- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This "raising the bar" is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon has been provided.

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR approved by SC in May 2012.
2. Initial comment period July 31, 2012 – August 29, 2012.

Proposed Action Plan and Description of Current Draft:

The SDT is working to address FERC's remand of the proposed clarification of TPL-002, Table 1 — footnote 'b', regarding the planned or controlled interruption of electric supply where a single Contingency occurs on a Transmission System. Table 1 appears in the first four of the current TPL standards but footnote 'b' only applies to TPL-002. Therefore, only TPL-002 is being posted for industry comment at this time. When the footnote has been approved, all four of the applicable TPL standards will be filed with the Commission.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Initial ballot	October 2012
2. Recirculation ballot	December 2012
3. BOT approval	February 2013

A. Introduction

1. Title: **System Performance Following Loss of a Single Bulk Electric System Element (Category B)**

2. Number: TPL-002-1c

3. Purpose: System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.

4. Applicability:

4.1. Planning Authority

4.2. Transmission Planner

5. Effective Date: The application of revised Footnote 'b' in Table 1 will take effect on the first day of the first calendar quarter, 60 months after approval by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. All other requirements remain in effect per previous approvals. The existing Footnote 'b' remains in effect until the revised Footnote 'b' becomes effective.

B. Requirements

R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I. To be valid, the Planning Authority and Transmission Planner assessments shall:

R1.1. Be made annually.

R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.

R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.1. Be performed and evaluated only for those Category B contingencies that would produce the more severe System results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.

R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.

R1.3.4. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.

R1.3.5. Have all projected firm transfers modeled.

R1.3.6. Be performed and evaluated for selected demand levels over the range of forecast system Demands.

R1.3.7. Demonstrate that system performance meets Category B contingencies.

R1.3.8. Include existing and planned facilities.

R1.3.9. Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.

R1.3.10. Include the effects of existing and planned protection systems, including any backup or redundant systems.

R1.3.11. Include the effects of existing and planned control devices.

R1.3.12. Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

R1.4. Address any planned upgrades needed to meet the performance requirements of Category B of Table I.

R1.5. Consider all contingencies applicable to Category B.

R2. When System simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-002-1_R1, the Planning Authority and Transmission Planner shall each:

R2.1. Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:

R2.1.1. Including a schedule for implementation.

R2.1.2. Including a discussion of expected required in-service dates of facilities.

R2.1.3. Consider lead times necessary to implement plans.

R2.2. Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.

R3. The Planning Authority and Transmission Planner shall each document the results of its Reliability Assessments and corrective plans and shall annually provide the results to its respective Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

M1. The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-1_R1 and TPL-002-1_R2.

M2. The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-002-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.
Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0a	October 23, 2008	Added Appendix 1 – Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO	Revised
0b	November 5, 2009	Added Appendix 2 – Interpretation of R1.3.10 approved by BOT on November 5, 2009	Addition
1b	April 2010	Revised footnote ‘b’ pursuant to FERC Order RM06-16-009.	Revised
1c	February 2013	Address remand of proposed footnote ‘b’ pursuant to FERC Order RM06-16-009	Revised

Table I. Transmission System Standards — Normal and Emergency Conditions

Category	Contingencies	System Limits or Impacts		
	Initiating Event(s) and Contingency Element(s)	System Stable and both Thermal and Voltage Limits within Applicable Rating [a]	Loss of Demand or Curtailed Firm Transfers	Cascading Outages
A No Contingencies	All Facilities in Service	Yes	No	No
B Event resulting in the loss of a single element.	Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault.	 Yes Yes Yes Yes	 No [b] No [b] No [b] No [b]	 No No No No
	Single Pole Block, Normal Clearing[e]: 4. Single Pole (dc) Line	Yes	No[b]	No
C Event(s) resulting in the loss of two or more (multiple) elements.	SLG Fault, with Normal Clearing[e]: 1. Bus Section 2. Breaker (failure or internal Fault)	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG or 3Ø Fault, with Normal Clearing[e], Manual System Adjustments, followed by another SLG or 3Ø Fault, with Normal Clearing[e]: 3. Category B (B1, B2, B3, or B4) contingency, manual system adjustments, followed by another Category B (B1, B2, B3, or B4) contingency	Yes	Planned/ Controlled[c]	No
	Bipolar Block, with Normal Clearing[e]: 4. Bipolar (dc) Line Fault (non 3Ø), with Normal Clearing[e]: 5. Any two circuits of a multiple circuit towerline[f]	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG Fault, with Delayed Clearing[e] (stuck breaker or protection system failure): 6. Generator 7. Transformer 8. Transmission Circuit 9. Bus Section	Yes Yes Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c]	No No No No

D [d] Extreme event resulting in two or more (multiple) elements removed or Cascading out of service	3Ø Fault, with Delayed Clearing[e] (stuck breaker or protection system failure): 1. Generator 3. Transformer 2. Transmission Circuit 4. Bus Section - - - - - - - - - - 3Ø Fault, with Normal Clearing[e]: 5. Breaker (failure or internal Fault) - - - - - - - - - - 6. Loss of towerline with three or more circuits 7. All transmission lines on a common right-of way 8. Loss of a substation (one voltage level plus transformers) 9. Loss of a switching station (one voltage level plus transformers) 10. Loss of all generating units at a station 11. Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.	Evaluate for risks and consequences. ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.

a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.

b) An objective of the planning process is to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. In limited circumstances, Firm Demand may be interrupted throughout the planning horizon to ensure that BES performance requirements are met. However, when interruption of Firm Demand is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the use of Firm Demand interruption meets the conditions shown in Attachment 1. In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW.

c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.

d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.

e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.

f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Firm Demand interruption under footnote ‘b’ is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote ‘b’ is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Firm Demand interruption under footnote ‘b’
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Firm Demand interruption under footnote ‘b’ (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder’s satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote ‘b’ utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Firm Demand interruption under footnote ‘b’ which must include the following:

1. Conditions under which Firm Demand interruption under footnote ‘b’ would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Firm Demand MW to be interrupted with:
    a. The estimated number and type of customers affected

  b. Assessment of the effect of the use of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community
3. Estimated frequency of Firm Demand interruption under footnote ‘b’ based on historical performance
4. Expected duration of Firm Demand interruption under footnote ‘b’ based on historical performance
5. Future plans to mitigate the need for Firm Demand interruption under footnote ‘b’
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote ‘b’
7. Alternatives to Firm Demand interruption considered and the rationale for not selecting those alternatives under footnote ‘b’
8. Assessment of potential overlapping uses of footnote ‘b’ including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Interruptions of Firm Demand under Footnote ‘b’ is Required

Before a Firm Demand interruption under footnote ‘b’ is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must assure that the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the use of Firm Demand interruption under footnote ‘b’ if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Firm Demand interruptions under footnote ‘b’, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Firm Demand interruption under footnote ‘b’ is greater than or equal to 25 MW

In no case can the planned Firm Demand interruption under footnote ‘b’ exceed 75 MW.

Once assurance has been received that the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the use of Firm Demand interruption under footnote ‘b’, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote ‘b’ for Firm Demand interruption.

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from MISO on August 9, 2007:

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed "Planning Coordinator" (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former "Planning Authority" name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

– Under the Functional Model, the Planning Coordinator "Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system" while the Transmission Planner "Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans." A PC's selection of "critical system conditions" and its associated generation dispatch falls within the purview of "methodology."

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

> **M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2]."

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a "valid assessment" means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term "planned outages" means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard1?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a "contingency" as defined in the *NERC Glossary of Terms Used in Standards.*

Appendix 2

Requirement Number and Text of Requirement
R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following **Category B of Table 1** (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s). **R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
Background Information for Interpretation
Requirement R1.3 and sub-requirement R1.3.10 of standard TPL-002-0a contain three key obligations: 1. That the assessment is supported by "study and/or system simulation testing that addresses each the following categories, showing system performance following Category B of Table 1 (single contingencies)." 2. "…these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s)." 3. "Include the effects of existing and planned protection systems, including any backup or redundant systems." *Category B of Table 1 (single Contingencies) specifies:* Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault. Single Pole Block, Normal Clearing[e]: 4. Single Pole (dc) Line *Note e specifies*: e) Normal Clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay. The NERC Glossary of Terms defines Normal Clearing as "A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems."
Conclusion
TPL-002-0a requires that System studies or simulations be made to assess the impact of single Contingency operation with Normal Clearing. TPL-002-0a R1.3.10 does require that all elements expected to be removed from service through normal operations of the Protection Systems be removed in simulations. This standard does not require an assessment of the Transmission System performance due to a Protection System failure or Protection System misoperation. Protection System failure or Protection System misoperation is addressed in TPL-003-0 — System Performance following Loss of Two or More Bulk

Electric System Elements (Category C) and TPL-004-0 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).

TPL-002-0a R1.3.10 does not require simulating anything other than Normal Clearing when assessing the impact of a Single Line Ground (SLG) or 3-Phase (3Ø) Fault on the performance of the Transmission System.

In regards to PacifiCorp's comments on the material impact associated with this interpretation, the interpretation team has the following comment:

Requirement R2.1 requires "a written summary of plans to achieve the required system performance," including a schedule for implementation and an expected in-service date that considers lead times necessary to implement the plan. Failure to provide such summary may lead to noncompliance that could result in penalties and sanctions.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR approved by SC in May 2012.

~~1.~~2. Initial comment period July 31, 2012 – August 29, 2012.

