement R6, to applicable government, provincial or law enforcement agencies and Registered Entities to enhance and support situational awareness.R2. Each Applicable Entity identified in Attachment 1 shall have an Operating Plan(s) for identifying, assessing and reporting impact events listed in Attachment 1 that includes the following components: 2.1. Method(s) for identifying impact events listed in Attachment 2.2. Method(s) for assessing cause(s) of impact events listed in Attachment 12.3. Method(s) for making internal and external notifications should an impact event listed in Attachment 1 occur. 2.4. Method(s) for updating the Operating Plan.2.5 Method(s) for making operation personnel aware of changes to the Operating Plan.R3. Each Applicable Entity shall implement their Operating Plan(s) to identify and assess cause of impact events listed in Attachment 1.R4. Each Applicable Entity shall provide training to all operation personnel at least annually.R5. Each Applicable Entity shall report impact events in accordance with its Operating Plan created pursuant to Requirement 2 and the timelines outlined in Attachment 1.
Dynegy Inc.	Yes	This does not address the inability of a GO/GOP to determine effects on the BES. Surrounding BES knowledge is limited for a GO/GOP.
E.ON Climate & Renewables	Yes	Refrain from having redundant reporting forms if at all possible. This can create confusion and lead to unnecessary penalty amounts and violations for registered entities. Potential” impacts of an event on the BES need to be clearly defined in the standard.
E.ON U.S. LLC	Yes	The new standard should incorporate all other disturbance, sabotage, or “impact event” reporting standards, such as CIP-008-3. At the very least it should reference those other standards that have within their scope

Organization	Yes or No	Question 15 Comment
		same/similar events in order to ensure complete reporting and full compliance. Suggesting that one standard provides the single reporting procedure, when in actuality it does not, is counterproductive. The discussion of “impact event” clearly indicates the SDT’s intent to include sabotage events in the proposed standard EOP-004-2.
ERCOT ISO	Yes	ERCOT ISO supports the comments provided by the SRC. However, if the standard is to be established, ERCOT ISO has offered the comments contained herein as improvements to the requirements proposed. The requirements listed do not take into consideration the hierarchical reporting necessary for events (i.e.: GO to GOP to BA). The current structure will lead to redundant and conflicting reporting from multiple entities. This will lead to confusion in the analysis of the event. Any system developed and used to report impact events must include notification to the other relevant entities (i.e.: Reliability Coordinator, Balancing Authority, Transmission Operator, and Generator Operator). The proposed standard should not rely on a centralized system that does not follow the established hierarchy of dissemination of information.
Exelon	Yes	The standard is lacking guidance for DOE Form OE-417 reporting as outlined in the current version of EOP-004 and doesn’t contain any non-BES related reporting. What is the governing process for OE-417 reporting?. Need clarification if one entity can respond on behalf to all entities in one company. Need a provision for entities to provide one report for all entities. Radiological sabotage is a defined term within the NRC glossary of terms. It would seem that a deliberate act directed towards a plant would also constitute an "impact event." In general, the DSR SDT should include discussions with the NRC to ensure communications are coordinated or consider utilizing existing reporting requirements currently required by the NRC for each nuclear generator operator for consistency. The definition of sabotage is defined by NRC is as follows: Any deliberate act directed against a plant or transport in which an activity licensed pursuant to 10 CFR Part 73 of NRC's regulations is conducted or against a component of such a plant or transport that could directly or indirectly endanger the public health and safety by exposure to radiation.
Georgia System Operations Corporation	Yes	Light years better than the current CIP-001-1 and EOP-004-1! With some changes from this comment period, we should have a clearer set of realistic requirements which could likely pass the ballot. Thanks go out to the drafting team for bringing clarity to this topic. Capitalization throughout this document is inconsistent. It is not in synch with the NERC Glossary. All terms that remain capitalized in the next draft (other than when used as a title or heading) should be defined in the Glossary of Terms Used in NERC Reliability Standards. Examples of not in synch with the Glossary: Registered Entity, Responsible Entity, Law Enforcement. These are not defined in the Glossary. The requirements that apply to entities should not use the word "analysis." "Assessment" should be used. Analysis is a different process (an ERO process) and is being addressed by

Organization	Yes or No	Question 15 Comment
		another group within NERC (Dave Nevius). This EOP-004 drafting team and the NERC analysis group should closely coordinate such that there are no conflicts and the combined requirements/processes are realistic (mainly regarding timelines).
Great River Energy	Yes	We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting. Please provide an e-mail address for the submittal of the report to NERC (and any other parties above a Regional Entity) within this Standard and a fax number as a backup to electronic submittal.
Green Country Energy	Yes	I think the drafting team has done a wonderful job of beginning the task of combining two related standards. I ask them to keep in mind the small generators, and others who do not have the wide view capability, that more than likely react to events that occur wih no knowledge of why they occured, and limited staff to address administrative standard requirements. Many times the KISS approach is the best approach.
Idaho Power Company	Yes	By including training requirements in each standard, creates confusion and compliance or failure to comply potentian. PER standards are in place for personel training, these standards should be utilized for adding requirements that require training for NERC Standards.
ISO New England Inc.	Yes	Request clarification on how RCIS is part of this Standard. The form should be filled out in two stages. First stage would be the immediately available information. The second stage would be the additional information such as one line diagrams. There is concern with burdening the reporting operator on filling out forms instead of operating the Bulk Electric System. Most of the draft requirements are written as administrative in nature, and this is not most effective. Changes need to be made to (or possibly elimination of) R1, R2, R3.The standards should be changed to define what a “disturbance” is for reporting in EOP-004. Sabotage reporting as per CIP-001 should be rescinded as EOP-004 already has such a requirement.
Kansas City Power & Light	Yes	The standard addressed a preliminary report it should also address the requirements of a final report.
MidAmerican Energy	Yes	This entire standard needs to be revised to consider a results based standard.
Midwest ISO Standards Collaborators	Yes	We are concerned with the Future Development Plan. It shows an initial ballot period starting in December. This standard has significant issues and will need another distinct comment period (and not the formal comment period in parallel with balloting) prior to balloting.

Organization	Yes or No	Question 15 Comment
MRO's NERC Standards Review Subcommittee	Yes	Please provide an e-mail address for the submittal of the report to NERC (and any other parties above a Regional Entity) within this Standard and a fax number as a backup to electronic submittal.EOP-004 Attachment 2: Impact Event Reporting Form (note in the proposed standards it states EOP-002) seems to be written for Actual Impact Events only. Perhaps another section could be added for "Potential" Impact Events.
NERC Staff	Yes	NERC staff commends the SDT on its work so far. Merging CIP-001 and EOP-004 is a significant improvement and eliminates some current redundancies for reporting events. NERC staff believes opportunities to improve the proposed standard still exist. In particular, the team should consider possible redundancies with the Reliability Coordinator Working Group (RCWG) reporting guidelines, the Electricity Sector - Information Sharing and Analysis Center (ES-ISAC) reporting requirements for sharing information across sectors, and the Events Analysis Working Group (EAWG) efforts to develop event reporting processes. Ideally, the SDT and the EAWG should work together to develop a single consistent set of reporting criteria that can be utilized in both the EAWG event reporting process and in the requirements of the EOP-004-2 Reliability Standard.
North Carolina Electric Coops	Yes	Keep in mind that redundancy in reporting requirements from the DOE does not improve or enhance bulk electric system reliability but rather creates more work for the reporting entity.
Northeast Power Coordinating Council	Yes	Request clarification on how RCIS is part of this Standard. The form should be filled out in two stages. First stage would be the immediately available information. The second stage would be the additional information such as one line diagrams. There is concern with burdening the reporting operator on filling out forms instead of operating the Bulk Electric System. Most of the draft requirements are written as administrative in nature, and this is not most effective. Changes need to be made to (or possibly elimination of) R1, R2, R3.The standards should be changed to define what a "disturbance" is for reporting in EOP-004. Sabotage reporting as per CIP-001 should be rescinded as EOP-004 already has such a requirement.
Pacific Gas and Electric Company	Yes	PG&E believes as the training requirements continue to expand, having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues.
Pacific Northwest Small Public Power Utility Comment Group	Yes	The proposed standard has a huge impact on small DPs. DPs that presently do not maintain 24/7 dispatch centers will need to begin doing so to meet the reporting deadlines such as 1 hour after an occurrence is identified (possibly identified by a third party) or 24 hour after an occurrence (regardless of when it was discovered by the DP). The planning, assessing, drilling, training, and reporting requirements (R2-R6), as well as documentation (M2-M6) by small entities will cause utility rates to rise, will reduce local level of service,

Organization	Yes or No	Question 15 Comment
		and will not represent a corresponding increase to the reliability of the BES.The SDT concept of clear criteria for reporting has not been met, since R2 effectively directs the applicable entities to develop their own criteria. The decision of which types of events will be reported to which external organizations has been left up to the applicable entity. The comment group notes that there is no coordination of effort required between the applicable entities and the RCs or TOs that issue reliability directives. Energy Emergencies requiring voltage reduction or load shedding are likely to be communicated to applicable entities via directives. The likely result of this lack of coordination is that entities will plan, drill, and train for an event, but when the directive comes it will not be the one planned, drilled, and trained for. Coordination between those sending and receiving directives would ensure the probable events and directed responses are the ones planned, drilled, and trained for.
PacifiCorp	Yes	This is yet another standard with training requirements not covered under any PER standards.Having different training requirements spread throughout the standards makes it increasingly difficult to ensure all training requirements are met.Developing a "Training Standard" that lists ALL required training would streamline the process and aid greatly in compliance monitoring.
Pepco Holdings, Inc - Affiliates	Yes	The EAWG is developing processes that will be enforced through the Rules of Procedure. It may be inappropriate to reference the EAWG process in the Mapping Document.
PNM Resources	Yes	PNM believes that having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues. This will become even more of an issue as training requirements continue to expand.
PPL Electric Utilities	Yes	Combining EOP-004, CIP-001 and CIP-008’s reporting requirements reduces redundancy and will add clarity to the compliance activities.
Puget Sound Energy	Yes	The DSR SDT’s concepts for implementing a new structure for reporting are appropriate. Proper implementation of those concepts is likely to result in a very much improved standard. However, the proposed standard falls well short of implementing the concepts and is not much of an improvement on the current standard.
Santee Cooper	Yes	We don’t believe that entities should be subjected to duplicate reporting to existing DOE requirements. How does redundancy in reporting requirements improve or enhance bulk electric system reliability?
SERC OC Standards Review	Yes	We find it disturbing that NERC is headed down a path of codifying requirements that are redundant to

Organization	Yes or No	Question 15 Comment
Group		existing DOE requirements. How does redundancy in reporting requirements improve or enhance bulk electric system reliability? Disclaimer:" The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."
Southern Company - Transmission	Yes	The only concern that we have with the proposed standard is that it feels like it is creating dual, not quite redundant, reporting requirements for cyber intrusions in concert with CIP-008. Hopefully, there will not have to be a redundant reporting requirement if we continue to merge efforts with the CIP Drafting Team. Since we will no longer use the word SABOTAGE in the new EOP-004, we are hoping the industry and the CIP Drafting Team will give us the criteria they wish for us to use in order to report CIP-008 incidents. We will then achieve a "ONE STOP SHOP" reporting standard.
Tenaska	Yes	Since the proposed EOP-004-2 Standard does not eliminate the OE-417 reporting requirement, it does not streamline the existing CIP-001-1 and EOP-004-1 reporting requirements for GO/GOP's. The "laundry list" of components required in the Operating Plan described in R2 is too specific and would make it more difficult to prove compliance during an audit. We prefer that the existing CIP-001-1 and EOP-004-1 Standards remain unchanged.
TransAlta Corporation	Yes	A Confidential Impact Event Report form is included in attachment 2 but nowhere in the standard does it say to use this form. This form appears to be similar to the "Preliminary Disturbance Report" form used in EOP-004-1. Clarity is required.
US Bureau of Reclamation	Yes	The SDT should consider that in reality it would be more streamlined to require immediate notification of an event for situational awareness, and then give adequate time for analysis of the cause. Reports that have an arbitrary rush will be diseased with low quality information and not much value in the long run to the BES. The Attachment A should be constructed around notification of situational awareness. The reporting timeline should be constructed around the different levels severity. The more severe the event, usually the more complicated the event is to analyze. Simple events usually do not have a significant impact.
We Energies	Yes	Please be careful to capitalize defined terms. If the intent is to not use the defined term, use another word."Forced intrusion" (cutting a fence, breaking in a door) may not be discovered for quite some time after it occurs. Should it be reported as soon as discovered? Even if there was no impact event (disturbance)? "Destruction of a Bulk Electric System Component" seems pretty specific. However, if a transformer kicks off line due to criminal damage, yet is considered repairable, is the event reportable?

Organization	Yes or No	Question 15 Comment
WECC	Yes	Having one training standard that captures all the training required within the NERC standards will allow for better clarity for the training departments in providing and meeting all NERC Standard compliance issues. This will become even more of an issue as training requirements continue to expand.CIP-001-1 has surprisingly been one of the most violated standards during the initial period. However, most entities have now developed and demonstrated a decent compliance process. Unless a revised standard to address the FERC directive on sabotage is developed (as suggested in 13 above) this proposed standard appears to eliminate sabotage reporting as a reliability standard to the potential detriment of BES reliability.

Consideration of Comments on Disturbance & Sabotage Reporting — Project 2009-01

The Disturbance & Sabotage Reporting Drafting Team (DSR SDT) thanks all commenters who submitted comments on the Second Posting of EOP-004-2, Impact Event Reporting (Project 2009-01).
This standard was posted for a 30-day public comment period from March 9, 2011 through April 8, 2011. The stakeholders were asked to provide feedback on the standard through a special Electronic Comment Form. There were 60 sets of comments, including comments from 188 different people from approximately 132 companies representing 10 of the 10 Industry Segments as shown in the table on the following pages.

In this report, comments have been organized by question to make it easier to see where there is consensus. Comments may be reviewed in their original format on the project page:

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration: The DSR SDT received many comments regarding the proposed definition of "Impact Event," the requirements, and event reporting in Attachment 1. The main stakeholder concerns were addressed as follows:

- Many stakeholders disagreed with the need for the definition of "Impact Event" and felt that the definition was ambiguous and created confusion. The DSR SDT agrees and has deleted the proposed definition from the standard. The list of events in Attachment 1 is all-inclusive and no further attempts to define "Impact Event" are necessary.
- Many stakeholders raised concerns with the 1 hour reporting requirement for certain types of events. The commenters believed that the restoration of service or the return to a stable bulk power system state may be jeopardized by having to report certain events within one hour. The DSR SDT agreed and revised the reporting time to 24 hours for most events, with the exception of damage or destruction of BES equipment, forced intrusion or cyber related incidents.
- Many stakeholders suggested that the reporting of events after the fact only justified a VRF of "lower" for each requirement. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF, as this requirement deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all "lower" with the exception of Requirement R2 which is a requirement to analyze

[1] The appeals process is in the Standard Processes Manual:.

events. This standard relates only to reporting events. Analysis of reported events is addressed through the NERC Events Analysis Program. Proposed changes to the Electric Reliability Organization Events Analysis Process Field Trial documents that clarify the role of the Events Analysis program in analyzing reported events will be posted for stakeholder comment separately.

- The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events to the appropriate entities in accordance with the Operating Plan based on Attachment 1. Requirement R3 makes sure that an entity can communicate information about events. Some of these events are dealing with potential sabotage events, and part of the reason to communicate these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 are consistent with the existing approved VRFs for both EOP-004 and CIP-001.
- Several commenters wanted more clarity regarding which entities report and to whom they report. Many stakeholders were confused regarding law enforcement notifications and questioned whether certain types of events (IROL, Public Appeal, etc.) needed to be reported to law enforcement. The background section of the standard provides guidance with respect to reporting events to law enforcement. For clarity, the DSR SDT has added the following sentence to the first paragraph under the heading "Law Enforcement Reporting": "These are the types of events that should be reported to law enforcement." The entire paragraph is:
    - "The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting events. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES."
- Some commenters also questioned whether or not the existing applicability would result in multiple reports being submitted by different entities for the same event. NERC staff has indicated that this is acceptable and that having multiple types of entities report the same event may provide different types of information about the event.

Commenters also had concerns about the applicability of the standard to Load Serving Entities who may not own physical assets as well as to the ERO and Regional Entity. The DSR SDT agrees that the Distribution Provider owns the assets per the Functional Model; however the LSE is an applicable entity under CIP-002. Events relating the CIP-002 assets are to be reported by the LSE. These are envisioned to be cyber assets. The DSR SDT also include the ERO or the RE as applicable entities based on the applicability of CIP-002

Some commenters identified issues with the footnotes in Attachment 1. These were revised as suggested. There were a few instances where the word "sabotage" remained in the standard or the flowchart. The DSR SDT has removed all instance of "sabotage" and replaced them with "event," and revised the flowchart to remove references to sabotage.

Several commenters were concerned that the DSR SDT and the NERC Events Analysis Working Group (EAWG) may not be in alignment. The DSR SDT is working in close coordination with the EAWG and will continue to develop the standard and will make the EAWG aware of the DSR SDT's efforts.

The issue of the FERC directives relating to this project was broached by several commenters. The DSR SDT envisions EOP-004-2 to be a continent-wide reporting standard. Any follow up investigation or analysis falls under the purview of the NERC Events Analysis Program under the NERC Rules of Procedure. This process is being revised by the EAWG. Discussions with FERC staff indicate that the current efforts of the DSR SDT and the EAWG are sufficient to address the intent of the directive.

After the drafting team completed its consideration of stakeholder comments, the standards and implementation plan were submitted for quality review. Based on feedback from the quality review, the drafting team has made two significant revisions to the standard. The first revision is to add a requirement for implementation of the Operating Plan listed in Requirement R1. There was only a requirement to report events, but no requirement specifically calling for updates to the Operating Plan or the annual review. This was accomplished by having two requirements. The first is Requirement R2 which specifies that an entity must implement the Operating Plan per Requirement R1, Parts 1.1, 1.2, 1.4 and 1.5:

> R2. Each Responsible Entity shall implement the parts of its Operating Plan that meet Requirement R1, Parts 1.1 and 1.2 for an actual event and Parts 1.4 and 1.5 as specified.

The second Requirement is R3 which addresses Part 1.3:

> R3. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.

The second revision based on the quality review pertains to Requirement R4. The quality review suggested revising the requirement to more closely match the language in the Rationale box that the drafting team developed. This would provide better guidance for responsible entities as well as provide more clear direction to auditors. The revised requirement is:

> R4. Each Responsible Entity shall verify (through actual implementation for an event, or through a drill or exercise) the communication process in its Operating Plan, created pursuant to Requirement 1, Part 1.3, at least annually (once per calendar year), with no more than 15 calendar months between verification or actual implementation.

1. **Do you agree with the revised Purpose Statement of EOP-004-2, Impact Event Reporting? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.**

Summary Consideration: The majority of stakeholders agree with the purpose statement. Some commenters had concerns with the use of the words "if known" and "industry awareness" and statements on requiring information from an analysis in the report which may not be known at the time of the report. Comments on this being an "after the fact" report and not real-time reporting have been addressed by a significant revision to the change in reporting times reflected in Attachment 1.

A number of commenters offered suggestions on the use of terms "situational awareness" versus "industry awareness." The DSR SDT used "industry awareness" to address concerns about real-time reporting (which this standard does not cover) and to avoid confusion with the NERC Situational Awareness organization.

The purpose statement was slightly revised to remove the defined term "Impact Event" and replace with the phrase "events with the potential to impact reliability". No other revisions were made.

> "To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of events with the potential to impact reliability and their causes, if known, by the Responsible Entities."

Organization	Yes or No	Question 1 Comment
Exelon	No	Although Exelon agrees that the proposed revision to the purpose statement of EOP-004-2 is better than the original draft; the DSR SDT should consider aligning the definition with the existing OE-417 terms. "Impact Events" are not clearly defined as reportable criteria in the DOE forms and may create confusion. Suggest rewording the purpose statement to simply "Incident Reporting" to align with existing terminology in OE-417 and removing the addition of a new term. A Purpose Statement is defined as "The reliability outcome achieved through compliance with the requirements of the standard." Propose that the purpose should be, "To require a review, assessment and report of events that could have an adverse material impact on the Bulk Electric System."
Response: The DSR DT thanks you for your comment. Form OE-417 report is a DOE report that is not specifically related to BES reliability and is not applicable outside of the United States. The standard only requires reporting of events. Analysis occurs through the NERC Events Analysis Program.		
SDG&E	No	SDG&E does not agree with the revised Purpose Statement because it does not reflect the standard's purpose of identifying reporting requirements for impact events. SDG&E recommends the following revised Purpose Statement: "To identify the reporting requirements for events considered to have an impact on the reliability of the Bulk

Organization	Yes or No	Question 1 Comment
		Electric System and to allow an awareness of these Impact Events to be understood by the industry in recognizing potential enhancements that may be made to the reliability of the BES.”
Response: The DSR SDT thanks you for your comment. The DSR SDT believes that the existing purpose statement addresses most of your suggested rewording. The last phrase “recognizing potential enhancements that may be made to the reliability of the BES” is not in the scope of the standard or this project.		
Dominion	No	It is not evident how Impact Event reporting will “improve industry awareness“ as suggested in the Purpose Statement. The transfer of Requirement R8 (ERO quarterly report) to the Rules of Procedure (paragraph 812) invalidates that claim within the context of this standard. Suggest removing this phrase from the Purpose Statement.
Response: The DSR DT thanks you for your comment. The ERO will issue reports for industry awareness purposes under the Rules of Procedure. If entities do not report events to the ERO, then these reports will not be issued.		
SPP Standards Review Group	No	We would suggest changing the purpose to read “To improve industry awareness and effectiveness in addressing risk to the BES by requiring the reporting of Impact Events and their causes, if known, by the Responsible Entities.”
Response: The DSR DT thanks you for your comment. The DSR SDT contends that the phrase “addressing risk to the BES” applies to the analysis of events which is not covered under the standard.		
United Illuminating Co	No	UI agrees with the idea but believes the statement can be improved to remove ambiguities. For example: “if known” can be modifying the word causes, or the word Impact events. To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of identified Impact Events and if known their causes, if known, by the Responsible Entities.
Response: The DSR SDT thanks you for your comment. The words “if known” are intended to modify the word ‘causes.’ The DSR SDT has revised the existing wording (from the clean version of the standard) to: *To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of events with the potential to impact reliability and their causes, if known, by the Responsible Entities.*		

Organization	Yes or No	Question 1 Comment
Arkansas Electric Cooperative Corporation	No	The purpose statement reads "To improve industry awareness of the BES." We suggest the purpose should state "To improve industry awareness and effectiveness in addressing risks to the BES." We feel the remaining purpose statement is unnecessary.
Response: The DSR SDT thanks you for your comment. The DSR SDT contends that the phrase "addressing risk to the BES" applies to the analysis of events which is not covered under the standard.		
Manitoba Hydro	No	Situational Awareness was replaced by the generic "Industry awareness." Justification for this was that Situational Awareness was a byproduct of a successful event reporting system and not a driver. Using Industry awareness clouds the clarity of the purpose. If personal are properly trained and conscious of their responsibilities, then they are in fact situationally aware, and will therefore drive the reporting process on the detection an Impact Event. Industry awareness falsely labels this Standard as unique to the electrical industry when clearly many outside and international agencies will be notified and involved. Situational Awareness seems much more appropriate and encompassing. Other then that the Purpose is a large improvement from the original.
Response: The DSR SDT thanks you for your comment. The DSR SDT changed "situational awareness" to "industry awareness" to address concerns about real-time reporting (which this standard does not cover) and to avoid confusion with the NERC Situational Awareness organization.		
Ameren	No	The original Purpose wording was clear, concise and understandable.
Response: The DSR SDT thanks you for your comment. The original purpose statement was in the form of a requirement and not a purpose statement.		
ISO New England, Inc	No	The purposed states To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of Impact Events and their causes, if known, by the Responsible Entities. Awareness by who in the industry?
Response: The DSR SDT thanks you for your comment. The requirements of this standard require that events be reported after-the-fact. The NERC Events Analysis Program will take certain events reported under this standard and analyze them to provide information to the entire body of users, owners and operators of the BES.		
Calpine Corp	No	The purpose has moved significantly from the originally approved SAR. The purpose should focus on reporting requirements for reporting electrical disturbances to the Bulk Electric System that exceed specific thresholds. Sabotage/vandalism/theft are a subset of the reportable events that could have or do cause a Bulk Electric System Electrical Disturbance. The Standards content should focus on setting requirements to

Organization	Yes or No	Question 1 Comment
		report specific types of electrical disturbance events and providing guidance for performing that reporting. Alternative language: Purpose: To establish reporting requirements for events that either cause, or have the potential to cause, significant disturbances on the Bulk Electric System.
Response: The DSR SDT thanks you for your comment**.** The purpose covers the EOP-004 and CIP-001 standards which include disturbance and sabotage. The use of the word 'events' and the definition of the specific events to be reported (see Attachment 1) is a result of combining these two standards as well as the drafting team's efforts to address FERC Order 693 Directives. The proposed purpose statement does not adequately address these items.		
BGE	No	BGE believes that using the term Impact Events as currently defined is too vague. An alternative statement would be requiring the reporting of events listed in Attachment 1 and their causes, if known and making the definition change as noted in question 2.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated the defined term "Impact Events" and uses the generic term "events: in the purpose statement. *To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of events with the potential to impact reliability and their causes, if known, by the Responsible Entities.*		
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	No	"To improve industry awareness and the reliability fo the Bulk Electric System by requiring the reporting of Impact Events and their causes, if known by the Responsible Entities." The revised purpose statement includes the phrase, if known. This seems like a huge loophole. They should change it to when discovered or when notified.
Response: The DSR SDT thanks you for your comment. The intent of "if known" was to make sure that events were reported regardless of whether the cause was known. It is important for entities to report events and to return the BES to a reliable operating state. Investigation of causes can occur at a later time.		
Indeck Energy Services	No	The reporting of events does not improve the reliability of the BES. If someone takes action based on the reporting, there might be an improvement. Because many of these events are not preventable, such as sabotage or weather, reporting them won't improve reliability. The original Purpose was satisfactory.
Response: The DSR SDT thanks you for your comment. The requirements of this standard require that events be reported after-the-fact. The NERC Events Analysis Program will take certain events reported under this standard and analyze them to provide information that will lead to improvements in BES reliability.		
Brazos Electric Power Cooperative	No	Instead of Impact Event could simply call it Event Information Reporting.

Organization	Yes or No	Question 1 Comment
Response: The DSR SDT thanks you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event."		
Compliance & Responsiblity Organization	No	See comments set forth in number 2.
Georgia Transmission Corporation & Oglethorpe Power Corporation	Yes	We find it unnecessary to state that the purpose of a Reliability Standard is to "improve the reliability of the Bulk Electric System."
Response: The DSR DT thanks you for your comment. The DSR SDT disagrees. This is an integral part of the purpose of reporting events.		
Midwest Reliability Organization	Yes	The addition of "industry awareness" adds to the scope of this Standard. Whereby an entity is required to inform the RC and others of actual and potential Impact Events.
Response: The DSR DT thanks you for your comment. The DSR SDT has streamlined Attachment 1 to ensure that the proper reporting is accomplished.		
American Municipal Power	Yes	The purpose is acceptable. I think it could be improved and simplified. There were not any questions on the title. Consider changing the title to Reportable Events. There were not any questions on the category. I suggest changing the category from Emergency Operations to Communications. Reporting events can trigger and be more than just Emergency Operations. I feel the reporting function performed by entities should be under the Communications category. Title: Reportable Events Purpose: To improve reliability by communicating timely information about an event or events.
Response: The DSR SDT thanks you for your comment. The DSR SDT revised the existing title of the standard to conform to the intended purpose of reporting events. The team discussed making this a COM standard during the initial DT discussions but decided to retain the existing EOP-004 standard category and number. This is not a real-time reporting standard but requires after the fact reporting.		
Ingleside Cogeneration LP	Yes	The addition of the modifier if known to reporting the cause of an Impact Event is appropriate. It often proves counter-productive to speculate as initial conjectures of the cause of an event are easy to come up with, but difficult to back out of later.
Response: The DSR SDT thanks you for your comment.		
Duke Energy	Yes	However, as we have noted previously, the DSR SDT statement that the proposed changes do not include any real-time operating notifications is inconsistent with requiring notification within one hour for thirteen of the

Organization	Yes or No	Question 1 Comment
		twenty listed Events in Attachment 1 Impact Event Table. Also, in the Background discussion, under Law Enforcement, the DSR SDT states that the objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting Impact Events. As we have previously commented, we are still required to make real-time reports under other standards. Requiring duplicate real-time reporting under EOP-004-2 is a waste of resources which could otherwise be used to improve reliability.
Response: The DSR SDT thanks you for your comment. We have made significant revisions to Attachment 1 and the reporting time requirements to address the real-time reporting concern.		
Constellation Power Generation	Yes	While CPG generally agrees with the purpose statement, we believe that the term Impact Events should be removed. Please see CPGs response to Question 2 discussing the term Impact Events.
Response: The DSR SDT thanks you for your comment. We have deleted the proposed defined term “Impact Events” and will use the generic term “event.” Please see responses to comments on question 2.		
Georgia System Operations Corporation	Yes	We agree with the purpose. However, we do not agree that the purpose will be achieved as this standard is currently drafted or that the standard is ready for balloting.
Response: The DSR SDT thanks you for your comment. We have made significant revisions to the body of the standard and Attachment 1.

2. Do you agree with the proposed definition of Impact Event? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: The majority of the commenters do not agree with the definition and thought the definition as overly broad, too subjective and confusing. Many commenters questioned whether there was a need for a definition of Impact Event at all. The DSR SDT discussed the comments and suggestions and decided to incorporate commenters' suggestion to delete the definition and rely on the Attachment 1 to stand on its own.

The DSR SDT has deleted the Impact Event definition.

Organization	Yes or No	Question 2 Comment
Georgia Transmission Corporation & Oglethorpe Power Corporation	No	We do not think that Impact Event should be defined using a recursive definition, i.e. that the word "impact" should be used in the definition of the term "Impact Event." Instead, we suggest using an enumerative definition in that the tables included in Attachment 1 are themselves used to define "Impact Event." If this definition is not acceptable, we suggest replacing the word "impact" in the definition with the word reduce, reduced, or potential to reduce the reliability of the BES.
Response: The DSR SDT thanks you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events for the given thresholds listed in Attachment 1.		
Northeast Power Coordinating Council	No	Is there a need for this definition? By itself the term is not specific on the types of events that are regarded as having an impact. The detailed listing of events that fall into a reportable event category, hence the basis for the Impact Event, is provided in Attachment A. The events that are to be reported can be called anything. Defining the term Impact Event does not serve the purpose of replacing the details in Attachment A, and such a term is not used anywhere else in the NERC Reliability Standards. For a complete definition of Impact Event, all the elements in Attachment A must be a part of it. Suggest consider not defining the term Impact Event, but rather use words to stipulate the need to have a plan, to implement the plan and to report to the appropriate entities those events listed in Attachment A.
Response: The DSR SDT thanks you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events for the given thresholds listed in Attachment 1.		

Organization	Yes or No	Question 2 Comment
Bonneville Power Administration	Yes	Agree, but note that this will add many more situations to reporting and it will require more staff time to accomplish this.
Response: The DSR SDT thanks you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events for the given thresholds listed in Attachment 1.		
Midwest Reliability Organization	No	The proposed definition is not supported by any of the established bright line criterias that are contained within attachment 1. This Results Based Standard should close any loop-holes that could be read into any section, especially the definition. According to rules of writing a definition, a definition should not contain part of the word that is being defined. Recommend the definition be enhanced to read: Impact Event: Any Contingency which has either effected or has the potential to effect the Stability of the BES as outlined per attachment 1. Within this enhanced recommendation, presently defined NERC terms are used (Contingency and Stability), thus supporting what is current used within our industry. There is also a quantifiable aspect of as outlined per attachment 1 that clearly defines Impact Events.
Response: The DSR SDT thanks you for your comment. The DSR SDT believes the definition is embodied in Attachment 1 criteria and needs no further clarification. We have deleted the proposed defined term "Impact Events" and will use the generic term "event."		
Western Electricity Coordinating Council	No	We question the need for a defined term. It appears that an Impact Event is any event identified in Attachment 1. The use of the defined term combined with the language of Requirement 2 to implement the Impact Event Operating Plan for Impact Events listed in Attachment 1 may be confusing. Is an Impact Event any event described by the proposed definition or is an Impact Event any event listed in Attachment 1?
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees the definition could be confusing. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events for the given thresholds listed in Attachment 1.		
Dominion	Yes	Dominion agrees with the proposed definition of Impact Events, but notes the use of the phrase has the potential to impact is somewhat subjective. The concern being a Responsible Entity makes a judgment on an events potential impact that is viewed differently after-the-fact by an auditor.
Response: The DSR SDT thanks you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events for the given thresholds listed in Attachment 1.		
Pepco Holdings Inc and Affiliates	No	The two sentence definition will not be adequate to serve well over the course of time. People will have to read and understand the standard without benefit of the detailed information, explanations and interpretations

Organization	Yes or No	Question 2 Comment
		available during the standards development process. Without additional explanation as provided in the background and the guideline and technical basis sections, to support the definition, the standard will be subject to confusion and interpretations. Consider adding a lot of the information and explanation that is in those sections to the standard. Any event could be an impact event. However, only a subset is reportable. What is really being addressed are reportable events. More specifically after the fact reporting of unplanned events.
Response: Thank you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events for the given thresholds listed in Attachment 1.		
Midwest ISO Standards Collaborators	No	The definition of Impact Event is overly broad because of the use of potential to impact and the Such as list. Consider routine switching has the potential to result in a mis-operation. This means all routine switching is an impact event. The Such as list should be struck and potential language should be struck.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event."		
FirstEnergy	No	Although we agree with the definition of Impact Event, we believe that it should be clear that this term is specific to the events listed in Attachment 1 of the standard. Therefore, we suggest adding the phrase (as detailed in Attachment 1 of EOP-004-2) in the definition.
Response: Thank you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
SERC OC Standards Review Group	No	We believe the definition is too broad even considering Attachment 1, footnote1, which, for example, uses the term significantly and other ambiguous terms. Consideration should be given to limiting the definition to unplanned events.
Response: Thank you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event."		
PJM Interconnection LLC	No	The term "Impact Event" has been too broadly defined. According to the current definition, any event (including routine operations) can have the potential to impact the reliability of the Bulk Electric System and hence can be an Impact Event. The definition should only include unplanned events. Attachment 1 lists the events that are reportable. It seems that the definition of Impact Event refers to the events in Attachment 1 as opposed to defining Impact Event. As such, it is best that the SDT not define Impact Event but use words to the effect that requires an entity to have a plan and implement it for reporting unplanned events outlined in Attachment 1. If Impact Event were to be defined, we suggest the following definiton would be a better

Organization	Yes or No	Question 2 Comment
		option:"An Impact Event is any unplanned event listed in Attachment I that has either adversely impacted or has the potential to adversely impact the reliability of the Bulk Electric System."
Response: Thank you for your comment. We have deleted the proposed defined term “Impact Events” and will use the generic term “event.”		
SRP	No	Suggest that definition include reference to the fact that this is non-desired occurence, as the word 'impact' has neither a positivie nor negative implication. This is not a well formed definition as it contains circular refernces to 'impacted' and 'event' within the definition.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.”		
We Energies	No	From an on-line dictionary, an event is something that happens. Combined with the phrase has the potential to impact and the definition of Impact Event would include every routine operation performed by any entity. Taking a generator on or off line, switching a transmission line in or out, traffic driving past a substation, all have the potential to impact the BES. The Impact Event definition is overly broad and needs to be significantly narrowed.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.”		
Compliance & Responsiblity Organization	No	NextEra Energy Inc. (NextEra) appreciates the drafting team providing valuable ideas and a framework on how to improve and consolidate CIP-001 and EOP-004. However, NextEra also believes that the currently drafted EOP-004-2 needs to be revised and enhanced to more clearly explain the Responsible Entities’ duties, the definition of sabotage and address FERC directives and concerns. For example, NextEra is not in favor using the term “Impact Event” which seems to add considerable confusion of what is or is not sabotage. In Order No. 693, FERC stated its interest in NERC revising CIP-001 to better define sabotage and requiring notification to the certain appropriate federal authorities, such as the Department of Homeland Security. FERC Order 693 at PP 461, 462, 467, 468, 471. NextEra has provided an approach that accomplishes FERC’s objectives and remains within the framework of the drafting team, but also focuses the process of determining and reporting only those sabotage acts that could impact other BES systems. Today, there are too many events that are being reported as sabotage to all parties in the Interconnection, when in reality these acts have no material affect or potential impact to other BES systems other than the one that experienced it. For example, while the drafting team notes the issue of copper theft is a localized act, there are other localized acts of sabotage that are committed by an individual, and these acts pose little, if any, impact or threat to other BES systems other than the one experiencing the sabotage event. Reporting sabotage that

Organization	Yes or No	Question 2 Comment
		has no need to sent of everyone does not necessary add to the security or reliability of the BES. Related, there is a need to clarify some of the current industry confusion on who should (and has the capabilities to) be reporting to a boarder audience of entities. Hence, NextEra approach provides a clear definition of sabotage, as well as the process for determining and reporting sabotage. NextEra further believes that some of the requirements can be consolidated and more clearly stated, and NextEra has attempted to do that in the approach presented below. Lastly, NextEra comments on Attachment 1 are submitted in response to question 17. NextEra Approach Delete definition of Impact Event and its use in the requirements and in Attachment 1 Delete 13, 14, 15 and 19 in Attachment 1 Delete and replace R1 through R5 with the following: New Definition Attempted or Actual Sabotage: an intentional act that attempts to or does destroy or damage BES equipment or a Critical Cyber Asset for the purpose of disrupting the operations of BES equipment, Critical Cyber Asset or the BES, and has a potential to materially threaten or impact the reliability of one or more BES systems (i.e., is one act in a larger conspiracy to threaten the reliability of the Interconnection or other BES systems). R1. Each Responsible Entity shall document and implement a procedure (either individually or jointly with other Responsible Entities) to accomplish the reporting requirements, including the time frames, assigned to the Responsible Entity as set forth in Attachment 1 items 1 through 12, 16, 17 and 18 for reporting from the Responsible Entity to its Regional Entity and NERC, using the form in Attachment 2 or the DOE OE-417 reporting form. R2. Each Responsible Entity shall document and implement a procedure (either individually or jointly with other Responsible Entities) to report to its internal personnel with a need to know and its Reliability Coordinator an act of Attempted or Actual Sabotage, using the form in Attachment 2 or the DOE OE-417 reporting form, within one hour after a determination has been made that an act Attempted or Actual Sabotage has occurred. To make a determination that an act of Attempted or Actual Sabotage has occurred, the Responsible Entity shall document and implement a procedure that requires it, as soon as practicable after the discovering an act appearing to be Attempted or Actual Sabotage, to engage local law enforcement or the Federal Bureau of Investigation or Royal Canadian Mounted Police, as deemed appropriate, to assist the Registered Entity make such a determination. Upon receiving a report of Attempted or Actual Sabotage from a Responsible Entity, the Reliability Coordinator shall within one hour forward the report to other impacted Reliability Coordinators, Responsible Entities, Regional Entities, NERC, Department of Homeland Security, and the Federal Bureau of Investigation or the Royal Canadian Mounted Police. R3. Each Responsible Entity shall review (and conduct a test for sabotage only) of its documented procedure required in R1 and R2 with no more than 15 calendar months between tests for sabotage reporting. If, based on the review or test, the Responsible Entity determines there is a need to update its documented procedure, it shall update the procedures within 90 calendar days of the review or test.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments and suggestions. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Other revisions were made to the standard based on comments received on specific requirements. The DSR SDT believes that these revisions clarify the requirements and has provided additional details in response to comments from questions Q3, Q6, Q7, Q8, Q11, Q12, Q13, Q14 and Q17. Please see the revised standard. In regards to sabotage, the DSR SDT believes that the reporting of events supports the reliability of the BES. Sabotage usually is determined after the event is investigated and sabotage may be one aspect of a single event. The intent is to report events (per Thresholds of Reporting in Attachment 1) that have an impact on BES reliability. The background section of the standard provides guidance with respect to reporting events to law enforcement. For clarity, the DSR SDT has added the following sentence to the first paragraph under the heading "Law Enforcement Reporting": "These are the types of events that should be reported to law enforcement." The entire paragraph is: "The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting events. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES."		
Exelon	No	The definition of impact events should be reworded to align with OE-417 and to explicitly reference that only events identified in EOP-004 ? Attachment 1 are to be reported. Suggest the following:"An incident that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-opeation, environmental conditions, or human action as defined in EOP-004 Attachment 1." Propose the definition be changed to include material impact and read as follows; Any event which has either caused or has the potential to cause an adverse material impact to the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action?
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
City of Tallahassee (TAL)	No	While I agree with the overall concept, I am concerned with "or has the potential to impact." While the standard makes reference to Attachment 1 Parts A and B, the inclusion of the attachment is not in the definition. This leaves ambiguity in the definition that could enable second guessing by auditors. Proposed: "An impact event is any event that has either impacted or has the potential to impact (above the

Organization	Yes or No	Question 2 Comment
		thresholds described in EOP-004-2 Attachment 1) the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.”
Response: Thank you for your comments. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.”		
American Electric Power	No	The definition is too broad and vague. The text in the comment form has the following sentence Only the events identified in EOP-004 Attachment 1 are required to be reported under this Standard. The definition should contain that caveat or something similar.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.” Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
USACE	No	1) You cannot use the terms impact and event to define impact event. 2) The phrase “has the potential to impact” makes the definition too vague. Every action taken to modify the system or its components has the potential to impact the Bulk Electric System. 3) Recommend to change the definition to “Any occurrence which has adversely affected the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.”
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.” Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Consumers Energy	No	The definition of Impact Event seems very vague and nebulous. This definition should be modified to be clear and concise, such that entities clearly understand what is included within the definition.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.” Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Ameren	No	The documentation from the SDT included the reliability objective for EOP-004-2 which should be included in the definition of Impact Event. Our suggested alternate defintion for Impact Event: "An Impact Event is any event that has either caused, or has the likely potential to cause, an outage which could lead to Cascading. Such events will be identified as being caused by, to the best of the reporting entity's information: (1) equipment falure or equipment mis-operation, (2) environmental conditions, and/or (3) human actions."

Organization	Yes or No	Question 2 Comment
		This alternate wording includes the reliability objective and clarifies the three known, or likely, causes of the Impact Event.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
ISO New England, Inc	No	We question the need for this definition since by itself the term is not specific on the types of events that are regarded as having an impact. The detailed listing of events that fall into a reportable event category, hence the basis for the Impact Event, is provided in Attachment A. For that matter, these events that are to be reported can be called anything, or just simply be titled "Event to be Reported" without having to define them. Defining the term Impact Event does not serve the purpose of replacing the details in Attachment A, and such a term is not used anywhere else in the NERC reliability standards. In fact, for the term Impact Event to be fully defined, all the elements in Attachment A must become a part of it. We therefore suggest the SDT to consider not defining the term Impact Event, but rather use words to stipulate the need to have a plan, to implement the plan and to report to the appropriate entities those events listed in Attachment A. If the SDT still wishes to retain a definition despite our reservations noted above, we strongly suggest an improvement. The proposed definition of Impact Event is overly broad because of the use of "potential to impact" and the "Such as" list. Consider that routine switching has the potential to result in a mis-operation. In that regard most routine switching could be interpreted as an impact event. The "Such as" list should be struck and "potential" language should be struck. An alternative definition to consider: An Impact Event is any deliberate action designed to reduce BES reliability; unintended accident that could result in an Adverse Reliability Impact; or an unusual natural event that causes or could cause an Adverse Reliability Impact.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Calpine Corp	No	Adding a definition for Impact Event is unnecessary and does not provide useful clarification of the actual reporting requirement for events that either impact the Bulk Electric System or have the potential to impact the Bulk Electric System. The all-encompassing nature of the proposed definition seems to conflict with the finite listing of events that actually require reporting. Although FERC specifically requested additional clarification of the term sabotage to clarify reporting requirements, the Drafting Team is correct in noting that sabotage implies intent and that the intent of human acts is not always easily determined. The fact that intent is not always determinable within the reporting timeframe can be dealt with more simply by requiring (in attachment

Organization	Yes or No	Question 2 Comment
		1) that human intrusions that have not been identified within the reporting timeframe as theft or vandalism should be reported as potential sabotage pending further clarification. This approach negates the need for an additional definition that may cause confusion regarding which events are reportable and eliminates the potential for under-reporting based on the assumption that the cause might be theft or vandalism.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
BGE	No	Change the definition of "Impact Event", to add the following phase to the definition "Any event (listed in Attachment 1) which has either…." Also, the phrase "…or has the potential to impact the reliability…" is too vague and broad. Such broad statement is unhelpful in clarifying entities' compliance obligation and potentially creates conflicted reporting between entities. A clear statement of how the reliability is affected should be used, i.e., results in contingency emergency situation or IROL.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Alliant Energy	No	The proposed definition is not supported by any of the established bright line criteria that are contained within attachment 1. This Results Based Standard should close any loop-holes that could be read into any section, especially the definition. We recommend the definition be enhanced to read: Impact Event: Any Contingency which has either effected or has the potential to effect the Stability of the BES as outlined per attachment 1. Within this enhanced recommendation, presently defined NERC terms are used (Contingency and Stability), thus supporting what is current used within our industry. There is also a quantifiable aspect of as outlined per attachment 1 that clearly defines Impact Events. If the above definition is not adopted, we believe it should be rephrased to narrow the scope to those events that result from malicious intent or human negligence/error. We are concerned that by using phrases like unintentional or intentional human action in combination with damage or destruction basically means everything except copper theft becomes a reportable impact event (including planned actions we must perform to comply with CIP-007 R7).
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
CenterPoint Energy	No	CenterPoint Energy suggests that the phrase "…or has the potential to impact…" be deleted as it makes the definition vague and broad. Similar issues encountered in trying to define sabotage may resurface, such as

Organization	Yes or No	Question 2 Comment
		varying definitions or interpretations of "potential." If this standard is to support after-the-fact reporting, the focus should be on actual events, not potential situations or events. Effective and efficient prevention would come from analysis of actual events. Resources and reporting could become overwhelmed upon having to consider "potential." All references to "potential" should be removed from the standard, guidance, and attachments.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
ExxonMobil Research and Engineering	No	The use of the word potential is ominous.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Occidental Power Marketing	No	The SDT includes in the definition the "potential to impact the reliability of the BES." This seems vague, although Attachment 1 clarifies what actually has to be reported. An LSE may have limited or no knowledge of "potential to impact." The SDT may want to refine the definition, e.g., "to the extent the entities' knowledge could reasonably reveal the impact."
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Lincoln Electric System	No	As currently drafted, the proposed definition of Impact Event appears vague and provides entities minimal clarity in terms of distinguishing events of significance. Recommend the drafting team reference Attachment 1: Impact Events Tables within the definition to direct industry towards more specific criteria.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
American Transmission Company	No	ATC does not agree with the proposed definition and further disagrees whether a definition is needed at all. Proposed Definition: The definition, read outside of the proposed standard, does not provide Registered Entities with a clear meaning of the purpose of the definition. It is ATCs opinion that the SDT is using the term Impact Event as an introduction phrase to Attachment 1. ATC would be more comfortable if the

Organization	Yes or No	Question 2 Comment
		definition was dropped and the team would re-write the requirement to specifically point to Attachment 1. It is our opinion that this type of structure would achieve the goal of the team to get Registered Entities to report on events identified in Attachment 1.The other option is for the team to write into the definition that the events being discussed are limited to those identified in Attachment 1. Also the language currently being used in the definition includes potential and such as. These terms should be struck from the definition.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Ingleside Cogeneration LP	No	The SDT includes in the definition the potential to impact the reliabilty of the BES. This seems vague, although ultimately the events which meet the threshold of a reportable Impact Event are governed by the tables under Attachment 1. We believe that there should be close, if not perfect, synchronization between the EROs Event Analysis Process and Attachment 1 since they share the same ultimate goal as EOP-004-2 to improve industry awareness and BES reliability.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Duke Energy	No	The phrase "…or has the potential to impact…" makes this an impossibly broad definition, and demonstrating compliance will not be straightforward.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Constellation Power Generation	No	The currently proposed definition is vague and can be easily misinterpreted. Coining a term to define the events that the DSR SDT hopes to capture in EOP-004-2 is a difficult task, one that may not be necessary. Replacing the term Impact Events with events in Attachment 1, would eliminate the need to define such a term. In addition, the phrase or has the potential to impact the reliability is too vague and broad. Such broad statement is unhelpful in clarifying entities compliance obligation and potentially creates conflicted reporting between entities. The language in the reporting requirements should be limited to real impact events, while information sharing on near miss or deficiency incidents should be handled as good industry practices and not subject to onerous compliance obligations. The drafting team should also give careful consideration to the existing reporting and information sharing currently in place in the industry. When an event occurs, partners in the electric sector are notified as part of

Organization	Yes or No	Question 2 Comment
		existing requirements outside of NERC compliance.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Georgia System Operations Corporation	No	It is not clear for the purposes of complying with this standard what it means to impact reliability. Impact in what way. To what degree. Do not define this term. An alternative would be to define it as those events listed in Appendix 1.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Indeck Energy Services	No	It's not a definition. It needs some quantification, such as, a Reportable Disturbance (NERC glossary), a reportable event under DOE OE-417, sabotage or bomb threat. Defining it as having or potentially having an impact is no definition. What is an impact? It needs to be quantified or auditors will have license to define it any way that they want. It shouldn't be a NERC Glossary definition if its only use is in EOP-004. Within EOP-004, it can be defined as anything in Attachment 1.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Progress Energy	No	Progress Energy appreciates the Standard Drafting Teams work on this project. Any potential impact is too vague and impossible to measure. Progress is unsure of how the ERO or Regional Entity measure impact. Potential is very subjective.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Brazos Electric Power Cooperative	No	
Southern Company	Yes	There is concern that the proposed definition for Impact Event does not allow for prudent judgment and preliminary situational assessment by the entity to declare a Potential Impact Event (especially threats) as non-credible. The thresholds for reporting established in Attachment 1 ? Part A provide a somewhat definitive bright line with regard to those events identified in Part A, but for some of the events in Part B there should be allowance for an assessment by the entity to reasonably determine whether the event poses a credible threat

Organization	Yes or No	Question 2 Comment
		to the reliability of the BES. This is attempted in the footnote to the Forced Intrusion event in Attachment 1 ? Part B, but we think this allowance for entity assessment and prudent judgment needs to apply more pervasively, perhaps by including the term credible in the definition of Impact Event or at least by adding the term credible wherever the term physical threat is used.
Response: Thank you for your comments. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." The word "credible" could lead to many interpretations as well. Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
American Municipal Power	Yes	The definition of Impact Event is acceptable and an improvement. I feel it could be improved and simplified further. Consider changing Impact Event to a "reportable event."
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Liberty Electric Power LLC	Yes	I am interpreting the phrase "has the potential" to exclude events which had the potential, but did not impact the BES. An example would be a generation trip - if the trip had happened during a system emergency it could have affected the BES, but since it happened under normal conditions there is no reporting responsibility. Some assurance on this interpretation would be appreciated.
Response: The DSR SDT thanks you for your comment. We have deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Manitoba Hydro	Yes	"Disturbance" has a unique and traditional meaning in the electrical industry, basically meaning "a notable electrical event causing in imbalance of load and generation." Attempting to include the many scenarios can that can affect reliability blurred the current vision of "Disturbance" and the addition of "unusual occurrences" just added to the confusion. It never seemed appropriate to submit an unusual occurrence on a "Disturbance Report." "Impact Event" is very encompassing and then detailed specifically in Attachment 1.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
Independent Electricity System Operator	Yes	We do not have any issue with the wording of the definition, but question the need for this definition since by itself the term is not specific on the types of events that are regarded as having an "impact." The detailed listing of events that fall into a reportable event category, hence the basis for the Impact Event, is provided in Attachment A. For that matter, these events that are to be reported can be called anything. Defining the term Impact Event does not serve the purpose of replacing the details in Attachment A, and such a term is not

Organization	Yes or No	Question 2 Comment
		used anywhere else in the NERC reliability standards. In fact, for the term Impact Event to be fully defined, all the elements in Attachment A must become a part of it. We therefore suggest the SDT to consider not defining the term Impact Event, but rather use words to stipulate the need to have a plan, to implement the plan and to report to the appropriate entities those events listed in Attachment A.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.” Reporting is only required for those events and for the given thresholds listed in Attachment 1.		
PPL Electric Utilities	Yes	PPL EU agrees with the definition. We would like to point out that our interpretation of the definition excludes maintenance work. Our interpretation also concludes that maintenance work that does not go as planned or goes awry and impacts the reliability of the BES would be an impact event and reported as required per Attachment 1.
Response: Thank you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.” Reporting is only required for those events and for the given thresholds listed in Attachment 1.

Response: Thank you for your response. Most commenters who responded to this question disagreed with the proposed definition and some suggested that the definition is not needed. In response, the drafting team has deleted the proposed defined term "Impact Events" and will use the generic term "event." Reporting is only required for those events and for the given thresholds listed in Attachment 1.

3. Do you agree that the DSR SDT has provided an equally efficient and effective solution to the FERC Order 693 directive to "further define sabotage"? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: Most stakeholders agreed that the drafting team addressed the directive to further define sabotage. Commenters generally agreed that the DSR SDT approach in the currently proposed solution effectively addresses FERC Order 693 directive. The approach clarifies the triggering event for an entity to take action and, by deleting all references to "sabotage," in effect removes the very term that had no clear definition.

Organization	Yes or No	Question 3 Comment
Pepco Holdings Inc and Affiliates	No	See #2. With out the explanation contained in background information, over time those that have not been involved with this standard development will struggle with how to interpret the code words of non environmental and intentional human action.
Response: The DSR DT thanks you for your comment. This is a Results-based standard and the format includes all of the information, with the exception of the Rationale boxes, through the ballot and filing of the standard. The background section of the proposed standard will be retained with the standard for future reference.		
Midwest ISO Standards Collaborators	No	In general, we agree that the standard drafting team has provided an equally efficient and effective alternative, but we wonder if the SDT has not in essence already defined sabotage in their description for why they cant define sabotage. It seems that sabotage involves willful intent to destroy equipment. In general, intent would have to be determined by an investigation of law enforcement. This could be part of the definition. There might be some obvious acts that could be included without investigation such as detonation of a bomb. Is it possible for the SDT to use the DOE definition for sabotage? We encourage the SDT to provide a definition for sabotage.
Response: The DSR DT thanks you for your comment. The DSR SDT believes that the reporting of events supports the reliability of the BES. Sabotage usually is determined after the event is investigated and that sabotage may be one aspect of a single event. The intent is to report (per Thresholds of Reporting in Attachment 1) events that have an impact on BES reliability. The background section of the standard provides guidance with respect to reporting events to law enforcement. For clarity, the DSR SDT has added the following sentence to the first paragraph under the heading "Law Enforcement Reporting": "These are the types of events that should be reported to law enforcement." The entire paragraph is: o "The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting events. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely		

Organization	Yes or No	Question 3 Comment
upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES.”		
Compliance & Responsiblity Organization	No	See comments set forth in number 2.
Response: The DSR DT thanks you for your comment. Please see the DSR DT response above for question number 2.		
Sweeny Cogeneration LP	No	The threshold for reporting what could be sabotage still leaves the door open for second guessing after-the-fact. For example, if graffiti is sprayed on a BES asset, the entity is to assume that the event is not to be reported. However, intent to harm the BES may be discovered at a later point with ramifications to the entity who did not report it. A solution may be to strengthen footnote 3 to both reporting tables, which makes an allowance to report if you cannot reasonably determine likely motivation of sabotage. If acceptable methods to provide justifiable evidence that reporting was NOT required, then this loophole may be corrected.
Response: The DSR SDT thanks you for your comment. The DSR SDT believes that the reporting of events supports the reliability of the BES. Sabotage usually is determined after the event is investigated and that Sabotage may be one aspect of a single event. The intent is to report events (per Thresholds of Reporting in Attachment 1) that have an impact on BES reliability. Attachment 1 has been updated per comments received.		
USACE	No	The DSR SDT should have defined sabotage since it helps the SDT working on CIP standards further define its action. Sabotage can be defined as the deliberate act of destruction, disruption, or damage of assets to impact the reliability of the BES.
Response: The DSR SDT thanks you for your comment. The DSR SDT believes that the reporting of events supports the reliability of the BES. Sabotage usually is determined after the event is investigated and that Sabotage may be one aspect of a single event. The intent is to report events (in Attachment 1) that have an impact on BES reliability. Attachment 1 has been updated per comments received.		
Consumers Energy	No	EOP-004 does not appear to address a reliability need. Reporting after-the-fact information such as that described in Impact Events does not do anything to improve Bulk Electric System reliability. Therefore, we recommend that CIP-001 be updated to address sabotage events, and that NERC otherwise rely on the statutory reporting to the DOE that is represented by OE-417 for any after-the fact information. The remainder of our comments reflects detailed comments on the posted draft, presuming that our objection

Organization	Yes or No	Question 3 Comment
		represented above will be disregarded.
Response: The DSR SDT thanks you for your comment. Providing event reporting information will start the event analysis process done by the current NERC Event Analysis Program. EOP-004-2 is the reporting vehicle to the ERO that will support the analysis phase of any event.		
Ameren	No	The SDT did not further define sabotage as directed by FERC, but instead created a new term that does not address the order. The Term Impact Event has no clarity or quantitative qualities by which an entity can determine what should be reported. The use of the phrase "has the potential to impact reliability" has such a vague scope, an auditor can interpret to mean any "off-normal" condition, which makes this standard impossible to comply with. The SDT should use the DOE definition of sabotage as follows: Sabotage - Defined by Department of Energy (DOE) as: An actual or suspected physical or Cyber attack that could impact electric power system adequacy or reliability Vandalism that targets components of any security system on the Bulk Electric System Actual or suspected Cyber or communications attacks that could impact electric power system adequacy or vulnerability, including ancillary systems which support networks (e.g. batteries) Any other event which needs to be reported by the Balancing Authority (Transmission Operations) to the Department of Energy. Sabotage can be the work of a single saboteur, a disgruntled employee or a group of individuals.
Response: The DSR SDT thanks you for your comment. The DSR SDT believes that the reporting of events supports the reliability of the BES. Sabotage usually is determined after the event is investigated and that Sabotage may be one aspect of a single event. The intent is to report events (per Thresholds of Reporting in Attachment 1) that have an impact on BES reliability. Attachment 1 has been updated per comments received. EOP-004-2 sets the minimum reporting requirements for events.		
Calpine Corp	No	The additional definition for “Impact Event” is unnecessary and does not provide useful clarification regarding actual reporting requirements. Sabotage, whatever the exact definition used, implies intent to damage or disrupt. The committee correctly notes that determination of actual intent is not always readily available. However, adding a general expansive definition encompasses all events that might disrupt the Bulk Electric System does not add clarity to the types of events that require reporting - which are listed in detail in Attachment 1.The issue can be more simply addressed by replacing the item “Human Intrusion” on Attachment 1, as follows: Event: Sabotage (note 3) Entity with Reporting Responsibility: All affected Responsible Entities listed

Organization	Yes or No	Question 3 Comment
		in the Applicability Section of this Standard. Threshold for Reporting: Forced Intrusions at a BES facility that have not been determined within the reporting period to be theft or vandalism that does not affect the operability of BES equipment. Note 3 For purposes of reporting under Attachment 1, reportable sabotage includes all forced intrusions at BES facilities that have potential to cause, or cause, any of the disturbance events listed in Attachment 1 and have not been determined to be theft or vandalism that did not result in any event listed in Attachment 1. Responsible Entities are not required to report incidents of theft or vandalism that do not result in disturbance events. This approach also eliminates the need to reference copper theft as a particular type of theft that does not require reporting.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.”. Attachment 1 has been updated per comments received. The DSR SDT believes that the reporting of events supports the reliability of the BES. Sabotage usually is determined after the event is investigated and that Sabotage may be one aspect of a single event. The intent is to report events (per Thresholds of Reporting in Attachment 1) that have an impact on BES reliability. Footnotes have been updated per comments received.		
CenterPoint Energy	No	CenterPoint Energy would agree if the definition for Impact Event was changed as suggested in the response to Question 2.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted the proposed defined term “Impact Events” and will use the generic term “event.”. Attachment 1 has been updated per comments received. The DSR SDT believes that the reporting of events supports the reliability of the BES.		
Duke Energy	No	Sabotage is still identified on the flowchart. Timeframes for reporting on Attachment 1 should be made consistent with DOE OE-417 reporting. Also on Attachment 1, the Threshold for Reporting on a Forced Intrusion Event should be Affecting BES reliability instead of At a BES facility.
Response: The DSR SDT thanks you for your comment. The DSR SDT has updated the flowchart. The DOE Form OE-417 is reviewed biennially by the DOE and can be updated or changed without NERC’s involvement. The DSR SDT has taken into consideration the possible use of Form OE-417 to report events to NERC and agrees that this will fulfill EOP-004-2’s reporting requirements. The DSR SDT has removed sabotage from the flowchart and has replaced it with: “Criminal act under federal jurisdiction.”		

Organization	Yes or No	Question 3 Comment
Indeck Energy Services	No	The SDT hasn't defined sabotage. Attachment 1 does not do justice to the concept of sabotage. Sabotage should be defined as any intentional damage to BES facilities the causes a Reportable Disturbance, reportable event under DOE OE-417 or involves a bomb or bomb threat.
Response: The DSR SDT thanks you for your comment. The DSR SDT believes that the reporting of events supports the reliability of the BES. The intent is to report events (per Thresholds of Reporting in Attachment 1) that have an impact on BES reliability. Sabotage usually is determined after the event is investigated and that Sabotage may be one aspect of a single event. The DOE Form OE-417 is reviewed biennially by the DOE and can be updated or changed without NERC's involvement. The DSR SDT has taken into consideration the possible use of Form OE-417 to report events to NERC and agrees that this will fulfill EOP-004-2's reporting requirements.		
Exelon	Yes	Exelon agrees with the DSR SDT in that the currently proposed solution effectively addresses the intent of FERC Order 693 directive to both clarify the triggering event for an entity to take action and by deleting all references to "sabotage" in effect removes the very term that had no clear definition.
Response: Thank you for your comment.		
Georgia Transmission Corporation & Oglethorpe Power Corporation	Yes	We agree with the approach taken by the SDT.
Northeast Power Coordinating Council	Yes	It is more important to report suspicious events than to determine if an event is caused by sabotage before it gets reported.
Midwest Reliability Organization	Yes	Sabotage is usually associated with a malicious attack. Entities have always lacked the clinical expertise to determine if an event was malicious or not. The Impact Event bright line criteria clearly states what the minimum reporting requirements are.
Manitoba Hydro	Yes	"Impact event", The DSR SDT reasoning for this. 'A sabotage event can only be typically determined by law enforcement after the fact" is very creative and concise!
Response: The DSR SDT thanks you for your comment.		

Organization	Yes or No	Question 3 Comment
Independent Electricity System Operator	Yes	We agree since it is more important to report suspicious events than to determine if an event is caused by sabotage before it gets reported.
Response: The DSR SDT thanks you for your comment.

Response: The DSR SDT thanks you for your response. Several commenters proposed revisions to the definition, and after deliberation the SDT has deleted the proposed defined term "Impact Events" and will use the generic term "event". Attachment 1 has been updated per comments received. The DSR SDT believes that the reporting of events supports the reliability of the BES.		

4. Do you agree with the proposed applicability of EOP-004-2 shown in Section 4 and Attachment 1 of the standard? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: The SDT believes that it has properly identified registered entities that may potentially have events and the appropriate types of events. A Registered Entity is only required to submit an events report for events listed in Attachment 1 if the registered entity was affected by the event. If an event occurs, only affected Registered Entities listed in Attachment 1 are required to submit a report on the event. The SDT believes that the industry will gain valuable information from having different perspectives of a single event. Differing viewpoints on the same event will provide for better clarity to all parties on the actual impact to the bulk electric system. The SDT would like to point out that reporting of events is from the time of identification not the time of the event. In response to the comments received, the SDT has made numerous enhancements to Attachment 1. **These revisions include:**

- **Added new column "Submit Attachment 2 or DOE OE-417 Report to:" which references Part 1.3 and provide the time required to submit the report.**
- **Combined Parts A and B into one table and reorganized it so that the events are listed in order of reporting times (either one hour or 24 hours)**
- **Removed references to "Impact Event" and replaced with the specific language for the event type in the "Entity with Reporting Responsibility". For example, replaced "Impact Event" with "automatic load shedding".**

The ERO and the RE were added as applicable entities to reflect CIP-002 applicability to this standard.

Organization	Yes or No	Question 4 Comment
Georgia Transmission Corporation & Oglethorpe Power Corporation	No	We do not believe that GO, TO, TSP, DP, or LSE should be included in the applicability of this standard. It is our opinion that the reporting requirements lie primarily with the applicable operator and should be limited as such. We recommend modifications as discussed in our response to question 6 to clearly define what types of events each Responsible Entity needs to prepare for. Currently, it seems that multiple entities are being required to report the same event for some events where only one entity should have a reporting responsibility. However, NERC should not decide which one entity should report a given event. The entities should have the flexibility to create a process which allows for coordination and communication at a local level and to work out with neighboring entities who might ultimately report events to the applicable

Organization	Yes or No	Question 4 Comment
		organizations.
Response: Thank you for your comments. The SDT disagrees that the operators are the only entities with obligations to report; owners and users may have very credible and valuable information relating to events. Such information may be extremely beneficial in developing lessons learned and analyzing events. Your suggestion to allow for local coordination and communication is a practical suggestion and the standard allows for it.		
Northeast Power Coordinating Council	No	Disagree with the following inclusion/exclusion of several entities: a. The applicable entities listed in Section 4 capture all the entities that are assigned a reporting responsibility in Attachment 1 of the standard. While some events in Attachment 1 have specific entities identified as responsible for reporting, certain events refer to the entities listed in specific standards (e.g. CIP-002) as the responsible entities for reporting. The latter results in IA, TSP and LSE (none of which being specifically identified as having a reporting responsibility) being included in the Applicability Section. NERC should be included in the Applicability Section as it is an applicable entity identified in CIP-002-3. b. If the above approach was not strictly followed, then suggest the SDT review the need to include IA, TSP and LSE since they generally do not own any Critical Assets and hence will likely not own any Critical Cyber Assets.
Response: The DSR SDT thanks you for your comment. The SDT believes it needs to follow the requirements of the standards as they currently apply. Since these entities are applicable to the underlying standards identified in Attachment 1, then they will be subject to reporting. If those standards are modified to remove the applicability to these functional registrations, then the appropriate SDT can modify the applicability of this standard. The SDT has reviewed the CIP-002-3 standard and has included the ERO and the RE in this standard.		
Pacific Northwest Small Public Power Utility Comment Group	No	We believe that facilities used in the local distribution of electric energy should be excluded from these requirements due the language of 16 U.S.C. ? 824o(a)(1) and 16 U.S.C. ? 824o(i)(1).
Response: The DSR SDT thanks you for your comment. The SDT constructed Attachment 1 based upon the existing requirements in the various reliability standards and established reporting obligations. The information about events and the analysis of those events will be useful to all owners, operators, and users of the bulk power system. The SDT has clarified the reporting requirement such that only those affected by the event are required to submit a report.		
PSEG Companies	No	The PSEG Companies believe the defining language, roles and responsibilities outlined in Attachment 1 are unclear and inconsistent. For example fuel supply emergency reporting footnote 2 “Report if problems with the fuel supply chain result in the projected need for emergency actions to manage reliability” attempts to clarify the condition for reporting but does not. Whose “emergency actions” are being referred to in the footnote? It is not clear if those actions would be related to the specific station or the overall Bulk Electric

Organization	Yes or No	Question 4 Comment
		System (BES). Can this be interpreted to imply a gas supply issue to one generating station as the result of pipeline maintenance, or local pressure issues would also requiring reporting? The PSEG Companies believe the definition of a fuel supply emergency needs to be more specific and less open to broad interpretation. In addition, the "Time to Submit Report" section of attachment 1 has a significant number of changes from the previous version. Accelerating the twenty four (24) hour to one (1) hour requirement for submitting the reports for several of the events takes resources away from managing the actual event. For the above comments failure to submit a report within 1 hour is a high or severe VSL for a fuel supply emergency. This approach seems inconsistent with ensuring the operation and reliability of the BES. One (1) hour reporting, in most cases, is not adequate time to compile the needed information, prepare report, ensure the accuracy, submit, and simultaneously manage the actual event. We recommend 24 hour reporting for: Damage or destruction to BES, Fuel Supply Emergency, Forced Intrusion, and Risk to BES equipment sections of Attachment 1.
Response: The DSR SDT thanks you for your comment. The SDT appreciates the observation on Fuel Supply Emergency and has adjusted Attachment 1 to address it. Reporting under the standard requires that the Registered Entity provide what information it has at the time of the report. The report may not provide the entire record or identification of the event. If the Registered Entity desires to submit an updated report, it may choose to do so; but there is no obligation to do so. The DSR SDT has significantly revised Attachment 1. We have removed the timing column and replaced it with more specific information regarding which form to submit and to whom the report is to be submitted. All events are now to be reported within 24 hours with the exception of Destruction of BES equipment, Damage or destruction of Critical Assets and Damage or destruction of Critical Cyber Asset events, Forced Intrusion, Risk to BES equipment and Detection of a reportable Cyber Security Incident. These events are to be reported within 1 hour. Notification of law enforcement (per Requirement R1, Part 1.3.2) is only required for these events. The background section of the standard provides guidance with respect to reporting events to law enforcement. For clarity, the DSR SDT has added the following sentence to the first paragraph under the heading "Law Enforcement Reporting": "These are the types of events that should be reported to law enforcement." The entire paragraph is: o "The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting events. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES."		
Dominion	No	1) Several of the events require filing a written Impact Event report within one hour. System Separation, for example, is going to require an "all hands on deck" response to the actual event. We note that the paragraph above Attachment 1, Part A indicates that a verbal report would be allowed in certain circumstances, but this

Organization	Yes or No	Question 4 Comment
		is the same issue with the formal report in that the system operators are concerned with managing the event and not the reporting requirements. Another example would be the Loss of Off-site power to a nuclear generating plant. Suggest reconsideration of one hour reporting requirement for events requiring extensive operator actions to mitigate; 2) Several events seem to have the “Threshold for Reporting” contained in footnotes rather than in the table. For example, Damage or destruction of BES equipment - Footnote 1, Fuel supply emergency - Footnote 2, etc.) Suggest moving the actual threshold into the table; 3) If one hour reporting remains as indicated in Attachment 1; align/rename events similar to that of the ‘criteria for filing’ events listed in DOE OE-417 for consistency.
Response: Thank you for your comment. Reporting under the standard requires that the Registered Entity provide what information it has at the time of the report. The report may not provide the entire record or identification of the event. If the Registered Entity desires to submit an updated report, it may choose to do so; but there is no obligation to do so. Based upon comments received, the SDT has updated the time reporting requirements in Attachment 1. Most events are to be reported within 24 hours. The DSR SDT has retained a one-hour reporting requirement for those events the DSR SDT believes are the types of event that would be typically reported to law enforcement and are of a more urgent nature.		
SPP Standards Review Group	No	While the SDT has recognized the issue of applicability to GO/TO in its background information with the Unofficial Comment Form, we still do not feel comfortable with the GO/TO being listed as a responsible entity when in fact it may be days before they become aware of an event worthy of reporting. If the GOP/TOP makes the report, are the GO/TO still responsible for filing a report? If the GOP/TOP do not file the report, would the GO/TO then be non-compliant? This issue appears to put additional risk on the GO/TO over which they have no control. We need some mechanism to eliminate unnecessary risk while at the same time ensuring that we have coverage for the BES. Perhaps this could be done through delegation agreements between the entities involved or through allowances within the standard itself. For example, could the phrase “appropriate parties in the Interconnection” as currently contained in CIP-001-1, R2 be incorporated into the standard to basically replace GO/TO?
Response: The DSR SDT thanks you for your comment. The SDT believes that it has properly identified registered entities that may potentially have events and the appropriate types of events. A Registered Entity is only required to submit an events report for events listed in Attachment 1 if the registered entity was affected by the event. If an event occurs, only affected Registered Entities listed in Attachment 1 are required to submit a report on the event. Having reports from different entities for the same event may provide a more complete understanding of the event.		
FirstEnergy	No	1. Attachment 1, Part A - Energy Emergency requiring Public appeal for load reduction - In the current draft Standard, the applicability has been revised from an RC and BA to "initiating entity." We can’t see where the GO/GOP would ever make this determination. Needs to be clarified.

Organization	Yes or No	Question 4 Comment
		2. Attachment 1, Part A - Energy Emergency requiring system-wide voltage reduction - In the current draft Standard, the applicability has been revised from an RC, TO, TOP, and DP to "initiating entity." We can't see where the GO/GOP would ever make this determination. Needs to be clarified. 3. Attachment 1, Part A - Voltage Deviations on BES facilities - A GOP may not be able to make the determination of a +/- 10% voltage deviation for ≥ 15 continuous minutes, this should be a TOP RC function only. 4. Attachment 1, Part A - Loss of offsite power (LOOP) classification should not apply to nuclear generators. The impact of a LOOP is dependent on the design of the specific nuclear unit and may not necessarily result in a unit trip. If a LOOP did result in a unit trip, the NRC requires notification by the nuclear GO/GOP via the Emergency Notification System (ENS), and time allowed for that notification (1 hour, 4 hours, 8 hour, or none at all) is, as mentioned above, dependent on the design of the plant. We believe it would be beneficial if consideration were given to coordinating reporting requirements for nuclear units with existing required notifications to the NRC to avoid duplication of effort. 5. Attachment 1 should align NERC Standard NUC-001 concerning the importance of ensuring nuclear plant safe operation and shutdown. If a transmission entity experiences an event that causes a loss of off-site power as defined in the nuclear generator's Nuclear Plant Interface Requirements, then the responsible transmission entity should report the event within 24 hours after occurrence. Also, for clarity "grid supply" should be replaced with "source" to ensure that notification occurs on a loss of one or multiple sources to a nuclear power plant. 6. Attachment 1, Part A - Damage or destruction of BES equipment. See Nuclear comments on question 17 below. 7. Attachment 1, Part B - Forced intrusion at a BES facility. See Nuclear comments on question 17 below. 8. Attachment 1, Part B - Risk to BES equipment from a non-environmental physical threat. What constitutes a "risk" to the reporting entity is still somewhat ambiguous, and although the DSR SDT has provided some examples, without more specific criteria for this event the affected entity will have difficulty in determining within 1 hour if a report is necessary. Also, see Nuclear comments on question 17 below.
Response: The DSR SDT thanks you for your comment. As a general note, the Applicability section of the standard includes each entity that will be responsible for reporting an event. Attachment 1 has a column "Entity with Reporting Responsibility" to indicate the appropriate entity that is required to report under this standard. For items 1-3 above, the GO or GOP will not be the likely deficient or initiating entity. This will most likely be the BA, TOP or the RC. For item 4, the LOOP event is to be reported by the TO and TOP, not the nuclear plant. For item 5, the TO and TOP are to report within 24 hours. The DSR discussed using "source", however this indicates a single source whereas "supply" encompasses all sources. For items 6, 7 and 8, please see response to Question 17 comments.		
SERC OC Standards Review Group	No	We agree that all of the entities listed should be responsible for reporting an event, provided they own BES assets, but guidance should be given for which entity in Attachment 1 actually files the report to avoid duplication for a single event.

Organization	Yes or No	Question 4 Comment
Response: The DSR SDT thanks you for your comment. The SDT believes that it has properly identified registered entities that may potentially have events and the appropriate types of events. A Registered Entity is only required to submit an events report for events listed in Attachment 1 if the registered entity was affected by the event. If an event occurs, only affected Registered Entities listed in Attachment 1 are required to submit a report on the event. Having reports from the different entities may provide valuable information on understanding the event.		
PJM Interconnection LLC	Yes	1. We agree that the entities listed should be responsible for ensuring events are reported, provided they own BES assets, but more guidance should be provided on which entity in Attachment 1 should actually file the report to avoid multiple entities reporting a single event. Current Attachment 1 results in significant duplicate reporting. 2. Although the applicable entities listed in Section 4 capture all entities that are assigned a reporting responsibility in Attachment 1, some events in Attachment 1 refer to entities applicable under a different standard (e.g CIP-002) as the responsible entities for reporting. This results in IA, TSP, and LSE (none of which, generally own Critical Assets and hence not likely own CCAs) as being responsible for reporting an event. We urge the SDT review the need to include IA, TSP, and LSE in applicable entities. Also, why is NERC an applicable entity in CIP-002-3 but not in this standard?
Response: Thank you for your comments. 1. The “Entity with Reporting Responsibility” column of Attachment 1 indicates who is responsible for submitting reports for each event type. It is expected that multiple reports will be received for the same event. Each entity experiencing the event may see something different. This reporting will allow for a more robust analysis process after the fact. 2. The IA. TSP and LSE are included as applicable entities for EOP-004 only because they are applicable under CIP-002. The only events that these entities are required to report are related to cyber assets. The ERO and the RE were added as applicable entities for consistency with CIP-002.		
SRP	No	The threshold for Reporting is broad, vague and repetitive. "Three or more BES Transmission Elements" is vague and could be interpreted as 3 breakers in a large system.
Response: The DSR SDT thanks you for your comment. Based upon comments received, the SDT has modified Attachment 1 accordingly.		
We Energies	No	Attachment 1: From the NERC Glossary, an Energy Emergency: A condition when a Load-Serving Entity has exhausted all other options and can no longer provide its customers’ expected energy requirements. The first four events listed can only apply to an LSE. Loss of Firm Load for >15 Minutes: By the NERC Glossary definitions of DP and LSE, the LSE would seem to be more appropriate than the DP. With the proposed one-hour reporting requirement, the industry would be undertaking significant regulatory risk with respect to timely reporting. The requirement to report the crime-based events in the field within one

Organization	Yes or No	Question 4 Comment
		hour, as shown in Attachment 1 Part A or Part B will be difficult. We could even discover a theft in progress with the suspect trapped inside the substation fence and the police attempting to make a safe arrest. We need more reporting time, especially when they have not even resulted in an outage. The industry is keenly interested in understanding the benefit of taking on the risk. What analysis, insight, warnings or recommendations would the ES-ISAC provide to the reporting entity, the industry or to law enforcement agencies in the hours after such an incident is reported? Note too that DOE requires reporting of a physical attack within one hour only when it "causes a major interruption or major negative impact on critical infrastructure facilities or to operations." In lesser cases, the entity gets up to six hours if it "impacts electric power system reliability." DOE has said that it is not interested in copper theft unless it causes one of these events. If the SDT is working to ensure consistency of reporting requirements, please consider DOE requirements too. Meeting the reporting deadline will mean that available resources in the control center will be devoted to ensuring the report is filed on time instead of making the site safe and arranging for prompt repair. It may even mean that law enforcement won't be contacted until the forms are filed with the ES-ISAC. The exception contained in footnote #1 of Attachment 1 with respect to copper theft is not an exception at all. The majority of copper theft from substations is, in fact, such grounding connectors which may or may not render the protective relaying inoperative. You could end up receiving reports from all over the USA, Canada and Mexico, mostly on Monday mornings as weekend copper thefts are discovered. Attachment 1 Part A table also contains redundancies. One of the cells reads, "Damage or Destruction of Critical Asset." One cannot destroy something without damaging it first. Consequently, it is sufficient to simply say, "Damage to a Critical Asset." Apply to all cells with the same phrase.

Response: Thank you for your comments. Only Registered Entities affected by the event have to submit a report. Entities that were not affected by the event are under no obligation to submit a report. Registered Entities are to report what information they have at the submission timeline. The SDT recognizes that a final report may not be possible at the submission time. The reporting requirements are consistent with the current reporting requirements of the various authorities. The one hour reporting times are listed as "one hour within recognition of an event". This should be sufficient to allow the reporting entity time to submit the report after the event has been recognized. Based upon comments received from many stakeholders, the SDT has modified Attachment 1. The background section of the standard provides guidance with respect to reporting events to law enforcement. For clarity, the DSR SDT has added the following sentence to the first paragraph under the heading "Law Enforcement Reporting": "These are the types of events that should be reported to law enforcement." The entire paragraph is:

o "The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting events. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES."

Organization	Yes or No	Question 4 Comment
Exelon	No	Remove LSE. As has been determined in previous filings, FERC has ruled that asset owning DP’s must be registered as LSE’s. The standard as proposed is applicable to DP’s. This addresses any concern with a “reliability gap” for reporting events that could have an adverse material impact to the BES. See FERC Docket RC-07-4-003, -6-003, -7-003 paragraphs 24 and 25. “The Commission approves … revisions to the Registry Criteria to have registered distribution providers also register as the LSE for all load directly connected to their distribution facilities… The registration of the distribution provider as the LSE for all load directly connected to its distribution facilities is for the purpose of compliance with the Reliability Standards. As NERC explains, distribution providers have both the infrastructure and access to information to enable them to comply with the Reliability Standards that apply to LSEs… The Commission finds that, based on these facts, NERC acted reasonably in determining that the distribution provider is the most appropriate entity to register as the LSE for the load directly connected to its distribution facilities.” Attachment 1, Part A – Energy Emergency requiring Public appeal for load reduction – In the current draft Standard, the applicability has been revised from an RC and BA to "initiating entity.” As a GO/GOP, I cannot see any event where a GO/GOP would be the responsible "initiating entity" or have the ability to determine an "Energy Emergency.” Suggest revising back to specific entities that would be likely responsible for this action (e.g., RC, BA, TOP). Attachment 1, Part A – Energy Emergency requiring system-wide voltage reduction – In the current draft Standard, the applicability has been revised from an RC, TO, TOP, and DP to "initiating entity.” As a GO/GOP, I cannot see any event where a GO/GOP would be the responsible "initiating entity" or have the ability to determine an "Energy Emergency" related to system-wide voltage reduction. Suggest revising back to specific entities that would be likely responsible for this action. Attachment 1, Part A – Voltage Deviations on BES facilities - A GOP may not be able to make the determination of a +/- 10% voltage deviation for ≥ 15 continuous minutes, this should be a TOP RC function only. Attachment 1, Part A – Loss of off-site power (grid supply) affecting a nuclear generating station – this event applicability should be removed in its entirety for a Nuclear Plant Generator Operator. The impact of loss of off-site power on a nuclear generation unit is dependent on the specific plant design, if it is a partial loss of off-site power (per the plant specific NPIRs) and may not result in a loss of generation (i.e., unit trip). If a loss of off-site power were to result in a unit trip, an Emergency Notification System (ENS) would be required to the Nuclear Regulatory Commission (NRC). Depending on the unit design, the notification to the NRC may be 1 hour, 8 hours or none at all. Consideration should be given to coordinating such reporting with existing required notifications to the NRC as to not duplicate effort or add unnecessary burden on the part of a Nuclear Plant Generator Operator during a potential transient on the unit. In addition, if the loss of off-site power were to result in a unit trip, if the impact to the BES were ≥2,000 MW, then required notifications would be made in accordance with the threshold for reporting for Attachment 1, Part A – Generation Loss. However, to align with the importance of ensuring nuclear plant safe operation and shutdown as implemented in NERC Standard NUC-001, if a transmission entity experiences an event that causes an unplanned loss of off-site power (source) as defined in the applicable Nuclear Plant Interface Requirements, then the responsible

Organization	Yes or No	Question 4 Comment
		transmission entity should report the event within 24 hours after occurrence. In addition, replace the words "grid supply" to "source" to ensure that notification occurs on an unplanned loss of one or multiple sources to a nuclear power plant. Suggest rewording as follows (including replacing the words "grid supply" to "source" and adding in the word "unplanned" to eliminate unnecessary reporting of planned maintenance activities in the table below): Event Entity with Reporting Responsibility Threshold for Reporting Time to Submit Report Unplanned loss of off-site power to a Nuclear generating plant (source) as defined in the applicable Nuclear Plant Interface Requirements (NPIRs) Each transmission entity responsible for providing services related to NPIRs (e.g., RC, BA, TO, TOP, TO, GO, GOP) that experiences the event causing an unplanned loss of off-site power (source) Unplanned loss of off-site power (source) to a Nuclear Power Plant as defined in the applicable NPIRs. Within 24 hours after occurrence
Response: Thank you for your comments. The SDT constructed Attachment 1 based upon the existing requirements in the various reliability standards and established reporting obligations. The LSE is an applicable entity under CIP-002 and CIP-008. The types of events that you list are not applicable to a GO/GOP. The Applicability section of the standard lists each entity that is applicable for some portion of the standard. The information in Attachment 1 specifies which entity must report for which type of event. The loss of off-site power is only applicable to the TO and TOP and not the nuclear plant operator.		
SDG&E	No	SDG&E recommends that “Load Serving Entity,” “Transmission Service Provider,” and “Interchange Authority” be removed from the proposed applicability shown in Section 4. These entities do not own assets that could have an impact on the Bulk Electric System. Additionally, none of these entities is listed as an “Entity with Reporting Responsibility” in Attachment 1. Finally, “Transmission Service Provider” is covered by either “Transmission Owner” or “Balancing Authority,” which are entities also listed in the proposed Applicability section, and “Load Service Entity” and “Interchange Authority” are covered by “Balancing Authority.”
Response: Thank you for your comments. The SDT constructed Attachment 1 based upon the existing requirements in the various reliability standards and established reporting obligations. The LSE, TSP and IC are applicable entities under CIP-002 and CIP-008.		
United Illuminating Co	No	Will an entity be required to develop an Operating Process for every Impact Event in Attachment 1, or only those events that apply to its Registration. For example, does a DP require evidence of an Operating Process/Procedure for Voltage Deviations on a BES Facility? Some items in Attachment 1 state “Each RC, BA, TOP, DP that experiences the Impact Event” (such as Loss of Firm Load). DP’s may have arranged with TOP and RC to communicate the event to TOP who then will file the NERC report and OE-417. The requirements in the Standard would allow for this as long as the Operating Plan documents it. Attachment 1 though can be interpreted that this arrangement would not be allowed and each entity shall file its own and separate report. UI suggests that Attachment 1 be modified to allow for an Entities Operating Plan to rely on another Entity making the final communication to NERC. “Each RC, BA, TOP, DP that experiences the Impact Event, either individually or combined on a single filing”

Organization	Yes or No	Question 4 Comment
Response: The DSR SDT thanks you for your comment. The SDT believes that it is not necessary to develop a separate Operating Process for each event, unless the company requires it. The SDT feels that any Registered Entity affected by an event needs to submit a report. The SDT believes that the Registered Entity can utilize any resource it has available to complete the reporting obligations and does not believe that Attachment 1 inhibits any options from being used. Based upon comments received, the SDT has decided to remove the definition of Impact Event from the standard and leave as identified through Attachment 1.		
American Municipal Power	No	No, I do not agree. The DP and LSE functions should be removed.
Response: The DSR SDT thanks you for your comment. The SDT constructed Attachment based upon the existing requirements in the various reliability standards and established reporting obligations. This information will be useful to all owners, operators, and users of the bulk power system. The DP and LSE are applicable entities under CIP-002 and CIP-008.		
Sweeny Cogeneration LP	No	In Attachment 1, Generator Operators who experience a ± 10% sustained voltage deviation for ≥ 15 continuous must issue a report For externally driven events, the GOP will have little if any knowledge of the cause or remedies taken to address it. We believe the language presently in EOP-004-1 is satisfactory that any “action taken by a Generator Operator” that results in a voltage deviation has to be reported by the GOP.
Response: Thank you for your comment. Reporting of events is an obligation of affected Registered Entities. Registered Entities who do not experience an event do not have any reporting obligations.		
Independent Electricity System Operator	No	We disagree with the following inclusion/exclusion of several entities: a. We assess that the applicable entities listed in Section 4 capture all the entities that are assigned a reporting responsibility in Attachment 1 of the standard. While some events in Attachment 1 have specific entities identified as responsible for reporting, certain events refer to the entities listed in specific standards (e.g. CIP-002) as the responsible entities for reporting. The latter results in IA, TSP and LSE (none of which being specifically identified as having a reporting responsibility) being included in the Applicability Section. If our reasoning is correct, we question why NERC was dropped from the Applicability Section as it is an applicable entity identified in CIP-002-3. b. If the above approach was not strictly followed, then we’d suggest the SDT review the need to include IA, TSP and LSE since they generally do not own any Critical Assets and hence will likely not own any Critical Cyber Assets.
Response: The DSR SDT thanks you for your comment. The SDT believes it needs to follow the requirements of the standards as they currently apply. Since these entities are applicable to the underlying standards identified in Attachment 1, they will be subject to reporting. If those standards are modified to remove the applicability to these functional registrations, then the appropriate SDT can modify the applicability of this standard. The SDT has reviewed the CIP-002-3		

Organization	Yes or No	Question 4 Comment
standard and have added the ERO and the RE as applicable entities. If an IA, TSP or LSE does not own Critical Assets nor Critical Cyber Assets, then they will have nothing to report under this standard.		
Ameren	No	The 1 hour reporting requirement, as reference in Attachment 1 is inappropriate. In the event an "Impact Event" were to be discovered the Responsible Entity should focus on public and personnel safety. The reporting requirement should read "Within 1 hour or as soon as conditions are deemed to be safe." This statement would be applicable to "Damage or destruction of Critical Asset" The SDT should not put personnel in the position of choosing to either comply with NERC or address public or co-worker safety. The Time to Submit Report states "within 1 hour after occurrence is identified" This gives an auditor a wide area to question. If personnel report the occurrence 1 hour after identified, but 24 hours after it occurred, we are subject to the personal beliefs of the auditor that the event was not identified 24 hours ago, and reported 24 hours late. This will also be difficult to measure as the operator will have to document in the plant log the time the event was identified, while possibly dealing with Emergency Conditions. In the Note above the Actual Reliability Impact Table, the SDT identifies that under certain conditions, NERC / RRO staff may not be available for continuous 24 hour reporting. The SDT should consider the same stipulations apply to operating personnel and they should not be held to a higher standard that NERC / RRO.
Response: Thank you for your comment. The reporting timelines for most events have been changed from 1 hour to 24 hours. The events that retain the one hour requirement are those that are more closely related to sabotage type events. The DSR SDT chose the wording "upon identification of an event" to allow for cases where an event may not be recognized for some time due to an asset being in a remote location for example. It is expected that an auditor will follow what is written in the standard rather their personal preference. In the note above Attachment 1, it does not state that the ERO may not be available. This note is related to R3.3 of EOP_004-1 and provides for delayed reporting by an entity during storms or other such instances.		
ISO New England, Inc	No	We disagree with the following inclusion/exclusion of several entities: a. We acknowledge that the applicable entities listed in Section 4 capture all the entities that are assigned a reporting responsibility in Attachment 1 of the standard. While some events in Attachment 1 have specific entities identified as responsible for reporting, certain events refer to the entities listed in specific standards (e.g. CIP-002) as the responsible entities for reporting. The latter results in IA, TSP and LSE (none of which being specifically identified as having a reporting responsibility) being included in the Applicability Section. If our reasoning is correct, we question why NERC was dropped from the Applicability Section as it is an applicable entity identified in CIP-002-3. b. If the above approach was not strictly followed, then we'd suggest the SDT review the need to include IA, TSP and LSE since they generally do not own any Critical Assets and hence will likely not own any Critical Cyber Assets. c. There is still significant duplicate reporting included. For instance, why do both the RC and TOP to report

Organization	Yes or No	Question 4 Comment
		voltage deviations? As written, a voltage deviation on the BES would require both to report. The same would hold true for IROLs. Perhaps IROLs should only be reported by the RC to be consistent with the recently FERC approved Interconnection Reliability Operating Limit standards.
Response: The DSR SDT thanks you for your comment. (a) The SDT believes it needs to follow the requirements of the standards as they currently apply. Since these entities are applicable to the underlying standards identified in Attachment 1, then they will be subject to reporting. If those standards are modified to remove the applicability to these functional registrations, then the appropriate SDT can modify the applicability of this standard. The SDT has reviewed the CIP-002-3 standard and have added the ERO and the RE as applicable entities. (b) The IA, TSP and LSE are included in the Applicability only as it relates to CIP-002 events listed in the table. (c) The DSR SDT has removed the RC from “Voltage Deviations” and the TOP from the IROL to address the comment.		
Calpine Corp	No	Expanding the current applicability of CIP-001-1 and EOP-004-1 to the GO function is unnecessary and will result in numerous duplicate reports, self-certifications, spot checks, and audits reviews, with no benefit to the reliability of the Bulk Electric System. The GOP is the appropriate applicable entity for generation facilities.
Response: The DSR SDT thanks you for your comment. The SDT believes that it has properly identified registered entities that may potentially have events and the appropriate types of events. A Registered Entity is only required to submit an events report for events listed in Attachment 1 if the registered entity was affected by the event. If an event occurs, only affected Registered Entities listed in Attachment 1 are required to submit a report on the event. Having reports from the different entities may provide valuable information on understanding the event. The SDT would like to point out that reporting of events is from the time of identification not the time of the event.		
Occidental Power Marketing	No	Load Serving Entities that do not own or operate BES assets (or assets that support the BES) should not be included in the Applicability. The SDT includes LSEs based on CIP-002; however, if the LSE does not have any BES assets (or assets that support the BES), CIP-002 should also not be applicable because the LSE could not have any Critical Assets or Critical Cyber Assets. It is understood that the SDT is trying to comply with FERC Order 693, Sections 460 and 461; however, Section 461 also states: "Further, when addressing such applicability issues, the ERO should consider whether separate, less burdensome requirements for smaller entities may be appropriate to address these concerns." A qualifier in the Applicability of EOP-004-2 that would include only LSEs that own, operate or control BES assets (or assets that support the BES) would seem appropriate and acceptable to FERC.
Response: The DSR SDT thanks you for your comment. The SDT believes it needs to follow the requirements of the standards as they currently apply. Since these entities are applicable to the underlying standards identified in Attachment 1, then they will be subject to reporting. The LSE is an applicable entity under CIP-002 and CIP-008. If those standards are modified to remove the applicability to these functional registrations, then the appropriate SDT can modify the applicability of this standard.		

Organization	Yes or No	Question 4 Comment
American Transmission Company	No	First, under Part A, the reporting requirement for three or more BES Transmission Elements will create confusion. The NERC definition for an Element is: "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components." This could be interpreted to be three potential transformers on a bus section; therefore, any bus section would require a report. It is suggested that this be reworded to indicate three or more BES transmission lines, bus sections, or transformers. Second, under Part A, the reporting requirement for "Damage or destruction of BES equipment" is too broad and needs to be modified. For example, an output contact on a relay could be damaged unintentionally during routine testing resulting in a reportable event. It is suggested that the list of BES equipment and full intent of this be further defined in the footnote. The intent needs to be clarified, such as "events that have an immediate and significant impact to the stability or reliability of the BES." Third, under Part A, the reporting requirement for "Damage or destruction of a Critical Cyber Asset" is too broad and needs to be modified. For example, an output contact on a relay could be damaged unintentionally during routine testing resulting in a reportable event.
Response: Thank you for your comments. (1) The event "Transmission Loss" has been modified to remove the word Element. This now refers to Facilities. 2. If damage to a contact on a relay poses a reliability threat, then it should be reported. There is a footnote for this the type of event that helps clarify what is expected to be reported. It states: 1 BES equipment that: i) Affects an IROL; ii) Significantly affects the reliability margin of the system (e.g., has the potential to result in the need for emergency actions); iii) Damaged or destroyed due to intentional or unintentional human action which removes the BES equipment from service. Do not report copper theft from BES equipment unless it degrades the ability of equipment to operate correctly (e.g., removal of grounding straps rendering protective relaying inoperative). 3. This relates only to Critical Cyber Assets identified under CIP-002. If a relay contact is identified under CIP-002 as a Critical Cyber Asset, then its damage or destruction should be reported.		
Ingleside Cogeneration LP	No	Owners and operators of facilities whose total removal from the BES would not meet any reportable threshold under Attachment 1 should not have to create and maintain Operating documents. The same would be true of any LSE, TSP, or IA that does not oversee any Critical Cyber Assets as identified under CIP-002. A statement to that effect could be made in Section 4 of EOP-004-2.
Response: Thank you for your comments. Requirements under Standards can only be enforced against Registered Entities, not whether or not they own or operate certain types of assets. The SDT believes it needs to follow the requirements of the standards as they currently apply. Since these entities are applicable to the underlying standards identified in Attachment 1, then they will be subject to reporting. If those standards are modified to remove the applicability to these		

Organization	Yes or No	Question 4 Comment
functional registrations, then the appropriate SDT can modify the applicability of this standard.		
Duke Energy	No	Section 4 is fine, but on Attachment 1, Entity with Reporting Responsibility should just identify "Initiating entity" for every Event, as was done with the first three Events. That way you avoid errors in leaving an entity off, or including an entity incorrectly (as was done with the GOP on Voltage Deviations).
Response: Thank you for comment. The SDT considered your comment in the development of Attachment 1 decided against including the Initiating Entity designation as it was not appropriate in those cases. Based upon comments received, the SDT has modified Attachment 1 accordingly.		
Constellation Power Generation	No	As stated in comments to earlier versions of EOP-004-2, CPG disagrees with the inclusion of Generator Owners. Since one of the goals in revising this standard is to streamline impact event reporting obligations, Generator Operators are the appropriate entity to manage event reporting as the entity most aware of events should they arise. At times, the information required to complete a report may warrant input from entities connected to generation, but the generator operator remains the best entity to fulfill the reporting obligation.
Response: Thank you for your comment. The SDT has chosen not to distinguish between Registered Entities as far as reporting. Instead the SDT has included Registered Entities which are involved or potentially involved in the types of events. Registered Entities need to recognize that only entities that are affected by the event have the reporting obligation.		
Georgia System Operations Corporation	No	We do not agree that this standard assigns clear responsibility for reporting. It seems that multiple entities are being required to report the same event for some events. Only one entity should report. See comments later regarding Attachment 1. NERC should not decide which ONE entity should report. The entities should be allowed to decide this (and include it in the Impact Event Operating Plan) and to let NERC or the region know who will report (or give them a copy of the plan).
Response: Thank you for your comment. The SDT has chosen not to distinguish between Registered Entities as far as reporting. Instead the SDT has included Registered Entities which are involved or potentially involved in the types of events. Registered Entities need to recognize that only entities that are affected by the event have the reporting obligation.		
Indeck Energy Services	No	Voltage Deviations should not be reportable by GOP. That's why we have TOP's. Damage or destruction of BES equipment should be reportable only if it causes or could cause a Reportable Disturbance, reportable DOE OE-417 event or sabotage (as defined above). Otherwise, an auditor could require reporting of a relay failure caused by human error even though the relay was in test mode and no BES impact was experienced. This category could be dropped in favor of the next one, damage to Critical Asset. Fuel Supply Emergency needs a definition. For natural gas, various conditions could be referred to as

Organization	Yes or No	Question 4 Comment
		emergencies, but unless they actually affect generation, they should not need to be reported. Fuel Supply Emergencies that cause a Reportable Disturbance or reportable DOE OE-417 event should be reported. It is unclear why Forced Intrusion should be reportable under EOP-004. If it causes a problem, it will be reportable as another category and is one more unpreventable event. Forced Intrusion isn't, in many cases, as the exceptions try to define, an impact event at all, but could be a cause, which would be reported as the cause of an impact event. Risk to BES Equipment is not well defined. It should be expanded to Risk to BES Equipment from a non-environmental physical threat within a reasonable distance of the Equipment. A train derailment on the line past the plant would likely be known, whereas one that was 1/2 mile or more away with flammable materials might not be known about unless a public warning was made.
Response: The DSR SDT thanks you for your comment. Voltage Deviation reporting no longer applies to the GOP. There is a footnote on Damage or Destruction to BES equipment that addresses your comment. It states: [1]BES equipment that: i) Affects an IROL; ii) Significantly affects the reliability margin of the system (e.g., has the potential to result in the need for emergency actions); iii) Damaged or destroyed due to intentional or unintentional human action which removes the BES equipment from service. Do not report copper theft from BES equipment unless it degrades the ability of equipment to operate correctly (e.g., removal of grounding straps rendering protective relaying inoperative). Fuel Supply Emergency has been removed from Attachment 1. Forced Intrusion is an event could be related to sabotage. Identification and reporting of such events may help identify trends. The footnote associated with Risk TO BES Equipment addresses your comment: Examples include a train derailment adjacent to BES equipment that either could have damaged the equipment directly or has the potential to damage the equipment (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a BES facility control center) and report of suspicious device near BES equipment.		
Brazos Electric Power Cooperative	No	Inclusion of LSE and DP is questionable.
Response: The DSR SDT thanks you for your comment. The SDT believes that it has properly identified registered entities that may potentially have events and the appropriate types of events. A Registered Entity is only required to submit an events report for events listed in Attachment 1 if the registered entity was affected by the event. The LSE and DP are applicable entities under CIP-002 and CIP-008. If an event occurs, only affected Registered Entities listed in Attachment 1 are required to submit a report on the event. Having reports from the different entities may provide valuable information on understanding the event. The SDT would like to point out that reporting of events is from the time of identification not the time of the event.		

Organization	Yes or No	Question 4 Comment
Manitoba Hydro	Yes	All registered entities are included. This means all field and office personal involved will create a 360 degree view of the BES, and fulfill "Situational awareness of the industry." In Attachment 1, the "Entity with Reporting Responsibility" entities vary. It might be clearer to leave all impact levels "Entity with Reporting Responsibility" as the RC, BA and TOP, as these are likely the only parties that will report as required. All other entities must report to the RC, BA and TOP.
Response: Thank you for your comment. The SDT had previously considered a hierarchal approach to report; however, this concept was rejected by the industry.		
American Electric Power	Yes	AEP agrees, but it further supports the notion that this standard should not apply to the IA, TSP, and LSE functions.
Response: The DSR SDT thanks you for your comment. The SDT constructed Attachment based upon the existing requirements in the various reliability standards and established reporting obligations. The LSE, TSP and IC are applicable entities under CIP-002 and CIP-008. The information about an event will be useful to all owners, operators, and users of the bulk power system.		
Southern Company	Yes	This will cause the duplication of reporting for some events. Reference EOP-004 Attachment 1: Impact Events Table; Event - Loss of Firm Load for ≥ 15 minutes (page 15 of standard) This requires the RC, BA, TOP, and DP to report. So if a storm front goes through our system and takes out 400MW of load in Alabama and Georgia the PCC would have to report as the RC, BA, and TOP. Alabama Power and Georgia Power would also have to report as DPs. The way it is now the PCC reports for any of these events.
Response: The DSR SDT thanks you for your comment. The SDT believes that it has properly identified registered entities that may potentially have events and the appropriate types of events. A Registered Entity is only required to submit an events report for events listed in Attachment 1 if the registered entity was affected by the event. If an event occurs, only affected Registered Entities listed in Attachment 1 are required to submit a report on the event. Having reports from the different entities for the same event may provide a more complete understanding of the event.		
Pepco Holdings Inc and Affiliates	Yes	More guidance is needed for which entity in Attachment 1 actually files the report to avoid duplicate filing.
Response: The DSR SDT thanks you for your comment. The SDT believes that it has properly identified registered entities that may potentially have events and the appropriate types of events. A Registered Entity is only required to submit an events report for events listed in Attachment 1 if the registered entity was affected by the event. If an event occurs, only affected Registered Entities listed in Attachment 1 are required to submit a report on the event. Having reports		

Organization	Yes or No	Question 4 Comment
from different entities for the same event may provide a more complete understanding of the event.

Farmington Electric Utility System	Yes	
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Yes	
Progress Energy	Yes	
Response: The DSR SDT thanks you for your comment. Several commenters provided suggestions that led to modifications of Attachment 1.		

5. Stakeholders suggested removing original Requirements 1, 7 and 8 from the standard and addressing the reliability concepts in the NERC Rules of Procedure. Do you agree with the removal of original requirements 1, 7 and 8 (which were assigned to the ERO) and the proposed language for the Rules of Procedure (Paragraph 812)? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: Most commenters agreed with the removal of R1, R7 and R8. The SDT has provided suggested language to NERC for inclusion into the Rules of Procedure.

Organization	Yes or No	Question 5 Comment
Midwest ISO Standards Collaborators	No	We see no issue with imposing requirements on NERC. However, we are not opposed to making these changes in the Rules of Procedure either.
Response: Thank you for your comments. We are pursuing changes to the Rules of Procedure.		
SERC OC Standards Review Group	No	We agree that the ERO should not have requirements applicable to them, but disagree with changing or revising the Rules of Procedure (ROP) giving this reporting responsibility solely to NERC. This responsibility may be performed by NERC but other learning organizations should also be considered for performing this responsibility. In addition, the proposed wording of the revision to the ROP appears to place the responsibility of notifying the appropriate law enforcement with NERC rather than with the local responsible entity.
Response: Thank you for your comments. The responsibility for notifying law enforcement remains with the entity and has been clarified in Attachment 1.		
PJM Interconnection LLC	No	We agree that the standard should not have requirements applicable to the ERO, but disagree with revising the NERC Rules of Procedure (RoP) to include suggested Section 812. The reporting responsibility should not be solely given to NERC. Other learning organizations must also be considered for performing this responsibility. Additionally, the proposed wording of Section 812 appears to imply that NERC will notify the appropriate law enforcement agencies as opposed to the local responsible entity.
Response: Thank you for your comments. The responsibility for notifying law enforcement remains with the entity and has been clarified in Attachment 1.		
SDG&E	No	SDG&E agrees with removing original Requirements 1, 7, 8 from the standard. In addition, SDG&E recommends that the standard reference Section 812 of the Rules of Procedure.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comments.		
Duke Energy	No	Proposed language for Section 812 is very confusing. Is the NERC "system" really going to perform all notifications: "applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, and regulatory agencies as necessary?" Is it intended that the NERC "system" will relieve registered entities of the obligation to make these other reports? Is there an implementation plan to achieve that objective? It appears that this current version of EOP-004-2 has the potential for significantly creating redundant reporting. Will the NERC reports be protected from FOIA disclosure? How will FERC Order 630 be followed (CEII disclosure)?
Response: Thank you for your comments. The SDT expects any system would facilitate the reporting to organizations specified in the submitted report. Until such time that the system can be established, the Registered Entity will be obligated to make the notifications as specified in its Operating Plan(s). The SDT has proposed an amendment to the NERC Rules of Procedure to assist in the development of a single reporting process for all three obligations.		
ExxonMobil Research and Engineering	No	Abstain from commenting on this question.
Brazos Electric Power Cooperative	No	
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration agrees that the NERC Rules of Procedure are the appropriate location for ERO assigned activities. However, we would like to get a solid commitment from NERC that the Events Analysis Process and the Reliability Assessment and Performance Analysis Group (RAPA) data analysis requirements for Protection System Misoperations is coordinated through a single process. Their unique data needs are understandable, but should not require the downstream entity to evaluate what is required by each sub-committee - and which reporting template to use.
Response: Thank you for your comments. Your comment addresses a concern that is beyond the scope of this project and cannot be addressed here. The SDT has communicated with the NERC Events Analysis Working Group and DOE in efforts to develop a single reporting process. The SDT will continue to work with those organizations to complete this task.		
Northeast Power Coordinating Council	Yes	Agree with the proposed removal, but have not assessed the proposed language for RoP para. 812 because unable to access it (not on the RoP page).
Response: Thank you for your comments.		

Organization	Yes or No	Question 5 Comment
Bonneville Power Administration	Yes	Ensure distribution of trends.
Response: Thank you for your comments.		
Midwest Reliability Organization	Yes	The ERO is not a user, owner or operator of the BES and the best place to contain their responsibilities, is in the Rules of Procedure.
Response: Thank you for your comments.		
Pepco Holdings Inc and Affiliates	Yes	Agree that NERC should not have requirements applicable to them.
Response: Thank you for your comments.		
American Municipal Power	Yes	A software solution may provide an easy expansion for reporting EOP-004, CIP-001, and additional standards.
Response: Thank you for your comments.		
Manitoba Hydro	Yes	Agree with R1, a central system for receiving and distributing reports. There is limited time and resources for control operators to follow up and ensure ALL required entities have received all information required in a timely manner. Agree with R7 and R8.
Response: Thank you for your comments.		
Sweeny Cogeneration LP	Yes	We agree that these requirements appropriately belong in the NERC Rules of Procedure. However, we are concerned with the multiple reporting requirements being driven by EOP-004-2, CIP-008-3, the ERO Events Analysis Team, the Reliability Assessment and Performance Analysis Group (RAPA). It is imperative that these efforts be consolidated into a single procedure using a single reporting template.
Response: Thank you for your comments. The DSR SDT agrees with the concept of the single reporting template and is working with other agencies to see if the single form would be achievable.

6. Do you agree with the proposed revisions to Requirement 2 (now R1) including the use of defined terms Operating Plan, Operating Process and Operating Procedure? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: Stakeholders were fairly evenly divided on this question. Overall, there appears to be a misconception on what is and isn't included in the Operating Plan(s). The SDT believes that current Sabotage Reporting substantially meets the requirements outlined in the standard, albeit there may be some needed alterations to accommodate the new standard. The updated subrequirement is a result of a FERC directive in Order No. 693. The DSR SDT removed references to Operating Process and Operating Procedure and revised the Requirement to:

R1. Each Responsible Entity shall have an Operating Plan that includes: [Violation Risk: Factor: Lower] [Time Horizon: Operations Planning]

1.1. A process for identifying events listed in Attachment 1.

1.2. A process for gathering information for Attachment 2 regarding events listed in Attachment 1.

1.3. A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as appropriate:

- Internal company personnel
- The Responsible Entity's Regional Entity
- Law enforcement
- Governmental or provincial agencies

1.4. Provision(s) for updating the Operating Plan within 90 calendar days of any change in assets, personnel, other circumstances that may no longer align with the Operating Plan; or incorporating lessons learned pursuant to R3.

1.5. A Process for ensuring the responsible entity reviews the Operating Plan at least annually (once each calendar year) with no more than 15 months between reviews.

Organization	Yes or No	Question 6 Comment
Georgia Transmission Corporation & Oglethorpe Power	No	The terms "Operating Procedure, Operating Plan, and Operating Process," while included in the NERC glossary, are not consistently used throughout the body of NERC standards as they are used in R1 of EOP-

Organization	Yes or No	Question 6 Comment
Corporation		004-2. As such, we do not see a reliability benefit in using the defined terms over the more commonly used terms of simply "plans, processes, and procedures." In part 1.1 of R1, we think that the requirement should clearly indicate that a particular Responsible Entity's Impact Event Plan should only be required to include those particular Impact Events for which the Responsible Entity has the reporting obligation. Therefore, we suggest the following modification to R1: "1.1 An Operating Process for identifying Impact Events listed in Attachment 1 for those Impact Events where the Responsible Entity is identified as having the reporting responsibility." Additionally, in part 1.3 of R1, we believe the language to be vague and will introduce the need for further clarification either through an interpretation or the CAN process in part because the verb tenses of the sub-sub-requirements do not agree and it appears to require notification to all listed parties for every Impact Event instead of only those that make sense for a particular event. As such, we suggest adding a column to the tables in Attachment 1 that identifies precisely which organizations should be notified in the case of a particular Impact Event and modifying part 1.3.2 to read: "1.3.2 External organizations to notify as specified in Attachment 1." Currently, as written, the standard could be interpreted to require notification to law enforcement for an IROL violation, for instance. Furthermore, we are concerned that as written, the standard may require that the same event must be reported by multiple responsible entities. Our current process uses notification between Responsible Entities (i.e. from a TO to a TOP and then from the TOP to NERC) to allow for a centralized and coordinated notification to law enforcement, NERC, etc. We are concerned that the requirement as written does not appear to allow this flexibility and may require both the TO and TOP to report the same event in order to prove compliance with the Standard.
Response: Thank you for your comments. The SDT believes that in order for a term to become consistent with the body of the reliability standards, each SDT will have to incorporate the terms as the opportunity to revise each standard arises. The SDT envisions that each Registered Entity will develop Operating Plan(s) appropriate to meet its obligations as outlined in the standard. Part 1.3 has been revised to indicate that each report must be sent to the ERO and the Registered Entity's Reliability Coordinator and the remaining entities as appropriate. Law Enforcement would certainly not be interested in an IROL violation, but they would be interested in Forced Intrusion.		
Bonneville Power Administration	No	Not sure that a 90-day update is needed to be sent to CEF.
Response: Thank you for your comments. That is not required in the standard. The SDT believes that it is unnecessary to forward any update to any organization outside of the Registered Entity. Updates should be used to inform internal personnel of any Operating Plan changes.		

Organization	Yes or No	Question 6 Comment
Pacific Northwest Small Public Power Utility Comment Group	No	1.4 makes no sense. The operating plan update and the change to its content occur simultaneously. Perhaps the SDT meant to say "Provision(s) for updating the Impact Event Operating Plan within 90 days of identification of a needed change to its content. This would be consistent with the "lessons learned" language of the prior version.
Response: Thank you for your comment. The DSR SDT added additional detail to Part 1.4 to address the broader term "content."		
PSEG Companies	No	The PSEG Companies believe that sections 1.3 and 1.3.2 will require notification of law enforcement agencies for all Impact Events defined in Attachment 1. This is appropriate for some events if there has been destruction to BES equipment, for example, but not in certain operational events. It should not be necessary to notify law enforcement that a non sabotage event like an IROL violation, generation loss or voltage deviation has occurred.
Response: Thank you for your comments. The DSR SDT feels that the Registered Entity will establish Operating Plan(s) appropriate for its needs including the specification of how and when law enforcement agencies are contacted. Part 1.3 has been revised to indicate that each report must be sent to the ERO and the Registered Entity's Reliability Coordinator and the remaining entities as appropriate. Law Enforcement would certainly not be interested in an IROL violation, but they would be interested in Forced Intrusion. Attachment 1 language has been updated to say "The parties identified…" which should be included in the entity's Operating Plan(s).		
Dominion	No	The requirement for Responsible Entities to establish an Impact Event Operating Plan, Operating Process, and Operating Procedure seems overly cumbersome and prescriptive. The use of these NERC defined terms create additional compliance burden for little, if any, improvement to reliability. Suggest simplification by requiring the Responsible Entities to have a procedure to report Impact Events, to the appropriate parties, pursuant to EOP-004. In addition, we request clarification of R1.4. It seems circular to us in that it requires the plan to be updated within 90 days of when it changes. Is the intent that any necessary changes identified in the annual review required by R4 be incorporated in a revision to the plan within 90 days of the review? If so, R1.4 belongs under R4. If not, we do not understand the requirement. What starts the 90 day count down?
Response: Thank you for your comment. The language in Requirement R1, Part 1.4 was inserted in response to a directive in FERC Order 693. The SDT feels that the directive requires Registered Entities to update their Operating Plan(s) within 90 days of the time the entity identified the need for the change, such as a new telephone number, personnel staff name/title, or addition/deletion of person or organization. The DSR SDT has made changes to better clarify "content."		

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 6 Comment</th></tr>
<tr><td>Pepco Holdings Inc and Affiliates</td><td>No</td><td>An Operating Plan, Operating Process or Operating Procedure implies something different than an after the fact reporting activity.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment. An Operating Plan is more than an after the fact reporting activity. The Operating Plan(s) incorporates the tasks or steps involved in the identification of events, establishing which internal personnel are to be involved in the communications and or reporting, and establishing the list of outside organizations to be contacted when an event happens.</td></tr>
<tr><td>SPP Standards Review Group</td><td>No</td><td>We would suggest rewording Part 1.3.2 to read “External organizations to notify may include but are not limited to the Responsible Entity’s Reliability Coordinator, NERC, Responsible Entity’s Regional Entity, Law Enforcement and Governmental or Provincial Agencies.”
We would also suggest the following for Part 1.4: “Provision(s) for updating the Impact Event Operating Plan within 90 days of any known changes to its content.”
Would also suggest adding “as requested” at the end of M1.</td></tr>
<tr><td colspan="3">Response: Thank you for your comments. (1) Requirement R1, Part 1.3 has been updated to “as appropriate” to address the parties to communicate event to. (2) The SDT agrees with your suggestions and has made similar word changes. 3) Agreed.</td></tr>
<tr><td>Midwest ISO Standards Collaborators</td><td>No</td><td>We do not believe that the use of the Operating Process, Operating Procedure, and Operating Plan for a reporting requirement is consistent with their definitions and certainly not with the intent of the definitions. For instance, an Operating Process is intended to meet an operating goal. What operating goal does this requirement meet?
An Operating Procedure includes tasks that must be completed by “specific operating positions.” This reporting requirement could be met by back office personnel. We also believe that parts 1.3 and 1.3.2 under Requirement 1 will require notification of law enforcement agencies for all Impact Events defined in Attachment 1. While some should require notification to law enforcement such as when firm load is shed, others certainly would not. For instance, law enforcement does not need to know that an IROL violation, generation loss or voltage deviation occurred.</td></tr>
<tr><td colspan="3">Response: Thank you for your comments. The Glossary Definition of Operating Plan is:
A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.
The definition uses “goal” rather than “operating goal”. The goal of the Operating Plan is to ensure that entities know how to identify the events listed in</td></tr>
</table>

Organization	Yes or No	Question 6 Comment
Attachment 1 and report them to the appropriate parties. The SDT disagrees with your views on Operating Process, Operating Procedure, and Operating Plan. The SDT appropriately describes the task at hand. The SDT feels that the Operating Plan can identify when law enforcement agencies need to be notified without specification from the SDT. The Background section of the standard contains a heading for "Law Enforcement" and provides clarification regarding the types of events that should be reported to law enforcement.		
FirstEnergy	No	1. We believe that the use of stringent definitions for an entity's process requires too much of the "how" instead of the "what." As long as the entity has a process, procedure (or whatever they want to call it) that includes the necessary information detailed in sub-parts 1.1 through 1.4 then that should suffice. 2. In sub-part 1.3, we suggest adding the phrase "as applicable" to clarify that not every event will require a notification to, for example, law enforcement. 3. In sub-part 1.4, we suggest adding clarification that the 90-day framework is only required for substantive changes and that all other minor editorial changes can be updated within a year.
Response: Thank you for your comments. (1) The SDT agrees with your suggestion that the entity can best determine what is included in its Operating Plan. The SDT does not envision instructing an entity on what or how of the Operating Plan(s). (2) The SDT feels that the Operating Plan can identify when law enforcement agencies need to be notified without specification from the SDT. (3) The update requirement comes from a FERC directive in Order No. 693. The SDT has validated the intent of the directive and has included that intent in the requirement. The SDT feels that the directive requires Registered Entities to update their Operating Plan(s) within 90 days of the time the entity identified the need for the change, such as a new telephone number, personnel staff name/title, or addition/deletion of person or organization. The DSR SDT has made changes to better clarify "content."		
SERC OC Standards Review Group	No	This is a reporting requirement and should not be confused with Operating Plans that have specific operating actions and goals. Each entity should prepare its own event reporting guideline that address impact events, identification, information gathering, and communication without specifying a specific format such as Operating Plans, Operating Process and Operating Procedures.
Response: Thank you for your comment. The SDT agrees with your viewpoint and believes that your statement is consistent with the intent of the requirement.		
PJM Interconnection LLC	No	1. This is an "after-the-fact" reporting requirement and should not be confused with Operating Plans that have specific operating actions and goals. Each entity should prepare its own impact event operating guideline that addresses impact events, identification of impact events, information gathering, and communication without specifying a specific format such as Operating Plans, Operating Process, and Operating Procedures. In fact, all three documents mentioned can all be a single document. 2. 1.3.2 requires notification of law enforcement agencies for all events listed in Attachment 1. This is essentially not true. For example, firm load is shed requires notification to law enforcement but an IROL

Organization	Yes or No	Question 6 Comment
		violation, generation loss, or voltage deviation do not.
Response: Thank you for your comment. (1) The SDT disagrees with your viewpoint that this requirement specifies after-the-fact reporting. The reporting requirement is later in the standard. The SDT agrees with your viewpoint on the operating guideline you provide and believes that your statement is consistent with the intent of the requirement. (2) The SDT believes that the Registered Entity's Operating Plan(s) can establish when and how law enforcement agencies are notified.		
We Energies	No	R1.2: By its NERC Glossary definition, an Operating Procedure is too prescriptive for data collection. An Operating Procedure requires specific steps to be taken by specific people in a specific order. We would have to predict every event that could happen to have every step in proper order to collect the data. It will be impossible to comply with this requirement. R1.3: Change "Impact Event" to "Impact Event listed in Attachment 1."
Response: Thank you for your comment. The SDT has changed R1 to simply "Operating Plan. The term "Impact Event" has been removed from the standard and R1 and its Parts refer to Attachment 1 as appropriate.		
Compliance & Responsiblity Organization	No	See comments to 2. Also, although NextEra agrees that a documented procedure is appropriate, NextEra does not favor the current approach of pre-defined layers of processes and documentation that seem to overly complicate, and, possibly contradict, already established internal methods by which a company implements policies, procedures and processes. Thus, NextEra's options suggest using a more generic approach that allows entities more flexibility to establish documents and processes, and demonstrate compliance. Such a generic approach was used in NextEra's proposed options set forth in response to number 2.
Response: Thank you for your comments. The SDT believes that most entities already have plans to mostly satisfy the requirements of EOP-004. These would be the procedures that are required under existing CIP-001, R1 and R2.		
Exelon	No	R.1 Does an entity need to develop a standalone Operating Plan if there is an existing process to address identification, assessing and reporting certain events? Suggest rewording to state "Each Responsible Entity shall have an Impact Event Operating Plan or equivalent implementing process that includes:" Disagree these new terms are required. Commonly accepted descriptions of programs, processes and procedures exist in registrar entities that would suffice. For example, R1 could use "Impact Event evaluation

Organization	Yes or No	Question 6 Comment
		and reporting process" as a generic term to describe what is required. This would allow an entity to utilize any existing protocols or management guidelines and naming conventions in effect in their organization.
Response: Thank you for your comments. The SDT The SDT believes that most entities already have plans to mostly satisfy the requirements of EOP-004. These would be the procedures that are required under existing CIP-001, R1 and R2. The Registered Entity will need to examine its current processes to ensure that all aspects of the new requirements are addressed. Thank you for the suggested re-wording. The SDT revised "Impact Event Operating Plan" to just "Operating Plan", thus allowing the entity to implement the requirements as needed.		
Tenaska	No	We already have adequate procedures in place to address sabotage and other significant events, pursuant to the existing CIP-001-1 and EOP-004-1 Standards. The requirement to develop a new Impact Event Operating Plan would increase the administrative burden on Registered Entities to comply with the proposed Standard, without providing a foreseeable improvement in system reliability. The "laundry list" of required Impact Event Operating Plan components is too specific and would make it more difficult to prove compliance with EOP-004-2 during an audit. A revised version of the proposed R5 is the only Requirement that is necessary to achieve the stated purpose of Project 2009-01.
Response: Thank you for your comments. The SDT The SDT believes that most entities already have plans to mostly satisfy the requirements of EOP-004. These would be the procedures that are required under existing CIP-001, R1 and R2 and these should mostly meet the intent of EOP-004. The Registered Entity will need to examine its current processes to ensure that all aspects of the new requirements are addressed. The Parts of R1 are not prescriptive and only provide the minimum information that is required to be in the Operating Plan. The SDT has removed R2 and revised R5 (now R2) to eliminate any duplication.		
United Illuminating Co	No	Does R1.1 require an Operating Process for each Impact Event in attachment 1 or an Operating Process that in general applies to all Impact Events?
Response: Thank you for question. The SDT feels that the Registered Entity can have an Operating Plan that in general applies to all events.		
American Municipal Power	No	No, remove R1. R1 is not an acceptable requirement nor should this be an operation. Focusing on a plan and procedure is overly prescriptive and costly. The only requirement should be to have an entity submit a report. Let the entity decide how they want to implement the reporting.
Response: Thank you for your comment. The SDT agrees that the Registered Entity can decide on the how to implement the reporting; however, this requirement mandates that the Registered Entity document its process.		

Organization	Yes or No	Question 6 Comment
Arkansas Electric Cooperative Corporation	No	We appreciate the effort the team has taken in improving the requirements since the last posting. For 1.3, it appears to suggest the communication must always include communicating to internal personnel and ALL external organizations. We suggest removing the reference to 1.3.1 and 1.3.2 and move 1.3.1 and 1.3.2 to 1.4 and 1.5 respectively. For 1.3.2, modify to state "Internal company personnel notification(s) deemed necessary by the Responsible Entity." For 1.4, we feel the term "content" is too broad as used here. For example, if the FBI changes the contact info for the JTTF, the Responsible Entity may not find out until an incident or annual exercise. Or if the contact person for the state agency changes position without notifying us, it would require us to then change the plan within 90 days. We suggest an annual review of the plan is sufficient for the objective of this requirement.
Response: Thank you for your comments. The SDT has added language "as appropriate" to allow the entity to make its own determination who to contact. The term "content" has been removed and replaced with more detail. The requirement for updates requires changes within 90-days. The SDT believes that the timeline for updating can only be based upon the notification to the Registered Entity. The SDT believes that 90-days from the date the Registered Entity is notified or made aware of the change is a suitable time period to update the document.		
Manitoba Hydro	No	Plan, Process and Procedure are all too interchangeable with each other and have no value being used in "one paragraph" as they do not differentiate from one or other. The terms "identify", "gather" and "communicate" better describe "Process, plan or procedure" so simplify to:1.4. Identification of Impact Events as listed in Attachment 1.1.5. Gathering information for inclusion into Attachment 2 regarding observed Impact Events listed in Attachment 1.1.6. Communicate recognized Impact Events to the following:
Response: Thank you for your comments. The SDT has revised R1 to only include an Operating Plan. Part 1.2 has been revised to "A process for gathering information…"		
American Electric Power	No	Even best developed plans, processes and procedures do not always lend themselves to address the issues at hand. There needs to be flexibility to allow entities to first address the reliability concern and second report correspondingly. Currently, this requirement is overly prescriptive and places unnecessary emphasis on the means to an end and not the outcome. The outcome for this requirement is to report Impact Events.
Response: Thank you for your comments. While the SDT appreciates your views, it disagrees with your assessment. The outcome of this requirement is not to report events; the outcome is to ensure that the Registered Entity has Operating Plan(s) for the identification of events, establishing which internal personnel are involved, identification of outside agencies to be notified, and having a provision for updating the plan(s). Reporting of events is a requirement later in the standard.		

Organization	Yes or No	Question 6 Comment
Consumers Energy	No	Requirement R1, "Have a plan…" with all of the listed criteria, seems to present a serious compliance risk to applicable entities without a direct reliability benefit, as long as entities still indentify and report relevant events. Ad-hoc procedures, as discussed within the R1 "Rationale" have been acknowledged within the rationale to be working effectively, and should remain sufficient without having a documented and by inference, signed, approved, dated document with revision history (as is being demanded today by compliance auditors wherever a "documented plan" is specified within the requirements).
Response: Thank you for your comments. While the SDT appreciates your views, it disagrees with your assessment. The SDT believes that most entities already have plans to mostly satisfy the requirements of EOP-004. These would be the procedures that are required under existing CIP-001, R1 and R2. The measure calls for a current, dated, in force Operating Plan to be provided.		
ISO New England, Inc	No	We do not believe that the use of the Operating Process, Operating Procedure, and Operating Plan for a reporting requirement is consistent with their definitions nor with the intent of the definitions. For instance, an Operating Process is intended to meet an operating goal. What operating goal does this requirement meet? An Operating Procedure includes tasks that must be completed by "specific operating positions." This reporting requirement could be met by back office personnel. We suggest that R1.3.2 delete the list of entities to notify. The terms used to identify who to notify are not defined terms and can lead to subjective interpretations. As written, the requirement does not aid the Applicable entity or the Compliance enforcers in clearly including or excluding who to notify. We also believe that parts 1.3 and 1.3.2 under Requirement 1 will require notification of law enforcement agencies for all Impact Events defined in Attachment 1. While some should require notification to law enforcement such as when there has been destruction to BES equipment, others certainly would not. For instance, law enforcement does not need to know that an IROL violation, generation loss or voltage deviation occurred. We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing the event. This will be particularly difficult when support personnel are not present such as during nights, holidays and weekends. We further suggest that as explicit statement that "reliable operations must ALWAYS take precedence to reporting times" be included in the standard.
Response: Thank you for your comments. While the SDT appreciates your views, it disagrees with your assessment. (P1) The outcome of this requirement is not to report events; the outcome is to ensure that the Registered Entity has Operating Plan(s) for the identification of events, establishing which internal personnel are involved, identification of outside agencies to be notified, and having a provision for updating the plan(s). The		

Organization	Yes or No	Question 6 Comment
SDT feels that current Sabotage Reporting guides already provides much of the information needed in the new R1. (P2) We have revised Requirement R1, Part 1.3 to "A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as appropriate:" This should address your concern regarding law enforcement notification. (P3) We have revised most reporting times to 24 hours. Events of a "sabotage" type nature remain at one hour. (P4) While the DSR SDT sees the point you are trying to make, we do not believe that reporting the events in Attachment 1, under the times listed, is burdensome. At the least, this can be accomplished by back office personnel who are not involved in restoration or other reliability efforts.		
Calpine Corp	No	In the "Rationale for R1", the draft states: "Every industry participant that owns or operates elements or devices on the grid has formal or informal process, procedure, or steps it takes to gather information regarding what happened and why it happened when Impact Events occur. This requirement has the Registered Entity establish documentation on how that procedure, process, or plan is organized." Absent substantial evidence that the proposed requirement addresses an actual systemic problem with the "formal or informal process, procedure, or steps it takes" for internal and external evaluation and notification of items listed in Attachment 1, there is no obvious need for this additional paperwork burden, which in most cases will result in a written procedure that documents another existing written procedure or procedures, that will be maintained for the sole purpose of demonstrating compliance with the requirement. Failure to properly report events is currently sanctionable under CIP-001-1 and EOP-004-1 and will continue to be sanctionable under proposed EOP-004-2. Adding a requirement to implement an "Impact Event Operating Plan", "Operating Procedure", and "Operating Process" is unnecessary. However, if the requirement is maintained, the related Measure M1 should state in plain language exactly what elements are required for compliance. Statements such as "The Impact Event Operating Plan may include, but not be limited to, the following?" begs the question regarding what other elements are required to demonstrate compliance. As written, M1 requires that entities provide an "Impact Event Operating Plan", but does specify the required elements of the plan. In the absence of much more detailed instruction on exactly what elements must be included in the various documents, the proposed requirement will create confusion with both compliance and enforcement of the requirement. An example of each of the various required documents would be helpful. Any difficulty in developing such an example would be instructive of the probable compliance issues that would ensure from the necessarily varying approaches taken by disparate entities attempting to meet the requirement.
Response: The DSR SDT thanks you for your comment. Requirement R1 comes from existing CIP-001, R1. The SDT believes it has addressed these concerns by removing the terms "Operating Procedure" and "Operating Process" and has generically referred to them in the elements of the Operating Plan outlined in		

Organization	Yes or No	Question 6 Comment
Parts 1.1-1.5 of the requirement.		
BGE	No	This seems overly restrictive in its use. Requirement is now telling entities how to resolve situations, not giving them a requirement to resolve the situation.
Response: Thank you for your comments. The requirement is written so that an entity has an Operating Plan that contains certain items. The SDT does not specify in the standard how the entity meets these obligations nor does it specify the form nor format of these items.		

Organization	Yes or No	Question 6 Comment
ExxonMobil Research and Engineering	No	The requirement to notify State Law Enforcement deviates from existing government security requirements that Petrochemical Facilities (Cogenerators) are required to follow. Per the Maritime Transportation Security Act of 2002 (MTSA) and the Chemical Facility Anti-Terrorism Standard (CFATS), Petrochemical Facilities are required to report the security incidents identified in EOP-004 Revision 2 to the National Response Center which is staffed by the United States Coast Guard. The National Response Center coordinates incident reporting to both the Department of Homeland Security and Federal Bureau of Investigation. Requiring Petrochemical Facilities to report security incidences to State Law Enforcement agencies duplicates their reporting of incidences to the appropriate law enforcement agencies. EOP-004 Revision 2 should be modified to synergize with existing federal security regulations so that those facilities that are required to comply with the MTSA and CFATS are, by default, compliant with EOP-004 Revision 2 when they comply with these existing federal security regulations. It is unclear, from the documentation provided in this revision of EOP-004, which entities a Responsible Entity is required to notify when certain types of Impact Events occur. Previously, CIP-001 included a similarly vague instruction that required notifications to the 'appropriate parties in the interconnection' and the FBI/RCMP. The Standard Drafting Team should identify which NERC Functional Entities should be notified when each of the Impact Events identified in Attachment 1 occurs. Current revisions of CIP-001 Revision 1 or EOP-004 Revision 1 do not include corresponding requirements to update procedures within a certain time frame. It's difficult to foresee a situation where an Entity would initiate a change to its response plan without being required to update the formal response plan documentation per their management of change process. Additionally, failure to update the procedure would result in the entity deviating from the procedure any time an impact event occurred, which would automatically force a violation of EOP-004-2 R2 for failure to properly implement their Operating Process. Furthermore, the only changes occurring between review cycles should be revisions to the contact information for third parties. It is beyond an entity's power to require third parties to notify the entity when the third party changes their contact information, and, as such, this requirement burdens registered facilities with responsibility for compliance for items that are beyond their realm of control.

Response: Thank you for your comments. (P1) The SDT believes that the requirement does not mandate contact to State Law Enforcement agencies; but merely to include them if appropriate. While we have tried to coordinate with the US DOE, Federal security regulations are outside the scope of this project. (P2) We have revised Requirement R1, Part 1.3 to "A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as appropriate:" Each type of event should be assessed by the entity to determine whether or not law enforcement needs to be notified,

(P3)The subrequirement for updating comes from a FERC directive in Order No. 693. If the Registered Entity's Operating Plan(s) have a provision for updating, then the entity only needs to verify that the updating does not exceed 90 days from the date of being aware.

Organization	Yes or No	Question 6 Comment
Farmington Electric Utility System	No	consider rewording 1.4; the wording implies a change to content already occurred, so it would be updated concurrently ? consider, updating the plan within 90 days of discovery of content requiring a change?
Response: Thank you for your comment. The SDT agrees with your suggestion and has revised Requirement R1, Part 1.4 to: Provision(s) for updating the Operating Plan within 90 calendar days of any change in assets, personnel, other circumstances that may no longer align with the Operating Plan; or incorporating lessons learned pursuant to R3.		
Constellation Power Generation	No	Per NERC's glossary of terms, an Operating Plan can include Operating Process documents and Operating Procedures. An Operating Process identifies general tasks while an Operating Procedure identifies specific tasks. CPG is unclear as to why R1.1 and R1.3 require the use of an Operating Process while R1.2 requires an Operating Procedure. CPG believes that R1.2 should be changed to require the use of an Operating Process instead of Operating Procedure. R1.2 is merely requiring an entity to fill out the necessary forms should an event occur, so requiring a clear and concise step by step procedure for filling out a form only adds a compliance burden to an entity instead of improving the reliability of the BES. CPG does agree with the DSR SDT that an entity should have a process in place mandating that the proper paperwork be completed in a timely manner should an event occur.
Response: Thank you for your comments. The SDT has modified Requirement R1, Part 1.1 and Part 1.3 to a "process" as part of the elements of the referenced "Operating Plan" in R1. The SDT has also changed "Operating Procedure" to a "process" in R1.2. This sub-requirement provides for establishing the list of internal personnel to be notified in the case of an event, not the reporting of the event.		
Georgia System Operations Corporation	No	-R1.3.2: "Law Enforcement", "Governmental Agencies", and "Provincial Agencies" are not proper nouns/names and are not defined in the NERC Glossary. They should not be capitalized. -R1.4: Keeping documents current and in force should be a matter of an entit
Response: Thank you for your comments. The SDT agrees with your suggestions on capitalization and has made the corrections. The update provision comes from a FERC directive in Order No. 693.		
Indeck Energy Services	No	The terms are not important and many plans or procedures already exist and restructuring them to match the

Organization	Yes or No	Question 6 Comment
		terms is wasteful. R1 is too prescriptive. R1 should state that a written document should show how the entity will comply with EOP-004. R1.2 is superfluous and should be deleted. The data must be gathered and the process will vary with the event. Trying to define the multitude of possibilities for the collection process is not productive and leaves open the possibility of missing something for an auditor to nit pick. R1.3 should just be a written communications plan/process/procedure for external notifications. R1.4 is redundant because it can't be changed within 90 days until the content has already been changed. R1.4 should be deleted. The Violation Risk Factor should be Low, if any, because this is historical reporting, with little or no reliability consequence.
Response: The SDT disagrees with your viewpoints associated with R1 because the requirement only specifies the elements required, now how to implement them. The SDT believes that many Registered Entities will be able to use their current Sabotage Reporting processes, with some slight modification to address the new sub-requirements. Requirement R1, Part 1.2: The requirement is written so that it is not prescriptive and allows the entity to identify the steps it will take to gather information for filing the report. The DSR SDT does not envision this as being a tome that contains specific data gathering protocol for each event type. Requirement R1, Part 1.3: Has been revised to: "1.3. A process for communicating recognized impact events listed in EOP-004 - Attachment 1 that includes to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and , but is not limited to the following as appropriate :" For Requirement R1, Part 1.4, the update provision comes from a FERC directive in Order No. 693. In addition, the SDT believes that the update is required within 90 days from the date of being notified of the change or update. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement 2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement 3 is insurance to make sure that an entity can communicate information about events. Requirement 2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
Midwest Reliability Organization	Yes	This is a NERC defined term and will assist entities in maintaining compliance with this (proposed) Standard.
Response: Thank you for your comment.		

Organization	Yes or No	Question 6 Comment
Western Electricity Coordinating Council	Yes	Are "Law Enforcement" considered a "Governmental Agency" (they are listed separately and both required) If not, is there any qualifiers on whether Law Enforcement or Governmental Agency refers to municipal, county, state or federal or any combination" Since the term "Provincial" is associated with "Governmental" it tends to indicate State level. As it is written now an auditor would require documentation of "some" Law Enforcement (other than company security) and an additional communication to at least "some" Agency which could be considered Governmental. Municipal or higher. Contact with City police or Sheriff and either city or county government rep would satisfy. Additional clarity would help from a compliance enforcement perspective.
Response: Thank you for your comments. The SDT expects that Registered Entities will identify the proper outside organizations needed for their organization. The SDT feels that law enforcement agencies include federal, state, provincial, or local law agencies and these are not the same as governmental or regulatory agencies. Please refer to the Background section of the standard for further clarification on law enforcement notifications.		
Alliant Energy	Yes	This is a NERC defined term and will assist entities in maintaining compliance with this (proposed) Standard. We believe the reference to Attachment 2 in R1.2 should be revised to the DOE Form and utilize only one reporting form, if at all possible.
Response: Thank you for your comments. The DSR SDT continues to work with the DOE to develop a single reporting form that is acceptable to both.		
Occidental Power Marketing	Yes	However, only LSEs with BES assets (or assets that support the BES) should be included in the Applicability section of the standard.
Response: Thank you for your comment. LSE applicability is related to their applicability under CIP-002 and CIP-008.		
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Yes	However, there needs to be some clarity on which government agencies (if not the FBI) are responsible for reporting these type of events.
Response: Thank you for your comments. Each Registered Entity should be aware of any reporting obligations it may have to various government agencies (federal, state/provincial, local). To the extent they exist, the notification needs to be included in the entity's Operating Plan(s).

7. Do you agree with the proposed revisions to Requirement 3 (now R2)? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: The slight majority of commenters agreed with the language of Requirement R2. A significant minority opinion exists where commenters suggest revisiting R2 and R5 to eliminate potential redundancy and confusion. Similar comments were received pertaining to Requirement 5 (question 10 below). The DSR SDT has revised Attachment 1 to indicate that entities must submit Attachment 2 or the DOE OE-417 form. This information was contained in Requirement R5. The intent of the two requirements is to have entities make appropriate notifications and report impact events contained in Attachment 1. By eliminating R2 and revising R5 (now R2), the DSR SDT has maintained the intent of the requirements while eliminating potential confusion and redundancy. The revised requirements are shown below:

~~R2. Each Responsible Entity shall implement its Impact Event Operating Plan documented in Requirement R1 for Impact Events listed in Attachment 1 (Parts A and B). [Violation Risk: Factor Medium] [Time Horizon: Real-time Operations and Same-day Operations]~~

Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].

Organization	Yes or No	Question 7 Comment
Georgia Transmission Corporation & Oglethorpe Power Corporation	No	We are concerned with having a separate requirement to implement the Plan. Is this requirement necessary on its own? Should R1 instead require a Responsible Entity to "document and implement" an Impact Event Operating Plan? More specifically, if an Entity does not have an Impact Event, are they in violation of this requirement? If merging this requirement with R1 is not acceptable we suggest moving the language from the measure to the requirement as such: "To the extent that a Reponsible Entity has an Impact Event on its Facilities, Each Responsible Entity shall implement?" Additionally, R1 uses the phrase "recognized Impact Event" where as R2 simply uses the term "Impact Event." The phrase "recognized Impact Event" should be used consistently in R2 as well.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted requirement 2 and revised requirements 1 and 5 to address your concern. The DSR SDT believes that the requirement should remain separate to eliminate the possibility of double jeopardy. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		

Organization	Yes or No	Question 7 Comment
Bonneville Power Administration	No	Minimize the number of requirements. Not sure what the new R2 intends that is different than having a valid plan (signed?). Why can't R1 have develop and implement? R5 is the reporting. Implement should be with R1 or R5 depending on the interpretation.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted requirement 2 and revised requirements 1 and 5 to address your concern. The DSR SDT believes that the requirement should remain separate to eliminate the possibility of double jeopardy. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		
PSEG Companies	No	Fuel supply emergency, as discussed in response to question 4 above, is not a defined condition. This event should be removed.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted Fuel Supply Emergency from Attachment 1. This item was removed in coordination with the NERC Events Analysis Working Group and the proposed Events Analysis Program.		
SERC OC Standards Review Group	No	We agree with the concept, but disagree with the use of the term "Operating Plan" as a defined term in line with our comments in question 6 above.
Response: The DSR SDT thanks you for your comment. Please see response to comments in Question 6 The DSR SDT has revised R1 to eliminate the use of Operating Process and Operating Procedure and have used more generic terms.		
PJM Interconnection LLC	No	We agree with the concept but disagree with the use of the term "Operating Plan" as a defined term in line with our comments in Question 6 above.

Organization	Yes or No	Question 7 Comment
Response: The DSR SDT thanks you for your comment. Please see response to comments in Question 6		
Compliance & Responsiblity Organization	No	See comments set forth in number 2.
Response: The DSR SDT thanks you for your comment. Please see response to question 2.		
Exelon	No	Agree that each Responsible Entity shall implement the [Impact] Events listed in Attachment 1 (Parts A and B); however, disagree with certain events, reporting responsibilities, threshold for reporting and time to submit reports as currently outlined in Attachment 1 (Parts A and B). Also suggest that R.2 be reworded to state for applicable [Impact] Events listed in Attachment 1 (Parts A and B). This requirement should only be applied to those events applicable to the registered entity.R2 is redundant to R1. No entity could claim to have met R1 if their plan / process was not operational and approved in the manner consistent with any other approved program, process, guideline etc. within their company.
Response: The DSR SDT thanks you for your comment. The DSR SDT has significantly revised Attachment 1. We have removed the timing column and replaced it with more specific information regarding which form to submit and to whom to submit the report. All events are now to be reported within 24 hours with the exception of Destruction of BES equipment, Damage or destruction of Critical Assets and Damage or destruction of Critical Cyber Asset events, Forced Intrusion, Risk to BES equipment and Detection of a reportable Cyber Security Incident. These events are to be reported within 1 hour. Notification of law enforcement per Part 1.3.2 is also required for these events only. The DSR SDT has also eliminated R2 and revised R5 for clarity and to eliminate potential redundancy. The DSR SDT believes that the requirement should remain separate to eliminate the possibility of double jeopardy. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		
Tenaska	No	The proposed Impact Event Operating Plan should not be required.
Response: The DSR SDT thanks you for your comment.		

Organization	Yes or No	Question 7 Comment
The DSR SDT has revised R1 to only include development of an Operating Plan that includes the Parts of R1. This Operating Plan is required so that the entity's personnel will know what to do in the event of an event, how to report the event and to whom the report should be sent.		
American Municipal Power	No	No, remove R2. R2 is not an acceptable requirement nor should this be an operation. Focusing on a plan is overly prescriptive and costly. The only requirement should be to have an entity submit a report. Let the entity decide how they want to implement the reporting.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated R2 and revised R5 for clarity and to eliminate potential redundancy. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		
American Electric Power	No	Requirement 5 and Requirement 2 are redundant. We recommend Requirement 2 be replaced with the language in Requirement 5. "Each Responsible Entity shall report Impact Events in accordance with the Impact Event Operating Plan pursuant to Requirement R1 and Attachment 1 using the form in Attachment 2 or the DOE OE-417."
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated R2 and revised R5 for clarity and to eliminate potential redundancy. The old Requirement R5 has been revised as the new Requirement R2, which reads: Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		
ISO New England, Inc	No	Fuel Supply Emergency is not a defined condition. We suggest that the SDT poll the ballot body regarding the reporting of Fuel Supply Emergencies. Fuel Supply is an economic consideration and the concept of Fuel Supply Emergency is subjective. A resource that uses coal or oil may vary its supplies based on economic considerations (the price of the fuel). For a conservative BA a fuel-on-demand supply line can be viewed as a fuel supply emergency whereas the resource owner sees the matter as good business. Moreover, the release of such reports to the public can have unintended consequences. Fuel disruptions caused by contract negotiations when reported to the public can result in non-union transportation employees being physically

Organization	Yes or No	Question 7 Comment
		harmed by fuel supply organizers thus resulting in the loss of non-contract fuel. Further, this information may aggravate the situation by causing the cost of fuel to be inflated by suppliers when demand is great. If this event is not deleted, then we would suggest that the definition be constrained to “declared” fuel supply emergencies. Suggest the deletion of category: Risk to BES equipment. Because of the broad definition of BES, the risk to BES equipment is overly broad and can be applied to any risk to any “part of” any BES asset. The footnote helps identify what the SDT was intending, however, the words themselves can result in overly broad findings by compliance enforcement people.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted Fuel Supply Emergency from Attachment 1. This item was removed in coordination with the NERC Events Analysis Working Group and the proposed Events Analysis Program.		
Calpine Corp	No	Requirement R2 is unnecessary for the same reasons listed above in answer to question 6 regarding Requirement R1. A new Reliability Standard requirement is not needed to verify that internal notifications are made within Registered Entities or to ensure that Registered Entities notify local law enforcement of suspicious activity, sabotage, theft, or vandalism. Such notifications are made by any company, and this requirement does not clearly enhance the reliability of the Bulk Electric System. Requirement R5 provides sanction in the event that events listed in Attachment 1 are not made appropriately. However, if the requirement is maintained, the related Measure M2 should state in plain language exactly what elements are required for compliance. In the absence of much more detailed instruction on exactly what elements must be included in the various documents, the proposed requirement will create confusion with both compliance and enforcement of the requirement. A detailed example of example documentation would be helpful. Any difficulty in developing such an example would be instructive of the probable compliance issues that would ensure from the necessarily varying approaches that would be taken by disparate entities attempting to meet the requirement.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated R2 and revised R5 for clarity and to eliminate potential redundancy. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		
CenterPoint Energy	No	CenterPoint Energy recommends deleting the current R2 as it is an inherent part of the current R5. For an entity to “report Impact Events in accordance with the Impact Event Operating Plan pursuant to R1” (see R5), the entity must “implement its Impact Operating Plan documented in Requirement 1?” (see R2). Including

Organization	Yes or No	Question 7 Comment
		both requirements is unnecessary and duplicative. Likewise, M2 should be deleted.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated R2 and revised R5 for clarity and to eliminate potential redundancy. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		
ExxonMobil Research and Engineering	No	The notification requirement and documentation in Attachment 1 do not clearly identify which entities need to be notified for each type of event detailed in Attachment 1. While it makes sense to notify the Reliability Coordinator, NERC, Regional Entity, Law Enforcement and other Governmental Agencies for sabotage type events, it does not seem proper to notify Law Enforcement agencies of a system disturbance that is unrelated to improper human intervention. Furthermore, it is our belief that a time frame of 1 hour is a short window for making a verbal notification to third parties, and an impossibly short window for requiring the submittal of a completed form regardless of the simplicity. When a Petrochemical Facility experiences an impact event, the initial focus should emphasize safe control of the chemical process. For those cases where registered entities are required to submit a form within 1 hour, the Standard Drafting Team should alter the requirement to allow for verbal notification during the first few hours following the initiation of an Impact Event (i.e. allow the facility time to appropriately respond to and gain control of the situation prior to making a notification which may take several hours) and provide separate notifications windows for those parties that will need to respond to an Impact Event immediately and those entities that need to be informed that one occurred for the purposes of investigating the cause of and response to an Impact Event. For example, a GOP should immediately notify a TOP when it experiences a forced outage of generation capacity as soon as possible, but there is no immediate benefit to notify NERC when site personnel are responding to the event in order to gain control of of the situation and determine the extent of the problem. The existing standard's requirement to file an initial report to entities, such as NERC, within 24 hours seems reasonable provided that proper real time notifications are made and the Standard Drafting Team reinstates EOP-004 Revision 1's Requirement 3.3, which allows for the extension of the 24 hour window during adverse conditions, into the requirement section of EOP-004 [the current revision locates this extension in Attachment 1, which, according to input received from Regional Entities, means that the extension would not be enforceable].
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated R2 and revised R5 for clarity and to eliminate potential redundancy. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment]. The DSR SDT has significantly revised Attachment 1. We have removed the timing column and replaced it with more specific information regarding which form to submit and to whom to submit the report. All events are now to be reported within 24 hours with the exception of Destruction of BES equipment, Damage or destruction of Critical Assets and Damage or destruction of Critical Cyber Asset events in Part A and Forced Intrusion, Risk to BES equipment and Detection of a reportable Cyber Security Incident in Part B. These events are to be reported within 1 hour. Notification of law enforcement per Part 1.3.2 is also required for		

Organization	Yes or No	Question 7 Comment
these events only.		
American Transmission Company	No	ATC does not agree with the proposed language in Requirement 3. ATC is concerned that, in order to demonstrate compliance, an entity will have to show that each step in the plan was followed which will likely leave entities facing the choice of choosing between different compliance violations. If the plan is not followed, but the report is made within the time given, then an entity is in violations of their plan. If the plan is followed, but the report does not get filed within the time allotted, then they face a possible violation of the time to report. ATC believes that the team should enforce the position that the report being filed in the time allotted is key, not that they necessarily follow and document that their plan was followed. Depending on the situation, the internal reporting will vary; however, based on the purpose of the Standard, the key is to get a report to NERC.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated R2 and revised R5 for clarity and to eliminate potential redundancy. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		
Georgia System Operations Corporation	No	-We suggest moving the language from the measure to the requirement as such:"To the extent that a Reponsible Entity has an Impact Event on its Facilities, each Responsible Entity shall implement?"Additionally, R1 uses the phrase "recognized Impact Event"
Response: The DSR SDT thanks you for your comment. Requirement 2 has been deleted along with its associated Measure M2. R1 no longer references “recognized” events.		
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	No	There are generally several events during the year. If the process is well documented, a drill or exercise is excessive. It should be sufficient to say “provide training.”
Response: The DSR SDT thanks you for your comment. This appears to be related to R3 in question 8. If an event occurs during the year, additional testing is not required.		
Indeck Energy Services	No	R2 is direct and to the point. The Violation Risk Factor should be Low, if any, because this is historical reporting, with little or no reliability consequence.

Organization	Yes or No	Question 7 Comment
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement 2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement 3 is insurance to make sure that an entity can communicate information about events. Requirement 2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
Midwest Reliability Organization	Yes	This clearly states that an entity's Operating Plan is to be used for reporting of Impact Events.
Response: The DSR SDT thanks you for your comment.		
Dominion	Yes	Dominion agrees subject to the comments provided in Question #6. In addition, Requirement R2 appears duplicative of Requirement R5.Suggest R2 be clarified relative to the intent.
Response: The DSR SDT thanks you for your comment. Please see responses to comments in Question 6. R2 was deleted and R5 was revised. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment]. The DSR SDT has revised R1 to eliminate the use of Operating Process and Operating Procedure and have used more generic terms.		
Manitoba Hydro	Yes	Removing "assess the initial probable cause" from the statement removes the ambiguity in the same way as replacing sabotage with impact level. Let the staff trained in this field determine probable cause after the fact.
Response: The DSR SDT thanks you for your comment.		
Occidental Power Marketing	Yes	However, only LSEs with BES assets (or assets that directly support the BES) should be included in the Applicability section of the standard.
Response: The DSR SDT thanks you for your comment. Attachment 1 specifies which types of events are required to be reported by each entity.		

Organization	Yes or No	Question 7 Comment
Constellation Power Generation	Yes	Although CPG agrees with the wording of Requirement 2, CPG has several comments and suggested changes regarding the Attachments, to which this requirement points. Please see those comments below.
Response: The DSR SDT thanks you for your comment. Please see responses below.

Response: The DSR SDT thanks you for your comment. Based on stakeholder comments, Requirement R2 was deleted and R5 was revised. Old R5, New R2. Each Responsible Entity shall report impact events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment].		

8. Do you agree with the proposed revisions to Requirement 4 (now R3)? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: There were several issues that commenters raised regarding removing the requirement. Below is a summary:

1) Review annual component CAN0010 states: Regardless of the registered entity's documented definition of annual, it will not supersede any requirement stated in the standard. The DSR SDT is defining "annual" within this Standard (and only for this Standard).

2) Remove R3-requirement – Several stakeholders believed the testing to be onerous. The language of the requirement was revised to indicate that only the communications portion of the Operating Plan is required to be tested. Each Responsible Entity shall conduct a test of the communication process in its Operating Plan, created pursuant to Requirement 1, Part 1.3, at least annually (once per calendar year), with no more than 15 calendar months between tests.

3) Unclear if actual events would qualify for a test in the requirement – The language in the measure was revised to add "Implementation of the communication process as documented in its Operating Plan for an actual event may be used as evidence to meet this requirement. "

4) VRF is too high on R3 – With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.

Organization	Yes or No	Question 8 Comment

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 8 Comment</th></tr>
<tr><td>Georgia Transmission Corporation & Oglethorpe Power Corporation</td><td>No</td><td>With the current CAN on the definition of annual, we do not believe that the additional qualification that the test shall be conducted "with no more that 15 calendar months between tests" is necessary. If instead the team believes that, in order to support the reliability of the BES, tests should be performed at least every 15 months, then the requirement should be to perform a test at least every 15 calendar months and remove the annual component.</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment.

The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. Per the CAN, “Regardless of the registered entity’s documented definition of annual, it will not supersede any requirement stated in the standard.” The team believes the requirement is specifying what the team believes to be appropriate.</td></tr>
<tr><td>Northeast Power Coordinating Council</td><td>No</td><td>The annual testing requirement is too frequent for a reporting, and not an operational process. The testing interval should be extended to five years.</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment.

The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. We feel that five years is too long of an interval between tests as contact information contained in the plan may change more often. A one year test is more likely to catch problems with the Operating Plan. If an entity has an event, then they do not need to test the plan during the annual cycle.</td></tr>
<tr><td>Bonneville Power Administration</td><td>No</td><td>Too burdensome to go through EACH and ALL individual Impacts and report each one on a drill basis with outside entities. One or two scenarios may be OK.</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment. It is not intended to perform a test for each type of event listed in Attachment 1. The entity is free to choose any single event to test its operating plan. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The test under R3 Operating Plan is to test the communication aspect of your Operating Plan.</td></tr>
<tr><td>Dominion</td><td>No</td><td>: The need to conduct a test of its Operating Process has not been established and is overly restrictive given that the purpose of the standard is to report Impact Events.</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment.

The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can</td></tr>
</table>

Organization	Yes or No	Question 8 Comment
respond appropriately in the case of an actual event. The SDT thinks it is critical to test the Operating Plan to verify that employees know the appropriate actions to take and that there are no issues with the reporting procedures. Not testing the Operating Plan could result in employees being unprepared to communicate and report for an actual event.		
SPP Standards Review Group	No	The SDT included a formal review process in the discussion of R4 in the Background Information in the Unofficial Comment Form as one of three options for demonstrating compliance with the testing requirements of R4, yet M3 only contains two of those options ? a mock Impact Event exercise and a real-time implementation of its Operating Process. The third option, a formal review process, is missing from M3 and needs to be added. We would suggest the following for M3: ?In the absence of an actual Impact Event, the Responsible Entity shall provide evidence that it conducted a mock Impact Event and followed its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3 or conducted a formal review of its Operating Process. The time period between tests, actual Impact Events or formal reviews shall be no more than 15 calendar months. Evidence may include, but is not limited to, operator logs, voice recordings or documentation.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The standard now has only three requirements. The requirement to test the communications process is important so that any issues or errors in the Operating Plan can be identified. The team feels that a formal review will not be able to identify any of these errors unless the communications process is tested.		
Midwest ISO Standards Collaborators	No	We appreciate the drafting team recognizes that actual implementation of the plan for a real event should qualify as a ?test?. However, we are concerned that review of this requirement in isolation of the background material and information provided by the drafting team may cause a compliance auditor to believe that a test cannot be met by actual implementation. Furthermore, we do not believe testing a reporting procedure is necessary. Periodic reminders to personnel responsible for implementing the procedure make sense but testing it does not add to reliability. If they don?t report an event, it will become obvious with all the tools (SAFNR project) the regulators have to observe system operations.
Response: The DSR SDT thanks you for your comment. We have added the following to the measure: "Implementation of the communication process as documented in its Operating Plan for an actual event may be used as evidence to meet this requirement."		
FirstEnergy	No	We believe that a separate requirement for testing the reporting process is unnecessary. The FERC directive that required periodic testing was directed at sabotage events per CIP-001. Since the proposed standard

Organization	Yes or No	Question 8 Comment
		moves the responsibility for classifying an event as sabotage from the entity to the applicable law enforcement authority, the need for a periodic drill is no longer necessary. We believe that Requirement R4 should suffice in ensuring that the individuals involved in the process are aware of their responsibilities.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The standard now has only three requirements. The requirement to test the communications process is important so that any issues or errors in the Operating Plan can be identified.		
SERC OC Standards Review Group	No	Annual testing of an ?after-the-fact? reporting procedure does not add to the reliability of the BES!
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The standard now has only three requirements. The requirement to test the communications process is important so that any issues or errors in the Operating Plan can be identified. This will allow for reporting to the appropriate entities in the case of an actual event.		
PJM Interconnection LLC	No	1. This is an ?after-the-fact? reporting requirement (administrative in nature). Annual testing of such a requirement does not add to the reliability of the BES. 2. R3 attempts to define ?Annual? for the Registered Entity to test its Operating Process. We believe R3 should follow the NERC definition of Annual as defined in the NERC Compliance Application Notice (CAN) ? CAN-0010 ? Definition of Annual as opposed to creating a new definition of Annual ? or ? refer to an entity?s defined use of the term annual.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The standard now has only three requirements. The requirement to test the communications process is important so that any issues or errors in the Operating Plan can be identified. This will allow for reporting to the appropriate entities in the case of an actual event. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. Per the CAN, "Regardless of the registered entity's documented definition of annual, it will not supersede any		

Organization	Yes or No	Question 8 Comment
requirement stated in the standard." The team believes the requirement is specifying what the team believes to be appropriate.		
We Energies	No	A test of the Operating Process for communication would be placing telephone calls. This requirement would have virtually every entity in North America calling NERC, Regional Entities, FERC/Provincial Agency, Public Service Commission, FBI/RCMP, local Police, etc. annually. Every entity will probably be asking for a confirmation letter from each telephone call for proof of compliance. This is an unnecessary requirement. Delete it.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The standard now has only three requirements. The requirement to test the communications process is important so that any issues or errors in the Operating Plan can be identified. This will allow for reporting to the appropriate entities in the case of an actual event.		
Compliance & Responsiblity Organization	No	See comments set forth in number 2. Also, while NextEra understands the need to have a testing requirement for sabotage (Order 693 at P 446), it does not find it necessary to have a testing requirement for the other events. At this time in the process, additional requirements for the sake of having a requirement are likely to detract from reliability. Thus, NextEra requests that the testing requirement be limited to sabotage related events.
Response: The DSR SDT thanks you for your comment. Please see responses to Question 2 above. Each entity may choose an event type for which to perform the communications process test. It need not be performed for each and every event type listed in Attachment 1. The test must include all aspects of the communications process, including NERC and the RE. The measure for R3 was revised to make it explicit that evidence for compliance for R3 includes an actual event. M3. The Responsible Entity shall provide evidence that it conducted a test of the communication process as documented in its Operating Plan impact events created pursuant to Requirement R1, Part 1.3. Implementation of the communication process as documented in its Operating Plan for an actual impact event may be used as evidence to meet this requirement. The time period between an actual impact event or test shall be no more than 15 months. Evidence may include, but is not limited to, operator logs, voice recordings, or dated documentation of a test. (R3)		
Exelon	No	- Each entity should be able to determine if they need a drill for a particular event. Is this document implying that the annual drill covering all applicable [Impact] Events?

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 8 Comment</th></tr>
<tr><td></td><td></td><td>- A provision should be added to be able to take credit for an existing drill/exercise that could incorporate the required communications to meet the intent of R.3 to alleviate the burden on conducting a standalone annual drill. The DSR SDT needs to provide more guidance on the objectives and format of the drill expected (e.g., table top, simulator, mock drill).

- A provision should be added to R.3 to allow for an actual event to be used as credit for the annual requirement. It would seem that the intent is as such based on the wording in M.3; however, it needs to be explicit in the Requirement.

- Must a test include communicating to NERC or the Region?</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment. Each entity may choose an event type for which to perform the communications process test. It need not be performed for each and every event type listed in Attachment 1. The test must include all aspects of the communications process, including NERC and the RE. The measure for R3 was revised to make it explicit that evidence for compliance for R3 includes an actual event.

M3. The Responsible Entity shall provide evidence that it conducted a test of the communication process as documented in its Operating Plan impact events created pursuant to Requirement R1, Part 1.3. Implementation of the communication process as documented in its Operating Plan for an actual impact event may be used as evidence to meet this requirement. The time period between an actual impact event or test shall be no more than 15 months. Evidence may include, but is not limited to, operator logs, voice recordings, or dated documentation of a test. (R3)</td></tr>
<tr><td>City of Tallahassee (TAL)</td><td>No</td><td>Comments: The verbiage “at least annually, with no more than 15 months between such tests” is an attempt to define annually. If you want every 15 months say “at least every 15 months.” Otherwise just say annual and let the entities decide what that is, as is being done with other “annual” requirements.

Additionally, while the Measure (M3) implies that an actual event would suffice it is not stated in the requirement, and the entire plan should be tested, not just a component. Proposed: Each Responsible Entity shall conduct a test of its Impact Event Operating Plan at least annually. A test of the Impact Event Operating Plan can range from a paper drill, to the response to an actual event.</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment. The language now reads: “annually (once per calendar year), with no more than 15 calendar months between tests”. This comports with the intent and with the recent CAN from NERC on the use of “Annual”. The intent of the requirement is to verify that an entity’s personnel can communicate with other entities when a real event occurs. It is expected that such a test will include all aspects of the communications process. The measure was revised to clarify that an actual event can be used in lieu of a test. R3 reads:

“Each Responsible Entity shall conduct a test of the communication process as documented in its Operating Plan, created pursuant to Requirement 1, Part 1.3, impact events at least annually, (once per calendar year), with no more than 15 calendar months between tests.”</td></tr>
</table>

Organization	Yes or No	Question 8 Comment
Tenaska	No	The proposed Impact Event Operating Plan should not be required, therefore any tests of the Operating Process should not be required.
Response: The DSR SDT thanks you for your comment. Stakeholder consensus indicates that the majority of stakeholders agree with the Operating Plan requirement.		
American Municipal Power	No	No, remove R3. R3 is not an acceptable requirement nor should this be an operation. Focusing on a test is overly prescriptive and costly. The only requirement should be to have an entity submit a report. Let the entity decide how they want to implement the reporting.
Response: The DSR SDT thanks you for your comment. The intent of the requirement is to verify that an entity's personnel can communicate with other entities when a real event occurs. It is expected that such a test will include all aspects of the communications process. The measure was revised to clarify that an actual event can be used in lieu of a test. This should not be a costly nor burdensome requirement.		
Liberty Electric Power LLC	No	It is not the proper role of the standards to dictate how an entity conducts training. Large utilities with backup control rooms and enough personnel can conduct routine drills without disturbing operations, but this is not always the case for small entities. Further, classroom training where emergency responses are discussed can be a better tool at times for assuring compliance with operating procedures. I would suggest R3 read "Each entity shall assure that personnel are aware of the requirements of EOP-004 and capable of responding as required."
Response: The DSR SDT thanks you for your comment. The DSR SDT agrees and has removed the training Requirement, R4.		
Sweeny Cogeneration LP	No	We do not see a reliability benefit in the planning and execution of tests or drills to ensure that regulatory reporting is performed in a timely fashion. It is sufficient that penalties can be assessed against entities that do not properly respond in accordance with EOP-004-2, leaving it to us to determine how to avoid them.
Response: The DSR SDT thanks you for your comment. The intent of the requirement is to verify that an entity's personnel can communicate with other entities when a real event occurs. It is expected that such a test will include all aspects of the communications process. The measure was revised to clarify that an actual event can be used in lieu of a test.		
American Electric Power	No	It is unclear if actual events would qualify for a test in the requirement; however, the associated measure and rationale appear to support this. We suggest the requirement be restated to allow for actual events to count for this requirement.