Proposed Action Plan and Description of Current Draft:

The SDT is working to address FERC's remand of the proposed clarification of TPL-002, Table 1 — footnote 'b', regarding the planned or controlled interruption of electric supply where a single Contingency occurs on a Transmission System. Table 1 appears in the first four of the current TPL standards but footnote 'b' only applies to TPL-002. Therefore, only TPL-002 is being posted for industry comment at this time. When the footnote has been approved, all four of the applicable TPL standards will be filed with the Commission.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Initial ~~posting~~ ballot	~~July~~October 2012
2. Recirculation ballot	~~October~~December 2012
3. BOT approval	February 2013

A. Introduction

1. Title: **System Performance Following Loss of a Single Bulk Electric System Element (Category B)**

2. Number: TPL-002-1c

3. Purpose: System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.

4. Applicability:

4.1. Planning Authority

4.2. Transmission Planner

5. Effective Date: The application of revised Footnote 'b' in Table 1 will take effect on the first day of the first calendar quarter, 60 months after approval by applicable regulatory ~~approval~~authorities. In those jurisdictions where ~~no~~ regulatory approval is not required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. All other requirements remain in effect per previous approvals. The existing Footnote 'b' remains in effect until the revised Footnote 'b' becomes effective.

B. Requirements

R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I. To be valid, the Planning Authority and Transmission Planner assessments shall:

R1.1. Be made annually.

R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.

R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.1. Be performed and evaluated only for those Category B contingencies that would produce the more severe System results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.

R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.

R1.3.4. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.

R1.3.5. Have all projected firm transfers modeled.

R1.3.6. Be performed and evaluated for selected demand levels over the range of forecast system Demands.

R1.3.7. Demonstrate that system performance meets Category B contingencies.

R1.3.8. Include existing and planned facilities.

R1.3.9. Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.

R1.3.10. Include the effects of existing and planned protection systems, including any backup or redundant systems.

R1.3.11. Include the effects of existing and planned control devices.

R1.3.12. Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

R1.4. Address any planned upgrades needed to meet the performance requirements of Category B of Table I.

R1.5. Consider all contingencies applicable to Category B.

R2. When System simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-002-1_R1, the Planning Authority and Transmission Planner shall each:

R2.1. Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:

R2.1.1. Including a schedule for implementation.

R2.1.2. Including a discussion of expected required in-service dates of facilities.

R2.1.3. Consider lead times necessary to implement plans.

R2.2. Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.

R3. The Planning Authority and Transmission Planner shall each document the results of its Reliability Assessments and corrective plans and shall annually provide the results to its respective Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

M1. The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-1_R1 and TPL-002-1_R2.

M2. The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-002-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.
Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0a	October 23, 2008	Added Appendix 1 – Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO	Revised
0b	November 5, 2009	Added Appendix 2 – Interpretation of R1.3.10 approved by BOT on November 5, 2009	Addition
1b	April 2010	Revised footnote ‘b’ pursuant to FERC Order RM06-16-009.	Revised
1c	February 2013	Address remand of proposed footnote ‘b’ pursuant to FERC Order RM06-16-009	Revised

Table I. Transmission System Standards — Normal and Emergency Conditions

Category	Contingencies	System Limits or Impacts		
	Initiating Event(s) and Contingency Element(s)	System Stable and both Thermal and Voltage Limits within Applicable Rating [a]	Loss of Demand or Curtailed Firm Transfers	Cascading Outages
A No Contingencies	All Facilities in Service	Yes	No	No
B Event resulting in the loss of a single element.	Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault.	 Yes Yes Yes Yes	 No [b] No [b] No [b] No [b]	 No No No No
	Single Pole Block, Normal Clearing [e]: 4. Single Pole (dc) Line	Yes	No[b]	No
C Event(s) resulting in the loss of two or more (multiple) elements.	SLG Fault, with Normal Clearing [e]: 1. Bus Section 2. Breaker (failure or internal Fault)	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG or 3Ø Fault, with Normal Clearing [e], Manual System Adjustments, followed by another SLG or 3Ø Fault, with Normal Clearing [e]: 3. Category B (B1, B2, B3, or B4) contingency, manual system adjustments, followed by another Category B (B1, B2, B3, or B4) contingency	Yes	Planned/ Controlled[c]	No
	Bipolar Block, with Normal Clearing [e]: 4. Bipolar (dc) Line Fault (non 3Ø), with Normal Clearing [e]: 5. Any two circuits of a multiple circuit towerline[f]	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG Fault, with Delayed Clearing [e] (stuck breaker or protection system failure): 6. Generator 7. Transformer 8. Transmission Circuit 9. Bus Section	 Yes Yes Yes Yes	 Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c]	 No No No No

D [d] Extreme event resulting in two or more (multiple) elements removed or Cascading out of service	3Ø Fault, with Delayed Clearing [e] (stuck breaker or protection system failure): 1. Generator 2. Transmission Circuit 3. Transformer 4. Bus Section 3Ø Fault, with Normal Clearing [e]: 5. Breaker (failure or internal Fault) 6. Loss of towerline with three or more circuits 7. All transmission lines on a common right-of way 8. Loss of a substation (one voltage level plus transformers) 9. Loss of a switching station (one voltage level plus transformers) 10. Loss of all generating units at a station 11. Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.	Evaluate for risks and consequences. ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.

a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.

b) An objective of the planning process ~~should be~~is to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. ~~Furthermore, i~~In limited circumstances, Firm Demand may ~~need to~~ be interrupted throughout the planning horizon to ensure that BES performance requirements are met. However, ~~W~~when interruption of Firm Demand is utilized within the Near-Term Transmission ~~p~~Planning ~~process~~ Horizon to address BES performance requirements, such interruption is limited to circumstances where the use of Firm Demand interruption meets the conditions shown in Attachment 1. In no case can the planned Firm Demand interruption under footnote 'b' exceed '~~x~~75' MW.

c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.

d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.

e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.

f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Firm Demand interruption under footnote 'b' is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 'b' is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. ~~shall document the stakeholder process which shall~~ The process must include the following:

1. Meetings must be open to ~~all~~ affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to ~~all~~ affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific ~~applications~~ location(s) of the planned Firm Demand interruption under footnote 'b'
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Firm Demand interruption under footnote 'b' (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 'b' utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Firm Demand interruption under footnote 'b' which must include the following:

1. Conditions under which Firm Demand interruption under footnote 'b' would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency

2. Amount of Firm Demand MW to be interrupted with:
   a. The estimated number and type of customers affected
   b. ~~An a~~Assessment of the effect of the use of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community
3. Estimated frequency of Firm Demand interruption under footnote ‘b’ based on historical performance
4. Expected duration of Firm Demand interruption under footnote ‘b’ based on historical performance
5. Future plans to mitigate the need for Firm Demand interruption under footnote ‘b’
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote ‘b’
7. Alternatives to Firm Demand interruption considered and the rationale for not selecting those alternatives under footnote ‘b’
8. Assessment of potential overlapping uses of footnote ‘b’ including overlaps with adjacent Transmission ~~p~~Planners and Planning Coordinators

III. Instances for which Regulatory Review ~~Approval~~ of Interruptions of Firm Demand under Footnote ‘b’ is Required

Before a Firm Demand interruption under footnote ‘b’ is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ~~Approval~~assure that ~~of the use of Firm Demand interruption under footnote ‘b’ by~~ the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the use of Firm Demand interruption under footnote ‘b’ ~~is required~~ if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Firm Demand interruptions under footnote ‘b’, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Firm Demand interruption under footnote ‘b’ is greater than or equal to 25 MW

~~Before a Firm Demand interruption under footnote ‘b’ is allowed to be utilized as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that approval is obtained from the regulatory authority or governing body responsible for retail electric service issues.~~

In no case can the planned Firm Demand interruption under footnote ‘b’ exceed ~~x~~75 MW.

Once assurance has been received that the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the use of Firm Demand interruption under footnote ‘b’~~When approval for the use of a footnote ‘b’ Firm Demand interruption is necessary under items III.1 or III.2 above~~, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ~~Regional Entity~~ ~~Entity~~ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote ‘b’ for Firm Demand interruption. ~~Within 45 days of receipt of this information, the Regional Entity must review each proposed use of Firm Demand interruption under footnote ‘b’ to verify that there are no Adverse Reliability Impacts including any potential cumulative effect within the Regional Entity’s footprint. If the Regional Entity states that an Adverse Reliability Impact will result due to the requested Firm Demand interruption, then the requesting entity may appeal the decision to the ERO. Regional Entity determinations of Adverse Reliability Impacts are to be evaluated by the Regional Entity through a published methodology approved by the ERO.~~

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from MISO on August 9, 2007:

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed "Planning Coordinator" (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former "Planning Authority" name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

– Under the Functional Model, the Planning Coordinator "Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system" while the Transmission Planner "Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans." A PC's selection of "critical system conditions" and its associated generation dispatch falls within the purview of "methodology."

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

M1. The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2]."