Organization	Yes or No	Question 8 Comment
Response: The DSR SDT thanks you for your comment. The intent of the requirement is to verify that an entity's personnel can communicate with other entities when a real event occurs. It is expected that such a test will include all aspects of the communications process. The measure was revised to clarify that an actual event can be used in lieu of a test.		
New Harquahala Generating Co.	No	M3. In the absence of an actual Impact Event, the Responsible Entity shall provide evidence that it conducted a mock Impact Event and followed its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3. The time period between actual and or mock Impact Events shall be no more than 15 months. Evidence may include, but is not limited to, operator logs, voice recordings, or documentation. (R3). The measure for R3 needs to make it clear that "exercise/drill/actual employment" can be a classroom exercise, utilizing scenarios for discussion. It should not be necessary to fully test the plan by making actual phone calls, notifications etc.
Response: The DSR SDT thanks you for your comment. The intent of the requirement is to verify that an entity's personnel can communicate with other entities when a real event occurs. It is expected that such a test will include all aspects of the communications process including making actual phone calls, etc. The measure was revised to clarify that an actual event can be used in lieu of a test. The purpose of the requirement is to ensure that the communications process works.		
ISO New England, Inc	No	We appreciate and agree with the drafting team recognizes that actual implementation of the plan for a real event should qualify as a "test." However, we are concerned that review of this requirement in isolation and without the benefit of the background material and information provided by the drafting team may cause a compliance auditor to believe that a test cannot be met by actual implementation. Furthermore, we do not believe testing a reporting procedure is necessary. Periodic reminders to personnel responsible for implementing the procedure make sense but testing it does not add to reliability. If they don't report an event, it will become obvious to compliance auditors. Recommend using language similar to CIP-009. "Each Responsible Entity shall conduct a an exercise of its operating process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3 at least annually, with no more than 15 calendar months between exercises." An exercise can range from a paper drill, to a full operational exercise, to reporting of actual incident Also, we question the need to conduct a test annually. Since this is only a reporting Standard and, as such, has no direct impact on reliability, we suggest modifying the testing requirement to once every three years. CIP-009-3 **R.2** Exercises —The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident. **M2.** The Responsible Entity shall make available its records documenting required exercises as specified in

Organization	Yes or No	Question 8 Comment
		Requirement R2.
Response: The DSR SDT thanks you for your comment. The intent of the requirement is to verify that an entity's personnel can communicate with other entities when a real event occurs. It is expected that such a test will include all aspects of the communications process. The measure was revised to clarify that an actual event can be used in lieu of a test.		
Calpine Corp	No	Absent substantial evidence that the proposed requirement addresses an actual systemic problem with actual submittal of reports of electrical disturbances, Requirement R4 should be removed. Failure to properly report events is currently sanctionable under CIP-001-1 and EOP-004-1 and will continue to be sanctionable under proposed EOP-004-2. Entities are capable of implementing procedures appropriate to ensure compliance with the actual reporting requirements without the addition of this "test." Alternately, if this requirement for annual tests is retained, it should be supplemented with a detailed example of an acceptable test and acceptable documentation of the test to avoid future compliance and enforcement issues. Stating "evidence may include, but is not limited to..." provides broad and unnecessary opportunity for future compliance and enforcement issues. Any difficulty the committee might encounter in developing such a detailed example would be instructive of the probable compliance and issues that would ensure from implementation of the requirement.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The requirement is written so that it is not prescriptive and allows the entity flexibility in how it tests its communications process.		
BGE	No	Requirement 3 (formerly R4) should be removed altogether because it is covered by the new R4. The topic of Disturbance Reporting is covered several times each year during operator training classes and the operators are tested on the material. Actual issued Disturbance Reports throughout the year are also covered during training class.
Response: The DSR SDT thanks you for your comment. R4 was a training requirement which has been revised and incorporated into Requirement R1, Part 1.5. This now calls for an annual review of the Operating Plan rather than training. The intent of the review is to ensure that the plan is up to date.		
Georgia System Operations Corporation	No	-With the current CAN on the definition of annual, we do not believe that the additional qualification that the test shall be conducted "with no more that 15 calendar months between tests" is necessary. Although we understand the additional qualification

Organization	Yes or No	Question 8 Comment
Response: The DSR SDT thanks you for your comment. The CAN language defers to the standard drafting team for any qualifications on "annual." The DSR SDT prefers the existing language.		
Indeck Energy Services	No	For smaller entities, for which few of the Attachment 1 events apply (eg a 75 MW wind farm), a drill is overkill. Reviewing the procedure during training should be sufficient. The solution is to require a drill for any entity for which any of the Attachment 1 events would cause a Reportable Disturbance or reportable DOE OE-417 event and training review for any other entities. The Violation Risk Factor should be Low, if any, because this is historical reporting, with little or no reliability consequence.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. Any drill or exercise that meets the intent of the requirement is acceptable. **VRF:** With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
ExxonMobil Research and Engineering	No	The annual (15 month) time window for conducting annual performance tests appears to be reasonable. However, the required scope of the test is vague. The Standard Drafting Team should modify the testing requirement to include boundary criteria such as whether notifications to third parties and law enforcement are required or if the test is limited to internal notifications and response processes. Furthermore, the current measure associated with this requirement, EOP-004 Revision 2 Measure 3, implies, that if an Impact Event occurs, the registered entity can count the activation of its Impact Event Operating Plan as a test and extend the test window 15 months from the date of activation. The Standard Drafting Team should revise the requirement to clarify that the test window resets when a site initiates its Impact Event Operating Plan in response to a real Impact Event as requirement criteria should not be included in a measure.

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 8 Comment</th></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment.

The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. It is expected that such a test will include all aspects of the communications process. The measure was revised to clarify that an actual event can be used in lieu of a test.</td></tr>
<tr><td>Occidental Power Marketing</td><td>No</td><td>We understand that this requirement is meant to comply with FERC Order 693, Section 466; however, there needs to be more specificity concerning what sort of "test" would be accepted for auditing purposes. Also, only LSEs with BES assets should be included in the Applicability section of the standard.</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment.

The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The requirement is written so that it is not prescriptive and allows the entity flexibility in how it tests its communications process.</td></tr>
<tr><td>Lincoln Electric System</td><td>No</td><td>As currently drafted, requirement R3 states one must “conduct a test” whereas the associated Measure requests evidence that one “conducted a mock Impact Event.” The Rationale box lends to further confusion by referencing a “drill or exercise” as a process to verify one’s Operating Process. To avoid potential confusion between R3 and M3, as well as to maintain consistency with the Rationale box, recommend the drafting team replace the word “test” with “drill or exercise” within R3 and the associated Measure.</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. It is not a common practice to include explanatory text in a requirement. The Results-based standards format allows the Rationale boxes to serve this role. The Rationale box includes language that indicates that an actual implementation of the plan counts as a test.</td></tr>
<tr><td>Farmington Electric Utility System</td><td>No</td><td>The measure for R3 indicates an actual Impact Event would count as a test, consider aligning the requirement with the measure to clarify an Impact Event could be considered a test.</td></tr>
<tr><td colspan="3">Response: The DSR SDT thanks you for your comment. Organization	Yes or No	Question 8 Comment
Ingleside Cogeneration LP	No	Since the reporting of event data to regulatory agencies does not support a front-line operations capability to mitigate or restore a BES impairment, regular simulations are not needed. Those notification items which test coordination between operating entities can be addressed in emergency operations exercises.
Response: The DSR SDT thanks you for your comment. We concur with your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event.		
Constellation Power Generation	No	As CPG stated in comments to earlier versions of EOP-004-2, this requirement adds a substantial compliance burden with little to no reliability improvement to the BES. Numerous entities in the NERC footprint have created fleet wide compliance programs for their facilities, instead of overseeing multiple stand alone compliance programs. This was done not just for the ease of administration, but it also greatly improves the reliability of the BES by ensuring consistency across multiple facilities. By requiring each responsible entity to test the Operating Process, those under a fleet wide compliance program will end up testing the same Operating Process numerous times. This would be inefficient, ineffective and unnecessarily costly. If the testing requirement remains, then the Responsible Entity should be able to take credit for testing of the Operating Process regardless of which entity in the fleet tested it. Alternatively, the drafting team should consider removing Requirement 3 (formerly R4) because in practice it is covered by the new R4. As discussed below R4 needs refinement, but the topic of Disturbance Reporting is covered during annual training.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. If the intent of this requirement is fulfilled by another exercise or drill conducted by the responsible entity, then that will meet the requirement.		
Duke Energy	Yes	We understand that the objective of this requirement is to test the Operating Process for communicating Impact Events; and that such test could be an actual exercise, a formal review, or a real-time implementation. But given that R1.4 requires updating the Operating Plan within 90 days of any changes, we believe the VRF for R3 should be LOW instead of MEDIUM.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a “lower” VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is		

Organization	Yes or No	Question 8 Comment
responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is “medium.” The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
Progress Energy	Yes	Do all individuals who are assigned roles and responsibilities in the Impact Event Operating Plan have to be involved with the test each time? Since there are multiple different types of Impact Events, it seems likely that only a subset of those Impact Events would be tested during an annual test, and therefore only a subset of individuals with responsibilities in the Impact Event Operating Plan would participate. For example, one test may exercise the Operating Process for properly reporting damage to a power plant that is a Critical Asset, and personnel from the Distribution Provider would not be involved in that test. Would such a scenario meet the requirement for the annual test? If so, it seems that some aspects of the Plan may never actually be required to be tested. This is ok, since R4 requires an annual review with personnel with responsibilities in the Impact Event Operating Plan. It must be made clear what is required in the annual test.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The requirement is written so that it is not prescriptive and allows the entity flexibility in how it tests its communications process.		
Manitoba Hydro	Yes	This requirement appears to be written so as to leave how each entity tests this procedure is up to them and not how. The testing of this procedure could vary vastly from entity to entity, meaning there is no set protocol on this procedure. As long as this requirement remains open, it is fair.
Response: The DSR SDT thanks you for your comment.		
United Illuminating Co	Yes	: FERC did state in Order 693 that the reporting procedure requires testing. UI is concerned that the scope of the requirement is unspecified. Does the exercise require only one type of Impact Event to be exercised per period, or is an entity required to simulate each Impact Event and notification
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. If your communications process differs by event type, then all communications should be tested.		

Organization	Yes or No	Question 8 Comment
Southern Company	Yes	This will cause all of the entities listed in R1.3.2 to receive test communications from all of the applicable entities annually.
Response: The DSR SDT thanks you for your comment. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The standard now has only three requirements. The requirement to test the communications process is important so that any issues or errors in the Operating Plan can be identified. This will allow for reporting to the appropriate entities in the case of an actual event.

9. Do you agree with the proposed revisions to Requirement 5 (now R4)? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: A significant number of commenters indicated that there was confusion surrounding the use of the term "review" in Requirements R3 and R4. Similar comments suggested that the measure for Requirement R4 has a training connotation, which is inconsistent with the language in the requirement, which uses the term "review." The DSR SDT has eliminated Requirement R4 and added a part to Requirement 1, Part 1.5, to require a process for ensuring that the event Operating Plan is reviewed at least annually, with no more than 15 calendar months between review sessions. Eliminating R4 and adding Part 1.5 maintains the intent while eliminating potential confusion and redundancy.

Other commenters suggested revisions to the use of the term annual. The DSR SDT reviewed the NERC definition of Annual as defined in the NERC Compliance Application Notice (CAN) CAN-0010, which provides drafting teams latitude to define the term within a requirement as they intend it to be used.

Organization	Yes or No	Question 9 Comment
Georgia Transmission Corporation & Oglethorpe Power Corporation	No	We do not believe that the requirement should specify that the plan must be reviewed with those personnel who have responsibilities identified in that plan as there is no requirement in R1 that the plan must identify any specific personnel responsibilities. Additionally, we seek clarification on whether review in this instance means train as indicated in the measure.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated requirement R4 and added a Part under Requirement R1, to require a process for ensuring that the event Operating Plan is reviewed at least annually, with no more than 15 calendar months between review sessions. By adding this Part to Requirement R1, the SDT has eliminated confusion and redundancy around the use of the term "review" and the training connotation in the Measure.		
Dominion	No	The need to periodically review its Impact Event Operating Plan has not been established and is overly restrictive (annually) given that the purpose of the standard is to report Impact Events. Suggest removing this requirement
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated requirement R4 and added a Part under Requirement R1, to require a process for ensuring that the event Operating Plan is reviewed at least annually, with no more than 15 calendar months between review sessions. The DSR SDT		

Organization	Yes or No	Question 9 Comment
's intent is to ensure that there is no gap in the review of the Operating Plan even though the plan has provision(s) for updating the event Operating Plan within 90 days of any change to its content. By adding this Part to Requirement R1, the SDT has eliminated confusion and redundancy around the use of the term "review" and the training connotation in the Measure.		
SPP Standards Review Group	No	There is confusion surrounding the use of the term review in R3 and R4. In R3 and the suggested revision to M3 in Question 8, review is an analysis of the plan by a specific group tasked to determine if the plan requires updating or modifying to remain viable. Review in R4 has training connotations for all personnel who have responsibilities identified in the plan. Although we understand the use of review in R4 is new to this version of EOP-004-2, we believe it may be more appropriate to use training rather than review in R4. And further, we feel the training should be focused on those specific portions of the plan that apply to specific job functions.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated Requirement R4 and added a Part under Requirement R1, to require a process for ensuring that the event Operating Plan is reviewed at least annually, with no more than 15 calendar months between review sessions. By adding this Part to Requirement R1, the SDT has eliminated confusion and redundancy around the use of the term "review" and the training connotation in the Measure.		
FirstEnergy	No	We believe that Requirement 4 does not warrant a Medium risk factor. For example, a simple review of the process does not have the same impact on the Bulk Electric System as the implementation of the Operating Plan per R2. Therefore, we believe R4 is at best a Low risk to the BES.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated Requirement R4 and has re-evaluated the Violation Risk Factors for each requirement. With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement 2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
We Energies	No	Include that this is for internal personnel as stated in the associated measure.

Organization	Yes or No	Question 9 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated Requirement R4 and the associated Measure.		
Compliance & Responsibility Organization	No	See comments set forth in number 2
Response: Thank you for your comments and suggestions. Please see responses to question 2.		
Exelon	No	Need more guidance on what personnel are expected to participate in the annual review. Training for all participants in a plan should not be required. Many organizations have dozens if not hundreds of procedures that a particular individual must use in the performance of various tasks and roles. Checking a box that states someone read a procedure does not add any value. This is an administrative burden with no contribution to reliability. If the intention is that internal personnel who have responsibilities related to the Operating Plan cannot assume the responsibilities unless they have completed training. This requirement places an unnecessary burden on the registered entities to track and maintain a database of all personnel trained and should not be a requirement for job function. A current procedure and/or operating plan that addresses each threshold for reporting should provide adequate assurance that the notifications will be made per an individual's core job responsibilities.
Response: Thank you for your comments. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The requirement is written so that it is not prescriptive and allows the entity flexibility in how it tests its communications process.		
City of Tallahassee (TAL)	No	The verbiage at least annually, with no more than 15 months between review sessions is an attempt to define annually. If you want every 15 months say at least every 15 months. Otherwise just say annual and let the entities decide what that is, as is being done with other annual requirements.
Response: Thank you for your comment. The DSR SDT took into consideration the CAN on the definition of 'Annual" and wrote the requirement to meet the intent of the team.		
Tenaska	No	The proposed Impact Event Operating Plan should not be required.
Response: The DSR SDT thanks you for your comment. The DSR SDT considers the proposed event Operating Plan a document that identifies the activities to achieve the purpose to improve industry awareness and the reliability of the Bulk Electric System. The DSR SDT has revised R1 to only include development of an Operating Plan that includes the sub-requirements of R1.		

Organization	Yes or No	Question 9 Comment
American Municipal Power	No	No, remove R4. R4 is not an acceptable requirement nor should this be an operation. Focusing on a plan and personnel tracking is overly prescriptive. The only requirement should be to have an entity submit a report. Let the entity decide how they want to implement the reporting.
Response: The DSR SDT thanks you for your comment. The DSR SDT has taken into consideration your comment, eliminated Requirement R4, and added Requirement R1, Part 1.5. The SDT agrees that the Registered Entity can decide on the how to implement the reporting; however, this requirement mandates that the Registered Entity document its process.		
Liberty Electric Power LLC	No	Again, the entity should determine the need for review of any procedure. Changing circumstances may dictate a shorter cycle, but no changes could dictate a longer review. I will note that spill prevention plans are required to be reviewed every five years, so I question the need for an 18-month review of the EOP plan.
Response: The DSR SDT thanks you for your comment. The review provisions are designed to ensure that contact information for internal and external organizations are correct and up to date.		
Arkansas Electric Cooperative Corporation	No	We appreciate the effort the team has taken in improving the requirements since the last posting. We request the team clarify if this also includes personnel observing and reporting the requirements or only those specifically listed in the plan. The measure seems to indicate it only includes those listed in the plan, but this is not clear in the requirement. If it includes those personnel involved in observing and notifying management, then this might include a significant portion of the organization. In either case, we feel the requirement should be modified as "review applicable portions of its Impact Event Operating Plan....
Response: The DSR SDT thanks you for your comment. The training provisions of the standard have been removed. The DSR SDT intent is to ensure that the Registered Entity has Operating Plan(s) for the identification of events, establishing which internal personnel are involved, identification of outside agencies to be notified, and having a provision for updating the plan(s). The SDT feels that current Sabotage Reporting guidelines already provide much of the information needed in the new R1.		
Calpine Corp	No	Failure to properly report events is currently sanctionable under CIP-001-1 and EOP-004-1 and will continue to be sanctionable under proposed EOP-004-2. Entities are capable of implementing procedures appropriate to ensure compliance with the actual reporting requirements without the addition a formal requirement to annually review their internal procedures with personnel. In the unlikely event that an entity cannot attain this level of operating competence without implementation of a new requirement, such Entities would be subject to enforcement under Requirement R5. Absent substantial evidence of systemic problems by Entities in contacting local law enforcement properly or failures to complete event reports to appropriate agencies when provided with clear guidance on the events to be reported, this requirement is unnecessary.

Organization	Yes or No	Question 9 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted Requirement R2 and revised Requirements R1 and R5 to address your concern. Requirement R5 (now R2) reads: R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.		
ExxonMobil Research and Engineering	No	Its unclear whether R4 is a training requirement to train all individuals who may be required to implement its Impact Event Operating Plan on an annual basis or a requirement for an Entity to review the Impact Event Operating Plan with at least one person from each position that has a role in the Impact Event Operating Plan in order to complete a quality review of the Impact Event Operating Plan. The SDT should clarify the intent of the requirement. If the intent is that both of the aforementioned interpretations is expected to occur, the SDT should break R4 into two requirements so that an entity is not violation of Requirement R4 when the entity fails to comply with one of the two imbedded requirements (e.g. if the quality review is not performed but all individuals were trained).
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted Requirement R4 and added a new Part 1.5 under R1 to address your concern. Part 1.5 calls for an annual review of the plan.		
Constellation Power Generation	No	The purpose of this requirement as currently worded is unclear. It seems to insinuate that a formal review of the Operating Plan takes place annually, and that any and all personnel identified in the plant are part of the review. If that is correct, than CPG believes this requirement is echoing Requirement 3. These two requirements can be incorporated into one. Furthermore, the Measure for R4 is too prescriptive, going so far as to specifically describe how this formal review should take place. It even states that the Responsible Entity needs to present documentation showing that the personnel in the plan were trained, yet there is no requirement for training. CPG would like the DSR SDT to revisit the purpose and intent of this requirement, alone and in concert with R3. If there are indeed similar then consolidate them into one requirement.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted Requirement R4 and added a new Part 1.5 under R1 to address your concern. Part 1.5 calls for an annual review of the plan.		
Georgia System Operations Corporation	No	With the current CAN on the definition of annual, we do not believe that the additional qualification that the test shall be conducted "with no more that 15 calendar months between reviews" is necessary. Remove "with no more that 15 calendar months between reviews.
Response: The DSR SDT thanks you for your comment. The SDT has revised the term annual to align with the definition in the NERC Compliance Application		

Organization	Yes or No	Question 9 Comment
Notice (CAN) CAN-0010.		
SERC OC Standards Review Group	Yes	We agree with the concept, but disagree with the use of the term Operating Plan as a defined term in line with our comments in question 6 above.
Response: The DSR SDT thanks you for your comment. The DSR SDT believes that the use of a defined term "Operating Plan" to describe the procedure to identify and report the occurrence of a disturbance is appropriate and has revised Requirement R1 to remove the terms Operating Process and Operating Procedure to eliminate confusion.		
PJM Interconnection LLC	Yes	1. We agree with the concept but disagree with the use of the term Operating Plan as a defined term in line with our comments to Question 6 above. 2. R4 attempts to define Annual for the Registered Entity to review its Impact Operating Plan. We believe R4 should follow the NERC definition of Annual as defined in the NERC Compliance Application Notice (CAN) CAN-0010 Definition of Annual as opposed to creating a new definition of Annual or refer to an entities defined use of the term annual.
Response: The DSR SDT thanks you for your comment. Please see responses to question 6 above. The DSR SDT reviewed the NERC definition of Annual as defined in the NERC Compliance Application Notice (CAN) CAN-0010. The NERC CAN provides drafting teams latitude to define annual within a Requirement as they believe is appropriate in the context of a particular standard.		
United Illuminating Co	Yes	As written it is a training burden. Certain persons will have only one step in one operating procedure to perform. There is no necessity to review the entire Operating Plan with them. For example, Field Personnel need to know that if they see something not right to report it immediately. In this instance there is no benefit to review the Operating Procedure/Process for firm load shedding with them.
Response: The DSR SDT thanks you for your comment. The training requirement has been removed. The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized events is correct so that the entity can respond appropriately in the case of an actual event. The DSR SDT has removed R4 to eliminate potential confusion and redundancy around the training connotation.		
Manitoba Hydro	Yes	Removing the extreme details within 30 days of revision and train before given responsibility and giving leeway to when this training is necessary, will allow training to be integrated into other existing training schedules. Inclusion of 5.3 and 5.4 would require unique set of time lines and additional resources to monitor and implement.
Response: The DSR SDT thanks you for your comment. The training provisions of the standard have been removed.		

Organization	Yes or No	Question 9 Comment
Occidental Power Marketing	Yes	However, only LSEs with BES assets (or assets that directly support the BES) should be included in the Applicability section of the standard.
Response: The DSR SDT thanks you for your comment. Attachment 1 specifies which types of events are required to be reported by each entity. LSE is included here due to CIP-002-3 applicability.		
Farmington Electric Utility System	Yes	A review of the Impact Event Operating Plan can be interrupted as an informal examination of the plan. The measure for R4 indicates evidence of a review, parties conducting the review AND when internal training occurred. It should be clarified in R4 training is expected as part of the review for personnel with responsibilities. This is an improvement from the previous 5.3 and 5.4, however, the team should consider adding back, and review/training shall be conducted prior to assuming the responsibility in the plan.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted Requirement R4 and added a new Part 1.5 under R1 to address your concern. Part 1.5 calls for an annual review of the plan.		
Ingleside Cogeneration LP	Yes	Yearly refresher training on the reporting process is appropriate. Ingleside Cogeneration also agrees that a review with those individuals with assigned responsibilities under the Operating Plan is a better way to frame the requirement.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted Requirement R4 and added a new Part 1.5 under R1 to address your concern. Part 1.5 calls for an annual review of the plan.		
Indeck Energy Services		R4 is redundant with R3 and should be deleted. The Violation Risk Factor should be Low, if any, because this is historical reporting, with little or no reliability consequence.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted Requirement R4 and revised R3. With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the

10. Do you agree with the proposed revisions to Requirement 6 (now R5) and the use of either Attachment 2 or the DOE-OE-417 form for reporting? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: The slight majority of commenters suggested revisiting R2 and R5 to eliminate potential redundancy and confusion. The intent of the two requirements is to have entities utilize the DOE Form OE-417 to report events listed on Attachment 1. If the entity completes DOE Form OE-417 to report an event, it does not have to transcribe the same information onto Attachment 2 but may be required to submit the form to the DOE and NERC. By eliminating R2 and revising R5 (now R2), the DSR SDT has maintained the intent of the requirements.

R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.

Organization	Yes or No	Question 10 Comment
Northeast Power Coordinating Council	No	R5 stipulates the use of Attachment 2 or the DOE-417, which is the vehicle for reporting only. This is the how part, not the what. The vehicle for reporting can easily be included in ***R2 where an entity is required to implement (execute) the Operating Plan upon detection of an Impact Event***. Suggest combining R2 with R5.
Response: The DSR SDT thanks you for your comment. The DSR SDT has also eliminated R2 and revised R5 (now R2) for clarity and to eliminate potential redundancy. R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.		
Dominion	No	Dominion does not agree because the Requirement is too restrictive giving the Responsible Entity the choice on reporting forms as either Attachment 2 or DOE OE-417. The use of Attachment 2 or DOE OE-417 may be appropriate when reporting to NERC, however, Requirement R 1.3.2 requires the Responsible Entities Impact Event Operating Plan to address notifications to non-NERC entities such as Law Enforcement or Governmental Agencies. It is likely that these organizations have specific reporting requirements or forms that will not line up the options prescribed in Requirement R5.Suggest revising Requirement R5 to not require the use of these two forms as the only options. If these 2 forms are used, suggest aligning the Event names in Attachment 1 to be similar to the criteria for filing event names in the DOE OE-417 to allow for consistency.

Organization	Yes or No	Question 10 Comment
		Also suggest aligning the time to submit for similar event names in each form.
Response: The DSR SDT thanks you for your comment. The DSR SDT has revised Attachment 1 to indicate that entities must submit Attachment 2 or the DOE OE-417 form. This information was contained in Requirement 5. The intent of the two requirements is to have entities make appropriate notifications and report events contained in Attachment 1. By eliminating R2 and revising R5 (now R2), the DSR SDT has maintained the intent of the requirements while eliminating potential confusion and redundancy. R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1. The DSR SDT has enhanced Attachment 1 and clarified the intent of each event, threshold and reporting time limits. The DSR SDT removed the column, Time to Submit Report and replaced it with Submit Attachment 2 or DOE OE-417 Report.		
SPP Standards Review Group	No	We feel there is redundancy between R2 and R5. To eliminate this redundancy, we propose to take the phrase using the form in Attachment 2 or the DOE OE-417 reporting form and adding it at the end of R2. Then what is left of R5 could be deleted. The new R2 would read Each Responsible Entity shall implement its Impact Event Operating Plan documented in Requirement R1 for Impact Events listed in Attachment 1 (Parts A and B) using the form in Attachment 2 or the DOE OE-417 reporting form.?
Response: The DSR SDT has revised Attachment 1 to indicate that entities must submit Attachment 2 or the DOE OE-417 form. This information was contained in Requirement 5. The intent of the two requirements is to have entities make appropriate notifications and report events contained in Attachment 1. By eliminating R2 and revising R5 (now R2), the DSR SDT has maintained the intent of the requirements while eliminating potential confusion and redundancy. R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.		
Midwest ISO Standards Collaborators	No	Requirement 2 and Requirement 5 appear to be very similar. Requirement 2 requires implementation of the Operating Plan, Operating Process and/or Operating Procedure in Requirement 1. The Operating Procedure requires gathering and reporting of information for the form in Attachment 2. What does Requirement 5 add that is not already covered in Requirement 2 except the ability to use the DOE OE-417 reporting form which
Response: The DSR SDT thanks you for your comment. The intent of the two requirements is to have entities utilize the DOE Form OE-417 to report events listed on Attachment 1. If the entity completes DOE Form OE-417 to report an event, they do not have to transcribe onto attachment 2 but may be required to submit it to the U.S. Department of Energy (DOE) and NERC. By eliminating R2 and revising R5 (now R2), the DSR SDT has maintained the intent of the requirements. R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.		
FirstEnergy	No	We believe that Requirement 5 does not warrant a Medium risk factor. Not using a particular form is strictly

Organization	Yes or No	Question 10 Comment
		administrative in nature and the VRF should be Low.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
PJM Interconnection LLC	No	R5 seems redundant as R2 already requires an entity to report any Impact Events by executing/implementing its Impact Event Operating Plan. R5 merely stipulates the use of Attachment 2 or DOE-417, which an entity automatically would use for reporting purposes while implementing its Impact Event Operating Plan.
Response: The DSR SDT thanks you for your comment. The intent of the two requirements is to have entities utilize the DOE Form OE-417 to report events listed on Attachment 1. If the entity completes DOE Form OE-417 to report an event, they do not have to transcribe onto attachment 2 but may be required to submit it to the U.S. Department of Energy (DOE) and NERC. By eliminating R2 and revising R5 (now R2), the DSR SDT has maintained the intent of the requirements. R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.		
Exelon	No	Agree that each Responsible Entity should be able to use either Attachment 2 or the DOE OE-417 form for reporting; however, a GO/GOP will not have the ability to respond to Attachment 2 Task numbers 8, 9, 10, 11, and 12. Suggest that the DSR SDT either evaluate a shortened form version, provide a note or provision for "N/A" based on registration, or revise form to be submitted by the most knowledgeable functional entity (e.g., TOP or RC).Need clear guidance as to which form is to be used for which Impact Event, we feel that one and only one form should be used to eliminate confusion. Attachment 2 has an asterisk on #s 7, 8, 9, 10 and 11 there is not reference corresponding to it.
Response: The DSR SDT thanks you for your comment. The DSR SDT has updated Attachment 2 to per comments received.		

Organization	Yes or No	Question 10 Comment
Tenaska	No	R5 should be changed to Each Responsible Entity shall report Impact Events listed in Attachment 1 using the form in Attachment 2 or the DOE OE-417 reporting form. This revised version of the proposed R5 is the only Requirement that is necessary to achieve the stated purpose of Project 2009-01. The proposed R1 through R4 should be deleted and R5 should be changed to R1.
Response: The DSR SDT thanks you for your comment. The SDT agrees the reporting is a fundamental aspect, but the operation plans are integral piece of the BES. The DSR SDT believes that the revisions created will provide clarity for the requirements. Please see the revised standard.		
American Municipal Power	No	R5 is not an acceptable requirement, but it can be improved. Each Responsible Entity shall report "Impact Events" to _____________ (address specified in attachment 1, website, entity, email address, or fax, etc.) Focusing on a plan and procedure is overly prescriptive. The only requirement should be to have an entity submit a report. Let the entity decide how they want to implement the reporting.
Response: The DSR SDT thanks you for your comment. The DSR SDT has eliminated R2 and revised R5 (now R2) for clarity and to eliminate potential redundancy. The SDT agrees that the Registered Entity can decide on the how to implement the reporting; however, this requirement mandates that the Registered Entity document its process. R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.		
Arkansas Electric Cooperative Corporation	No	We appreciate the effort the team has taken in improving the requirements since the last posting. For R5, we suggest including the reporting form as part of the plan in R1. Otherwise, a violation of R5 would also indicate a violation of R2.
Response: The DSR SDT thanks you for your comment. The DSR SDT has also eliminated R2 and revised R5 (now R2) for clarity and to eliminate potential redundancy. R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.		
American Electric Power	No	This should be one-step covered by the implementation in requirement 2. We like the ability to use one form (i.e. NERC Attachment 2 or the DOE-417); however, we would prefer to have this information only be reported once.
Response: The DSR SDT thanks you for your comment. EOP-004-2 allows entities to utilize the DOE Form OE-417 to report events listed on Attachment 1. If the entity completes DOE Form OE-417 to report an event, they do not have to transcribe onto attachment 2 but may be required to submit it to the U.S. Department of Energy (DOE) and NERC.		

Organization	Yes or No	Question 10 Comment
Consumers Energy	No	We understand that DOE is migrating to an on-line reporting facility rather than the email-submitted OE-417. If they do so, Form OE-417will not be available for providing to NERC, and the reporting specified by EOP-004 will be duplicative of that for DOE. We recommend that NERC, RFC and the DOE work cooperatively to enable a single reporting system in which on-line reports are made available to all appropriate parties.
Response: The DSR SDT thanks you for your comment. The SDT agrees with the concept of the single reporting template and is working with other agencies to see if the single form would be achievable.		
Independent Electricity System Operator	No	R5 stipulates the use of Attachment 2 or the DOE-417, which is the vehicle for reporting only. This is the how part, not the what. The vehicle for reporting can easily be included in R2 where an entity is required to implement (execute) the Operating Plan upon detection of an Impact Event. We suggest the SDT combine R2 with R5.
Response: The DSR SDT thanks you for your comment. The DSR SDT has also eliminated R2 and revised R5 (now R2)for clarity and to eliminate potential redundancy. R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.		
Ameren	No	The "Responsible Entity" should be limited to those functions with the most oversight such as the BA, RC, or TOP. Otherwise there will be multiple DOE OE-417 reports sent by multiple entities.
Response: Thank you for your comments. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view of what has happened. The entire Attachment 1 has been updated to reflect the comments that were received.		
ISO New England, Inc	No	R5 stipulates the use of Attachment 2 or the DOE-417, which is the vehicle for reporting only. This is the how part, not the what. The vehicle for reporting can easily be included in R2 where an entity is required to implement (execute) the Operating Plan upon detection of an Impact Event. We suggest the SDT combine R2 with R5.
Response: The DSR SDT thanks you for your comment. The DSR SDT has also eliminated R2 and revised R5 (now R2) for clarity and to eliminate potential redundancy.		
Calpine Corp	No	The use of DOE OE-417 is acceptable, but the language of Requirement R5 should be modified. The disturbance event form must be filled out correctly, irrespective of the requirements of an Entities Impact Event Operating Plan. Reference to that Plan does not add clarity to the requirement to report events. The

Organization	Yes or No	Question 10 Comment
		requirement should delete the reference to the Impact Event Operating Plan? and simply state: Each Responsible Entity shall report events listed in Attachment 1 using the provided form, or where also required to complete the current version of DOE OE-417, that form. Although one of the primary stated purposes of the original SAR was to simplify the reporting process by creating a single form, the fact that some entities are already required to report substantially identical information to DOE argues for retention of the use of the DOE form.
Response: The DSR SDT thanks you for your comment. DSR SDT has deleted requirement 2 and revised requirements R1 and R5 (now R2) to address your concern. The entire Attachment 1 has been updated to reflect the comments that were received.		
BGE	No	Language needs to be more specific on when to use Attachment 2 or DOE-OE-417.
Response: The DSR SDT thanks you for your comment. Attachment 2 should be the normal reporting vehicle unless the entity is required to submit an OE-417 to the DOE. This keeps the entity from having to file two distinctly different reports for the same event.		
Alliant Energy	No	We believe Attachment 2 should be deleted, and NERC should work with the DOE to have one form for all events, if possible. It makes the reporting procedure much simpler, only having to use one form.
Response The DSR SDT thanks you for your comment. EOP-004-2 allows entities to utilize the DOE Form OE-417 to report events listed on Attachment 1. If the entity completes DOE Form OE-417 to report an event, they do not have to transcribe onto attachment 2 but may be required to submit it to the U.S. Department of Energy (DOE) and NERC. The DSR SDT is currently working with the DOE to make revisions to Form OE-417 that would achieve the objective of your comment. We will continue to pursue this.		
ExxonMobil Research and Engineering	No	The notification requirement and documentation in Attachment 1 do not clearly identify which entities need to be notified for each type of event detailed in Attachment 1. While it makes sense to notify the Reliability Coordinator, NERC, Regional Entity, Law Enforcement and other Governmental Agencies for sabotage type events, it does not seem proper to notify Law Enforcement agencies of a system disturbance that is unrelated to improper human intervention. Furthermore, it is our belief that a time frame of 1 hour is a short window for making a verbal notification to third parties, and an impossibly short window for requiring the submittal of a completed form regardless of the simplicity. When a Petrochemical Facility experiences an impact event, the initial focus should emphasize safe control of the chemical process. For those cases where registered entities are required to submit a form within 1 hour, the Standard Drafting Team should alter the requirement to allow for verbal notification during the first few hours following the initiation of an Impact Event (i.e. allow the facility time to appropriately respond to and gain control of the situation prior to making a notification which may take several hours) and provide separate notifications windows for those parties that will need to respond to an Impact Event immediately and those entities that need to be informed that one occurred for the

Organization	Yes or No	Question 10 Comment
		purposes of investigating the cause of and response to an Impact Event. For example, a GOP should immediately notify a TOP when it experiences a forced outage of generation capacity as soon as possible, but there is no immediate benefit to notify NERC when site personnel are responding to the event in order to gain control of the situation and determine the extent of the problem. The existing standards requirement to file an initial report to entities, such as NERC, within 24 hours seems reasonable provided that proper real time notifications are made and the Standard Drafting Team reinstates EOP-004 Revision 1's Requirement 3.3, which allows for the extension of the 24 hour window during adverse conditions, into the requirement section of EOP-004 [the current revision locates this extension in Attachment 1, which, according to input received from Regional Entities, means that the extension would not be enforceable].
Response: The DSR SDT thanks you for your comment. The SDT envisions that each Registered Entity will develop Operating Plan(s) appropriate to meet its obligations as outlined in the standard. The SDT doesn't feel it necessary to prescribe to the Registered Entity any particular interpretation on how to achieve compliance, including who the information should be reported to. The entire Attachment 1 has been updated to reflect the comments that were received.		
American Transmission Company	No	Attachment 2, Task #14 in the report should be modified to read, Identify any known protection system misoperation(s). If this report is filed quickly, there is not enough time to assess all operations to determine any misoperation. As a case in point, it typically takes at least 24 hrs. to receive final lightning data; therefore, not all data is available to make a proper determination of a misoperation
Response: The DSR SDT thanks you for your comment. The entire Attachment 1 has been updated to reflect your comment.		
Constellation Power Generation	No	The requirements for filling out the DOE-OE-417 form are not necessarily the same as the requirements prescribed in Attachment 1. CPG suggests that the drafting team create a new requirement, spelling out when an entity is required to complete the DOE-OE-417 form.
Response: The DSR SDT thanks you for your comment. Any entity that is obligated to submit Form OE-417 may submit that completed form to NERC in lieu of Attachment 2.		
Georgia System Operations Corporation	No	R5: This standard should not require all Responsible Entities to report the same event. Entities should be allowed to report in a hierarchical manner. They should be allowed to coordinate impact event plans and include in their plans the entity that has the responsibility for reporting various events. Flexibility should be allowed to provide different reporting entities depending on the type of event. In R5, does each Responsible Entity shall report Impact Events in accordance with the Impact Event Operating Plan? Allow this hierarchical reporting and flexibility? An entity should be allowed to report to another operating entity by whatever reporting form or mechanism works and then the other entity reports to NERC using the required NERC or DOE form. Add "To the extent that a Responsible Entity had an Impact Event," at the beginning of R5 and

Organization	Yes or No	Question 10 Comment
		M5.
Response: The DSR SDT thanks you for your comment. Each entity is required to report their portion of the event, however they can coordinate. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, will be able to provide the ERO and others with a different views of what has happened. The DSR SDT understands that there may be multiple reports (for certain events) that are required by different government agencies. NERC will continue to streamline the reporting process as we move into the future. The DSR SDT has also eliminated R2 and revised R5 (now R2) for clarity and to eliminate potential redundancy.		
Indeck Energy Services	No	The Violation Risk Factor should be Low, if any, because this is historical reporting, with little or no reliability consequence.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
Bonneville Power Administration	Yes	Reporting form OK. Note that the Frequency Maximum/Minimum Section should be clarified. A Gen Loss doesn't usually experience a high (maximum) frequency, just the low immediately following the event.
Response: The DSR SDT thanks you for your comment		
Midwest Reliability Organization	Yes	This will reduce any double reporting to the ERO and FERC.
PPL Supply	Yes	Reporting consistency and timelines may need to be reviewed for example: Fuel Supply Emergency - OE-417 requires reporting within 6 hours / Attachment 1 Part B requires reporting within 1 hour.
Response: The DSR SDT thanks you for your comment The DSR SDT has significantly revised Attachment 1 and deleted Fuel Supply Emergency from Attachment 1. This item was removed in coordination with the NERC Events Analysis Working Group and the proposed Events Analysis Program. All events are		

Organization	Yes or No	Question 10 Comment
now to be reported within 24 hours with the exception of Destruction of BES equipment, Damage or destruction of Critical Assets and Damage or destruction of Critical Cyber Asset events in Part A and Forced Intrusion, Risk to BES equipment and Detection of a reportable Cyber Security Incident in Part B.		
SERC OC Standards Review Group	Yes	We agree with the concept, but disagree with the use of the term Operating Plan as a defined term in line with our comments in question 6 above.
Response: The DSR SDT thanks you for your comment. The SDT agrees with your viewpoint and believes that your statement is consistent with the intent of the requirement. (refer to question 6)		
United Illuminating Co	Yes	Put it's before Impact Event Operating Plan.
Response: The DSR SDT thanks you for your comment. Please see the revised standard.		
Manitoba Hydro	Yes	The DOE-OE-417 appears more intuitive and descriptive (and on line ability), but having the either or option is fine.DOE-OE-417 Form is mentioned several time in this Standard, but no link to this document.
Response: The DSR SDT thanks you for your comment. Please see the revised standard.		
CenterPoint Energy	Yes	CenterPoint Energy agrees with the idea of streamlining the reporting process through the use of existing report forms. However, as noted in the response to Question 11, the Company has concerns about the DOE OE-417 Form, specifically the timeframes in which to submit reports. CenterPoint Energy will be making the same recommendation to extend reporting timeframes during the DOE OE-417 report revision process when the current form expires on 12/31/11. Any future changes to the DOE Form could also impact reporting for this requirement.
Response: The entire Attachment 1 has been updated to reflect the comments that were received. Footnotes in Attachment 1 have been updated to reflect the comments that the DSR SDT received. The DOE Form OE-417 is under review by the U.S. Department of Energy (DOE) and can be updated or changed without NERC's involvement. The DSR SDT has taken into consideration the use of OE-417 to report events to NERC and agrees that this will fulfill EOP-004-2's reporting requirements.		
PPL Electric Utilities	Yes	We would like to suggest the language be changed such that submission via a NERC system would be acceptable in addition to the use of the Attachment 2 Form or the DOE OE-417 form. The standard would then accommodate the proposed revision to NERC Rules of Procedure 812. NERC will establish a system to collect impact events reports??

Organization	Yes or No	Question 10 Comment
Response: The DSR SDT thanks you for your comment. The SDT expects any system would facilitate the reporting to organizations specified in the submitted report. Until such time that the system can be established, the Registered Entity will be obligated to make the notifications as specified in its Operating Plan(s). The DSR SDT is currently working with the U.S. Department of Energy (DOE) to make revisions to Form OE-417that would achieve the objective of your comment, and will continue to pursue this.		
Ingleside Cogeneration LP	Yes	Although our preference would be to have a single form, Ingleside Cogeneration realizes that is not likely in the near term. We would like to see that remain as a goal of the project team or the ERO.
Response: The DSR SDT thanks you for your comment. The DSR SDT is currently working with the DOE to make revisions to Form Form OE-417that would achieve the objective of your comment, and will continue to pursue this.		
Duke Energy	Yes	There is so much overlap between Attachment 2 and the DOE OE-417 that we believe the DOE OE-417 should be revised to include the additional items that must be reported to NERC, so that there is only one form to submit to NERC and DOE.
Response: The DSR SDT thanks you for your comment. The DSR SDT is currently working with the DOE to make revisions to Form OE-417 that would achieve the objective of your comment, and will continue to pursue this.

11. Do you agree with the proposed revisions to Attachment 1? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: Most commenters expressed concerns with the reporting times listed in Attachment 1. Upon review of comments received concerning Attachment 1, the DSR SDT did a thorough review and updated the entire document, along with all Footnotes. The DSR SDT removed the column, Time to Submit Report and replaced it with Submit Attachment 2 or DOE OE-417 Report. There were many noted comments that a one hour reporting time frame does not coincide with an after the fact reporting Standard. The DSR SDT reviewed each time frame to report and has extended most of the time frames to 24 hours. There are a few events that have a one hour reporting requirement that was not changed because these are events that would generally be reported to law enforcement authorities and prompt reporting is in the interest of BES reliability. Duplicate reporting of events was minimized where possible. There are several events that will require reporting by multiple entities to achieve a complete enough picture to facilitate industry awareness.

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 11 Comment</th></tr>
<tr><td>Georgia Transmission Corporation & Oglethorpe Power Corporation</td><td>No</td><td>As stated above in response to question 6, we believe that a column should be added to the tables to explicitly indicate what external organizations should receive the communications of a particular Impact Event type. Additionally we have concerns with the following table items: Threshold for reporting Transmission Loss: As stated, this will require the reporting of almost all transmission outages. This is particularly true taking into consideration the current work of the drafting team to define the Bulk Electric System. The loss of a single 115kV network line could meet the threshold for reporting as the definition of Element includes both the line itself and the circuit breakers. Instead, we recommend the following threshold "Three or more BES Transmission lines." This threshold has consistency with CIP-002-4 and draft PRC-002-2. This threshold also needs additional clarification as to the timeframe involved. Is the intent the reporting of the loss of 3 or more BES Transmission Elements anytime within a 24 hour period or must they be lost simultaneously? Also, we recommend that these three losses be the result of a related event to require reporting.Entity with Reporting Responsibility for Loss of Off-site power to a nuclear generating plant (grid supply): The reporting responsibility should clarify that this is only entities included in the Nuclear Plan Interface Requirements.</td></tr>
<tr><td colspan="3">Response: The DSR DT thanks you for your comment. Upon review the DSR SDT has included a column to indicate the minimum parties who are required to receive the entity’s notification. The Threshold for Reporting has been updated to reflect comments that have been received.</td></tr>
<tr><td>Northeast Power Coordinating</td><td>No</td><td>As indicated under Question 4, we question the need to include IA, TSP and LSE in the responsible entities</td></tr>
</table>

Organization	Yes or No	Question 11 Comment
Council		for reporting.
Response: The DSR DT thanks you for your comment. The DSR SDT has established that CIP-002 and CIP-008 are applicable to an IA, TSP, and LSE. These entities will report a Cyber Security Incident per Attachment 2 (or OE-417) as the vehicle to inform the ERO, their Regional Entity and their Reliability Coordinator.		
Bonneville Power Administration	No	Generally OK, but there are too many events to report. The loss of 3 BES elements for a large geographic entity for a (5 county?) windstorm that has little impact to the system is not needed. 3 elements within the same minute could be acceptable and 6? elements still out within an hour ... or something to that affect could work.
Response: The DSR DT thanks you for your comment. Upon review the DSR SDT has included a column to indicate the minimum parties who are required to receive the entity's notification. The Threshold for Reporting has been updated to reflect comments that have been received.		
Midwest Reliability Organization	No	1) Section 9 of the Impact Reporting Form states: "List transmission facilities (lines, transformers, busses, etc.) tripped and locked out." But Part A of Attachment 1 states: "Three or more BES Transmission Elements." a. Should section 9 state: "List transmission facilities (lines, transformers, busses, etc.) tripped or locked out"? b. Should section 9 state: "List transmission elements (lines, transformers, busses, etc.) tripped or locked out"? This will align the reporting criteria with the actual reporting form.2) Section 13 of the Impact Reporting Form states: "Identify the initial probable cause or known root cause of the actual or potential Impact Event if know at the time of submittal of Part I of this report:." Recommend that "of Part I" be removed since there is no Part 2.3) Every Threshold in attachment 1 gives a clear measurable bright line, except: ?Transmission Loss?. As presently written ?Three or more BES Transmission Elements? could imply that a Report will be required to be submitted if a BES transmission substation is removed from service to perform maintenance. Or there could be three separate elements within a large substation that are out of service (and don?t effect each other) that will require a Report. Upon review of the TPL standards, there are normally planned items that our industry plans for. It is recommended that the Threshold for Reporting of Transmission Loss be enhanced to read: ?Two or more BES Transmission Elements that exceed TPL Category D operating criteria or its successor?. This threshold now is based on a actively enforced NERC Standard, and each RC and TOP are aware of what this bright line is.
Response: The DSR DT thanks you for your comment. Upon review the DSR SDT has included a column to indicate the minimum parties who are required to receive the entity's notification. The Threshold for Reporting has been updated to reflect comments that have been received. Attachment 2 has been updated to reflect the changes noted in your comments and changes per the received comments.		
PPL Supply	No	Recommendation: Add a column in Attachment 1 to acknowledge the events that require a OE-417 Report

Organization	Yes or No	Question 11 Comment
		and list the number under Schedule 1 that required Form OE-417Report. This would add accuracy and consistency among reporting entities.
Response: The DSR DT thanks you for your comment. The DOE Form OE-417 is under review by the DOE and can be updated or changed without NERC's involvement. The DSR SDT has taken into consideration the use of OE-417 to report events to NERC and agrees that this will fulfill EOP-004-2's reporting requirements.		
Pacific Northwest Small Public Power Utility Comment Group	No	The comment group is composed of smaller entities that do not all maintain 24/7 administrative support. While many of the 1 hour reporting thresholds do not affect us, some do. Others may come into play as standards are revised, such as the CIPs. We ask the SDT to consider the identification or verification that starts the clock on these may come at inopportune times for meeting a one hour deadline for these entities. Restoration may be delayed in an attempt to meet these time limits. Safety should always be the number one priority, and restoration and continuity of service second. We see reporting of these events much further down the list. We note that FERC order 693, paragraph 471 does not dictate a specific reporting time period and therefore we suggest timing requirements that promote situational awareness but allow smaller entities needed flexibility. FERC order 693, paragraph 470 directed the ERO to consider ?APPA?s concerns regarding events at unstaffed or remote facilities, and triggering events occurring outside staffed hours at small entities.? Our comment group does not believe the SDT has adequately responded to APPA?s concerns but rather took the 1 hour Homeland security requirement referenced in paragraph 470 verbatim. While a report within an hour might be ideal, it is not always practicable. We suggest: 1) as soon as possible after service has been restored to critical services within the service territory, or 2) By the COB the first business day after discovery. Our comment group realizes the difficulty in wording standards/requirements that lump small entities in with larger ones and we believe our suggestion achieves some balance. Expecting smaller entities to achieve timing requirements that can only be normally met under ideal conditions at large entities is not feasible or fair.
Response: The DSR DT thanks you for your comment. Upon review the DSR SDT has included a column to indicate the minimum parties who are required to receive the entity's notification. The Threshold for Reporting has been updated to reflect comments that have been received. EOP-004-2 requires an entity to "push" information to certain parties for industry awareness. Since this Standard is an after the fact reporting Standard, reporting times for a majority of event types reporting times for a majority of event types have been extended to allow the impacted entity to recover from the event and then report. The starting time to report is upon an entity's recognized the event, per Submit Report column of Attachment 1.		
PSEG Companies	No	For the reasons cited in response to question 4 above the language roles and responsibilities remain inconsistent and unclear. The Time to Report changes are unreasonable and there is significant duplicate reporting required.

Organization	Yes or No	Question 11 Comment
Response: The DSR DT thanks you for your comment. Upon review the DSR SDT has included a column to indicate the minimum parties who are required to receive the entity's notification. The Threshold for Reporting has been updated to reflect comments that have been received. EOP-004-2 requires an entity to "push" information to certain parties for industry awareness. Since this Standard is an after the fact reporting Standard, reporting times for a majority of event types have been extended to allow the impacted entity to recover from the event and then report.		
Dominion	No	1) A particular Event could be applicable to multiple entities and Attachment 1 would require each applicable entity to report the event. This is duplicative and would appear to overburden the reporting system. 2) Loss of off-site power (grid supply) reporting for nuclear plants is duplicative of reporting done to satisfy NRC requirements. Given the activity at a nuclear plant during this event, this additional reporting is not desired. 3) Cyber intrusion remains an event that would need to be reported multiple times (e.g., this standard, OE-417, NRC requirements, etc.). 4) Since external reporting for other regulators (e.g., DOE, NRC, etc.) remains an obligation of the Applicable Entity, suggest that Attachment 1 only contain impact events as defined in the current version of EOP-004.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed and updated the functional entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view of what has happened. The DSR SDT understands that there may be multiple reports (for certain events) that are required by different governing agencies. NERC will continue to streamline the reporting process in the future.		
Pepco Holdings Inc and Affiliates	No	The entity responsible for reporting is not clear. Is the initiating entity the same as requesting entity or implementing entity? In the paper it indicates the DT intent is for the entity that performs the action or is directly affected will report.It seems that the proposal would result in a significant amount of duplicate reporting.
Response: The DSR DT thanks you for your comment. The DSR SDT believes it is clear that the reporting entity is the entity that experiences an event or initiates the event (per Threshold for Reporting in Attachment 1). The DSR SDT will ensure that the supporting guideline clearly states this. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view to what has happened.		
SPP Standards Review Group	No	Threshold for Reporting ? Some of the thresholds used to trigger event reporting seem arbitrary. For example, why were three BES Transmission Elements selected for the transmission loss trigger? What?s significant with three? There may be situations where one element can impact reliability more than other situations where three or more lines may be lost. The defining line should be impact to reliability, not a simple count of elements. Also, timing of the loss of these elements is important. If the three elements are lost over a 3-day span, does this trigger an event report? We would think not and would like to see that clarification in the

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 11 Comment</th></tr>
<tr><td></td><td></td><td>standard.Public appeals ? Some entities may utilize load reduction (Demand Response, interruptible loads, etc) in the normal course of daily operation in lieu of committing additional generation resources. Because this is not an Energy Emergency as defined in the NERC Glossary, would such an event trigger the filing of an Impact Event report under EOP-004-2? We would like clarification on this issue.Multiple entity reporting responsibility ? Several of the triggering events in Attachment 1 list multiple entity reporting responsibility. The SDT needs to clarify precisely who has the actual reporting responsibility for those events. For example, if a DP loses ? 300 MW (or ? 200 MW depending on size) of load who files the report? Is it the DP, TOP, BA or RC? Attachment 1 would lead us to believe all four are required to file reports. This redundancy is unnecessary and creates unneeded paperwork. Surely this redundancy is not the intent of the SDT.Reporting timeframe ? The timeframes for reporting these after-the-fact reports need to be thoroughly reviewed and, we believe, realigned. Which is more important to the reliability of the BES, operating and controlling the BES following an Impact Event or filing a report describing that event? Most operating desks are staffed by a single operator at nights and on weekends. Their focus should be on operating the system, not filing a report with NERC or DOE within one hour.There appears to be inconsistency in the reporting times among the triggering events. There doesn?t appear to be any logic regarding how the times were selected. Shouldn?t impact to the reliability of the BES be that basis? Why is a BA with 50 MW of load who makes a public appeal to customers for load reduction required to report within 1 hour while an IROL violation doesn?t need to be reported for 24 hours? Clearly the IROL violation has a greater impact on the reliability of the BES. Therefore, shouldn?t these types of reports be filed sooner than those events with less impact on BES reliability?Risk to BES equipment ? The Threshold for Reporting this event indicates that only those events associated with a non-environmental physical threat should be reported. The train derailment example in the footnote then conversely describes just such an environmental threat with flammable or toxic cargo. Which should it be? Additionally, how does one determine the applicability of a potential threat? Is this time dependent, is it threat dependent, how do we factor all this in?</td></tr>
<tr><td colspan="3">Response: The DSR DT thanks you for your comment. The DSR SDT believes it is clear that the reporting entity is the entity that experiences an event or initiates the event (per Threshold for Reporting in Attachment 1). The DSR SDT will ensure that the supporting guideline clearly states this. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view to what has happened. The entire Attachment 1 has been updated to reflect the comments that were received.</td></tr>
<tr><td>FirstEnergy</td><td>No</td><td>Nuclear facilities should be explicitly excluded from the events which have CIP standards as the threshold for reporting since they are exempt from the CIP standards.</td></tr>
<tr><td colspan="3">Response: The DSR DT thanks you for your comment. The DSR SDT understands that nuclear facilities are exempt from CIP Standards but the Loss of Off Site Power to a nuclear generating plant is a Transmission Owner’s and Transmission Operator’s responsibility and needs to be reported to the ERO and their</td></tr>
</table>

Organization	Yes or No	Question 11 Comment
Regional Entity for the follow up as described by the Event Analysis Program.		
SERC OC Standards Review Group	No	While we agree with the changes made, we do not believe the goal of eliminating duplicate reporting has been accomplished. In addition, the threshold for transmission loss does not adequately translate to previous ?loss of major system components? which had a threshold of ?significantly affects the integrity of interconnected system operations?.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view of what has happened. The entire Attachment 1 has been updated to reflect the comments that were received.		
PJM Interconnection LLC	No	There is still a significant amount of duplicate reporting involved in Attachment 1, which needs to be cleared. See comments to Question 4.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others a different view of what has happened. The entire Attachment 1 has been updated to reflect the comments that were received.		
We Energies	No	It appears that the footnotes only apply one place in the table. Place the footnote in the table where it applies.Voltage Deviations on BES Facilities: 10% compared to what? Rated?Forced Intrusion: ?At a BES facility? facility or Facility?
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. The Footnotes have been reviewed and updated per comments received.		
LG&E and KU Energy LLC	No	In Attachment 1, the existing EOP-004-1 Attachment 1, point 6 includes an ?Or? for the entities (RC, TOP, GOP) for a, b and c. The way the SDT has pulled this apart, they have included the GOP as having an impact on the Voltage Deviations on BES Facilities. The TOP monitors the transmission system and directs GOPs when they need to change in order to protect the system reliability. This is not something the GOP is responsible for monitoring. The GOP is required to be at the TOP assigned voltage schedule and that actually falls under VAR-002 already. Please remove the GOP from the line of ?Voltage Deviations on BES Equipment.? The way EOP-004-1 Attachment 1 point 6 is currently written, the GOP is an ?or? and does fall into parts b or c, where part 6b is similar to the proposed line ?Damage or destruction of BES equipment? identified in the proposed EOP-004-2 Attachment 1. However, currently the GO/GOP reports ?Loss of Major System Components? on EOP-004-1 within 24 hours of determining damage to the equipment. The proposed ?One hour? is too tight of a window as the GO/GOP often do not know the extent of damage that

Organization	Yes or No	Question 11 Comment
		soon. Typically the OEM is called upon to come and do a thorough inspection and assess the extent of damage, of if there even is any damage; once the ?loss of major system components? is determined, then the 24 hour clock begins today.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view of what has happened. The entire Attachment 1 has been updated to reflect the comments that were received.		
Compliance & Responsiblity Organization	No	See comments set forth in number 2
Exelon	No	Attachment 1, Part A ? Energy Emergency requiring Public appeal for load reduction ? In the current draft Standard, the applicability has been revised from an RC and BA to "initiating entity." As a GO/GOP, I cannot see any event where a GO/GOP would be the responsible "initiating entity" or have the ability to determine an "Energy Emergency." Suggest revising back to specific entities that would be likely responsible for this action (e.g., RC, BA, TOP). Attachment 1, Part A ? Energy Emergency requiring system-wide voltage reduction ? In the current draft Standard, the applicability has been revised from an RC, TO, TOP, and DP to "initiating entity." As a GO/GOP, I cannot see any event where a GO/GOP would be the responsible "initiating entity" or have the ability to determine an "Energy Emergency" related to system-wide voltage reduction. Suggest revising back to specific entities that would be likely responsible for this action.Attachment 1, Part A ? Voltage Deviations on BES facilities - A GOP may not be able to make the determination of a +/- 10% voltage deviation for ? 15 continuous minutes, this should be a TOP RC function only. Attachment 1, Part A ? Generation Loss of ? 2, 000 MW for a GOP does not provide a time threshold. If the 2, 000 MW is from a combination of units in a single location, what is the time threshold for the combined unit loss? Suggest that a time threshold be added for clarity.Attachment 1, Part A ? Loss of off-site power (grid supply) affecting a nuclear generating station ? this event applicability should be removed in its entirety for a Nuclear Plant Generator Operator. The impact of loss of off-site power on a nuclear generation unit is dependent on the specific plant design, if it is a partial loss of off-site power (per the plant specific NPIRs) and may not result in a loss of generation (i.e., unit trip). If a loss of off-site power were to result in a unit trip, an Emergency Notification System (ENS) would be required to the Nuclear Regulatory Commission (NRC). Depending on the unit design, the notification to the NRC may be 1 hour, 8 hours or none at all. Consideration should be given to coordinating such reporting with existing required notifications to the NRC as to not duplicate effort or add unnecessary burden on the part of a Nuclear Plant Generator Operator during a potential transient on the unit. In addition, if the loss of off-site power were to result in a unit trip, if the impact to the BES were ?2,000 MW, then required notifications would be made in accordance with the threshold for reporting for Attachment 1, Part A ? Generation Loss. However, to align with the importance of ensuring nuclear plant safe operation and shutdown as implemented in NERC Standard NUC-001, if a transmission entity experiences an event

Organization	Yes or No	Question 11 Comment
		that causes an unplanned loss of off-site power (source) as defined in the applicable Nuclear Plant Interface Requirements, then the responsible transmission entity should report the event within 24 hours after occurrence. In addition, replace the words "grid supply" to "source" to ensure that notification occurs on an unplanned loss of one or multiple sources to a nuclear power plant. Suggest rewording as follows (including replacing the words "grid supply" to "source" and adding in the word "unplanned" to eliminate unnecessary reporting of planned maintenance activities in the table below):Event Entity with Reporting Responsibility Threshold for Reporting Time to Submit ReportUnplanned loss of off-site power to a Nuclear generating plant (source) as defined in the applicable Nuclear Plant Interface Requirements (NPIRs) Each transmission entity responsible for providing services related to NPIRs (e.g., RC, BA, TO, TOP, TO, GO, GOP) that experiences the event causing an unplanned loss of off-site power (source) Unplanned loss of off-site power (source) to a Nuclear Power Plant as defined in the applicable NPIRs. Within 24 hours after occurrenceAttachment 1, Part A ? Damage or destruction of BES equipment ? The event criteria is still ambiguous and does not provide clear guidance; specifically, the determination of the aggregate impact of damage may not be immediately understood ? it does not seem reasonable to expect that the 1 hour report time clock starts on identification of an occurrence. Suggest that the 1 hour report time clock begins following confirmation of event. ? The initiating event needs to explicitly state that it is a physical and not cyber. ? If the damage or destruction is related to a deliberate act, consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security event (see additional comments in response to item 17 below). Attachment 1, Part A ? Damage or destruction of Critical Cyber Asset The events that are associated with Critical Cyber Assets should be removed from this Standard. Critical Cyber Asset related events are better addressed in the reporting of Cyber Security Incidents which is already included in Attachment 1, Part B and the CIP standards currently require details about Critical Cyber Assets to be protected with access to that information restricted to only specifically authorized personnel.Attachment 1, Part A ? Damage or destruction of Critical Asset The events that are associated with Critical Assets should be removed from this Standard. Critical Assets are typically whole control centers, substations or generation plants and the damage or destruction of individual pieces of equipment at one of these locations will usually not have much impact to the BES. Any important impacts located at these sites are already addressed in the other existing [Impact] Event types or would be addressed in the Cyber Security Incident event which is already included in Attachment 1, Part B. The CIP standards also currently require that details about Critical Assets and Critical Cyber Assets must be protected with access to that information restricted to only specifically authorized personnel. The identification of Critical Asset is also only an interim step used to identify the Critical Cyber Assets that need to have cyber security protections and the NERC Project 2008-06 CSO706 Standards Drafting Team is currently expecting to eliminate the requirement to identify Critical Assets in the draft revisions they are currently working on. Attachment 1, Part B ? Forced intrusion at a BES facility ? Consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a

Organization	Yes or No	Question 11 Comment
		potential security event (see additional comments in response to item 17 below).Attachment 1, Part B ? Risk to BES equipment from a non-environmental physical threat ? this event leaves the interpretation of what constitutes a "risk" with the reporting entity. Although the DSR SDT has provided some examples, there needs to be more specific criteria for this event as this threshold still remains ambiguous and will lead to difficulty in determining within 1 hour if a report is necessary. Consideration should also be given to coordinating such reporting with existing required notifications to the NRC and FBI as to not duplicate effort or add unnecessary burden on the part of a nuclear GO/GOP during a potential security event (see additional comments in response to item 17 below).Attachment 1, Part B ? Detection of a reportable Cyber Security IncidentAlthough the DSR SDT agreed that there may be confusion between reporting requirements in this draft and the current CIP-008, "Cyber Security ? Incident Reporting and Response Planning", Part B now requires a 1 hour report after occurrence. The DSR SDT should verify the timing and reporting required for these Cyber Security Incident events is coordinated with the NERC Project 2008-06 CSO706 Standards Drafting Team.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view of what has happened. The entire Attachment 1 has been updated to reflect the comments that were received. The DSR SDT has worked closely with NERC Staff, the Event Analysis Working Group, Project 2008-06 and the U.S. Department of Energy to ensure that EOP-004-2 captures what FERC has directed and will improve the reliability of the BES.		
SDG&E	No	For ?Detection of a reportable Cyber Security Incident,? Attachment 1 identifies the threshold for reporting as: ?that meets the criteria in CIP-008 (or its successor)?; however, CIP-008 has no specified criteria, so this is an unusable threshold. Additionally, SDG&E recommends that the timing of any follow-up and/or final reports required by the standard be listed in the Attachment 1 table.
Response: The DSR DT thanks you for your comment. CIP-008 states that an entity will report a Cyber Security Incident to the ES-ISAC. EOP-004-2, Attachment 2 is the vehicle to report a Cyber Security Incident. It is also required to be sent to their RC which will give them the industry awareness of a single event or is it a multiple event within their area.		
City of Tallahassee (TAL)	No	One hour should be expanded. While I realize the importance of getting information to NERC/ESISAC/whoever, most of the 1-hour requirements are tied to events that may not be resolved within one hour. This will result in stopping restoration efforts or monitoring to submit paperwork. Calling in additional assistance, while certainly a possibility, may not be feasible to accomplish in sufficient time to meet the one-hour deadline. If any of these events were to truly have a detrimental effect on the BES, the effects would have already been felt.Recommend all 1-hour reports be extended to 4-hours. This should also be placed on the list to modify Form OE-417report time lines.

Organization	Yes or No	Question 11 Comment
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view of what has happened. The entire Attachment 1 has been updated to reflect the comments that were received. The DOE Form OE-417 is not governed by NERC but the DSR SDT is proposing to allow an entity to use it to report an event in lieu of Attachment 2.		
Lakeland Electric	No	Event ? Transmission lossThreshold for Reporting ? Revise to ?Loss of three or more BES Transmission elements within a 15 minute period?. This change would capture a sequence of transmission element losses and remove the question if timing that will arise if other transmission elements trip, cascade, due to loss of the first element. There may also be a need for a footnote to clarify that a transmission element that is removed from service by a transmission operator to prevent uncontrolled cascading would be classified as a loss (something for the SDT to consider). Event ? Energy Emergency requiring Public appeal for load reductionThreshold for Reporting ? Add a footnote: Repeated public appeals for the same initiating Impact Event shall be reported as one Public Appeal Event. The initiation and release to the media of the Public appeal(s) should be the reportable event. Question: would an internal request to large industrial customers for voluntary load reductions be reportable under this Event?
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view of what has happened. The entire Attachment 1 has been updated to reflect the comments that were received. Demand responsive load is not covered within this proposed Standard unless it fulfills a Threshold of Reporting within Attachment 1. Footnotes have been update to reflect comments received.		
Arkansas Electric Cooperative Corporation	No	We appreciate the effort the team has taken in improving the requirements since the last posting. Event Forced Intrusion: The timeframe is very small given the possibly minimal risk to the BES. It often takes much longer than 1 hour after verification of intrusion to determine the intrusion was only for copper theft. We suggest a 24 hour time frame or tie the timeframe to the "verification of forced intrusion."
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received.		
Manitoba Hydro	No	Reporting for CCA's should be limited to damage associated with a detected cyber security incident.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. Damage or destruction of Critical Cyber Assets s is per CIP-002 and may not fall into the category of Cyber Security Response as outlined by an entity.		
Sweeny Cogeneration LP	No	In Attachment 1, Part A, Generator Operators who experience a ? 10% sustained voltage deviation for ? 15

Organization	Yes or No	Question 11 Comment
		continuous must issue a report For externally driven events, the GOP will have little if any knowledge of the cause or remedies taken to address it. We believe the language presently in EOP-004-1 is satisfactory that any ?action taken by a Generator Operator? that results in a voltage deviation has to be reported by the GOP.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received.		
American Electric Power	No	The time to submit a report for the inclusion of the damage or destruction of BES equipment, critical asset, or critical cyber asset is too aggressive. The critical cyber asset reporting is redundant with CIP-008. Furthermore, reporting equipment failures within an hour for Critical Assets is going to overwhelm operators that need to focus on the restoration efforts. Self-evident equipment failures at a Critical Asset (such as a tube leak at a generator which is a Critical Asset) should not be required to be reported. Maybe the wording should be stated as an ?abnormal occurrence? rather than ?equipment failure.?It would be helpful if there was a defining or a footnote that defines the nature and/or duration for loss of some equipment. For example, is a transmission loss for sustain or momentary outages?
Response: The DSR DT thanks you for your comment. The Implementation Plan for this project now includes a provision to retire the requirement in CIP-008 for reporting (Requirement 1, Part 1.3). The entire Attachment 1 has been updated to reflect the comments that were received.		
USACE	No	The "Potential Reliability Impact" table should be taken out. Refered to previous comment on our position on potentail impacts.
Response: The DSR DT thanks you for your comment. The DSR SDT believes that potential events are required to be reported to provide industry awareness.		
Consumers Energy	No	1. In reference to the Impact Event addressing ?Loss of Firm load for greater than or equal to 15 minutes?, this is likely to occur for most entities most frequently during storm events, where the loss of load builds slowly over time. In these cases, exceeding the threshold may not be apparent until a considerable time has lapsed, making the submittal time frame impossible to meet. Even more, it may be very difficult to determine if/when 300 MW load (for the larger utilities) has been lost during storm events, as the precise load represented by distribution system outages may not be determinable, since this load is necessarily dynamic. Suggest that the threshold be modified to ?Within 1 hour after detection of exceeding 15-minute threshold?. Additionally, these criteria are specifically storm related wide spread distribution system outages. These events do not pose a risk to the BES.2. Many of the Impact Events listed are likely to occur, if they occur, at widely-distributed system facilities, making reporting ?Within 1 hour after occurrence is identified? possibly impractical, particularly in order to provide any meaningful information. Please give consideration to clearly permitting some degree of investigation by the entity prior to triggering the ?time to submit?3. Referring to the

Organization	Yes or No	Question 11 Comment
		?Transmission Loss? Impact Event, please provide more specificity. Is this intended to address :- anytime that three or more BES Transmission Elements are out of service, - only when three or more BES Transmission Elements are concurrently out-of-service due to unscheduled events, - only when three or more BES Transmission Elements are simultaneously automatically forced out-of-service, or- only when three or more BES Transmission Elements are forced from service in some proximity to each other? It is not unusual, for a large transmission system, that this many elements may be concurrently forced out-of-service at widely-separated locations for independent reasons.4. Referring to the ?Fuel Supply Emergency? Impact Event, OE-417 requires 6-hour reporting, where the Impact Event Table requires 1-hour reporting. The reporting period for EOP-004-2 should be consistent with OE-417.5. For that matter, the SDT should carefully compare the Impact Event Table with OE-417. Where similar Impact Events are listed, consistent terminology should be used, and identical reporting periods specified. Where the Impact Event Table contains additional events, they should be clarified as being distinct from OE-417 to assist entities in implementation. Further, since OE-417 must be reviewed and updated every three years, EOP-004 should defer to the reporting time constraints within OE-417 wherever listed in order to assure that conflicting reporting requirements are not imposed.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed' Loss of Firm Load' as a reporting event, and believe the reporting requirement currently approved in EOP-004-1 should remain in EOP-004-2. The DSR SDT has removed the 'Fuel Supply Emergencies' event after considering comments the DSR SDT received on this event. The DOE Form OE-417 is reviewed biennially by the DOE and can be updated or changed without NERC's involvement. The DSR SDT has taken into consideration the use of Form O- 417 to report events to NERC and agrees that this will fulfill EOP-004-2's reporting requirements. The entire Attachment 1 has been updated to reflect the comments that were received.		
Independent Electricity System Operator	No	As indicated under Q4, we question the need to include IA, TSP and LSE in the responsible entities for reporting.
Response: The DSR DT thanks you for your comment. The DSR SDT has established that CIP-002-4 and CIP-008-3 are applicable to an IA, TSP, and LSE. These entities will report a Cyber Security Incident per Attachment 2 (or OE-417) as the vehicle to inform the ERO, their Regional Entity and their Reliability Coordinator.		
Ameren	No	See response to question 4.
Response: The DSR DT thanks you for your comment. Please see question 4 response.		
ISO New England, Inc	No	As indicated under Q4, we question the need to include IA, TSP and LSE in the responsible entities for reporting. There is still significant duplicate reporting included. For instance, why do both the RC and TOP to report voltage deviations? As written, a voltage deviation on the BES would require both to report. The same

Organization	Yes or No	Question 11 Comment
		would hold true for IROLs. Perhaps IROLs should only be reported by the RC to be consistent with the recently FERC approved Interconnection Reliability Operating Limit standards. Also, the CIP reporting requirements duplicate was is already contained in the CIP Standards, specifically CIP-008. Also, we are required to intentionally destroy Critical Cyber Assets when they are retired, why would we be required to report this?
Response: The DSR DT thanks you for your comment. The DSR SDT has established that CIP-002-3 and CIP-008-3 are applicable to an IA, TSP, and LSE. These entities will report a Cyber Security Incident per Attachment 2 (or OE-417) as the vehicle to inform the ERO, their Regional Entity and their Reliability Coordinator. If a Critical Cyber Asset (CCA) was to be retired, the entity would declassify it as a CCA and therefore it would not be required to be reported. The Implementation Plan for this project now includes a provision to retire the requirement in CIP-008 for reporting (Requirement 1, Part 1.3)		
Calpine Corp	No	1. Additional clarity on the nature of reportable ?Fuel Emergencies? is needed. Does loss of interruptible gas transportation require reporting? 2. Additional clarity on the threshold for ?damage or destruction of BES equipment? is needed. Footnote 1 on page 16 states, in part ?Significantly affects the reliability margin of the system (e.g. has the potential to result the need for emergency actions?. For generating facilities, does this statement refer specifically to the parallel requirement to report any loss of generation >= 2,000 in the Eastern or Western Connection or >= 1,000 in the ERCOT or Quebec Interconnection? If not, exactly what level of damage at a generating plant requires reporting? Use of imprecise terms such as ?significantly? sets the stage for future compliance and enforcement confusion.3. Additional clarity is required for ?Detection of reportable Cyber Security Incident." Is this item intended to apply only to Critical Cyber Assets, or is it an extension of the requirement to all applicable entities irrespective of their Critical Asset status? If it applies only to Critical Cyber Assets, does this reporting requirement create redundant reporting (as reporting is already required under CIP-008-4)? CIP-008-4 requires reporting only of events affecting Critical Cyber Assets. If a more expansive application is intended, what equipment or systems are to be included in the reporting requirement?
Response: The DSR DT thanks you for your comment. The event of Fuel Supply Emergencies has been removed per comments the DSR SDT received. The entire Attachment 1 has been updated to reflect the comments that were received. Footnotes in Attachment 1 have been updated to reflect the comments that the DSR SDT received. Damage to BES equipment's foot note has been enhanced to mean that the BES piece of equipment is required to be removed from service. CIP-008 states that an entity will report a Cyber Security Incident to the ES-ISAC. EOP-004-2, Attachment 2 is the vehicle to report a Cyber Security Incident.		
BGE	No	For the following Events (Damage or destruction of BES equipment, Damage of destruction of Critical Asset, and Damage or destruction of a Critical Cyber Asset), submitting a report within 1 hour after occurrence is identified is too short of a time frame. Generally, the initial time period is spent in recovering from the situation and restoring either electric service or restoring computer services to assure proper operations. To

Organization	Yes or No	Question 11 Comment
		distract from the restoration to normal activities to focus on a report would be detrimental to reliability. Notification of an event may perhaps be made by phone call within 1 hour but completing a report should be required no less than 6 or 12 hours. Determining a cause (especially external or intentional) could take longer than 1 hour to determine and complete a report.It is important to consider the imposition created by a compliance obligation and weigh it against the other demands before the operator at that time. A compliance obligation should avoid becoming a distraction from reliability related work. Under impact event type scenarios, in the first hour of the event, the primary concern should be coping with/resolving the event.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. Footnotes in Attachment 1 have been updated to reflect the comments that the DSR SDT received. Damage to BES equipment's foot note has been enhanced to mean that the BES piece of equipment is required to be removed from service.		
Alliant Energy	No	The item relating to Loss of Firm Load for > 15 minutes should be revised to 500 MW and 300 MW. For many companies, a storm moving across their system could cause more than 300 MW of firm load to be lost, but there is no impact on the BES, so why does the detailed reporting need to be done?The items relating to ?damage or destruction? need to be revised to not be so wide. As currently written, a plan by a company to raze a facility could be considered a violation and must be reported. We believe it needs to tightened to malicious intent or human negligence/error.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed Loss of Firm load and believe the reporting requirement presented approved in EOP-004-1 is substantial and should remain within EOP-004-2. If a Critical Cyber Asset (CCA) was to be retired, the entity would declassify it as a CCA and therefore it would not be required to be reported.		
CenterPoint Energy	No	(1) CenterPoint Energy believes that the ?Entity with Reporting Responsibility? for the first three events in Part A should be clarified. There could still be confusion regarding the ?initiating entity? for events where one entity directs another to take action. From the text on page 5 of the Unofficial Comment Form, it appears that the SDT intended for the ?initiating entity? to be the entity that takes action. To make this clear in Attachment 1, CenterPoint Energy recommends replacing ?initiating entity? with ?Each (insert applicable entities) that (insert action). For example, for ?Energy Emergency requiring a Public appeal? the Entity with Reporting Responsibility should be ?Each?that issues a public appeal for load reduction?. (2) Part A: The threshold for reporting ?System Separation? should not be fixed at greater than or equal to 100 MW for all entities, but rather should be scaled to previous year?s demand as in ?Loss of Firm load for greater than or equal to 15 minutes?, so that for entities with demand greater than or equal to 3000 MW, the island would be greater than or equal to 300MW. (3) Part A: The one hour reporting requirements are unreasonable and burdensome. The Background text indicates that ?proposed changes do not include any real-time operating notifications?? CenterPoint Energy believes all one hour reporting requirements could potentially divert resources away from

Organization	Yes or No	Question 11 Comment
		responding to the event. In many instances the event may still be developing within one hour. Likewise, the 24 hour reporting requirements are also burdensome. CenterPoint Energy recommends changing all reporting requirements to 48 hours. CenterPoint Energy acknowledges that the DOE OE-417 report requires certain one hour and 6 hour reporting. Those requirements should also be extended, and CenterPoint Energy will be making the same recommendation during the DOE OE-417 report revision process when the current form expires on 12/31/11.(4) Part B: CenterPoint Energy is very concerned with the ?events? listed under Attachment 1 ? Potential Reliability Impact ? Part B and believes Part B should be deleted. These arbitrary ?events? with ?potential reliability impact? and reporting times place unnecessary burden on entities to report ?situations? that would rarely impact the reliability of the BES. Entities should be aware of developing situations; however, this standard should not require reporting of such occurrences.(5) Part B: Of particular concern is the overly broad ?Risk to BES equipment? and the example provided in the footnote. CenterPoint Energy believes the SDT has already identified the events with the greatest risk to impact the BES in Part A. Also including ?potential reliability impact? situations in Part B inappropriately dilutes attention away from the truly important events. The industry, NERC and FERC should not lose sight of the forest for the trees.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. Footnotes in Attachment 1 have been updated to reflect the comments that the DSR SDT received. The DOE Form OE-417 is under review by the DOE and can be updated or changed without NERC's involvement. The DSR SDT has taken into consideration the use of OE-417 to report events to NERC and agrees that this will fulfill EOP-004-2's reporting requirements.		
ExxonMobil Research and Engineering	No	The notification requirement and documentation in Attachment 1 do not clearly identify which entities need to be notified for each type of event detailed in Attachment 1. While it makes sense to notify the Reliability Coordinator, NERC, Regional Entity, Law Enforcement and other Governmental Agencies for sabotage type events, it does not seem proper to notify Law Enforcement agencies of a system disturbance that is unrelated to improper human intervention. Furthermore, it is our belief that a time frame of 1 hour is a short window for making a verbal notification to third parties, and an impossibly short window for requiring the submittal of a completed form regardless of the simplicity. When a Petrochemical Facility experiences an impact event, the initial focus should emphasize safe control of the chemical process. For those cases where registered entities are required to submit a form within 1 hour, the Standard Drafting Team should alter the requirement to allow for verbal notification during the first few hours following the initiation of an Impact Event (i.e. allow the facility time to appropriately respond to and gain control of the situation prior to making a notification which may take several hours) and provide separate notifications windows for those parties that will need to respond to an Impact Event immediately and those entities that need to be informed that one occurred for the purposes of investigating the cause of and response to an Impact Event. For example, a GOP should immediately notify a TOP when it experiences a forced outage of generation capacity as soon as possible, but there is no immediate benefit to notify NERC when site personnel are responding to the event in order to gain control of of the situation and determine the extent of the problem. The existing standard?s

Organization	Yes or No	Question 11 Comment
		requirement to file an initial report to entities, such as NERC, within 24 hours seems reasonable provided that proper real time notifications are made and the Standard Drafting Team reinstates EOP-004 Revision 1's Requirement 3.3, which allows for the extension of the 24 hour window during adverse conditions, into the requirement section of EOP-004 [the current revision locates this extension in Attachment 1, which, according to input received from Regional Entities, means that the extension would not be enforceable].
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. Footnotes in Attachment 1 have been updated to reflect the comments that the DSR SDT received.		
PPL Electric Utilities	No	We very much appreciate the work performed by SDT and consideration of all the comments received. While we agree with the majority of the Attachment 1 changes, we suggest the SDT add further clarification to Attachment 1, Part A, Event 'Transmission Loss'. Does this mean permanent loss? Do two lines and a pole constitute a loss of three elements? E.g. Consider the loss of a 230 kV line with two tapped transformers. This does not have a significant effect on the BES, yet would it be reportable? We would prefer Attachment 1, Part A, ?Threshold Reporting? be clarified. E.g. ?Three or more "unrelated" pieces of equipment for a single event?.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. Footnotes in Attachment 1 have been updated to reflect the comments that the DSR SDT received.		
Lincoln Electric System	No	While LES supports the bright line criteria listed in Attachment 1 for reporting Impact Events, we have concerns regarding the reporting threshold for ?Transmission loss?. For Transmission loss of three or more Transmission Elements, LES supports the MRO NSRS? suggested wording of ?Two or more BES Transmission Elements that exceed TPL Category D operating criteria or its successor.?
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received.		
American Transmission Company	No	Energy Emergency requiring Public AppealATC believes that the phrase ?initiating entity? is unclear and could be interpreted in multiple ways. 1) the entity has the authority to call for public appeals, 2) the entity has the authority to declare an Energy Emergency, or 3) the entity determines and identifies the need for the Energy EmergencyTypically the BA?s call for public appeals, so does every BA that calls for the public appeal have to make a filing?The RC declares the need for an Energy Emergency, so are they the initiating entity? A TOP could also identify the need for public appeals and notify the RC about the request. In this case, is the TOP the initiating entity?Given the above examples, ATC believes that the SDT needs to clarify who is required to make the filing. Voltage Deviations on BES FacilitiesATC believes that this should be clarified because one may assume that a loss of a single bus in which voltage goes to zero for more than 15 minutes

Organization	Yes or No	Question 11 Comment
		is reportable. It is ATC understands that what the SDT means is a voltage dip, not an outage to a BES facility. However, given the brief description, ATC is not 100% sure whether there is a clear understanding of the standard?s intent.Energy Emergency resulting in automatic firm load shedding Please provide additional clarify.ATC believes that the SDT should not use the term ?Impact Event? when identifying the entity with reporting responsibility. The term ?Impact Event? is identified in the standard and points to Attachment 1 but now is being used outside of that context and requires entities to interpret what qualifies as an Impact Event.The above observation also applies to those other events that use the term ?Impact Event? to describe Reporting Responsibility.Footnote 1: ATC would like the phrase ?as determined by the equipment owner? added to the footnote. This simple phrase will allow entities to be sure that they are responsible for determining if the damage significantly affects the reliability margin of the system. Without this phrase, entities could be subject to non-compliance actions based on differences of opinions to the extent of the damage on the system. The other option the SDT has is to provide additional clarity on what qualifies as a significant affect.Time to Submit Report:ATC strongly disagrees with the 1 hour time to submit a report because it does not fit with the purpose of this standard. The purpose of this standard is to increase awareness, however, requiring a one-hour reporting window following the event provides little to no benefit. ATC believes that these events should have a 24 hour reporting window which allows for a reasonable amount of time to gather information and report the issue.If the SDT disagrees with this observation, ATC believes a complete explanation should be provided on why knowledge of an event within an hour is significantly better than having the knowledge of the event in a 24 hour time period. ATC strongly believes that NERC will gain as much or more knowledge of the event by giving entities time to understand the event and report.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received.		
Duke Energy	No	? Attachment 1 contains three reportable events (Damage or destruction of Critical Asset, Damage or destruction of a Critical Cyber Asset, and Detection of a reportable Cyber Security Incident) that overlap with CIP-008-3 Cyber Security Incident Reporting and Response Planning and could result in redundant or conflicting content between the two standards. We propose either of the following options:1. Remove the requirement for reporting these events from EOP-004-2 and add the timing and reporting requirements into CIP-008-3, R1.3. ?Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.? OR2. Replace the reporting requirement in CIP-008-3, R1.3. with a reference to report as required in EOP-004-2.? Also, as noted in our comment to Question #4 above, the Attachment 1 Section ?Entity with Reporting Responsibility? should just identify ?Initiating entity? for every Event, as was done with the first three Events. That way you avoid errors in leaving an entity off, or including an entity incorrectly (as was done with the GOP on Voltage Deviations). We note that LSE is listed in the standard as an Applicable entity, and should be included in Attachment 1.

Organization	Yes or No	Question 11 Comment
		Our suggestion would handle this oversight. We also note that CIP-001 does not include Distribution Provider in the list of applicable entities, but EOP-004-2 does include the DP.? We reiterate our comment to Question #1 above that the DSR SDT statement that the proposed changes do not include any real-time operating notifications is inconsistent with requiring notification within one hour for thirteen of the twenty listed Events in Attachment 1.? The last six events refer to the entity that experiences the potential Impact Event. We believe that the word ?potential? should be struck, as this creates an impossibly broad reporting requirement.? Footnote 1 should be revised to strike the phrase ?has the potential to? from the parenthetical, as this creates an impossibly broad reporting requirement.? The Impact Event ?Risk to BES equipment? should be revised to ?Risk to BES equipment that results in the need for emergency actions?. The accompanying footnote 4 should be revised to read as follows: Examples could include a train derailment adjacent to BES equipment (e.g. flammable or toxic cargo that would cause the evacuation of a BES facility control center), or a report of a suspicious device near BES equipment.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. CIP-008 states that an entity will report a Cyber Security Incident to the ES-ISAC. EOP-004-2, Attachment 2 is the vehicle to report a Cyber Security Incident. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the ERO and others with a different view of what has happened. The DSR SDT understands that there may be multiple reports (for certain events) that are required by different government agencies. NERC will continue to streamline the reporting process as we move into the future.		
Constellation Power Generation	No	CPG has the following concerns regarding Attachment 1: ?Real-Time - On page 5 of the proposed standard, the team noted that ?the proposed changes do not include any real-time operating notifications.? However, several events in Attachment 1 require that documentation be completed and submitted to the ERO within 1 hour. For generation sites that are unmanned, or only have 1 to 2 operators on site at all times, a 1 hour requirement is not only onerous but is essentially ?real time.??Response within 1 hour - It is important to consider the imposition created by a compliance obligation and weigh it against the other demands before the operator at that time. A compliance obligation should avoid becoming a distraction from reliability related work. Under impact event type scenarios, in the first hour of the event, the primary concern should be coping with/resolving the event. Other notification requirements exists based on required agency response relative to the concern at hand (e.g. public evacuations, fire assistance, etc.) Notification within an hour under EOP-004 does not appear to represent a relevant benefit to resolving the situation and the potential cost would be borne by reliability and recovery efforts. Anything performed within the first hour of the event must be to benefit the public or benefit the restoration of power.?Damage or destruction of BES equipment ? the reporting requirement of 1 hour is extremely onerous. A good example is the failure of a major piece of equipment at a remote combustion turbine generation site. Combustion turbine generation sites are not usually manned with many people. If a failure of a major piece of equipment were to occur, the few people on site need to complete communications to affected entities, communications to their management, as well as

Organization	Yes or No	Question 11 Comment
		emergency switching and ensuring that no other pieces of equipment are effected or harmed. There is little time to complete a form in 1 hour. This should be changed to 48 hours. The form is also inadequate for this type of event. o Using the example above of a failure of a major piece of equipment, CPG is not sure if it?s reportable per Attachment 1, which further proves that Attachment 1 is not clear. Per the footnote regarding damage to BES equipment, the failure would not be reportable, as it does not affect IROL, given the information at the plant it does not significantly affect the reliability margin of the system, and was not damaged or destroyed due to intentional or unintentional human action. However, it would be reportable per the table as the table states ?equipment failure? and ?external cause.? Clarification is needed.?Damage or destruction of Critical Asset ? This item should be removed or significantly refined. For generation assets, a critical asset is essentially the entire plant, so in many cases the information reported at this level would not be useful if the valuable details reside at the equipment level. If it is not removed, then see the notes above on the 1 hour requirement for the completion of the form. ?Fuel supply emergency ? 1 hour for reporting the document is unreasonable. See the earlier notes. ?Risk to BES equipment ? ?From a non-environmental physical threat? This item is too vague and subjective. A catch all category to capture a broad list of potential risks is problematic for entities to manage in their compliance programs and to audit. This should be removed.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received.		
Georgia System Operations Corporation	No	Energy Emergency requiring public appeal for load reduction:-The NERC Glossary defines ?Energy Emergency? as a ?condition when a Load-Serving Entity has exhausted all other options and can no longer provide its customers? expected energy requirements.? Per EOP-002, an Energy Emergency Alert may be initiated by the RC upon RC sole discretion, upon BA request, or upon LSE request.-Question: Is it intended that the LSE reports the event if the LSE requests an alert, the BA reports the event if the BA requests an alert, and the RC reports it if it is a RC sole discretion decision? What if an alert is not initiated? Is it an Energy Emergency? Is it an impact event? Who must initiate the public appeal? Since it must be reported within a certain time after the issuance of the public appeal, is it not an impact event until after the initiation of the public appeal (which should be after the initiation of the alert)? Shouldn?t the reporting of the impact event be done by the initiator of the public appeal? The event should probably be the public appeal and not the Energy Emergency.-?Public? should not be capitalized.-The reliability objective of this standard is not achieved by NERC knowing of this within 1 hour and the need for NERC to know this within 1 hour to meet its objective of analyzing events has not been justified or explained.? Energy Emergency requiring system-wide voltage reduction: See Energy Emergency requiring public appeal for load reduction above regarding requesting Energy Emergency Alerts. If this event is to be reported within a certain time after ?the event?, at what time is the event marked? Or is it within a certain time after the initiation of the voltage reduction and, if so, shouldn?t the reporting of the impact event be done by the initiator of the voltage reduction? The event should probably be the system-wide voltage reduction and not the Energy Emergency. The reliability objective

Organization	Yes or No	Question 11 Comment
		of this standard is not achieved by NERC knowing of this within 1 hour and NERC does not need to know this within 1 hour and the need for NERC to know this within 1 hour to meet its objective of analyzing events has not been justified or explained.Energy Emergency requiring manual firm load shedding:-See Energy Emergency requiring public appeal for load reduction above regarding requesting Energy Emergency Alerts. If this event is to be reported within a certain time after ?the event?, at what time is the event marked? Or is it a certain time after the initiation of the shedding of load, if so, shouldn?t the reporting of the impact event be done by the initiator of the shedding of the load? If the RC directs a BA to shed load, then the BA directs a DP to do it, then the DP sheds the load, who is the initiator of the load shedding? The event should probably be the firm load shedding and not the Energy Emergency.-The reliability objective of this standard is not achieved by NERC knowing of this within 1 hour and the need for NERC to know this within 1 hour to meet its objective of analyzing events has not been justified or explained.Energy Emergency resulting in automatic firm load shedding:Whenever load is automatically shed both the DP and the TOP ?experience? the event. So does the BA and the LSE. This event includes ?or? between ?DP? and ?TOP.? Is that intentional? Other events in the table do not include either an ?and? or an ?or.? The entities are separated only by commas. NERC should not require multiple entities to report the same event. See comment for R5 above. If a DP "experiences" an automatic load shedding doesn't the TOP also experience it? Both should not report the same event.-The reliability objective of this standard is not achieved by NERC knowing of this within 1 hour and the need for NERC to know this within 1 hour to meet its objective of analyzing events has not been justified or explained.Voltage deviations on BES Facilities:-Should GOs/GOPs be required instead to report to BAs when this condition exists with the BA then reporting to NERC? The idea of a deviation "on BES Facilities" is not clear. On any one Facility? On all Facilities in an area? How wide of an area?-?Voltage Deviation? is not proper noun/name and is not defined in the NERC Glossary. It should not be capitalized.IROL violation: Multiple entities should not report the same event. Please define ?IROL Violation? or use lowercase. It is assumed that ?IROL Violation? means operation ?outside the IROL for a time greater than IROL TV.?Loss of firm load for ? 15 minutes:-Multiple entities should not report the same event. The reliability objective of this standard is not achieved by NERC knowing of this within 1 hour and the need for NERC to know this within 1 hour to meet its objective of analyzing events has not been justified or explained. ?Firm Demand? is defined but not ?Firm load.?System separation (islanding):-Multiple entities should not report the same event. A DP separating from the transmission system should not be a reportable event for a DP in and of itself. If it leads to a sufficient loss of load, it is reportable as above.-The reliability objective of this standard is not achieved by NERC knowing of this within 1 hour and the need for NERC to know this within 1 hour to meet its objective of analyzing events has not been justified or explained. The words ?separation? and ?islanding? should not be capitalized.Generation loss:-Should GOs/GOPs be required instead to report to BAs when their generation is lost with the BA then reporting to NERC when the total is ? 2,000 MW? A ?loss? of generation should be clarified. Is the discovery of damaged equipment in an offline plant which makes the plant unavailable for an extended period of time a ?loss? of generation?-It should be clarified if this event means the concurrent loss of the generation or losing the generation non-concurrently

Organization	Yes or No	Question 11 Comment
		but they are concurrently unavailable. What is the time window for losing the generation? Lost within seconds of each other? Minutes? Hours?Loss of off-site power to a nuclear generating plant (grid supply):-Multiple entities should not report the same event.-?Off? should be lowercase.Transmission loss:-RCs should not be required to report the loss of transmission elements to NERC. A ?loss? of a BES Transmission Element should be clarified.It should be clarified if this event means the concurrent loss of elements or the non-concurrent loss of the elements but they are concurrently unavailable. What is the time window for losing the elements? When elements are lost, it will be difficult to differentiate if they are BES Transmission Elements or not. Alarms don't immediately identify this. It could lead to gross over-reporting if no distinction is made by a TOP and the TOP reports all losses of 3 elements. It may still be over-reporting (from a reasonableness/practicality basis) even if the differentiation could be easily made and only BES Transmission Elements are reported. Threshold for reporting Transmission Loss: As stated, this will require the reporting of almost all transmission outages. This is particularly true taking into consideration the current work of the drafting team to define the Bulk Electric System. The loss of a single 115kV network line could meet the threshold for reporting as the definition of Element includes both the line itself and the circuit breakers. Instead, we recommend the following threshold "Three or more BES Transmission lines." This threshold has consistency with CIP-002-4 and draft PRC-002-2. This threshold also needs additional clarification as to the timeframe involved. Is the intent the reporting of the loss of 3 or more BES Transmission Elements anytime within a 24 hour period or must they be lost simultaneously? Also, we recommend that the three losses be the result of a related event to require reporting.Damage or destruction of BES equipment that i. affects an IROL; ii. significantly affects the reliability margin of the system (e.g., has the potential to result in the need for emergency actions); or iii. damaged or destroyed due to intentional or unintentional human action (Do not report copper theft from BES equipment unless it degrades the ability of equipment to operate correctly, e.g., removal of grounding straps rendering protective relaying inoperative.):-What is ?BES equipment?? Would an operator know which equipment is BES equipment and which is not or which BES equipment affects an IROL (if we had one) or which does not? It is a judgment call as to whether the effect was significant or not or if it has the potential or not. Multiple entities should not report the same event. Unplanned control center evacuation:-?Control Center? should be lowercase.-The reliability objective of this standard is not achieved by NERC knowing of this within 1 hour and the need for NERC to know this within 1 hour to meet its objective of analyzing events has not been justified or explained.Fuel supply emergency:Multiple entities should not report the same event. Should GOs/GOPs be required instead to report to BAs when they have a fuel supply emergency with the BA then reporting to NERC if the situation is projected to require emergency action at the BA level?-The reliability objective of this standard is not achieved by NERC knowing of this within 1 hour and the need for NERC to know this within 1 hour to meet its objective of analyzing events has not been justified or explained.Loss of all monitoring or voice communication capability (affecting a BES control center for ? 30 minutes):-Does this event mean that ALL capability at both the primary and backup control centers or just one?Forced intrusion at a BES facility (report if you cannot reasonably determine likely motivation, i.e., intrusion to steal copper or spray graffiti is not reportable unless it affects (affects ? not effects) the reliability

Organization	Yes or No	Question 11 Comment
		of the BES):-What is a ?BES facility?? It is not clear for the purposes of complying with this standard what it means to affect the reliability of the BES. Deferred for ECMS review and additional comments.Risk to BES equipment (examples include a train derailment adjacent to BES equipment that either could have damaged the equipment directly or has the potential to damage the equipment, e.g., flammable or toxic cargo that could pose fire hazard or could cause evacuation of a BES facility control center, and report of suspicious device near BES equipment.):-In the footnote, delete ?could have? from ??either could have damaged?? Something that could cause evacuation of a control center does not pose a risk to damaging BES equipment. The threshold is ?from a non-environmental physical threat? but the example (toxic cargo) IS an environmental threat.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. The DSR SDT reviewed the term 'Energy Emergency' and has removed it from Attachment 1.		
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	No	The one hour reporting timeline is unrealistic for this event. In general it looks like other events requiring the 1 hour reporting timeline are for event that are ?initiated? by the system operator. (ie load shedding, public load reduction, EEP?). Loss of BES equipment is in general 24 hour reporting timeline. It should be, ?as soon as possible but within 24 hours."
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received.		
Indeck Energy Services	No	Comments were included in previous comments.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received.		
BC Hydro		For the change from 24hr to 1hr reporting for events, 1 hour goes extremely quickly in these types of events and it will be difficult to report anything meaningful. As the RC is kept informed during the event why is the report required within 1hr?
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. EOP-004-2 is an after the fact reporting Standard. The entity experiencing an event is required to inform their RC per other NERC Standards.		
Brazos Electric Power Cooperative	No	Question applicability to DP.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed and updated the entities that need to report an event. Some have been reduced to a single entity where others have multiple entities. These multiple entities will have different views of the event, and will be able to provide the		

Organization	Yes or No	Question 11 Comment
ERO and others with a different view of what has happened. The entire Attachment 1 has been updated to reflect the comments that were received.		
Progress Energy	No	Progress Energy appreciates the effort of the Standard Drafting Team, but we do have some issues with the content of Attachment 1. The loss of three Transmission Elements can occur with a single transmission line outage. Progress is concerned that the possible frequency of this type of reporting could be an extreme burden. Under the column ?Entity with Reporting Responsibility,? why do all related entities have to report the same event? (i.e. do the RC and the TOP in the RC footprint both have to report an event, or is it either/or? The word ?Each? implies separate reports. What is the Reliability-based need for both an RC and the BA/TOP/GO within the footprint to file the same report for the same event?) For vertically integrated companies it should be clear that only one report is required per Impact Event that will cover the reporting requirements for all registered entities within that company.The ?damage or destruction of BES equipment? footnote contains the language ?Significantly affects the reliability margin?.? The word significantly should not be used in a Standard because it is subjective. Reliability margin is also undefined. System Operators must be trained on how to comply with the Standard, and thus objective criteria must be developed for reporting. ?1 hour after occurrence? places a burden on System Operators for reporting when response to and information gathering dealing with the Impact Event may still be occurring. There is a note that states that the timing guidelines may not be met ?under certain conditions?? but then requires a call to both its Regional Entity and notification to NERC. The focus should be on the event response and this type of reporting should occur ?within an hour or as soon as practical.? It is unclear what the voltage deviations of +-10% based on (i.e. is that +-10% of nominal voltage? This may require new alarm set-points to be placed in service in Energy Management Systems in order for entities to able to prove in an audit that they reported all occurrences of voltage exceeding the 10% limit for 15 minutes or more. It has been stated by Regional Entity audit and enforcement personnel that attestations cannot be used to ?prove the positive.?)The word ?potential? should be removed from Attachment 1 and from the definition of Impact Event. An event is either an Impact Event or not. If an entity has to evacuate its control center facility temporarily for a small fire, or any other such minor occurrence, then it activates its EOP-008 compliant backup control center, and there is no impact to reliability, then why does there need to be a report generated?The ?Forced Intrusion? category is problematic. The footnote 3 states: ?Report if you cannot reasonably determine likely motivation (i.e., intrusion to steal copper or spray graffiti is not reportable unless it effects (sic) the reliability of the BES).? ?Reasonably determine likely motivation? makes this subjective. If someone breaks into a BES substation fence to steal copper, is interrupted and leaves, then entity personnel determine someone tried to break into the substation, but cannot determine why, then this table requires a report to be filed within an hour. It is unclear what the purpose of such a report would be. Progress agrees that multiple reports in a short time across multiple entities may indicate a larger issue.
Response: The DSR DT thanks you for your comment. The entire Attachment 1 has been updated to reflect the comments that were received. Footnotes		

Organization	Yes or No	Question 11 Comment
have been updated per comments received.		
Liberty Electric Power LLC	Yes	A qualified yes here - please clarify footnote 1 to the table. Are the listed qualifications "and" or "or" statements -IOW, if destruction of BES equipment through human error does not have the potential to result in the need for emergency actions, is it still reportable? If a 18-240 KV step-up transformer suffers minor damage because a conservator tank was valved out, is this reportable under this definition?
Response: The DSR DT thanks you for your comment. Footnotes have been update to reflect comments received. This proposed Standard is targeted at BES level Thresholds for Reporting as outlined in Attachment 1.		
Ingleside Cogeneration LP	Yes	We believe that there should be close, if not perfect, synchronization between the ERO?s Event Analysis Process and Attachment 1 since they share the same ultimate goal as EOP-004-2 to improve industry awareness and BES reliability.
Response: The DSR DT thanks you for your comment. EOP-004-2 is an after the fact reporting Standard and the reports submitted by entities complying with the standard may be used by the NERC Event Analysis Program to review reported events. The Event Analysis Program may change their categories of events at anytime, but revisions to an approved standard must follow the standards development process embodied in the NERC Standard Processes Manual. Despite the differences in process, the DSR SDT is working closely with the Event Analysis Working Group to ensure alignment between the standard and the program to the maximum extent possible.		
Occidental Power Marketing	Yes	There does not appear to be any reportable events for LSEs that do not own, operate, or control BES assets (or assets that directly support the BES) in Attachment 1. This would support removing such entities from the Applicability.
Response: The DSR DT thanks you for your comment. The DSR SDT understands that every LSE may not own or operate BES assets. If of the LSE does not own or operate BES assets, then EOP-004-2 would not be applicable to that LSE. Since CIP-002 and CIP-008 are applicable to LSEs they will be required to be applicable under EOP-004-2 for cyber incidents.

12. Do you agree with the proposed measures for Requirements 1-5? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: The majority of commenters agree with the proposed measures. Since two requirements were removed, the DSR SDT did a complete review of the Requirements and associated Measure and assured that Measurements did not add to any Requirement. The Measures have been rewritten to reflect strict accuracy to each Requirement and provide a minimum measure required for an entity to be compliant.

Organization	Yes or No	Question 12 Comment
Georgia Transmission Corporation & Oglethorpe Power Corporation	No	Several of the measures appear to introduce items that are not required by the standard. For instance, R3 requires that a test of the communications process be performed, however Measure 3 indicates that a mock impact event be performed. Measure 4 indicates that personnel be listed in the plan and be trained on the plan, however there is no requirement to include people in the plan or to train them.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
Northeast Power Coordinating Council	No	Concerns with M5:a. As suggested in the response to Question 10 above, R5 should be combined with R2; b. If R5 to remain as is, then M5 goes beyond the requirement in R5 in that it asks for evidence to support the type of Impact Event experienced. Attachment 2 already requires the reporting entity to provide all the details pertaining to the Impact Event. It is not clear what kind of additional evidence is needed to ?support the type of Impact Event experienced?. Also, the date and time of the Impact Event is provided in the reporting form. Why the need to provide additional evidence on the date and time of the Impact Event?
Response: The DSR SDT thanks you for your comment. Requirement 2 has been deleted as requested by the industry. Requirement R5 (now R2) was revised along with the measure: R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment]. M2. Responsible Entities shall provide a record of the type of event experienced; a dated copy of the Attachment 2 form or OE-417 report; and dated and time-		

Organization	Yes or No	Question 12 Comment
stamped transmittal records to show that the event was reported.		
Pacific Northwest Small Public Power Utility Comment Group	No	It is unclear when reporting to the Compliance Enforcement Authority is required. Does the registered entity report initially, and then anytime a change to the plan is made, or a drill is performed. Or is the information only provided following a request of the Compliance Enforcement Authority, and if so what is the acceptable time limit to respond?
Response: The DSR SDT thanks you for your comment. The Measure is designed to inform applicable entities of the minimum acceptable evidence needed to prove compliance with a requirement. The reference to Compliance Enforcement Authority has been removed since it does not assist an entity in the minimum level of evidence needed per the requirement.		
Dominion	No	1) M1 is open ended. Suggest adding ?on request? to the end of the sentence as written; 2) M4 requires evidence of ?when internal personnel were trained; however, Requirement R4 does not require training.
Response: The DSR SDT thanks you for your comment. The Measure is designed to inform applicable entities of the minimum acceptable evidence needed to prove compliance with a requirement. The reference to Compliance Enforcement Authority has been removed since it does not assist an entity in the minimum level of evidence needed per the requirement.		
SPP Standards Review Group	No	The measures are written as if they are adding requirements to the standards. Using wording such as ?shall provide? gives this implication. We would suggest wording such as ?examples of acceptable evidence to demonstrate compliance may be??See Question 6 for comments regarding M1.See Question 8 for comments regarding M3.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
Midwest ISO Standards Collaborators	No	We disagree with Measurement 4. It implies that the review must be conducted in person. Why could other means such as a web training or a reminder memo not satisfy the requirement? Because Requirement 1 does not require submittal of the Operating Plan, Operating Process and/or the Operating Procedure, Measurement 1 should only require submittal to the Compliance Enforcement Authority upon its request.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement. Requirement 4 has been deleted.		
FirstEnergy	No	Measure M4 includes the phrase ?when internal personnel were trained on the responsibilities in the plan? implies the Requirement R4 requires training. R4 is only requiring the review of a document of the necessary

Organization	Yes or No	Question 12 Comment
		personnel and that the rest of the measure covers the needed evidence for R4. This phrase in the measure should be removed. We suggest the following for M4:M4. Responsible Entities shall provide the materials presented to verify content and the association between the people listed in the plan and those who participated in the review, documentation showing who was present.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement. Requirement 4 has been deleted.		
SERC OC Standards Review Group	No	The measures should be revised to match the general nature of the comments we have made on each requirement.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
PJM Interconnection LLC	No	1. We disagree with M4 as it seems to indicate that all training needs to be in person and precludes any form of Computer Based Training (CBT). 2. As indicated in 10, R5 is redundant as R2 already required an entity to report any Impact Events by executing/implementing its Impact Event Operating plan. If R5 is to remain as is, then M5 goes beyond the requirement by requiring the entity to produce evidence of compliance for the type of Impact Event experienced. It is not clear as to what additional evidence is needed to ?support the type of Impact Event experienced?.
The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
We Energies	No	M1 contains a redundancy: It currently reads, ?Each Responsible Entity shall provide the current in force Impact Event Operating Plan to the Compliance Enforcement Authority.? (?In force? is the same as ?current?.)M2: Change ?Impact Event? to ?Impact Event listed in Attachment 1?.M3: This is an additional requirement. R3 does not require a mock Impact Event. R3 requires a test of the communicating Operating Process. As stated above, R3 and M3 should be deleted.M4: This is written assuming classroom training. R4 does not require formal training much less classroom training. R4 requires that those (internal) personnel who have responsibilities in the plan review the Impact Event Operating Plan.M5: When we report, how do we show to an auditor that we reported ?using the plan?? Delete the reference to ?the plan?.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		

Organization	Yes or No	Question 12 Comment
Compliance & Responsiblity Organization	No	See comments set forth in number 2.
Exelon	No	? M1 - Suggest rewording to state "Each Responsible Entity shall provide the current revision of the Impact Event Operating Plan or equivalent implementing process"? M3 ? Need to provide more guidance on evidence of compliance to meet R.3 The DSR SDT needs to provide more guidance on the objectives and format of the drill expected (e.g., table top, simulator, mock drill) and what evidence will be required to illustrate compliance.? M5 - Suggest that the DSR SDT provide a note or provision to allow for the DOE OE-417 reporting form be submitted by the most knowledgeable functional entity (e.g., the TOP or RC) experiencing the event.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
City of Tallahassee (TAL)	No	M3 & M4 should be modified if comments above (#8 and #9) are incorporated.M4 - Providing the ?materials presented? is beyond the scope of compliance. This constitutes a review of the training program which is beyond the scope of the standard. Review of attendance sheets should be sufficient. The personnel will be listed in the Plan/Process/Procedure. Modify M4: Responsible Entities shall provide evidence of those who participated in the review, showing who was present and when internal personnel were trained on their responsibilities in the plan.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
Tenaska	No	The proposed R1 through R4 should be deleted and a revised version of R5 should become R1. The proposed measures for the new R1 should be revised accordingly.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
American Municipal Power	No	M1-M4 should be eliminated and M5 should be revised to incorporate a simplified R5. M5 - Date and time of submitted report
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		

Organization	Yes or No	Question 12 Comment
Liberty Electric Power LLC	No	Due to disagreement with R3 and R4.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
Arkansas Electric Cooperative Corporation	No	We applaud the drafting team's effort in crafting more meaningful measures. However, we have concerns with the measures reading like requirements in stating Responsible Entities "shall" do something. We suggest crafting the measures to provide acceptable, but not all exclusive, forms of evidence by stating something similar to "Acceptable forms of evidence may include??
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
New Harquahala Generating Co.	No	See R3 comments
Response: The DSR SDT thanks you for your comment. Please see R3 responses.		
Consumers Energy	No	We understand that DOE is migrating to an on-line reporting facility rather than the email-submitted OE-417. If they do so, Form OE-417will not be available for providing to NERC, and the reporting specified by EOP-004 will be duplicative of that for DOE. We recommend that NERC, RFC and the DOE work cooperatively to enable a single reporting system in which on-line reports are made available to all appropriate parties.
Response: The DSR SDT thanks you for your comment. The DSR SDT has been working with the U.S. Department of Energy (DOE) to streamline the reporting process. The DOE Form OE-417 will be accepted at NERC if you are reporting an event to the DOE.		
Independent Electricity System Operator	No	We do not have any issues with Measures M1, M2 and M4, but have a concern with M3 and a couple of concerns with M5:M3: This Measure contains a requirement for the Responsible Entities to conduct a mock Impact Event. We disagree to have this included in the Measure. R3 requires the Responsible Entity to conduct a test of its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3. The Measure should adhere to this condition only. We suggest to change the wording to:The Responsible Entity shall provide evidence that it conducted a test of it its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3. The time period between actual and or mock Impact Events shall be no more than 15 months. Evidence may include, but is not limited to, operator logs, voice recordings, documentation or a report on an actual Impact Event.M5: a. As

Organization	Yes or No	Question 12 Comment
		suggested above, R5 should be combined with R2;b. If R5 to remain as is, then M5 goes beyond the requirement in R5 in that it asks for evidence to support the type of Impact Event experienced. Attachment 2 already requires the reporting entity to provide all the details pertaining to the Impact Event. It is not clear what kind of additional evidence is needed to ?support the type of Impact Event experienced?. Also, the date and time of the Impact Event is provided in the reporting from. Why do we need to provide additional evidence on the date and time of the Impact Event?
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement. Requirement R5 (now R2) was revised along with the measure: R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment]. M2. Responsible Entities shall provide a record of the type of event experienced; a dated copy of the Attachment 2 form or OE-417 report; and dated and time-stamped transmittal records to show that the event was reported.		
ISO New England, Inc	No	We do not have any issues with Measures M1, M2 and M4, but have a comment on M3 and a couple of concerns with M5:M3: This Measure contains a requirement for the Responsible Entities to conduct a mock Impact Event. We disagree to have this included in the Measure. R3 requires the Responsible Entity to conduct a test of its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3. The Measure should adhere to this condition only. We suggest to change the wording to:The Responsible Entity shall provide evidence that it conducted a test of it its Operating Process for communicating recognized Impact Events created pursuant to Requirement R1, Part 1.3. The time period between actual and or mock Impact Events shall be no more than 15 months. Evidence may include, but is not limited to, operator logs, voice recordings, documentation or a report on an actual Impact Event.M5:a. As suggested above, R5 should be combined with R2;b. If R5 to remain as is, then M5 goes beyond the requirement in R5 in that it asks for evidence to support the type of Impact Event experienced. Attachment 2 already requires the reporting entity to provide all the details pertaining to the Impact Event. It is not clear what kind of additional evidence is needed to ?support the type of Impact Event experienced?. Also, the date and time of the Impact Event is provided in the reporting from. Why do we need to provide additional evidence on the date and time of the Impact Event?c. We disagree with Measurement 4. It implies that the review must be conducted in person. Why couldn?t other means such as web training or a reminder memo not satisfy the requirement?
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement. Requirement R5 (now R2) was revised along with the measure:		

Organization	Yes or No	Question 12 Comment
R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment]. M2. Responsible Entities shall provide a record of the type of event experienced; a dated copy of the Attachment 2 form or OE-417 report; and dated and time-stamped transmittal records to show that the event was reported.		
Calpine Corp	No	Requirements R1, R2, R3, and R4 are unnecessary, as discussed above. The measure for Requirement R5 should focus on the need to report accurately and promptly, not on a Responsible Entity?s ?Operating Plan?. If the Requirements are retained, the measures should state in much greater detail what actions and documentation are required for compliance.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement. Requirement R5 (now R2) was revised along with the measure: R2. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1. [Violation Risk: Factor: Medium] [Time Horizon: Operations Assessment]. M2. Responsible Entities shall provide a record of the type of event experienced; a dated copy of the Attachment 2 form or OE-417 report; and dated and time-stamped transmittal records to show that the event was reported.		
CenterPoint Energy	No	M1: CenterPoint Energy recommends that the phrase ?current in force? be updated to ?current? or ?currently effective?. Additionally, CenterPoint Energy suggests clarifying M1 by adding ?within 30 days upon request?, which would be consistent with language found in measures in other standards. The revised measure would read, ?Each Responsible Entity shall provide the currently effective Impact Event Operating Plan to the Compliance Enforcement Authority within 30 days upon request.? M2: If R2 is deleted (as recommended in response to Question 7), then M2 should be deleted.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement. R2 was deleted along with the measure M2.		
ExxonMobil Research and Engineering	No	Measure M3 introduces a psuedo-requirement by implying you are able to reset the testing clock if you implement our Impact Event Operating Plan in response to an Impact Event. This should be covered in Requirement R3. Measure M4 should refer to positions and evidence that people occupying those positions participated in the annual review of the Impact Event Operating Plan. Given the number of individuals involved in operations and the cycle of promotions and reassignments, it?s unreasonable to expect an entity

Organization	Yes or No	Question 12 Comment
		to identify specific individuals in their Impact Event Operating Plan. As the one hour time window is not long enough for entities to report all types of events when responding to the impact the Imact Event had on its facility, Measure M5 should be modified to include voice recordings and log book entries to capture verbal information reported to required parties.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
Constellation Power Generation	No	See CPG?s earlier comments regarding the Requirements and Measures.
Response: The DSR SDT thanks you for your comment. See response to comments on Requirements and Measures.		
Georgia System Operations Corporation	No	There are a lot of inconsistencies between the requirements and the measures. The measures add requirements that are not stated in the requirements. The measures need to be made consistent with the requirements and to not add to them. Also see comments on requirements earlier for language to move from the measures into the requirements.M2: Remove "on its Facilities." The word "its" leads to a lot of confusion regarding who reports what. Attachment 1 should make clear "what" needs to be reported. The entities' operating plan should make it clear as to who should report each "what." Furthermore, not all Impact Events are "on Facilities."M3: Replace "that it conducted a mock Impact Event" with "that it conducted a test of its Operating Process." Delete "The time period between actual and or mock Impact Events shall be nor more than 15 months."M4: The measure says that documentation showing when personnel were trained is required. R4 does not require training. The requirement and the measure should be made clear and consistent.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	No	M3 -The testing of the Plan by drill or mock impact event is unnecessary and burdensome.
Response: The DSR SDT thanks you for your comment. The Measure M3 has been revised as follows: M3. The Responsible Entity shall provide evidence that it conducted a test of the communication process in its Operating Plan events created pursuant to Requirement R1, Part 1.3. Implementation of the communication process as documented in its Operating Plan for an actual event may be used as evidence to meet this requirement. The time period between an actual event or test shall be no more than 15 months. Evidence may include, but is not limited to, operator logs,		

Organization	Yes or No	Question 12 Comment
voice recordings, or dated documentation of a test. (R3) The intent of R3 is to ensure that the communications process of the Operating Plan works when needed. The annual test is not burdensome and an actual event will take the place of the test.		
Farmington Electric Utility System	No	See comments in requirements for R3 and R4
Response: The DSR SDT thanks you for your comment. See response to comments on R3 and R4.		
Indeck Energy Services	No	M1 is OK. M2 should be about implementation, not about any particular events--M5 is about events. Implementation would include distribution and training. M3 should be modified to reflect a training review by entities that cannot cause a Reportable Disturbance or reportable DOE OE-417 event and for the others documentation of an actual event (which is not included in the present M3) or a drill or mock event. M4 is OK. M5 should only include the reports submitted and the date of submission. Further evidence of the event is redundant.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.		
Brazos Electric Power Cooperative	No	M2 and M5 appear to duplicate each other.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement. R2/M2 have been deleted and R5/M5 is now R2/M2.		
Progress Energy	No	M3 states that ?In the absence of an actual Impact Event, the Responsible Entity shall provide evidence that it conducted a mock Impact Event?? Does this mean that, if an entity experiences an Impact Event that is reportable, then the entity does not have to perform its annual test? If so, this should be made clear in the Requirement.
Response: The DSR SDT thanks you for your comment. That is the intent of the requirement. The Rationale box has been revised to express this intent. The measure now reads: The Responsible Entity shall provide evidence that it conducted a test of the communication process in its Operating Plan for events created pursuant to Requirement R1, Part 1.3. Implementation of the communication process as documented in its Operating Plan for an actual event may be used as evidence to meet this requirement. The time period between an actual event or test shall be no more than 15 months. Evidence may include, but is		

Organization	Yes or No	Question 12 Comment
not limited to, operator logs, voice recordings, or dated documentation of a test. (R3)		
Occidental Power Marketing	Yes	In general, the measures are okay. However, as mentioned above for R3, there needs to be more specificity as to what is acceptable as a "mock Impact Event" for auditing purposes--especially for small entities such as LSEs that do not own, operate, or control BES assets.
Response: The DSR SDT thanks you for your comment. Each measure has been rewritten for the associated requirement to reflect only what is within the requirement.

13. Do you agree with the proposed Violation Risk Factors for Requirements 1-5? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: Many stakeholders suggested that the reporting of events after the fact only justified a VRF of Lower for each requirement. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement 2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement 3 is insurance to make sure that an entity can communicate information about events. Requirement 2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.

Organization	Yes or No	Question 13 Comment
Northeast Power Coordinating Council	No	If R5 is to remain as is, then the VRF should be a Lower, not a Medium. R5 stipulates the form to be used. It is a vehicle to convey the needed information, and as such it is an administrative requirement. Failure to use the form provided in Attachment 2 or the DOE form does not lead to unreliability.

Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
Pepco Holdings Inc and Affiliates	No	This standard involves after the fact reporting of events. Other standards deal with the real time notifications. How do the risk factors between the two line up? A VRF of Low would seem appropriate, since a violation would not affect the reliability of the BES.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. Requirement 2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement 3 is insurance to make sure that an entity can communicate information about events. Requirement 2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is “medium.” The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
FirstEnergy	No	1. We believe that Requirement 5 does not warrant a “Medium” risk factor. Not using a particular form is strictly administrative in nature and the VRF should be “Low.” 2. We believe that Requirement 4 does not warrant a “Medium” risk factor. For example, a simple review of the process does not have the same impact on the Bulk Electric System as the implementation of the Operating Plan per R2. Therefore, we believe R4 is at best a “Low” risk to the BES.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a “lower” VRF. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is “medium.” The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
PJM Interconnection LLC	No	All VRFs should be lower as Requirements 1-5 are all administrative in nature. A violation of any of these requirements does not directly or indirectly affect the reliability of the BES.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a “lower” VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement 2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement 3 is insurance to make sure that an entity can communicate information about events. Requirement 2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is “medium.” The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
We Energies	No	All VRFs should be Lower. They are all administrative and will not affect BES Reliability.

Liberty Electric Power LLC	No	See Q 12.
Response: The DSR SDT thanks you for your comment. Please see response to Question 12.		

Organization	Yes or No	Question 13 Comment
Manitoba Hydro	No	Reduce the Long Term Planning items to Lower VRF. The planning items will not have the same impact on the reliability of the system as real time operations.
Response: The DSR SDT thanks you for your comment. Each Requirement is in the Operations Assessment or Operations Planning time horizon. With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a “lower” VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is “medium.” The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
Independent Electricity System Operator	No	If R5 were to remain as is, then the VRF should be a Lower, not a Medium since R5 stipulates the form to be used. It is a vehicle to convey the needed information, and as such it is an administrative requirement. Failure to use the form provided in Attachment 2 or the DOE form does not give rise to unreliability.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a “lower” VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. Georgia System Operations Corporation	No	Failing to report to NERC any of many of the listed events does not present a reliability risk. The exception to this would be those threat events where the ES-ISAC needs to be notified. The object of the standard is to prevent or reduce the risk of Cascading. Reporting system situations to appropriate operating entities who can take some mitigating action (e.g., a LSE reporting to its BA or a BA reporting to its RC) and reporting threats to law enforcement officials could prevent or reduce the risk of Cascading but reporting to NERC (except for events where the ES-ISAC needs to know) is unlikely to do that. Reporting of most of the listed events to NERC does not meet the objective of this standard and should be removed from this standard. Such events should be reported to NERC through some other (than a Reliability Standard) requirement for reporting to NERC so that NERC can accomplish its mission of analyzing events. Analyzing events may lead to an understanding that could reduce the future risk of Cascading but analyzing events cannot be performed in time to reduce any impending risks.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. 14. Do you agree with the proposed Violation Severity Levels for Requirements 1-5? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: Most commenters agreed with the VSLs. The DSR SDT has deleted R4 and R2, and R5 has become R2. The VSLs have been aligned with the revised requirements. The 'Severe' rating for excessively long reporting times has been retained as the DSR SDT believes that fairly reflects the definition of 'Severe' i.e., The performance or product measured does not substantively meet the intent of the requirement.

Organization	Yes or No	Question 14 Comment
Northeast Power Coordinating Council	No	No major issues with the proposed VSLs. However, because of the preceding comments, want to see the next revision of the draft.
Response: The DSR SDT thanks you for your comment.		
Bonneville Power Administration	No	For R5 VSL's: suggest moving the 1-2 hours down one level to Moderate and move the >2 hours down to High with a range of 2-8 hours. Leave the "Failed to Submit" in the Severe category.
Response: The DSR SDT thanks you for your comment. The DSR SDT has increased most reporting timeframes to 24 hours. Those that still require 1 hour reporting have been adjusted to better align with the 24 hour VSLs. Namely, taking twice as long to report is a 'Medium' VSL. The 'Severe' rating for excessively long reporting times has been retained as the DSR SDT believes that fairly reflects the definition of 'Severe' i.e., The performance or product measured does not substantively meet the intent of the requirement.		
Western Electricity Coordinating Council		Regarding the proposed VSLs for R3, since communication testing involves multiple parties it would be more appropriate to base severity level on the number of applicable parties which were not tested rather than how long after 15 months it took to do the test. The standard already builds in a 3 month leeway, In reality the way it is written almost guarantees a lower severity level.
Response: The DSR SDT thanks you for your comment. VSLs reflect the degree to which the requirements are met. The DSR SDT envisions that communication testing will include all parties referenced in the entity's operating plan. Failure to test any part of that communication process is a failure of that Part of the requirement.		
Pepco Holdings Inc and Affiliates	No	This standard involves after the fact reporting of events. Other standards deal with the real time notifications. How do the severity level between the two line up? See above VRF comments.

Organization	Yes or No	Question 14 Comment
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the VSLs appropriately align with the NERC Guidelines.		
SPP Standards Review Group	No	Requirement 4: We would suggest the following:Low ? The Responsible Entity reviewed its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan in more than 15 calendar months but less than 18 calendar months since the last review.Moderate - The Responsible Entity reviewed its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan in more than 18 calendar months but less than 21 calendar months since the last review.High - The Responsible Entity reviewed its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan in more than 21 calendar months but less than 24 calendar months since the last review.Severe - The Responsible Entity failed to review its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan within 24 calendar months since the last review.Requirement 5: With our suggested deletion of Requirement 5, we further suggest deleting the VSLs associated with Requirement 5.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R4 and R2, and R5 has become R2.		
SERC OC Standards Review Group	No	The VSLs should reflect the comments on the requirements above.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R4 and R2, and R5 has become R2. The VSLs have been aligned with the revised requirements.		
PJM Interconnection LLC	No	VSLs should reflect the comments on the VRFs above.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the VSLs appropriately align with the NERC Guidelines.		
We Energies	No	Change the VRFs as indicated above and the Time Horizons as indicated below.
Response: The DSR SDT thanks you for your comment. Please see responses to those comments.		
Compliance & Responsiblity Organization	No	See comments set forth in number 2.
Response: The DSR SDT thanks you for your comment. Please see responses Question 2.		

Organization	Yes or No	Question 14 Comment
Exelon	No	Suggest rewording the 1 hour reporting for High and Severe to state "communicate or submit" a report within ? depending on the severity of the event, an actual report may not be feasible. Similar to an NRC event report, a provision should be made for verbal notifications in lieu of an actual submitted report. An entity should not be penalized for failing to submit a written report within 1 hour if the communications were completed within the 1 hour time period meeting the intent of the Standard.
Response: The DSR SDT thanks you for your comment. Attachment 1 allows you to provide a verbal report under the conditions you contemplate.		
SDG&E	No	This Reliability Standard provides a list of reporting requirements that are applicable to registered entities, thus it is a paperwork exercise; therefore, SDG&E recommends that none of the requirements should exceed a ?Moderate? Violation Severity Level. Failure on the part of an applicable Registered Entity to provide an event report will have no immediate impact on the Bulk Electric System.
Response: The DSR SDT thanks you for your comment. VSLs describe how fully an entity meets the requirements and are not a measure of severity or impact. These items are captured in the VRFs.		
American Municipal Power		No, this is not acceptable. Eliminate R1-R4 and change R5. Severe: n/aHigh VSL: n/aMedium VSL: No report for a reportable eventLow VSL: Late report for a reportable event
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R4 and R2, and R5 has become R2. The VSLs have been aligned with the revised requirements.		
Liberty Electric Power LLC	No	See Q 12.
Response: The DSR SDT thanks you for your comment. Please see responses to Question 12.		
Consumers Energy	No	1. In reference to the Impact Event addressing ?Loss of Firm load for greater than or equal to 15 minutes?, this is likely to occur for most entities most frequently during storm events, where the loss of load builds slowly over time. In these cases, exceeding the threshold may not be apparent until a considerable time has lapsed, making the submittal time frame impossible to meet. Even more, it may be very difficult to determine if/when 300 MW load (for the larger utilities) has been lost during storm events, as the precise load represented by distribution system outages may not be determinable, since this load is necessarily dynamic. Suggest that the threshold be modified to ?Within 1 hour after detection of exceeding 15-minute threshold?. Additionally, these criteria are specifically storm related wide spread distribution system outages. These events do not pose a risk to the BES.2. Many of the Impact Events listed are likely to occur, if they occur, at widely-distributed system facilities, making reporting ?Within 1 hour after occurrence

Organization	Yes or No	Question 14 Comment
		is identified? possibly impractical, particularly in order to provide any meaningful information. Please give consideration to clearly permitting some degree of investigation by the entity prior to triggering the ?time to submit?.3. Referring to the ?Fuel Supply Emergency? Impact Event, OE-417 requires 6-hour reporting, where the Impact Event Table requires 1-hour reporting. The reporting period for EOP-004-2 should be consistent with OE-417.
Response: The DSR SDT thanks you for your comment. The DSR SDT has increased almost all reporting timeframe to 24 hours. Also, the fuel supply emergency has been removed from Attachment 1. Reporting period was chosen to meet NERC needs, you may have more restrictive periods for OE-417, but that is outside the jurisdiction of the DSR SDT.		
Calpine Corp	No	Requirements R1, R2, R3, and R4 are unnecessary, as discussed above. If retained, the violation risk factors should be low for those requirements, as they all simply support the requirement to actually report correctly stated in Requirement R5.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R4 and R2, and R5 has become R2. The VSLs have been aligned with the revised requirements.		
CenterPoint Energy	No	CenterPoint Energy believes that the Severe VSL for R5 (Reporting) in the current draft incorrectly equates 2X reporting with failure to submit a report. CenterPoint Energy believes the VSLs for R5 should all reflect a factor increase in time. For example, the lower VSL should be 1.5X the reporting time frame. The Moderate VSL should be 2x the reporting time frame. The High VSL should be 3x the reporting time frame. The Severe VSL should be failure to report.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R4 and R2, and R5 has become R2. The VSLs have been aligned with the revised requirements. The 'Severe' rating for excessively long reporting times has been retained as the DSR SDT believes that fairly reflects the definition of 'Severe' i.e., The performance or product measured does not substantively meet the intent of the requirement.		
ExxonMobil Research and Engineering	No	VRFs, VSLs, and THs ideally should be based on the impact event type; alternatively a low VRF seems more appropriate for the requirements of this standard.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the VSLs and time horizons appropriately align with the requirements and NERC Guidelines. With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2)		

Organization	Yes or No	Question 14 Comment
and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001.		
Indeck Energy Services	No	There should be only Lower VSL's. This is reporting of historical events and there is no direct effect on BES reliability. How does missing 3 parts of R1 compare to tripping a 4,000 MW generating station because vegetation was not properly managed? Just because there are 4 levels, doesn't mean that all Standards need to use them all. If you step back, and think about causes of cascading outages, reporting events 1 hour or 24 hours later has no significance. There is no direct preventative causation either.
Response: The DSR SDT thanks you for your comment. VSLs describe how fully an entity meets the requirements and are not a measure of severity or impact to the BES. These items are captured in the VRFs.		
Progress Energy	No	Progress disagrees with the High and Severe VSLs listed for R5. If an entity experiences an Impact Event and fails to submit a report within an hour as required, it may be that there are multiple mitigating circumstances. It is not reasonable to require reporting within an hour since identifying a reportable event often takes longer than this time period.
Response: The DSR SDT thanks you for your comment. The DSR SDT has increased almost all reporting timeframe to 24 hours. Also, VSLs describe how fully an entity meets the requirements and are not a measure of severity or impact to the BES. These items are captured in the VRFs.		
Georgia System Operations Corporation	No	None.
Independent Electricity System Operator		We do not have any major issues with the proposed VSLs. However, in view of our comments on some of the Questions, above, we reserve our comments upon seeing a revised draft.
Response: The DSR SDT thanks you for your comment.		
ISO New England, Inc		We do not have any major issues with the proposed VSLs. However, in view of our comments on some of the Questions, above, we reserve our comments upon seeing a revised draft.

Organization	Yes or No	Question 14 Comment
Response: The DSR SDT thanks you for your comment.

City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Yes	

15. Do you agree with the proposed Time Horizons for Requirements 1-5? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: Many stakeholders suggested that the Time Horizons for this standard should be Operations Assessment or Operations Planning rather than Long Term Planning. The DSR SDT agrees. The DSR SDT has deleted R2, and R5 has become R2 with a time horizon of Operations Assessment, which is defined as 'follow-up evaluations and reporting of real time operations'. R4 has been deleted and the time horizon for R1 and R3 has been changed to Operations Planning.

Organization	Yes or No	Question 15 Comment
Northeast Power Coordinating Council	No	For the purpose of developing and updating an Impact Event Operating Plan, there should not be any requirements that fall into the Long-term planning horizon. As the name implies, the plan is used in the operating time frame. Consistent with other plans such as system restoration plans which need to be updated and tested annually, most of the Time Horizons in that standard (EOP-005-2) are either Operations Planning or Real-time Operations. Suggest the Time Horizon for R1, R3 and R4 be changed to Operations Planning.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R2, and R5 has become R2 with a time horizon of Operations Assessment, which is defined as 'follow-up evaluations and reporting of real time operations'. R4 has been deleted and the time horizon for R1 and R3 has been changed to Operations Planning.		
Bonneville Power Administration	No	Depends on the answer to #7. If implementation means a signed and valid Plan, then it should be with Long Term. If reporting the events, then it should be Real-Time/Same Day Operations.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted the separate requirement to 'implement the plan'. The reporting obligation is now R2 with a time horizon of Operations Assessment, which is defined as 'follow-up evaluations and reporting of real time operations'.		

SPP Standards Review Group	No	Based on our previous comments in response to Question 11, we feel that the Time Horizon for R2 should be lengthened. Assigning it a Real-time Operations and Same ?day Operations timeframe has too much of an impact on real-time operations. Pushing it back will allow support personnel to do the after-the-fact reporting and keep this burden off of the operators.
Response: The DSR SDT thanks you for your comment. The reporting obligation is now R2 with a time horizon of Operations Planning, which is defined as 'follow-up evaluations and reporting of real time operations'.		
Midwest ISO Standards Collaborators	No	R2 and R5 should be Operations Assessment since it deals with after the fact reporting. R3 should included Operations Assessment since an actual event could be used as the test.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R2, and R5 has become R2 with a time horizon of Operations Planning, which is defined as 'follow-up evaluations and reporting of real time operations'. R4 has been deleted and the time horizon for R1 and R3 have been changed to Operations Planning		
SERC OC Standards Review Group	No	R2 and R5 should be in the Operations Assessment time horizon.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R2, and R5 has become R2 with a time horizon of Operations Planning, which is defined as 'follow-up evaluations and reporting of real time operations'. R4 has been deleted and the time horizon for R1 and R3 have been changed to Operations Planning		
PJM Interconnection LLC	No	R2 and R5 should be in Operations Assessment Time Horizon as they deal with ?after-the-fact? reporting.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R2, and R5 has become R2 with a time horizon of Operations Planning, which is defined as 'follow-up evaluations and reporting of real time operations'. R4 has been deleted and the time horizon for R1 and R3 have been changed to Operations Planning		
We Energies	No	R2 and R5 should be Operations Assessment.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R2, and R5 has become R2 with a time horizon of Operations Planning, which is defined as 'follow-up evaluations and reporting of real time operations'. R4 has been deleted and the time horizon for R1 and R3 have been changed to Operations Planning		

Consumers Energy	No	1. In reference to the Impact Event addressing ?Loss of Firm load for greater than or equal to 15 minutes?, this is likely to occur for most entities most frequently during storm events, where the loss of load builds slowly over time. In these cases, exceeding the threshold may not be apparent until a considerable time has lapsed, making the submittal time frame impossible to meet. Even more, it may be very difficult to determine if/when 300 MW load (for the larger utilities) has been lost during storm events, as the precise load represented by distribution system outages may not be determinable, since this load is necessarily dynamic. Suggest that the threshold be modified to ?Within 1 hour after detection of exceeding 15-minute threshold?. Additionally, these criteria are specifically storm related wide spread distribution system outages. These events do not pose a risk to the BES.2. Many of the Impact Events listed are likely to occur, if they occur, at widely-distributed system facilities, making reporting ?Within 1 hour after occurrence is identified? possibly impractical, particularly in order to provide any meaningful information. Please give consideration to clearly permitting some degree of investigation by the entity prior to triggering the ?time to submit?.3. Referring to the ?Fuel Supply Emergency? Impact Event, OE-417 requires 6-hour reporting, where the Impact Event Table requires 1-hour reporting. The reporting period for EOP-004-2 should be consistent with OE-417.
Response: The DSR SDT thanks you for your comment. The DSR SDT has increased almost all reporting timeframe to 24 hours. Also, the fuel supply emergency has been removed from Attachment 1. Reporting period was chosen to meet NERC needs, you may have more restrictive periods for OE-417, but that is outside the jurisdiction of the DSR SDT.		
Independent Electricity System Operator	No	For the purpose of developing and updating an Impact Event Operating Plan, there should not be any requirements that fall into the Long-term planning horizon. As the name implies, the plan is used in the operating time frame. And consistent with other plans such as system restoration plan which needs to be updated and tested annually, most of the Time Horizons in that standard (EOP-005-2) are either Operations Planning or Real-time Operations. We suggest the Time Horizon for R1, R3 and R4 be changed to Operations Planning.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R2, and R5 has become R2 with a time horizon of Operations Planning, which is defined as 'follow-up evaluations and reporting of real time operations'. R4 has been deleted and the time horizon for R1 and R3 have been changed to Operations Planning		

ISO New England, Inc	No	For the purpose of developing and updating an Impact Event Operating Plan, there should not be any requirements that fall into the Long-term planning horizon. As the name implies, the plan is used in the operating time frame. And consistent with other plans such as system restoration plan which needs to be updated and tested annually, most of the Time Horizons in that standard (EOP-005-2) are either Operations Planning or Real-time Operations. We suggest the Time Horizon for R1, R3 and R4 be changed to Operations Planning. The Time Horizon for R2 and R5 should be changed to Operations Assessment since they both deal with after the fact reporting.
Response: The DSR SDT thanks you for your comment. The DSR SDT has deleted R2, and R5 has become R2 with a time horizon of Operations Planning, which is defined as 'follow-up evaluations and reporting of real time operations'. R4 has been deleted and the time horizon for R1 and R3 have been changed to Operations Planning		
ExxonMobil Research and Engineering	No	VRFs, VSLs, and THs ideally should be based on the impact event type; alternatively a low VRF seems more appropriate for this requirements of this standard.
Response: The DSR SDT thanks you for your comment. With the revised standard, there are now three requirements. Requirement R1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment 1. This is procedural in nature and justifies a "lower" VRF. This requirement is administrative in nature and deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program. The two remaining requirements in EOP-004-2 are to report events based on the specifics in Attachment 1 (R2) and to test the communications protocol of the Operating Plan once per year (R3). Requirement R2 specifies that an entity is responsible for reporting events in accordance with the Operating Plan based on Attachment 1. Requirement R3 is insurance to make sure that an entity can communicate information about events. Requirement R2 specifies that the responsible entity must report an event to the appropriate entities. Some of these events are dealing with potential sabotage events. Part of the reason to report these types of events is to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events and the approved VRFs for each of the requirements is "medium." The VRFs for EOP-004-2 comport with the existing approved VRFs for both EOP-004 and CIP-001. The DSR SDT believe the VSLs and revised time horizons appropriately align.		
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	No	Why shorten the normal process?
Response: The DSR SDT thanks you for your comment. The DSR SDT has revised most of the reporting timelines 24 hours.		

Indeck Energy Services	No	These requirements have no time horizon. There about history and not about the future.
Response: The DSR SDT thanks you for your comment. All NERC standards must have a time horizon associated with each requirement. Time horizons are used as a factor in determining size of a sanction.		
American Municipal Power	No	
USACE	No	
Pepco Holdings Inc and Affiliates	Yes	However, do they line up with the corresponding real time reporting procedures as mentioned above, #13 and #14?
Response: The DSR DT thanks you for your comment. Please see responses to comments #13 and #14. Since the time for reporting impact events is no more than 24 hours, the time horizon has been revised to Operations Planning.		
Midwest Reliability Organization	Yes	
PPL Supply	Yes	
Dominion	Yes	
FirstEnergy	Yes	
Southern Company	Yes	
SRP	Yes	
City of Tallahassee (TAL)	Yes	
New Harquahala Generating Co.	Yes

American Transmission Company	Yes	
Ingleside Cogeneration LP	Yes	
Duke Energy	Yes	

Georgia System Operations Corporation	Yes	None.

16. Do you agree with the proposed Implementation Plan for EOP-004-2? If not, please explain why not and if possible, provide an alternative that would be acceptable to you.

Summary Consideration: The majority of commenters agreed with the Implementation Plan. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with. Consequently the effective date remains as first calendar day of the third calendar quarter following the regulatory approval/BOT adoption as applicable.

Organization	Yes or No	Question 16 Comment
Pepco Holdings Inc and Affiliates	No	The proposed time line is too short. It is easy to revise procedures. However developing training and integrating the training into the schedule takes time. Shorter time frame takes away adequate time to integrate into the training plan and disrupts operator schedules. Since notifications already exist and after the fact reporting does not impact BES reliability, why the need to expedite? There are many other training activities that must be coordinated with this.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
FirstEnergy	No	We believe the previous proposal for a 12 month implementation was more appropriate and suggest the team revert back to that timeframe.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
Southern Company	No	The implementation time should be 12 months after approval regardless of the elapsed time taken to get the standard approved.

Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
Exelon	No	The DSR SDT reduced the implementation from one year to between six and nine months based on the revised standard requirements. Exelon disagrees with the proposed shortened implementation timeframe. The current revision to EOP-004 still requires an entity to generate, implement and provide any necessary training for the "Impact Event Operating Plan" by a registered entity. Commenters previously supported a one year minimum; but the requirements for implementation have not changed measurably - six to nine months is not adequate to implement as written.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
SDG&E	No	SDG&E recommends a 9 month minimum timeframe for implementation.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
United Illuminating Co	No	The SDT should be specific that on the effective date an Entity will have the Operating documented and approved. The SDT should be specific that the first simulation is required to occur 15 months following the effective date. The SDT should be specific that the first annual review shall occur with in 15 months after the effective date.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
American Electric Power	No	With the scope of applicable functions expanding, more time will be required to develop broader processes and training. This will need to be extended for 18 months to get the process implemented and everyone trained.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
CenterPoint Energy	No	CenterPoint Energy prefers the previously accepted timeline of 1 year.

Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
Georgia System Operations Corporation	No	There is nothing about the revisions that were made to the requirements that shortens the time needed by the industry to get prepared for this revision. The removal of requirements for NERC does not shorten the requirements for the industry. Eighteen months (or 12 months minimum) should be alloted to prepare for this revision.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
Brazos Electric Power Cooperative	No	A one year implementation is needed to develop and implement formal documents to meet requirements.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	No	The implementation Plan was to move up the timeline and we do not see why this needs to be pushed forward on a shortened timeline. It should remain at the one year implementation schedule especially if annual exercises are not removed from the standard requirements as this take some time to prepare.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
ExxonMobil Research and Engineering		Recommend 4th calendar quarter instead of 3rd.
Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
Consumers Energy	No	
Dominion	Yes	Dominion agrees with the Implementation Plan; however, notes that the title for EOP-004-2 is inconsistent with the actual proposed standard.

Response: The DSR SDT thanks you for your comment. The DSR SDT believe the revisions made as part of this comment period have made the standard easier to implement. This latest revision more closely aligns with existing EOP-004 requirements, which entities are already complaint with.		
Farmington Electric Utility System	Yes	Nine months would be preferred
Response: The DSR SDT thanks you for your comment. The majority of stakeholders agree with the proposed implementation plan and it will remain unchanged.		
Northeast Power Coordinating Council	Yes	
Bonneville Power Administration	Yes

17. If you have any other comments you have not already provided in response to the questions above, please provide them here.

Summary Consideration: The majority of comments received relate to Attachment 1 and the Flowchart in the background section. The DSR SDT has made conforming revisions to each based on the comments received. The Flowchart waqs updated to remove references to sabotage and replaced with "Criminal act invoking federal jurisdiction". In response to the comments received, the SDT has made numerous enhancements to Attachment 1. These revisions include:

- **Added new column "Submit Attachment 2 or DOE OE-417 Report to:" which references Part 1.3 and provide the time required to submit the report.**
- **Combined Parts A and B into one table and reorganized it so that the events are listed in order of reporting times (either one hour or 24 hours)**
- **Removed references to "Impact Event" and replaced with the specific language for the event type in the "Entity with Reporting Responsibility". For example, replaced "Impact Event" with "automatic load shedding".**

The ERO and the RE were added as applicable entities to reflect CIP-002 applicability to this standard.

Organization	Yes or No	Question 17 Comment
Georgia Transmission Corporation & Oglethorpe Power Corporation		In the discussion and related flowchart described as "A Reporting Process Solution - EOP-004," the discussion suggests that Industry should notify the state law enforcement agency and then allow the state agency to coordinate with local law enforcement. It has been our experience that we receive very good response from local law enforcement and they have existing processes to notify state or federal agencies as necessary. It appears the recommendation is to bypass the local law enforcement, but it is not clear that representatives from state or local law enforcement were included in this discussion (see proposal discussed with "FBI, FERC Staff, NERC Standards Project Coordinator and SDT Chair"). It would be helpful to see some additional clarification to understand why the state agency was chosen over local or federal agencies. Finally, we would like to express our gratitude to the DSR SDT for their hard work in making improvements to the NERC standards for event reporting.

Organization	Yes or No	Question 17 Comment
Response: The DSR DT thanks you for your comment. The Flowchart has been updated. The DSR SDT has reviewed all comments and believes it is the responsibility of the Reporting Entity to contact the appropriate law enforcement officials.		
Bonneville Power Administration		Work needed on Part A Damage or Destruction of BES equipment. The Note 1 is OK, but the Threshold doesn't match well. If a PCB is damaged by lightning or an earthquake, Note 1 (human action) doesn't require Reporting (proper interpretation), but the Threshold still requires "equipment damage."
Response: The DSR DT thanks you for your comment. Attachment 1 has been updated concerning Destruction of BES equipment and the associated footnote has been revised.		
Midwest Reliability Organization		On the Impact Reporting Form, number 7,8,9,10, and 11 have an astrict (*) but nothing describes what the astrict means. Recommend a foot note be added to state: * If applicable to the reported Impact Event.
Response: The DSR DT thanks you for your comment. Attachment 1, Part B has been updated to reflect these noted changes.		
Western Electricity Coordinating Council		Actual Reliability Impact Table comments: Note that per the NERC glossary "Energy Emergency" only is defined for an LSE. Energy Emergency is the precursor term in the first three lines. Thus logically an LSE is the only entity which would be initiating the event and responsible for reporting for first three items. We don't believe that is the intent.We suggest you consider just eliminating ?Energy Emergency? and going with:? Public appeal for load reduction? system-wide voltage reduction? manual firm load sheddingFor Loss of Off site power at Nuc Station is reporting really expected of each of the entities listed? (lots of reports) We suggest you consider just the Nuclear GOP and perhaps the associated TOP. Perhaps you could use the CIP approach as in the next two rows and say Applicable GOP and Transmission Entities under NUC-001-2Potential Reliability Impact Table Comments:For Fuel Supply Emergency, Forced Intrusion, Risk to BES Equipment, Cyber Security Incident where owner/operator are both listed (GO/GOP or TO/TOP) could consider perhaps reporting to be assigned to only one rather than both.
Response: The DSR DT thanks you for your comment. The DSR SDT has removed the use of "Energy Emergency" and has updated Loss of offsite power to a nuclear generating plant within Attachment 1. Fuel Supply emergency has been removed from Attachment 1 per comments received. The entire Attachment 1 has been updated per comments received.		
Pacific Northwest Small Public Power Utility Comment Group		All five requirements refer to Attachment 1 Part A either directly, or indirectly by referring to R1 plans. Attachment 1 Part A, though, only provides the thresholds required for reporting (R5). No thresholds are provided for planning (R1) or the requirements referencing the plan (R2-R4). Strictly interpreted, an entity would be required to plan for any amount of firm load loss exceeding 15 minutes (for example), implement the

Organization	Yes or No	Question 17 Comment
		plan for any amount and then report only those events that exceeded the applicable 200 or 300 MW level. An entity that had a peak load of less than 200 MW would still need to meet R1-R4 regarding load loss. We believe the SDT intended to use common thresholds for all the requirements. Suggest relabeling the Attachment 1 Part A column header from ?Threshold for Reporting? to ?Threshold.?We also fail to see how an entity?s size in MWh affects the threshold for reporting firm load loss.
Response: The DSR DT thanks you for your comment. The DSR SDT has revised each Requirement and Attachment 1. There are other events within Attachment 1 that a responsible entity will be required to report.		
Dominion		The following comments are provided on the Reporting Hierarchy for Impact Events EOP-004-2: 1) A reference to sabotage still exists in a ?decision block?; 2) The ?entry block? only specifies ?actual Impact Events? and does not address ?potential?; 3) Hierarchy is misspelled in the title.Attachment 2: Impact Event Reporting Form; in questions 7, 8, 9, 10, 11 what is the purpose of the *(asterisk) behind each Task that is named?
Response: The DSR DT thanks you for your comment. The Flowchart has been updated based on comments received. Attachment 2 has been updated to reflect comments received.		
Pepco Holdings Inc and Affiliates		IRO-000-1, Sec D1.5 and TOP-007, Sec D1.1 there are ?after the fact? reporting requirements for IROL violations. Since IROL violations are included in this standard, should those standards be modified?Should the standard include a specific statement that this standard deals only with after the fact and other standards deal with real time reporting?Since this standard deals with after the fact reporting, consideration should be given to extending the time to report as defined in Attachment 1. One hour does not seem to be reasonable.
Response: The DSR DT thanks you for your comment. The DSR SDT has reviewed TOP-007 and note that the 72 hour issue is not defined within a Requirement. This issue has been forwarded to the "NERC Issues Data base." Attachment 1 has been updated to reflect this event to 24 hours per comments received.		
SPP Standards Review Group		In Attachment 2 just before the table, the statement is made that ?NERC will accept the DOE OE-417 form in lieu of this form if the entity is required to submit an OE-417 report.? But the last sentence in the Guideline and Technical Basis white paper, it is stated that ? For example, if the NERC Report duplicates information from the DOE form, the DOE report may be included or attached to the NERC report, in lieu of entering that information on the NERC report.? These are in conflict with each other. Which is correct? We prefer the former over the latter.In Attachment 2 in Tasks 7-11 an asterisk appears in those tasks. To what does this asterisk refer?

Organization	Yes or No	Question 17 Comment
Response: The DSR DT thanks you for your comment. The DSR SDT's White Paper was the initial road map for the SDT to follow. The DSR SDT has proposed allowing entities to use the DOE Form OE-417 to report events listed within Attachment 1.		
Midwest ISO Standards Collaborators		We believe the reporting time lines are too aggressive for some events. Reporting events within an hour is not reasonable as an entity may still be dealing with the event. This will be particularly difficult when support personnel are not present such as during nights, holidays, and weekends.
Response: The DSR DT thanks you for your comment. Attachment 1 has been updated per comments received.		
FirstEnergy		FE offers the following additional comments and suggestions: 1. In the Background section of EOP-004-2, on page 6 under Stakeholders in the Reporting Process, we suggest adding ?Regional Entity? and ?Nuclear Regulatory Commission?. 2. The DSR SDT makes reference to comments that Exelon provided that suggested adopting the NRC definition of "sabotage." We feel the comment made by Exelon in their previous submittal was to ensure that the DSR SDT included the Nuclear Regulatory Commission (NRC) as a key Stakeholder in the Reporting Process and FE agrees with this suggestion. Nuclear generator operators already have specific regulatory requirements to notify the NRC for certain notifications to other governmental agencies in accordance with 10 CFR 50.72(b)(s)(xi). We ask that the DSR SDT contact the NRC about this project to ensure that existing communication and reporting that a licensee is required to perform in response to a radiological sabotage event (as defined by the NRC) or any incident that has impacted or has the potential to impact the BES does not create either duplicate reporting, conflicting reporting thresholds or confusion on the part of the nuclear generator operator. We believe this is a similar situation as what was recently resolved between NERC and the NRC concerning the applicability of CIPs 002 ? 009 for nuclear plants. Each nuclear generating site licensee must have an NRC approved Security Plan that outlines applicable notifications to the FBI. Depending on the severity of the security event, the nuclear licensee may initiate the Emergency Plan (E-Plan). We ask that the proposed "Reporting Hierarchy for Impact Event EOP-004-2," flow chart be coordinated with the NRC to ensure it does not conflict with existing expected NRC requirements and protocol associated with site specific Emergency and Security Plans.
Response: The DSR DT thanks you for your comment. 1. We have added these as requested. 2. The NRC was added to the list on page 6 as requested. The events in Attachment 1 that are applicable to nuclear plants are: Generation loss (>1,000 MW WECC, >2,000 MW Elsewhere); Destruction of BES Equipment; Damage or destruction of Critical Asset per CIP-002; Damage or destruction of a Critical Cyber Asset per CIP-002; Forced Intrusion; Risk to BES Equipment; and Detection of a Reportable Cyber Security incident. Two of these events are addressed in the situation that you mention above (CIP-002). The other events should be reported to both the NRC and ERO if they occur. These are considered to be sabotage type events.		

Organization	Yes or No	Question 17 Comment
SERC OC Standards Review Group		In Attachment 1, the reporting timeline should be no less than the end of the next business day for after-the-fact reporting of events. If reporting in a time frame less than this is required for reliability, the groups or organizations receiving the reports should be included in the functional model. The emphasis should be on giving the operators the time to respond to events and not to reporting requirements.?The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.?
Response: The DSR DT thanks you for your comment. Attachment 1 has been updated to reflect comments received. Many of the reporting time frames have been revised to 24 hours.		
PJM Interconnection LLC		In the Compliance Enforcement Authority Section on Page 11, the second bullet says ?If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement?. We are not sure what this exactly implies or means. Additional clarification is required.
Response: The DSR DT thanks you for your comment. The statement that PJM is referring to applies to Regional Entities that also have a functional model obligation.		
Southern Company		Need guidance for incorporating disturbance reporting that is in CIP-008.
Response: The DSR DT thanks you for your comment. EOP-004-2 is the reporting vehicle for CIP-008. CIP-008-4, Requirement 1, Part 1,3 will be retired upon approval of EOP-004-2.		
We Energies		Attachment 2: What do the asterisks refer to? I didn?t see a comment or description related to them.#7 & #10: What is ?tripped?? Automatic or manual or both.#13: This report has no Part 1.Flowchart: By the flowchart, the only time an OE-417 is filed is when I do not need to contact Law Enforcement. The Reporting Hierarchy flow chart should be modified. In the lower right corner it indicates that if sabotage is not confirmed, the state law enforcement agency investigates. Law enforcement agencies will not investigate an incident that is not a crime. Note too that state law enforcement agencies do not even investigate these kinds of events unless and until requested by local law enforcement. The local law enforcement agency always has initial jurisdiction until surrendered or seized by a superior agency?s authority. Evidence Retention is incomplete. From the NERC Standards Process Manual: ?Evidence Retention: Identification, for each requirement in the standard, of the entity that is responsible for retaining evidence to demonstrate compliance, and the duration for retention of that evidence.?

Organization	Yes or No	Question 17 Comment
Response: The DSR DT thanks you for your comment. Attachment 1 and Attachment 2 have been updated per comments received. The Flowchart has been updated per your comment.		
Compliance & Responsiblity Organization		Nuclear power plants (a need for a revised approach)With respect to sabotage, damage or destruction of BES equipment, damage or destruction of a Critical Asset, damage or destruction of a Critical Cyber Asset, forced intrusion, etc., nuclear plants already have a responsibility to report the events to the FBI and the Nuclear Regulatory Commission (NRC). Performing another report to NERC, with potentially different requirements, within 60 minutes of an event does not seem necessary or practical. It would also be difficult, during an event, to report to external organizations, including but not limited to the Responsible Entities? Reliability Coordinator, NERC, Responsible Entities? Regional Entity, Law Enforcement, and Governmental or Provincial Agencies when operations personnel are pre-occupied with an abnormal or emergency situation. Further, nuclear plants already have an obligation to report the loss of off site power to NRC. Similarly, now that cyber assets will be regulated by the NRC, these reporting requirements should not be applicable to a nuclear power plant. Thus, there is a need to exempt nuclear power plants from these requirements or provide more flexibility to such plants, given its pre-existing NRC reporting requirements.Attachment 1.There is no explanation for why a report must be submitted within one hour of a event. As stated with respect to nuclear, an entity should not be prioritizing between stabilizing the system and reporting. One approach that would help balance conflicting priorities is to start the time frame after ?all is clear.? Another approach could involve the use of target times, with an allowance for exceptions during emergencies or situations in which it is impracticable. Another alternative is to have two times: an earlier ?target reporting time? and second later ?mandatory reporting time.? Further, the current wording suggests that a generator owner or generator operator will be able to determine the impact or potential impact on the BES. This is not realistic, given that impacts to the BES are generally only understood at a transmission operator or reliability coordinator level. Thus, the concept of relying on generators to determine impacts on the BES needs to be eliminated.Also, as written, for a generator, Attachment 1 appears to require a report when a lighting arrestor fails at a Critical Asset. NextEra cannot see any justification for reporting such an event, and this is another reason why Attachment 1 needs more review and revision prior to the next draft of EOP-004-2. This one reason why NextEra has suggested a materiality test for reporting in a definition of Attempted or Actual Sabotage.
Response: The DSR DT thanks you for your comment. Attachment 1 has been updated per comments received. Any NRC requirements or comments fall outside the scope of this project.		
Exelon		The DSR SDT makes reference to comments that were previously provided that suggested adopting the NRC definition of "sabotage." Respectfully, this commenter believes the DSR SDT did not understand the intent of the original comment. The comment made by Exelon in the October 15, 2009 submittal was to ensure that the DSR SDT made an effort to include the Nuclear Regulatory Commission (NRC) as a key Stakeholder in

Organization	Yes or No	Question 17 Comment
		the Reporting Process and to consider utilizing existing reporting requirements currently required by the NRC for each nuclear generator operator.Depending on the event, a nuclear generator operator (NRC licensee) also has specific regulatory requirements to notify the NRC for certain notifications to other governmental agencies in accordance with 10 CFR 50.72, "Immediate notification requirements for operating nuclear power reactors," paragraph (b)(2)(xi).The one hour notification requirement for an intrusion event would also meet an emergency event classification at a nuclear power plant. If an operations crew is responsible for the one hour notification and if separate notifications must be completed within the Emergency Plan event response, then an evaluation in accordance with 10 CFR 50.54, "Conditions of licensees," paragraph (q), would need to be performed to ensure that this notification requirement would not impact the ability to implement the Emergency Plan.At a minimum the DSR SDT should communicate this project to the NRC to ensure that existing communication and reporting that a licensee is required to perform in response to a radiological sabotage event (as defined by the NRC) or any incident that has impacted or has the potential to impact the BES does not create either duplicate reporting, conflicting reporting thresholds or confusion on the part of the nuclear generator operator. Note that existing reporting/communication requirements are already established with the FBI, DHS, NORAD, FAA, State Police, LLEA and the NRC depending on the event. There are existing nuclear plant specific memorandums of understanding between the NRC and the FBI and each nuclear generating site licensee must have a NRC approved Security Plan that outlines applicable notifications to the FBI. Depending on the severity of the security event, the nuclear licensee may initiate the Emergency Plan. The proposed "Reporting Hierarchy for Impact Event EOP-004-2," needs to be communicated and coordinated with the NRC to ensure that the flow chart does not conflict with existing expected NRC requirements and protocol associated with site specific Emergency and Security Plans. Propose allowing for verbal reporting via telephone, for 1 hr. reporting with a follow up using the forms.With the revised standard EOP-004-2 it eliminates the #8; loss of electric service >= 50K, however, that requirement is still required for the DOE-OE-417 form. The question is do we still have to send it to NERC / Region if NERC/ Region does not specifically still have that as a requirement? Also, with that requirement, on the current EOP-004-1 it says that schedule 1 has to be filled out within 1 hour? This doe not coincide with DOE-OE-417 form. The bottom line, it looks like there is inconsistency as to what is reportable per EOP-004-2 and DOE-OE-417 form, some of the items are redundant, some are not, but better guidance is needs as to which form to use when. The SDT should have a Webaniar with the industry to create an understanding as to who is responsible to report what and at what time.
Response: The DSR DT thanks you for your comment. The NRC issues falls outside the scope of this project		
City of Tallahassee (TAL)		Attachment 2 (Impact Event Reporting Form) items 8, 9, 10, and 11 have an asterisk but no identification as to what the asterisks refer to.
Response: The DSR DT thanks you for your comment. The asterisk was addressed at the bottom of the second page of the form. Attachment 2 has been		

Organization	Yes or No	Question 17 Comment
updated to align with the types of events that are to be reported.		
APX Power Markets		The reporting of Impact Events needs to be clear spelled out and if moving some of that to State Agencies it needs to be consistent in all States at the same time and which State it should be reported to. We have a 24-hour Desk in one state that handles facilites in many other States. If there is an Impact Event that needs to be reported, where is that report sent to. The State the facility resides in or the State where our 24-hour Desk resides in.
Response: The DSR DT thanks you for your comment. Attachment 1 has been updated per comments received and a new column has been added to reflect who the impacted entity is required to report to.		
Arkansas Electric Cooperative Corporation		We appreciate the added context through the use of extended background information, rationale statements, and corresponding guideline and hope this context will remain in line with the Standards through the ballot and approval process. We have a few suggestions and questions related to this context. Our comments for this question relate to the contextual information. First of all, in the diagram on page 8, we suggest the appropriate question to ask is "Is event associated with potential criminal activity?" rather than "Report to Law Enforcement?? Also, it would be helpful to make clear the communication flow associated with the State Agency is the responsibility of the State Agency and not the Responsible Entity. This could be shown with a different colored background that calls this process out separately. In the rationale box for R3, it states "The DSR SDT intends?? We propose this should read similar to "The objective of this requirement is?? Overall, we suggest the SDT review the guidance document to make sure any changes made to the requirements are consistent with the guidance.
Response: The DSR DT thanks you for your comment. The flowchart has been updated per comments received. The Rationale box will be removed upon this Standard being Filled for approval.		
American Electric Power		We still do not agree that LSE, TSP and IA should be included in the applicability of this standard. Having processes to report to local or federal law enforcement agencies is ?legislating the obvious?. The focus on this standard should only be on Impact Event reporting to reliability entities.
Response: The DSR DT thanks you for your comment. Attachment 1 has been reviewed and updated. The LSE, TSP, and IA are required under the CIP Standards and Attachment 1 is based on reporting per the CIP requirements.		
Consumers Energy		1. We appreciate the aggregation of redundant standards on this subject, but have some concerns about the content of the aggregated standard as listed below and in reference to previous questions on this comment form.2. It is not clear whether an event that meets OE-417 reporting criteria but is not defined within EOP-

Organization	Yes or No	Question 17 Comment
		004-2 is an Impact Event; for example, ?loss of 50,000 or more customers for 1 hour or more? is required to be reported to DOE as a OE-417 type 11 event but it is not clear whether EOP-004-2 requires that such events be also reported to NERC. The ?Reporting Hierarchy? flow chart seems to suggest that any OE-417 must still be filed with NERC/RE. If the flow chart is not consistent with the intent of the Requirements, it must be clarified.3. NERC implies active involvement of law enforcement. This assumes that law enforcement has the resources to be involved in an Impact Event investigation and fulfill the standard reporting requirements. This is an unrealistic expectation as we have experienced first-hand, a lack of response by law enforcement agencies as their resources shrink due to economic issues. Additionally, NERC is asking that we place credence in law enforcement, on our behalf, to make a definitive decision about the reporting of events. Refer to page 6 of EOP-004-2 under ?Law Enforcement Reporting?: ??Entities rely upon law enforcement agencies to respond and investigate those Impact Events which have the potential of wider area affect?? In many cases, the internal security function must work with system operations personnel to thoroughly understand the system and the effects of certain events. It is unrealistic to think law enforcement would be in a position to make BES decisions within the timeframe given without having system operations experience. It is our experience that external agencies do not understand the integration / inter-connectivity, resiliency, or implications of our energy infrastructure.4. Within Michigan, a ?Michigan Fusion Center: Michigan Intelligence Operations Center (MIOC)? has been established. - Today, we share information such as substation issues and identity theft (not internal issues) to the MIOC. The MIOC is trending incidents on critical infrastructure assets and sectors around the state. The private sector is encouraged to report to the Fusion Center. If NERC is collecting this type of information for future studies and trending / analysis, they should coordinate with each state?s Fusion Center.
Response: The DSR DT thanks you for your comment**.** The DSR SDT has reviewed and updated the Requirements per the comments received. Attachment 1 has been updated and the team has an additional column to reflect where a report should be sent. EOP-004-2 does not define what "law enforcement"" is and that will be left up to each entity.		
Ameren		The following is a list of our greatest concerns. (1) We are concerned about the lack of definitions and use of critical non-capitalized terms. As an example, there is a reportable Impact Event if there is a +/- 10% Voltage Deviation for 15 minutes or more on BES Facilities. As a first example, why is the term Voltage Deviation capitalized when it is not in the NERC Glossary and not proposed to be added? Where is the deviation measured - at any BES metering device? What is the deviation to be reported - the nominal voltage? the high-side of the Voltage Schedule? the low-side of the Voltage Schedule? the generator terminals? when a unit is starting up? All of these are possible interpretations, but < 1% of them would ever result in a Cascading outage - which is the reliability objective of this Standard. A second example is a Generation loss. The threshold for reporting is 2,000 MW, or more, for the Eastern or Western Interconnection. Is this simultaneous loss of capacity over the entire Interconnection? Or, cumulative loss within 1 hour? Or, cumulative loss within 24 hours? How many individual GOPs have responsibility for > 2,000 MW? It seems

Organization	Yes or No	Question 17 Comment
		this would more effectively apply only to an RC and/or BA. The likelihood that one GOP would lose that much generation at once is probably remote. A third example would be the damage or destruction of BES equipment event. The term "equipment" was left lower case with a footnote explanation that includes "?due to intentional or unintentional human action?." This is likely to require the determination of intent by the human involved, which will almost certainly impossible to determine within the 1 hour reporting time. Also, what is the definition of the terms "damage" and "destruction"? Once again, if the reliability intent is to ONLY report Events that have a likely chance of leading to Cascading, this will greatly reduce the potentially enormous reporting burden. that could result without this type of clarification. (2) Without a very thorough understanding of the definitions of the terms requiring reporting, the 1 hour reporting constraint on most events will likely require that we frequently overreport events to minimize any chance of non-compliance. A webinar explaining expected reporting requirements would very useful and valuable. It is also unclear why so many Impact Events require such a short reporting time period. There will almost certainly be many times at 2:00 AM on a weekend when experts and the appropriate personnel will be available to quickly analyze an event and decide, within 1 hour, if a report is necessary. (3) Have all the new Impact Event reporting requirements been checked against reporting requirements from other Standards? For example, the Voltage Deviation Event would appear to potentially overlap/conflict with instructions from a TOP for VAR-002 compliance. Since VAR-002-2 is now in draft, has the SDT worked with that Team to determine if the requirements dovetail?
Response: The DSR DT thanks you for your comment**.** The DSR SDT has updated the Requirements within EOP-004-2 and both Attachments 1 and 2 per comments received. Many of the reporting time frames have been extended to 24 hours per comments received. Voltage deviation is no longer capitalized. All event types are not intended to be new defined terms for the NERC Glossary and have been revised to lower case words. The reporting of voltage deviations is no longer applicable to the GOP which obviates the need to coordinate with the VAR-002 standard drafting team.		
ISO New England, Inc		Under the ?Law Enforcement Reporting? it is stated ?The Standard is intended to reduce the risk of Cascading involving Impact Events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES.? We question whether a reporting standard can ?reduce the risk of cascading? and wonder if the reference to the threat ?around them? refers to law enforcement? We would expect that the appropriate operating personnel are the only entities that would be able to mitigate the potential risk to the BES.As it currently stands there is a potential duplication between the reporting requirements under EOP-004-2 (i.e. Attachment 2 Form) and the ERO Event Analysis Process that is undergoing field test (i.e. Event Report Form). This will result in entities (potentially multiple) reporting same event under two separate processes using two very similar forms. Is this the intent or will information requirements be coordinated further prior to adoption in order to meet the declared objective that the impact event reporting under EOP-004 be ?the starting vehicle for any required Event Analysis within the NERC Event Analysis Program?