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a "valid assessment" means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term "planned outages" means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard1?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a "contingency" as defined in the *NERC Glossary of Terms Used in Standards.*

Appendix 2

Requirement Number and Text of Requirement
R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following **Category B of Table 1** (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s). **R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
Background Information for Interpretation
Requirement R1.3 and sub-requirement R1.3.10 of standard TPL-002-0a contain three key obligations: 1. That the assessment is supported by "study and/or system simulation testing that addresses each the following categories, showing system performance following Category B of Table 1 (single contingencies)." 2. "…these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s)." 3. "Include the effects of existing and planned protection systems, including any backup or redundant systems." *Category B of Table 1 (single Contingencies) specifies:* Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault. Single Pole Block, Normal Clearing[e]: 4. Single Pole (dc) Line *Note e specifies*: e) Normal Clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay. The NERC Glossary of Terms defines Normal Clearing as "A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems."
Conclusion
TPL-002-0a requires that System studies or simulations be made to assess the impact of single Contingency operation with Normal Clearing. TPL-002-0a R1.3.10 does require that all elements expected to be removed from service through normal operations of the Protection Systems be removed in simulations. This standard does not require an assessment of the Transmission System performance due to a Protection System failure or Protection System misoperation. Protection System failure or Protection System misoperation is addressed in TPL-003-0 — System Performance following Loss of Two or More Bulk

Electric System Elements (Category C) and TPL-004-0 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).

TPL-002-0a R1.3.10 does not require simulating anything other than Normal Clearing when assessing the impact of a Single Line Ground (SLG) or 3-Phase (3Ø) Fault on the performance of the Transmission System.

In regards to PacifiCorp's comments on the material impact associated with this interpretation, the interpretation team has the following comment:

Requirement R2.1 requires "a written summary of plans to achieve the required system performance," including a schedule for implementation and an expected in-service date that considers lead times necessary to implement the plan. Failure to provide such summary may lead to noncompliance that could result in penalties and sanctions.

Implementation Plan for Project 2010-11: TPL Table 1 Order

Standards Involved:

- TPL-001-1 — System Performance Under Normal (No Contingency) Conditions (Category A)
- TPL-002-1c — System Performance Following Loss of a Single Bulk Electric System Element (Category B)
- TPL-003-1 — System Performance Following Loss of Two or More Bulk Electric System Elements (Category C)
- TPL-004-1 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no new definitions in the proposed standards and no proposed changes to other standards.

Compliance with Standards

The four standards are all applicable to both the Transmission Planner and the Planning Authority.

Effective Dates

The effective date is the date entities are expected to meet the performance identified in these standards.

The application of revised Footnote ‘b’ in Table 1 will take effect on the first day of the first calendar quarter, 60 months after approval by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. All other requirements remain in effect per previous approvals. The existing Footnote ‘b’ remains in effect until the revised Footnote ‘b’ becomes effective.

All other requirements remain in effect per previous approvals.

Project Revision of TPL-002 footnote ‘b’ and TPL-001 footnote 12

Unofficial Comment Form

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the Standard. The electronic comment form must be completed by **8 p.m. November 19, 2012**. If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

You can access the project webpage here.

Background Information

This posting is soliciting formal comment.

FERC Order No. 762 issued April 19, 2012 remanded TPL-002-1b as vague, unenforceable, and not responsive to the previous Commission directives on this matter. The Standards Committee directed the Standards Drafting Team (SDT) to revise footnote ‘b’ in accordance with the directives of Orders No. 693 and 762. The SDT was also charged with revising the corresponding footnote 12 of TPL-001-2 in order to prevent the remand of TPL-001-2.

The SDT adopted a philosophy of minimal changes to the actual footnote itself. This was done to minimize confusion as to what was changed, for ease of reading and following the footnote, and for formatting within the actual standards documents. This philosophy resulted in the development of an attachment to the footnote where the actual changes in response to the Commission Orders are contained. It should be noted that attachments to standards are part and parcel of the standard itself and thus are binding to applicable entities.

A data request to collect data to assist the SDT in its work was posted for response in accordance with Section 1600 of the NERC Rules of Procedure. A spreadsheet summarizing the data request findings has been included with this posting. Specifically, the data obtained led to the following decisions:

- Order 762 provided guidance suggesting that a ceiling for footnote ‘b’ use be established. Therefore, the SDT has set the ceiling for footnote ‘b’ use at 75 MW based on the data provided. Currently, five entities reported that they utilized footnote ‘b’ for single Contingencies in their planning process for between 50 and 75 MW of potential Load shed and no entity reported that it utilized footnote ‘b’ for more than 75 MW. The SDT believes that with the Stakeholder Process, the involvement of local regulatory and governmental bodies and by setting a ceiling value for the first time, that it has significantly raised the bar on this issue. Furthermore, the SDT does not believe that it is appropriate to set a limit that would automatically eliminate some existing usages and force those entities to construct new transmission facilities.

- As shown in the data request findings, the average number of MW used with footnote 'b' is approximately 19 MW. The SDT has set the threshold value for when regulatory review is required at 25 MW based on this average value. The SDT believes that setting this value as indicated by the data request findings sets the appropriate balance between the stakeholder process and the additional step of obtaining regulatory and ERO reviews. And again, the SDT believes that setting this threshold value so that regulatory and ERO reviews are required for instances of footnote 'b' utilization between 25 and 75 MW significantly raises the bar.
- The data request showed that the majority of footnote 'b' utilizations were at voltage levels below 300 kV. The SDT believes that this validates the selection of the 300 kV EHV distinction in Section III of the Attachment where regulatory and ERO reviews are required.
- The majority of Contingencies cited as causing an entity to utilize footnote 'b' were line outages. This caused the SDT to consider limiting the use of footnote 'b' to such types of Contingencies and eliminating its usage for transformer outages. However, with the number of instances of transformer outages reported (11), the SDT did not believe such a step was warranted and has not set up a constraint as to types of Contingencies in association with footnote 'b' utilization.
- The data obtained did not indicate any way to isolate usage of footnote 'b' to the fringes of the system whether that meant geographical or electrical fringes. The SDT believes that constraining the use of footnote 'b' to the supposed fringes of a system could potentially be discriminatory and thus invalid. In addition, the introduction of the Stakeholder Process for all uses of footnote 'b' and the regulatory and ERO reviews for the 25 – 75 MW range of use will allow for a true indication of whether the use of footnote 'b' is infringing on societal values which should be a better arbiter of what constitutes a fringe of the system.

The SDT has made a number of changes to the Attachment based on comments received from the first posting. Principal among these, was the deletion of the role of the Regional Entity in the review process and the clarification of the role of the regulatory authorities from approval to review.

The SDT reminds commenters that the Stakeholder Process was previously approved by the NERC Board of Trustees and that inclusion of this process is not the issue. The issue is clarifying the details of that process to answer the concerns in Order 762.

There have been no changes to the Implementation Plan originally filed with the standards.

You do not have to answer all questions. Enter All Comments in Simple Text Format. Bullets, numbers, and special formatting will not be retained.

Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.

Questions

1. Do you agree with the text in the body of the footnote including the maximum capacity threshold? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. For the maximum capacity item, please supply any technical rationale for your comment along with limiting conditions and any current criteria in use at your entity.

☐ Yes

[Docket No. RM11-18-000; Order No. 762]

Transmission Planning Reliability Standards

(Issued April 19, 2012)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Final Rule.

SUMMARY: Under section 215 of the Federal Power Act, the Federal Energy Regulatory Commission remands proposed Transmission Planning (TPL) Reliability Standard TPL-002-0b, submitted by the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization. The proposed Reliability Standard includes a provision that allows for planned load shed in a single contingency provided that the plan is documented and alternatives are considered and vetted in an open and transparent process. The Commission finds that this provision is vague, unenforceable and not responsive to the previous Commission directives on this matter. Accordingly, the Final Rule remands NERC's proposal as unjust, unreasonable, unduly discriminatory or preferential, and not in the public interest.

DATES: This rule will become effective **[Insert date 60 days after publication in the FEDERAL REGISTER].**

ADDRESSES: You may submit comments, identified by docket number by any of the following methods:

- Agency Web Site: http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
- Mail/Hand Delivery: Commenters unable to file comments electronically must mail or hand deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Transmission Planning Reliability Standards Docket No. RM11-18-000

Order No. 762

FINAL RULE

(Issued April 19, 2012)

1. Under section 215(d) of the Federal Power Act,[1] the Commission remands proposed Transmission Planning (TPL) Reliability Standard TPL-002-0b, submitted by the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization. The proposed Reliability Standard includes a provision that allows for planned load shed in a single contingency provided that the plan is documented and alternatives are considered and vetted in an open and transparent process.[2] The Commission finds that this provision is vague, unenforceable and not responsive to the previous Commission directives on this matter. Accordingly, the Final

[1] 16 U.S.C. § 824o(d)(4) (2006).

[2] NERC filed a petition seeking approval of Table 1, footnote 'b' of four Reliability Standards: Transmission Planning: TPL-001-1– System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b – System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1– System Performance Following Extreme Events Resulting

(continued…)

Rule remands NERC's proposal as unjust, unreasonable, unduly discriminatory or preferential, and not in the public interest. We require NERC to utilize its Expedited Reliability Standards Development Process to develop timely modifications to TPL-002-0b, Table 1 footnote 'b' in response to our remand.[3]

I. Background

2. Section 215 of the FPA requires a Commission-certified Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards, which are subject to Commission review and approval. Approved Reliability Standards are enforced by the ERO, subject to Commission oversight, or by the Commission independently. On March 16, 2007, the Commission issued Order No. 693, approving 83 of the 107 Reliability Standards filed by NERC, including Reliability Standard TPL-002-0.[4] In addition, pursuant to section 215(d)(5) of the FPA,[5] the Commission directed

---

in the Loss of Two or More Bulk Electric System Elements (Category D). While footnote 'b' appears in all four of the above referenced TPL Reliability Standards, its relevance and practical applicability is limited to TPL-002-0a.

[3] NERC Rules of Procedure, Appendix 3A, Standard Processes Manual at 34 (effective January 31, 2012).

[5] 16 U.S.C. § 824o(d)(5)(2006).