Organization	Yes or No	Question 17 Comment
Response: The DSR DT thanks you for your comment. The Background section was provided to assist entities in understanding the DSR SDT's process for updating CIP-001 and EOP-004, only.		
Calpine Corp		Focusing on reporting of actual disturbance events as listed in Attachment 1 based on potential or actual impact to the Bulk Electric System will provide maximum benefit to system reliability without adding needless levels of new documentation generated to demonstrate compliance. Absent significant evidence of systemic problems in the industry with past reporting attributable to causes other than a lack of clear guidance on the types events that require reporting, the proposed Standard should focus on the single issue of correct reporting, without attempting to micromanage how Entities internally manage such reporting.
Response: The DSR DT thanks you for your comment. The DSR SDT has updated the requirements andAttachments 1 and 2 per comments received.		
BGE		Please provide a Mapping Document which shows where the four CIP-001 requirements map to in the new EOP-004-2, and note if any of the CIP-001 requirements have been eliminated. A Mapping Document was provided during the first Comment Period, but not during the second Comment Period. A Mapping Document will be very helpful to companies in aligning standard owners in reviewing this proposal and in transitioning compliance programs when the revised standard is approved.
Response: The DSR DT thanks you for your comment. The DSR SDT has a current Mapping Document and it will be updated to reflect the changes that the DSR SDT has made to EOP-004-2. This Mapping document will be posted with the standard when it is posted for comment and ballot.		
CenterPoint Energy		CenterPoint Energy believes the flowchart found on page 8 identifying the reporting hierarchy for EOP-004 is helpful. CenterPoint Energy believes the DOE reporting items should also be included on the right side of the chart. Some of the issues with CIP-001 were a result of law enforcement?s preference and procedures for notification. Law enforcement?s preferences and procedures should be considered for this draft. (Reference: http://www.fbi.gov/contact-us/when)
• **Response:** The DSR DT thanks you for your comment. The DSR SDT has updated the flowchart and a current Mapping Document and it will be updated to reflect the changes that the DSR SDT has made to EOP-004-2. The background section of the standard provides guidance with respect to reporting events to law enforcement. For clarity, the DSR SDT has added the following sentence to the first paragraph under the heading "Law Enforcement Reporting": "These are the types of events that should be reported to law enforcement." The entire paragraph is: "The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting events. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact		

Organization	Yes or No	Question 17 Comment
a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES."		
PPL Electric Utilities		We thank the SDT for addressing so many Industry concerns with the 2010 draft of EOP-004-2. We feel the current draft version of EOP-004-2 is a significant improvement over current EOP-004-1 and CIP-001-1 standard and the previous draft. Thank you for your time.
Response: Thank you for your comment.		
Occidental Power Marketing		Occidental Power Marketing appreciates the extensive work accomplished by the SDT and their responsiveness to comments. Also, the presentation of this draft with its extensive explanation of the SDT's considerations during development of the draft were very helpful in preparing our comments.
Response: Thank you for your comment.		
Constellation Power Generation		CPG has the following comments regarding Attachment 2:?Generally, this attachment is inadequate for all events. The real-life experience with the recent SW cold snap demonstrated that the questions inadequately capture what may be of greatest concern in the situation. ?Question 4 ? this question is vague. It should be removed. ?Question 7 ? the role of generation in an event may not always be related to a trip. As experienced with the recent SW cold snap, this question may inadequately capture information relevant to the situation at hand. The drafting team should reassess how best to gather information relevant to the event and useful for evaluation.?Question 8 ? generation is not required to monitor frequency during events, so this would not be answered. This question also assumes that frequency had been impacted, which is not always the case (i.e., the plant could not come online). ?The asterisk on some questions in Attachment 2 is not defined.
Response: The DSR DT thanks you for your comment. The DSR SDT has updated the requirements and Attachments 1 and 2 per comments received. Attachment 2 has been streamlined to match the types of events that are to be reported. The purpose of this standard is to have events reported. Once reported, the events are included in the NERC Events Analysis Program for possible further investigation. The asterisk has been removed from Attachment 2.		
Georgia System Operations Corporation		Attachment 2: Impact Event Reporting Form-Instructions for filling out this form are needed.-Line 7, Generation tripped off-line: What is the asterisk for after this task and after the many others following? This should only be reported by a BA. Does generation ?tripped off-line? mean the same as generation ?lost??-Line 9, List of transmission facilities (lines, transformers, buses, etc.) tripped and locked-out: Does this means the same as BES Transmission Elements lost?-Line 10: The column headings in white text on lighter blue

Organization	Yes or No	Question 17 Comment
		background at the top do not seem to apply from this line on.-Line 11, Restoration Time: Restoration of what? Initial/Final clock time? Transmission? What about transmission? Generation/Demand?-Line 13, Identify the initial probable cause or known root cause of the actual or potential Impact Event if known at time of submittal of Part I of this report: ?At the time of submittal of Part I of this report??? Where is Part II? Did you mean Part A? Is Part B to be submitted at a different time?Background-Page 5, last sentence which is continued on page 6: This standard does not recognize the various ?versions? of companies in the industry. The standard is made applicable to a long list of registered entity types. In many cases, many of these entities are wrapped into one company. A company may be responsible for ?everything? in a geographic area. It may be almost every registered entity type with no other registered entities within its geographic area. There should be no conflicts or need for coordination with others for this company. Everything would be coordinated internally within that one company before being reported to NERC and no one else would be reporting to NERC.However, sometimes one company is only a LSE. When an LSE-only is having a LSE impact event, the LSE should report to some higher operating entity like its BA and should not report to NERC. Reporting should be done in a hierarchical manner within appropriate operating entities and then reported to NERC at the RC (or BA) level or as agreed among entities in any coordinated impact event reporting plans. The RC, BA, TOP, and LSE should not all be held accountable for reporting the same event.This standard does not deal exclusively with after-the-fact reporting. Some events deal with the condition of the system (risk of possible future events) or condition of an entity?s ability to operate (supplying fuel, covering load, etc.) or with a threat to the BES.-Page 6, Summary of Concepts: A single form may have been an objective but it is obviously not a concept being implemented by the standard. There are two forms.-Page 6, Law Enforcement Reporting: The object of the standard may be to prevent or reduce the risk of Cascading. Reporting system situations to appropriate operating entities who can take some mitigating action (e.g., a LSE reporting to its BA or a BA reporting to its RC) and reporting threats to law enforcement officials could prevent or reduce the risk of Cascading but reporting to NERC is unlikely to a do that. Reporting of most of the listed events to NERC does not meet the objective of this standard and should be removed from this standard. Such events should be reported to NERC through some other (than a Reliability Standard) requirement for reporting to NERC so that NERC can accomplish its mission of analyzing events. Analyzing events may lead to an understanding that could reduce the future risk of Cascading but not any impending risks.-Page 6, Stakeholders: What is ?Homeland Security ? State?? We know what the Department of Homeland Security and the State Department are but this term is not clear. -Page 6, ?State Regulators?, ?Local Law Enforcement?, and State Law Enforcement?: These are not proper nouns/names and are not defined in the NERC Glossary. They should not be capitalized.-Pages 7 & 8, Law enforcement: Is each entity required to determine procedures for reporting to law enforcement and work it out with the state law enforcement agency? Do the state law enforcement agencies know this? Or is there a pre-determine procedure that is already worked out with the state law enforcement agency that entities are to follow?

- **Response:** The DSR DT thanks you for your comment. The DSR SDT has updated the requirements and Attachments 1 and 2 per comments received.

Organization	Yes or No	Question 17 Comment
Attachment 2 has been streamlined to match the types of events that are to be reported. The purpose of this standard is to have events reported. Once reported, the events are included in the NERC Events Analysis Program for possible further investigation. The background section of the standard provides guidance with respect to reporting events to law enforcement. For clarity, the DSR SDT has added the following sentence to the first paragraph under the heading "Law Enforcement Reporting": "These are the types of events that should be reported to law enforcement." The entire paragraph is: "The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting events. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES."		
City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power		We like the option to use the OE_417 as the reporting form for these events.
Response: The DSR DT thanks you for your comment. EOP-004-2 allows entities to utilize the DOE Form OE-417 to report events.		
Indeck Energy Services		This revision seriously missed the mark.
Response: The DSR DT thanks you for your comment. The DSR SDT has updated the requirements and Attachments 1 and 2 per comments received.		
Progress Energy		Progress thanks the Standard Drafting Team for their efforts on this project.The BES definition is still being revised under ?Project 2010-17: Proposed Definition of Bulk Electric System.? ?BES equipment? is mentioned several times in this Standard. A better definition of BES is important to the effectiveness of this Standard and integral to entities ability to comply with the Standard requirements. In Attachment 2, on the Impact Event Reporting form, item 10 is ?Demand Tripped? and the categories include ?FIRM? and ?INTERRUPTIBLE.? It is unclear why interruptible load is included on the reporting form.
Response: The DSR DT thanks you for your comment. The definition of BES will apply to this standard after it is approved by stakeholders, the NERC BOT and FERC. The DSR SDT has updated the requirements, Attachments 1 and 2 per comments received. Attachment 2 has been streamlined to match the types of events that are to be reported. The purpose of this standard is to have events reported. Once reported, the events are included in the NERC Events Analysis Program for possible further investigation. Firm and Interruptible load have been removed from the list of reportable events in Attachment 1.		

Consideration of Comments

Disturbance and Sabotage Reporting (Project 2009-01)

The Disturbance and Sabotage Reporting Drafting Team thanks all commenters who submitted comments on the second formal posting for Project 2009-01—Disturbance and Sabotage Reporting. The standard was posted for a 45-day public comment period from October 28, 2011 through December 12, 2011 and included an initial ballot during the last 10 days of the comment period. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 76 sets of comments, including comments from approximately 171 different people from approximately 140 companies representing nine of the ten Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page:

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President of Standards and Training, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration

EOP-004-2 was posted for a 45-day formal comment period and initial ballot from October 28-December 12, 2011. The DSR SDT received comments from stakeholders to improve the readability and clarity of the requirements of the standard. The revisions that were made to the standard are summarized in the following paragraphs.

Purpose Statement

The DSR SDT revised the purpose statement to remove ambiguous language "with the potential to impact reliability". The Purpose statement now reads:

> "To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities."

[1] The appeals process is in the Standard Processes Manual
http://www.nerc.com/files/Appendix_3A_Standard_Processes_Manual_Rev%201_20110825.pdf

Operating Plan

Based on stakeholder comments, Requirement R1 was revised for clarity. Part 1.1 was revised to replace the word “identifying” with “recognizing” and Part 1.2 was eliminated. This also aligns the language of the standard with FERC Order 693, Paragraph 471.

> “(2) specify baseline requirements regarding what issues should be addressed in the **procedures for recognizing** {emphasis added} sabotage events and making personnel aware of such events;”

Requirement R1, Part 1.3 (now Part 1.2) was revised by eliminating the phrase “as appropriate” and adding language indicating that the Responsible Entity is to define its process for reporting and with whom to report events. Part 1.2 now reads:

> “1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity’s Reliability Coordinator; law enforcement governmental or provincial agencies.”

The SDT envisions that most entities will only need to slightly modify their existing CIP-001 Sabotage Reporting procedures to comply with the Operating Plan requirement in this proposed standard. As many of the features of both sabotage reporting procedures and the Operating Plan are substantially similar, the SDT feels that some information in the sabotage reporting procedures may need to updated and verified.

Operating Plan Review and Communications Testing

Requirement R1, Part 1.4 was removed and Requirement 1, Part, 1.5 was separated out as new Requirement 4. Requirement R4 was revised and is now R3. FERC Order 693, Paragraph 466 includes provisions for periodic review and update of the Operating Plan:

> “466. The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures.”

Requirement R3 requires an annual test of the communication portion of Requirement R1 while Requirement R4 requires an annual review of the Operating Plan.:

> "R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2."

> "R4. Each Responsible Entity shall conduct an annual review of the event reporting Operating Plan in Requirement R1."

The DSR SDT envisions that the annual test will include verification that communication information contained in the Operating Plan is correct. As an example, the annual update of the Operating Plan could include calling "others as defined in the Responsibility Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated. Note that there is no requirement to test the reporting of events to the Electric Reliability Organization and the Responsible Entity's Reliability Coordinator.

Operating Plan Implementation

Most stakeholders indicated that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to:

> "R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."

Reporting Timelines

The DSR SDT received many comments regarding the various entries of Attachment 1. Many commenters questioned the reliability benefit of reporting events to the ERO within 1 hour. Most of the events with a one hour reporting requirement were revised to 24 hours based on stakeholder comments; those types of events are currently required to be reported within 24 hours in the existing mandatory and enforceable standards. The only remaining type of event that is to be reported within one hour is "A reportable Cyber Security Incident" as it is required by CIP-008 and FERC Order 706, Paragraph 673:

"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"

The table was reformatted to separate one hour reporting and 24 hour reporting. The last column of the table was also deleted and the information contained in the table was transferred to the sentence above each table. These sentences are:

"One Hour Reporting: Submit Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within one hour of recognition of the event."

"Twenty-four Hour Reporting: Submit Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within twenty-four hour of recognition of the event."

Note that the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.

Cyber-Related Events

The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1. Stakeholders pointed out these events are adequately addressed through the CIP-008 and "Damage or Destruction of a Facility "reporting thresholds. CIP-008 addresses Cyber Security Incidents which are defined as:

"Any malicious act or suspicious event that:

- Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,
- Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset."

A Critical Asset is defined as:

"Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System."

Since there is an existing event category for damage or destruction of Facilities, having a separate event for "Damage or Destruction of a Critical Asset" is unnecessary.

Damage or Destruction

The event for “Destruction of BES equipment” has been revised to “Damage or destruction of a Facility”. The threshold for reporting information was expanded for clarity:

> “Damage or destruction of a Facility that: affects an IROL
> OR
> Results in the need for actions to avoid an Adverse Reliability Impact
> OR
> Results from intentional human action.”

Facility Definition

The DSR SDT used the defined term “Facility” to add clarity for this event as well as other events in Attachment 1. A Facility is defined as:

> “A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)”

The DSR SDT did not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.

Physical Threats

Several stakeholders expressed concerns relating to the “Forced Intrusion” event. Their concerns related to ambiguous language in the footnote. The SDR SDT discussed this event as well as the event “Risk to BES equipment”. These two event types had overlap in the perceived reporting requirements. The DSR SDT removed “Forced Intrusion” as a category and the “Risk to BES equipment” event was revised to “Any physical threat that could impact the operability of a Facility”.

Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported.

The footnote regarding this event type was expanded to provide additional guidance in:

> "Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also, report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility."

Use of DOE OE-417

The DSR SDT received many comments requesting consistency with DOE OE-417 thresholds and timelines. These items, as well as, the Events Analysis Working Group's (EAWG) requirements were considered in creating Attachment 1, but differences remain for the following reasons:

- EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'
- OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America
- NERC has no control over the criteria in OE-417, which can change at any time
- Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary

In an effort to minimize administrative burden, US entities may use the OE-417 form rather than Attachment 2 to report under EOP-004. The SDT was informed by the DOE of its new online process coming later this year. In this process, entities may be able to record email addresses associated with their Operating Plan so that when the report is submitted to DOE, it will automatically be forwarded to the posted email addresses, thereby eliminating some administrative burden to forward the report to multiple organizations and agencies.

Miscellaneous

Other minor edits were made to Attachment 1. Several words were capitalized but not defined terms. The DSR SDT did not intend for these terms to be capitalized (defined terms) and these words were reverted to lower case. The event type "Loss of monitoring or all voice communication capability" was divided into two separate events as "Loss of monitoring capability" and "Loss of all voice communication capability".

Attachment 2 was updated to reflect the revisions to Attachment 1. The reference to "actual or potential events" was removed. Also, the event type of "other" and "fuel supply emergency" was removed as well.

It was noted that 'Transmission Facilities' is not a defined term in the NERC Glossary. Transmission and Facilities are separately defined terms. The combination of these two definitions are what the DSR SDT has based the applicability of "Transmission Facilities" in Attachment 1.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. The DSR SDT has revised EOP-004-2 to remove the training requirement R4 based on stakeholder comments from the second formal posting. Do you agree this revision? If not, please explain in the comment area below.

Summary Consideration: As a result of the industry comments, the SDT has further modified the standard as follows:

- Requirement R1, Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom events are communicated.

- Combined relevant parts of Requirement R1, Parts 1.4, 1.5 and Requirement R4 into Requirement 1, Part 1.3.

- Deleted the requirement for drills or exercises

- Clarified that only Registered Entities conduct annual tests of the communication process outlined in Requirement 1, Part 1.2

- Changed the review of the Operating Plan to 'annually'

The DSR SDT envisions the testing under Requirement R1, Part 1.3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsibility Entity's Operating Plan" (see Part 1.2) to verify their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.

Despite some industry opposition, both the periodic review of the Operating Plan and the testing requirements were maintained to meet the intent of FERC Order 693, Paragraph 466:

"The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."

Organization	Yes or No	Question 1 Comment
Beaches Energy Services, City of	Negative	First, I wish to thank the SDT for their hard work and making significant progress in significant improvements in the standard. I commend the

Organization	Yes or No	Question 1 Comment
Green Cove Springs		direction that the SDT is taking. There are; however, a few unresolved issues that cause me to not support the standard at this time. 1. An issue of possible differences in interpretation between entities and compliance monitoring and enforcement is the phrase in 1.3 that states "the following as appropriate". Who has the authority to deem what is appropriate? The requirements should be clear that the Responsible Entity is the decision maker of who is appropriate, otherwise there is opportunity for conflict between entities and compliance. *Requirement R1,* Part *1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom to communicate events to as stated in the entity's Operating Plan.* In addition, 1.4 is onerous and burdensome regarding the need to revise the plan within 90 days of "any" change, especially considering the ambiguity of "other circumstances". "Other circumstances" is open to interpretation and a potential source of conflict. *Requirement R1, Part 1.4 was removed from the standard.*
Response: Thank you for your comment. Please see response above.		
New Brunswick Power Transmission Corporation	Negative	It is NBPT's opinion that because this is a standard associated with reporting events after an occurrence, it is overly burdensome to require drills and exercises for verification purposes as described in R4. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications*

Organization	Yes or No	Question 1 Comment
		process in Part 1.2.
Response: Thank you for your comment. Please see response above.		
United Illuminating Co.	Negative	R4 is not clear what is expected. There is a difference between testing a process that consists of identify an event then select commuication contacts versus needing to test contacts for each event in Attachment 1 and drill each event and document each event drill. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *The DSR SDT envisions that the testing under Requirement r3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* In R2 the phrase "as specified" should be replaced or completed, as specified by what. *The DSR SDT has deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read: "Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004*

Organization	Yes or No	Question 1 Comment
		Attachment1."
Response: Thank you for your comment. Please see response above.		
City of Farmington	Negative	R4 requires verification through a drill or exercise the communication process created as part of R1.3. Clarification of what a drill or exercise should be considered. In order to show compliance to R4 would the entity have to send a pseudo event report to Internal Personnel, the Regional Entity, NERC ES-ISAC, Law Enforcement, and Governmental or provincial agencies listed in R1.3 to verify the communications plan? It would not be a burden on the entity so much, however, I'm not sure the external parties want to be the recipient of approximately 2000 psuedo event reports annually. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.*
Response: Thank you for your comment. Please see response above.		
Hydro One Networks, Inc.	Negative	Referring to Requirement R4, the communication process can be verified without having to go through a drill or exercise. Any specific testing or

Organization	Yes or No	Question 1 Comment
		verification of the process is the responsibility of the Responsible Entity. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* *Despite some industry opposition, both periodic review of the Operating Plan and the test requirements were maintained to meet the intent of FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."*
Response: Thank you for your comment. Please see response above.		
Ameren Services	Negative	The current language in the parenthesis of R4 suggests that the training requirement was actually not removed, in that "a drill or exercise" constitutes training. As documented in the last sentence of the Summary of Key Concepts section, "The proposed standard deals exclusively with after-the-fact reporting." We feel that training, even if it is called drills or exercises is not necessary for an after-the-fact report. *Requirement R4 related to an annual test of the communication portion of*

Organization	Yes or No	Question 1 Comment
		Requirement R1 by a drill or exercise and this has been removed. This has been revised to: *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* *Despite some industry opposition, both periodic review of the Operating Plan and the test requirements were maintained to meet the intent of FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."*
Response: Thank you for your comment. Please see response above.		
Liberty Electric Power LLC	Negative	Voting no due to training not being an option to fill the "drill" requirement. The reason for R4 seems to be to assure personnel will respond to an event in accordance with the entity procedure. Entities meet their obligations for other regulatory requirements with training, and should be permitted to do so for R4. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including*

Organization	Yes or No	Question 1 Comment
		notification to the Electric Reliability Organization, of the communications process in Part 1.2. *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated. This language does not preclude the verification of contact information taking place during a training event.*
Response: Thank you for your comment. Please see response above.		
ACES Power Marketing, Hoosier Energy Rural Electric Cooperative, Inc., Sunflower Electric Power Corporation, Great River Energy	Negative	We appreciate the efforts of the SDT in considering the comments of stakeholders from prior comment periods. We believe this draft is greatly improved over the previous version and we agree with the elimination of the term "sabotage" which is a difficult term to define. The determination of an act of sabotage should be left to the proper law enforcement authorities. However, we also realize that the proper authorities would be hard pressed to make these determinations without reporting from industry when there are threats to BES equipment or facilities. We understand and agree there should be verification of the information required for such reporting (contact information, process flow charts, etc). But we still believe improvements can be made to the draft standard. The use of the words "or through a drill or exercise" in Requirement R4 still implies that training is required if no actual event has occurred. When you conduct a fire "drill" you are training your employees on evacuation routes and who they need to report to. Not only are you verifying your process but you are training your employees as well. It is imperative that the information in the Event

Organization	Yes or No	Question 1 Comment
		Reporting process is correct but we don't agree that performing a drill on the process is necessary. We recommend modifying the requirement to focus on verifying the information needed for appropriate communications on an event. And we agree this should take place at least annually. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* *This language does not preclude the verification of contact information taking place during a training event.*
Response: Thank you for your comment. Please see response above.		
Florida Municipal Power Agency	No	First, we wish to thank the SDT for their hard work and making significant progress in significant improvements in the standard. We commend the direction that the SDT is taking. There are; however, a few unresolved issues that cause us to not support the standard at this time. An issue of possible differences in interpretation between entities and compliance monitoring and enforcement is the phrase in 1.3 that states "the following as appropriate". Who has the authority to deem what is appropriate? The

Organization	Yes or No	Question 1 Comment
		requirements should be clear that the Responsible Entity is the decision maker of who is appropriate, otherwise there is opportunity for conflict between entities and compliance. *Requirement R1, Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom to communicate events to as stated in the entity's Operating Plan. Part 1.2 now reads: "A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies."* In addition, 1.4 is onerous and burdensome regarding the need to revise the plan within 90 days of "any" change, especially considering the ambiguity of "other circumstances". "Other circumstances" is open to interpretation and a potential source of conflict. *Requirement R1, Part 1.4 was removed from the standard.*
Response: Thank you for your comment. Please see response above.		
Illinois Municipal Electric Agency	No	IMEA agrees with the removal of the training requirement, but also believes verification is not a necessary requirement for this standard; therefore, R4 is not necessary and should be removed. *Requirement R4 related to an annual test of the communication portion of Requirement 1. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including*

Organization	Yes or No	Question 1 Comment
		notification to the Electric Reliability Organization, of the communications process in Part 1.2. *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.*
Response: Thank you for your comment. Please see response above.		
Indiana Municipal Power Agency	No	IMPA does not believe that R4 is necessary. In addition, if a drill or exercise is used to verify the communication process, some of the parties listed in R1.3 may not want to participate in the drill or exercise every 15 months, such as law enforcement and governmental agencies. IMPA would propose a contacting these agencies every 15 months to verify their contact information only and updating their information in the plan as needed, without performing a drill or exercise. *This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* *The testing requirement is included in the Standard to meet the intent of*

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. Please see response above.		
Northeast Power Coordinating Council	No	Requirement R4 is unnecessary. Whether or not the process, plan, procedure, etc. is "verified" is of no consequence. EOP standards are intended to have entities prepare for likely events (restoration/evacuation), and to provide tools for similar unforeseen events (ice storms, tornadoes, earthquakes, etc.). They should not force a script when results are what matters. *Requirement R4 related to an annual test of the communication portion of Requirement 1. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* *The testing requirement is included in the Standard to meet the intent of FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 1 Comment
Southern Company	No	Southern agrees with removing the training requirement of R4 from the previous version of the standard. However, Southern suggests that drills and exercises are also training and R4 in this revised standard should be removed in its entirety *The "drill or exercise" language has been deleted. Requirement R4 related to an annual test of the communication portion of Requirement 1. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* *The testing requirement is included in the Standard to meet the intent of FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."*

If any discrepancies are noted, the Operating Plan would be updated.* *This language does not preclude the verification of contact information taking place during a training event.*
Response: Thank you for your comment. Please see response above.		
Ingleside Cogeneration LP	Yes	: Yes. Ingleside Cogeneration LP agrees that training on an incident reporting operations plan should be at the option of the entity. However, we recommend that a statement be included in the "Guideline and Technical Basis" section that encourages drills and exercises be coincident with those conducted for Emergency Operations. Since front-line operators must send out the initial alert that a reportable condition exists, such exercises may help determine how to manage their reporting obligations during the early stages of the troubleshooting process. This is especially true where a notification must be made within an hour of discovery - a very short time period. *The "drill or exercise" language has been removed. Requirement R4 related to an annual test of the communication portion of Requirement 1. This has*

Response: Thank you for your comment. Please see response above.		
American Public Power Association	Yes	APPA agrees that removal of the training requirement was an appropriate revision to limit the burden on small registered entities. However, APPA requests clarification from the SDT on the current draft of R4. If no event occurs during the calendar year, a drill or exercise of the Operating Plan communication process is required. APPA believes that if this drill or exercise is required, then it should be a table top verification of the internal communication process such as verification of phone numbers and stepping through a Registered Entity specific scenario. This should not be a full drill with requirements to contact outside entities such as law enforcement, NERC, the RC or other entities playing out a drill scenario. This full drill would be a major burden for small entities. *The "drill or exercise" language has been removed. Requirement R4 related to an annual test of the communication portion of Requirement 1. This has*

Organization	Yes or No	Question 1 Comment
		been revised to: *R3. 2. **The DSR SDT includes two requirement regarding implementation of the Operating Plan specified in Requirement R1. The previous version of the standard had a requirement to implement the Operating plan as well as a requirement to report events. The two requirements R2 and R3 were written to delineate implementation of the Parts of R1. Do you agree with these revisions? If not, please explain in the comment area below.**

   R2. Each Responsible Entity shall implement the parts of its Operating Plan that meet Requirement R1, Parts 1.1 and 1.2 for an actual event and Parts 1.4 and 1.5 as specified.

   R3. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.

Summary Consideration: Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to:

"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."

Organization	Yes or No	Question 2 Comment
Ameren Services	Negative	(2) The new wording while well intentioned, effectively does not add clarity and leads to confusion. From our perspective, R1, which requires and Operating Plan, which is defined by the NERC glossary as: "A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan." *The DSR SDT thanks you for your comment. The SDT has made changes to the*

		requirements highlighted in your comments. *FERC Order 693, Paragraph 466 includes provisions for periodic review and update of the Operating Plan: "466. The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."* (3) Is not a proper location for an after-the-fact reporting standard? In fact it could be argued that after-the-fact reports in and of themselves do not affect the reliability of the bulk electric system. *The DSR SDT does not agree with this comment. Reporting of an event will give the Electric Reliability Organization and your Reliability Coordinator the situational awareness of what has occurred on your part of the BES. Plus as described in your Operating Plan, you would have communicated the event as you saw fit. By broadcasting that an event has occurred you will increase the awareness of your company (as described in your Operating Plan) and increase the awareness of the Electric Reliability Organization and your Reliability Coordinator.* (4) But considering the proposed standard as written with the Operating Plan in requirement R1, and implementation of the Operating Plan in requirement R2 (except the actual reporting which is in R3) and then R3 which requires implementing the reporting section R1.3, it is not clear how these requirements can be kept separate in either implementation nor by the CEA. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2). The test and review requirement is*

		included in the Standard to meet the intent of FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures." (5) The second sentence in the second paragraph of "Rationale for R1" states:"The main issue is to make sure an entity can a) identify when an event has occurred and b) be able to gather enough information to complete the report." This is crucial for a Standard like this that is intended to mandate actions for events that are frequently totally unexpected and beyond normal planning criteria. This language needs to be added to Attachment 1 by the DSR SDT as explained in the rest of our comments. *The DSR SDT has updated the Rationale for Part 1.2 (previous Part 1.3) to read as: "Part 1.2 could include a process flowchart, identification of internal and external personnel or entities to be notified, or a list of personnel by name and their associated contact information." Whereas Part 1.2 now states:* *"1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies."*
Response: Thank you for your comment. Please see response above.		
Old Dominion Electric Coop.	Negative	I disagree with two things in the presently drafted standard. First, I do not feel a separate requirement to implement the plan is necessary (R2), *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of*

Organization	Yes or No	Question 2 Comment
		Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read: *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."* and I do not think that verification of the communications process should require a minimum of a drill or exercise. This is verified now under th current standard CIP-001 through verifice contact with the appropriate authorities and this should be enough to verify that the communications for the plan is in place. *The "drill or exercise" language has been removed. Requirement R4 related to an annual test of the communication portion of Requirement 1. This has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2. The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.*
Response: Thank you for your comment. Please see response above.		
ACES Power Marketing, Hoosier Energy Rural Electric Cooperative, Inc., Sunflower Electric Power Corporation,	Negative	Requirement R2 requires Responsible Entities to implement the various sub-requirements in R1. We believe it is unnecessary to state that an entity must implement their Operating Plan in a separate requirement. Having a separate requirement seems redundant. If the processes in the Operating Plan are not

Organization	Yes or No	Question 2 Comment
Great River Energy/ ACES Power Marketing Standards Collaborators/ Great River Energy		implemented, the entity is non-compliant with the standard. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."* There doesn't need to be an extra requirement saying entities need to implement their Operating Plan. *The test and review requirement is included in the Standard to meet the intent of FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."*
Response: Thank you for your comment. Please see response above.		
Hydro One Networks, Inc.	Negative	Requirement R2 seems to not be necessary. Who would have a plan and not implement it? This may also introduce double jeopardy issues should some entity not have a plan as required in R1. They would be unable to implement something they did not have so automatically non-compliant with R1 and R2. o Requirements R2 and R3 seem to be redundant. Isn't implementing the Operating Plan the same as reporting events in accordance with its Operating Plan? *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of*

Organization	Yes or No	Question 2 Comment
		Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read: *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."* The standard mentions collecting information for Attachment 2, but the standard does not state what to do with Attachment 2. Is it merely a record for demonstrating compliance with R3? *The DSR SDT has updated Requirement R2 to read: "Each Responsible Entity must report and communicate events according to its Operating Plan based on the information in Attachment 1."* *The DSR SDT has also added the following statement to Attachment 1 for 1 hour reporting time frame and 24 hour reporting time frame, respectfully:* *"One Hour Reporting: Submit Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within one hour of recognition of the event"* *And* *"Twenty-four Hour Reporting: Submit Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within twenty-four hour of recognition of the event."*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 2 Comment
Beaches Energy Services, City of Green Cove Springs	Negative	Requirements R2 and R3 are to implement the Operating Plan. Hence, R3 should be a bullet under R2 and not a separate requirement. In addition, for R2, the phrase “actual event” is ambiguous and should mean: “actual event that meets the criteria of Attachment 1” I suggest the following wording to R2 (which will result in eliminating R3) “Each Responsible Entity shall implement its Operating Plan: o For actual events meeting the threshold criteria of Attachment 1, in accordance with Requirement R1 parts 1.1, 1.2 and 1.3 *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *“R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1.”* o For review and updating of the Operating Plan, in accordance with Requirement R1 parts 1.4 and 1.5” Note that I believe that if the SDT decides to not combine R2 and R3, then we disagree with the distinction between the two requirements. *Requirements R2 and R3 have been combined. Requirement 1, Part 1.4 was removed.* The division of implementing R1 through R2 and R3 as presented is “implementing” vs. “reporting”. We believe that the correct division should rather be “implementation” of the plan (which includes reporting) vs. revisions to the plan. *The DSR SDT has updated Requirement R2 to read as: “R2. Each Responsible Entity shall implement the Operating Plan that meets Requirement R1 for events listed in Attachment 1.”* *FERC Order 693 section 617 states “…the Commission directs the ERO to develop a*

Response: Thank you for your comment. Please see response above.		
American Electric Power	No	AEP prefers to avoid requirements that are purely administrative in nature. Requirements should be clear in their actions of supporting of the BES. For example, we would prefer requirements which state what is to be expected, and allowing the entities to develop their programs, processes, and procedures accordingly. It has been our understanding that industry, and perhaps NERC as well, seeks to reduce the amount to administrative (i.e. document-based) requirements. We are confident

Organization	Yes or No	Question 2 Comment
		that the appropriate documentation and administrative elements would occur as a natural course of implementing and adhering to action-based requirements. In light of this perspective, we believe that that R1 and R2 is not necessary, and that R3 would be sufficient by itself. Our comments above notwithstanding, AEP strongly encourages the SDT to consider that R2 and R3, if kept, be merged into a single requirement as a violation of R2 would also be a violation of R3. Two violations would then occur for what is essentially only a single incident. Rather than having both R2 and R3, might R3 be sufficient on its own? R2 is simply a means to an end of achieving R3. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2).* *.* *The test and review requirement is included in the Standard to meet the intent of FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."* If there is a need to explicitly reference implementation, that could be addressed as part of R1. For example, R1 could state "Each Responsible Entity shall implement an Operating Plan that includes..."R1 seems disjointed, as subparts 1.4 and 1.5 (updating and reviewing the Operating Plan) do not align well with subparts 1.1 through 1.3 which are process related. If 1.4 and 1.5 are indeed needed, we recommend that they be a part of their own requirement(s). Furthermore, the action of these requirements should be changed from emphasizing provision(s) of a process to demonstrating the underlying activity.

Organization	Yes or No	Question 2 Comment
		The DSR SDT has maintained Requirement 1 with the wording of "Operating Plan" which gives entities the flexibility of containing an Operating Process or Operating Procedure, as stated as "An Operating Plan may contain Operating Procedures and Operating Processes. Please note the use of "may contain" in the NERC approved definition. *Requirement 1 now reads as "Each Responsible Entity shall have an Operating Plan that includes:* *1.1. A process for recognizing each of the events listed in EOP-004 Attachment 1.* *1.2. A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies.* 1.4 AEP is concerned by the vagueness of requiring provision(s) for updating the Operating Plan for "changes", as such changes could occur frequently and unpredictably. *Part 1.4 was removed from the standard.* *It is the sole responsibility of the Applicable Entity to determine when an annual review of the Operating Plan is required. The Operating Plan has the minimum requirement for an annual review. You may review your Operating Plan as often as you see appropriate.*
Response: Thank you for your comment. Please see response above.		
Occidental Power Services,	No	Attachment 1 and R3 require event reports to be sent to the ERO and the entity's RC and to others "as appropriate." Although this gives the entity some discretion, it

Organization	Yes or No	Question 2 Comment
Inc. (OPSI)		might also create some "Monday morning quarterbacking" situations. This is especially true for the one hour reporting situations as personnel that would be responding to these events are the same ones needed to report the event. OPSI suggests that the SDT reconsider and clarify reporting obligations with the objective of sending initial reports to the minimum number of entities on a need-to-know basis. *Requirement R1, Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom to communicate events to as stated in the entity's Operating Plan.* *The DSR SDT also received many comments regarding the various events of Attachment 1. Many commenters questioned the reliability benefit of reporting events to the ERO and their Reliability Coordinator within 1 hour. Most of the events with a one hour reporting requirement were revised to 24 hours based on stakeholder comments as well as those types of events are currently required to be reported within 24 hours in the existing mandatory and enforceable standards. The only remaining type of event that is to be reported within one hour is "A reportable Cyber Security Incident" as it required by CIP-008.* *FERC Order 706, paragraph 673 states: "…each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but, in any event within one hour of the event…"*
Response: Thank you for your comment. Please see response above.		
Ingleside Cogeneration LP	No	Attachment 1 and requirement R3 are written in a manner which would seem to indicate that internal personnel and law enforcement personnel would have to be copied on the submitted form - either Attachment 2 or OE-417. We believe the intent is to submit such forms to the appropriate recipients only (e.g.; the ERO and

Organization	Yes or No	Question 2 Comment
		the DOE). The requirement should be re-written to clarify that this is the case. *The DSR SDT thanks you for your comment. Requirement 1 has been updated and now reads as"* *Each Responsible Entity shall have an Operating Plan that includes:* *1.1. A process for recognizing each of the events listed in EOP-004 Attachment 1.* *1.2. A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies.* *The Applicable Entity's Operating Plan is to contain the process for reporting events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and for communicating to others as defined in the Responsible Entity's Operating Plan. All events in Attachment 1 are required to be reported to the Electric Reliability Organization and the Responsible Entity's Reliability Coordinator. The Operating Plan may include: internal company personnel, your Regional Entity, law enforcement, and governmental or provisional agencies, as you identify within your Operating Plan. This gives you the flexibility to tailor your Operating Plan to fit your company's needs and wants.*
Response: Thank you for your comment. Please see response above.		
Florida Municipal Power Agency	No	Both requirements are to implement the Operating Plan. Hence, R3 should be a bullet under R2 and not a separate requirement. In addition, for R2, the phrase "actual event" is ambiguous and should mean: "actual event that meets the criteria of Attachment 1"We suggest the following wording to R2 (which will result in eliminating R3)"Each Responsible Entity shall implement its Operating Plan: o For actual events meeting the threshold criteria of Attachment 1 in accordance with

Organization	Yes or No	Question 2 Comment
		Requirement R1 parts 1.1, 1.2 and 1.3 *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."* o For review and updating of the Operating Plan in accordance with Requirement R1 parts 1.4 and 1.5"Note that we believe that if the SDT decides to not combine R2 and R3, then we disagree with the distinction between the two requirements. *The test and review requirement is included in the Standard to meet the intent of FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."* The division of implementing R1 through R2 and R3 as presented is "implementing" vs. "reporting". 		Bulk-Power System to provide data…". In order for entities to provide data they are required to implement their Operating Plan.
Response: Thank you for your comment. Please see response above.		
Indiana Municipal Power Agency	No	Both requirements seem to be implementing the Operating Plan which means R3 should be a bullet under R2 and not a separate requirement. IMPA supports making R2 and R3 one requirement and eliminating the current R3 requirement. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."* In addition, R2 needs to be clarified when addressing an actual event. IMPA recommends saying "an actual event that meets the criteria of Attachment 1." *The DSR SDT has implemented your suggestion.* *Requirement R2now reads as: "Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1.".*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 2 Comment
CenterPoint Energy	No	CenterPoint Energy believes the current R2 is unnecessary and duplicative. Upon reporting events as required by R3, entities will be implementing the relevant parts of their Operating Plan that address R1.1 and R1.2. This duplication is clear when reading M2 and M3. Acceptable evidence is an event report. R2 should be modified to remove this duplicative requirement. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."*
Response: Thank you for your comment. Please see response above.		
Orange and Rockland Utilities, Inc./Consolidated Edison Co. Of NY, Inc.	No	Comments: o R1.3 should be revised as follows: A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as determined by the responsible entity: ["appropriate: - deleted] [otherwise it is not clear who determines what communication level is appropriate] o R1.4 should be revised as follows: Provision(s) for updating the Operating Plan following ["within 90 calendar days of any" - deleted] change in assets or personnel (if the Operating Plan specifies personnel or assets) , ["other circumstances" - deleted] that may no longer align with the Operating Plan; or incorporating lessons learned pursuant to Requirement R3. o R1.5 should be deleted. Responsible Entities can determine the frequency of Operating Plan updates. Requirement 1.4 requires updating the Operating Plan within 90 calendar days for changes in "assets, personnel.... or incorporating lessons

Organization	Yes or No	Question 2 Comment
		learned”. *Requirement 1 has been updated and now reads as”* *Each Responsible Entity shall have an Operating Plan that includes:* *1.1. A process for recognizing each of the events listed in EOP-004 Attachment 1.* *1.2. A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity’s Reliability Coordinator; law enforcement governmental or provincial agencies.* This requirement eliminates the need for Requirement 1.5 requiring a review of the Operating Plan on an annual basis. *The test and review requirement is included in the Standard to meet the intent of FERC Order 693, paragraph 466: “The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures.”*
Response: Thank you for your comment. Please see response above.		
ISO New England	No	In accordance with the results-based standards concept, all that is required, for the “what” is that company X reported on event Y in accordance with the reporting requirements in attachment Z of the draft standard. Therefore, we proposed the only requirement that is necessary is R3, which should be re-written to read..."Each

Organization	Yes or No	Question 2 Comment
		Responsible Entity shall report to address the events listed in Attachment 1." *Requirement 1 and 2 is the basis of the "what" you have described in your comment. Whereas Attachment 1 contains a minimum list of events that apply to Requirement 1, this is why Requirement R2 was rewritten as: "R2. Each Responsible Entity shall implement the Operating Plan that meets Requirement R1 for events listed in Attachment 1."* *The DSR SDT was directed to incorporate certain items such as; FERC Order 693, paragraph 466: "The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."*
Response: Thank you for your comment. Please see response above.		
SERC OC Standards Review Group	No	It is confusing why R3 is not considered part of R2, which deals with implementation of the Operating Plan and it appears that R3 could be interpreted as double jeopardy. We suggest deleting R3. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement the Operating Plan that meets Requirement R1 for events listed in Attachment 1."*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 2 Comment
Oncor Electric Delivery Company LLC	No	NERC's Event Analysis Program tends to parallel many of the reporting requirements as outlined in EOP-004 Version 2. Oncor recommends that NERC considers ways of streamlining the reporting process by either incorporating the Event Analysis obligations into EOP-004-2 or reducing the scope of the Event Analysis program as currently designed to consist only of "exception" reporting. *The Event Analysis Program may use a reported event as a basis to analyze an event. The reporting required in EOP-004-2 provides the input to the Events Analysis Process. The processes of the Event Analysis Program fall outside the scope of this project, but the DSR SDT has collaborated with them of events contained in Attachment 1.*
Response: Thank you for your comment. Please see response above.		
NV Energy	No	On my read of the Standard, R2 and R3 appear to be duplicative, and I can't really distinguish the difference between the two. The action required appears to be the same for both requirements. Even the Measures for these two sound similar. It is not clear to me what it means to "implement" other than to have evidence of the existence and understanding of roles and responsibilities under the "Operating Plan." I suggest elimination of R2 and inclusion of a line item in Measure 1 calling for evidence of the existence of an "Operating Plan" including all the required elements in R1. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2 Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."*

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. Please see response above.		
Northeast Power Coordinating Council	No	R1.3 should be revised as follows: A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as determined by the responsible entity:...Without this change it is not clear who determines what communication level is appropriate. *Requirement 1, Part 1.3 (now Part 1.2) was updated per comments received.* *1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies.* R1.4 should be revised as follows: Provision(s) for updating the Operating Plan following any change in assets or personnel (if the Operating Plan specifies personnel or assets), that may no longer align with the Operating Plan; or incorporating lessons learned pursuant to Requirement R3. R1.5 should be deleted. Responsible Entities can determine the frequency of Operating Plan updates. Requirement 1.4 requires updating the Operating Plan within 90 calendar days for changes in "assets, personnel.... or incorporating lessons learned", (or our preceding proposed revision). *Requirement 1, part 1.4 has been deleted and Requirement R2 has been updated to read as: "R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."* This requirement eliminates the need for Requirement 1.5 requiring a review of the Operating Plan on an annual basis.

Organization	Yes or No	Question 2 Comment
		The only true requirement that is results-based, not administrative and is actually required to support the Purpose of the Standard is R3. *The DSR SDT revised the purpose statement to remove ambiguous language "with the potential to impact reliability". The Purpose statement now reads:* *"To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities."*
Response: Thank you for your comment. Please see response above.		
Illinois Municipal Electric Agency	No	R2 is not necessary, and should be removed. Subrequirement R1.4 is also not necessary and should be removed. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."*
Response: Thank you for your comment. Please see response above.		
Kansas City Power & Light	No	Requirement R1.1 is confusing regarding the "process for identifying events listed in Attachment 1". Considering Attachment 1, the Events Table, already identifies the events required for reporting, please clearly describe in the requirement what the "process" referred to in requirement R1.1 represents. *The DSR SDT has reviewed FERC Order 693 and paragraph 471 states: "…(2) specify*

Organization	Yes or No	Question 2 Comment
		baseline requirement regarding what issues should be addressed in the procedures for recognizing sabotage events and making personnel aware of such events…” *The DSR SDT has written Requirement 1, Part 1.1 to read as: “A process for recognizing each of the events listed in EOP-004 Attachment 1”. An Applicable Entity may rely on SCADA alarms as a process for recognizing an event or being made aware of an event through a scheduled Facility check. The DSR SDT has not been overly prescriptive on part 1.1 but has allowed each Applicable Entity to determine their own process for recognizing events listed in Attachment 1.*
Response: Thank you for your comment. Please see response above.		
Luminant Power	No	Requirements R1, R2, and R4 are burdensome administrative requirements and are contradictory to the NERC stated Standards Development goals of reducing administrative requirements by moving to performance requirements. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *“R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1.”* *Requirement R1, Part 1.3 (now Part 1.2) was revised to indicate that the Responsible Entity is to define its process for reporting and with whom to report events. Part 1.2 now reads:* *“1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004*

Organization	Yes or No	Question 2 Comment
		Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies." There is only one Requirement needed in this standard: "The Responsible Entity shall report events in accordance with Attachment 1." Attachment 1 should describe how events should be reported by what Entity to which party within a defined timeframe. If this requirement is met, all the other proposed requirements have no benefit to the reliability of the Bulk Electric System. Per the NERC Standard Development guidelines, only items that provide a reliability benefit should be included in a standard. *The DSR SDT has updated Attachment 1 to a minimum threshold for Applicable Entities to report contained events. Requirement R2 has been updated to reflect that Applicable Entities shall implement their Operating Plan per Requirement 1 for events listed in Attachment 1. Requirement R2 reads as: "R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."*
Response: Thank you for your comment. Please see response above.		
Xcel Energy	No	Suggest modifying R3 to indicate this is related to R 1.3.Each Responsible Entity shall report events to entities specified in R1.3 and as identified as appropriate in its Operating Plan. *Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3*

Organization	Yes or No	Question 2 Comment
		(now R2) *R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1."*
Response: Thank you for your comment. Please see response above.		
Colorado Springs Utilities	No	The act of implementing the plan needs to include reporting events per R1, sub-requirement 1.3. R2 should simply state something like, "Each Responsible Entity shall implement the Operating Plan that meets the requirements of R1, as applicable, for an actual event or as specified." Suggest eliminating R3 which, seems to create double jeopardy effect. *Requirement R2 was updated to reflect comments received to read as: "R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1." R3 was deleted.*
Response: Thank you for your comment. Please see response above.		
Intellibind	No	The language proposed is not clear and will continue to add confusion to entities who are trying to meet these requirements. It is not clear that the drafting team can put itself in the position of how the auditors will interpret and implement compliance against thithe R2 requirement. Requirements should be written to stand alone, not reference other requirements (or parts of the requirments. If the R1 parts 1.1, 1.2, 1.4 and 1.5 are so significant for this requirement, then they should be rewritten in R2. *Most stakeholders believed that Requirements R2 and R3 were redundant and having*

Organization	Yes or No	Question 2 Comment
		both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read: *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1."*
Response: Thank you for your comment. Please see response above.		
Southern Company	No	These requirements as drafted in this revised standard potentially create a situation where an entity could be deemed non-compliant for both R2 and R3. For example, if a Responsible Entity included a reporting obligation in its Operating Plan, and failed to report an event, the Responsible Entity could be deemed non-compliant for R2 for not "implementing" its plan and for R3 for not reporting the event to the appropriate entities. A potential solution to address this would be to add Requirement 1, Part 1.3 to Requirement 2 and remove Requirement 3 in its entirety. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1."* We also request clarification on Measure M3. Which records should have "dated and time-stamped transmittal records to show that the event was reported"? Some of the communication is handled via face-to-face conversation or through telephone

Organization	Yes or No	Question 2 Comment
		conversation. *Measurement 3 has been deleted since Requirement 3 has been deleted. The new Measurement 2 allows for "…or other documentation". This may be in any form that the Applicable Entity wishes to maintain that they met Requirement 2. The Electric Reliability Organization does allow "Attestations" along with voice recordings as proof of compliance.*
Response: Thank you for your comment. Please see response above.		
Independent Electricity System Operator	No	We agree with the revision to R2 and R3, but assess that a requirement to enforce implementation of Part 1.3 in Requirement R1 is missing. Part 1.3 in Requirement R1 stipulates that:1.3. A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as appropriate: o Internal company personnel o The Responsible Entity's Regional Entity o Law enforcement o Governmental or provincial agenciesThe implementation of Part 1.3 is not enforced by R2 or R3 or any other Requirements in the standard. Suggest to add another requirement or expand Requirement R4 (and M4) to require the implementation of this Part in addition to verifying the process. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1."* *Requirement 1 has been updated and now reads as"*

Organization	Yes or No	Question 2 Comment
		Each Responsible Entity shall have an Operating Plan that includes: *1.1 A process for recognizing each of the events listed in EOP-004 Attachment 1.* *1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies.*
Response: Thank you for your comment. Please see response above.		
Independent Electricity System Operator	Affirmative	The IESO believes that a requirement to enforce implementation of Part 1.3 in Requirement R1 is missing. Part 1.3 in Requirement R1 stipulates that: 1.3. A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as appropriate: o Internal company personnel o The Responsible Entity's Regional Entity o Law enforcement o Governmental or provincial agencies The implementation of Part 1.3 is not enforced by R2 or R3 or any other Requirements in the standard. The IESO suggests that another requirement be added or Requirement R4 (and M4) be expanded to require the implementation of this Part in addition to verifying the process. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the*

Organization	Yes or No	Question 2 Comment
		timeframe specified in EOP-004 Attachment 1." *Requirement 1 has been updated and now reads as"* *Each Responsible Entity shall have an Operating Plan that includes:* *1.1 A process for recognizing each of the events listed in EOP-004 Attachment 1.* *1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies.*
Response: Thank you for your comment. Please see response above.		
Bonneville Power Administration	Yes	BPA believes the measures for R2 are unclear since they are similar to R3's reporting measures.
Response: Thank you for your comment. The SDT has revised the standard to have a single implementation requirement with a single associated measure.		
Compliance & Responsbility Office	Yes	See comments in response to Question 4.
Response: Thank you for your comment. See response to Question 4.		
Constellation Energy on behalf of Baltimore Gas & Electric, Constellation Power Generation, Constellation Energy Commodities Group,	Yes	While we support the delineation of the different activities associated with implementation and reporting, further clarification would be helpful. R1. 1.3: As currently written, it is somewhat confusing, in particular the use of the qualifier "as appropriate". *The DSR SDT has updated Requirement 1, Part 1.2 to read as: "A process for*

Organization	Yes or No	Question 2 Comment
Constellation Control and Dispatch, Constellation NewEnergy and Constellation Energy Nuclear Group.		*communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies."* In addition, the use of the word "communicating" to capture both reporting to reliability authorities and notifying others may leave the requirement open to question. Below is a proposed revision: 1.3 A process for reporting events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and for communicating to others as defined in the Responsible Entity's Operating Plan, such as: o Internal company personnel o The Responsible Entity's Regional Entity o Law Enforcement o Government or provincial agenciesR1, 1.4: the last phrase of the requirements seems to be leftover from an earlier version. The requirement should end after the word "Plan".R1, 1.5: "Process" should not be capitalized. While we understand the intent of the draft language and appreciate the effort to streamline the requirements, we propose an adjusted delineation below that we feel tracks more cleanly to the structure of a compliance program. Proposed revised language:R2. Each Responsible Entity shall implement its Operating Plan to meet Requirement R1, parts 1.1 and 1.2 for an actual event(s).M2. Responsible Entities shall provide evidence that it implemented it Operating Plan to meet Requirement R1, Parts 1.1 and 1.2 for an actual event. *The DSR SDT has updated Requirement 1, Part 1.2 to read as: "A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator;*

Organization	Yes or No	Question 2 Comment
		law enforcement governmental or provincial agencies." *The Applicable Entity's Operating Plan is to contain the process for reporting events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and for communicating to others as defined in the Responsible Entity's Operating Plan. All events in Attachment 1 are required to be reported to the Electric Reliability Organization and the Responsible Entity's Reliability Coordinator. The Operating Plan may include: internal company personnel, your Regional Entity, law enforcement, and governmental or provisional agencies, as you identify within your Operating Plan. This gives you the flexibility to tailor your Operating Plan to fit your company's needs and wants.* *DSR SDT has revised R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1.* *DSR SDT has revised M2. "Each Responsible Entity will have, for each event experienced, a dated copy of the completed EOP-004 Attachment 2 form or DOE form OE-417 report submitted for that event; and dated and time-stamped transmittal records to show that the event was reported supplemented by operator logs or other operating documentation. Other forms of evidence may include, but are not limited to, dated and time stamped voice recordings and operating logs or other operating documentation for situations where filing a written report was not possible.* Evidence may include, but is not limited to, an submitted event report form (Attachment 2) or a submitted OE-417 report, operator logs, or voice recording.R3. Each Responsible Entity shall implement its Operating Plan to meet Requirement R1, parts 1.4 and 1.5.M3. Responsible Entities shall provide evidence that it implemented it Operating Plan to meet Requirement R1, Parts 1.4 and 1.5. Evidence may include, but is not limited to, dated documentation of review and update of the Operating Plan.

Organization	Yes or No	Question 2 Comment
		R4. Each Responsible Entity shall verify (through implementation for an actual event, or through a drill, exercise or table top exercise) the communication process in its Operating Plan, created pursuant to Requirement 1, Part 1.3, at least annually (once per calendar year), with no more than 15 calendar months between verification. M4. The Responsible Entity shall provide evidence that it verified the communication process in its Operating Plan for events created pursuant to Requirement R1, Part 1.3. Either implementation of the communication process as documented in its Operating Plan for an actual event or documented evidence of a drill, exercise, or table top exercise may be used as evidence to meet this requirement. The time period between verification shall be no more than 15 months. Evidence may include, but is not limited to, operator logs, voice recordings, or dated documentation of a verification. *Requirement 4 (now R3) was revised as:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]* *M3. Each Responsible Entity will have dated and time-stamped records to show that the annual test of Part 1.2 was conducted. Such evidence may include, but are not limited to, dated and time stamped voice recordings and operating logs or other communication documentation. The annual test requirement is considered to be met if the responsible entity implements the communications process in Part 1.2 for an actual event. (R3)*
Response: Thank you for your comment. Please see response above.		
Exelon	Yes	Why is the reference to R1.3 missing from EOP-004-2 Requirement R2?

Organization	Yes or No	Question 2 Comment
		R1.3 was associated with implementation in R3 which was removed from the standard. DSR SDT has revised R2 to read as: "Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1."
Response: Thank you for your comment. Please see response above.

3. **The DSR SDT revised reporting times for many events listed in Attachment 1 from one hour to 24 hours. Do you agree with these revisions? If not, please explain in the comment area below.**

Summary Consideration: The DSR SDT appreciates the industry comments on the difficulty associated with reporting events that impact reliability. However, the SDT desires to point out that it is not the objective of this standard to provide an analysis of the event; but to provide the known facts of the events at the reporting threshold of onehour or 24hours depending upon the type of event. The SDT worked with the DOE and the NERC EAWG to develop reporting timelines consistent between the parties in an effort to promote consistency and uniformity.

The SDT has not established any requirement for a final or follow up report. The obligation is to report the facts known at the time. Once the report has been provided to the parties identified in the Operating Plan, no further action is required. All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:

> **"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"**

For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report, and is consistent with current in-force standard EOP-004-1.

Organization	Yes or No	Question 3 Comment
Ameren Services	Negative	(6)By our count there are still six of the nineteen events listed with a one hour reporting requirement and the rest are all within 24 hour after the occurrence (or recognition of the event). This in our opinion, is reporting in real-time, which is against one of the key concepts listed in the background section:"The DSR SDT wishes to make clear that the proposed Standard does not include any real-time operating notifications for the events listed in Attachment 1. Real-time reporting is achieved through the RCIS and is covered in other standards (e.g. the TOP family of

Organization	Yes or No	Question 3 Comment
		standards). The proposed standard deals exclusively with after-the-fact reporting." *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1.* (7)We believe the earliest preliminary report required in this standard should at the close of the next business day. Operating Entities, such as the RC, BA, TOP, GOP, DP, and LSE should not be burdened with unnecessary after-the-fact reporting while they are addressing real-time operating conditions. Entities should have the ability to allow their support staff to perform this function during the next business day as needed. We acknowledge it would not be an undue burden to cc: NERC on other required governmental reports with shorter reporting timeframes, but NERC should not expand on this practice. *No preliminary report is required within the revised standard. Also, timelines have been revised (Please see response to item (6) above).* (8)We agree with the extension in reporting times for events that now have 24 hours of reporting time. As a GO there are still too many potential events that still require a 1 hour reporting time that is impractical, unrealistic and could lead to inappropriate escalation of normal failures. For example, the sudden loss of several control room display screens for a BES generator at 2 AM in the morning, with only 1 hour to report something, might be mistakenly interpreted as a cyber-attack. The reality is

Organization	Yes or No	Question 3 Comment
		most likely something far more mundane such as the unexpected failure of an instrument transformer, critical circuit board, etc. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1.* (9) The "EOP-004 Attachment 1: Events Table" is quite lengthy and written in a manner that can be quite subjective in interpretation when determining if an event is reportable. We believe this table should be clear and unambiguous for consistent and repeatable application by both reliability entities and a CEA. The table should be divided into sections such as: 9a) Events that affect the BES that are either clearly sabotage or suspected sabotage after review by an entity's security department and local/state/federal law enforcement.(b) Events that pose a risk to the BES and that clearly reach a defined threshold, such as load loss, generation loss, public appeal, EEAs, etc. that entities are required to report by the end of the next business day.(c) Other events that may prove valuable for lessons learned, but are less definitive than required reporting events. These events should be reported voluntarily and not be subject to a CEA for non-reporting.(d)Events identified through other means outside of entity reporting, but due to their nature, could benefit the industry by an event report with lessons learned. Requests to report and perform analysis on these type of events should be vetted through a ERO/Functional Entity process to ensure resources provided to this effort have an effective reliability benefit.

Organization	Yes or No	Question 3 Comment
		The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows: • *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* • *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples.* *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* (10)Any event reporting shall not in any manner replace or inhibit an Entity's responsibility to coordinate with other Reliability Entities (such as the RC, TOP, BA, GOP as appropriate) as required by other Standards, and good utility practice to operate the electric system in a safe and reliable manner. *The DSR SDT agrees and believes the revised reporting timelines support that concept.* (11) The 1 hour reporting maximum time limit for all GO events in Attachment 1 should be lengthened to something reasonable - at least 24 hours. Operators in our energy centers are well-trained and if they have good reason to suspect an event

Organization	Yes or No	Question 3 Comment
		that might have serious impact on the BES will contact the TOP quickly. However, constantly reporting events that turn out to have no serious BES impact and were only reported for fear of a violation or self-report will quickly result in a cry wolf syndrome and a great waste of resources and risk to the GO and the BES. The risk to the GO will be potential fines, and the risk to the BES will be ignoring events that truly have an impact of the BES. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1.* (12)The 2nd and 3rd Events on Attachment 1 should be reworded so they do not use terms that may have been deleted from the NERC Glossary by the time FERC approves this Standard. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* (13) The terms "destruction" and "damage" are key to identifying reportable events. Neither has been defined in the Standard. The term destruction is usually defined as 100% unusable. However, the term damage can be anywhere from 1% to 99%

Organization	Yes or No	Question 3 Comment
		unusable and take anywhere from 5 minutes to 5 months to repair. How will we know what the SDT intended, or an auditor will expect, without additional information? *The 'Damage or Destruction' event category has been revised to say ' …to a Facility', (a defined term) and thresholds have be modified to provide clarity.* *The DSR SDT used the defined term "Facility" to add clarity for several events listed in Attachment 1. A Facility is defined as:* *"A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)"* *The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.* (14)We also do not understand why "destruction of BES equipment" (first item Attachment 1, first page) must be reported < 1 hour, but "system separation (islanding) > 100 MW" (Attachment 1, page 3) does not need to be reported for 24 hours. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the*

Organization	Yes or No	Question 3 Comment
		incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. (15)The first 2 Events in Attachment 1 list criteria Threshold for Reporting as "...operational error, equipment failure, external cause, or intentional or unintentional human action." The term "intentional or unintentional human action" appears to cover "operational error" so these terms appear redundant and create risk of misreporting. Can this be clarified? *The second event has been deleted and the language has been clarified in the 'Threshold for Reporting' column in the 'Damage or Destruction' event category. The updated Threshold for Reporting now reads as:* *"Damage or destruction of a Facility that:* • *Affects an IROL (per FAC-014)* *OR* • *Results in the need for actions to avoid an Adverse Reliability Impact* *OR* • *Results from intentional human action."* (16)The footnote of the first page of Attachment 1 includes the explanation "...ii) Significantly affects the reliability margin of the system..." However, the GO is prevented from seeing the system and has no idea what BES equipment can affect the reliability margin of the system. Can this be clarified by the SDT? *The footnote has been deleted and relevant information moved to the 'Threshold for Reporting column in the 'Damage or Destruction' event category.* (17) The use of the term "BES equipment" is problematic for a GO. NERC Team 2010-

Organization	Yes or No	Question 3 Comment
		17 (BES Definition) has told the industry its next work phase will include identify *The term "BES equipment" is no longer used. The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity.* *The DSR SDT used the defined term "Facility" to add clarity for several events listed in Attachment 1. A Facility is defined as:* *"A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)"* *The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.*
Response: Thank you for your comment. Please see response above.		
Beaches Energy Services, City of Green Cove Springs	Negative	3. Att. 1, going from 1 to 24 hrs: The times don't seem aggressive enough for some of the Events related to generation capacity shortages, e.g., we would think public appeal, system wide voltage reduction and manual firm load shedding ought to be within an hour. These are indicators that the BES is "on the edge" and to help BES reliability, communication of this status is important to Interconnection-wide reliability. *This standard concerns after-the-fact reporting. It is assumed that Responsible Entities will make appropriate real-time notifications as per other applicable standards, operating agreements, and good utility practice. This standard does not preclude a Responsible Entity from reporting more quickly than required by Attachment 1.*

Organization	Yes or No	Question 3 Comment
		4. The Rules of Procedure language for data retention (first paragraph of the Evidence Retention section) should not be included in the standard, but instead referred to within the standard (e.g., “Refer to Rules of Procedure, Appendix 4C: Compliance Monitoring and Enforcement Program, Section 3.1.4.2 for more retention requirements”) so that changes to the RoP do not necessitate changes to the standard. *The DSR SDT believes that although the evidence retention language is the same as the current RoP, it is not specifically linked, so changes to the RoP will not necessitate changes to the standard.* In R4, it might be worth clarifying that, in this case, implementation of the plan for an event that does not meet the criteria of Attachment 1 and going beyond the requirements R2 and R3 could be used as evidence. Consider adding a phrase as such to M4, or a descriptive footnote that in this case, “actual event” may not be limited to those in Attachment 1. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to read:* *“R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1. ”* Comments to Attachment 1 table: On “Damage or destruction of Critical Asset” and “... Critical Cyber Asset”, Version 5 of the CIP standards is moving away from the

Organization	Yes or No	Question 3 Comment
		binary critical/non-critical paradigm to a high/medium/low risk paradigm. Suggest adding description that if version 5 is approved by FERC, that “critical” would be replaced with “high or medium risk”, or include changing this standard to the scope of the CIP SDT, or consider posting multiple versions of this standard depending on the outcome of CIP v5 in a similar fashion to how FAC-003 was posted as part of the GO/TO effort of Project 2010-07. *The ‘Damage or Destruction’ events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and ‘Damage or Destruction of a Facility’ reporting thresholds.* On “forced intrusion”, the phrase “at BES facility” is open to interpretation as “BES Facility” (e.g., controversy surrounding CAN-0016) which would exclude control centers and other critical/high/medium cyber system Physical Security Perimeters (PSPs). We suggest changing this to “BES Facility or the PSP or Defined Physical Boundary of critical/high/medium cyber assets”. This change would cause a change to the applicability of this reportable event to coincide with CIP standard applicability. On “Risk to BES equipment”, that phrase is open to too wide a range of interpretation; we suggest adding the word “imminent” in front of it, i.e., “Imminent risk to BES equipment”. For instance, heavy thermal loading puts equipment at risk, but not imminent risk. Also, “non-environmental” used as the threshold criteria is ambiguous. For instance, the example in the footnote, if the BES equipment is near railroad tracks, then trains getting derailed can be interpreted as part of that BES equipment’s “environment”, defined in Webster’s as “the circumstances, objects, or conditions by which one is surrounded”. It seems that the SDT really means “non-weather related”, or “Not risks due to Acts of Nature”. *‘Forced intrusion’ and ‘Risk to BES Equipment’ have been combined under a new event type called ‘A physical threat that could impact the operability of a Facility’. Using judgment is unavoidable for this type of event. This language was chosen*

Organization	Yes or No	Question 3 Comment
		because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples. On "public appeal", in the threshold, the descriptor "each" should be deleted, e.g., if a single event causes an entity to be short of capacity, do you really want that entity reporting each time they issue an appeal via different types of media, e.g., radio, TV, etc., or for a repeat appeal every several minutes for the same event? *To clarify your point, the threshold has been changed to 'Public appeal or load reduction event'.* Should LSE be an applicable entity to "loss of firm load"? As proposed, the DP is but the LSE is not. In an RTO market, will a DP know what is firm and what is non-firm load? Suggest eliminating DP from the applicability of "system separation". The system separation we care about is separation of one part of the BES from another which would not involve a DP. *The DSR SDT believes the current applicability is correct and the threshold provides sufficient discrimination to drive the proper Applicable Entities to report.* On "Unplanned Control Center Evacuation", CIP v5 might add GOP to the applicability, another reason to add revision of EOP-004-2 to the scope of the CIP v5 drafting team, or in other ways coordinate this SDT with that SDT. Consider posting a couple of versions of the standard depending on the outcome of CIP v5 in a similar fashion to the multiple versions of FAC-003 posted with the GO/TO effort of Project 2010-07. *The DSR SDT believes the current applicability is correct. The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed*

Organization	Yes or No	Question 3 Comment
		from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds. Note that EOP-008-0 is only Applicable to Balancing Authorities, Transmission Operators and Reliability Coordinators, this is the basis for the "Entity with reporting Responsibilities" and reads as" "Each RC, BA, TOP that experiences the event".
Response: Thank you for your comment. Please see response above.		
Arkansas Electric Cooperative Corporation	Negative	AECC appreciates the efforts of the SDT to address our comments from the previous posting and feels the Standards have shown great improvement in the current posting. Our negative vote stems from concerns around the 1 hour reporting requirements for events having no size thresholds and ambiguity for external entity reporting in R1.3. Please refer to the comments submitted by the SPP Standards Review Group. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 3 Comment
PowerSouth Energy Cooperative	Negative	Attachment 1 needs to be eliminated. It is confusing to operators and doesn't enhance the reliability of the BES. *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.*
Response: Thank you for your comment. Please see response above.		
Clark Public Utilities	Negative	Attachment 1 provides confusion not clarification. Just use the OE-417 reporting form for any and all events identified in that form for any one-hour or six-hour reporting. Utilities are required by law to provide the DOE notification and the SDT has just confused the situation by attempting (as it appears) to rename the one-hour reporting events. In some instances, Attachment 1 contradicts the DOE reporting. Public appeals for load reduction are required within 24 hours (according to the Events Table) but OE-417 requires such pubic appeals to be reported within one

Organization	Yes or No	Question 3 Comment
		hour. Clark recommends the Events Table show first the one hour reporting of OE-417, then the six hour reporting of OE-417, and finally any additional reporting that is desired but not reportable to DOE. This will help in not confusing seemingly related events. The table should indicate which form is to be used and should mandate Form OE-417 for all DOE reportable events and the Attachment 2: Event Reporting Form for all reportable events not subject to the DOE reporting requirements. *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.* Clark questions whether the event labeled Forced Intrusion really needs to be reported in one hour. It can take several hours to determine if a forced entry actually occurred. Clark is also unsure if reporting forced intrusions at these facilities (if no other disturbance occurs) will provide any information useful in preventing system disturbances but believes this event should be changed to a 24 hour notification.

Organization	Yes or No	Question 3 Comment
		'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. The event labeled Detection of a reportable Cyber Security Incident should have the Entity with Reporting Responsibility changed to the following: "Applicable Entities under CIP-008." The Threshold for Reporting on this event is based on the criteria in CIP-008. If an entity is not an applicable entity under CIP-008, it should not have a reporting requirement based on CIP-008 that appears in EOP-004. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.*
Response: Thank you for your comment. Please see response above.		
City of Farmington	Negative	Attachment 1: BES equipment is too vague - consider changing to BES facility and including that reduces the reliability of the BES in the footnote. Is the footnote an and or an or? *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity.* *The DSR SDT used the defined term "Facility" to add clarity for several events listed in Attachment 1. A Facility is defined as:*

Organization	Yes or No	Question 3 Comment
		"A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)" *The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.* Attachment 1: Version 5 of CIP Requirements the use of the terms Critical Asset and Critical Cyber Asset. The drafting team should consider revising the table to be flexible so it will not require modification when new versions of CIP become effective. Clarify if Damage or Destruction is physical damage (aka - cyber incidents would be part of CIP-008 covered separately in Attachment 1.) *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* Attachment 1: Unplanned Control Center evacuation - remove "potential" from the reporting responsibility Attachment 1: *The 'potential' language has been removed. The threshold for Reporting now reads as: "Each RC, BA, TOP that experiences the event".* SOL Tv - is not defined. *The SOL Violation (WECC only) event has been revised to remove Tv and replace it with "30 minutes" to be consistent with TOP-007-WECC requirements. The event has*

Organization	Yes or No	Question 3 Comment
		also been revised to indicate an SOL associated with a Major WECC transfer path. Attachment 2 - 3: change to, “Did the event originate in your system?” The requirement only requires reporting for Events - not potential events. This implies if there is potential for an event to occur, the entity should report (potential of a public appeal or potential to shed firm load) *The ‘actual or potential’ language has been removed.* Attachment 2 4: “Damage or Destruction to BES equipment” should be “Destruction of BES Equipment” like it is in Attachment 1 and “forced intrusion risk to BES equipment” remove “risk” *The ‘Damage or Destruction’ event category has been revised to say ‘…to a Facility’, (a defined term) and thresholds have be modified to provide clarity. Also, the reporting timeline is now 24 hours.* *‘Forced intrusion’ and ‘Risk to BES Equipment’ have been combined under a new event type called ‘A physical threat that could impact the operability of a Facility’. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred.* The OE-417 requires several of the events listed in Attachment 1 be reported within 1 hour. FEUS recommends the drafting team review the events and the OE-417 form and align the reporting window requirements. For example, public appeals, load shedding, and system separation have a 1 hour requirement in OE-417. *OE-417, as well as, the EAWG’s requirements were considered in creating Attachment*

Organization	Yes or No	Question 3 Comment
		1, but there remain differences for the following reasons: • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.*
Response: Thank you for your comment. Please see response above.		
Wisconsin Public Service Corp.	Negative	EOP-004 Attachment 1 states: That any Damage or destruction of a Critical Cyber Asset per CIP-002 Applicable Entities under CIP-002 Through intentional or unintentional human action. Requires reporting in 1 hour of recognition of event. This is too low of a threshold for reporting. Unintentional damage could be caused by an individual spilling coffee on a laptop. Hardly the item for a report. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 3 Comment
ACES Power Marketing, Hoosier Energy Rural Electric Cooperative, Inc., Sunflower Electric Power Corporation, Great River Energy	Negative	For many of the events listed in Attachment 1, there would be duplicate reporting the way it is written right now. For example, in the case of a fire in a substation (Destruction of BES equipment), the RC, BA, TO, TOP and perhaps the GO and GOP could all experience the event and each would have to report on it. This seems quite excessive and redundant. We recommend eliminating this duplicate reporting. *The DSR SDT has tried to minimize duplicative reporting, but recognizes there may be events that trigger more than one report. The current applicability ensures an event that could affect just one of the entities with reporting responsibility isn't missed.*
Response: Thank you for your comment. Please see response above.		
Consumers Energy	Negative	Forced intrusion needs to be specifically defined. A 1-hour report requirement is not necessary but for critical events that would have wide-ranging impact. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. Organization	Yes or No	Question 3 Comment
		Requirements 2 and 3 should be combined into a single requirement. *The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1."*
Response: Thank you for your comment. Please see response above.		
MidAmerican Energy Co.	Negative	MidAmerican Energy believes Attachment 1 expands the scope of what must be reported beyond what is required by FERC directives and beyond what is needed to improve security of the BES. Based on our understanding of Attachment 1, the category of "damage or destruction of a critical cyber asset" will likely result in hundreds or thousands of small equipment failures being reported to NERC and DOE, with no improvement to security. For example, hard drive failures, server failures, PLC failures and relay failures could all meet the criteria of "damage or destruction of a critical cyber asset." which would be required reporting in 1 hour. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat*

Organization	Yes or No	Question 3 Comment
		that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred. EOP-004-2 needs to clearly state that initial reports can be made by a phone call, email or another method, in accordance with paragraph 674 of FERC Order 706. MidAmerican recommends replacing Attachment 1 and Attachment 2 with the categories and timeframes that are listed in OE-417. This eliminates confusion between government requirements in OE-417 and NERC standards. *Attachment 1 provides the flexibility to make a verbal report. The header of Attachment 1 states:* *"NOTE: Under certain adverse conditions (e.g. severe weather, multiple events) it may not be possible to report the damage caused by an event and issue a written Event Report within the timing in the table below. In such cases, the affected Responsible Entity shall notify parties per R1 and provide as much information as is available at the time of the notification. Reports to the ERO should be submitted to one of the following: e-mail: esisac@nerc.com, Facsimile: 609-452-9550, Voice: 609-452-1422."* *Attachment 2 provides the flexibility to make a verbal report. The header of Attachment 2 states:* *"This form is to be used to report events. The Electric Reliability Organization and the Responsible Entity's Reliability Coordinator will accept the DOE OE-417 form in lieu of this form if the entity is required to submit an OE-417 report. Reports to the ERO should be submitted via one of the following: e-mail: esisac@nerc.com, Facsimile: 609-452-9550, voice: 609-452-1422."* *OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs;*

Organization	Yes or No	Question 3 Comment
		accommodation of other reporting obligations was considered as an opportunity not a 'must-have' • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Seattle City Light	Negative	Overarching Concern related to EOP-004-2 draft: The contemporaneous drafting efforts related to both the proposed Bulk Electric System ("BES") definition changes, as well as the CIP standards Version 5, could significantly impact the EOP-004-2 reporting requirements. Caution needs to be exercised when referencing these definitions, as the definitions of a BES element could change significantly and Critical Assets may no longer exist. As it relates to the proposed reporting criteria, it is debatable as to whether or not the destruction of, for example, one relay would be a reportable incident under this definition going forward given the current drafting team efforts. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* Related to "Reportable Events" of Attachment 1: 1. A reportable event is stated as, "Risk to the BES", the threshold for reporting is, "From a non-environmental physical threat". This appears to be a catch-all event, and basically every other event in Attachment 1 should be reported because it is a risk to the BES. Due to the subjectivity of this event, suggest removing it from the list. *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as*

Organization	Yes or No	Question 3 Comment
		a threat, not when it may have first occurred. 2. A reportable event is stated as, "Damage or destruction of Critical Asset per CIP-002". The term"Damage" would have to be defined in order for an entity to determine a threshold for what qualifies as "Damage" to a CA. One could argue that normal"Damage" can occur on a CA that is not necessary to report. There should also be caution here in adding CIP interpretation within this standard. Reporting Thresholds 1. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* The SDT made attempts to limit nuisance reporting related to copper thefts and so on which is supported. However a number of the thresholds identified in EOP-004-2 Attachment 1 are very low and could congest the reporting process with nuisance reporting and reviewing. An example is the "BES Emergency requiring manual firm load shedding of greater than or equal to 100 MW or the Loss of Firm load for = 15 Minutes that is greater than or equal to 200 MW (300 MW if the manual demand is greater than 3000 MW). In many cases these low thresholds represent reporting of minor wind events or other seasonal system issues on Local Network used to provide distribution service. *These thresholds reflect those used in the current in-force EOP-004-1, and haven't congested the reporting process to date.* Firm Demand 1. The use of Firm Demand in the context of the draft Standards could be used to describe commercial arrangements with a customer rather than a

Organization	Yes or No	Question 3 Comment
		reliability issue. Clarification of Firm Demand would be helpful *The DSR SDT did not use the words 'Firm Demand' anywhere in the proposed standard.*
Response: Thank you for your comment. Please see response above.		
Constellation Energy; Constellation Energy Commodities Group; Constellation Power Source Generation, Inc.	Negative	Please see the comments offered in the concurrent comment form. While Constellation is voting negative on this ballot, we recognize the progress made by the drafting team and find the proposal very close to acceptable. It should be noted that our negative vote is due to remaining concerns with the Attachment 1: Event Table categories language. In the comment form Constellation proposes revisions to both the requirement language and to the Event Table language; however, the Event Table language is the greater hurdle *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.*

Southern California Edison Co.	Negative	SCE and WECC are in agreement on one key point (removing the requirement to

Organization	Yes or No	Question 3 Comment
		determine if an act was "sabotage"), however, I continue to believe SCE will find the one-hour reporting requirement difficult to manage. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.*
Response: Thank you for your comment. Please see response above.		
City of Redding	Negative	The following comments are directed toward Attachment 1: We commend the SDT for properly addressing the sabotage issue. However, additional confusion is caused by introducing term "damage". As "damage" is not a defined term it would be beneficial for the drafting team to provide clarification for what is meant by "damage". *The 'Damage or Destruction' event category has been revised to say '…to a Facility', (a defined term) and thresholds have be modified to provide clarity. Also, the reporting timeline is now 24 hours.*

Organization	Yes or No	Question 3 Comment
		The threshold for reporting “Each public Appeal for load reduction” should clearly state the triggering is for the BES Emergency as routine “public appeal" for conservation could be considered a threshold for the report triggering.. *The DSR SDT believes the current language of the event category ‘BES Emergency…’ clearly excludes routine conservation requests. The Threshold for Reporting has been updated to read as: “Public appeal for load reduction event”.* Regarding the SOL violations in Attachment 1 the SOL violations should only be those that affect the WECC Paths. *The SOL Violation (WECC only) event has been revised to remove Tv and replace it with “30 minutes” to be consistent with TOP-007-WECC requirements. The event is now “SOL for Major WECC Transfer Paths (WECC only)”. .*
Response: Thank you for your comment. Please see response above.		
Avista Corp.	Negative	The VSLs associated with not reporting in an hour for some of the events (Destruction of BES Equipment) is too severe. Operators need to be able to deal with events and not worry about reporting until the system is secure. Back office personnel are only available 40-50 hours per week, so the reporting burden falls on the Operator. *The DSR SDT believes the VSL is appropriate for the only remaining 1 hour event.*
Response: Thank you for your comment. Please see response above.		
Avista Corp.	Negative	There is definitely a need to communicate and report out system events to NERC, RCs, and adjacent utilities. However, this new standard has gone too far with regards to reporting of certain events within a 1 hour timeframe and the associated VSLs for going beyond the hour time period. Operators need to be able to deal with the system events and not worry about reporting out for the “Destruction of BES

Organization	Yes or No	Question 3 Comment
		equipment" (first row in Attachment 1 -Reportable Events). Operators only have 40-50 hours out of 168 hours in a week where supporting personnel are also on shift, so this reporting burden will usually fall on the Operators not back office support. Again this is another example of the documentation requirements of a standard being more important than actually operating the system. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.* The "Destruction of BES equipment" event is too ambiguous and will lead to interpretations by auditors to determine violations. The ambiguity will also lead to the reporting of all BES equipment outages to avoid potential violations of the standard. It usually takes more than an hour to determine the cause and extent of an outage. *The 'Damage or Destruction' event category has been revised to say '…to a Facility', (a defined term) and thresholds have be modified to provide clarity. Also, the reporting timeline is now 24 hours.*

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comment. Please see response above.		
National Association of Regulatory Utility Commissioners	Negative	Therequirement that any event with the potential to impact reliability be reported is overly broad and requires more focus. *'Forced intrusion' and 'Risk to BES Equipment' (which this footnote referenced) have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred.*
Response: Thank you for your comment. Please see response above.		
Alameda Municipal Power, Salmon River Electric Cooperative	Negative	We feel that the drafting team has done an excellent job of providing clarify and reasonable reporting requirements to the right functional entity. We support the modifications but would like to have two additional minor modification in order to provide additional clarification to the Attachment I Event Table. We suggest the following clarifications: For the Event: BES Emergency resulting in automatic firm load shedding Modify the Entity with Reporting Responsibility to: Each DP or TOP that experiences the automatic load shedding within their respective distribution serving or Transmission Operating area. *The DSR SDT believes the current language is sufficient and cannot envision how a BA, TOP, or DP could 'experience the automatic load shedding' if it didn't take place in its balancing, transmission operating, or distribution serving area.*

Organization	Yes or No	Question 3 Comment
		For the Event: Loss of Firm load for = 15 Minutes Modify the Entity with Reporting Responsibility to: Each BA, TOP, DP that experiences the loss of firm load within their respective balancing, Transmission operating, or distribution serving area. With these modifications or similar modifications we fully support the proposed Standard. *The DSR SDT believes the current language is sufficient and cannot envision how a BA, TOP, or DP could 'experience the loss of firm load' if it didn't take place in its balancing, transmission operating, or distribution serving area.*
Response: Thank you for your comment. Please see response above.		
Orange and Rockland Utilities, Inc.	No	o Generally speaking the SDT should work with the NERC team drafting the Events Analysis Process (EAP) to ensure that the reporting events align and use the same descriptive language. o EOP-004 should use the exact same events as OE-417. These could be considered a baseline set of reportable events. If the SDT believes that there is justification to add additional reporting events beyond those identified in OE-417, then the event table could be expanded. o If the list of reportable events is expanded beyond the OE-417 event list, the supplemental events should be the same in both EOP-004-2 and in the EAP Categories 1 through 5. *OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may*

Organization	Yes or No	Question 3 Comment
		trigger further information requests from EAWG as necessary *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004.* o It is not clear what the difference is between a footnote and "Threshold for Reporting". All information should be included in the body of the table, there should be no footnotes. *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'A physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* o Event: "Risk to BES equipment" should be deleted. This is too vague and subjective. Will result in many "prove the negative" situations.' *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred.* o Event: "Destruction of BES equipment" is again too vague. The footnote refers to equipment being "damaged or destroyed". There is a major difference between

Organization	Yes or No	Question 3 Comment
		destruction and damage. *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity.* o Event: "Damage or Destruction of a Critical Asset or Critical Cyber Asset" should be deleted. Disclosure policies regarding sensitive information could limit an entity's ability to report. Unintentional damage to a CCA does not warrant a report. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* o Event: "BES Emergency requiring public appeal for load reduction" should be modified to note that this does not apply to routine requests for customer conservation during high load periods *The DSR SDT believes the current language of the event category 'BES Emergency...' clearly excludes routine conservation requests.*
Response: Thank you for your comment. Please see response above.		
Ameren	No	(1)By our count there are still six of the nineteen events listed with a one hour reporting requirement and the rest are all within 24 hour after the occurrence (or recognition of the event). This in our opinion, is reporting in real-time, which is against one of the key concepts listed in the background section:"The DSR SDT wishes to make clear that the proposed Standard does not include any real-time operating notifications for the events listed in Attachment 1. Real-time reporting is achieved through the RCIS and is covered in other standards (e.g. the TOP family of

Organization	Yes or No	Question 3 Comment
		standards). The proposed standard deals exclusively with after-the-fact reporting." *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.* (2)We believe the earliest preliminary report required in this standard should at the close of the next business day. Operating Entities, such as the RC, BA, TOP, GOP, DP, and LSE should not be burdened with unnecessary after-the-fact reporting while they are addressing real-time operating conditions. Entities should have the ability to allow their support staff to perform this function during the next business day as needed. We acknowledge it would not be an undue burden to cc: NERC on other required governmental reports with shorter reporting timeframes, but NERC should not expand on this practice. *No preliminary report is required within the revised standard.* (3)We agree with the extension in reporting times for events that now have 24 hours of reporting time. As a GO there are still too many potential events that still require

Organization	Yes or No	Question 3 Comment
		a 1 hour reporting time that is impractical, unrealistic and could lead to inappropriate escalation of normal failures. For example, the sudden loss of several control room display screens for a BES generator at 2 AM in the morning, with only 1 hour to report something, might be mistakenly interpreted as a cyber-attack. The reality is most likely something far more mundane such as the unexpected failure of an instrument transformer, critical circuit board, etc. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.*
Response: Thank you for your comment. Please see response above.		
Duke Energy	No	All events in Attachment 1 should have reporting times of no less than 24 hours. As stated on page 6 of the current draft of the standard: "The DSR SDT wishes to make clear that the proposed Standard does not include any real-time operating notifications for the events listed in Attachment 1. Real-time reporting is achieved through the RCIS and is covered in other standards (e.g. the TOP family of standards). The proposed standard deals exclusively with after-the-fact reporting."We maintain

Organization	Yes or No	Question 3 Comment
		that a report which is required to be made within one hour after an event is, in fact, a real time report. In the first hour or even several hours after an event the operator may appropriately still be totally committed to restoring service or returning to a stable bulk power system state, and should not stop that recovery activity in order to make this "after-the-fact" report. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.*
Response: Thank you for your comment. Please see response above.		
American Public Power Association	No	APPA echoes the comments made by Central Lincoln: We do not believe the SDT has adequately addressed the FERC Order to "Consider whether separate, less burdensome requirements for smaller entities may be appropriate." The one and 24 hour reporting requirements continue to be burdensome to the smaller entities that do not maintain 24/7 dispatch centers. The one hour reporting requirement means that an untimely "recognition" starts the clock and reporting will become a higher

Organization	Yes or No	Question 3 Comment
		priority than restoration. The note regarding adverse conditions does not help unless we were to consider the very lack of 24/7 dispatch to be such a condition. APPA recommends the SDT evaluate a less burdensome requirement for smaller entities with reporting requirements in Attachment 1. This exception needs to address the fact that not all entities have 24 hour 7 day a week operating personnel. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.* *The DSR SDT believes that reliability is best served by imposing reporting criteria based on impact to the BES rather than an arbitrary entity size threshold. With these latest revisions, all the proposed event categories provide thresholds that will capture the appropriate entities and provide a manageable timeframe.* However, APPA cautions the SDT that changes to this standard may expose entities to reporting violations on DOE-OE-417 which imposes civil and criminal penalties on reporting events to the Department of Energy. APPA recommends that the SDT reach out to DOE for clarification of reporting requirements for DOE-OE-417 for small entities, asking DOE to change their reporting requirement to match EOP-004-2. If

Organization	Yes or No	Question 3 Comment
		DOE cannot change their reporting requirement the SDT should provide an explanation in the guidance section of Reliability Standard EOP-004-2 that addresses these competing FERC/DOE directives. *OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.*
Response: Thank you for your comment. Please see response above.		
BC Hydro	No	As an event would be verbally reported to the RC, all the one hour requirements to submit a written report should be moved from one hour to 24 hours. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact*

Organization	Yes or No	Question 3 Comment
		appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…" *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.*
Response: Thank you for your comment. Please see response above.		
Bonneville Power Administration	No	BPA believes that the first three elements in Attachment 1 are too generic and should be with only the intentional human criterion. The suspicious device needs to be determined as a threat (and not left behind tools) before requiring a report. *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity. These thresholds include intentional human action as well as impact-based for those cases when cause isn't known. The determination of a threat as you suggest is now part of the revised event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred.*

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comment. Please see response above.		
CenterPoint Energy	No	CenterPoint Energy agrees with the revision that allows more time for reporting some events; however, some 1 hour requirements remain. The Company does not agree with this timeframe for any event. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.*
Response: Thank you for your comment Please see response above.		
Consolidated Edison Co. of NY, Inc.	No	Comments: We have a number of comments on Attachment 1 and will make them here: o Generally speaking the SDT should work with the NERC team drafting the Events Analysis Process (EAP) to ensure that the reporting events align and use the same descriptive language. o EOP-004 should use the exact same events as OE-417. These could be considered a baseline set of reportable events. If the SDT believes that there is justification to add additional reporting events beyond those identified in OE-417, then the event table could be expanded. o If the list of reportable events

Organization	Yes or No	Question 3 Comment
		is expanded beyond the OE-417 event list, the supplemental events should be the same in both EOP-004-2 and in the EAP Categories 1 through 5. *OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004.* o It is not clear what the difference is between a footnote and "Threshold for Reporting". All information should be included in the body of the table, there should be no footnotes. *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'Any physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* o Event: "Risk to BES equipment" should be deleted. This is too vague and subjective. Will result in many "prove the negative" situations.'