NERC to develop modifications to 56 of the 83 approved Reliability Standards, including footnote 'b' of Reliability Standard TPL-002-0.[6]

A. Transmission Planning (TPL) Reliability Standards

3. Currently-effective Reliability Standard TPL-002-0b addresses Bulk-Power System planning and related transmission system performance for single element contingency conditions. Requirement R1 of TPL-002-0b requires that each planning authority and transmission planner "demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the network can be operated to supply projected customer demands and projected firm transmission services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I."[7] Table I identifies different categories of contingencies and allowable system impacts in the planning process. With regard to system impacts, Table I further provides that a Category B (single) contingency must not result in cascading outages, loss of demand or curtailed firm transfers, system instability or exceeded voltage or thermal limits. With regard to loss of demand, current footnote 'b' of Table 1 states:

> Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems.

---

[6] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 1797.

[7] Reliability Standard TPL-002-0a, Requirement R1.

> To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.

B. Order No. 693 Directive

4. In Order No. 693, the Commission stated that it believes that the transmission planning Reliability Standard should not allow an entity to plan for the loss of non-consequential firm load in the event of a single contingency.[8] The Commission directed the ERO to develop certain modifications, including a clarification of Table 1, footnote ‘b.’

5. In a subsequent clarifying order, the Commission stated that it believed that a regional difference, or a case-specific exception process that can be technically justified, to plan for the loss of firm service would be acceptable in limited circumstances.[9] Specifically, the Commission stated that “a regional difference, or a case-specific exception process that can be technically justified, to plan for the loss of firm service at the fringes of various systems would be an acceptable approach.”[10]

C. NERC Petition

6. On March 31, 2011, NERC filed a petition seeking approval of its proposal to revise and clarify footnote 'b' "in regard to load loss following a single contingency."[11] NERC stated that it did not eliminate the ability of an entity to plan for the loss of non-consequential load in the event of a single contingency but drafted a footnote that, according to NERC, "meets the Commission's directive while simultaneously meeting the needs of industry and respecting jurisdictional bounds."[12] NERC stated that its proposed footnote 'b' establishes the requirements for the limited circumstances when and how an entity can plan to interrupt Firm Demand for Category B contingencies. According to NERC, the provision allows for planned interruption of Firm Demand when "subject to review in an open and transparent stakeholder process."[13] NERC's proposed footnote 'b' states:

> An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate redispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements.

---

[11] NERC Petition at 10.

[12] *Id.*

[13] *Id.*

> When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.

7. NERC supplemented the filing on June 7, 2011, in response to a Commission deficiency letter. NERC explained that "the approach proposed in footnote 'b' is equally efficient because many of the stakeholder processes that will be used in footnote 'b' planning decisions are already in place, as implemented by FERC in Order No. 890 and in state regulatory jurisdictions."[14] NERC also pointed to state public utility commission processes or processes existing in local jurisdictions that address transmission planning issues that could serve to provide a case-specific review of the planned interruption of Firm Demand. According to NERC, such processes would more likely engage the appropriate local-level decision-makers and policy-makers.

8. With respect to review and oversight by NERC and the Regional Entities, NERC submitted that an ERO-specific process would place the ERO in the position of managing and actively participating in a planning process, which conflicts with its role as the compliance monitor and enforcement authority. NERC also stated that neither the ERO nor the Regional Entities will review decisions regarding planned interruptions. Their role will be limited to reviewing whether the registered entity participated in a stakeholder process when planning to interrupt Firm Demand. NERC explained that

[14] NERC Data Response at 4.

Regional Entities will have oversight after-the-fact by auditing the entity's implementation of footnote 'b' to determine if the entity planned on interrupting Firm Demand and whether the decision by the entity to rely on planned interruption of Firm Demand was vetted through the stakeholder process and qualified as one of the situations identified in footnote 'b.'

9. Furthermore, NERC stated that an objective of the planning process should be to minimize the likelihood and magnitude of planned Firm Demand interruptions. NERC contended that, due to the wide variety of system configurations and regulatory compacts, it is not feasible for the ERO to develop a one-size-fits-all criterion for limiting the planned firm load interruptions for Category B events. According to NERC, the standards drafting team evaluated setting a certain magnitude of planned interruption of Firm Demand, but there was no analytical data to support a single value, and it would be viewed as arbitrary.

D. Notice of Proposed Rulemaking

10. On October 20, 2011, the Commission issued a Notice of Proposed Rulemaking (NOPR[15]) proposing to remand NERC's proposal to modify footnote 'b.' In the NOPR, the Commission stated that it believed that NERC's proposal does not meet the directives in Order No. 693 and the June 2010 Order and does not clarify or define the circumstances in which an entity can plan to interrupt Firm Demand for a single

[15] *Transmission Planning Reliability Standards*, Notice of Proposed Rulemaking, 76 FR 66229 (Oct. 20, 2011), FERC Stats. & Regs. ¶ 32,683 (2011).

contingency. The Commission expressed concern that the procedural and substantive parameters of NERC's proposed stakeholder process are too undefined to provide assurances that the process will be effective in determining when it is appropriate to plan for interrupting Firm Demand, does not contain NERC-defined criteria on circumstances to determine when an exception for planned interruption of Firm Demand is permissible, and could result in inconsistent results in implementation. The NOPR stated that the proposed footnote effectively turns the processes into a reliability standards development process outside of NERC's existing procedures. Furthermore, the NOPR stated that regardless of the process used, the result could lead to inconsistent reliability requirements within and across reliability regions. While the Commission recognized that some variation among regions or entities is reasonable, there are no technical or other criteria to determine whether varied results are arbitrary or based on meaningful distinctions.

11. The Commission proposed to provide further guidance on acceptable approaches to footnote 'b' and sought comment on certain options for revising footnote 'b', as well as other potential options to solve the concerns outlined in the NOPR. In response to the NOPR, comments were filed by seventeen interested parties.[16]

[16] NERC, The Edison Electric Institute (EEI), American Public Power Association (APPA), National Association of Regulatory Utility Commissioners (NARUC), ITC Holdings Corp. (ITC), Manitoba Hydro, California Department of Water Resources State Water Project (California SWP) Hydro One Networks, Inc and the Ontario Independent Electricity System Operator (Hydro One and IESO), Duke Energy Corporation (Duke), New York State Public Service Commission (NYPSC), Bonneville Power Administration

(continued…)

II. Discussion

12. For the reasons discussed below, the Commission concludes that NERC's proposed TPL-002-0b does not meet the Commission's Order No. 693 directives, nor is it an equally effective and efficient alternative. Further, the Commission finds that the proposal is vague, potentially unenforceable and may lack safeguards to produce consistent results. On this basis, the Commission remands the proposal to NERC as unjust, unreasonable, unduly discriminatory or preferential and not in the public interest. Below, the Commission also provides guidance on acceptable approaches to footnote 'b.'

13. The Commission adopts the proposed NOPR finding that the footnote 'b' process lacks adequate parameters. The Reliability Standard requires that, when planning to interrupt Firm Demand, the Firm Demand interruption must be "subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments."[17] Without meaningful substantive parameters governing the stakeholder process, the enforceability of this obligation by NERC and the Regional Entities would be limited to a review to ensure only that a stakeholder process occurred. As NERC explained, Regional Entities' involvement is limited to after-the-fact oversight by

(BPA), Kansas City Power & Light Company and KCP&L Greater Missouri Operations Company (KCPL), Midwest Independent System Operator, Inc. (MISO), Public Utility District No. 1 of Snohomish County, Washington, (Snohomish), Transmission Access Policy Study Group (TAPS), Powerex Corp. (Powerex), and Florida Reliability Coordinating Council (FRCC).

[17] NERC Petition at 10.

auditing the entity's implementation of footnote 'b' to determine if the entity planned on interrupting Firm Demand and whether the decision by the entity to rely on planned interruption of Firm Demand was vetted through the stakeholder process and qualified as one of the situations identified in footnote 'b.'[18]

14. Further, the NERC proposal leaves undefined the circumstances in which it is allowable to plan for Firm Demand to be interrupted in response to a Category B contingency. The Commission believes that proposed footnote 'b' could be used as a means to override the reliability objective and system performance requirements of the TPL Reliability Standard without any technical or other criteria specified to determine when planning to interrupt Firm Demand would be allowable, and without violating any of the requirements of the TPL Reliability Standard. The TPL Reliability Standard requires that a planner demonstrate through a valid assessment that the transmission system is planned and can be operated to supply projected Firm Demand at all demand levels over a range of forecasted system demands.[19] In addition, a planner must consider all single contingencies under Table 1, Category B and demonstrate system performance.[20] For single contingency events where system performance is not met, a planner must provide a written summary of its plans to achieve system performance

[18] NERC Data Response at 7-9.

[19] Reliability Standard TPL-002-0b, Requirement R1.

[20] Reliability Standard TPL-002-0b, Requirement R1.3.7.

including implementation schedules, in service dates of facilities and implementation lead times.[21]

15. However, if system performance is not met for any single contingency event(s) under NERC's proposed footnote 'b,' a planner could plan to interrupt some portion of Firm Demand to meet system performance requirements thereby overriding the performance requirements of the TPL Reliability Standard. For example, if a planner determines during its annual assessment that for a single bulk-power system transformer contingency other bulk-power system elements would exceed their thermal ratings, a planner would have authority under the standard to plan to interrupt Firm Demand to relieve the exceeded thermal ratings of the bulk-power system elements rather than planning the system to withstand such a single contingency and avoid shedding firm load as the performance requirements of the TPL Reliability Standard require. Therefore, without articulating some bounds on the use of the planned shedding of Firm Demand, there could be instances of multiple exceptions that could affect the robustness of the system. Further, contrary to commenters contentions, NERC's proposal, for example, has no provision to evaluate this cumulative effect of the individual decisions to shed firm.[22]

---

[21] Reliability Standard TPL-002-0b, Requirement R2.

[22] BPA Comments at 5 ("The reasons for interrupting Firm Demand would be documented in studies and demonstrate that there would be no adverse impact to the BPS"); FRCC Comments at 3 ("Indeed, the transmission planning entity is responsible as part of the system assessment process under the TPL standards to test remedies to ensure

(continued…)

16. The Commission disagrees with commenters that NERC's proposed footnote 'b' will have no adverse impact on reliable planning of the bulk-power system because planning to shed Firm Demand is intended to ensure that single contingency events do not result in adverse impacts and intended to preserve bulk-power system reliability.[23] Table 1 of the TPL Reliability Standard identifies the system performance requirements or "System Limits or Impacts" that a planner must apply during its assessment of Category B, single contingency events.[24] Except in limited circumstances, if a planner determines that it must plan to interrupt Firm Demand so that it does not violate the Table 1 system performance requirements, a planner should not apply footnote 'b' as a mitigation plan to plan to operate reliably. The Commission therefore is concerned that NERC's proposal provides authority to adjust the TPL Reliability Standard and its system

that they address the problems being caused and do not cause additional problems."); and Hydro One Comments at 5 ("Loss of load is under the purview of the regulatory authority and not NERC, unless it has an adverse impact on the BES which is already taken into consideration by the TPL standards… In all cases, steps are taken in planning, design and operations of the system to ensure that Firm Demand shedding would not adversely impact the BES…").

[23] *See, e.g.,* NERC Comments at 11, TAPS Comments at 10, APPA Comments at 6.

[24] Reliability Standard TPL-002-0b, Table 1, Transmission System Standards – Normal and Emergency Conditions. Table 1 identifies the system performance requirements or "System Limits or Impacts" which are as follows: "System Stable and both Thermal and Voltage Limits within Applicable Rating", "Loss of Demand or Curtailed Firm Transfers" and "Cascading Outages."

performance requirements for each single contingency event that does not meet the system performance requirements of Table 1.

17. Further, NERC has not provided technically sound means of determining situations in which planning to interrupt Firm Demand would be allowable. While NERC expects that such determinations will be made in a stakeholder process, this provides no assurance that such a process will use technically sound means of approving or denying exceptions. The Commission concludes that the multiple stakeholder processes across the country engaging in such determinations could lead to inconsistent and arbitrary exceptions including, potentially, allowing entities to plan to interrupt any amount of Firm Demand in any location and at any voltage level.

18. While the Commission recognizes that some variation among regions or entities is reasonable given varying grid topography and other considerations, there are no technical or other criteria to determine whether varied results are arbitrary or based on meaningful distinctions. The Commission, thus, concludes that NERC's proposal lacks safeguards to ensure against inconsistent results and arbitrary determinations to allow for the planned interruption of Firm Demand.

19. A remand gives NERC and industry flexibility to develop an approach that would address the issues identified by the Commission with the proposed footnote 'b' stakeholder process including, as discussed below, definition of the process and criteria or guidelines for the process.

20. The Commission believes that, on remand, both NERC and the Commission will benefit from a more complete record regarding the electric industry's reliance on planned

Firm Demand interruptions. In response to the Commission's request to explain and quantify the extent to which Firm Demand is planned to be interrupted pursuant to currently-effective footnote 'b,' NERC explained:

> NERC and the Regional Entities have not collected statistics or preformed a survey concerning the prospective implementation of Footnote b under TPL-002-0a. During the drafting team's deliberations concerning TPL-001-2 and TPL-002-0a Footnote b, including the NERC Technical Conference on Footnote b, the informal assessments demonstrated that the use of Footnote b would not be widespread.[25]

Likewise, several commenters state that the interruption of Firm Demand is rarely needed, but provide no support for this conclusion.[26] For example, EEI asks the Commission to "recognize" that "…the actions taken as outcomes of the planning review process, are likely to identify few/isolated circumstances in which these [footnote b] provisions would be invoked…."[27] However, the Commission believes that more specific information regarding the specific circumstances and frequency with which Firm Demand is planned to be interrupted will assist both NERC in developing, and the Commission in reviewing, appropriate revisions to footnote 'b" on remand. Therefore, pursuant to section 39.2(d) of the Commission's regulations,[28] we direct NERC to identify the specific instances of any planned interruptions of Firm Demand under

---

[25] NERC Data Response at 10.

[26] *See, e.g.,* FRCC Comments at 4; MISO Comments at 4; BPA Comments.

[27] EEI Comments at 2.

[28] 18 U.S.C. § 39.2(d).

footnote ‘b’ and how frequently the provision has been used. We direct NERC to use section 1600 of its Rules of Procedure to obtain information from users, owners and operators of the bulk-power system to provide this requested data.[29] NERC shall submit this information to the Commission with NERC’s footnote ‘b’ filing that addresses the concerns in this Final Rule.

21. We urge NERC to develop in a timely manner an appropriate modification that is responsive to the Commission’s directives in Order No. 693 and our concerns set forth in this Final Rule. In that regard, we require NERC to deploy its Expedited Reliability Standards Development Process to quickly respond to the remand. As the Commission noted in previous orders, the use of planned or controlled load interruption is a fundamental reliability issue and, certainty regarding the loss of non-consequential load for a single contingency event is warranted.[30] Thus, using the Expedited Standards Development Process will more rapidly bring needed certainty to this fundamental reliability issue.

22. Below we discuss three concerns: (a) jurisdictional issues, (b) lack of technical criteria, and (c) the stakeholder process. The Commission also provides guidance on other acceptable approaches.

---

[29] NERC Rules of Procedure, Section 1601 (effective January 31, 2012).

[30] *North American Electric Reliability Corp.*, 130 FERC ¶ 61,200 (2010) (March 2010 Order); *North American Electric Reliability Corp.*, 131 FERC ¶ 61,231 (2010) (June 2010 Order).

A. Jurisdictional Issues

23. A number of commenters express concern that the Commission is reaching beyond its FPA section 215 jurisdiction.[31] Commenters assert that the Commission options exceed its jurisdiction involving acceptable levels and types of service. Commenters seek assurance that the Commission's proposal does not infringe on matters reserved to the States and instead "only prescribe acceptable load shedding as it pertains to wholesale customers that are in a position to select interruptible or conditional firm transmission service."[32] NARUC states that "any NERC standard for shedding distribution level load must be guided by States and that a demonstration that interruption of the load will not cause instability, uncontrolled separation, or cascading failures on the bulk system is appropriate for a NERC standard."[33] NARUC adds that specifications of what retail load and what levels of retail load can be interrupted is a State determination that is not reviewable by the Commission. TAPS agrees with NERC that issues pertaining to whether it is permissible to plan to interrupt firm load involves conflicts among federal, provincial, state, and local governing bodies.[34]

24. The Commission disagrees that it is infringing on State Commissions or overstepping jurisdictional bounds. In this Final Rule, the Commission remands NERC's

---

[31] *See, e.g.,* Comments of NERC, NARUC, APPA and TAPS.

[32] NYPSC Comments at 5.

[33] NARUC Comments at 3-4.

[34] TAPS Comments at 9.

proposed footnote ‘b’ as an inadequate mechanism to address planned curtailment of firm demand and not responsive to the Commission’s directives in Order No. 693 regarding this matter. The Commission is not directing that NERC develop a specific solution or approach on remand. Thus, our remand of the NERC proposed modification to TPL-002-0b, Table 1, footnote ‘b’ is fully within the Commission’s authority pursuant to section 215(d)(4) to remand to the ERO for further consideration a modification to a proposed reliability standard that the Commission disapproves in whole or in part. Moreover, FPA section 215 gives the Commission jurisdiction over mandatory Reliability Standards to ensure reliability of the Bulk-Power System.[35] Consistent with its statutory authority, the Commission’s interest and focus in this proceeding is on the planned interruption of Firm Demand on the Bulk-Power System. The Commission views this matter in the context of Reliability Standard TPL-002-0b, which requires that in planning the system to withstand the loss of a single Bulk-Power System element, Bulk-Power System performance criteria must be met. If it is not met, a corrective action plan is required to address the Bulk-Power System performance criteria violation. Contingencies studied pursuant to Reliability Standard TPL-002-0b pertinent to Bulk-Power System facilities are subject to Commission jurisdiction under FPA section 215. In sum, the performance of the Bulk-Power System under the TPL-002-0b Reliability Standard is within the Commission’s jurisdiction.

[35] 16 U.S.C. § 824o(b)(1).

B. Lack of Technical Criteria

NOPR Proposal

25. In the NOPR, the Commission proposed to remand NERC's proposal to modify Reliability Standard TPL-002-0b, Table 1, footnote 'b.' The Commission stated that it believed that NERC's proposal does not meet the directives in Order No. 693 and the June 2010 Order and does not clarify or define the circumstances in which an entity can plan to interrupt Firm Demand for a single contingency.[36] In the NOPR the Commission expressed concern that NERC's proposed footnote 'b' lacks parameters. Without any substantive parameters governing the stakeholder process, the enforceability of this obligation by NERC and the Regional Entities would be limited to a review to ensure only that a stakeholder process occurred. The Commission noted that NERC appears to confirm this concern, as NERC explained that Regional Entities' involvement is limited to after-the-fact oversight by auditing the entity's implementation of footnote 'b' to determine if the planned interruption of Firm Demand was vetted through the stakeholder process.[37]

26. Further, in the NOPR the Commission stated that since the proposed footnote 'b' contains no constraints, it could allow an entity to plan to interrupt any amount of planned Firm Demand, in any location or at any voltage level as needed for any single contingency, provided that it is documented and subjected to a stakeholder process. The

[36] NOPR, FERC Stats. & Regs. ¶ 32,683 at P 11.