Organization	Yes or No	Question 3 Comment
		'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. o Event: "Destruction of BES equipment" is again too vague. The footnote refers to equipment being "damaged or destroyed". There is a major difference between destruction and damage. *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity.* o Event: "Damage or Destruction of a Critical Asset or Critical Cyber Asset" should be deleted. Disclosure policies regarding sensitive information could limit an entity's ability to report. Unintentional damage to a CCA does not warrant a report. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* o Event: "BES Emergency requiring public appeal for load reduction" should be modified to note that this does not apply to routine requests for customer conservation during high load periods.

Organization	Yes or No	Question 3 Comment
		The DSR SDT believes the current language 'BES Emergency...' clearly excludes routine conservation requests.
Response: Thank you for your comment. Please see response above.		
Electric Reliability Council of Texas, Inc.	No	Destruction of BES equipment: 1. Request that the term "destruction" be clarified. *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity.* Damage or destruction of Critical Asset per CIP-002: 1. Request that the terms "damage" and "destruction" be clarified. 2. Is the expectation that an entity report each individual device or system equipment failure or each mistake made by someone administering a system? *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* 3. Request that "initial indication of the event" be changed to "confirmation of the event". Event monitoring and management systems may receive many events that are determined to be harmless and put the entity at no risk. This can only be determined after analysis of the associated events is performed. *The 'initial indication of the event' is no longer part of the threshold for 'Damage or Destruction of a Facility'* Risk to BES equipment: Request that the terms "risk" be clarified. *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'.*

Organization	Yes or No	Question 3 Comment
		Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred.
Response: Thank you for your comment. Please see response above.		
Exelon	No	Due to the size of the service territories in ComEd and PECO it's difficult to get to some of the stations within in an hour to analyze an event which causes concern with the 1 hour criteria. It is conceivable that the evaluation of an event could take longer then one hour to determine if it is reportable. Exelon cannot support this version of the standard until the 1 hour reporting criteria is clarified so that the reporting requirements are reasonable and obtainable. Exelon has concerns about the existing 1 hour reporting requirements and feels that additional guidance and verbiage is required for clarification. We would like a better understanding when the 1 hour clock starts please consider using the following clarifying statement, in the statements that read, "recognition of events" please consider replacing the word "recognition" with the word "confirmation" as in a "confirmed event" *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force*

Organization	Yes or No	Question 3 Comment
		standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.
Response: Thank you for your comment. Please see response above.		
Energy Northwest - Columbia	No	Energy Northwest - Columbia (ENWC) has concerns about the existing 1 hour reporting requirements and feels that additional guidance and verbiage is required for clarification. ENWC would like the word "recognition" in the statement that reads, "recognition of events," be replaced by "confirmation" as in "confirmed event."Also, we would like clarification as to when the 1 hour clock starts. Please consider changing recognition in "within 1 hour of recognition of event" and incorporating in "confirmation." *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event..."* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 3 Comment
Indiana Municipal Power Agency	No	IMPA believes that some of the times may not be aggressive enought that are related to generation capacity shortages. *This standard concerns after-the-fact reporting. It is assumed that Responsible Entities will make appropriate real-time notifications as per other applicable standards, operating agreements, and good utility practice. This standard does not preclude a Responsible Entity from reporting more quickly than required by Attachment 1.* In addition, IMPA believes clarity needs to be added when saying within 1 hour of recognition of event. For example, A fence cutting may not be discovered for days at a remote substation and then a determination has to be made if it was “forced intrusion” - Does that one hour apply once the determination is made that is was “forced intrusion” or from the time the discovery was made? Some of the 1 hour time limits can be expanded to allow for more time, such as forced intrusion, destruction of BES equipment, Risk to BES equipment, etc. *‘Forced intrusion’ and ‘Risk to BES Equipment’ have been combined under a new event type called ‘Any physical threat that could impact the operability of a Facility’. Timelines start at the moment the Responsible Entity determines the event represents a threat, not when it first occurred.*
Response: Thank you for your comment. Please see response above.		
Luminant Power	No	Luminant agrees with the changes the SDT made, however, the timeline should be modified to put higher priority activities before reporting requirements. The SDT should consider allowing entities the ability to put the safety of personnel, safety of the equipment, and possibly the stabilization of BES equipment efforts prior to initiating the one hour reporting timeline. Reporting requirements should not be prioritized above these important activities. The requirement to report one hour after the recognition of such an event may not be sufficient in all instances. Entities

Organization	Yes or No	Question 3 Comment
		should not have a potential violation as a result of putting these priority issues first and not meeting the one hour reporting timeline. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event..."* *Actions taken to maintain the reliability of the BES in real-time always take precedence over reporting. The revised thresholds should ensure there is no perverse driver to act differently.*
Response: Thank you for your comment. Please see response above.		
MidAmerican Energy	No	MidAmerican Energy agrees with the direction of consolidating CIP-001, EOP-004 and portions of CIP-008. However, we have concerns with some of the events included in Attachment 1 and reporting timelines. EOP-004-2 needs to clearly state that initial reports can be made by a phone call, email or another method, in accordance with paragraph 674 of FERC Order 706. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event..."* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*

Organization	Yes or No	Question 3 Comment
		MidAmerican Energy believes draft Attachment 1 expands the scope of what must be reported beyond what is required by FERC directives and beyond what is needed to improve security of the BES. Based on our understanding of Attachment 1, the category of "damage or destruction of a critical cyber asset" will result in hundreds or thousands of small equipment failures being reported to NERC and DOE, with no improvement to security. For example, hard drive failures, server failures, PLC failures and relay failures could all meet the criteria of "damage or destruction of a critical cyber asset." *The DSR SDT agrees and the 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* We recommend replacing Attachment 1 and Attachment 2 with the categories and timeframes that are listed in OE-417. This eliminates confusion between government requirements in OE-417 and NERC standards. *OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may*

Organization	Yes or No	Question 3 Comment
		trigger further information requests from EAWG as necessary *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004.* Reporting timelines and reporting formFERC Order 706, paragraph 676, directed NERC to require a responsible entity to "at a minimum, notify the ESISAC and appropriate government authorities of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report." In paragraph 674, FERC stated that the Commission agrees that, in the "aftermath of a cyber attack, restoring the system is the utmost priority." They clarified: "the responsible entity does not need to initially send a full report of the incident...To report to appropriate government authorities and industry participants within one hour, it would be sufficient to simply communicate a preliminary report, including the time and nature of the incident and whatever useful preliminary information is available at the time. This could be accomplished by a phone call or another method." While FERC did not order completion of a full report within one hour in Order 706, the draft EOP-004 Attachment 1 appears to require submittal of formal reports within one hour for six of the categories, unless there have been "certain adverse conditions" (in which case, as much information as is available must be submitted at the time of notification). *It is assumed that Responsible Entities will make appropriate real-time notifications as per other applicable standards, operating agreements, and good utility practice. As stated above, all one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673. For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions, which would certainly include the aftermath of a cyber attack that had*

Organization	Yes or No	Question 3 Comment
		major impact on the BES. The Violation Severity Levels are extreme for late submittal of a report. For example, it would be a severe violation to submit a report more than three hours following an event for an event requiring reporting in one hour. *The DSR SDT believes the VSL is appropriate now that it only applies to the remaining 1 hour reportable event, which is the Reportable Cyber Event under CIP-008.* MidAmerican Energy suggests incorporating the language from FERC Order 706, paragraph 674, into the EOP-004 reporting requirement to allow preliminary reporting within one hour to be done through a phone call or another method to allow the responsible entity to focus on recovery and/or restoration, if needed.MidAmerican Energy agrees with the use of DOE OE-417 for submittal of the full report of incidents under EOP-004 and CIP-008. We would note there are two parts to this form -- Schedule 1-Alert Notice, and Schedule 2-Narrative Description. Since OE-417 already requires submittal of a final report that includes Schedule 2 within 48 hours of the event, MidAmerican Energy believes it is not necessary to include a timeline for completion of the final report within the EOP-004 standard. We would note that Schedule 2 has an estimated public reporting burden time of two hours so it is not realistic to expect Schedule 2 to be completed within one hour. Events included in Attachment 1:MidAmerican Energy believes draft Attachment 1 expands the scope of what must be reported beyond what is required by FERC directives and beyond what is needed to improve security of the BES. The categories listed in Attachment 1 with one-hour reporting timelines cause the greatest concern. None of these categories are listed in OE-417, and all but the last row would not be considered a Cyber Security Incident under CIP-008, unless there was malicious or suspicious intent. *All one hour reporting timelines have been changed to 24 hours with the exception of*

Organization	Yes or No	Question 3 Comment
		a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673: *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event..."* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*
Response: Thank you for your comment. Please see response above.		
SERC OC Standards Review Group	No	No event should have a reporting time less than at the close of the next business day. Any reporting of an event that requires a less reporting time should only be to entities that can help mitigate an event such as an RC or other Reliability Entity. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event..."* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 3 Comment
Southwestern Power Administration	No	One hour is not enough time to make these assessments for all of the six items in attachment 1. All timing requirements should be made the same in order to simplify the reporting process. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*
Response: Thank you for your comment. Please see response above.		
ITC	No	See comments to Question #4
Response: Thank you for your comment. See response to Question 4.		
Southern Company	No	Southern request clarification on one of the entries in Attachment 1. The concern is with the last row on page 21 of Draft 3. What is the basis for "Voltage deviations"? The Threshold is Â±10% sustained for â‰¥ 15 minutes. Is the voltage deviation based on the Voltage Schedule for that particular timeframe, or is it something else (pre-contingency voltage level, nominal voltage, etc.)? *A sustained voltage deviation of ± 10% on the BES is significant deviation and is indicative of a shortfall of reactive resources either pre- or post-contingency. The DSR SDT is indifferent to which of nominal, pre-contingency, or scheduled voltage, is used*

Organization	Yes or No	Question 3 Comment
		as the baseline, but for simplicity and to promote a common understanding suggest using nominal voltage. In addition, the second row of Attachment 1 lists "Damage or destruction of a Critical Cyber Asset per CIP-002" as a reportable event. The threshold includes "...intentional or unintentional human action" and gives us 1 hour to report. The term "damage" may be overly broad and, without definition, is not limited in any way. If a person mistypes a command and accidentally deletes a file, or renames something, or in any way changes anything on the CCA in error, then this could be considered "damage" and becomes a reportable event. The SDT should consider more thoroughly defining what is meant by "damage". Should it incorporate the idea that the essential functions that the CCA is performing must be adversely impacted? *The DSR SDT agrees and the 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* Lastly, no event should have a reporting time shorter than at the close of the next business day. Any reporting of an event that requires a shorter reporting time should only be to entities that can help mitigate an event such as an RC or other Reliability Entity. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber*

Organization	Yes or No	Question 3 Comment
		security incident as soon as possible, but in any event, within one hour of the event…" *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*
Response: Thank you for your comment. Please see response above.		
FEUS	No	The OE-417 requires several of the events listed in Attachment 1 be reported within 1 hour. FEUS recommends the drafting team review the events and the OE-417 form and align the reporting window requirements. For example, public appeals, load shedding, and system seperation have a 1 hour requirement in OE-417. *OE-417 thresholds and reporting timelines were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America. Non-US Responsible Entities cannot be obligated to report in shorter timelines simply to make the two forms line up. The current in-force EOP-004 requires 24 hour reporting on the items you have identified and so does the latest version of EOP-004-2* • *NERC has no control over the criteria in OE-417, which can change at any time* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004.*

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comment. Please see response above.		
SPP Standards Review Group	No	The purpose of the reporting requirement should be clear either in the text of the requirements or through an explanation that is embodied in the language of the approved set of standards. This would be consistent with a "Results-based" architecture. What is lacking in the proposed language of this standard is recognition that registered entities differ in size and relevance of their impact on the Bulk Electric System. Also, events that are reportable differ in their impact on the registered entity. A "one-size fits all" approach to this standard may cause smaller entities with low impact on the grid to take extraordinary measures to meet the reporting/timing requirements and yet be too "loose" for larger more sophisticated and impacting entities to meet the same requirements. Therefore, we believe language of the standard must clearly state the intent that entities must provide reports in a manner consistent with their capabilities from a size/reliability impact perspective and from a communications availability perspective. Timing requirements should allow for differences and consider these variables.Also, we would suggest including language to specifically exclude situations where communications facilities may not be available for reporting. For example, in situations where communications facilities have been lost, initial reports would be due within 6 hours of the restoration of those communication facilities. *The DSR SDT has reviewed Attachment 1 and made revisions to Event types, used the NERC approved term 'Facility', and revised some of the language under 'Entity with Reporting Responsibility' to ensure that these reportable events correctly represent the relative impact to the BES. Also, all one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event..."*

Organization	Yes or No	Question 3 Comment
		For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. We would also suggest that Attachment 1 be broken into two distinct parts such that those events which must be reported within 1 hour standout from those events that have to be reported within 24 hours. *The DSR SDT agrees and has implemented your suggestion.*
Response: Thank you for your comment. Please see response above.		
Kansas City Power & Light	No	The reportable events listed in Attachment 1 can be categorized as events that have had a reliability impact and those events that could have a reliability impact. The listed events that could have a reliability impact should have a 24 hour reporting requirement and the events that have had a reliability impact are appropriate at a 1 hour reporting. The following events with a 1 hour report requirement are recommended to change to 24 hour: Forced Intrusion and Risk to BES Equipment. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*

Organization	Yes or No	Question 3 Comment
		In addition, the Attachment 1 Events Table is incomplete as many of the listed events are incomplete regarding reporting time requirements and event descriptions. *Attachment 1 has been revised to more clearly indicate reporting timelines and some of the event descriptions were changed to add clarity.* Also recommend removing (ii) from note 5 with event "Destruction of BES equipment" as this part of the note is already described in the event description and insinuates reporting of equipment losses that do not have a reliability impact. *This footnote has been deleted* The events, "Damage or destruction of Critical Asset per CIP-002" and "Damage or destruction of a Critical Cyber Asset per CIP-002", does not have sufficient clarity regarding what that represents. A note similar in nature to Note 5 for BES equipment is recommended. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.*
Response: Thank you for your comment. Please see response above.		
Los Angeles Department of Water and Power	No	The reporting time of within 1 hour of recognition for a "Forced Intrusion" (last event category on page 20 of Draft 3, dated October 25, 2011) when considered with the associated footnote "Report if you cannot reasonably determine likely motivation" is overly burdensome and unrealistic. What is "reasonably determine likely motivation" is too general and requires further clarity. For example, LADWP has numerous facilities with extensive perimeter fencing. There is a significant

Organization	Yes or No	Question 3 Comment
		difference between a forced intrusion like a hole or cut in a property line fence of a facility versus a forced intrusion at a control house. Often cuts in fences, after further investigation, are determined to be cases of minor vandalism. An investigation of this nature will take much more than the allotted hour. The NERC Design Team needs to develop difference levels for the term “Force Intrusion” that fit the magnitude of the event and provide for adequate time to determine if the event was only a case of minor vandalism or petty thief. The requirement, as currently written, would unnecessarily burden an entity in reporting events that after given more time to investigate would more than likely not have been a reportable event. *‘Forced intrusion’ and ‘Risk to BES Equipment’ have been combined under a new event type called ‘A physical threat that could impact the operability of a Facility’. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred.*
Response: Thank you for your comment. Please see response above.		
Northeast Power Coordinating Council	No	The SDT should work with the NERC team drafting the Events Analysis Process (EAP) to ensure that the reporting events align and use the same descriptive language.EOP-004 should use the exact same events as OE-417. These could be considered a baseline set of reportable events. If the SDT believes that there is justification to add additional reporting events beyond those identified in OE-417, then the event table could be expanded. If the list of reportable events is expanded beyond the OE-417 event list, the supplemental events should be the same in both EOP-004-2 and

Organization	Yes or No	Question 3 Comment
		in the EAP Categories 1 through 5. *OE-417 thresholds and reporting timelines were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America. Non-US Responsible Entities cannot be obligated to report in shorter timelines simply to make the two forms line up. The current in-force EOP-004 requires 24 hour reporting on the items you have identified and so does the latest version of EOP-004-2* • *NERC has no control over the criteria in OE-417, which can change at any time* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004.* It is not clear what the difference is between a footnote and "Threshold for Reporting". All information should be included in the body of the table, there should be no footnotes. *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'A physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* Event: Risk to BES equipment should be deleted. This is too vague and subjective. This will result in many "prove the negative" situations. *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new*

Organization	Yes or No	Question 3 Comment
		event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Event: Damage or Destruction of a Critical Asset or Critical Cyber Asset should be deleted. Disclosure policies regarding sensitive information could limit an entity's ability to report. Unintentional damage to a CCA does not warrant a report. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* Event: BES Emergency requiring public appeal for load reduction should be modified to note that this does not apply to routine requests for customer conservation during high load periods. *The DSR SDT believes the current language of the event category 'BES Emergency...' clearly excludes routine conservation requests.*
Response: Thank you for your comment. Please see response above.		
Florida Municipal Power Agency	No	The times don't seem aggressive enough for some of the Events related to generation capacity shortages, e.g., we would think public appeal, system wide voltage reduction and manual firm load shedding ought to be within an hour. These are indicators that the BES is "on the edge" and to help BES reliability,

Organization	Yes or No	Question 3 Comment
		communication of this status is important to Interconnection-wide reliability. *This standard concerns after-the-fact reporting. It is assumed that Responsible Entities will make appropriate real-time notifications as per other applicable standards, operating agreements, and good utility practice. This standard does not preclude a Responsible Entity from reporting more quickly than required by Attachment 1.*
Response: Thank you for your comment. Please see response above.		
NorthWestern Energy	Affirmative	In Attachment 1 NorthWestern Eneergy does not agree with the Transmission loss event, the threshold for reporting is "Unintentional loss of Three or more Transmission Facilities (excluding successful automatic reclosing)." There are lots of instances where this can happen and not have any major impacts to the BES. This reporting requirement is stemming from the Event Analysis Reporting Requirements and in many instances does not constitute an emergency. *You are correct. This event is used as a trigger to the Events Analysis Process.* Also, in Attachment 1 it is not clear when the DOE OE-417 form MUST be submitted. It give an option to use this form or another form but does not state when it must be used - confusing. *For the purposes of EOP-004, Responsible Entities may use either Attachment 2 or OE-417. Submission of OE-417 to the DOE is mandatory for US entities and outside the scope of NERC. Giving you the option to submit OE-417 to NERC and your RC to satisfy EOP-004 is permitted as a matter of convenience so you don't have to submit two different forms for the same event.*
Response: Thank you for your comment. Please see response above.		
Rutherford EMC	Affirmative	The SDT should consider adding a clause in the standard exempting small DP/LSEs

Organization	Yes or No	Question 3 Comment
		from the standard if the DP/LSE annually reviews and approves that it owns no facilities or equipment creating an event as decribed in Attachment 1. *The DSR SDT believes that reliability is best served by imposing reporting criteria based on impact to the BES rather than an arbitrary entity size threshold. With these latest revisions, all the proposed event categories provide thresholds that will capture the appropriate entities and provide a manageable timeframe.*
Response: Thank you for your comment. Please see response above.		
Fort Pierce Utilities Authority	Affirmative	The triggering event “Detection of a reportable Cyber Security Incident” listed in Attachment 1 assigns essentially all utilities reporting responsibility. This is not in line its reporting threshold, which is an event meeting the criteria in CIP-008. Shouldn’t the responsibility fall on only those responsible for compliance with CIP-008, version 3 or 4, as determined by CIP-002? The SDT should also give additional consideration to necessary provisions to make it align with the proposed CIP-008-5. *The ‘Entity with Reporting Responsibility’ has been changed to reflect your comment to ‘Each Responsible Entity applicable under CIP-008 that experiences the Cyber Security Incident.*
Response: Thank you for your comment. Please see response above.		
Nebraska Public Power District	Yes	Although 24 hours is a vast improvement, one business day would make more sense for after the fact reporting. *All one hour reporting timelines have been changed to 24 hours with the exception of a ‘Reportable Cyber Security Incident’. This is maintained due to FERC Order 706, Paragraph 673:* *“direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber*

Organization	Yes or No	Question 3 Comment
		security incident as soon as possible, but in any event, within one hour of the event…" *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*
Response: Thank you for your comment. Please see response above.		
FirstEnergy	Yes	Although we agree with the timeframes for reporting, we have other concerns as listed in our response to Question 4.
Response: Thank you for your comment. Please see response to question 4.		
Intellibind	Yes	Does this reporting conflict with reporting for DOE, and Regions? If so, what reporting requirements will the entity be held accountable to? Managing multiple reporting requirements for the multiple agencies is very problematic for entities and this standard should resolve those reporting requirments, as well as reduce the reporting down to one form and one submission. Reporting to ESISAC should take care of all reporting by the company. NERC should route all reports to the DOE, and regions through this mechanism. *OE-417 thresholds and reporting timelines were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America. Non-US Responsible Entities cannot be obligated to report in shorter timelines simply to make the two forms line up. NERC has no control over the criteria in OE-417, which can change at any time*

Organization	Yes or No	Question 3 Comment
		In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. NERC cannot take on the statutory obligation of US entities to report to the DOE.
Response: Thank you for your comment. Please see response above.		
Dominion	Yes	Dominion appreciates the changes that have been made to increase the 1 hr reporting time to 24 hours.
Response: Thank you for your comment.		
APX Power Markets (NCR-11034)	Yes	In my opinion the remaining items with 1 hour reporting requirements will in most cases require the input of in-complete information, since you maybe aware of the outage/disturbance, but not aware of any reason for it. If that is acceptable just to get the intitial report that there was an outage/disturbance then we are OK. I believe it would help to have that clarifed in the EOP, or maybe a CAN can be created for that. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions.*

Compliance & Responsbility Office	Yes	See comments in response to Question 4.
Response: Thank you for your comment. See response to Question 4.		
Lower Colorado River Authority	Yes	The proposed reporting form for EOP-004-2 is less extensive than the Brief Report required by the Event Analysis process, but there is some duplication of efforts. EOP-004 has an “optional” Written Description section for the event, while the Brief Report requires more detailed information such as a sequence of events, contributing causes, restoration times, etc. Please clarify whether Registered Entities will still be required to submit both forms. Please also ensure there will not be duplication of efforts between the two reports. Although this is fairly minor, the clarification should be addressed. *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary.*
Response: Thank you for your comment. Please see response above.		
City of Austin dba Austin Energy	Yes	The proposed reporting form for EOP-004-2 is less extensive than the Brief Report required by the Event Analysis process, but there is some duplication of efforts. Constellation Energy on behalf of Baltimore Gas & Electric, Constellation Power Generation, Constellation Energy Commodities Group, Constellation Control and Dispatch, Constellation NewEnergy and Constellation Energy Nuclear Group.	Yes	We agree with the change to the reporting times in Attachment 1. While this is an improvement, other concerns with the language in the events table language remain. Please see additional details below:General items: o All submission instructions (column 4 in Events Table) should qualify the recognition of the event as "of recognition of event as a reportable event." *Column 4 has been deleted. The table headings now state that Responsible Entities must submit the report within X hours of recognition of event.* o Is the ES-ISAC the appropriate contact for the ERO given that these two entities are separate even though they are currently managed by NERC? *Yes. This is the current reporting contact and this is the advice that the DSR SDT team received from NERC.* In addition, are the phone numbers in the Attachment 1 NOTE accurate? Is it possible they will change in a different cycle than the standard?

Organization	Yes or No	Question 3 Comment
		Yes. The standard will require updating should the phone number change. Specific Event Language: o Destruction of BES Equipment, footnote: Footnote 1, item iii confuses the clarification added in items i. and ii. Footnote 1 should be modified to state BES equipment that (i) an entity knows will affect an IROL or has been notified the loss affects an IROL; (ii) significantly affects the reserve margin of a Balancing Authority or Reserve Sharing Group. Item iii should be dropped. *The 'Damage or Destruction' event category has been revised to say "to a Facility', (a defined term) and thresholds have be modified to provide clarity. Footnotes for this event have been deleted.* o Damage or destruction of Critical Asset per CIP-002: Within the currently developing revisions to CIP-002 (version 5), Critical Asset will be retired as a glossary term. As well as addressing the durability of this event category, additional delineation is needed regarding which asset disruptions are to be reported. A CA as currently defined incorporates assets in a broad perspective, for instance a generating plant may be a Critical Asset. As currently written in Attachment 1, reporting may be required for unintended events, such as a boiler leak that takes a plant offline for a minor repair. Event #1 - Destruction of BES Equipment - captures incidents at the relevant equipment regardless of whether they are a Critical Asset or not. We recommend dropping this event. However, if reference to CIP-002 assets remains, it will be important to capture reporting of the events relevant to reliability and not just more events. o Damage or destruction of a Critical Cyber Asset per CIP-002: Because CCAs are defined at the component level, including this trigger is appropriate; however, as with CAs, the CCA term is scheduled to be retired under CIP-002 version 5. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately*

Organization	Yes or No	Question 3 Comment
		addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds. o Forced Intrusion: The footnote confuses the goal of including this event category. In addition, "forced" doesn't need to define the incident. Constellation proposes the following to better define the event:Intrusion that affects or attempts to affect the reliable operation of the BES (1)(1) Examples of "affecting reliable operation of the BES are": (i) device operations, (ii) protective equipment degradation, (iii) communications systems degradation including telemetered values and device status. o Risk to BES equipment: This category is too vague to be effective and the footnote further complicates the expectations around this event. The catch all concept of reporting potential risks to BES equipment is problematic. It's not clear what the reliability goal of this category is. Risk is not an event, it is an analysis. How are entities to comply with this "event", never mind within an hour? It appears that the information contemplated within this scenario would be better captured within the greater efforts underway by NERC to assess risks to the BES. This event should be removed from the Attachment 1 list in EOP-004. *'Forced intrusion' and 'Risk to BES Equipment' (which this footnote referenced) have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred.* o BES Emergency requiring system-wide voltage reduction: the Entity with Reporting Responsibility should be limited to RC and TOP.

Organization	Yes or No	Question 3 Comment
		Entity with Reporting Responsibility states 'Initiating entity is responsible for reporting', which the DSR SDT feels is adequate direction in conjunction with the event: BES Emergency requiring system-wide voltage reduction. o Voltage deviations on BES Facilities: The Threshold for Reporting language needs more detail to explain +/- 10% of what? Proposed revision: Â± 10% outside the voltage schedule band sustained for â‰¥ 15 continuous minutes o IROL Violation (all Interconnections) or SOL Violation (WECC only): Should "Interconnections" be capitalized? o Transmission loss: The reporting threshold should provide more specifics around what constitutes Transmission Facilities. One minor item, under the Threshold for Reporting, "Three" does not need to be capitalized. *Both Transmission and Facilities are defined terms and the DSR SDT feels this gives sufficient direction.*
Response: Thank you for your comment. Please see response above.		
Pacific Northwest Small Public Power Utility Comment Group	Yes	While we agree with the revisions as far as they went, we do not believe the SDT has adequately addressed the FERC Order to "Consider whether separate, less burdensome requirements for smaller entities may be appropriate." The one and 24 hour reporting requirements continue to be burdensome to the smaller entities that do not maintain 24/7 dispatch centers. The one hour reporting requirement means that an untimely "recognition" starts the clock and reporting will become a higher priority than restoration. The note regarding adverse conditions does not help unless we were to consider the very lack of 24/7 dispatch to be such a condition. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber*

Organization	Yes or No	Question 3 Comment
		security incident as soon as possible, but in any event, within one hour of the event…" *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. Also, Attachment 1 provides the flexibility to make a verbal report under adverse conditions. For the revised event category 'A physical threat that could impact the operability of a Facility' the reporting timeline of 24 hours starts when the situation has been determined as a threat, not when it may have first occurred.* *The DSR SDT believes that reliability is best served by imposing reporting criteria based on impact to the BES rather than an arbitrary entity size threshold. With these latest revisions, all the proposed event categories provide thresholds that will capture the appropriate entities and provide a manageable timeframe.*
Response: Thank you for your comment. Please see response above.		
Clallam County PUD No.1	Yes	While we agree with the revisions as far as they went, we do not believe the SDT has adequately addressed the FERC Order to "Consider whether separate, less burdensome requirements for smaller entities may be appropriate." Response: Thank you for your comment. Please see response above.		
Illinois Municipal Electric Agency	Yes	With the understanding this is within 24 hrs., and good professional judgment determines the amount of time to report the event to appropriate parties.
Response: Thank you for your comment.		
Ingleside Cogeneration LP	Yes	Yes. Any reporting that is mandated during the first hour of an event must be subject to close scrutiny. Many of the same resources that are needed to troubleshoot and stabilize the local system will be engaged in the reporting - which will impair reliability if not carefully applied. We believe that the ERO should reassess the need for any immediate reporting requirements on a regular basis to confirm that it provides some value to the restoration process. *All one hour reporting timelines have been changed to 24 hours with the exception of a ‘Reportable Cyber Security Incident’. This is maintained due to FERC Order 706,*

Organization	Yes or No	Question 3 Comment
		Paragraph 673: *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1. 4. **Do you have any other comment, not expressed in questions above, for the DSR SDT?**

Summary Consideration: The issues addressed in this question resulted in the DSR SDT reviewing and updating each requirement, Attachment 1 and Attachment 2. The DSR SDT has removed ambiguous language such as "risk" and "potential" based on comments received. All of the time frames in Attachment 1 have been moved to 24 hours upon recognition with the exception to reporting of CIP-008 events that remains one hour per FERC Order 706. Attachment 2 has been rewritten to mirror Attachment 1 events for entities who wish to use Attachment 2 in lieu of the DOE Form OE 417. VSLs have been reviewed to match the updated requirements.

Organization	Yes or No	Question 4 Comment
Cleco Corporation, Cleco Power, Cleco Power LLC	Abstain	Cleco does not use the VSL or VRF.
Response: Thank you for your comment		
Oklahoma Gas and Electric Co.	Abstain	Please see comments on SPP ballot
Response: Thank you for your comment. See response to those comments.		
Alberta Electric System Operator	Abstain	The Alberta Electric System Operator will need to modify parts of this standard to fit the provincial model when it develops the Alberta Reliability Standard.
Response: Thank you for your comment.		
Gainesville Regional Utilities	Affirmative	Looking forward to the added clarity.
Response: Thank you for your comment.		

Organization	Yes or No	Question 4 Comment
Manitoba Hydro	Affirmative	Manitoba Hydro is voting affirmative but would like to point out the following issues: -Attachment 1: The term 'Transmission Facilities' used in Attachment 1 is capitalized, but it is not a defined term in the NERC glossary. The drafting team should clarify what is meant by 'Transmission Facilities' and remove the capitalization. – *The DSR SDT has reviewed the NERC Glossary of Terms and notes that Transmission and Facilities are both defined. The combination of these two definitions are what the DSR SDT has based the applicability of "Transmission Facilities" in Attachment 1.* Attachment 2: The inclusion of 'fuel supply emergency' in Attachment 2 creates confusion as it infers that reporting a 'fuel supply emergency' may be required by the standard even though it is not listed as a reportable event in Attachment 1. On a similar note, it is not clear what the drafting team is hoping to capture by including a checkbox for 'other' in Attachment 2. *The DSR SDT has removed both "fuel supply emergency" and "other" from Attachment 2.*
Response: Thank you for your comment. Please see response above.		
Oncor Electric Delivery	Affirmative	NERC's Event Analysis Program tends to parallel many of the reporting requirements as outlined in EOP-004 Version 2. Oncor recommends that NERC consider ways of streamlining the reporting process by either incorporating the Event Analysis obligations into EOP-004-2 or reducing the scope of the Event Analysis program as currently designed to consist only of "exception" reporting. *The reporting of events as required in EOP-004 is the input to the Events Analysis Program. Events are reported to the ERO and the EAP will follow up as per the EAP processes and procedures.*

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. Please see response above.

Empire District Electric Co.	Affirmative	We agree with the comments provided by SPP
Response: Thank you for your comment. Please see response to SPP comments.		
Lakeland Electric	Negative	1. Further clarity is needed. For example the standard stipulates in R1.3 ". .as appropriate." Who deems what is appropriate? Also in R1.4 ". .other circumstances" is open to interpretation. *Requirement R1, Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom to communicate events to as stated in the entity's Operating Plan.* *Requirement R1, Part 1.4 was removed from the standard* 2. Remove paragraph 1 of the data retention section as it parrots the Rules of Procedure, Appendix 4C: Compliance Monitoring and Enforcement Program, Section 3.1.4.2. Possibly place a pointer to the CMEP in the data retention section. *The item in question is standard boilerplate language that is being placed in all NERC standards.*

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. Please see response above.		
CPS Energy	Negative	oR1.4: CPS Energy believes that "updating the Operating Plan within 90 calendar days of any change..." is a very burdensome compliance documentation requirement. *Requirement R1, Part 1.4 was removed from the standard.* oAttachment 1: Events Table: In DOE OE-417 local electrical systems with less than 300MW are excluded from reporting certain events since they are not significant to the BES. CPS Energy believes that the benefit of reporting certain events on systems below this value would outweigh the compliance burden placed on these small systems. *Upon review of the DOE OE 417, it states "Local Utilities in Alaska, Hawaii, Puerto Rico, the U.S. Virgin Islands, and the U.S. Territories - If the local electrical system is less than 300 MW, then only file if criteria 1, 2, 3 or 4 are met". Please be advised this exception applies to entities outside the continental USA.*
Response: Thank you for your comment. Please see response above.		
Lakeland Electric	Negative	An issue of possible differences in interpretation between entities and compliance monitoring and enforcement is the phrase in 1.3 that states "the following as appropriate". Who has the authority to deem what is appropriate? *Requirement R1, Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom to communicate events to as stated in the entity's Operating Plan*

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. Please see response above.		
Dynegy Inc.; Southern Illinois Power Coop.; Louisville Gas and Electric Co.	Negative	Comments submitted as part of the SERC OC; I agree with the comments of the SERC OC Standards Review group that have been provided to NERC.; We are a signatory to the SERC OC RRG comments filed last week.
Response: Thank you for your comment. Please see response to the SERC OC RRG comments.		
Hydro One Networks, Inc.	Negative	First and foremost we are not supportive of continuance of standards that are not "results based". Standards written to gather data, make reports etc. should not be written. There should be other processes for reporting in place that will not be subject to ERO oversight and further compliance burdens. *The DSR SDT has been following the guidance set by NERC to write a "results based" standard. As with any process there may be many different ways to achieve the same outcome. The NERC Quality Process has not indicated any request to update this Standard, concerning the Results Based Standard format.* o We are disappointed that the standard does not appear to reduce reporting requirements nor does it promote more efficient reporting. We encourage the SDT to take a results based approach and coordinate and reduce reporting through efficiencies between the various agencies and NERC. *The DSR SDT is staying within scope of the approved SAR and will be forwarding your concern of efficiencies between various agencies and NERC* o The Purpose statement is very broad, and "...by requiring the reporting of events with the potential to impact reliability and their causes..." on the Bulk Electric System it can be said that every event occurring on the Bulk Electric System would have to be reported. There is already an event analysis process in place. Could this reporting

Organization	Yes or No	Question 4 Comment
		be effectively performed in that effort? *The DSR SDT revised the purpose statement to remove ambiguous language "with the potential to impact reliability". The Purpose statement now reads:* *"To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities."* o The standard prescribes different sets of criteria, and forms. *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.* o There should be one recipient of event information. That recipient should be a

Organization	Yes or No	Question 4 Comment
		"clearinghouse" to ensure the proper dissemination of information. *The DSR SDT is proposing revisions to the NERC Rules of Procedure that address your comment:* *812. NERC Reporting Clearinghouse* *NERC will establish a system to collect report forms as established for this section or standard, from any Registered Entities, pertaining to data requirements identified in Section 800 of this Procedure. Upon receipt of the submitted report, the system shall then forward the report to the appropriate NERC departments, applicable regional entities, other designated registered entities, and to appropriate governmental, law enforcement, regulatory agencies as necessary. This can include state, federal, and provincial organizations.* o Why is this standard applicable to the ERO? *The ERO is applicable to CIP-008 and therefore is applicable to this proposed Standard.*
Response: Thank you for your comment. Please see response above.		
FirstEnergy Corp., FirstEnergy Energy Delivery, FirstEnergy Solutions, Ohio Edison Company	Negative	FirstEnergy appreciates the hard work of the drafting team and believes it has made great improvements to the standards. However, we must vote negative at this time until a few issues are clarified per our comments submitted through the formal comment period.
Response: Thank you for your comment. Please see response to your other comments.		
Lakeland Electric	Negative	In general; here has not been sufficient prudency review for the standard, especially R1, to justify a performance based standard around a Frequency Response Measure *Based on your short comment, Requirement 1 has been modified as requested by stakeholders. The DSR SDT cannot answer the issue of Frequency Response Measures*

Organization	Yes or No	Question 4 Comment
		since it is not within the scope of the SAR.
Response: Thank you for your comment. Please see response above.		
Northeast Power Coordinating Council	Negative	NPCC believes that further revision of the standard is necessary so is not able to support the VSLs at this time. Comments to the standard will be made in the formal comment period.
Response: Thank you for your comment. Please see responses to your other comments.

Comment Group.		
Rochester Gas and Electric Corp.	Negative	RG&E supports comments to be submitted to NPCC.
New Brunswick System Operator	Negative	See comments submitted by the NPCC Reliability Standards Committee and the IRC Standards Review Committee.
Florida Municipal Power Pool	Negative	See FMPA's comments
Response: Thank you for your comment. See responses to those comments.		
Commonwealth of Massachusetts Department of Public Utilities	Negative	Standards written to gather data, make reports etc. should not be written. There should be other processes for reporting in place that will not be subject to ERO oversight and further compliance burdens. *FERC Order 693 section 617 states "…the Commission directs the ERO to develop a modification to EOP-004-1 through the reliability Standards development process that includes any Requirement necessary for users, owners, and operators of the Bulk-Power System to provide data…". In order for entities to provide data they are required to implement their Operating Plan. EOP-004-2 will satisfy this FERC directive.*
Response: Thank you for your comment. Please see response above.		
Hydro One Networks, Inc.	Negative	Suggested key concepts for the SDT consideration in this standard: ? Develop a single form to report disturbances and events that threaten the reliability of the bulk electric system ? Investigate other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements ? Establish clear criteria for reporting ? *The DSR SDT has only provided one form within this proposed Standard, please see*

Organization	Yes or No	Question 4 Comment
		Attachment 2. Based on stakeholder feedback, the DSR SDT has allowed stakeholders to use the DOE Form OE 417. Please note that not every Stakeholder in NERC wishes to use the DOE Form OE 417. Establish consistent reporting timelines ? *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1.* Provide clarity around who will receive the information and how it will be used ? Explore other opportunities beside a standard to effectively achieve the same outcome. Standards should be strictly results based, whose purpose is to achieve an adequate level of reliability on the BES. *The DSR SDT has clearly stated who will receive the information: Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom to report events. Part 1.2 now reads:* *"1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations*

Organization	Yes or No	Question 4 Comment
		needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies." *The information received will be mainly used for situational awareness and other processes.*
Response: Thank you for your comment. Please see response above.		
Orlando Utilities Commission	Negative	The contemporaneous drafting efforts related to both the proposed Bulk Electric System ("BES") definition changes, as well as the CIP standards Version 5, could significantly impact the EOP-004-2 reporting requirements. Caution needs to be exercised when referencing these definitions, as the definitions of a BES element could change significantly and Critical Assets may no longer exist. As it relates to the proposed reporting criteria, it is debatable as to whether or not the destruction of, for example, one relay would be a reportable incident under this definition going forward given the current drafting team efforts. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.*
Response: Thank you for your comment. Please see response above.		
James A Maenner	Negative	The information in section "5 Background" should be moved from the standard to a supporting document. *The DSR SDT will refer to guidance within the Standards Development process on the proper place to maintain Background information.*

Organization	Yes or No	Question 4 Comment
		The reporting exemption language for weather in the Note on Attachment 1 - Events Table should be included in R3, not just a note. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2based on stakeholder comments and revised R3 (now R2) to:* *"R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1."* The "Guideline and Technical Basis", last 3 pages, should be moved from the standard to a supporting document. *The Guideline and Technical Basis section is a part of the Results-Based Standard format and the information contained in it is in the correct place.*
Response: Thank you for your comment. Please see response above.		
Kansas City Power & Light Co.	Negative	The proposed Standard is in need of additional work to complete the Attachment 1, complete the VSL's, and clarify language and content within the proposed standard. *The DSR SDT has reviewed and revamped all Requirements and both Attachments based on stakeholders feedback. This will provide clarity for entities to follow.*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 4 Comment
SERC Reliability Corporation	Negative	The purpose of the standard "To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of events with the potential to impact reliability and their causes, if known, by the Responsible Entities" has not been achieved as written. There is the potential for the information and data contemplated by this standard to be useful in achieving the stated purpose through follow-on activities of the industry, the regions, and NERC. However, as drafted, Attachment 1 will inform the ERO of the existence of only a portion of the "events with the potential to impact reliability and their causes, if known". *The DSR SDT revised the purpose statement to remove ambiguous language "with the potential to impact reliability". The Purpose statement now reads:* *"To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities."* Events listed in Appendix E to the ERO Event Analysis Process document should be incorporated into the standard instead of hardwiring inconsistency by requiring a different set of events. Alternatively, the SDT should explore deleting Attachment 1 and instead referencing the ERO Event Analysis process (which as a learning organization will have systematic changes to the reporting thresholds over time). At first this may seem contrary to the SDT objective of eliminating fill-in-the-blank aspects of the existing standard but the SDT should explore the Commission's willingness to accept a reference document for reporting thresholds. Additionally, it is unclear how NERC's role as the ES-ISAC is supported through the requirements of this reliability standard. It appears to undermine the ability of NERC (ES-ISAC) to be made timely aware of threats to the critical infrastructure--at odds with it's purpose. Thus, this draft does not achieve the elimination of redundant reporting envisioned in the SAR, nor does it achieve the objective of supporting NERC in the analysis of disturbances or blackouts. *The DSR SDT is following NERC's ANSI approved process for standards development.*

Organization	Yes or No	Question 4 Comment
		The ERO Events Analysis process does not have the frame work as required by the ANSI development process. Within this proposed Standard, when an Attachment 1 event is recognized, the ERO (which is the ES-ISAC) will be one of the first to be notified, as will the entities Reliability Coordinator. This will enhance situational awareness as per the entity's Operation Plan and this Standard. *FERC Order 693 section 617 states "…the Commission directs the ERO to develop a modification to EOP-004-1 through the reliability Standards development process that includes any Requirement necessary for users, owners, and operators of the Bulk-Power System to provide data…". In order for entities to provide data they are required to implement their Operating Plan. EOP-004-2 will satisfy this FERC directive.*
Response: Thank you for your comment. Please see response above.		
Tucson Electric Power Co.	Negative	The tie between an Operating Plan and reportable disturbance events is not clear. Being the exception, I feel that a reportable disturbance methodology should be part of an Emergency Operating Plan. *EOP-004-2 provides Applicable Entities with the minimum report requirements for events contained in Attachment 1. NERC has defined Operating Plan in part as: "A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes." An entity may include a reportable disturbance methodology within their Operating Plan since this Standard does not preclude it.*
Response: Thank you for your comment. Please see response above.		
United Illuminating Co.	Negative	The VSL table is mistyped. R2 lists 1.1 and 1.5. R4 VRF should be lower.

Organization	Yes or No	Question 4 Comment
		Requirement R4 (now R3) calls for conducting an annual test of the communications process in Requirement 1, Part 1.2. It is not strictly administrative in nature and therefore does not meet the VRF guideline for a Lower VRF. .
Response: Thank you for your comment. Please see response above.		
PSEG Energy Resources & Trade LLC, PSEG Fossil LLC, Public Service Electric and Gas Co.	Negative	There are several items that need clarification. See PSEG's separately provided comments.
Response: Thank you for your comment. Please see response to your other comments.		
Kansas City Power & Light Co.	Negative	There is no VSL for R4. *The VSL for Requirement R4 was inadvertently redlined in the redline version of the standard, but it was present in the clean version.*
Response: Thank you for your comment. Please see response above.		
Ameren Services	Negative	We believe that these [VRFs and VSLs] will change as we expect some changes in the draft standard.
Response: Thank you for your comment.		
New York State Department of Public Service	Negative	While the proposed standard consolidates many reporting requirements, the requirement that any event with the "potential to impact reliability" be reported is overly broad and will prove to be burdensome and distracting to system operations. *The DSR SDT revised the purpose statement to remove ambiguous language "with the potential to impact reliability". The Purpose statement now reads:*

Organization	Yes or No	Question 4 Comment
		"To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities."
Response: Thank you for your comment. Please see response above.		
Springfield Utility Board		o The Draft 3 Version History still lists the term "Impact Event" instead of "Event". *This has been corrected.* o Draft 3 of EOP-004-2 - Event Reporting does not provide a definition for the term "Event" nor does the NERC Glossary of Terms Used in Reliability Standards. SUB recommends that "Event" be listed and defined in "Definitions and Terms Used in the Standard" as well as the NERC Glossary, providing a framework and giving guidance to entities for how to determine what should be considered an "Event" (ex: sabotage, unusual occurrence, metal theft, etc.). *The DSR SDT has reviewed this issue and has changed "Event" to "event". Attachment 1 contains each reportable 'event".*
Response: Thank you for your comment. Please see response above.		
Northeast Utilities		- Incorporate NERC Event Analysis Reporting into this standard. Make the requirements more specific to functional registrations as opposed to having requirements applicable to "Responsible Entities".- The description of a Transmission Loss Event in A *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1. The DSR SDT has reviewed and reworded "Entities with Reporting Responsibilities" to require the minimum amount of entities who will be required to report each event.*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 4 Comment
Progress Energy		(1) Attachment 1 lists "Destruction of BES Equipment" as a reportable event but then lists "equipment failure" as one of several thresholds for reporting, with a one hour time limit for reporting. It is simply not common sense to think of the simple failure of a single piece of equipment as "destruction of BES equipment". Does the standard really expect that every BES equipment failure must be reported within one hour, regardless of cause or impact to BES reliability? What is the purpose of such extensive reporting? *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* • *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* (2) The same comment as (1) above is applicable to the "Damage or destruction of Critical Asset" because one threshold is simple "equipment failure" as well. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* (3) Footnote 2 (page 20) says copper theft is not reportable "unless it effects the reliability of the BES", but footnote 1 on the same page says copper theft is reportable if "it degrades the ability of equipment to operate properly". In this instance, the proposed standard provides two different criteria for reporting one of the most common events on the same page. *The DSR SDT has removed all footnotes with the exception of the updated event within Attachment 1 that states: "A physical threat that could impact the operability of a Facility". This event has the following footnote, which states: "Examples include a*

Organization	Yes or No	Question 4 Comment
		train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility." (4) Forced Intrusion must be reported if "you cannot determine the likely motivation", and not based on a conclusion that the intent was to commit sabotage or intentional damage. This would require reporting many theft related instances of cut fences and forced doors (including aborted theft attempts where nothing is stolen) which would consume a great deal of time and resources and accomplish nothing. This criteria is exactly the opposite of the existing philosophy of only reporting events if there is an indication of an intent to commit sabotage or cause damage. *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples.* (5) "Risk to BES equipment...from a non-environmental physical threat" is reportable, but this is an example of a vague, open ended reporting requirement that will either

Organization	Yes or No	Question 4 Comment
		generate a high volume of unproductive reports or will expose reporting entities to audit risk for not reporting potential threats that could have been reported. The standard helpfully lists train derailments and suspicious devices as examples of reportable events. *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples.* The existing CAN for CIP-001 (CAN-0016) is already asking for a list of events that were analyzed so the auditors can determine if a violation was committed due to failure to report. I can envision the CAN for this new standard requiring a list of all "non-environmental physical threats" that were analyzed during the audit period to determine if applicable events were reported. This could generate a great deal of work simply to provide audit documentation even if no events actually occur that are reportable. It would also be easy for an audit team to second guess a decision that was made by an entity not to report an event (what is risk?...how much risk was present due to the event?...). Also, the reporting for this vague criteria must be done within one hour. Any event with a one hour reporting requirement should be crystal clear and unambiguous. *The DSR SDT has reworded and updated Attachment 1 per comments received and believes that the language used obviates the need for CAN-016. CAN-0016 has been*

Organization	Yes or No	Question 4 Comment
		remanded. (6) Transmission Loss...of three or more Transmission Facilities" is reportable. "Facility" is a defined term in the NERC Glossary, but "Transmission Facility" is not a defined term, which will lead to confusion when this criteria is applied. This requirement raises many confusing questions. What if three or more elements are lost due to two separate or loosely related events - is this reportable or not? What processes will need to be put in place to count elements that are lost for each event and determine if reporting is required? Why must events be reported that fit an arbitrary numerical criteria without regard to any material impact on BES reliability? *The DSR SDT used the defined term "Facility" to add clarity for several events listed in Attachment 1. A Facility is defined as:* *"A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)"* *The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.* *Both Transmission and Facilities are defined terms and the DSR SDT feels this gives sufficient direction.*
Response: Thank you for your comment. Please see response above.		
MRO NSRF		: The MRO NSRF wishes to thank the SDT for incorporating changes that the industry had with reporting time periods and aligning this with the Events Analysis Working Group and Department of Energy's OE 417 reporting form.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment.		
FirstEnergy		1. Attachment 1 - Regarding the 1st event listed in the table, "Destruction of BES Equipment" and its accompanying Footnote 1, we believe that this event should be broken into two separate events that incorporate the specifics in the footnote as follows: a. "Destruction of BES equipment that associated with an IROL per FAC-014-2." Regarding the 1st event we have proposed - We have proposed this be made specific to IROL as stated in Footnote 1 part i. Also, we believe that only the RC and TOP would have the ability to quickly determine and report within 1 hour if the destruction is associated with an IROL. The other entities listed would not necessarily know if the event affects and IROL. Therefore, we also propose that the Entities with Reporting Responsibilities (column 2) be revised to only include the RC and TOP. *The DSR SDT agrees with your comment and made the following changes:* *'Threshold for Reporting' column in the 'Damage or Destruction' event category. The updated Threshold for Reporting now reads as:* *"Damage or destruction of a Facility that:* • *Affects an IROL (per FAC-014)* *OR* • *Results in the need for actions to avoid an Adverse Reliability Impact* *OR* • *Results from intentional human action."* b. "Destruction of BES equipment that removes the equipment from service." Regarding the 3rd event we have proposed - We have proposed this be made specific to destruction of BES equipment that removes the equipment from service as stated in Footnote 1 part iii. Also, the other part of footnote 1 part iii which states "Damaged or destroyed due to intentional or unintentional human action" is not

Organization	Yes or No	Question 4 Comment
		required since it is covered in the threshold for reporting. Also the term "Damaged" in this part iii is not appropriate since these events are limited to equipment that has been destroyed. We also propose that the Entities with Reporting Responsibilities (column 2) for this event would remain the same as it states now since any of those entities may observe out of service BES equipment.Regarding part ii of footnote 1, we do not believe that this event needs to be separated. Regarding the phrase "significantly affects the reliability margin of the system be clarified so that it is not left up to the entity to interpret a "significant" affect. Lastly, since we have incorporated parts i and iii into the two separate events and removed part ii as proposed above, the only statement that needs to be left in the Footnote 1 is: "Do not report copper theft from BES equipment unless it degrades the ability of equipment to operate correctly (e.g., removal of grounding straps rendering protective relaying inoperative)." *The DSR SDT has removed all footnotes with the exception of the updated event within Attachment 1 that states: "Any physical threat that could impact the operability of a Facility". This event has the following footnote, which states: "Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility."* 2. Attachment 1 - We ask that the team add an "Event #" column to the table so that each of the events listed can be referred to by #, such as Event 1, Event 2, etc. *The DSR SDT believes that the minimum reporting attributes are contained in Attachment 1.* 3. Attachment 1 - Event titled "Damage or destruction of a Critical Cyber Asset per

Organization	Yes or No	Question 4 Comment
		CIP-002", the proposed threshold for reporting seems incomplete. We suggest the threshold for this event match the threshold for the Critical Asset event which states: "Initial indication the event was due to operational error, equipment failure, external cause, or intentional or unintentional human action."4. Attachment 1 - Events titled "Damage or destruction of a Critical Assets per CIP-002" and "Damage or destruction of a Critical Cyber Asset per CIP-002" seem ambiguous due to the term "damage". We suggest removal of "damage" or clarity as to what is considered a damaged asset.5. VSL Table - Instead of listing every entity, it may be more efficient to simply say "The Responsible Entity" in the VSL for each requirement.6. Guideline and Technical Basis section - This section does not provide guidance on each of the requirements of the standard. We suggest the team consider adding guidance for the requirements. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.*
Response: Thank you for your comment. Please see response above.		
Southwest Power Pool Regional Entity		1. EOP-004-2 R1.4 states entities must update their Operating Plans within 90 calendar days of incorporating lessons learned pursuant to R3. However, neither R3 nor Attachment 1 include a timeline for incorporating lessons learned. It is unclear when the "clock starts" on incorporating improvements or lessons learned. Within 90 days of what? 90 days of the event? 90 days from when management approved the lesson learned? Auditors need to know the trigger for the 90-day clock. *Requirement R1, Part 1.4 was removed from the standard.* 2. The Event Analysis classification includes Category 1C "failure or misoperation of

Organization	Yes or No	Question 4 Comment
		the BPS SPS/RAS". This category is not included in EOP-004-2's Attachment 1. This event, "failure or misoperation of the BPS SPS/RAS", needs to either be added to Attachment 1 or removed from the Event Analysis classification. It is important that EOP-004-2 Attachment 1 and the Event Analysis categories match up.Thank you for your work on this standard. *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.*
Response: Thank you for your comment. Please see response above.		
Independent Electricity System Operator		1. Measures M1, M2 and M3: Suggest to achieve consistent wording among them by saying the leading part to "Each Responsible Entity shall provide...." *The DSR SDT is following the guidance within the Standards Development process on*

Organization	Yes or No	Question 4 Comment
		the wording pertaining to items outside the realm of a requirement. 2. In our comments on the previous version, we suggested the SDT to review the need to include IA, TSP and LSE for some of the reporting requirements in Attachment 1. The SDT's responded that it had to follow the requirements of the standards as they currently apply. Since these entities are applicable to the underlying standards identified in Attachment 1, they will be subject to reporting. We accept this rationale. However, the revised Attachment 1 appears to be still somewhat discriminative on who needs to report an event. For example, the event of "Detection of a reportable Cyber Security Incident" (6th row in the table) requires reporting by a list of responsible entities based on the underlying requirements in CIP-008, but the list does not include the IA, TSP and LSE. We again suggest the SDT to review the need for listing the specific entities versus leaving it general by saying: "Applicable Entities under CIP-008" for this particular item, and review and establish a consistent approach throughout Attachment 1. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008.* 3. VSLs: a. Suggest to not list all the specific entities, but replace them with "Each Responsible Entity" to simplify the write-up which will allow readers to get to the violation condition much more quickly. b. For R1, it is not clear whether the conditions listed under the four columns are "OR" or "AND". We believe it means "OR", but this needs to be clarified in the VSL table.4. The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after "applicable regulatory approval" in the Effective Dates Section on P. 2 of the draft standard and P. 1 of the draft implementation plan, to the following effect: ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities." *The DSR SDT is following the guidance within the Standards Development process on*

Organization	Yes or No	Question 4 Comment
		the wording pertaining to items outside the realm of a requirement.
Response: Thank you for your comment. Please see response above.		
NRECA		1. Please ensure that the work of the SDT is done in close coordination with Events Analysis Process (EAP) work being undertaken by the PC/OC and BOT, and with any NERC ROP additions or modifications. NRECA is concerned that the EAP work being done by these groups is not closely coordinated even though their respective work products are closely linked -- especially since the EAP references information in EOP-004. *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.*

Organization	Yes or No	Question 4 Comment
		2. The SDT needs to be consistent in its use of "BES" and "BPS" - boths acronyms are used throughout the SDT documents. NRECA strongly prefers the use of "BES" since that is what NERC standards are written for. *The DSR SDT has used BES within EOP-004-2. All references to BPS have been removed.* 3. Under "Purpose" section of standard, 3rd line, add "BES" between "impact" and "reliability." Without making this change the "Purpose" section could be misconstrued to refer to reliability beyond the BES. *The DSR SDT revised the purpose statement to remove ambiguous language "with the potential to impact reliability". The Purpose statement now reads:* ***"To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities."*** 4. In the Background section there is reference to the Events Analysis Program. Is that the same thing as the Events Analysis Process? Is it something different? Is it referring to a specific department at NERC? Please clarify in order to reduce confusion. Also in the Background section there is reference to the Events Analysis Program personnel. Who is this referring to -- NERC staff in a specific department? Please clarify. *The DSR SDT was explaining that the DSR SDT and has been coordinating with the "Events Analysis Working Group.* 5. In M1 please be specific regarding what "dated" means. *This is a common term used with many NERC Standards and simply means that your evidence is dated and time stamped.* 6. In M3 please make it clear that if there wasn't an event, this measure is not applicable

Organization	Yes or No	Question 4 Comment
		The DSR SDT has not implied that Applicable Entities need to prove that something did not happen. 7. In R4 it is not clear what "verify" means. Please clarify. *R4 (now R3) was revised to remove "verify"* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* 8. In Attachment 1 there are references to Critical Asset and Critical Cyber Asset. These terms will likely be eliminated from the NERC Glossary of Terms when CIP V5 moves forward and is ultimately approved by FERC. This could create future problems with EOP-004 if CIP V5 is made effective as currently drafted. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008.* 9. In Attachment 1 the one hour timeframe for submitting data for the first 7 items listed is very tight. Other than being required by the EOE)E-417 form, NRECA requests that the SDT provide further support for this timeframe. If there are not distinct reasons why 1 hour is the right timeframe for this, then other timeframes should be explored with DOE. *The DSR SDT also received many comments regarding the various events of Attachment 1. Many commenters questioned the reliability benefit of reporting events to the ERO and their Reliability Coordinator within 1 hour. Most of the events with a one hour reporting requirement were revised to 24 hours based on stakeholder comments as well as those types of events are currently required to be reported within 24 hours in the existing mandatory and enforceable standards. The only remaining type of event that is to be reported within one hour is "A reportable Cyber*

Organization	Yes or No	Question 4 Comment
		Security Incident" as it required by CIP-008. *FERC Order 706, paragraph 673 states: "…each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but, in any event within one hour of the event…"* *Note that members of NRECA may be required to submit the DOE Form OE 417, and this agency's reporting requirements are not within scope of the project.* 10. While including Footnote 1 is appreciated, NRECA is concerned that this footnote will create confusion in the compliance and audit areas and request the SDT to provide more definitive guidance to help explain what these "Events" refer to. NRECA has the same comment on Footnote 2 and 3. Specifically in Footnote 3, how do you clearly determine and audit from a factual standpoint something that "could have damaged" or "has the potential to damage the equiment?" *The DSR SDT has removed all footnotes with the exception of the updated event within Attachment 1 that states: "A physical threat that could impact the operability of a Facility". This event has the following footnote, which states: "Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility."* 11. In the Guideline and Technical Basis section, in the 1st bullet, how do you determine, demonstrate and audit for something that "may impact" BES reliability? *This statement has been removed per comments received.* 12. On p. 28, first line, this sentence seems to state that NERC, law enforcement and other entities - not the responsible entity - will be doing event analysis. My understanding of the current and future Event Analysis Process is that the

Organization	Yes or No	Question 4 Comment
		responsible entity does the event analysis. Please confirm and clarify. *EOP-004-2 requires Applicable Entities to "report " and "communicate" as stated in Requirement 1, Part 1.2: "A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies."* *The Event Analysis Program may use a reported event as a basis to analyze an event. The processes of the Event Analysis Program fall outside the scope of this project, but the DSR SDT has collaborated with them of events contained in Attachment 1.* *The Standard does not require the Applicable Entity to analyze a reported event.*
Response: Thank you for your comment. Please see response above.		
Exelon		1. Please replace the text "Operating Plan" with procedure(s). Many companies have procedure(s) for the reporting and recognition of sabotage events. These procedures extend beyond operating groups and provide guidance to the entire company. *Thank you for your comment. The DSR SDT intends on keeping "Operating Plan" within EOP-004-2 since NERC has it defined as:* *"A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan". As stated, the Operating Plan may contain Operating procedures or Operating Processes. This will give Applicable Entities the greatest flexibility in achieving compliance with this Standard.*

Organization	Yes or No	Question 4 Comment
		2. The Loss of Off-site power event criteria is much improved from the last draft of EOP 004-2; however, some clarification is needed to more accurately align with NERC Standard NUC-001 in both nomenclature and intent. Specifically, as Exelon has previously commented, there are many different configurations supplying offsite power to a nuclear power plant and it is essential that all configurations be accounted for. As identified in the applicability section of NUC-001 the applicable transmission entities may include one or more of the following (TO, TOP, TP, TSP, BA, RC, PC, DP, LSE, and other non-nuclear GO/GOPs). Based on the response to previous comments submitted for Draft 2, Exelon understands that the DSR SDT evaluated the use of the word “source” but dismissed the use in favor of “supply” with the justification “[that] ‘supply’ encompasses all sources”. Exelon again suggests that the word “source” is used as the event criteria in EOP-004-2 as this nomenclature is commonly used in the licensing basis of a nuclear power plant. By revising the threshold criteria to “one or more” Exelon believes the concern the DSR SDT noted is addressed and ensures all sources are addressed. In addition, by revising the threshold for reporting to a loss of “one or more” will ensure that all potential events (regardless of configuration of off-site power supplies) will be reported by any applicable transmission entity specifically identified in the nuclear plant site specific NPIRs.As previously suggested, Exelon again proposes that the loss of an off-site power source be revised to an “unplanned” loss to account for planned maintenance that is coordinated in advance in accordance with the site specific NPIRs and associated Agreements. This will also eliminate unnecessary reporting for planned maintenance.Although the loss of one off-site power source may not result in a nuclear generating unit trip, Exelon agrees that an unplanned loss of an off-site power source regardless of impact should be reported within the 24 hour time limit as proposed. Suggest that the Loss of Offsite power to a nuclear generating plant event be revised as follows:Event: Unplanned loss of any off-site power source to a Nuclear Power PlantEntity with Reporting Responsibility: The applicable Transmission Entity that owns and/or operates the off-site power source to a

Organization	Yes or No	Question 4 Comment
		Nuclear Power Plant as defined in the applicable Nuclear Plant Interface Requirements (NPIRs) and associated Agreements.Threshold for Reporting: Unplanned loss of one or more off-site power sources to a Nuclear Power Plant per the applicable NPIRs. *Based on comments received, this event has been updated within Attachment 1 to read as:* *"Complete loss of off-site power to a nuclear generating plant (grid supply)".* 3. Attachment 1 Generation loss event criteria Generation lossThe â‰¥ 2000 MW/â‰¥ 1000 MW generation loss criteria do not provide a time threshold or location criteria. If the 2000 MW/1000 MW is intended to be from a combination of units in a single location, what is the time threshold for the combined unit loss? For example, if a large two unit facility in the Eastern Interconnection with an aggregate full power output of 2200 MW (1100 MW per unit) trips one unit (1100 MW) [T=0 loss of 1100 MW] and is ramping back the other unit from 100% power and 2 hours later the other unit trips at 50% power [550 MW at time of trip]. The total loss is 2200 MW; however, the loss was sustained over a 2 hour period. Would this scenario require reporting in accordance with Attachment 1? What if it happened in 15 minutes? 1 hour? 24 hours? Exelon suggests the criteria revised to include a time threshold for the total loss at a single location to provide this additional guidance to the GOP (e.g., within 15 minutes to align with other similar threshold conditions). Threshold for Reporting ï€ â‰¥ 2,000 MW unplanned total loss at a single location within 15 minutes for entities in the Eastern or Western Interconnection â‰¥ 1000 MW unplanned total loss at a single location within 15 minutes for entities in the ERCOT or Quebec Interconnection *The DSR SDT has not modified this event since it is being maintained as it is presently enforceable within EOP-004-1.* 4. Exelon appreciates that the DSR SDT has added the NRC to the list of Stakeholders in the Reporting Process, but does not agree with the SDT response to FirstEnergy's

Organization	Yes or No	Question 4 Comment
		comment to Question 17 [page 206] that stated "NRC requirements or comments fall outside the scope of this project." Quite the contrary, this project should be communicated and coordinated with the NRC to eliminate confusion and duplicative reporting requirements. There are unique and specific reporting criteria and coordination that is currently in place with the NRC, the FBI and the JTTF for all nuclear power plants. If an event is in progress at a nuclear facility, consideration should be given to coordinating such reporting as to not duplicate effort, introduce conflicting reporting thresholds, or add unnecessary burden on the part of a nuclear GO/GOP who's primary focus is to protect the health and safety of the public during a potential radiological sabotage event (as defined by the NRC) in conjunction with potential impact to the reliability of the BES. *The DSR SDT has established a minimum amount of reporting for events listed in Attachment 1. The NRC does not fall under the jurisdiction of NERC and so therefore it is not within scope of this project.* 5. Attachment 1 Detection of a reportable Cyber Security Incident event criteria.The threshold for reporting is "that meets the criteria in CIP-008". If an entity is exempt from CIP-008, does that mean that this reportable event is therefore also not applicable in accordance with EOP-004-2 Attachment 1? *If an entity is exempt from CIP-008, then they do not have to report this type of event. Entities can report any situation at anytime to whomever they wish. If an entity is responsible for items that fall under a Cyber Security Incident, then they would report per this standard.*
Response: Thank you for your comment. Please see response above.		
Duke Energy		1. Reporting under EOP-004-2 should be more closely aligned with Events Analysis Reporting. *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating*

Organization	Yes or No	Question 4 Comment
		Attachment 1, but there remain differences for the following reasons: • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.* 2. Attachment 1 - Under the column titled "Entity with Reporting Responsibility", several Events list multiple entities, using the phrase "Each RC, BA, TO, TOP, GO, GOP, DP that experiences..." or a similar phrase requiring that multiple entities report the same event. We believe these entries should be changed so that multiple reports aren't required for the same event. *The DSR SDT agrees that there may be some dual reporting for the same event. The minimum Applicable Entities have been review and updated where updates could be made. The DSR SDT believes that a dual report will provide a clearer picture of the breadth and depth of an event the Electric Reliability Organization and the Applicable Entities Reliability Coordinator.* 3. Attachment 1 - The phrase "BES equipment" is used several times in the Events Table and footnotes to the table. "Equipment" is not a defined term and lacks clarity. "Element" and "Facility" are defined terms. Replace "BES equipment" with

Organization	Yes or No	Question 4 Comment
		"BES Element" or "BES Facility". *The DST SDT has removed the term "equipment" from Attachment 1 per comments received.* 4. Attachment 1 - The Event "Risk to BES equipment" is unclear, since some amount of risk is always present. Reword as follows: "Event that creates additional risk to a BES Element or Facility." *The DSR SDT has removed this event from Attachment 1. Several stakeholders expressed concerns relating to the "Forced Intrusion" event. Their concerns related to ambiguous language in the footnote. The SDR SDT discussed this event as well as the event "Risk to BES equipment". These two event types had overlap in the perceived reporting requirements. The DSR SDT removed "Forced Intrusion" as a category and the "Risk to BES equipment" event was revised to "A physical threat that could impact the operability of a Facility".* 5. Attachment 1 - The Threshold for Reporting Voltage deviations on BES Facilities is identified as "+ 10% sustained for > 15 continuous minutes." Need to clarify + 10% of what voltage? We think it should be nominal voltage. *A sustained voltage deviation of ± 10% on the BES is significant deviation and is indicative of a shortfall of reactive resources either pre- or post-contingency. The DSR SDT is indifferent to which of nominal, pre-contingency, or scheduled voltage, is used as the baseline, but for simplicity and to promote a common understanding suggest using nominal voltage.* 6. Attachment 1 - Footnote 1 contains the phrase "has the potential to". This phrase should be struck because it creates an impossibly broad compliance responsibility. Similarly, Footnote 3 contains the same phrase, as well as the word "could" several times, which should be changed so that entities can reasonably comply.

Organization	Yes or No	Question 4 Comment
		The DSR SDT has removed all footnotes with the exception of the updated event within Attachment 1 that states: "A physical threat that could impact the operability of a Facility". This event has the following footnote, which states: "Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility." 7. Attachment 1 - The "Unplanned Control Center evacuation" Event has the word "potential" in the column under "Entity with Reporting Responsibility". The word "potential" should be struck.8. Attachment 2 - Includes "fuel supply emergency", which is not listed on Attachment 1. *The DSR SDT has removed the word "potential" from this event. It now reads as: "Each RC, BA, TOP that experiences the event"*
Response: Thank you for your comment. Please see response above.		
Energy Northwest - Columbia		1. The Loss of Off-site power event criteria is much improved from the last draft of EOP 004-2; however, some clarification is needed to more accurately align with NERC Standard NUC-001 in both nomenclature and intent. Specifically, there are many different configurations supplying offsite power to a nuclear power plant and it is essential that all configurations be accounted for. As identified in the applicability section of NUC-001 the applicable transmission entities may include one or more of the following (TO, TOP, TP, TSP, BA, RC, PC, DP, LSE, and other non-nuclear GO/GOPs). Based on the response to previous comments submitted for Draft 2, Energy Northwest understands that the DSR SDT evaluated the use of the word "source" but dismissed the use in favor of "supply" with the justification "[that] 'supply' encompasses all sources". Energy Northwest suggests that the word

Organization	Yes or No	Question 4 Comment
		“source” is used as the event criteria in EOP-004-2 as this nomenclature is commonly used in the licensing basis of a nuclear power plant. By revising the threshold criteria to “one or more” Energy Northwest believes the concern the DSR SDT noted is addressed and ensures all sources are addressed. In addition, by revising the threshold for reporting to a loss of “one or more” will ensure that all potential events (regardless of configuration of off-site power supplies) will be reported by any applicable transmission entity specifically identified in the nuclear plant site specific NPIRs.Energy Northwest proposes that the loss of an off-site power source be revised to an “unplanned” loss to account for planned maintenance that is coordinated in advance in accordance with the site specific NPIRs and associated Agreements. This will also eliminate unnecessary reporting for planned maintenance.Although the loss of one off-site power source may not result in a nuclear generating unit trip, Energy Northwest agrees that an unplanned loss of an off-site power source regardless of impact should be reported within the 24 hour time limit as proposed. Suggest that the Loss of Offsite power to a nuclear generating plant event be revised as follows:Event: Unplanned loss of any off-site power source to a Nuclear Power PlantEntity with Reporting Responsibility: The applicable Transmission Entity that owns and/or operates the off-site power source to a Nuclear Power Plant as defined in the applicable Nuclear Plant Interface Requirements (NPIRs) and associated Agreements.Threshold for Reporting: Unplanned loss of one or more off-site power sources to a Nuclear Power Plant per the applicable NPIRs. *Based on comments received, this event has been updated within Attachment 1 to read as:* *“Complete loss of off-site power to a nuclear generating plant (grid supply)”.* 2. Please consider changing "Operating Plan" with "Procedure(s)". Procedures extend beyond operating groups and provide guidance to the entire company.

Organization	Yes or No	Question 4 Comment
		The DSR SDT intends on keeping "Operating Plan" within EOP-004-2 since NERC has it defined as: *"A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan". As stated, the Operating Plan may contain Operating procedures or Operating Processes. This will give Applicable Entities the greatest flexibility in achieving compliance with this Standard.*
Response: Thank you for your comment. Please see response above.		
Colorado Springs Utilities		Agree with concept to combine CIP-001 into EOP-004. Agree with elimination of "sabotage" concept. Appreciate the attempt to combine reporting requirements, but it seems that in practice will still have separate reporting to DOE and NERC/Regional Entities. EOP-004-2 A.5. "Summary of Key Concepts" refers to Att. 1 Part A and Att. 1 Part B. I believe these have now been combined. EOP-004-2 A.5. "Summary of Key Concepts" refers to development of an electronic reporting form and inclusion of regional reporting requirements. It is unfortunate no progress was made on this front.
Response: Thank you for your comment. The DSR SDT is providing a proposed revision to the NERC Rules of Procedure to address the electronic reporting concept. These proposed revisions will be posted with the standard.		
American Transmission Company, LLC		ATC appreciates the work of the SDT in incorporating changes that the industry had with reporting time periods and aligning this with the Events Analysis Working Group and Department of Energy's OE 417 reporting form.
Response: Thank you for your comment.		