[37] *Id.* P 12.

Commission found this result remains contrary to the underlying Reliability Standard and prior Commission orders.[38] The Commission requested comment on this specific concern of the lack of technical criteria or parameters.

Comments

27. Some commenters agree with the Commission that there is lack of technical criteria to determine planned interruption of Firm Demand. For example, California SWP states that Reliability Standards "should ensure transparent criteria based on technical merits and not software limitations derived from a desire to mask [locational marginal pricing] price signals with socialized pricing or on *status quo* practices."[39] ITC believes that there is a need for defined parameters that will guide the review of exceptions and that will prevent planned interruptions from becoming commonplace.[40] Manitoba Hydro states that the characteristics of openness and transparency are indicators of a non-discriminatory planning process; however, these characteristics do not ensure that certain reliability criteria of the planned facilities will be met.[41]

28. Other commenters disagree with the Commission's concern that there is a lack of criteria to determine planned interruption of Firm Demand. NERC states that it does not believe that an exceptions process that provides defined criteria, with some allowances,

---

[38] *Id.*

[39] California SWP Comments at 4.

[40] ITC Comments at 2.

[41] Manitoba Hydro Comments at 6.

could be crafted that would respect pre-existing decision making processes that occur at state and local jurisdictions. NERC argues that the decision to interrupt local load is essentially an economic decision – a quality of service issue, not a reliability issue.[42]

29. MISO disagrees that additional language would reduce the potential for inconsistent results and points out that registered entities already have many established requirements that govern the transmission planning processes.[43] MISO believes that if the Commission determines that criteria are needed, such criteria should be determined by the stakeholders in the regions though their established stakeholder processes.[44] EEI does not believe that specific criteria should be developed until a better understanding is obtained regarding the role of service interruptions as a reliability tool.[45] EEI believes that these are appropriate aspects of the NERC proposal that would be readily amenable to an initial implementation approach, followed by an adjustment period that would refine the overall process consistent with the Commission's concerns.

Commission Determination

30. We believe that openness and transparency do not alone ensure that bulk electric system performance criteria will be met to ensure system reliability. The Commission is not persuaded that developing technical criteria is unachievable. As the Commission

---

[42] NERC Comments at 13.

[43] MISO Comments at 3.

[44] *Id.* at 5.

[45] EEI Comments at 10.

observed in the NOPR, NERC has thresholds in other reliability contexts, such as vegetation management pursuant to Reliability Standard FAC-003-1 which applies to all transmission lines operated at 200 kV and above. Likewise, NERC's Statement of Compliance Registry Criteria includes numerous thresholds for determining eligibility for registration.[46]

31. The Commission does not agree with EEI's recommendation to implement a stakeholder process that is absent technical criteria but then amend it later. While the Commission has, in other circumstances, approved a Reliability Standard and, as a separate action, directed NERC to develop a modification pursuant to section 215(d)(5) of the FPA, in such proceedings the Commission concluded that the proposed Reliability Standard was just, reasonable, not unduly discriminatory or preferential and in the public interest. In the immediate proceeding, however, we cannot make such a finding in light of the flawed stakeholder process provision.

32. In response to MISO's argument that such criteria should be determined by the stakeholders in the regions though their established stakeholder processes, the Commission would be amenable to such an approach if, for example, NERC and/or the Regional Entities developed an exception process that provides flexibility in decisions based on disparate topology or on other matters since they could utilize their technical

[46] *See, e.g.*, NERC Statement of Registry Criteria, section III. The Commission approved the Statement of Registry Criteria in Order No. 693. *See* Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 95.

expertise to determine the reliability impact from one region to another. For these reasons, the Commission concludes that a more defined process is needed with NERC-defined technical criteria to determine planned interruption of Firm Demand. However, we conclude that the approach of allowing a decentralized process without any overarching parameters is unacceptable.

33. With regard to NERC's comment that the decision to interrupt local load is essentially an economic decision that is a quality of service issue, not a reliability issue, the Commission notes that in Order No. 693, we dismissed the argument that it may be preferable to plan the bulk electric system in such a manner that contemplates the interruption of some firm load customers in the event of a N-1 contingency, and that such interruption is based largely on the matter of economics, not reliability.[47]

C. Stakeholder Process

NOPR Proposal

34. In the NOPR, the Commission expressed concern that NERC's proposed footnote 'b' stakeholder process is insufficient to meet Order No. 693 and the June 2010 Order clarification that a regional difference, or a case-specific exception process that can be technically justified, to plan for the loss of firm services at the fringes of the systems is acceptable in limited circumstances.[48] The Commission also noted that nothing in the proposed footnote 'b' defines the stakeholder process, other than that it must be an open

[47] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 1792.

[48] NOPR, FERC Stats. & Regs. ¶ 32,683 at P 19.

and transparent stakeholder process that includes addressing stakeholder comments.[49] The Commission noted that any meeting that is open to stakeholders could meet this criteria.

35. The Commission further stated that the lack of a defined stakeholder process could allow a transmission planner to develop a process that provides insufficient opportunity for stakeholder participation and transparency yet still comply with the standard. The Commission expressed its belief that nothing in the proposed footnote 'b' restricts the stakeholder process, other than that it must be an open and transparent stakeholder process that includes addressing stakeholder comments. The Commission requested comment on whether a stakeholder process is the appropriate vehicle to approve or deny exceptions to allow entities to plan to interrupt Firm Demand for a single contingency and if so, whether the proposed footnote 'b' would require any stakeholder due process.

Comments

36. Several commenters believe that NERC's proposed stakeholder process is the appropriate venue to approve or deny exceptions to interrupt planned Firm Demand. NERC and other commenters contend that building on existing stakeholder processes is appropriate, rather than creating new, duplicative processes. While EEI, APPA, and TAPS concur with or acknowledge the Commission's concerns about the inadequacy of the proposed stakeholder process, they nonetheless urge the Commission to approve

[49] *Id.* P 20.

NERC's proposal stating that it reflects the considered expertise that instances of planned load shed are uncommon and not amenable to a one-size-fits-all approach.[50] NERC believes the introduction of an additional planning process may contribute to further delays and regulatory confusion. NERC states that "keeping decision-making with those most impacted by decisions regarding reliability and costs, lack of jurisdictional authority, and the existence of established open and transparent stakeholder processes – are the reasons NERC did not create a new stakeholder process."[51]

37. Duke Energy believes that the current Order No. 890-type process involving the local transmission planning collaborative is the appropriate stakeholder process. Duke Energy suggests that footnote 'b' should be revised to include a local regulatory authority process as the appropriate stakeholder process to allow entities to plan to interrupt Firm Demand for a single contingency. According to Duke Energy, in such a process a transmission planner would submit its plan to interrupt Firm Demand for a single contingency to its local regulatory authority that has jurisdiction over quality of service to local load prior to any actual interruption of Firm Demand.

38. BPA states that the stakeholder process will keep the decision local, where the parties involved understand the different factors that must be considered in deciding the

---

[50] *See, e.g.*, EEI Comments at 3, TAPS Comments at 5, APPA Comments at 3.

[51] NERC Comments at 12.

proper path forward.[52] APPA maintains that these processes impose due process requirements on the transmission planner, including participation in an open and transparent stakeholder process that considers stakeholder comments.[53]

39. FRCC disagrees with the Commission that enforceability is limited since the process requires development of a record documenting the decisions and stakeholder comments and planning authority responses. According to FRCC, the result will provide NERC and the Commission substantive and procedural grounds to assess whether sufficient consideration was given to maintaining reliability.[54]

40. Some commenters believe that NERC's proposed stakeholder process is not the appropriate vehicle to approve or deny exceptions to interrupt planned Firm Demand. ITC argues that the stakeholder process is inadequately undefined to ensure that planned Firm Demand interruptions are kept to a minimum. Manitoba Hydro indicates that by acknowledging an exception for interruptible Firm Demand, NERC appears to recognize that the right to interrupt is not solely a reliability issue, but also a commercial or legal issue based on contractual rights.[55]

41. While TAPS encourages the Commission to accept NERC's proposed footnote 'b,' it shares the NOPR's concerns about the adequacy of the open and transparent

[52] BPA Comments at 4.

[53] APPA Comments at 5.

[54] FRCC Comments at 3.

[55] Manitoba Hydro Comments at 5.

stakeholder process and has argued for a decision-making role for transmission-dependent utilities in the Order No. 890 and Order No. 1000 planning processes to ensure that stakeholder processes do not result in a presentation of a decision followed by the transmission provider simply "rubber-stamping" the decision.[56] If the Commission determines that these objectives cannot be accomplished without more robust action from the Commission in this proceeding, TAPS urges the Commission not to remand the proposed footnote 'b,' but instead to accept NERC's proposal and direct NERC to submit a further modified footnote 'b' to address the parameters of the "open and transparent stakeholder process that includes addressing stakeholder comments."[57]

Commission Determination

42. The Commission is not persuaded that the stakeholder process is adequately defined. The Commission is concerned that the stakeholder process could undermine the system performance criteria of TPL-002-0b Reliability Standard. As the Commission stated in Order No. 693, one of the key reliability objectives of the TPL Reliability Standard is that the system can be operated following the loss of one element and supply projected firm customer demands and projected firm transmission services at all demand levels over the range of forecast system demands.[58] The Commission finds that the stakeholder process without appropriate parameters is inconsistent with the reliability

---

[56] TAPS Comments at 5.

[57] *Id.* at 11.

[58] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 1771.

objective to supply projected firm customer demands for the loss of one element. While the Reliability Standard requires that the system is planned so that the system can be operated following the loss of one element and supply projected firm customer demands, the proposed stakeholder process could defeat this by allowing a transmission planner to plan to shed as much load as needed so that the system can be operated to supply whatever customers remain.

43. The Commission agrees with TAPS to the extent it observes that the proposal could allow a transmission planner to utilize a new or existing stakeholder process that provides insufficient opportunity for a stakeholder to provide meaningful input. We conclude that the stakeholder process with no criteria to objectively assess whether varied results are arbitrary or based on meaningful differences is unjust, unreasonable, unduly discriminatory or preferential, and not in the public interest. Nothing in proposed footnote ‘b’ defines the stakeholder process, other than it must be an open and transparent stakeholder process that includes addressing stakeholder comments.

44. The Commission is not persuaded by FRCC’s comment that enforceability is not limited by proposed footnote ‘b’ and that development of a record will provide NERC “substantive and procedural” grounds to assess the outcome of the process. Neither FRCC nor any other commenter identifies the minimum procedural safeguards to assure an adequate level of stakeholder participation and consideration of stakeholder comment in the decision-making process. Moreover, even NERC, which states that it can conduct

after-the-fact audits, indicates that such audits would not explore substantive adequacy or the reliability basis for a decision to plan to shed Firm Demand.[59] Further, the Commission is not persuaded by APPA and BPA comments that local stakeholder participation and due process requirements imposed on the transmission planner are sufficient. Rather, the Commission believes that if a transmission planner invokes a process that provides for minimal stakeholder involvement, it could argue that it satisfied the provision, even if the transmission planner is the ultimate decision maker and simply 'rubber stamps' its own proposal to interrupt planned Firm Demand.

D. Guidance on Acceptable Approaches to Footnote 'b'

45. The Commission proposed three options in the NOPR for further guidance on acceptable approaches to footnote 'b.' In addition, the Commission requested comment on other potential options to solve the concerns outlined in the NOPR.

1. Existing Protocols to Develop Criteria/Quantitative Limits

46. In the NOPR, the Commission acknowledged that NERC considered a variety of limits but observed that NERC's establishment of some form of criteria for planning to interrupt Firm Demand could be an acceptable approach for footnote 'b.' The Commission requested comment on whether existing protocols such as the Department of Energy's Electric Emergency Incident and Disturbance Report (Form OE-417), which requires an entity to report a certain amount of uncontrolled loss of firm system loads, or

[59] NERC Data Response at 7-9.

NERC's Statement of Compliance Registry Criteria could provide guidance to NERC to devise criteria.

Comments

47. Commenters were unanimous that the examples of existing protocols would not be beneficial to devise criteria. NERC and others state that any bright-line megawatt limit would be inappropriate because the bright-line would be arbitrary.[60] Some commenters do not believe that existing protocols, such as the requirement in Form OE-417 should be used to determine criteria related to planned loss of Firm Demand.[61]

48. BPA, ITC, and Duke Energy comment that setting a quantitative limit would push transmission planners to plan to meet such a limit for a single contingency in all cases. Currently, transmission planners start from the premise that no load should be interrupted in the event of a single contingency. ITC believes that including such an acceptable lost load criterion as an option could lead to that option being chosen as the "default solution," i.e., allowing for a certain amount of acceptable interruption of Firm Demand without a stakeholder exception review process.[62] In the same vein, Duke indicates that a specific megawatt threshold may prohibit certain interruptions of Firm Demand that would be acceptable from a quality of service and local consequences perspectives.[63]

---

[60] NERC Comments at 14.

[61] ITC Comments at 5; *see also* Hydro One and IESO Comments.

[62] ITC Comments at 5.

[63] Duke Comments at 6.

Commission Determination

49. The Commission is persuaded by the commenters that Form OE-417 or the Registry Criteria are not, by themselves, beneficial to use to devise criteria. The Commission also agrees that a bright-line criteria by itself does not present a viable option and would have the potential to constitute an acceptable *de facto* interruption and become commonplace to plan to interrupt Firm Demand. For example, if the bright-line criteria included up to 50 MW of planned interruptible Firm Demand under proposed footnote 'b', then planners may choose to automatically shed up to 50 MW of load as their first course of action for any single contingency event that would cause a violation of system performance criteria. This is not an acceptable outcome.

2. A Blend of Quantitative and Qualitative Thresholds

50. The Commission also sought comment on whether a blend of quantitative and qualitative thresholds to be used to interrupt planned Firm Demand would be an appropriate option for providing criteria that would be generally applicable, but also for allowing for certain cases that may exceed the criteria. For example, a Reliability Standard could require a process with a quantitative limitation on how much Firm Demand could be planned for interruption and the standard could provide an exception process where a registered entity would submit documents and explanation to the ERO or a Regional Entity for approval based upon certain considerations.[64] The Commission

[64] NOPR, FERC Stats. & Regs. ¶ 32,683 at P 18.

suggested that setting generally applicable criteria for when an applicable entity can plan to shed Firm Demand, coupled with an exceptions process overseen by NERC and the Regional Entities, could mean that few exception requests must be processed by NERC and the Regional Entities.[65] The Commission observed in the NOPR that this approach may satisfy the need for technical criteria while accounting for NERC's concerns about the difficulty of developing a one-size-fits-all criterion for limiting planned Firm Demand interruptions and the appropriateness and feasibility of managing and actively participating in each planning process.

Comments

51. California SWP indicates that standards must constrain the use of firm load shedding as a reliability solution in transmission planning and at the same time, require a transparent and clearly defined stakeholder process to support any such planned use of load shedding for single contingency events.[66] BPA suggests that, if the Commission does set a quantitative limit on planned interruption of Firm Demand, a limit based on a fraction of aggregated normal peak load would be one option that may be more effective and adaptable to all sizes of utilities.[67]

---

[65] *Id.* P 27.

[66] California SWP Comments at 2.

[67] BPA Comments at 4.

52. Other commenters disagree that a blend is a good option. NARUC indicates that rather than inventing another stakeholder process by requiring NERC to set specific quantitative or qualitative requirements for distribution load shedding, NERC should look to State commissions and existing State curtailment plans to guide load shedding in contingency planning.[68] Duke Energy submits that a blend of quantitative and qualitative thresholds does not provide enough flexibility to permit the qualitative assessment of the loads and locations for which transmission planners may interrupt under their exercise of footnote 'b' because a blended threshold may still rely too heavily on a quantitative threshold for planned interruption of Firm Demand.[69] FRCC states it is not feasible to develop a single quantitative rule that would apply equitably to all stakeholders and regions.[70]

53. EEI believes that adopting a process that would provide greater clarity, reporting, and refinement would provide the specific information on the extent that the footnote 'b' issue presents itself. EEI also agrees with NERC that efforts to create a one-size-fits-all approach have less value than a process that ensures openness and transparency.

---

[68] NARUC Comments at 3.

[69] Duke Energy Comments at 7.

[70] FRCC Comments at 7.

Commission Determination

54. The Commission believes that setting a quantitative and qualitative threshold in developing a limited exception for planned interruption of Firm Demand may be a workable solution. First, qualitative thresholds could be used to overcome the concern discussed immediately above regarding the quantitative threshold becoming an acceptable *de facto* interruption of planned Firm Demand. By utilizing a blend, the planner must also meet the qualitative threshold which could consist of, for example, the submittal of documents and explanation to the entity ultimately deciding whether the planned load shed is acceptable. For example, if 100 MW of planned Firm Demand was permitted to be interrupted, the planner could not automatically and unilaterally shed up to 100 MW of planned Firm Demand each time system performance criteria would be violated. Under the blend concept, the Commission envisions that the planner would consider up to 100 MW of planned Firm Demand interruption along with other options to resolve the system performance criteria violation and submit its documentation and explanation to the entity deciding whether the planned load shed is acceptable. The concept of a blend of thresholds would prevent an acceptable *de facto* interruption of planned Firm Demand and avoid the difficulty of developing a one-size-fits-all criterion for limiting planned Firm Demand interruptions, but still allow for those limited circumstances to be reviewed in an exception process where a limited amount of planned interruption of Firm Demand may be acceptable.

55. We believe it is appropriate for the Regional Entities, with NERC as the final authority, to make determinations under a “blended” exception process. First, NERC and

the Regional Entities provide both objectivity in the decision-making process as well as the necessary reliability-focused expertise. Second, this should not overly burden NERC or Regional Entity resources as utilization of the planned load shed exception is – and would be – rarely utilized.[71] Further, we are not persuaded by the assertion that NERC would be conflicted as the ERO and also inserting itself in the process. NERC's ERO role would continue, in coordination with its current responsibilities in implementing other exceptions such as the Technical Feasibility Exception process under the Critical Infrastructure Protection Reliability Standards.