Organization	Yes or No	Question 4 Comment
Manitoba Hydro		Attachment 1 - The term 'Transmission Facilities' used in Attachment 1 is capitalized, but it is not a defined term in the NERC glossary. The drafting team should clarify this issue. *Both Transmission and Facilities are defined terms and the DSR SDT feels this gives sufficient direction.* Attachment 2 - The inclusion of 'Fuel supply emergency' in Attachment 2 creates confusion as it infers that reporting a 'fuel supply emergency' may be required by the standard even though 'fuel supply emergency' is not listed in Attachment 1. On a similar note, it is not clear what the drafting team is hoping to capture by including a checkbox for 'other' in Attachment 2. *The DSR SDT has removed both "fuel supply emergency" and "other" from Attachment 2.*
Response: Thank you for your comment. Please see response above.		
NV Energy		Attachment 1 includes an item "Detection of a reportable cyber security incident." The reporting requirement is a report via Attachment 2 or the OE417 report form submittal. However, under CIP-008, to which this requirement is linked, the reporting is accomplished via NERC's secure CIPIS reporting tool. This appears to be a conflict in that the entity is directed to file reporting under CIP-008 that differs from this subject standard. *CIP-008-4, Requirement 1, Part 1.3 states that an entity must have:* *1.3 Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.*

Organization	Yes or No	Question 4 Comment
		EOP-004-2 also allows for submittal of the report to the ESISAC. Attachment 1 also includes a provision for reporting the "loss of firm load greater than or equal to 15 minutes in an amount of 200MW (or 300MW for peaks greater than 3000MW). This appears to be a rather low threshold, particularly in comparison with the companion loss of generation reporting threshold elsewhere in the attachment. The volume of reports triggered by this low threshold will likely lead to an inordinate number of filed reports, sapping NERC staff time and deflecting resources from more severe events that require attention. I suggest either an increase in the threshold, or the addition of the qualifier "caused by interruption/loss of BES facilities" in this reporting item. This qualifier would therefore exclude distribution-only outages that are not indicative of a BES reliability issue. *The DSR SDT has not modified this event since it is being maintained as it is presently enforceable within EOP-004-1.*
Response: Thank you for your comment. Please see response above.		
BC Hydro		Attachment 1: Reportable Events: BC Hydro recommends further defining “BES equipment” for the events Destruction of BES equipment and Risk to BES equipment. Attachment 1: Reportable Events: BC Hydro recommends defining the Forced intrusion event as the wording is very broad and open to each entities interpretation. What would be a forced intrusion ie entry or only if equipment damage occurs? *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* • *The ‘Damage or Destruction’ event category has been revised to say ‘ to a Facility’, (a defined term) and thresholds have be modified to provide clarity.*

Organization	Yes or No	Question 4 Comment
		The footnote was deleted • *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples.* *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.*
Response: Thank you for your comment. Please see response above.		
ISO New England		Attachment 1should be revisited. "Equipment Damage" is overly vague and will also potentially result in reporting on equipment failures which may simply be related to the age and/or vintage of equipment. *The DSR SDT has revised this event based on comments received. The new event is "Damage or destruction of a Facility" which has a threshold of "Damage or destruction of a Facility that:* *Affects an IROL (per FAC-014)* *OR* *Results in the need for actions to avoid an Adverse Reliability Impact* *OR*

Organization	Yes or No	Question 4 Comment
		Results from intentional human action."
Response: Thank you for your comment. Please see response above.		
Constellation Energy on behalf of Baltimore Gas & Electric, Constellation Power Generation, Constellation Energy Commodities Group, Constellation Control and Dispatch, Constellation NewEnergy and Constellation Energy Nuclear Group.		Background Section: The background section in this revision of EOP-004 reads more like guidance than a background of the development of the event reporting standard. Because of the background remains as part of the standard, the language raises questions as to role it plays relative to the standard language. For instance, the Law Enforcement Reporting section states:"Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES." It's not clear how "potential to impact to a wider area of the BES" is defined and where it fits into the standard. As well, and perhaps more problematic, is the Reporting Hierarchy for Reportable Events flow chart. While the flow chart concept is quite useful as a guidance tool, the flow chart currently in the Background raises questions. For instance, the Procedure to Report to Law Enforcement sequence does not map to language in the requirements. Further, Entities would not know about the interaction between law enforcement agencies. *The DSR SDT included the flow chart as an example of how an entity might report and communicate an event. For clarity, we have added the phrase "Example of Reporting Process Including Law Enforcement" to the top of the page.* Please see additional recommended revisions to the requirement language and to the Events Table in the Q2 and Q3 responses. *The DSR SDT has removed the wording of "potential" based on comments received.* Attachment 2: Event Reporting Form: The review of the form is one of the many aspects to compare with the developments within the Events Analysis Process (EAP) developments. We support the effort to create one form for submissions. The

Organization	Yes or No	Question 4 Comment
		recent draft EAP posted as part of Planning Committee and Operating Committee agendas includes a form requiring a few bits of additional relevant information when compared to the EOP-004 form. This may be a valuable approach to avoid follow up inquiries that may result if the form is too limited. We suggest that consideration be given to the proposed EAP form. One specific note on the Proposed EOP-004 Attachment 2: The "Potential event" box in item 3 should be eliminated to track with the removal of the "Risk to the BES" category. *The DSR SDT has updated Attachment 2 to remove potential event and "Risk to the BES" category based on comments received.*
Response: Thank you for your comment. Please see response above.		
Bonneville Power Administration		BPA believes that Attachment 1 has too many added reportable items because unintentional, equipment failure & operational errors are included in the first three items. A. Change to only "intentional human action". Otherwise, the first item "destruction of BES equipment" is too burdensome, along with its short time reporting time: i. - If a single transformer fails that shouldn't require a report. ii.- Emergency actions have to be taken for any failure of equipment, e.g. a loss of line reduces a path SOL and requires curtailments to reduce risk to the system. *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* • *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* B. The item for "risk to BES" is not necessary until the suspicious object has been identified as a threat. If what turns out to be air impact wrench left next to BES

Organization	Yes or No	Question 4 Comment
		equipment, that should not be a reportable incident as this current table implies. *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples.* *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* C. The nuclear "LOOP" should be only reported if total loss of offsite source (i.e. 2 of 2 or 3 of 3) when supplying the plants load. If lightning or insulator fails causing one of the line sources to trip that's not a system disturbance especially if it is just used as a backup. It should only be a NRC process if they want to monitor that. *The DSR SDT has updated this event per your comment, it now reads as: "Complete loss of off-site power to a nuclear generating plant (grid supply)"* The VRF/VSL: BPA believes that the VRF for R2 & R4 should be "Lower". *The DSR SDT has reviewed and updated the two new requirements and believe the VRF's follow the NERC Standard development process.*
Response: Thank you for your comment. Please see response above.		
CenterPoint Energy		CenterPoint Energy appreciates the SDT's consideration of comments and removal of the term, Impact Event. However, the Company still suggests removing the phrase "with the potential to impact" from the purpose as it is vast and vague. An

Organization	Yes or No	Question 4 Comment
		alternative purpose would be "To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of events that impact reliability and their causes if known". The focus should remain on those events that truly impact the reliability of the BES. *The DSR SDT revised the purpose statement to remove ambiguous language "with the potential to impact reliability". The Purpose statement now reads:* ***"To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities."*** CenterPoint Energy remains very concerned about the types of events that the SDT has retained in Attachment 1 as indicated in the following comments: Destruction of BES Equipment - The loss of BES equipment should not be reportable unless the reliability of the BES is impacted. *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* • *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* Footnote 5, iii should be modified to tie the removal of a piece of equipment from service back to reliability of the BES. Risk to BES equipment: This Event is too vague to be meaningful and should be deleted. The Event should be modified to "Detection of an imminent physical threat to BES equipment". *The SDR SDT discussed this event as well as the event "Risk to BES equipment". These two event types had overlap in the perceived reporting requirements. The DSR SDT removed "Forced Intrusion" as a category and the "Risk to BES equipment" event was revised to "A physical threat that could impact the operability of a Facility".*

Organization	Yes or No	Question 4 Comment
		Jsing judgment is unavoidable for this type of event. This language was chosen because he Responsible Entity is the best position to exercise this judgment and determine vhether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to ndustry awareness are reported. *The footnote regarding this event type was expanded to provide additional guidance in:* *"Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility."* Any reporting time frame of 1 hour is unreasonable; Entities will still be responding to the Event and gathering information. A 24 hour reporting time frame would be more reasonable and would still provide timely information. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1.*

Organization	Yes or No	Question 4 Comment
		System Separation: The 100 MW threshold is too low for a reliability impact. A more appropriate threshold is 500 MW. *The DSR SDT has reviewed your request and have determined the event as written "Each separation resulting in an island of generation and load ≥ 100 MW" does impact the reliability of the BES.* Loss of Monitoring or all voice communication capability: The two elements of this Event should be separated for clarity as follows: "Loss of monitoring of Real-Time conditions" and "Loss of all voice communication capability." *The DSR SDT has broken this event down into two distinct events: "Loss of all voice communication capability" and "Complete or partial loss of monitoring capability", per comments received.*
Response: Thank you for your comment. Please see response above.		
Orange and Rockland Utilities, Inc./Consolidated Edison Co. of NY, Inc.		Comments: o Requirement 4 does not specifically state details necessary for an entity to achieve compliance. Requirement 4 should provide more guidance as to what is required in a drill. Audit / enforcement of any requirement language that is too broad will potentially lead to Regional interpretation, inconsistency, and additional CANs. o R4 should be revised to delete the 15 month requirement. CAN-0010 recognizes that entities may determine the definition of annual. *Requirement R4 has been revised as you suggested.* o The Purpose of the Standard should be revised because some of the events being reported on have no impact on the BES. Revise Purpose as follows: To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of [add] "major system events." [delete - "with the potential to impact

Organization	Yes or No	Question 4 Comment
		reliability and their causes, if known, by the Responsible Entities.”] *The DSR SDT revised the purpose statement to remove ambiguous language “with the potential to impact reliability”. The Purpose statement now reads:* ***“To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities.”***
Response: Thank you for your comment. Please see response above.		
Entergy Services		Entergy agrees with and supports comments submitted by the SERC OC Standards Review group.
Response: Thank you for your comment.		
ITC		Footnote 1 and the corresponding Threshold For Reporting associated with the first Event in Attachment 1 are not consistent and thus confusing. Qualifying the term BES equipment through a footnote is inappropriate as it leads to this confusion. For instance, does iii under Footnote 1 apply only to BES equipment that meet i and ii or is it applicable to all BES equipment? *The SDR SDT discussed this event as well as the event “Risk to BES equipment”. These two event types had overlap in the perceived reporting requirements. The DSR SDT removed “Forced Intrusion” as a category and the “Risk to BES equipment” event was revised to “A physical threat that could impact the operability of a Facility”.* *Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported.*

Organization	Yes or No	Question 4 Comment
		The footnote regarding this event type was expanded to provide additional guidance in: *"Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility."* The inclusion of equipment failure, operational error and unintentional human action within the threshold of reporting for "destruction" required in the first 3 Events listed in Attachment 1 is also not appropriate. It is clear through operational history that the intent of the equipment applied to the system, the operating practices and personnel training developed/delivered to operate the BES is to result in reliable operation of the BES which has been accomplished exceedingly well given past history. This is vastly different than for intentional actions and should be excluded from the first 3 events listed in Attachment. To the extent these issues are present in another event type they will be captured accordingly. *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* • *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* • *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its*

Organization	Yes or No	Question 4 Comment
		Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples. *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* Footnote 1 should be removed and the Threshold for Reporting associated with the first three events in Attachment 1 should be updated only to include intentional human action. This will also result in including all BES equipment that was intentionally damaged in the reporting requirement and not just the small subset qualified by the existing footnote 1. This provides a much better data sample for law enforcement to make assessments from than the smaller subset qualified by what we believe the intent of footnote 1 is. *The SDR SDT discussed this event as well as the event "Risk to BES equipment". These two event types had overlap in the perceived reporting requirements. The DSR SDT removed "Forced Intrusion" as a category and the "Risk to BES equipment" event was revised to "A physical threat that could impact the operability of a Facility".* *Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported.* *The footnote regarding this event type was expanded to provide additional guidance in:*

APX Power Markets (NCR-11034)		For Attachment 1 and the events titled "Unplanned Control Center evacuation" and "Loss of monitoring or all voice communication capabiliy".RC, BA, and TOP are the only listed entity types listed for reporting responsibility. We are a GOP that offers a SCADA service in several regions and those type of events could result in a loss of situational awareness for the regions we provide services. I believe the requirement for reporting should not be limited to Entity Type, but on their impact for situational awareness to the BES based on the amount of generation they control (specific to our case), or other criteria that would be critical to the BES (i.e. voltage, frequency). *Note that EOP-008-0 is only applicable to Balancing Authorities, Transmission Operators and Reliability Coordinators, this is the basis for the "Entity with reporting Responsibilities" and reads as" "Each RC, BA, TOP that experiences the event".*
Response: Thank you for your comment. Please see response above.		
ACES Power Marketing Standards Collaborators/ Great River Energy		For many of the events listed in Attachment 1, there would be duplicate reporting the way it is written right now. For example, in the case of a fire in a substation (Destruction of BES equipment), the RC, BA, TO, TOP and perhaps the GO and GOP could all experience the event and each would have to report on it. This seems quite excessive and redundant. We recommend eliminating this duplicate reporting. *The DSR SDT has tried to minimize duplicative reporting, but recognizes there may be*

Organization	Yes or No	Question 4 Comment
		events that trigger more than one report. The current applicability ensures an event that could affect just one of the entities with reporting responsibility isn't missed.
Response: Thank you for your comment. Please see response above.		
Intellibind		I do not see that the rewrite of this standard is meeting the goal of clear reliability standards, and in fact the documents are looking more like legal documents. Though the original EOP-004 and CIP-001 was problematic at times, this rewrite, and the need to have such extensive guidance, attachments, and references for EOP-004-2 will create an even more difficult standard to properly meet to ensure compliance during an audit. Though CIP-001 and EOP-004 were related, combining them in a single standard is not resolving the issues, and is in fact complicating the tasks.Requirements in this standard should deal with only one specific issue, not deal with multiple tasks. I am not sure how an auditor will consistently audit against R2, and how a violation will be categorized when an entity implements all portions of their Operating Plan, however fails to fully address all the requirements in R1, thereby not fully implementing R2, in strict interpretation. *The DSR SDT does not agree that the proposed EOP-004-2 "will create an even more difficult standard to properly meet to ensure compliance during an audit". The DSR SDT main concern is the reporting of events per Attachment 1 is in-line with the Purpose of this Standard that states: "To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities." The NERC Reliability Standards are designed to support the reliability of the BES.* *Requirement R2has been updated to read as: ""R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment1." Based on comments received.* The drafting team should not set up a situation where an entity is in double jeopardy for missing an element of a requirement.I also suggest that EOP-004-2 be given a

Organization	Yes or No	Question 4 Comment
		new EOP designation rather than calling it a revision. This way implementation can be better controlled, since most companies have written specific CIP-001 and EOP-004 document that will not simple transfer over to the new version. This standard is a drastic departure from the oringial versions. I appreciate the level of work that is going into EOP-004-2, it appears that significant time and effort has been going into the supporting documentation. It is my opinion that if this much material has to be created to state what the standard really requires, then the standard is flawed. When there are 21 pages of explanation for five requirements, especially when we have previously had 16 pages that originally covered 2 separate reliability standards, we need to reevaluate what we are really doing. *The DSR SDT has revised EOP-004 and CIP-001 using the results based standard development process. This process calls for the drafting team to develop documentation regarding its thoughts during the development process. This allows for a more robust standard which contains background material for an entity to have sufficient guidance to show compliance with the standard.*
Response: Thank you for your comment. Please see response above.		
Imperial Irrigation District		IID strongly believes the reporting flowchart should not be part of a standard. The suggestion is to replace it with a more clear, right to the point requirement. *The DSR SDT has discussed this issue and believes it would be too prescriptive to have a flow chart as a requirement. If desired, an entity can have a flow chart as part of the Operating Plan as stated in Requirement 1.*
Response: Thank you for your comment. Please see response above.		
Illinois Municipal Electric Agency		IMEA appreciates this opportunity to comment. IMEA appreciates the SDT's efforts to simplify reporting requirements by combining CIP-001 with EOP-004. [IMEA encourages NERC to continue working towards a one-stop-shop to simplify reporting on ES-ISAC.] IMEA supports, and encourages SDT consideration of, comments

		submitted by APPA and Florida Municipal Power Agency.
Response: Thank you for your comment. Please see the responses to the other comments that you mention.		
Westar Energy		In Requirement 1.3, the statement “and the following as appropriate” is vague and subject to interpretation. Who determines what is appropriate? We feel it would be better if the SDT would specify for each event, which party should be notified. *Requirement R1, Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase “as appropriate” and indicating that the Responsible Entity is to define its process for reporting and with whom to report events. Part 1.2 now reads:* *“1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity’s Reliability Coordinator; law enforcement governmental or provincial agencies.”*
Response: Thank you for your comment. Please see response above.		
South Carolina Electric and Gas		In terms of receiving reports, is it the drafting teams expectation that separate reports be developed by both the RC and the TOP, GO, BA, etc. for an event that occurs on a company's system that is within the RC's footprint? One by the RC and one by the TOP, GO, BA, etc. In terms of meeting reporting thresholds, is it the drafting teams expectation that the RC aggregate events within its RC Area to determine whether a reporting threshold has been met within its area for the quantitative thresholds? *The DSR SDT has tried to minimize duplicative reporting, but recognizes there may be events that trigger more than one report. The current applicability ensures an event*

Organization	Yes or No	Question 4 Comment
		that could affect just one of the entities with reporting responsibility isn't missed. *It is possible for the Applicable Entities within the Reliability Coordinator's area to be part of a JRO/CFR but this is outside the scope of this Project.*
Response: Thank you for your comment. Please see response above.		
Occidental Power Services, Inc. (OPSI)		Load Serving Entities that do not own or operate BES assets should not be included in the Applicability. In current posting, the SDT states that it includes LSEs based on CIP-002; however, if the LSE does not have any BES assets, CIP-002 should also not be applicable, because the LSE could not have any Critical Assets or Critical Cyber Assets. It is understood that the SDT is trying to comply with FERC Order 693, Section 460 and 461; however, Section 461 also states "Further, when addressing such applicability issues, the ERO should consider whether separate, less burdensome requirements for smaller entities may be appropriate to address these concerns." A qualifier in the Applicability of EOP-004-2 that would include only LSEs that own or operate BES assets would seem appropriate. The proposed CIP-002 Version V has such a qualifier in that it applies to a "Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES: o A UFLS program required by a NERC or Regional Reliability Standard o A UVLS program required by a NERC or Regional Reliability Standard"The SDT should consider the same wording in the Applicability section of EOP-004-2 on order to be consistent with what will become the standing version of CIP-002 (Version 5). *The DSR SDT has "considered" section 460 and 461 of FERC Order 693 and has tried to minimize duplicative reporting, but recognizes there may be events that trigger more than one report. The current applicability ensures an event that could affect just one of the entities with reporting responsibility isn't missed.* *The DSR SDT wishes to draw your attention to section 459 of FERC Order 693 which states: " … an adversary may target a small user, owner or operator because it may*

Organization	Yes or No	Question 4 Comment
		have similar equipment or protections as a larger facility, that is, the adversary may use an attack against a smaller facility as a training 'exercise'".
Response: Thank you for your comment. Please see response above.		
American Electric Power		M4: Recommend removing the text "for events" so that it instead reads "The Responsible Entity shall provide evidence that it verified the communication process in its Operating Plan created pursuant to Requirement R1, Part 1.3."R4: It is not clear to what extent the verification needs to be applied if the process used is complex and includes a variety of paths and/or tasks. The draft team may wish to consider changing the wording to simply state "each Responsible Entity shall test each of the communication paths in the operating plan". We also recommend dropping "once per calendar year" as it is inconstant with the measure itself which allows for 15 months. *The DSR SDT has revised R4 (now R3 and the associated measure M3:* *M3. Each Responsible Entity will have dated and time-stamped records to show that the annual test of Part 1.2 was conducted. Such evidence may include, but are not limited to, dated and time stamped voice recordings and operating logs or other communication documentation. The annual test requirement is considered to be met if the responsible entity implements the communications process in Part 1.2 for an actual event. (R3)*
Response: Thank you for your comment. Please see response above.		
Indiana Municipal Power Agency		Many of the items listed in Attachment 1 are onerous and burdensome when it comes to making judgments or determinations. What one may consider "Risk to BES equipment" another person may not make the same determination. Clarity needs to

Organization	Yes or No	Question 4 Comment
		be added to make the events easier to determine and that will result in less issues when it comes to compliance audits. IMPA does not understand the usage of the terms Critical Asset and Critical Cyber Asset as they will be retired with CIP version 5.IMPA believes the data retention requirements are way too complicated and need to be simplified. It seems like it would be less complicated if one data retention period applied to all data associated with this standard. *The DSR has revised many of the events listed in Attachment 1 to provide clarity. We have also removed the references to Critical Asset and Critical Cyber Asset.* On “public appeal”, in the threshold, the descriptor “each” should be deleted, e.g., if a single event causes an entity to be short of capacity, do you really want that entity reporting each time they issue an appeal via different types of media, e.g., radio, TV, etc., or for a repeat appeal every several minutes for the same event? *The DSR SDT has updated the Public Appeal event to read as: “Public appeal for load reduction event” based on comments received.*
Response: Thank you for your comment. Please see response above.		
MidAmerican Energy		MidAmerican proposes eliminating the phrase “with no more than 15 months between reviews” from R1.5. While we agree this is best practice, it creates the need to track two conditions for the review, eliminates flexibility for the responsible entity and does not improve security to the Bulk Electric System. There has not been a directive from FERC to specify the definition of annual within the standard itself. In conjunction with this comment, the Violation Severity Levels for R4 should be revised to remove the references to months. *The DSR SDT has removed this phrase from the requirement (now R3).*

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. Please see response above.		
Oncor Electric Delivery Company LLC		NERC's Event Analysis Program tends to parallel many of the reporting requirements as outlined in EOP-004 Version 2. Oncor recommends that NERC considers ways of streamlining the reporting process by either incorporating the Event Analysis obligations into EOP-004-2 or reducing the scope of the Event Analysis program as currently designed to consist only of "exception" reporting. *The DSR SDT has reviewed the Event Analysis Programs criteria. The DSR SDT has determined that Attachment 1 covers the minimum reporting requirements.*
Response: Thank you for your comment. Please see response above.		
Compliance & Responsbility Office		NextEra Energy, Inc. (NextEra) appreciates the DSR SDT revising proposed EOP-004-2, based on the previous comments of NextEra and the stakeholders. NextEra, however, believes that EOP-004-2 needs additional refinement prior to approval. R1.3In R1.3, NextEra is concerned that the term “internal company personnel” is unclear and may be misinterpreted. For example, NextEra does not believe this term should include all company or corporate personnel, or even all personnel in the Responsible Entity’s company or business unit. Instead, the definition of personnel should be limited to those who could be directly impacted by the event or are working on the event. Thus, NextEra suggests that the language in R1.3 be revised to read: “Internal Responsible Entity personnel whose tasks require them to take specific actions to mitigate, stop the spread and/or normalize the event, or personnel who are directly impacted by the event.” NextEra is concerned that R1.3, as written, will be interpreted differently from company to company, region to region, auditor to auditor, and, therefore, may result in considerable confusion during actual events as well as during the audits/stop checks of EOP-004-2 compliance.

Organization	Yes or No	Question 4 Comment
		The DSR SDT has written Requirement R1, Part 1.2 in a way to allow the entity to determine who should receive the communication within your company as stated in your Operating Plan. Also, in R1.3, NextEra is concerned that many of the events listed in Attachment A already must be reported to NERC under its trial (soon to be final) Event Analysis Reporting requirements (Event Analysis). NextEra believes duplicative and different reporting requirements in EOP-004-2 and the Event Analysis rules will cause confusion and inefficiencies during an actual event, which will likely be counterproductive to promoting reliability of the bulk power system. Thus, NextEra believes that any event already covered by NERC's Event Analysis should be deleted from Attachment 1. Events already covered include, for example, loss of monitoring or all voice, loss of firm load and loss of generation. If this approach is not acceptable, NextEra proposes, in the alternative, that the reporting requirements between EOP-004-2 and Event Analysis be identical. For instance, in EOP-004-2, there is a requirement to report any loss of firm load lasting for more than 15 minutes, while the Event Analysis only requires reporting the of loss of firm load above 300 megawatts and lasting more than 15 minutes. Similarly, EOP-004-2 requires the reporting of any unplanned control center evacuation, while the Event Analysis only requires reporting after the evacuation of the control center that lasted 30 minutes or more. Thus, NextEra requests that either EOP-004-2 not address events that are already set forth in NERC's Event Analysis, or, in the alternative, for those duplicative events to be reconciled and made identical, so the thresholds set forth in the Event Analysis are also used in EOP-004-2. *The DSR SDT has worked with the EAWG to develop Attachment 1. At one point they matched. The event for loss of load matches and we revised the "unplanned control center evacuation" event to be for 30 minutes or more.* In addition, NextEra believes that a reconciliation between the language "of recognition" in Attachment 1 and "process to identify" in R1.1 is necessary. NextEra prefers that the language in Attachment 1 be revised to read " . . . of the

Organization	Yes or No	Question 4 Comment
		identification of the event under the Responsible Entity's R1.1 process." For instance, the first event under the "Submit Attachment 2 . . . ." column should read: "The parties identified pursuant to R1.3 within 1 hour of the identification of an event under the Responsible Entity's R1.1 process." This change will help eliminate confusion, and will also likely address (and possibly make moot) many of the footnotes and qualifications in Attachment 1, because a Responsible Entity's process will likely require that possible events are properly vetted with subject matter experts and law enforcement, as appropriate, prior to identifying them as "events". Thus, only after any such vetting and a formal identification of an event would the one hour or twenty-four hour reporting clock start to run. R1.4, R1.5, R3 and R4NextEra is concerned with the wording and purpose of R1.4, R1.5, R3 and R4. *The language was revised in Requirement 1, Part 1.1 to "recognize" based on other comments received.* For example, R1.4 requires an update to the Operating Plan for ". . . any change in assets, personnel, other circumstances . . . ." This language is much too broad to understand what is required or its purpose. Further, R1.4 states that the Operating Plan shall be updated for lessons learned pursuant to R3, but R3 does not address lessons learned. Although there may be lessons learned during a post event assessment, there is no requirement to conduct such an assessment. Stepping back, it appears that the proposed EOP-004-2 has a mix of updates, reviews and verifications, and the implication that there will be lessons learned. Given that EOP-004-2 is a reporting Standard, and not an operational Standard, NextEra is not inclined to agree that it needs the same testing and updating requirements like EOP-005 (restoration) or EOP-008 (control centers). Thus, it is NextEra's preference that R1.4, R1.5 and R4 be deleted, and replaced with a new R1.4 as follows:R1.4 A process for ensuring that the Responsibly Entity reviews, and updates, as appropriate its Operating Plan at least annually (once each calendar year) with no more than 15 months between reviews.If the DSR SDT does not agree with this approach, NextEra, in the alternative, proposes a second approach that consolidates R1.4, R1.5 and R4 in a new R1.4 as follows:R1.4 A process for ensuring that the Responsibly Entity tests

Organization	Yes or No	Question 4 Comment
		and reviews its Operating Plan at least annually (once each calendar year) with no more than 15 months between a test and review. Based on the test and review, the Operating Plan shall be updated, as appropriate, within 90 calendar days. If an actual event occurs, the Responsible Entity shall conduct a post event assessment to identify any lessons learned within 90 calendar days of the event. If the Responsible Entity identifies any lessons learned in post event assessment, the lessons learned shall be incorporated in the Operating Plan within 90 calendar days of the date of the final post event assessment. NextEra purposely did not add language regarding "any change in assets, personnel etc," because that language is not sufficiently clear or understandable for purposes of a mandatory requirement. Although it may be argued that it is a best practice to update an Operating Plan for certain changes, unless the DST SDT can articulate specific, concrete and understandable issues that require an updated Operating Plan prior to an annual review, NextEra recommends that the concept be dropped. *Requirement 1, Part 1.4 was merged with Part 1.5 as well as R4. The resulting requirement is now Requirement 3:* *"Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]* Nuclear Specific ConcernsEOP-004-2 identifies the Nuclear Regulatory Commission (NRC) as a stakeholder in the Reporting Process, but does not address the status of reporting to the NRC in the Event Reporting flow diagram on page 9. Is the NRC considered Law Enforcement as is presented in the diagram? Since nuclear stations are under a federal license, some of the events that would trigger local/state law enforcement at non-nuclear facilities would be under federal jurisdiction at a nuclear site. *The process flowchart is an example of how an entity might operate. If an event requires notification of the NRC, this would be an example of notification of a regulatory authority. It is anticipated that the reporting entity would also notify law*

Organization	Yes or No	Question 4 Comment
		enforcement if appropriate. There are some events listed in Attachment 1 that seem redundant or out of place. For example, a forced intrusion is a one hour report to NERC. However, if there is an ongoing forced intrusion at a nuclear power plant, there are many actions taking place, with the NRC Operations Center as the primary contact which will mobilize the local law enforcement agency, etc. *The DSR SDT removed "Forced Intrusion" as a category and the "Risk to BES equipment" event was revised to "Any physical threat that could impact the operability of a Facility".* It is unclear that reporting to NERC in one hour promotes reliability or the resolution of an emergency in progress. *All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:* *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1.* Also, is there an ability to have the NRC in an emergency notify NERC? The same concerns related to cyber security events.Procedures versus PlanNextEra also suggests replacing "Operating Plan" with "procedures". Given that EOP-004-2 is a reporting Standard and not an operational Standard, it is typical for procedures that address this standard to reside in other departments, such as Information Management and Security. In other words, the procedures needed to address the requirements of EOP-004-2 are likely broader than the NERC-defined Operating Plan.

Organization	Yes or No	Question 4 Comment
		Within your Operating Plan you are required to "report" events to the ERO and your RC and communicate this information (to others) as you define it within your company's Operating Plan. This will allow you to customize any events as you see fit. Clean-Up ItemsIn Attachment 1, Control Centers should be capitalized in all columns so as not to be confused with control rooms. *Since "control center" is not a defined term, it has been revised to lower case.* Also, the final product should clearly state that the process flow chart that is set forth before the Standard is for illustrative purposes, so there is no implication that a Registered Entity must implement multiple procedures versus one comprehensive procedure to address different reporting requirements. *The introduction of the flow chart is clearly marked "Example of Reporting Process including Law Enforcement".*
Response: Thank you for your comment. Please see response above.		
PacifiCorp		No comment.
Arizona Public Service Company		No comments
PPL Electric Utilities and PPL Supply Organizations`		Our comments center around the footnotes and events 'Destruction of BES equipment' and 'Loss of Off-site power to a nuclear generating plant'. We request the SDT consider adding a statement to the standard that acknowledges that not all registered entities have visibility to the information in the footnotes. E.G. Destruction of BES equipment. A GO/GOP does not necessarily know if loss of specific BES equipment would affect any IROL and therefore would not be able to consider this criteria in its reporting decision. Loss of BES equipment would be reported to the BA/RC and the BA/RC would know of an IROL impact and the BA/RC

Organization	Yes or No	Question 4 Comment
		is the appropriate entity to report. We request the SDT consider the information in the footnotes for inclusion in the table directly. Consider Event 'Destruction of BES equipment'. Is footnote 1 a scoping statement? Is it part of the threshold? Is it the impact? Is it defining Destruction? If the BES equipment was destroyed by weather and does not affect an IROL, then is no report is needed? Alternatively, do you still apply the threshold and say it was external cause and therefore report? *Several event categories were removed or combined to improve Attachment 1. The footnotes that you mention were removed and included in the threshold for reporting column. If an entity does not experience an event, then they should not report on it. As you suggest, most GO /GOPs do not see the transmission system. It is anticipated that they will report for events on their Facilities.* We suggest including a flowchart on how to use Attachment 1 with an example. The flowchart would explain the order in which to consider the event and the threshold, and footnotes if they remain. Regarding Attachment 1 Footnote 1 'do not report copper theft...unless it degrades the ability of equipment to operate correctly.', is this defining destruction as not operating correctly ? or is the entirety of footnote 1 a definition of destruction? Regarding Attachment 1 Footnote 1, iii, we request this be changed for consistency with the Event and suggest removing damage from the footnote. i.e. The event is 'destruction' whereas the footnote says 'damaged or destroyed'. The standard does not provide guidance on damage vs destruction which could lead to differing reporting conclusions. Is the reporting line out of service, beyond repair, or is it timeframe based? Regarding Attachment 1 Footnote 2 ' to steal copper... unless it affects the reliability of the BES', is affecting the reliability of the BES a consideration in all the events? PPL believes this is the case and request this statement be made. This could be included in the flowchart as a decision point. Regarding Event 'Loss of Off-site power to a nuclear generating plant', the threshold for reporting does not designate if the off-site loss is planned and/or unplanned - or if the reporting threshold includes the loss of one source of off-site power or is the reporting limited to when all off-site sources are unavailable. PPL recommends the event be ‘Total unplanned loss of offsite power to a nuclear generating plant (grid

Organization	Yes or No	Question 4 Comment
		supply)'Thank you for considering our comments. *The SDR SDT discussed "Forced Intrusion" as well as the event "Risk to BES equipment". These two event types had overlap in the perceived reporting requirements. The DSR SDT removed "Forced Intrusion" as a category and the "Risk to BES equipment" event was revised to "A physical threat that could impact the operability of a Facility".* *Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported.* *The footnote regarding this event type was expanded to provide additional guidance in:* *"Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility."* *The DSR SDT has updated the Requirements based on comments received along with updating Attachment 1 and 2. Please review the updated standard for all your concerns.*
Response: Thank you for your comment. Please see response above.		
City of Austin dba Austin		Overarching Concern related to EOP-004-2 draft:The contemporaneous drafting efforts related to both the proposed Bulk Electric System ("BES") definition changes

Organization	Yes or No	Question 4 Comment
Energy		and CIP Standards Version 5 could significantly impact the EOP-004-2 reporting requirements. Caution needs to be exercised when referencing these definitions, as the definition of a BES element could change significantly and the concepts of “Critical Assets” and “Critical Cyber Assets” no longer exist in Version 5 of the CIP Standards. *The ‘Damage or Destruction’ events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and ‘Damage or Destruction of a Facility’ reporting thresholds.* Additionally, it is debatable whether the destruction of, for example, one relay would be a reportable incident given the proposed language. Related to “Reportable Events” of Attachment 1:1. The “Purpose” section of the Standard indicates it is designed to require the reporting of events “with the potential to impact reliability” of the BES. Footnote 1 and the “Threshold for Reporting” associated with the Event described as “Destruction of BES equipment” expand the reporting scope beyond that intent. For example, a fan on a generation unit can be destroyed because a plant employee drops a screwdriver into it. We believe such an event should not be reportable under EOP-004-2. Yet, as written, a Responsible Entity could interpret that event as reportable (because it would be “unintentional human action” that destroyed a piece of equipment associated with the BES). If the goal of the SDT was to include such events, we think the draft Standard goes too far in requiring reporting. If the SDT did not intend to include such events, the draft Standard should be revised to make that fact clear. *‘Forced intrusion’ and ‘Risk to BES Equipment’ have been combined under a new event type called ‘A physical threat that could impact the operability of a Facility’. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT*

Organization	Yes or No	Question 4 Comment
		believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. 2. Item iii) in Footnote 1 seems redundant with the Threshold for Reporting.3. The word "Significantly" in item ii) of footnote 1 introduces an element of subjectivity. What is "significant" to one person may not be significant to someone else.4. The word "unintentional" in Item iii) of footnote 1 may introduce nuisance reporting. The SDT should consider: (1) changing the Event description to "Damage or destruction of BES equipment" (2) removing the footnote and (3) replacing the existing "Threshold for Reporting" with the following language:"Initial indication the event: (i) was due to intentional human action, (ii) affects an IROL or (iii) in the opinion of the Responsible Entity, jeopardizes the reliability margin of the system (e.g., results in the need for emergency actions)" *The SDR SDT revised this event to "Damage or destruction of a Facility" and removed the footnote. The threshold for reporting now reads:* *Damage or destruction of a Facility that:* *Affects an IROL (per FAC-014)* *OR* *Results in the need for actions to avoid an Adverse Reliability Impact* *OR* *Results from intentional human action.* 5. One reportable event is "Risk to the BES" and the threshold for reporting is, "From a non-environmental physical threat." This appears to be intended as a catch-all reportable event. Due to the subjectivity of this event description, we suggest removing it from the list. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical*

Organization	Yes or No	Question 4 Comment
		Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds. 6. One reportable event is "Damage or destruction of Critical Asset per CIP-002." The SDT should define the term "Damage" in order for an entity to determine a threshold for what qualifies as "Damage" to a CA. Normal "damage" can occur on a CA that should not be reportable (e.g. the screwdriver example, above). *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* 7. For the event called "BES Emergency requiring public appeal for load reduction," the SDT should make it clear who should report such an event. For example, in the ERCOT Region, there is a requirement that ERCOT issue public appeals for load reduction (See ERCOT Protocols Section 6.5.9.4). As the draft of EOP-004-2 is currently written, every Registered Entity in the ERCOT Region would have to file a report when ERCOT issues such an appeal. Such a requirement is overly burdensome and does not enhance the reliability of the BES. The Standard should require that the Reliability Coordinator file a report when it issues a public appeal to reduce load. *The DSR SDT has tried to minimize duplicative reporting, but recognizes there may be events that trigger more than one report. The current applicability ensures an event that could affect just one of the entities with reporting responsibility isn't missed.* Reporting Thresholds1. See Paragraph 1 in the "Related to 'Reportable Events' of Attachment 1" section, above. 2. We believe damage or destruction of Critical

Organization	Yes or No	Question 4 Comment
		Assets or CCAs resulting from operational error, equipment failure or unintentional human action should not be reportable under this Standard. We recommend changing the thresholds for "Damage or destruction of Critical Asset..." and "Damage or destruction of a [CCA]" to "Initial Indication the event was due to external cause or intentional human action." 3. We support the SDT's attempted to limit nuisance reporting related to copper thefts. However, a number of the thresholds identified in EOP-004-2 Attachment 1 are very low and could clog the reporting process with nuisance reporting and reviewing. An example is the "BES Emergency requiring manual firm load shedding" of â‰¥ 100 MW or "Loss of Firm load for â‰¥ 15 Minutes" that is â‰¥ 200 MW (300 MW if the manual demand is greater than 3000 MW). In many cases, those low thresholds would require reporting minor wind events or other seasonal system issues on a local network used to provide distribution service. Firm Load1. The use of the term "Firm load" in the context of the draft Standard seems inappropriate. "Firm load" is not defined in the NERC Glossary (although "Firm Demand" is defined). If the SDT intended to use "Firm Demand," they should revise the draft Standard to use that language. If the SDT wishes to use the term "Firm load" they should define it. [For example, we understand that some load agrees to be dropped in an emergency. In fact, in the ERCOT Region, we have a paid service referred to as "Emergency Interruptible Load Service" (EILS). If the SDT intends that "Firm load" means load other than load which has agreed to be dropped, it should make that fact clear.] *The thresholds and events listed in Attachment 1 are currently required under DOE OE-417 and NERC reporting requirements.* Comments to Attachment 21. The checkbox for "fuel supply emergency" should be deleted because it is not listed as an Event on Attachment 1. *The DSR SDT has removed both "fuel supply emergency" and "other" from Attachment 2.*

Organization	Yes or No	Question 4 Comment
		2. There should be separation between "forced intrusion" and "Risk to BES equipment." They are separate Events on Attachment 1. *Several stakeholders expressed concerns relating to the "Forced Intrusion" event. Their concerns related to ambiguous language in the footnote. The SDR SDT discussed this event as well as the event "Risk to BES equipment". These two event types had overlap in the perceived reporting requirements. The DSR SDT removed "Forced Intrusion" as a category and the "Risk to BES equipment" event was revised to "A physical threat that could impact the operability of a Facility".* *Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported.* Comments to Guideline and Technical BasisThe last paragraph appears to state NERC will accept an OE-417 form as long as it contains all of the information required by the NERC form and goes on to state the DOE form "may be included or attached to the NERC report." If the intent is for NERC to accept the OE-417 in lieu of the NERC report, this paragraph should be clarified. *The DSR SDT received many comments requesting consistency with DOE OE-417 thresholds and timelines. These items as well as the Events Analysis Working Group's (EAWG) requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across*

Organization	Yes or No	Question 4 Comment
		North America • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use the OE-417 form rather than Attachment 2 to report under EOP-004. The SDT was informed by the DOE of its new online process coming later this year. In this process, entities may be able to record email addresses associated with their Operating Plan so that when the report is submitted to DOE, it will automatically be forwarded to the posted email addresses, thereby eliminating some administrative burden to forward the report to multiple organizations and agencies.*
Response: Thank you for your comment. Please see response above.		
Salt River Project/ Lower Colorado River Authority		Overarching Concern related to EOP-004-2 draft:The contemporaneous drafting efforts related to both the proposed Bulk Electric System ("BES") definition changes and CIP Standards Version 5, could significantly impact the EOP-004-2 reporting requirements. Caution needs to be exercised when referencing these definitions, as the definition of a BES element could change significantly and the concepts of “Critical Assets” and “Critical Cyber Assets” no longer exist in Version 5 of the CIP Standards. *The ‘Damage or Destruction’ events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and ‘Damage or Destruction of a Facility’ reporting thresholds.* Additionally, it is debatable whether the destruction of, for example, one relay would

Organization	Yes or No	Question 4 Comment
		be a reportable incident given the proposed language. Related to “Reportable Events” of Attachment 1:1. The “Purpose” section of the Standard indicates it is designed to require the reporting of events “with the potential to impact reliability” of the BES. Footnote 1 and the “Threshold for Reporting” associated with the Event described as “Destruction of BES equipment” expand the reporting scope beyond that intent. For example, a fan on a generation unit can be destroyed because a plant employee drops a screwdriver into it. We believe such an event should not be reportable under EOP-004-2. Yet, as written, a Responsible Entity could interpret that event as reportable (because it would be “unintentional human action” that destroyed a piece of equipment associated with the BES). If the goal of the SDT was to include such events, we think the draft Standard goes too far in requiring reporting. If the SDT did not intend to include such events, the draft Standard should be revised to make that fact clear. *‘Forced intrusion’ and ‘Risk to BES Equipment’ have been combined under a new event type called ‘A physical threat that could impact the operability of a Facility’. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred.* 2. Item iii) in Footnote 1 seems redundant with the Threshold for Reporting.3. The word “Significantly” in item ii) of footnote 1 introduces an element of subjectivity. What is “significant” to one person may not be significant to someone else.4. The word “unintentional” in Item iii) of footnote 1 may introduce nuisance reporting. The SDT should consider: (1) changing the Event description to “Damage or destruction of BES equipment” (2) removing the footnote and (3) replacing the

		events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. 2. A reportable event is stated as, "Damage or destruction of Critical Asset per CIP-002". The term "Damage" would have to be defined in order for an entity to determine a threshold for what qualifies as "Damage" to a CA. One could argue that normal "Damage" can occur on a CA that is not necessary to report. There should also be caution here in adding CIP interpretation within this standard. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* Reporting Thresholds1. The SDT made attempts to limit nuisance reporting related to copper thefts and so on which is supported. However a number of the thresholds identified in EOP-004-2 Attachment 1 are very low and could congest the reporting process with nuisance reporting and reviewing. An example is the "BES Emergency requiring manual firm load shedding of greater than or equal to 100 MW or the Loss of Firm load for â‰¥ 15 Minutes that is greater than or equal to 200 MW (300 MW if the manual demand is greater than 3000 MW). In many cases these low thresholds represent reporting of minor wind events or other seasonal system issues on Local Network used to provide distribution service. Firm Demand1. The use of Firm Demand in the context of the draft Standards could be used to describe commercial arrangements with a customer rather than a reliability issue. Clarification of Firm Demand would be helpful *The DSR SDT has updated the requirements based on comments received along with updating Attachment 1 and 2. Please review the updated standard for all your*

Organization	Yes or No	Question 4 Comment
		concerns.
Response: Thank you for your comment. Please see response above.		
Pacific Northwest Small Public Power Utility Comment Group		Project 2008-06 proposes to withdraw the terms “Critical Asset” and “Critical Cyber Asset” from the NERC Glossary. In order to avoid a reliability gap when this occurs, we propose including High and Medium Impact BES Cyber Systems and Assets. *The ‘Damage or Destruction’ events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and ‘Damage or Destruction of a Facility’ reporting thresholds.* The revised wording to add, “as appropriate” to R1.3 is a concern. We understand the SDT’s intent to not require all the bulleted parties to be notified for every event type. But will a good faith effort on the part of the registered entity to deem appropriateness be subject to second guessing and possible sanctions by the Compliance Enforcement Authority if they disagree? We note that CIP-001 required an interpretation to address this issue, but cannot assume that interpretation will carry over. We suggest spelling out exactly who shall deem appropriateness. *The phrase “as appropriate” was removed and Requirement 1, Part 1.2 was revised to:* *A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity’s Reliability Coordinator; law enforcement governmental or provincial agencies.* R4 continues to be an onerous requirement for smaller entities. Verification was not

Organization	Yes or No	Question 4 Comment
		part of the SAR and we are not convinced it is needed for reliability. We are unsure how a DP with no generation, no BES assets, no Critical Cyber Assets, and less than 100 MW of load; would meet R4. Shall they drill for impossible events? We ask that R4 be removed. At a minimum it should exclude entities that cannot experience the events of Attachment 1.Entities that cannot experience the events of Attachment 1should likewise be exempt from R1.2, 1.3, R2, and R3. *Requirement R4 (now R3) was revised to :* *Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2.* *Requirement R1, Part 1.1 specifies that an entity must have a process for recognizing "applicable events". An entity is only required to have the Operating Plan as it relates to events applicable to that entity. The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated. This language does not preclude the verification of contact information taking place during a training event. The DSR SDT has updated the Requirements based on comments received along with updating Attachment 1 and 2. Please review the updated Standard for all your concerns.*
Response: Thank you for your comment. Please see response above.		
Clallam County PUD No.1		Project 2008-06 proposes to withdraw the terms "Critical Asset" and "Critical Cyber Asset" from the NERC Glossary. In order to avoid a reliability gap when this occurs,

Organization	Yes or No	Question 4 Comment
		we propose including High and Medium Impact BES Cyber Systems and Assets. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* The revised wording to add, "as appropriate" to R1.3 is a concern. We understand the SDT's intent to not require all the bulleted parties to be notified for every event type. But will a good faith effort on the part of the registered entity to deem appropriateness be subject to second guessing and possible sanctions by the Compliance Enforcement Authority if they disagree? We note that CIP-001 required an interpretation to address this issue, but cannot assume that interpretation will carry over. We suggest spelling out exactly who shall deem appropriateness. Part 1.3 (now Part 1.2 was revised to: 1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies. R4 continues to be an onerous requirement for smaller entities. Verification was not part of the SAR and we are not convinced it is needed for reliability. We are unsure how a DP with no generation, no BES assets, no Critical Cyber Assets, and less than 100 MW of load; would meet R4. Shall they drill for impossible events? We ask that R4 be removed. At a minimum it should exclude entities that cannot experience the events of Attachment 1. Entities that cannot experience the events of Attachment 1should likewise be exempt from R1.2, 1.3, R2, and R3. *Part 1.1 has been revised to include "applicable events listed in EOP-004, Attachment*

Organization	Yes or No	Question 4 Comment
		1." If an entity cannot experience an event, then it would not be an applicable event. *Requirement R4 (now R3) has been revised to:* *R3. Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]* *The DSR SDT envisions that the testing under R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated. This language does not preclude the verification of contact information taking place during a training event.*
Response: Thank you for your comment. Please see response above.		
FEUS		R4 requires verification through a drill or exercise the communication process created as part of R1.3. Clarification of what a drill or exercise should be considered. In order to show compliance to R4 would the entity have to send a pseudo event report to Internal Personnel, the Regional Entity, NERC ES-ISAC, Law Enforcement, and Governmental or provincial agencies listed in R1.3 to verify the communications plan? It would not be a burden on the entity so much, however, I'm not sure the external parties want to be the recipient of approximately 2000 psuedo event reports annually. *Requirement R4 (now R3) related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. Requirement R1, R3 now reads: "Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2."The DSR SDT envisions that the testing under Requirement 3 will include*

Organization	Yes or No	Question 4 Comment
		verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated. This language does not preclude the verification of contact information taking place during a training event. Attachment 1: BES equipment is too vague - consider changing to BES facility and including that reduces the reliability of the BES in the footnote. Is the footnote an and or an or?Attachment 1: Version 5 of CIP Requirements remove the terms Critical Asset and Critical Cyber Asset. The drafting team should consider revising the table to include BES Cyber Systems. Clarify if Damage or Destruction is physical damage (aka - cyber incidents would be part of CIP-008.) *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* Attachment 1: Unplanned Control Center evacuation - remove "potential" from the reporting responsibility *The DSR SDT has removed both "fuel supply emergency" and "other" from Attachment 2.* Attachment 2 - 3: change to, "Did the event originate in your system?" The requirement only requires reporting for Events - not potential events. *The DSR SDT has streamlined Attachment 2, per comments received.*

Organization	Yes or No	Question 4 Comment
		Attachment 2 4: “Damage or Destruction to BES equipment” should be “Destruction of BES Equipment” like it is in Attachment 1 and “forced intrusion risk to BES equipment” remove “risk” *The DSR SDT has streamlined Attachment 2 to reflect the events of Attachment 1, per comments received.*
Response: Thank you for your comment. Please see response above.		
ReliabilityFirst		ReliabilityFirst thanks the SDT for their effort on this project. ReliabilityFirst has a number of concerns/questions related to the draft EOP-004-2 standard which include the following:1. General Comment - The SDT should consider any possible impacts that could arise related to the applicability of Generator Owners that may or may not own transmission facilities. This will help alleviate any potential or unforeseen impacts on these Generator Owners *The DSR SDT cannot apply items such as GO/TO issues when NERC and the Regions are not in agreement to what the issue and solution is.* 2. General Comment - Though the rationale boxes contain useful editorial information for each requirement, they should rather contain the technical rationale or answer the question “why is this needed” for each requirement. The rationale boxes currently seem to contain suggestions on how to meet the requirements. ReliabilityFirst suggests possibly moving some of the statements in the “Guideline and Technical Basis” into the rationale boxes, as some of the rationale seems to be contained in that section. *The DSR SDT will continue to update rationale boxes per comments received.* 3. General comment - The end of Measure M4 is incorrectly pointing to R3. This should refer to R4. *Measurement 4 has been corrected.* 4. General Comment - ReliabilityFirst recommends the “Reporting Hierarchy for

Organization	Yes or No	Question 4 Comment
		Reportable Events" flowchart should be removed from the "Background" section and put into an appendix. ReliabilityFirst believes the flowchart is not really background information, but an outline of the proposed process found in the new standard. *The DSR SDT provided a flow chart for stakeholders to use if desired. EOP-004-2 sets a minimum level of reporting per the events described in Attachment 1. The DSR SDT has received negative feedback in past drafts, the DSR SDT was too prescriptive.* 5. Applicability Comment - ReliabilityFirst questions the newly added applicability for both the Regional Entity (RE) and ERO. Standards, as outlined in many, if not all, the FERC Orders, should have applicability to users, owners and operators of the BES and not to the compliance monitoring entities (e.g. RE and ERO). Any requirements regarding event reporting for the RE and ERO should be dealt with in the NERC Rules of Procedure and/or Regional Delegation Agreements. It is also unclear who would enforce compliance on the ERO if the ERO remains an applicable entity. *The ERO is an Applicable Entity under the current version of CIP-008 and therefore they are held to EOP-004-2. Note, this proposed Standard has been through two Quality Reviews and there has been no rejection from NERC .* 6. Requirement Comment - ReliabilityFirst believes the process for communicating events in Requirement R1, Part 1.3 should be all inclusive and therefore include the bullet points. Bullet points are considered to be "OR" statements and thus ReliabilityFirst believes they should be characterized as sub-parts. Listed below is an example:1.3. A process for communicating events listed in Attachment 1 to the following:1.3.1 Electric Reliability Organization, 1.3.2 Responsible Entity's Reliability Coordinator 1.3.3 Internal company personnel 1.3.4 The Responsible Entity's Regional Entity 1.3.5 Law enforcement 1.3.6 Governmental or provincial agencies *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. Requirement R3 now reads: "Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in*

Organization	Yes or No	Question 4 Comment
		Part 1.2. ". The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated. 7. Requirement Comment - ReliabilityFirst questions why Requirement R1, Part 1.1 and Part 1.2 are not required to be verified when performing a drill or exercise in Requirement R4? ReliabilityFirst believes that performing a drill or exercise utilizing the process for identifying events (Part 1.1) and the process for gathering information (Part 1.2) are needed along with the verification of the process for communicating events as listed in Part 1.3. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. Requirement R3 now reads: "Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2. ". The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* 8. Compliance Section Comment - Section 1.1 states "If the Responsible Entity works for the Regional Entity..." and ReliabilityFirst questions the intent of this language. ReliabilityFirst is unaware of any Responsible Entities who work for a Regional Entity. Also, if the Regional Entity and ERO remain as applicable entities, in Section 1.1 of

Organization	Yes or No	Question 4 Comment
		the standard, it is unclear who will act as the Compliance Enforcement Authority (CEA). *The DSR SDT has followed the guidance in the Standards Development process to assure that "template" information is correct. The language included is directly from NERC guideline documents* 9. Compliance Section Comment - ReliabilityFirst recommends removing the second, third and fourth paragraphs from Section 1.2 since ReliabilityFirst believes entities should retain evidence for the entire time period since their last audit. *The DSR SDT has followed the guidance in the Standards Development process to assure that "template" information is correct. The language included is directly from NERC guideline documents* 10. Compliance Section Comment - ReliabilityFirst recommends modifying the fifth paragraph from Section 1.2 as follows: "If a Registered Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or until a data hold release is issued by the CEA." ReliabilityFirst believes, as currently stated, the CEA would be required to retain information for an indefinite period of time. *The DSR SDT has followed the guidance in the Standards Development process to assure that "template" information is correct. The language included is directly from NERC guideline documents.* 11. Compliance Section Comment - ReliabilityFirst recommends removing the sixth paragraph from Section 1.2 since the requirement for the CEA to keep the last audit records and all requested and submitted subsequent audit records is already covered in the NERC ROP. *The DSR SDT has followed the guidance in the Standards Development process to assure that "template" information is correct. The language included is directly from*

Organization	Yes or No	Question 4 Comment
		NERC guideline documents 12. Attachment 1 Comment - It is unclear what the term/acronym “Tv” is referring to. It may be beneficial to include a footnote clarifying what the term “Tv” stands for. *Tv is based on FAC-010 and the DSR SDT believes that this is clear to affected stakeholders.* 13. VSL General Comment - although ReliabilityFirst believes that the applicability is not appropriate, as the REs and ERO are not users, owners, or operators of the Bulk Electric System, the Regional Entity and ERO are missing from all four sets of VSLs, if the applicability as currently written stays as is. If the Regional Entity and ERO are subject to compliance for all four requirements, they need to be included in the VSLs as well. Furthermore, for consistency with other standards, each VSL should begin with the phrase “The Responsible Entity...” *The DSR SDT will follow the guidance in the Standards Development process to assure that “template” information is correct.* 14. VSL 4 Comment - The second “OR” statement under the “Lower” VSL should be removed. By not verifying the communication process in its Operating Plan within the calendar year, the responsible entity completely missed the intent of the requirement and is already covered under the “Severe” VSL category. *The DSR SDT will follow the guidance in the Standards Development process to assure that “template” information is correct.*
Response: Thank you for your comment. Please see response above.		
Northeast Power Coordinating		Requirement 4 does not specifically state the details necessary for an entity to

Organization	Yes or No	Question 4 Comment
Council		achieve compliance. Requirement 4 should provide more guidance as to what is required in a drill. Audit/enforcement of any requirement language that is too broad will potentially lead to Regional interpretation, inconsistency, and additional CANs.R4 should be revised to delete the 15 month requirement. CAN-0010 recognizes that entities may determine the definition of annual.The standard is too specific, and drills down into entity practices, when the results are all that should be looked for.The standard is requiring multiple reports. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. Requirement R3 now reads: "Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2. ". The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.* The Purpose of the Standard is very broad and should be revised because some of the events being reported on have no impact on the BES. Revise Purpose wording as follows: To improve industry awareness and the reliability of the Bulk Electric System "by requiring the reporting of major system events with the potential to impact reliability and their causes..." on the Bulk Electric System it can be said that every event occurring on the Bulk Electric System would have to be reported. *The DSR SDT revised the purpose statement to remove ambiguous language "with the potential to impact reliability". The Purpose statement now reads:* *"To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities."*

Organization	Yes or No	Question 4 Comment
		Referring to Requirement R4, the testing of the communication process is the responsibility of the Responsible Entity. There is an event analysis process already in place.The standard prescribes different sets of criteria, and forms.There should be one recipient of event information. That recipient should be a "clearinghouse" to ensure the proper dissemination of information. *EOP-004 is a standard that requires reporting of events to the ERO. The events analysis program receives these reports and determines whether further analysis is appropriate.* Why is this standard applicable to the ERO? *NERC as the ERO is currently a Responsible Entity under CIP-008, and therefore the proposed EOP-004-2 has the ERO as a Responsible Entity.* Requirement R2 is not necessary. It states the obvious.Requirements R2 and R3 are redundant.The standard mentions collecting information for Attachment 2, but nowhere does it state what to do with Attachment 2. *Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2 based on stakeholder comments and revised R3 (now R2) to:* *"Requirement R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1."*

Organization	Yes or No	Question 4 Comment
		None of the key concepts identified on page 5 of the standard are clearly stated or described in the requirements: o Develop a single form to report disturbances and events that threaten the reliability of the bulk electric system. *OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.* o Investigate other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements. o Establish clear criteria for reporting. o Establish consistent reporting timelines. *The DSR SDT does allow entities to use the DOE Form OE 417 in lieu of Attachment 2 to report an event. Attachment 1 has been updated to provide consistent criteria for reporting as well as reporting timelines. All one hour reporting timelines have been changed to 24 hours with the exception of a 'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673:*

Organization	Yes or No	Question 4 Comment
		"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…" *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1.* o Provide clarity for who will receive the information and how it will be used. The standard's requirements should be reviewed with an eye for deleting those that are redundant, or do not address the Purpose or intent of the standard. *Requirement R1 has been updated and now reads as"* *Each Responsible Entity shall have an Operating Plan that includes:* *1.1. A process for recognizing each of the events listed in EOP-004 Attachment 1.* *1.2. A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies.* *The Applicable Entity's Operating Plan is to contain the process for reporting events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and for communicating to others as defined in the Responsible Entity's Operating Plan. All events in Attachment 1 are required to be reported to the Electric Reliability Organization and the Responsible Entity's Reliability Coordinator. The Operating Plan may include: internal company personnel, your Regional Entity, law enforcement, and governmental or provisional agencies, as you identify within your Operating Plan. This gives you the flexibility to tailor your Operating Plan to fit your*

Organization	Yes or No	Question 4 Comment
		company's needs and wants.
Response: Thank you for your comment. Please see response above.		
American Public Power Association		Requirement R1:1.3. A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as appropriate: o Internal company personnel o The Responsible Entity's Regional Entity o Law enforcement o Governmental or provincial agencies APPA believes that including the list of other entities needing to be included in a process for communicating events under 1.3 may open this requirement up for interpretation. APPA requests that the SDT remove from the requirement the listing of; "Internal company personnel, The Responsible Entity's Regional Entity, Law enforcement & Governmental or provincial agencies" and include these references in a guidance document. The registered entities need to communicate with the ERO and the RC if applicable for compliance with this standard and to maintain the reliability of the BES. Communication with other entities such as internal company personnel, law enforcement and the Regional Entity are expected, but do not impact the reliability of the BES. This will simplify the reporting structure and will not be burdensome to registered entities when documenting compliance. If this is not an acceptable solution, APPA suggests revising 1.3 to remove the wording "the following as appropriate" and add "other entities as determined by the Responsible Entity. Examples of other entities may include, but are not limited to:" Then it is clear that the list is examples and should not be enforced by the auditor. *Requirement R1 has been updated and now reads as* *"Each Responsible Entity shall have an Operating Plan that includes:* *1.1. A process for recognizing each of the events listed in EOP-004 Attachment 1.* *1.2. A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004*

Organization	Yes or No	Question 4 Comment
		Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies. *The Applicable Entity's Operating Plan is to contain the process for reporting events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and for communicating to others as defined in the Responsible Entity's Operating Plan. All events in Attachment 1 are required to be reported to the Electric Reliability Organization and the Responsible Entity's Reliability Coordinator. The Operating Plan may include: internal company personnel, your Regional Entity, law enforcement, and governmental or provisional agencies, as you identify within your Operating Plan. This gives you the flexibility to tailor your Operating Plan to fit your company's needs and wants.* 1.4. Provision(s) for updating the Operating Plan within 90 calendar days of any change in assets, personnel, other circumstances that may no longer align with the Operating Plan; or incorporating lessons learned pursuant to Requirement R3. APPA understands that the SDT is following the FERC order requiring a 90 day limit on updates to any changes to the plan. However, APPA believes that "updating the Operating Plan within 90 calendar days of any change..." is a very burdensome compliance documentation requirement. APPA reminds the SDT that including DPs in this combined standard has increased the number of small Responsible Entities that will be required to document compliance. APPA requests that the SDT combine requirement 1.4 and 1.5 so the Operating Plan will be reviewed and updated with any changes on a yearly basis. If this is not an acceptable solution, APPA suggests that the "Lower VSL" exclude a violation to 1.4. The thought being, a violation of 1.4 by itself is a documentation error and should not be levied a penalty. *Requirement 1, Part 1.4 has been removed from the standard.* Attachment 1: Events TableAPPA believes that the intent of the SDT was to mirror the DOE OE-417 criteria in reporting requirements. With the inclusion of DP in the

Organization	Yes or No	Question 4 Comment
		Applicability, however, APPA believes the SDT created an unintended excessive reporting requirement for DPs during insignificant events. *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.* APPA recommends that a qualifier be added to the events table. In DOE OE-417 local electrical systems with less than 300MW are excluded from reporting certain events since they are not significant to the BES. APPA believes that the benefit of reporting certain events on systems below this value would not outweigh the compliance burden placed on these small systems. Therefore, APPA requests that the standard drafting team add the following qualifier to the Events Table of Attachment 1: "For systems with greater than 300MW peak load." This statement should be placed in the Threshold for Reporting column for the following Events: BES Emergency requiring appeal for load reduction, BES

Organization	Yes or No	Question 4 Comment
		Emergency requiring system-wide voltage reduction, BES Emergency requiring manual firm load shedding, BES Emergency resulting in automatic firm load shedding. This will match the DOE OE-417 reporting criteria and relieve the burden on small entities. *Upon review of the DOE OE 417, it states "Local Utilities in Alaska, Hawaii, Puerto Rico, the U.S. Virgin Islands, and the U.S. Territories - If the local electrical system is less than 300 MW, then only file if criteria 1, 2, 3 or 4 are met". Please be advised this exception applies to entities outside the continental USA.* *The DSR SDT has tried to minimize duplicative reporting, but recognizes there may be events that trigger more than one report. The current applicability ensures an event that could affect just one of the entities with reporting responsibility isn't missed.* Definition of "Risk to BES equipment":The SDT attempted to give examples of the Event category "Risk to BES equipment" in a footnote. This footnote gives the Responsible Entity and the Auditor a lot of room for interpretation. APPA suggests that the SDT either define this term or give a triggering mechanism that the industry would understand. One suggestion would be "Risk to BES equipment: An event that forces a Facility Owner to initiate an unplanned, non-standard or conservative operating procedure." Then list; "Examples include train derailment adjacent to BES Facilities that either could have damaged the equipment directly or has the potential to damage the equipment..." This will allow the entity to have an operating procedure linked to the event. If this suggestion is taken by the SDT then the Reporting column of Attachment 1 needs to be changed to: "The parties identified pursuant to R1.3 within 1 hour of initiating conservative operating procedures." *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and*

Organization	Yes or No	Question 4 Comment
		determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples.
Response: Thank you for your comment. Please see response above.		
Western Electricity Coordinating Council		Results-based standards should include, within each requirement, the purpose or reason for the requirement. The requirements of this standard, while we support the requirements, do not include the goal or proupose of meeting each stated requirement. The Measures all include language stating “the responsible entity shall provide...”. During a quality review of a WECC Regional Reliability Standard we were told that the “shall provide” language is essentially another requirement to provide something. If it is truly necessary to provide this it should be in the requirements. It was suggested to us that we drop the “shall provide” language and just start each Measure with the “Evidence may include but is not limited to...”. *The DSR SDT changed each instance of “shall” to “will” within the measures. We will defer to NERC Quality Review comments for any additional revisions.*
Response: Thank you for your comment. Please see response above.		
Sacramento Municipal Utility District (SMUD)		SMUD and BANC agree with the revised language in EOP-004-1 requirements, but we have identified the following issues in A-1:We commend the SDT for properly addressing the sabotage issue. However, additional confusion is caused by introducing term "damage". As "damage" is not a defined term it would be beneficial for the drafting team to provide clarification for what is meant by "damage".

Organization	Yes or No	Question 4 Comment
		The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows: • *The 'Damage or Destruction' event category has been revised to say ' to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* • *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples.* *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* *As discussed in prior comment forms, the DSR SDT has elected not to define "sabotage". As defined in an Entity's operating Plan, the requirement is to report and communicate an event as listed in Attachment 1. EOP-004-2 does not require analysis of any event listed in Attachment 1.* The threshold for reporting "Each public Appeal for load reduction" should clearly state the triggering is for the BES Emergency as routine "public appeal" for conservation could be considered a threshold for the report triggering. *To clarify your point, the threshold has been changed to 'Public appeal or load reduction event'.*

Organization	Yes or No	Question 4 Comment
		Regarding the SOL Violations in Attachment 1 the SOL Violations should only be those that affect the WECC paths. *The DSR SDT has included the following language for WECC's SOL violation in Attachment 1:* *"IROL Violation (all Interconnections) or SOL Violation for Major WECC Transfer Paths (WECC only)"* The SDT made attempts to limit nuisance reporting related to copper thefts and so on which is supported. However a number of the thresholds identified in EOP-004-2 Attachment 1 are very low and could congest the reporting process with nuisance reporting and reviewing. *The DSR SDT made reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary.*
Response: Thank you for your comment. Please see response above.		
Southern Comnpany		Southern has the following comments:(1) In Requirement R1.4, we request the SDT to clarify what is meant by the term "assets"? *The DSR SDT has deleted Requirement R1, Part 1.4, thus "assets" is not contained in EOP-004-2 based on comments received.* 2) If requirement 4 is not deleted, should we have to test every possible event described in our Operating Plan or each event listed in Attachment 1 to verify communications? *The DSR SDT has deleted Requirement R4 based on comments received.* (3) In the last paragraph of the "Summary of Key Concepts" section on page 6 of

Organization	Yes or No	Question 4 Comment
		Draft 3, there is a statement that "Real-time reporting is achieved through the RCIS..." The only reporting required on RCIS by the Standards is for EEAs and TLRs. Please review and modify this language as needed. *The DSR SDT believes "The DSR SDT wishes to make clear that the proposed Standard does not include any real-time operating notifications for the events listed in Attachment 1. Real-time reporting is achieved through the RCIS and is covered in other standards (e.g. the TOP family of standards). The proposed standard deals exclusively with after-the-fact reporting" is correct.* (4) Evidence Retention (page 12 of Draft 3): The 3 calendar year reference has no bearing on a Standard that may be audited on a cycle greater than 3 years. *The DSR SDT has updated the Evidence Retention section with standard language provided by NERC staff.* (5) In the NOTE for Attachment 1 (page 20 of Draft 3), what is meant by "periodic verbal updates" and to whom should the updates be made? *The DSR SDT has updated the note in question to remove the language of "periodic verbal updates", it now reads as:* *"NOTE: Under certain adverse conditions (e.g. severe weather, multiple events) it may not be possible to report the damage caused by an event and issue a written Event Report within the timing in the table below. In such cases, the affected Responsible Entity shall notify parties per R1 and provide as much information as is available at the time of the notification. Reports to the ERO should be submitted to one of the following: e-mail: esisac@nerc.com, Facsimile: 609-452-9550, Voice: 609-452-1422."* (6) There are Prerequisite Approvals listed in the Implementation Plan. Is it appropriate to ask industry to vote on this Standard Revision that has a prerequisite approval of changes in the Rules of Procedure that have not been approved? *The proposed revisions to the Rules of Procedure should have been posted with the*

Organization	Yes or No	Question 4 Comment
		standard. This posting will occur with the successive ballot of EOP-004-2. (7) We believe the reporting of the events in Attachment 1 has no reliability benefit to the Bulk Electric System. We suggest that Attachment 1 should be removed. *The DSR SDT disagrees with this comment. Attachment 1 is the minimum set of events that will be required to report and communicate per your Operating Plan will be aware of system conditions.*
Response: Thank you for your comment. Please see response above.		
Texas Reliability Entity		Substantive comments:1.ERO and Regional Entities should not be included in the Applicability of this standard. Just because they may be subject to some CIP requirements does not mean they also have to be included here. The ERO and Regional Entities do not operate equipment or systems that are integral to the operation of the BES. Also, none of the VSLs apply to the ERO or to Regional Entities. *The DSR SDT is following guidance that NERC has provided to the DSR SDT. The ERO and the RE are applicable entities under CIP-008. Reporting of Cyber Security Incidents is the responsibility of the ERO and the RE.* 2.The first entry in the Events Table should say “Damage or destruction of BES equipment.” Equipment may be rendered inoperable without being “destroyed,” and entities should not have to determine within one hour whether damage is sufficient to cause the equipment to be considered “destroyed.” Footnote 1 refers to equipment that is “damaged or destroyed.” *The ‘Damage or Destruction’ event category has been revised to say ‘to a Facility’, (a defined term) and thresholds have be modified to provide clarity.* *The DSR SDT used the defined term “Facility” to add clarity for several events listed in*

Organization	Yes or No	Question 4 Comment
		Attachment 1. A Facility is defined as: *"A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)"* *The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.* 3.In the Events Table, consider whether the item for "Voltage deviations on BES facilities" should also be applicable to GOPs, because a loss of voltage control at a generator (e.g. failure of an automatic voltage regulator and power system stabilizer) could have a similar impact on the BES as other reportable items. *The DSR SDT disagrees with this comment. Attachment 1 is the minimum set of events that will be required to report and communicate per your Operating Plan will be aware of system conditions.* 4.In the Events Table, under Transmission Loss, does this item require that at least three Facilities owned by one entity must be lost to trigger the reporting requirement, or is the reporting requirement also to be triggered by loss of three Facilities during one event or occurrence that are owned by two or three different entities? *The DSR SDT has stated in Attachment 1 that "Each TOP that experiences the transmission loss". This would mean per individual TOP.* 5.In the Events Table, under Transmission Loss, it is unclear how Facilities are to be counted to determine when "three or more" Facilities are lost. In the NERC Glossary, Facility is ambiguously defined as "a set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." In many cases, a "set of electrical equipment" can be selected and counted in different ways, which makes this item ambiguous.

Organization	Yes or No	Question 4 Comment
		Both Transmission and Facilities are defined terms and the DSR SDT feels this gives sufficient direction. 6.In the Events Table, under Transmission Loss, it appears that a substation bus failure would only count as a loss of one Facility, even though it might interrupt flow between several transmission lines. We believe this type of event should be reported under this standard, and appropriate revisions should be made to this entry. *The DSR SDT used the defined term "Facility" to add clarity for this event as well as other events in Attachment 1. A Facility is defined as:* *"A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)"* *The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.* 7.In the Events Table, under Transmission Loss, consider including generators that are lost as a result of transmission loss events when counting Facilities. For example, if a transmission line and a transformer fail, resulting in a generator going off-line, that should count as a loss of "three or more" facilities and be reportable under this standard. *Attachment 1 is the minimum set of events that will be required to report and communicate per your Operating Plan will be aware of system conditions.* 8.In the Events Table, under "Unplanned Control Center evacuation" and "Loss of monitoring or all voice communication capability," GOPs should be included. GOPs also operate control centers that would be subject to these kinds of occurrences. *Attachment 1 is the minimum set of events that will be required to report and*

Organization	Yes or No	Question 4 Comment
		communicate per your Operating Plan will be aware of system conditions. 9.In the Events Table, under "Loss of monitoring or all voice communication capability," we suggest adding that if there is a failure at one control center, that event is not reportable if there is a successful failover to a backup system or control center. *The DSR SDT has split this event into two separate events based on comments received, it now reads as: "Loss of all voice communication capability" and "Complete or partial loss of monitoring capability".* 10."Fuel supply emergency" is included in the Event Reporting Form, but not in Attachment 1, so there is no reporting threshold or deadline provided for this type of event. *Attachment 2 was updated to reflect the revisions to Attachment 1. The reference to "actual or potential events" was removed. Also, the event type of "other" and "fuel supply emergency" was removed as well.* Clean-up items:1.In R1.5, capitalize "Responsible Entity" and lower-case "process". *The DSR SDT has deleted Requirement 1, part 1.5.* 2.In footnote 1, add "or" before "iii)" to clarify that this event type applies to equipment that satisfies any one of these three conditions. *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'A physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* 3.In the Event Reporting Form, "forced intrusion" and "Risk to BES equipment" are run together and should be separated. *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new*

Organization	Yes or No	Question 4 Comment
		event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. VSLs:1.We support the substance of the VSLs, but the repeated long list of entities makes the VSLs extremely difficult to read and decipher. The repeated list of entities should be replaced by "Responsible Entities." 2.If the ERO and Regional Entities are to be subject to requirements in this standard (which we oppose), they need to be added to the VSLs. *The DSR SDT has revised the VSLs to eliminate the list of entities and lead with "Responsible Entity".*
Response: Thank you for your comment. Please see response above.		
		Suggest removing 1.4 since 1.5 ensures a annual review. . The implementation of the plan should also include the necessary reporting. *Requirement R1, Part 1.4 has been removed.*
Response: Thank you for your comment. Please see response above.		
Electric Compliance		The concepts of "Critical Assets" and "Critical Cyber Assets" no longer exist in Version 5 of the CIP Standards and so this may cause confusion. Recommend modifying to be in accordance with Version 5. Additionally, it is debatable whether the

Organization	Yes or No	Question 4 Comment
		destruction of, for example, one relay would be a reportable incident given the proposed language. We recommend modifying the language to insure nuisance reporting is minimized. One reportable event is, "Risk to the BES" and the threshold for reporting is, "From a non-environmental physical threat." This appears to be a catch-all reportable event. Due to the subjectivity of this event description, we suggest removing it from the list. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as stakeholders pointed out that these events were adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility "reporting thresholds. CIP-008 addresses Cyber Security Incidents which are defined as:* *"Any malicious act or suspicious event that:* *• Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,* *• Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset."* *A Critical Asset is defined as:* *"Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System."* *Since there is an existing event category for damage or destruction of Facilities, having a separate event for "Damage or Destruction of a Critical Asset" is unnecessary.* Footnote 1 and the "Threshold for Reporting" associated with the Event described as "Destruction of BES equipment" expand the reporting scope. For example, a fan on a

Organization	Yes or No	Question 4 Comment
		transformer can be destroyed because a technician drops a screwdriver into it. We believe such an event should not be reportable under EOP-004-2. Yet, as written, a Responsible Entity could interpret that event as reportable (because it would be "unintentional human action" that destroyed a piece of equipment associated with the BES). If the goal of the SDT was to include such events, we think the draft Standard goes too far in requiring reporting. If the SDT did not intend to include such events, the draft Standard should be revised to make that fact clear. Proposed Footnote: BES equipment that become damaged or destroyed due to intentional or unintentional human action which removes the BES equipment from service that i) Affects an IROL; ii) Significantly affects the reliability margin of the system (e.g., has the potential to result in the need for emergency actions); iii). Do not report copper theft from BES equipment unless it degrades the ability of equipment to operate correctly (e.g., removal of grounding straps rendering protective relaying inoperative). *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'A physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* The word "Significantly" in item ii) of footnote 1 and "as appropriate" in section 1.3 introduces elements of subjectivity. What is "significant" or "appropriate" to one person may not be to someone else. *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'A physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* In section 1.4, we believe that revising the plan within 90 days of "any" change should be changed to 180 days or else classes of events should be made so that only

Organization	Yes or No	Question 4 Comment
		substantial changes are required to made within the 90 day timeframe. *Requirement R1, Part 1.4 was removed from the standard.*
Response: Thank you for your comment. Please see response above.		
Georgia System Operations Corporation		The ERO and the Regional Entity should not be listed as Responsible Entities. The ERO and the Regional Entity should not have to meet the requirements of this standard, especially reporting to itself. *The ERO and the RE are applicable under the CIP-008 standard and are therefore applicable under EOP-004.* Attachment 1 (all page numbers are from the clean draft):Page 20, destruction of BES equipment: part iii) of the footnote adds damage as an event but the heading is for destruction. Is it just for destruction? Or is it for damage or destruction? *The DSR SDT has modified Attachment 1 to bring more clarity. The 'Destruction' event category has been revised to include damage or destruction of a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* Page 21, Risk to BES equipment: Footnote 3 gives an example where there is flammable or toxic cargo. These are environmental threats. However, the threshold for reporting is for non-environmental threats. Which is it? *For this event, environmental threats are considered to be severe weather, earthquakes, etc. rather than an external threat.* Page 21, BES emergency requiring public appeal for load reduction: A small deficient

Organization	Yes or No	Question 4 Comment
		entity within a BA may not initiate public appeals. The BA is typically the entity which initiates public appeals when the entire BA is deficient. The initiating entity should be the responsible entity not the deficient entity. *The DSR SDT revised this event to indicate the "initiating" entity is responsible for reporting.* Page 21, BES emergency requiring manual firm load shedding: If a RC directs a DP to shed load and the DP initiates manually shedding its load as directed, is the RC the initiating entity? Or is it the DP? *The DSR SDT believes the wording of "initiating entity" provides enough clarity for each applicable entity to understand. In this case, the RC made the call to shed load and therefore should report.* Page 22, system separation (islanding): a DP does not have a view of the system to see that the system separated or how much generation and load are in the island. Remove DP. *The DSR SDT disagrees with your comment. DP's may be the first to recognize that they are islanded or separated from the system.* Attachment 2 (all page numbers are from the clean draft):Page 25: fuel supply emergencies will no longer be reportable under the current draft. *The DSR SDT has removed both "fuel supply emergency" and "other" from Attachment 2 based on comments received.* Miscellaneous typos and quality issues (all page numbers are from the clean draft):Page 5, the last paragraph: There are two cases where Parts A or B are referred to. Attachment 1 no longer has two parts (A & B).Page 27, Discussion of Event Reporting: the second paragraph has a typo at the beginning of the sentence.

Organization	Yes or No	Question 4 Comment
		The DSR SDT has corrected these typos.
Response: Thank you for your comment. Please see response above.		
Thompson Coburn LLP on behalf of Miss. Delta Energy Agency		The first three incident categories designated on Attachment 1 as reportable events should be modified. As the Standard is current drafted, each incident category (i.e., destruction of BES equipment, damage or destruction of Critical Assets, and damage or destruction of Critical Cyber Assets) requires reporting if the event was due to unintentional human action. For example, under the reporting criteria as drafted, inadvertently dropping and damaging a piece of computer equipment designated as a Critical Cyber Asset while moving or installing it would appear to require an event report within an hour of the incident. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as stakeholders pointed out that these events were adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility "reporting thresholds. CIP-008 addresses Cyber Security Incidents which are defined as:* *"Any malicious act or suspicious event that:* *• Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,* *• Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset."* *A Critical Asset is defined as:* *"Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System."*

Organization	Yes or No	Question 4 Comment
		Since there is an existing event category for damage or destruction of Facilities, having a separate event for "Damage or Destruction of a Critical Asset" is unnecessary. MDEA requests that the Drafting Team consider modifying footnote 1 and each of the first three event categories to reflect that reportable events include only those that (i) affect an IROL; (ii) significantly affect the reliability margin of the system; or (iii) involve equipment damage or destruction due to intentional human action that results in the removal of the BES equipment, Critical Assets, and/or Critical Cyber Assets, as applicable, from service. *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'A physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* Footnote 2 (which now pertains only to the fourth incident category - forced intrusions) should also apply to the first three event categories. Specifically, responsible entities should report intentional damage or destruction of BES equipment, damage or destruction of Critical Assets, and damage or destruction of Critical Cyber Assets if either the damage/destruction was clearly intentional or if motivation for the damage or destruction cannot reasonably be determined and the damage or destruction affects the reliability of the BES. *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'A physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* Attachment 1 is also unclear to the extent that the incident category involving reports for the detection of reportable Cyber Security Incidents includes a reference to CIP-008 as the reporting threshold. While entities in various functional categories

Organization	Yes or No	Question 4 Comment
		(i.e., RCs, BAs, TOPs/TOs, GOPs/GOs, and DPs) are listed as being responsible for the reporting of such events, some entities in these functional categories may not currently be subject to CIP-008. If it is the Drafting Team's intent to limit event reports for Cyber Security Incidents to include only registered entities subject to CIP-008, that clarification should be incorporated into the listing of entities with reporting responsibility for this incident category in Attachment 1. *The "Entity with reporting responsibility" for the event "A reportable Cyber Security Incident" has been revised to "Each Responsible Entity applicable under CIP-008-4 or its successor that experiences the Cyber Security Incident".*
Response: Thank you for your comment. Please see response above.		
Luminant Power		The following comments all apply to Attachment 1: o As a general comment, SDT should specifically list the entities the reportable event applies to in the table for clarity. Do not use general language referencing another standard or statements such as "Deficient entity is responsible for reporting", "Initiating entity is responsible for reporting", or other similar statements used currently in the table. This leaves this open and subject to interpretation. *The DSR SDT disagrees with your comment. This language provides the most flexibility for applicable entities and maintains a minimum level of who is required to report or communicate events based an entity's Operating Plan, as described in Requirement 1.* Also, there are a number of events that do not apply to all entities. o Destruction of BES equipment should be Intentional Damage or Destruction of BES equipment. Unintentional actions occur and should not be a requirement for reporting under disturbance reporting. *The event for "Destruction of BES equipment" has been revised to "Damage or destruction of a Facility". The threshold for reporting information was expanded for*

Organization	Yes or No	Question 4 Comment
		clarity: *"Damage or destruction of a Facility that: affects an IROL* *OR* *Results in the need for actions to avoid an Adverse Reliability Impact* *OR* *Results from intentional human action."* o Actions or situations affecting equipment or generation unit availability due to human error, equipment failure, unintentional human action, external cause, etc. are reported in real time to the BA and other entities as required by other NERC Standards. Disturbance reporting should avoid the type of events that, for instance, would cause the total or partial loss of a generating unit under normal operational circumstances. There are a number of issues with the table in this regard. *The DSR SDT has removed such language based on comments received.* o For clarity, consider changing the table to identify for each event type "who" should be notified. This appears to be missing from the table overall. *The DSR SDT has updated Requirement R1, Part 1.2 to read as: ""1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies."* o Reportable Events, the meaning for the Event labeled "Destruction of BES equipment" is not clear. Footnote 1 adds the language "iii) Damaged or destroyed due to intentional or unintentional human action which removes the BES equipment

Organization	Yes or No	Question 4 Comment
		from service." This language can be interpreted to mean that any damage to any BES equipment caused by human action, regardless of intention, must be reported within 1 hour of recognition of the event. This requirement will be overly burdensome. If this is not the intent of the definition of "Destruction of BES equipment", the footnote should be re-worded. As such, it is subjective and left open to interpretation. It should focus only on intentional actions to damage or interrupt BES functionality. It should not be worded as such that every item that trips a unit or every item that is damaged on a unit requires a report. That is where the language right now is not clear. There are and will continue to be unintentional human error that results in taking equipment out of service. This standard was meant to replace sabotage reporting. *All footnotes are deleted and appropriate content moved to 'Thresholds for Reporting' with the exception of the footnote relating to the new event category 'A physical threat that could impact the operability of a Facility'. This remaining footnote provides examples only.* o Damage or destruction of Critical Asset per CIP-002 and Damage or destruction of a Critical Cyber Asset per CIP-002 should be removed from the table as Intentional Damage or Destruction of BES equipment would cover this as well. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as stakeholders pointed out that these events were adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility "reporting thresholds. CIP-008 addresses Cyber Security Incidents which are defined as:* *"Any malicious act or suspicious event that:* *• Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,* *• Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber*

Organization	Yes or No	Question 4 Comment
		Asset." *A Critical Asset is defined as:* *"Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System."* *Since there is an existing event category for damage or destruction of Facilities, having a separate event for "Damage or Destruction of a Critical Asset" is unnecessary.* o Risk to BES equipment should be removed from the table as it is very subjective and broad. At a minimum, the 1 hour reporting timeline should begin after recognition and assessment of the incident. As an example, a fire close to BES equipment may not truly be a threat to the equipment and will not be known until an assessment can be made to determine the risk. *The DSR SDT has removed this event based on comments received.* o Detection of a Reportable Cyber Security incident should be removed from the table as this is covered by CIP-008 requirements. Having this in two separate standards is double jeopardy and confusing to entities. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as stakeholders pointed out that these events were adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility "reporting thresholds. CIP-008 addresses Cyber Security Incidents which are defined as:* *"Any malicious act or suspicious event that:*

Organization	Yes or No	Question 4 Comment
		• Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or, *• Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset."* *A Critical Asset is defined as:* *"Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System."* *Since there is an existing event category for damage or destruction of Facilities, having a separate event for "Damage or Destruction of a Critical Asset" is unnecessary.* o Generation Loss event reporting should only apply to the BA. These authorities have the ability and right to contact generation resources to supply necessary information needed for reporting. This would also eliminate redundant reporting by multiple entities for the same event. *The DSR SDT has tried to minimize duplicative reporting, but recognizes there may be events that trigger more than one report. The current applicability ensures an event that could affect just one of the entities with reporting responsibility isn't missed.* o Suggest that Generation Loss MW loss would match up with the 1500 MW level identified in CIP Version 4 or Version 5 for consistency between future CIP standards and this disturbance reporting standard. This would then cover CIP and significant MW losses that should be reported. *The DSR SDT disagrees as this threshold is based on the current EOP-004-1.* o The Generation Loss MW loss amount needs to have a time boundary. Luminant

Organization	Yes or No	Question 4 Comment
		would suggest a loss of 1500 MW within 15 minutes. *The DSR SDT disagrees as this threshold is based on the current EOP-004-1.* o Unplanned Control Center evacuation should not apply to entities that have backup Control Centers where normal operations can continue without impact to the BES. *The DSR SDT disagrees with your comment. By reporting and communicating per an entity's Operating Plan, you will provide situational awareness to entities per your Operating Plan.* o Loss of monitoring or all voice communication capability should be separated. Also the 24 hour reporting requirement may not be feasible if communications is down for longer than 24 hours. *The DSR SDT has split this event into two separate events based on comments received, it now reads as: "Loss of all voice communication capability" and "Complete or partial loss of monitoring capability".* Luminant would suggest removal of the communication reporting event as there are a number of things that could cause this to occur for longer than the reporting requirement allows, thus putting entities at jeopardy of a potential violation that is out of their control. How does an entity report if all systems and communications are down for more than 24 hours? What about in instances of a partial or total blackout? These events could last much longer than 24 hours. All computer communication would likely also be down thus rendering electronic reporting unavailable. *EOP-004-2 only requires an entity to report and communicate per their Operating Plan within the time frames set in Attachment 1.*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 4 Comment
Kansas City Power & Light		The implementation plan indicates that much of CIP-008 is retained. The reporting requirements in CIP-008 and the required reportable events outlined in Attachment 1 are an overlap with CIP-008-3 R1.1 which says “Procedures to characterize and classify events as reportable Cyber Security Incidents” and CIP-008-3 R1.3 which requires processes to address reporting to the ES-ISAC. There is also a NERC document titled, Security Guideline for the Electricity Sector: Threat and Incident Reporting, which is a guideline to “assist entities to identify and classify incidents for reporting to the ES-ISAC”. The SDT should consider the content of the Security Guideline for the Electricity Sector: Threat and Incident Reporting when considering the reporting requirements proposed EOP-004. The efforts to incorporate CIP-008 into EOP-004 are insufficient and will result in serious confusion between proposed EOP-004 and CIP-008 and reporting expectations. Considering the complexity CIP incident reporting and the interests of ES-ISAC, it may be beneficial to leave CIP-008 out of the proposed EOP-004 and limit EOP-004 to the reporting interests of NERC. *Attachment 2 (or the DOE Form OE 417) is the reporting form to be used for reporting a “Cyber Security Incident”.* The flowchart states, “Notification Protocol to State Agency Law Enforcement”. Please correct this to, “Notification to State, Provincial, or Local Law Enforcement”, to be consistent with the language in the background section part, “A Reporting Process Solution - EOP-004”. *The DSR SDT has updated the “Example of reporting _Process including Law Enforcement”, and please note that this is only an “example”.* Measure 4 is not clear enough regarding the extent to which drills should be performed. Does the measure mean that all events in the events list need to be drilled or is drilling a subset of the events list sufficient? Please clearly indicate the extent of drilling that is required or clearly indicate in the requirement the extent of the drills to be performed is the responsibility of the Responsible Entity to identify in their “processes”.