56. The Commission does not agree with BPA's suggestion of using quantitative thresholds based on a fraction of aggregated normal peak load. BPA's suggestion attempts to address the concerns of commenters that a bright-line threshold must be established that would be a one-size-fits-all criteria. For example, instead of a megawatt bright-line threshold for all entities, the ERO could establish a threshold based on a percentage of aggregated normal peak load. The Commission believes that it would be difficult to demonstrate that adoption of BPA's suggestion would be just and reasonable, not unduly discriminatory or preferential and in the public interest. If criteria were established that permitted a percentage of aggregated normal peak load as an acceptable threshold for planned interruption of Firm Demand, even a small percentage could equate

---

[71] *See, e.g.,* FRCC Comments at 4; MISO Comments at 4; BPA Comments.

to entire towns, cities or regions of load.[72] The Commission, therefore, does not support the planned interruption of Firm Demand based on a fraction of aggregated normal peak load. The Commission believes that an appropriate mechanism would be based on impact studies that consider minimizing planned interruption of Firm Demand within, and adjacent to, communities and small localities.

57. The Commission offers guidance to NERC to consider the option of a blend of quantitative and qualitative thresholds. An example of a qualitative threshold could include identifying geographical or topological "fringes of the system." While interruption at the fringes of the system may be expected by some consumers, not all customers necessarily have that same expectation. For example, we don't expect that many water treatment facilities or telecom switching stations normally plan to be interrupted for single contingency events.[73] While the Commission has offered one example of a qualitative threshold, NERC may explore other qualitative thresholds on remand. The Commission believes that a blend of quantitative and qualitative thresholds coupled with an exception process overseen by NERC and the Regional Entities would be a reasonable option to allow for the limited interruption of planned Firm Demand.

[72] For example, the PJM aggregated normal system peak load is approaching 160,000 MW, so a one percent threshold would equate to allowance of planned interruption for a single contingency of up to 1600 MW of load, which is the size of some entire towns, cities or regions.

[73] While we anticipate that such facilities are prepared for distribution-level blackouts, we are not aware that they are prepared for a transmission-level blackout.

Accordingly, the Commission directs the ERO to consider some blend of quantitative and qualitative thresholds.

3. <u>Customer or Community Consent</u>

58. In the NOPR the Commission also requested comment on whether a feasible option would be to revise footnote 'b' to allow for the planned interruption of Firm Demand in circumstances where the "transmission planner can show that it has customer or community consent and there is no adverse impact to the Bulk-Power System."[74] The Commission suggested that this would not require affirmative consent by every individual retail customer, but would recognize that either group would need to be adequately defined. The Commission requested comments on who might be able to represent the customer or community in this option and how customer or community consent might be demonstrated.[75] The Commission also requested comment on how it would be determined that firm demand shedding with customer consent would not adversely impact the Bulk-Power System. Additionally, the Commission requested comment on whether a customer who would otherwise consent to having its planning authority or transmission planner plan to interrupt Firm Demand pursuant to this option could instead select interruptible or conditional firm service under the tariff to address cost concerns.

---

[74] NOPR, FERC Stats. & Regs. ¶ 32,683 at P 28.

[75] *Id.*

Comments

59. Several commenters agreed with the Commission that the customer or community consent should be required. ITC believes the customers or entities should be involved in a stakeholder process such as a representative group for the affected load or customers (community representatives or a separate load serving entity where the transmission provider is not an integrated utility), the public service/utility regulatory commission for the affected load, the RTO or ISO for the affected area, and any other affected entity. California SWP also supports notice to and consent of loads (or their wholesale representatives) that are planned to be interrupted for the loss of a single element.[76] In its comments, California SWP explains that it was "surprised to learn that in lieu of transmission upgrades, [its transmission planner] relied on interruption of SWP's large firm pump loads supposedly receiving the same California Independent System Operator (CAISO) transmission service as provided to SCE loads. At that time, SWP was not consulted about the planned curtailment of its firm loads as an alternative to a transmission upgrade, and thus had no opportunity to correct this error."[77]

60. Other commenters disagree that customer or community consent should be required. NERC states that it has no relationship with retail customers and, therefore, has no mechanism to bring retail customers into the conversation. NERC adds that both

---

[76] California SWP Comments at 4.

[77] *Id.* at 2-3.

wholesale and retail customers are already involved in state processes which provide a forum for them to be heard.

61. Hydro One and the IESO submit that customer interests are managed by the relevant regulatory authority and consent is through regulatory approval. In all cases, steps are taken in planning, design, and operations of the system to ensure that Firm Demand shedding would not adversely impact the bulk electric system in addition to the fact that the customer also has other options such as to select interruptible service. NYPSC recommends that the Commission only prescribe acceptable load shedding as it pertains to wholesale customers that are in a position to select interruptible or conditional firm transmission service under Commission-approved tariffs.

62. FRCC states that the evaluation of the possible use of interruptible or conditional firm service instead of planned interruptions of Firm Demand is not warranted. According to FRCC, the adoption of a Firm Demand interruption alternative would inherently entail customer benefits from foregone project costs and the non-incurrence of environmental and other impacts. The customers would also generally enjoy a higher quality of service than traditional interruptible or conditional firm. Consequently, FRCC believes that applying any such rate in place of Demand interruption would present imponderable issues of quantification and application.

63. BPA does not believe that this proceeding is appropriate to decide issues related to service choice. BPA argues that the Commission has determined that the rate for conditional firm service be the same as the firm rate. BPA does not anticipate that the interruption of Firm Demand would occur on a frequent basis, if at all. Thus, BPA does

not believe that a customer should pay a different transmission rate under these circumstances. APPA states that footnote ‘b’ arms wholesale transmission customers and communities served at retail with information and studies prepared by the transmission planner, documenting the specific circumstances (i.e., specific Bulk Electric System Contingency events) under which interruption of Firm Demand may be needed to address bulk electric system performance requirements.

Commission Determination

64. We understand NERC’s position that as the entity that addresses Bulk-Power System reliability, it does not have a mechanism to coordinate with customers. Likewise, how to define customers and community decisions and engage them in the NERC process could be challenging.[78]

65. At the same time, California SWP provides a compelling example of how a customer can be adversely affected by planned load shedding for Firm Demand if it was unaware its load would be interrupted until its load was actually shed. In contrast to California SWP’s experience, a customer should have notice and understanding that the transmission planner plans to curtail certain Firm Demand in the event of a single

[78] As suggested in the NOPR, customer or community consent would not require affirmative consent by every individual retail customer, but the process NERC developed would recognize that either group would need to be adequately defined. We note that, although NERC comments that it addresses Bulk-Power System reliability, the process that NERC proposes will impact firm load service to retail customers.

contingency indentified in the system modeling under NERC's Transmission Planning requirements. NERC should consider these matters on remand.[79]

Summary

66. In sum, the Commission remands the proposed footnote 'b' and directs NERC to revise its proposal to address the Commission's concerns described above, subject to consideration of the additional guidance provided in this Final Rule.

67. As stated in the NOPR, NERC will need to support the revision to footnote 'b.' If there is a threshold component to the revised footnote, NERC would need to support the threshold and show that instability, uncontrolled separation, or cascading failures of the system will not occur as a result of planning to shed Firm Demand up to the threshold. In addition, if there is an individual exception option, the applicable entities should be required to find that there is no adverse impact to the Bulk-Power System from the exception and that it is considered in wide-area coordination and operations. Further, the Commission believes that any exception should be subject to further review by the Regional Entity or NERC.

III. Information Collection Statement

68. The Office of Management and Budget (OMB) regulations require that OMB approve certain reporting and recordkeeping (collections of information) imposed by an

[79] We will not consider the tariff-related comments as they are beyond the scope of this rulemaking.

agency.[80] The information contained here is also subject to review under section 3507(d) of the Paperwork Reduction Act of 1995.[81]

69. As stated above, the subject of this Final Rule is NERC's proposed modification to Table 1, footnote 'b' applicable in four TPL Reliability Standards. This Final Rule remands the footnote 'b' modification to NERC. By remanding footnote 'b' the applicable Reliability Standards and any information collection requirements are unchanged. Therefore, the Commission will submit this Final Rule to OMB for informational purposes only.

70. Interested persons may obtain information on the reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: data.clearance@ferc.gov, phone: (202) 502-8663, or fax: (202) 273-0873].

IV. Environmental Analysis

71. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[82] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment.

[80] 5 CFR § 1320.11.

[81] 44 U.S.C. § 3507(d).

[82] *Regulations Implementing the National Environmental Policy Act of* 1969, Order No. 486, 52 FR 47897 (Dec. 17, 1987), FERC Stats. & Regs., Regulations Preambles 1986-1990 ¶ 30,783 (1987).

Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[83] The actions proposed herein fall within this categorical exclusion in the Commission's regulations.

V. Regulatory Flexibility Act

72. The Regulatory Flexibility Act of 1980 (RFA)[84] generally requires a description and analysis of final rules that will have significant economic impact on a substantial number of small entities. The RFA mandates consideration of regulatory alternatives that accomplish the stated objectives of a proposed rule and that minimize any significant economic impact on a substantial number of small entities. The Small Business Administration's (SBA) Office of Size Standards develops the numerical definition of a small business.[85] The SBA has established a size standard for electric utilities, stating that a firm is small if, including its affiliates, it is primarily engaged in the transmission, generation and/or distribution of electric energy for sale and its total electric output for the preceding twelve months did not exceed four million megawatt hours.[86] The RFA is not implicated by this Final Rule because the Commission is remanding footnote 'b' and not proposing any modifications to the existing burden or reporting requirements. With no changes to the Reliability Standards as approved, the Commission certifies that this

[86] *