Organization	Yes or No	Question 4 Comment
		Requirement R4 (now R3) has been revised and the measure now reads: *Each Responsible Entity will have dated and time-stamped records to show that the annual test of Part 1.2 was conducted. Such evidence may include, but are not limited to, dated and time stamped voice recordings and operating logs or other communication documentation. (R3)* Evidence Retention - it is not clear what the phrase "prior 3 calendar years" represents in the third paragraph of this section regarding data retention for requirements and measures for R2, R3, R4 and M2, M3, M4 respectively. Please clarify what this means. Is that different than the meaning of "since the last audit for 3 calendar years" for R1 and M1? *This has been revised for clarity and to be consistent with NERC Guidance documents. The new evidence retention reads:* *Each Responsible Entity shall retain the current, in force document plus the 'date change page' from each version issued since the last audit or the current and previous version for Requirements R1, R4 and Measures M1, M4.* *Each Responsible Entity shall retain evidence from prior 3 calendar years for Requirements R2, R3 and Measures M2, M3.* VSL for R2 under Severe regarding R1.1 may require revision considering the comment regarding R1.1 in item 2 previously stated. In addition, the VRF for R2 is MEDIUM. R2 is administrative regarding the implementation of the requirements specified in R1. Documentation and maintenance should be considered LOWER. There is no VSL for R4 and a VSL for R4 needs to be proposed. *The DSR SDT reviewed and updated both VSL's for the new requirements.*
Response: Thank you for your comment. Please see response above.		

Organization	Yes or No	Question 4 Comment
SPP Standards Review Group		The inclusion of optional entities to which to report events in R1.3 introduces ambiguity into the standard that we feel needs to be eliminated. We propose the following replacement language for R1.3:A process for communicating events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the Responsible Entity's Regional Entity.We would also propose to incorporate the law enforcement and governmental or provincial agencies mentioned in R1.3 in Attachment 1 by adding them to the existing language for each of the event cells. For example, the first cell in that column would read:The parties identified pursuant to R1.3 and applicable law enforcement and governmental or provincial agencies within 1 hour of recognition of event.Similarly, the phrase '...and applicable law enforcement and governmental or provincial agencies...' should be inserted in all the remaining cells in the 4th column. *Requirement R1, Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom to report events. Requirement R1,Part 1.2 now reads:* *"1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies."*
Response: Thank you for your comment. Please see response above.		
Santee Cooper		The on-going development of the definition of the BES could have significant impacts on reporting requirements associated with this standard.The event titled "Risk to the

Organization	Yes or No	Question 4 Comment
		BES" appears to be a catch-all event and more guidance needs to be provided on this category. *Several stakeholders expressed concerns relating to the "Forced Intrusion" event. Their concerns related to ambiguous language in the footnote. The SDR SDT discussed this event as well as the event "Risk to BES equipment". These two event types had overlap in the perceived reporting requirements. The DSR SDT removed "Forced Intrusion" as a category and the "Risk to BES equipment" event was revised to "A physical threat that could impact the operability of a Facility".* *Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported.* The event titled "Damage or Destruction of a Critical Asset or Critical Cyber Asset per CIP-002" is ambiguous and further guidance is recommended. Ambiguity in a standard leaves it open to interpretation for all involved. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as stakeholders pointed out that these events were adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility "reporting thresholds. CIP-008 addresses Cyber Security Incidents which are defined as:* *"Any malicious act or suspicious event that:* *• Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,*

Organization	Yes or No	Question 4 Comment
		• Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset.” *A Critical Asset is defined as:* *“Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.”* *Since there is an existing event category for damage or destruction of Facilities, having a separate event for “Damage or Destruction of a Critical Asset” is unnecessary.*
Response: Thank you for your comment. Please see response above.		
Florida Municipal Power Agency		The Rules of Procedure language for data retention (first paragraph of the Evidence Retention section) should not be included in the standard, but instead referred to within the standard (e.g., “Refer to Rules of Procedure, Appendix 4C: Compliance Monitoring and Enforcement Program, Section 3.1.4.2 for more retention requirements”) so that changes to the RoP do not necessitate changes to the standard. *The language incorporated in this section of the standard is boilerplate language provided by NERC staff for inclusion in each standard.* In R4, it might be worth clarifying that, in this case, implementation of the plan for an event that does not meet the criteria of Attachment 1 and going beyond the requirements R2 and R3 could be used as evidence. Consider adding a phrase as such to M4, or a descriptive footnote that in this case, “actual event” may not be limited to those in Attachment 1.

Organization	Yes or No	Question 4 Comment
		Most stakeholders believed that Requirements R2 and R3 were redundant and having both in the standard was not necessary. Requirement R2 called for implementation of Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 called for reporting events in accordance with the Operating Plan. The DSR SDT deleted Requirement R2based on stakeholder comments and revised R3 (now R2) to: *"Requirement R2. Each Responsible Entity shall implement its event reporting Operating Plan for applicable events listed in EOP-004 Attachment 1, and in accordance with the timeframe specified in EOP-004 Attachment 1."* Comments to Attachment 1 table:On "Damage or destruction of Critical Asset" and "... Critical Cyber Asset", Version 5 of the CIP standards is moving away from the binary critical/non-critical paradigm to a high/medium/low risk paradigm. Suggest adding description that if version 5 is approved by FERC, that "critical" would be replaced with "high or medium risk", or include changing this standard to the scope of the CIP SDT, or consider posting multiple versions of this standard depending on the outcome of CIP v5 in a similar fashion to how FAC-003 was posted as part of the GO/TO effort of Project 2010-07. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as stakeholders pointed out that these events were adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility "reporting thresholds. CIP-008 addresses Cyber Security Incidents which are defined as:* *"Any malicious act or suspicious event that:* *• Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,* *• Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber*

Organization	Yes or No	Question 4 Comment
		Asset." *A Critical Asset is defined as:* *"Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System."* *Since there is an existing event category for damage or destruction of Facilities, having a separate event for "Damage or Destruction of a Critical Asset" is unnecessary.* On "forced intrusion", the phrase "at BES facility" is open to interpretation as "BES Facility" (e.g., controversy surrounding CAN-0016) which would exclude control centers and other critical/high/medium cyber system Physical Security Perimeters (PSPs). We suggest changing this to "BES Facility or the PSP or Defined Physical Boundary of critical/high/medium cyber assets". This change would cause a change to the applicability of this reportable event to coincide with CIP standard applicability. *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* • *The 'Damage or Destruction' event category has been revised to say ' to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* • *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its*

Organization	Yes or No	Question 4 Comment
		Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples. *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* On "Risk to BES equipment", that phrase is open to too wide a range of interpretation; we suggest adding the word "imminent" in front of it, i.e., "Imminent risk to BES equipment". For instance, heavy thermal loading puts equipment at risk, but not imminent risk. Also, "non-environmental" used as the threshold criteria is ambiguous. For instance, the example in the footnote, if the BES equipment is near railroad tracks, then trains getting derailed can be interpreted as part of that BES equipment's "environment", defined in Webster's as "the circumstances, objects, or conditions by which one is surrounded". It seems that the SDT really means "non-weather related", or "Not risks due to Acts of Nature". *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* • *The 'Damage or Destruction' event category has been revised to say ' to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* • *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. 		Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples. *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* On "public appeal", in the threshold, the descriptor "each" should be deleted, e.g., if a single event causes an entity to be short of capacity, do you really want that entity reporting each time they issue an appeal via different types of media, e.g., radio, TV, etc., or for a repeat appeal every several minutes for the same event? *The DSR SDT has updated the event concerning "public appeals" based on comments received and now reads as: "Public appeal for load reduction event".* Should LSE be an applicable entity to "loss of firm load"? As proposed, the DP is but the LSE is not. In an RTO market, will a DP know what is firm and what is non-firm load? Suggest eliminating DP from the applicability of "system separation". The system separation we care about is separation of one part of the BES from another which would not involve a DP. *The DSR SDT believes the "Entity with Reporting Responsibility" maintains the minimum number and type of entities that will be required to report such an event.* On "Unplanned Control Center Evacuation", CIP v5 might add GOP to the applicability, another reason to add revision of EOP-004-2 to the scope of the CIP v5 drafting team, or in other ways coordinate this SDT with that SDT. Consider posting a couple of versions of the standard depending on the outcome of CIP v5 in a similar fashion to the multiple versions of FAC-003 posted with the Go/TO effort of Project 2010-07.

Organization	Yes or No	Question 4 Comment
		The DSR SDT can only provide information on approved standards, not yet to be defined standards.
Response: Thank you for your comment. Please see response above.		
Dominion		There is still inconsistency in Attachment 1 vs. the DOE OE-417 form; in future changes, Dominion suggests align/rename events similar to that of the 'criteria for filing' events listed in the DOE OE-417, by working in coordination with the DOE. *Thank you for your comment. Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an opportunity not a 'must-have'* • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.* *Please note that not all entities in North America are required to submit the DOE Form OE 417.* Minor comment; in the Background section, the drafting team refers to bulk power

Organization	Yes or No	Question 4 Comment
		system (redline page 5; 1st paragraph and page 7; 2nd paragraph) rather than bulk electric system. *This has been revised to Bulk Electric System.* The note in Attachment 1 states in part that "the affected Responsible Entity shall notify parties per R1 and ..." Dominion believes the correct reference to be R3. In addition, capitalized terms "Event" and "Event Report" are used in this note. Dominion believes the terms should be non-capitalized as they are not NERC defined terms. *The DSR SDT has updated this note based on comments received and now reads as: "NOTE: Under certain adverse conditions (e.g. severe weather, multiple events) it may not be possible to report the damage caused by an event and issue a written event report within the timing in the table below. In such cases, the affected Responsible Entity shall notify parties per R1 and provide as much information as is available at the time of the notification. Reports to the ERO should be submitted to one of the following: e-mail: esisac@nerc.com, Facsimile: 609-452-9550, Voice: 609-452-1422."* Attachment 1 - "Detection of a reportable Cyber Security Incident - That meets the criteria in CIP-008". This essentially equates the criteria to be defined by the entity in its procedures as required by CIP-008 R1.1., additional clarification should be added in Attachment 1 to make this clear. *The DSR SDT believes that this event language provides enough clarity by providing the minimum events to be reported.* The last sentence in Attachment 2 instructions should clarify that the email, facsimile and voice communication methods are for ERO notification only. *The DSR SDT agrees and has revised the sentence to include "to the ERO".* Dominion continues to believe that the drill or exercise specified in R4 is

Organization	Yes or No	Question 4 Comment
		unnecessary. Dominion suggests deleting this activity in the requirement. *Requirement R4 related to an annual test of the communication portion of Requirement R1 by a drill or exercise and this has been removed. Requirement R3 now reads: "Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2. ".* *The DSR SDT envisions that the testing under Requirement R3 will include verification of contact information contained in the Operating Plan is correct. As an example, the annual review of the Operating Plan could include calling "others as defined in the Responsible Entity's Operating Plan" (see Part 1.2) to verify that their contact information is up to date. If any discrepancies are noted, the Operating Plan would be updated.*
Response: Thank you for your comment. Please see response above.		
Ingleside Cogeneration LP		We are encouraged that the 2009-01 project team has eliminated duplicate reporting requirements from multiple organizations and governmental agencies. Ingleside Cogeneration LP believes that there are further improvements that can be made in this area - as the remaining overlap seem to be a result of legalities and preferences, not technical issues. We would like to see an ongoing commitment by NERC for a single process that will consolidate and automate data entry, submission, and distribution. *Attachment 1 is the basis for EOP-004-2; it contains the events and thresholds for reporting. OE-417, as well as, the EAWG's requirements were considered in creating Attachment 1, but there remain differences for the following reasons:* • *EOP-004 requirements were designed to meet NERC and the industry's needs; accommodation of other reporting obligations was considered as an*

Organization	Yes or No	Question 4 Comment
		opportunity not a 'must-have' • *OE-417 only applies to US entities, whereas EOP-004 requirements apply across North America* • *NERC has no control over the criteria in OE-417, which can change at any time* • *Reports made under EOP-004 provide a minimum set of information, which may trigger further information requests from EAWG as necessary* *In an effort to minimize administrative burden, US entities may use OE-417 rather than Attachment 2 to report under EOP-004. Note you may have to report the same event more quickly to the DOE than is required by EOP-004, but this cannot be helped due to bullet point 2 above.* *Please note that not all entities in North America are required to submit the DOE Form OE 417.*
Response: Thank you for your comment. Please see response above.		
SERC OC Standards Review Group		We believe that reporting of the events in Attachment 1 has no reliability benefit to the bulk electric system. In addition, Attachment 1, in its current form, is likely to be impossible to implement consistently across North America. A requirement, to be considered a reliability requirement, must be implementable. We suggest that Attachment 1 should be removed. *The DSR SDT disagrees with this comment. Attachment 1 is the minimum set of events that will be required to report and communicate per your Operating Plan will be aware of system conditions.* We have a question about what looks like a gap in this standard: Assuming one of thedrivers for the standard is to protect against a coordinated physical or cyber attack on the grid, what happens if the attack occurs in 3-4 geographically diverse areas? State or provisional law enforcement officials are not accountable under the standard, so we have no way of knowing if they report the attack to the FBI or the

Organization	Yes or No	Question 4 Comment
		RCMP. Even if one or two of them did, might not the FBI, in different parts of the country, interpret it as vandalism, subject to local jurisdiction?It seems that NERC is the focal point that would have all the reports and, ideally, some knowledge how the pieces fit together. It looks like NERC's role is to solely pass information on "applicable" events to the FERC. Unless the FERC has a 24x7 role not shown in the standard, should not NERC have some type of assessment responsibility to makes inquiries at the FBI/RCMP on whether they are aware of the potential issue and are working on it?"The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers." *Requirement R1, Part 1.2 was updated and now reads as: "A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies."* *By reporting to the ERO all events, this will allow the ERO to coordinate with other agencies as they see fit.*
Response: Thank you for your comment. Please see response above.		
ZGlobal on behalf of City of Ukiah, Alameda Municipal Power, Salmen River Electric, City of Lodi		We feel that the drafting team has done an excellent job of providing clarification and reasonable reporting requirements to the right functional entity. However we feel additional clarification should be made in the Attachment I Event Table. We suggest the following modifications:For the Event: BES Emergency resulting in automatic firm load sheddingModify the Entity with Reporting Responsibility to: Each DP or TOP that experiences the automatic load shedding within their respective distribution serving or Transmission Operating area. *The DSR SDT believes the "Entity with Reporting Responsibility" contains the minimum*

Organization	Yes or No	Question 4 Comment
		entities that will be required to report and reads as: "Each DP or TOP that experiences the automatic load shedding" For the Event: Loss of Firm load for â‰¥ 15 MinutesModify the Entity with Reporting Responsibility to: Each BA, TOP, DP that experiences the loss of firm load within their respective balancing, Transmission operating, or distribution serving area. *The DSR SDT believes the "Entity with Reporting Responsibility" contains the minimum entities that will be required to report and reads as: "Each BA, TOP, DP that experiences the loss of firm load"*
Response: Thank you for your comment. Please see response above.		
PSEG		We have several comments:1. The "Law Enforcement Reporting" section on p. 6 is unclearly written. The first three sentences are excerpted here: "The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting events. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement."The outages described prior to the last sentence are "vandalism and terrorism." The next sentence states "Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES." If the SDT intended to only have events reported to law enforcement that could to Cascading, it should state so clearly and succinctly. But other language implies otherwise. *The DSR SDT has updated the "Example of reporting _Process including Law Enforcement", and please note that this is only an "example".* a. The footnote 1 on Attachment 1 (p. 20) states: "Do not report copper theft from BES equipment unless it degrades the ability of equipment to operate correctly (e.g.,

Organization	Yes or No	Question 4 Comment
		removal of grounding straps rendering protective relaying inoperative)." Rendering a relay inoperative may or may not lead to Cascading. *The DSR SDT has removed all footnotes with the exception of the updated event within Attachment 1 that states: "A physical threat that could impact the operability of a Facility". This event has the following footnote, which states: "Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility."* b. With regard to "forced intrusion," footnote 2 on Attachment 1 states: "Report if you cannot reasonably determine likely motivation (i.e., intrusion to steal copper or spray graffiti is not reportable unless it effects (sic) the reliability of the BES." The criterion, or criteria, for reporting an event to law enforcement needs to be unambiguous. The SDT needs to revise this "Law Enforcement Section" so that is achieved. The "law enforcement reporting" criterion, or criteria, should also be added to the flow chart on p. 9. We suggest the following as a starting point for the team to discuss: there should be two criteria for reporting an event to law enforcement: (1) BES equipment appears to have been deliberately damaged, destroyed, or stolen, whether by physical or cyber means, or (2) someone has gained, or attempted to gain, unauthorized access by forced or unauthorized entry (e.g., via a stolen employee keycard badge) into BES facilities, including by physical or cyber means. *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* *The 'Damage or Destruction' event category has been revised to say ' to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was*

Organization	Yes or No	Question 4 Comment
		deleted *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples.* *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* 2. The use of the terms "communicating events" in R1.3, and the use of the term "communication process" are confusing because in other places such as R3 the term "reporting" is used. If the SDT intends "communicating" to mean "reporting" as that later term is used in R3, it should use the same "reporting" term in lieu of "communicating" or "communication" elsewhere. Inconsistent terminology causes confusion. PSEG prefers the word "reporting" because it is better understood. *Requirement R1, Part 1.3 (now Part 1.2) was revised to add clarifying language by eliminating the phrase "as appropriate" and indicating that the Responsible Entity is to define its process for reporting and with whom to report events. Requirement R1, Part 1.2 now reads:* *"1.2 A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement governmental or provincial agencies."*

Organization	Yes or No	Question 4 Comment
		The SDT envisions that most entities will only need to slightly modify their existing CIP-001 Sabotage Reporting procedures in order to comply with the Operating Plan requirement in this proposed standard. As many of the features of both are substantially similar, the SDT feels that some information may need to updated and verified. 3. Attachment 1 needs to more clearly define what is meant by “recognition of an event.”a. When equipment or a facility is involved, it would better state within “X” time (e.g., 1 hour) of “of confirmation of an event by the entity that either owns or operates the Element or Facility.” *Based on stakeholder comments, Requirement R1 was revised for clarity. Requirement R1, Part 1.1 was revised to replace the word “identifying” with “recognizing” and Part 1.2 was eliminated. This also aligns the language of the standard with FERC Order 693, Paragraph 471.* *“(2) specify baseline requirements regarding what issues should be addressed in the procedures for recognizing {emphasis added} sabotage events and making personnel aware of such events;”* b. Other reports should have a different specification of the starting time of the reporting deadline clock. For example, in the requirement for reporting a “BES Emergency requiring public appeal for load reduction,” it is unclear what event is required to be reported - the “BES Emergency requiring public appeal” or “public appeal for load reduction.” If the later is intended, then the event should be reported within “24 hours after a public appeal for load reduction is first issued.” These statements need to be reviewed and customized for each event by the SDT so they are unambiguous. *All one hour reporting timelines have been changed to 24 hours with the exception of a*

Organization	Yes or No	Question 4 Comment
		'Reportable Cyber Security Incident'. This is maintained due to FERC Order 706, Paragraph 673: *"…direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event…"* *For the remaining events, 24 hours should provide sufficient time to manage the incident in real-time before having to report and is consistent with current in-force standard EOP-004-1.* In summary, the starting time for the reporting clock to start running should be made clear for each event. This will require that the SDT review each event and customize the starting time appropriately. The phrase "recognition of an event" should not be used because it is too vague. *Based on stakeholder comments, Requirement R1 was revised for clarity. Part 1.1 was revised to replace the word "identifying" with "recognizing" and Part 1.2 was eliminated. This also aligns the language of the standard with FERC Order 693, Paragraph 471.* *"(2) specify baseline requirements regarding what issues should be addressed in the procedures for recognizing {emphasis added} sabotage events and making personnel aware of such events;"* 4. When EOP-004-2 refers to other standards, it frequently omits the version of the standard. Example: see the second and third row of Attachment 1 that refers to "CIP-002." Include the version on all standards referenced. *References to CIP-002 have been removed from the standard. The intent of referencing those standards is to prevent rewriting the standard within EOP-004-2. The threshold for reporting CIP-008 events is written as "That meets the criteria in CIP-008-4 or its successor."*

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. Please see response above.		
Ameren		Yes. We have the other comments as follow:(1) The "EOP-004 Attachment 1: Events Table" is quite lengthy and written in a manner that can be quite subjective in interpretation when determining if an event is reportable. We believe this table should be clear and unambiguous for consistent and repeatable application by both reliability entities and a CEA. *The DSR SDT has reviewed and further revised Attachment 1 based on comments received. We believe that it is both concise and easily interpreted.* The table should be divided into sections such as: 9a) Events that affect the BES that are either clearly sabotage or suspected sabotage after review by an entity's security department and local/state/federal law enforcement.(b) Events that pose a risk to the BES and that clearly reach a defined threshold, such as load loss, generation loss, public appeal, EEAs, etc. that entities are required to report by the end of the next business day.(c) Other events that may prove valuable for lessons learned, but are less definitive than required reporting events. These events should be reported voluntarily and not be subject to a CEA for non-reporting. *The DSR SDT received many comments regarding the various entries of Attachment 1. Many commenters questioned the reliability benefit of reporting events to the ERO within 1 hour. Most of the events with a one hour reporting requirement were revised to 24 hours based on stakeholder comments as well as those types of events are currently required to be reported within 24 hours in the existing mandatory and enforceable standards. The only remaining type of event that is to be reported within one hour is "A reportable Cyber Security Incident" as it required by CIP-008 and FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a*

Organization	Yes or No	Question 4 Comment
		cyber security incident as soon as possible, but in any event, within one hour of the event…" *The table was reformatted to separate one hour reporting and 24 hour reporting. The last column of the table was also deleted and the information contained in it was transferred to the sentence above each table. These sentences are:* *"One Hour Reporting: Submit Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within one hour of recognition of the event."* *"Twenty-four Hour Reporting: Submit Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within twenty-four hour of recognition of the event."* (d)Events identified through other means outside of entity reporting, but due to their nature, could benefit the industry by an event report with lessons learned. Requests to report and perform analysis on these type of events should be vetted through a ERO/Functional Entity process to ensure resources provided to this effort have an effective reliability benefit. *The DSR SDT has deleted the "lessons learned" language. Requirement R4 now only requires an annual review of the Operating Plan - the '90 days' and ' other circumstances' elements have been removed.* (2)Any event reporting shall not in any manner replace or inhibit an Entity's responsibility to coordinate with other Reliability Entities (such as the RC, TOP, BA, GOP as appropriate) as required by other Standards, and good utility practice to operate the electric system in a safe and reliable manner. *The DSR SDT concurs with your comment.*

Organization	Yes or No	Question 4 Comment
		(3) The 1 hour reporting maximum time limit for all GO events in Attachment 1 should be lengthened to something reasonable - at least 24 hours. Operators in our energy centers are well-trained and if they have good reason to suspect an event that might have serious impact on the BES will contact the TOP quickly. However, constantly reporting events that turn out to have no serious BES impact and were only reported for fear of a violation or self-report will quickly result in a cry wolf syndrome and a great waste of resources and risk to the GO and the BES. The risk to the GO will be potential fines, and the risk to the BES will be ignoring events that truly have an impact of the BES. *The DSR SDT received many comments regarding the various entries of Attachment 1. Many commenters questioned the reliability benefit of reporting events to the ERO within 1 hour. Most of the events with a one hour reporting requirement were revised to 24 hours based on stakeholder comments as well as those types of events are currently required to be reported within 24 hours in the existing mandatory and enforceable standards. The only remaining type of event that is to be reported within one hour is "A reportable Cyber Security Incident" as it required by CIP-008 and FERC Order 706, Paragraph 673:* *"direct the ERO to modify CIP-008 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but in any event, within one hour of the event..."* *The table was reformatted to separate one hour reporting and 24 hour reporting. The last column of the table was also deleted and the information contained in it was transferred to the sentence above each table. These sentences are:* *"One Hour Reporting: Submit Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within one hour of recognition of the*

Organization	Yes or No	Question 4 Comment
		event." *"Twenty-four Hour Reporting: Submit Attachment 2 or DOE-OE-417 report to the parties identified pursuant to Requirement R1, Part 1.2 within twenty-four hour of recognition of the event."* (4)The 2nd and 3rd Events on Attachment 1 should be reworded so they do not use terms that may have been deleted from the NERC Glossary by the time FERC approves this Standard. *The 'Damage or Destruction' events specifically relating to Critical Assets and Critical Cyber Assets were removed from Attachment 1, as these events are adequately addressed through the CIP-008 and 'Damage or Destruction of a Facility' reporting thresholds.* (5) The terms "destruction" and "damage" are key to identifying reportable events. Neither has been defined in the Standard. The term destruction is usually defined as 100% unusable. However, the term damage can be anywhere from 1% to 99% unusable and take anywhere from 5 minutes to 5 months to repair. How will we know what the SDT intended, or an auditor will expect, without additional information? *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* *The 'Damage or Destruction' event category has been revised to say ' to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new*

Organization	Yes or No	Question 4 Comment
		event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples. *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* (6)We also do not understand why "destruction of BES equipment" (first item Attachment 1, first page) must be reported < 1 hour, but "system separation (islanding) > 100 MW" (Attachment 1, page 3) does not need to be reported for 24 hours. *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* *The 'Damage or Destruction' event category has been revised to say 'to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. Organization	Yes or No	Question 4 Comment
		timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it may have first occurred. Also, the footnote only contains examples. *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.* (7)The first 2 Events in Attachment 1 list criteria Threshold for Reporting as "...operational error, equipment failure, external cause, or intentional or unintentional human action." The term "intentional or unintentional human action" appears to cover "operational error" so these terms appear redundant and create risk of misreporting. Can this be clarified? *The DSR SDT has updated this language based on comments received and now reads as: " Damage or destruction of a Facility that:* *Affects an IROL (per FAC-014)* *OR* *Results in the need for actions to avoid an Adverse Reliability Impact* *OR* *Results from intentional human action."* (8)The footnote of the first page of Attachment 1 includes the explanation "...ii) Significantly affects the reliability margin of the system..." However, the GO is prevented from seeing the system and has no idea what BES equipment can affect the reliability margin of the system. Can this be clarified by the SDT? *The DSR SDT has removed all footnotes with the exception of the updated event within Attachment 1 that states: "A physical threat that could impact the operability of a Facility". This event has the following footnote, which states: "Examples include a*

Organization	Yes or No	Question 4 Comment
		train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility." (9) The use of the term "BES equipment" is problematic for a GO. NERC Team 2010-17 (BES Definition) has told the industry its next work phase will include identifying the interface between the generator and the transmission system. The 2010-17 current effort at defining the BES still fails to clearly define whether or not generator tie-lines are part of the BES. In addition, NERC Team 2010-07 may also be assigned the task of defining the generator/transmission interface and possibly whether or not these are BES facilities. Can the SDT clarify the use of this term? For example, does it include the entire generator lead-line from the GSU high-side to the point of interconnection? Does it include any station service transformer supplied from the interconnected BES? *The DSR SDT has modified Attachment 1 to bring more clarity. The more subjective events were rewritten as follows:* • *The 'Damage or Destruction' event category has been revised to say ' to a Facility', (a defined term) and thresholds have be modified to provide clarity. The footnote was deleted* • *'Forced intrusion' and 'Risk to BES Equipment' have been combined under a new event type called 'A physical threat that could impact the operability of a Facility'. Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported. Note that the reporting timeline (now revised to 24 hours) starts when the situation has been determined as a threat, not when it*

Organization	Yes or No	Question 4 Comment
		may have first occurred. Also, the footnote only contains examples. *These two remaining event categories that aren't related to power system phenomena are essential as they effectively translate the intent of CIP-001 into EOP-004.*
Response: Thank you for your comment. Please see response above.		
Performance Analysis Subcommittee		There continues to be some confusion regarding whether the loss of firm load was consistent with the planned operation of the system or was an unintended consequence. As such it might be helpful if instead of a single check box for loss of firm load there were two check boxes 1) loss of firm load – consequential and 2) loss of firm load non-consequential. *Thank you for your comment. The DSR SDT believes that Attachment 2 contains the minimum amount of information under this standard. Any entity reporting an event can add as much information as they see fit.*
Response: Thank you for your comment. Please see response above.		
Southwestern Power Administration's		"Attachment 1 contains elements that do not need to be included, and redundant elements such as: Forced intrusion at BES Facility - A facility break-in does not necessarily mean that the facility has been impacted or has undergone damage or destruction. *The DSR SDT discussed this event as well as the event "Risk to BES equipment". These two event types had overlap in the perceived reporting requirements. The DSR SDT removed "Forced Intrusion" as a category and the "Risk to BES equipment" event was*

Organization	Yes or No	Question 4 Comment
		revised to "Any physical threat that could impact the operability of a Facility". *Using judgment is unavoidable for this type of event. This language was chosen because the Responsible Entity is the best position to exercise this judgment and determine whether or not an event poses a threat to its Facilities. The DSR SDT believes this revised event type will minimize administrative burden and ensure that events meaningful to industry awareness are reported.* *The footnote regarding this event type was expanded to provide additional guidance in:* *"Examples include a train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center). Also report any suspicious device or activity at a Facility. Do not report copper theft unless it impacts the operability of a Facility."* Detection of a reportable Cyber Security Incident per CIP-008 - If entities are addressing this requirement in CIP-008, why do so again in EOP-004 (Attachment 2-EOP-004, Reporting Requirement number 5)? *The reporting aspects of CIP-008 have been removed from CIP-008 and are included in EOP-004. Please see the Implementation Plan with regards to the retirement of CIP-008, R1.3* Transmission Loss: Each TOP that experiences transmission loss of three or more facilities - This element should be removed or rewritten so that it only applies when the loss includes a contingent element of an IROL facility." *The DSR SDT disagrees with limiting this type of event to only "a contingent element*

Organization	Yes or No	Question 4 Comment
		of an IROL facility." It is important for situational awareness and trending analysis to have these types of events reported.
Response: Thank you for your comment. Please see response above.		
The Performance Analysis Subcommittee		There continues to be some confusion regarding whether the loss of firm load was consistent with the planned operation of the system or was an unintended consequence. As such it might be helpful if instead of a single check box for loss of firm load there were two check boxes 1) loss of firm load – consequential and 2) loss of firm load non-consequential. *The DSR SDT believes that this information should be obtained in follow up through the Events Analysis Program. The reporting entity may have concerns or difficulties in determining if load is consequential or non-consequential in its initial analysis for the report. Further investigation outside of the reporting time of 24 hours may be needed to make this determination.*
Response: Thank you for your comment. Please see response above.

Consideration of Comments

Disturbance and Sabotage Reporting – Project 2009-01

The Disturbance and Sabotage Reporting Drafting Team thanks all commenters who submitted comments on the draft standard EOP-004-2. This standard was posted for a 30-day public comment period from April 25, 2012 through May 24, 2012. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 87 sets of comments, including comments from approximately 210 different people from approximately 135 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page:

http://www.nerc.com/filez/standards/Project2009-01_Disturbance_Sabotage_Reporting.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President of Standards and Training, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_Standard_Processes_Manual_Rev%201_20110825.pdf

Summary Consideration: The DSR SDT received several suggestions for improvement to the standard. As a result of these revisions, the DSR SDT is posting the standard for a second successive ballot period.

The DSR SDT has removed reporting of Cyber Security Incidents from EOP-004 and have asked the team developing CIP-008-5 to retain this reporting. With this revision, the Interchange Coordinator, Transmission Service Providers, Load-Serving Entity, Electric Reliability Organization and Regional Entity were removed as Responsible Entities.

Most of the language contained in the “Background” Section was moved to the “Guidelines and Technical Basis” Section. Minor language changes were made to the measures and the data retention section. Attachment 2 was revised to list events in the same order in which they appear in Attachment 1.

Requirement R1 was revised to include the Parts in the main body of the Requirement. The Measure and VSLs were updated accordingly.

Following review of the industry’s comments, the SDT has re-examined the FERC Directive in Order 693 and has dropped both R3 and R4, as they were written and established a new Requirement R3 to have the Registered Entity “validate” the contact information in the contact list(s) they may have for the events applicable to them. This validation needs to be performed each calendar year to ensure that the list(s) have current and up-to-date contact data.

> R3. Each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1each calendar year. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The SDT reviewed, discussed and updated Attachment 1 based on comments received for commenters, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. Under the Event Column, the SDT starts to classify each type of an event by assigning an “Event” title. The DSRSDT then updated the “Entity with Reporting Responsibilities” column to simply state which entity has the responsibility to report if they experience an event. The last column, “Threshold for Reporting” is a bright line that, if reached, the entity needs to report that they experienced the applicable event per Requirement 1.

The DSR SDT proposed a revision to the NERC Rules of Procedure (Section 812). The SDT has learned that NERC has started a new effort to forward event reports to applicable government authorities. As such, Section 812 is no longer needed and will be removed from this project.

NERC

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. **The SDT has revised EOP-004-2 by removing Requirement 1, Part 1.4 and separating Parts 1.3 and 1.5 into new Requirements R3 and R4. Requirement R3 calls for an annual test of the communications portion of the Operating Plan and Requirement R4 requires an annual review of the Operating Plan. Do you agree with this revision? If not, please explain in the comment area below.**

Summary Consideration: Following review of the industry's comments, the SDT has re-examined the FERC Directive in Order 693 and has dropped both R3 and R4, as they were written and established a new Requirement R3 to have the Registered Entity "validate" the contact information in the contact list(s) they may have for the applicable events to their functional registration(s). This validation needs to be performed on a calendar year period to ensure that the list(s) have current and up-to-date contact data.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	Regarding Requirement R3, add the following wording from Measure M3 to the end of R3 after the wording "in Part 1.2.": The annual test requirement is considered to be met if the responsible entity implements the communications process in Part 1.2 for an actual event. This language must be in the Requirement to be considered during an audit. Measures are not auditable. Regarding Requirement R4, replace the words "an annual review" with the words "a periodic review. "Add the following to R4: The frequency of such periodic reviews shall be specified in the Operating Plan and the time between periodic reviews shall not exceed five (5) years. This does not preclude an annual review in an Entity's operating plan. The Entity will then be audited to its plan. If the industry approves a five (5) year periodic review 'cap', and FERC disagrees, then FERC will have to issue a directive, state its reasons and provide justification for an annual review that is not arbitrary or capricious. Adding the one year "test" requirement adds to the administrative tracking burden and adds no reliability value.

Organization	Yes or No	Question 1 Comment
Response: The SDT thanks you for your comment. The SDT has removed R4 and revised R3 that calls for the responsible entity to validate contact information contain in the Operating Plan each calendar year as described in Requirement R1. The “Annual review” is used to ensure that the event reporting Operating Plan is up to date. If an entity experiences an event, communication evidence from the event may be used to show compliance.		
DECo	No	Should only have annual "review" requirement rather than test.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirements highlighted in your comment.		
Duke Energy	No	Under R3, we agree with testing communications internally. Just as the ERO is excluded under R3, other external entities should also be excluded. External communications should be verified under R4.
Response: The SDT thanks you for your comment. Due to industry opposition, the SDT revised Requirement R3 to remove test to “validate” contact information contained in the Operating Plan. If an entity experiences an actual event, communication evidence from the event may be used to show compliance with the validation requirement for the specific contacts used for the event.		
Dominion	No	While Dominion believes these are positive changes, we are concerned that placing actual calls to each of the “other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity’s Reliability Coordinator; law enforcement, governmental or provincial agencies” may be seen by one or more of those called as a ‘nuisance call’. Given the intent is to insure validity of the contact information (phone number, email, etc), we suggest revising the standard language to support various forms of validation to include, documented send/receipt of email, documented verification of phone number (use of phone book, directory assistance, etc).
Response: The SDT thanks you for your comment. The SDT has made changes to the requirement highlighted in your comment.		

Organization	Yes or No	Question 1 Comment
SPP Standards Review Group	No	There needs to be a more granular definition of which entities should be included in the annual testing requirement in R3. To clarify what must be tested we propose the following language to replace the last sentence in M3. The annual test requirement is considered to be met if the responsible entity implements any communications process in the Operating Plan during an actual event. If no actual event was reported during the year, at least one of the communication processes in the Operating Plan must be tested to satisfy the requirement. We do not believe the time-stamping requirement in M3 and M4 contribute to the reliability of the BES. A dated review should be sufficient.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirement highlighted in your comments. The Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. If an entity experiences an actual event, communication evidence from the event may be used to show compliance with the validation requirement for the specific contacts used for the event. Time-stamping has been removed.		
Florida Municipal Power Agency	No	First, FMPA believes the standard is much improved from the last posting and we thank the SDT or their hard work. Having said that, there are still a number of issues, mostly due to ambiguity in terms, which cause us to vote Negative. R3 and R4 should be combined into a single requirement with two subparts, one for annual testing, and another to incorporate lessons learned from the annual testing into the plan (as opposed to an annual review).The word “test” is ambiguous as used in R3, e.g., does a table top drill count as a “test”? Is the intent to “test” the plan, or “test” the phone numbers, or what?
Response: The SDT thanks you for your comment. The SDT has made changes to the requirement highlighted in your comment.		
MRO NSRF	No	R3 states: Each Responsible Entity shall conduct an annual test, not including notification to the Electric Reliability Organization, of the communications process in Part 1.2. R1.2 states: A process for communicating each of the

Organization	Yes or No	Question 1 Comment
		applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to the Electric Reliability Organization and other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement, governmental or provincial agencies. With the use of "i.e." the SDT is mandating that each other entity must be contacted. The NSRF believes that the SDT meant that "e.g." should be used to provide examples. The SDT may wish to add another column to Attachment 1 to provide clarity. R3 requires and annual test that would include notification of:"other organizations needed for the event type; i.e. the Regional Entity; company personnel; the Responsible Entity's Reliability Coordinator; law enforcement, governmental or provincial agencies."Since NERC see no value in receiving these test notification we are doubtful other entities identified in R1.2 would find them of value. The real purpose of this requirement appears to be to assure operators are trained in the use of the procedure, process, or plan that assures proper notification. PER-005 already requires a systematic approach to training. It is hard to comprehend an organization not identifying this as a Critical Task, and if they failed to identify it as a Critical Task that this would not be a violation. Therefore this requirement is not required. Furthermore organizations test their response to events in accordance with CIP-008 R1.6. Therefore this requirement is covered by other standards and is not needed. The SDT may need to address this within M3, by stating "... that the annual test of the communication process of 1.2 (e.g. communication via e-mail, fax, phone, etc) was conducted". R4 states: Each Responsible Entity shall conduct an annual review of the event reporting Operating Plan in Requirement R1. We question the value of requiring an annual review. If the Standard does not change, there seems little value in requiring an annual review. This appears to be an administrative requirement with little reliability value. It would likely be identified as a requirement that that should be eliminated as part of the

Organization	Yes or No	Question 1 Comment
		request by FERC to identify strictly administrative requirements in FERC's recent order on FFTR. We suggest it be eliminated.
Response: The SDT thanks you for your comment. Requirement R3 called for test of all contact information contain. The SDT deleted Requirement R4 based on stakeholder comments and revised R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization. **The annual review requirement was maintained to meet the intent of NERC Order 693, Paragraph 466. The Commission does not specify a review period, as suggested; rather, believes that the appropriate period should be determined through the ERO's Reliability Standards.** **"The Commission affirms the NOPR directive and directs the ERO to incorporate a periodic review or updating of the sabotage reporting procedures and for the periodic testing of the sabotage reporting procedures."**		
ISO/RTO Standards Review Committee	No	The SRC offers comments regarding the posted draft requirements; however, by so doing, the SRC does not indicate support of the proposed requirements. Following these comments, please see the latter part of the SRC's response to Question 4 below for an SRC proposed alternative approach: Regarding the proposed posted requirements, without indicating support of those requirements, the SRC concurs with the changes as they provide better streamlining of the four key requirements, with enhanced clarity. However, we are unclear on the intent of Requirement R3, in particular the phrase "not including notification to the Electric Reliability Organization" which begs the question on whether or not the test requires notifying all the other entities as if it were a real event. This may create confusion in ensuring compliance and during audits. Suggest the SDT to review and modify this requirement as appropriate. Regarding part 1.2, the SRC requests that the text be terminated after the word "type" and before "i.e." As written, the requirement does not allow for the entity to add/remove others as necessary. Please consider combining R3 and R4.

Organization	Yes or No	Question 1 Comment
		These can be accomplished at the same time. The process should be evaluated to determine effectiveness when an exercise or test is conducted. The SDT is asked to review the proposal and to address the issue of requirements vs. bullets vs. sub-requirements. It is suggested that each requirement be listed independently, and that each sub-step be bulleted.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirement highlighted in your comment.		
ACES Power Marketing Standards Collaborators	No	(1) We agree with removing Part 1.4 and we agree with a requirement to periodically review the event reporting Operating Plan. However we are not convinced the review of the Operating Plan needs to be conducted annually. The event reporting Operating Plan likely will not change frequently so a biannual review seems more appropriate. (2) We also do not believe that Requirement R3 is needed at all. Requirement R3 compels the responsible entity to test their Operating Plan annually. We do not see how testing an Operating Plan that is largely administrative in nature contributes to reliability. Given that the drafting team is obligated to address the FERC directive regarding periodic testing, we suggest the Operating Plan should be tested biannually. This would still meet the FERC directive requiring periodic testing.
Response: The SDT thanks you for your comment. The SDT deleted Requirement R4 based on stakeholder comments and revised R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization.		
Southern Company Services	No	There are approximately 17 event types for which Responsible Entities must have a process for communicating such events to the appropriate entities and R3 states that "The Responsible Entity shall conduct an annual test of the communications process". It is likely that the same communications process will be used to report multiple event types, so Southern suggest that

Organization	Yes or No	Question 1 Comment
		the Responsible Entities conduct an annual test for each unique communications process. Southern suggest that this requirement be revised to state “Each Responsible Entity shall conduct an annual test of each unique communications process addressed in R1.2”. o In Attachment 1, for Event: “Damage or destruction of a Facility”, SDT should consider removing “Results from actual or suspected intentional human action” from the “Threshold for Reporting” column. The basis for this suggestion is as follows: o The actual threshold should be measurable, similar to the thresholds specified for other events in Attachment 1. [Note: The first two thresholds identified (i.e., “Affects and IROL” and “Results in the need for actions to avoid an Adverse Reliability Impact”) are measurable and sufficiently qualify which types of Facility damage should be reported.] o The determination of human intent is too subjective. Including this as a threshold will cause many events to be reported that otherwise may not need to be reported. (e.g., Vandalism and copper theft, while addressed under physical threats, is more appropriately classified as damage. These are generally intentional human acts and would qualify for reporting under the current guidance in Attachment 1. They may be excluded from reporting by the threshold criteria regarding IROLs and Adverse Reliability Impact, if the human intent threshold is removed.) o It may be more appropriate to address human intent in the event description as follows: “Damage or destruction of a Facility, whether from natural or human causes”. Let the thresholds related to BES impact dictate the reporting requirement. o In Attachment 1, for Event: “Complete or partial loss of monitoring capability”, SDT should consider changing the threshold criteria to state: “Affecting a BES control center for â‰¥ 30 continuous minutes such that analysis capability (State Estimator, Contingency Analysis) is rendered

Organization	Yes or No	Question 1 Comment
		inoperable." There may be instances where the tools themselves are out of commission, but the control center personnel have sufficiently accurate models and alternate methods of performing the required analyses.

Response: The SDT thanks you for your comment. The SDT has made changes to the requirement highlighted in your initial comment.

The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. Under the Event Column, the SDT starts to classify each type of an event by assigning an "Event" title. The DSR SDT then updated the "Entity with Reporting Responsibilities" column to simply state what entity has the responsibility to report if they experience an event. The last column, "Threshold for Reporting" is a bright line that, if reached, the entity needs to report that they experienced the applicable event per Requirement 1.

Damage or destruction of a Facility:

The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state;

Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency.

This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).

This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.

Organization	Yes or No	Question 1 Comment
Progress Energy	No	It should be clear that the Operating Plan can be multiple procedures. It is an unnecessary burden to have entities create a new document outlining the Operating Plan. Having to create a new Operating Plan would not improve reliability and would further burden limited resources. The annual testing required by R3 should be clarified. Do all communication paths need to be annually tested or just one path? An actual event may only utilize one communication 'leg' or 'path' and leave others untested and utilized. Entities may have a corporate level procedure that 'hand-shakes' with more localized procedures that make up the entire Operating Plan. Must all communications processes be tested to fulfill the requirement? If an entity has 'an actual event' it is not necessarily true that their Operating Plan has been exercised completely, yet this one 'actual event' would satisfy M3 as written.
Response: The SDT thanks you for your comment. Regarding your initial comment on the need to create a new document, the SDT believes that a Registered Entity with a procedure under CIP-001 will be able to utilize that document as the starting point for the Operating Plan here. The SDT feels that many of the necessary components will already exist in that document and the Registered Entity should only need to edit it accordingly for the types of Events applicable to them. The SDT has made changes to the standard highlighted in your comment.		
Hydro One	No	In the Requirement R3, we suggest adding the following wording from Measure M3 to the end of R3 after the wording “in Part 1.2.”: The annual test requirement is considered to be met if the responsible entity implements the communications process in Part 1.2 for an actual event. This language must be in the Requirement to be considered during an audit. Measures are not auditable. Statement “... not including notification to the ERO...” as it stands now is confusing. We suggest that this statement is either reworded (and explained in the Rational for this requirement) or outright removed for clarity purposes In the requirement R4, we suggest replacing the words “an annual

Organization	Yes or No	Question 1 Comment
		review" with the words "a periodic review." Add the following to R4: The frequency of such periodic reviews shall be specified in the Operating Plan and the time between periodic reviews shall not exceed five (5) years. This does not preclude an annual review in an Entity's operating plan. The Entity will then be audited to its plan. If the industry approves a five (5) year periodic review 'cap,' and FERC disagrees, then FERC will have to issue a directive, state it reasons and provide justification for an annual review that is not arbitrary or capricious. Adding the one year "test" requirement adds to the administrative tracking burden and adds no reliability value. The table in the standard is clear regarding what events need to be reported. An auditor may want to see a test for "each" of the applicable events listed in EOP-004 Attachment 1.If the requirement for "an" annual test remains in the standard in R3, then it should be made clear that a test is not required for "each" of the applicable events listed in Attachment 1 (reference to R1.2.)
Response: The SDT thanks you for your comment. Each Responsible Entity must report and communicate events according to its Operating Plan based on the information in EOP-004 Attachment 1. The SDT removed the Operating Plan Process from Requirement 1 and revised the measure to meet the communications of Requirement R1, "to implement an operating plan within the time frames specified in Attachment 1." Requirement R3 called for test of all contact information contained. The SDT deleted Requirement R4 based on stakeholder comments and revised R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization.		
CenterPoint Energy	No	CenterPoint Energy recommends that "and implement" be added after "Each Responsible Entity shall have" in Requirement R1. After such revision, Requirement R2 will not be needed as noted in previous comments submitted by the Company.

Organization	Yes or No	Question 1 Comment
		CenterPoint Energy also believes that Requirement R3 is not needed as an annual review encompassing the elements of the test described in the draft is sufficient.
Response: The SDT thanks you for your comment. The SDT considered the consolidation of the first and second requirements. However, since the requirements have the Registered Entity perform two distinct steps, a single requirement cannot be written to achieve multiple tasks. Each task must stand on its own and be judged singly. **The annual review helps ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization.**		
Arkansas Electric Cooperative Corporation	No	AECC supports the comments submitted by ACES Power Marketing.
Response: The SDT thanks you for your comment. Please review the response directed to them.		
MWDSC	No	Transmission Owners (TO) should not be included as a "Responsible Entity" for this or other requirements because the Operating Plan is usually prepared by the Transmission Operator (TOP). For TOs who are not also TOPs, there are usually delegation agreements. CIP-001 never directly applied to TOs.
Response: The SDT thanks you for your comment. The SDT disagrees with your assessment, as the TOs are physical owners of the equipment that would be affected by this standard. As Owners of the equipment, they need to be reporting on what is happening to their equipment.		
Manitoba Hydro	No	(R1.1 and 1.2) It is unclear whether or not R1.1 and R1.2 require a separate recognition and communication process for each of the event types listed in Attachment 1 or if event types can be grouped as determined appropriate by the responsible entity given that identical processes will apply for multiple types of events. Manitoba Hydro suggests that wording is revised so

Organization	Yes or No	Question 1 Comment
		that multiple event types can be addressed by a single process as deemed appropriate by the Responsible Entity. (R3) It is unclear whether or not R3 requires the testing of the communications process for each separate event type identified in Attachment 1. If so, this would be extremely onerous. Manitoba Hydro suggests that only unique communication processes (as identified by the Responsible Entity in R1.2) require an annual test and that testing should not be required for each type of event listed in Attachment 1. As well, Manitoba Hydro believes that testing the communications process alone is not as effective as also providing training to applicable personnel on the communications process. Manitoba Hydro suggests that R3 be revised to require annual training to applicable personnel on the communications process and that only 1 test per unique communications process be required annually.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirements highlighted in your comments. Each Responsible Entity must report and communicate events according to its Operating Plan based on the information in EOP-004 Attachment 1. The SDT has attempted to clarify that it is the choice of the Registered Entity on whether one, or more than one, contact list(s) is needed for the differing types applicable to them. Depending upon your needs of who you have an obligation to report, you can elect to have one or multiple lists. **Requirement R3 called for test of all contact information contained. The SDT deleted Requirement R4 based on stakeholder comments and revised R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization.**		
Occidental Power Services, Inc.	No	There should be an exception for LSEs with no BES assets from having an Operating Plan and, therefore, from testing and review of such plan. These LSEs have no reporting responsibilities under Attachment 1 and, if they have nothing ever to report, why would they have to have an Operating Plan and have to test and review it? This places an undue burden on small entities

Organization	Yes or No	Question 1 Comment
		that cannot impact the BES.
Response: The SDT thanks you for your comment. LSEs, as being applicable under the Cyber Security standards, were included in the applicability of this standard. Since the SDT is proposing to keep the Cyber Security reporting requirements in CIP-008, LSEs have been removed from the applicability of this standard. This action will not negate the LSE responsibilities under that standard and your comments will need to be addressed there.		
Xcel Energy	No	1) In R1.2, We understand what the drafting team had intended here. However, we are concerned that the way this requirement is drafted, using i.e., it could easily be interpreted to mean that you must notify all of those entities listed. Instead, we are suggesting that the requirement be rewritten to require entities to define in their Operating Plan the minimum organizations/entities that would need to be notified for applicable events. We believe this would remove any ambiguity and make it clear for both the registered entity and regional staff. We recommend the requirement read something like this: 1.2. A process for communicating each of the applicable events listed in EOP-004 Attachment 1 in accordance with the timeframes specified in EOP-004 Attachment 1 to applicable internal and external organizations needed for the event type, as defined in the Responsible Entity's Operating Plan. 2) We also suggest that R3 be clarified as to whether communications to all organizations must be tested or just those applicable to the test event type/scenario.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirements highlighted in your comments.		
American Electric Power	No	R3: How many different scenarios need to be tested? For example, reporting sabotage-related events might well be different than reporting reliability-related events such as those regarding loss of Transmission. While these

Organization	Yes or No	Question 1 Comment
		examples might vary a great deal, other such scenarios may be very similar in nature in terms of communication procedures. Perhaps solely testing the most complex procedure would be sufficient. AEP agrees with the changes with R3 calling for an annual test provided the requirement R2 is modified to include the measure language "The annual test requirement is considered to be met if the responsible entity implements the communications process in Part 1.2 for an actual event." M3: While we agree that "the annual test requirement is considered to be met if the responsible entity implements the communications process in Part 1.2 for an actual event", we believe it would be preferable to include this text in R3 in addition to M3. Measures included in earlier standards (some of which are still enforced today) had little correlation to the requirement itself, and as a result, those measures were seldom referenced. M3: It would be unfair to assume that every piece of evidence required to prove compliance would be dated and time-stamped, so we recommend removing the text "dated and time-stamped" from the first sentence so that it reads "Each Responsible Entity will have records to show that the annual test of Part 1.2 was conducted." The language regarding dating and time stamps in regards to "voice recordings and operating logs or other communication" is sufficient.
Response: The SDT thanks you for your comment. Based on stakeholder comments the SDT revised R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization. The SDT agrees with the point raised on time-stamping and has removed it from the standard.		
Entergy	No	The requirement for a "time stamped record" of annual review is unreasonable and unnecessary. A dated document showing that a review was performed should be sufficient.

Organization	Yes or No	Question 1 Comment
Response: The SDT thanks you for your comment. The SDT has made changes to the requirements highlighted in your comment. The SDT has removed time-stamping from the standard.		
New York Power Authority	No	Please see comments submitted by NPCC Regional Standards Committee (RSC).
Response: The SDT thanks you for your comment. Please review the response to the commenter.		
Consolidated Edison Co. of NY, Inc.	No	Requirement R3: Following the sentence ending "in Part 1.2" add the following wording from the Measure to R3: The annual test requirement is considered to be met if the responsible entity implements the communications process in Part 1.2 for an actual event. This language must be in the Requirement to be considered during an audit. Measures are not auditable. Requirement R4: Replace the words "an annual review" with the words "a periodic review."Following the first sentence in R4 add: The frequency of such periodic reviews shall be specified in the Operating Plan and the time between periodic reviews shall not exceed five (5) years.
Orange and Rockland Utilities, Inc.	No	Requirement R3: Following the sentence ending "in Part 1.2" add the following wording from the Measure to R3: The annual test requirement is considered to be met if the responsible entity implements the communications process in Part 1.2 for an actual event. This language must be in the Requirement to be considered during an audit. Measures are not auditable. Requirement R4: Replace the words "an annual review" with the words "a periodic review." Following the first sentence in R4 add: The frequency of such periodic reviews shall be specified in the Operating Plan and the time between periodic reviews shall not exceed five (5) years.
Response: The SDT thanks you for your comment. Based on stakeholder comments the SDT revised R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively		

Organization	Yes or No	Question 1 Comment
report events to assure situational awareness to the Electric Reliability Organization. The SDT considered various time frames for the action needed and felt that a calendar year was necessary due to the FERC Directive in Order 693 and to ensure that contact information remained useful in a timely manner.		
MidAmerican Energy	No	See the NSRF comments. The real purpose of this requirement appears to be to assure operators are trained in the use of the procedure, process, or plan that assures proper notification. PER-005 already requires a systematic approach to training. Reporting to other affected entities is a PER-005 system operator task. Therefore this requirement already covered by PER-005 and is not required. Organizations are also required to test their response to events in accordance with CIP-008 R1.6. Therefore this requirement is covered by other standards and is not needed. Inclusion of this standard would place entities in a double or possible triple jeopardy. The SDT may need to expand M3 reporting options, by stating "... that the annual test of the communication process of 1.2 (e.g. communication via e-mail, fax, phone, ect) was conducted". R4 is an administrative requirement with little reliability value and should be deleted. It would likely be identified as a requirement that that should be eliminated as part of the request by FERC to identify strictly administrative requirements in FERC's recent order on FFTR.
Response: The SDT thanks you for your comment. The SDT asks you to review the response to that commenter. The SDT disagrees with your understanding of the real purpose. Reporting of events listed in Attachment 1 is necessary for personnel beyond the operators. **The SDT deleted Requirement R4 based on stakeholder comments and revised Requirement R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization.**		
Illinois Municipal Electric Agency	No	IMEA reluctantly (in recognition of the SDT's efforts and accomplishments to date) cast a Negative vote for this project primarily based on R3 because it is

Organization	Yes or No	Question 1 Comment
		attempting to fix a problem that does not exist and impacts small entity resources in particular. IMEA is not aware of seeing any information regarding a trend, or even a single occurrence for that matter, in a failure to report an event due to failure in reporting procedures. A small entity is less likely to experience a reportable event, and therefore is less likely to be able to take advantage of the provision in M3 to satisfy the annual testing through implementation of an actual event. If there is a problem that needs to be fixed, it would make much more sense to replace the language in R3 with a simple requirement for the RC, BA, IC, TSP, TOP, etc. to inform the TO, DP, LSE if there is a change in contact information for reporting an event. It is hard to believe that an RC, BA, IC, TSP, TOP, etc. is going to want to be annually handling numerous inquiries from entities regarding the accuracy of contact information. The impact of unnecessary requirements on entity resources, particularly small entities', is finally starting to get some meaningful attention at NERC and FERC. It would be a mistake to adopt another unnecessary requirement as currently specified in R3.
Response: The SDT thanks you for your comment. The SDT has revised Requirement R3 to help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization.		
Amercican Transmission Company, LLC	No	ATC recommends eliminating R4 altogether. If R3, the annual test, is conducted as part of the Operating Plan, R4 is merely administrative, and does not add value to reliability.
Response: The SDT thanks you for your comment. The SDT deleted Requirement R4 based on stakeholder comments and revised Requirement R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization.		
NextEra Energy Inc	No	NextEra Energy, Inc. (NextEra) does not agree that annual reviews and

Organization	Yes or No	Question 1 Comment
		annual tests should be mandated via Reliability Standards; instead, NextEra believes it is more appropriate to require that the Operating Plan be up-to-date and reviewed/tested as the Responsible Entity deems necessary. These enhancements provide for a robust Operating Plan, without arbitrary deadlines for a review and testing. It also provides Responsible Entities of different sizes and configurations the flexibility to efficiently and effectively integrate compliance with operations. Thus, NextEra requests that R1 be revised to read: "Each Responsible Entity shall have an up-to-date event reporting Operating Plan that is tested and reviewed as the Responsible Entity deems necessary and includes: ...". Consistent with these changes NextEra also requests that R3 and R4 be deleted.
Response: The SDT thanks you for your comment. While the SDT recognizes the simplicity that your comment would bring, it cannot be implemented in that manner. For auditability reasons, each task must be separate and distinct in order for the performance to be assessed. Alternatively, the SDT has re-constructed three distinct requirements that can be judged and evaluated on their own with compromising the others.		
ISO New England Inc	No	Due to the FERC mandate to assign VRFs/VSLs, we do not support using subrequirements and, instead, favor the use of bullets when the subrequirements are not standalone but rely on the partent requirement.
Response: The SDT thanks you for your comment. The SDT has revised the language and removed all subrequirements.		
Exelon Corporation and its affiliates	No	It's not clear that R3 and R4 need to be separated. Consider revising R3 to read: "Through use or testing, verify the operability of the plan on an annual basis" and dropping R4.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirements highlighted in your comment.		

Organization	Yes or No	Question 1 Comment
Indiana Municipal Power Agency	No	IMPA does not believe that both R3 and R4 are necessary and they are redundant to a degree. Generally, when performing an annual review of a process or procedure, the call numbers for agencies or entities are verified to be up to date. Also, in R3, what does "test" mean. It could mean have different meanings to registered entities and to auditors which does not promote consistency among the industry. IMPA recommends going with an annual review of the process and having the telephone numbers verified that are in the event reporting Operating Plan. IMPA also believes that the local and federal law enforcement agencies would rather go with a verification of contact information over being besieged by "test" reports. The way R3 is written gives the appearance that the SDT did not want to overwhelm the ERO with all of the "test" reports from the registered entities (by excluding them from the test notification).
Response: The SDT thanks you for your comment. The SDT has made changes to the requirements highlighted in your comment.		
ERCOT	No	ERCOT has joined the IRC comments on this project and offers these additional comments. ERCOT requests that the measure be updated to say "acceptable evidence may include". As written, the measure reads that there is only one way to comply with the requirement. The Standards should note "what" an entity is required to do and not prescribe the "how".
Response: The SDT thanks you for your comment. The SDT has made changes to the standard highlighted in your comment.		
Brazos Electric Power Cooperative	No	Please see the comments submitted by ACES Power Marketing.
Response: The SDT thanks you for your comment. Please review the response to that commenter.		
Central Lincoln	No	The new language of R3 and R4 provide nothing to clarify the word "annual." We note that while a Compliance Application Notice was written on this,

Organization	Yes or No	Question 1 Comment
		Central Lincoln believes that standards should be written so they do not rely on the continually changing CANs. CAN-0010 itself implies that "annual" should be defined within the standards themselves. We suggest: R3 Each Responsible Entity shall conduct a test of the communications process in R1 Part 1.2, not including notification to the Electric Reliability Organization, at least once per calendar year with no more than 15 calendar months between tests.R4 Each Responsible Entity shall conduct a review of the event reporting Operating Plan in Requirement R1. at least at least once per calendar year with no more than 15 calendar months between reviews.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirements highlighted in your comment.		
Kansas City Power & Light	No	Requirement 3 requires a test of the communications in the operating plan. A test implies a simulation of the communications part of the operating plan by actual communications being conducted pursuant to the plan. It is not appropriate to burden agencies with testing of communications under a test environment. Recommend the drafting team consider a confirmation of the contact information with various agencies as the operations plan dictates.
Response: The SDT thanks you for your comment. SDT has made changes to the requirements highlighted in your comment.		
Bonneville Power Administration	Yes	BPA believes that the annual testing and review as described in R3 is too cumbersome and unnecessary for entities with large footprints to inundate federal and local enforcement bodies such as the FBI for "only" testing and the documenting for auditing purposes. BPA suggests that testing be performed on a bi-annual or longer basis.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirements highlighted in your comment; however, the SDT has decided that the period will be shorter than your suggestion based upon comments received from all parties.		

Organization	Yes or No	Question 1 Comment
Seattle City Light	Yes	This is a great improvement over the prior CIP and EOP versions. However, please see #4 for overall comment.
Response: The SDT thanks you for your comment. Please review the response to Question 4.		
Utility Services	Yes	While agreeing with the change, confusion may exist with the CAN that exists for the term "Annual". Utility Services suggests that the language be changed to "Every calendar year" or something equivalent. Given everything that transpired in the discussion on the term annual, using a different phrase may be advantageous.
Response: The SDT thanks you for your comment. The SDT has made changes to the requirement highlighted in your comment.		
United Illuminating Company	Yes	R3 should be clear that the annual test of the plan does not mean each communication path for each applicable event on an annual basis.
Response: The SDT thanks you for your comment. Requirement R3 has been rewritten to address comments like yours and other industry members. While testing is no longer a part of the requirement, validating the contact information associated with each contact list for each applicable event type is.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration LP agrees that it is appropriate to test reporting communications on an annual basis, primarily to validate that phone numbers, email ids, and contact information is current. We appreciate the project team's elimination of the terms "exercise" and "drill", which we believe connotates a formalized planning and assessment process. An annual review of the Operating Plan implies a confirmation that linkages to sub-processes remain intact and that new learnings are captured. We also agree that it is appropriate only to require an updated Revision Level Control chart entry as evidence of compliance - it is very likely that no updates are required after the review is complete. In our view, both of these requirements are sufficient to assure an effective assessment of all facets of

Organization	Yes or No	Question 1 Comment
		the Operating Plan. As such, we fully agree with the project team's decision to delete the requirement to update the plan within 90 days of a change. In most cases, our internal processes will address the updates much sooner, but there is no compelling reason to include it as an enforceable requirement.
Response: The SDT thanks you for your comment.		
City of Austin dba Austin Energy	Yes	Austin Energy (AE) supports the requirements for (1) an annual test of the communications portion of the Operating Plan (R3) and (2) an annual review of the Operating Plan (R4); however, we offer a slight modification to the measures associated with those requirements. AE does not believe that records evidencing such test and reviews need to be time-stamped to adequately demonstrate compliance with the requirements. In each case, we recommend that the first sentence of M3 and M4 start with "Each Responsible Entity will have dated records to show that the annual ..."
Response: The SDT thanks you for your comment. The SDT has removed the time-stamping provision in the standard.		
Springfield Utility Board	Yes	o SUB supports the removal of Requirement 1, Part 1.4, as well the separation of Parts 1.3 and 1.5, agreeing that they are their own separate actions. o The Draft 4 Version History still lists the term "Impact Event" rather than "Event".
Response: The SDT thanks you for your comment. The SDT has made changes highlighted in your comment.		
FirstEnergy Corp	Yes	FE agrees with the revision but has the following comments and suggestions: 1. We request clarity and guidance on R3 (See our comments in Question 4 for further consideration). Also, we suggest a change in the phrase "shall conduct an annual test" to "shall conduct a test each calendar year, not to exceed 15 calendar months between tests". This wording is consistent with other

Organization	Yes or No	Question 1 Comment
		standards in development such as CIP Version 5.2. 2. In R4 we suggest a change in the phrase “shall conduct an annual review” to “shall conduct a review each calendar year, not to exceed 15 calendar months between reviews”. This wording is consistent with other standards in development such as CIP Version 5.
Response: The SDT thanks you for your comment. The SDT deleted Requirement R4 based on stakeholder comments and revised Requirement R3 so that each Responsible Entity shall validate all contact information contained in the Operating Plan per Requirement R1 each calendar year. Requirement R3 will help ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization.		
Independent Electricity System Operator	Yes	We concur with the changes as they provide better streamlining of the four key requirements, with enhanced clarity. However, we are unclear on the intent of Requirement R3, in particular the phrase “not including notification to the Electric Reliability Organization” which begs the question on whether or not the test requires notifying all the other entities as if it were a real event. This may create confusion in ensuring compliance and during audits. Suggest the SDT to review and modify this requirement as appropriate.
Response: The SDT thanks you for your comment. The SDT has revised the standard’s language to address this concern.		
Public Utility District No. 1 of Snohomish County	Yes	This is an excellent improvement over the prior CIP and EOP versions. However, please see #4 for overall comment.
Seattle City Light	Yes	This is a great improvement over the prior CIP and EOP versions. However, please see #4 for overall comment.
MEAG Power	Yes	This is a great improvement over the prior CIP and EOP versions. However, please see #4 for overall comment.
Response: The SDT thanks you for your comment. Please review the response to Question 4.		

Organization	Yes or No	Question 1 Comment
Tacoma Power	Yes	Tacoma Power agrees with the requirement but would suggest removing all instances the word “Operating” from the Standard. The requirements should read, “ Each Responsible Entity shall have an “Event Reporting Plan...”.The term Operating in this context is confusing as there are many other “Operating Plans” for other defined emergencies. This standard is about “Reporting” and should be confined to that.
Response: The SDT thanks you for your comment. The SDT has chosen to include “Operating” due to the definition in the NERC Glossary. The SDT believes Operating Plan clearly defines what is needed in this standard.		
Idaho Power Co.	Yes	But this is going to require that we create a new Operating Plan with test procedures and revision history.
Response: The SDT thanks you for your comment. The SDT believes that an existing procedure, that meets the requirements of CIP-001-2a, may well be the starting point for the Operating Plan in this standard, or could go a long way towards achieving the requirements in this standard. The SDT revised Requirement R3 to remove test to “validate” contact information contained in the Operating Plan. If an entity experiences an actual event, communication evidence from the event may be used to show compliance with the validation requirement for the specific contacts used for the event.		
American Public Power Association	Yes	APPA appreciates the SDT making these requirements clearer as requested in our comments on the previous draft standard.
Response: The SDT thanks you for your comment.		
Puget Sound Energy, Inc.	Yes	This draft is a considerable improvement on the previous draft in terms of clarity and will be much easier for Responsible Entities to implement. Puget Sound Energy appreciates the drafting team’s responsiveness to stakeholder’s concerns and the opportunity to comment on the current draft. The drafting team should revise Requirement R2 to state that the “activation” of the Operating Plan is required only when an event occurs, instead of using the term “implement”. “Implementation” could also refer

Organization	Yes or No	Question 1 Comment
		to the activities such as distributing the plan to operating personnel and training operating personnel on the use of the plan. These activities are not triggered by any event and, since it is clear from the measure that this requirement is intended to apply only when there has been a reportable event, the requirement should be revised to state that as well. The drafting team should revise measure M2 to require reports to be “supplemented by operator logs or other reporting documentation” only “as necessary”. In many cases, the report itself and time-stamped record of transmittal will be the only documents necessary to demonstrate compliance with requirement R2.Under Requirement R3, using an actual event as sufficient for meeting the requirement for conducting an annual test would likely fall short of demonstrating compliance with the entire scope of the Operating Plan. R1.2 requires "a process for communicating EACH of the applicable events listed....". If the actual event is only one of many "applicable" events, is it sufficient to only exercise one process flow? If there is no actual event during the annual time-frame, do all the process flows then have to be exercised?
Response: The SDT thanks you for your comment. The SDT appreciates the suggestion; however, to be consistent with other reliability standards, the SDT has elected to continue to use the word “Implement.” Your suggestion could end up creating confusion and misunderstandings since the context is not used elsewhere. **The SDT has revised the language the requirements and measures as a result of your and other commenter’s remarks.**

2. **The SDT made clarifying revisions to Attachment 1 based on stakeholder feedback. Do you agree with these revisions? If not, please explain in the comment area below.**

Summary Consideration:

The SDT reviewed, discussed and updated Attachment 1 based on comments received for commenters, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. Under the Event Column, the SDT starts to classify each type of an event by assigning an "Event" title. The DSR SDT then updated the "Entity with Reporting Responsibilities" column to simply state which entity has the responsibility to report if they experience an event. The last column, "Threshold for Reporting" is a bright line that, if reached, the entity needs to report that they experienced the applicable event per Requirement 1.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	Regarding Attachment 1, language identical to event descriptions in the NERC Event Analysis Process and FERC OE-417 should be used. Creating a third set of event descriptions is not helpful to system operators. Recommend aligning the Attachment 1 wording with that contained in Attachment 2, DOE Form OE-417 and the EAP whenever possible. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. Using identical terminology will be difficult to achieve as the DOE form and EAP have differing processes for identification of the reportable incidences. The SDT has tried to set up the reportable events in the standard to be as similar as possible to the other organizations without being tied to their specific language. Attachment 2 has been modified to match the events types listed in Attachment 1.** The following pertains to Attachment 1:Replace the Attachment 1 "NOTE" with the following clarifying wording: NOTE: The Electric Reliability Organization and the Responsible Entity's Reliability Coordinator will accept the DOE OE-417 form in lieu of Attachment 2 if the entity is required to submit an OE-417 report. Submit reports to

Organization	Yes or No	Question 2 Comment
		the ERO via one of the following: e-mail: esisac@nerc.com, Facsimile: 609-452-9550, Voice: 609-452-1422. Initial submittal by Voice within the reporting time frame is acceptable for all events when followed by a hardcopy submittal by Facsimile or e-mail as and if required. **The SDT thanks you with your comment. First, the SDT believes that you intended the comment to address the "Note" on Attachment 2, not Attachment 1. The SDT does not believe that a hardcopy report is necessary if the organization has made voice contact.** The proposed "events" are subjective and will lead to confusion and questions as to what has to be reported. **The SDT disagrees and has established "events" to be reported based on bright line criteria. The events are consistent with previous versions of the CIP-001 and EOP-004 standards, as well as incidences being reporting to the DOE and EAP.** Event: A reportable Cyber Security Incident. All reportable Cyber Security Incidents may not require "One Hour Reporting." A "one-size fits all" approach may not be appropriate for the reporting of all Cyber Security Incidents. The NERC "Security Guideline for the Electricity Sector: Threat and Incident Reporting" document provides time-frames for Cyber Security Incident Reporting. For example, a Cyber Security Compromise is recommended to be reported within one hour of detection, however, Information Theft or Loss is recommended to be reported within 48 hours. Recommend listing the Event as "A confirmed reportable Cyber Security Incident. The existing NERC "Security Guideline for the Electricity Sector: Threat and Incident Reporting" document uses reporting time-frames based on "detection" and "discovery." Recommend using the word confirmed because of the investigation time that may be required from the point of initial "detection" or "discovery" to the point of confirmation, when the compliance "time-clock" would start for the reporting requirement in EOP-004-2. **The SDT is revising the standard to not contain reporting for Cyber Security incidents. Under the revisions, CIP-008-3 and successive versions will retain the**

Organization	Yes or No	Question 2 Comment
		reporting requirements. Event: Damage or destruction of a Facility Threshold for Reporting: revise language on third item to read: Results from actual or suspected intentional human action, excluding unintentional human errors. **The SDT reviewed, discussed and updated "Damage and destruction of a Facility" based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. The new "threshold" now states:** **"Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in the need for actions to avoid a BES Emergency."** **This language gives the required guidance of who has to report within its Area that results in need for actions to avoid a BES Emergency (as defined by NERC: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System).** **This relates to either a completely destroyed Facility where an action is required to avoid a BES Emergency, or a Facility that is damaged to a point that actions are required to avoid a BES Emergency. By reporting either a "damaged or destroyed" Facility, within 24 hours, it will give the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that the electrical system has been reconfigured or may need to be reconfigured, thus supporting reliable operations of each interconnection.** Event: Any physical threat that could impact the operability of a Facility This Event category should be deleted. The word "could" is hypothetical and therefore

Organization	Yes or No	Question 2 Comment
		unverifiable and un-auditable. The word "impact" is undefined. Please delete this reporting requirement, or provide a list of hypothetical "could impact" events, as well as a specific definition and method for determining a specific physical impact threshold for "could impact" events other than "any." **The SDT removed all language under "Entity with Reporting Responsibility" with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Physical threat to its Facility excluding weather related threat, which has the potential to degrade the normal operation of the Facility** **Or** **Suspicious device or activity at a Facility** **Do not report copper theft unless it degrades normal operations of a Facility."** **This language gives the required guidance that if there is a physical threat that has the potential to degrade a Facility's normal operation or a suspicious device or activity is discovered at a Facility, it is required to be reported within 24 hours, this will give the ERO (and whomever else the entity wishes to inform per Requirement R1) the situational awareness that the Facility has a potential of not being able to operate as it is designed. The SDT also states that copper theft is not a reportable event unless it degrades the normal operation of a Facility.** Event: BES Emergency requiring public appeal for load reduction. Replace wording in the Event column with language from #8 on the OE-417 Reporting Form to eliminate reporting confusion. Following this sentence add, "This shall exclude other public

Organization	Yes or No	Question 2 Comment
		appeals, e.g., made for weather, air quality and power market-related conditions, which are not made in response to a specific BES event." **The SDT disagrees with quantifying a use of public appeals reporting for different types of events. The important item here is that a public appeal was issued for load reduction. A report is required to inform the ERO (and whoever else the entity wishes to inform per Requirement R1) of your current status and provide them with the situational awareness of the status of your system.** Event: Complete or partial loss of monitoring capability Event wording: Delete the words "or partial" to conform the wording to the NERC Event Analysis Process. **The SDT reviewed, discussed and updated Attachment 1 based on comments received, FERC directives and what is required for combining CIP-001 and EOP-004 into EOP-004-2. This event now only applies to "Complete loss of monitoring capability affecting a BES control center for 30 continuous minutes or more such that analysis capability (State Estimator, Contingency Analysis) is rendered inoperable." This will only apply to an RC, BA, or TOP who have this capability to start with.** Event: Transmission Loss Revise to BES Transmission Loss **The SDT removed all language under "Entity with Reporting Responsibility" with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Unexpected loss, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing)."** Event: Generation Loss Revise to BES Generation Loss **The SDT removed all language under "Entity with Reporting Responsibility" with the exception of entity(s) that are required to report an applicable event. The SDT**

Organization	Yes or No	Question 2 Comment
		removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state: **"Total generation loss, within one minute, of ≥ 2,000 MW for entities in the Eastern or Western Interconnection** **OR** **≥ 1,000 MW for entities in the ERCOT or Quebec Interconnection."** **The SDT believes that if an entity reaches this threshold, it needs to be reported and most likely this will be BES connected generation assets.**
Response: The SDT thanks you for your comment.		
DECo	No	On pg 17 in the Rationale Box for EOP-004 Attachment 1: The set of terms is specific then includes the word ETC. Then further lists areas to exclude. Then on Pg 23 of document it includes train derailment near a transmission right of way and forced entry attempt into a substation facility as reportable. These conflict. Also see conflict when in pg 21 states the DOE OE417 would be excepted in lieu of the NERC form, but on the last pg it states the DOE OE417 should be attached to the NERC report indicating the NERC report is still required.
Response: The SDT thanks you for your comment. While the SDT would like to point out the "etc." is the last word in the definition of Facility; the SDT has removed footnote 1 and the forced intrusion statement has been removed. The SDT has updated to remove the conflict of "attached to the NERC report…" The SDT agrees with your comments and have revised the standard to address these discrepancies.		
Duke Energy	No	(1)We disagree with reporting CIP-008 incidents under this standard. We agree with the one-hour notification timeframe, but believe it should be in CIP-008 to avoid double jeopardy. **The SDT has discussed this issue with Project 2008-06, Cyber Security SDT and we have remanded the one-hour event back to CIP-008. The next version of EOP-004-2 will not contain a one hour reporting requirement.** (2)Damage or destruction of a Facility - Need clarity on how a vertically integrated

Organization	Yes or No	Question 2 Comment
		entity must report. For example a GOP probably won't know if an IROL will be affected. Also, there shouldn't be multiple reports from different functional entities for the same event. Suggest splitting this table so that GO, GOP, DP only reports "Results from actual or suspected intentional human action". **The SDT removed all language under "Entity with Reporting Responsibility," with the exception of entity(s) that are required to report an applicable event. The SDT removed this language so the entities within this column are clearly stated and identified. Under the "Threshold for Reporting" column, a bright line was updated based on currently enforced Reliability Standards, FERC directives and industry comments to state:** **"Damage or destruction of its Facility that results from actual or suspected intentional human action.** **This language gives the required guidance that if there is actual intentional human action that damages or destroys a Facility, it is required to be reported within 24 hours, this will give the ERO (and whoever else the entity wishes to inform per R1) the situational awareness that the Facility was 'damaged or destroyed' intentionally by a human."** **This event was written to cover the increase of "Entity with Reporting Responsibility," and removing the RC since they do not own Facility(s).** **The SDT also included a second part of this event being "suspected intentional human action." This language was required to give an entity the reporting responsibility to report to the ERO (and whoever else the entity wishes to inform per Requirement R1) the situational awareness that they suspect that their Facility was damaged or destroyed by intentional human action. The SDT envisions that entities could further define what a suspected intentional human action is within their Operating Plan.** (3)Generation Loss - Need more clarity on the threshold for reporting. For example if
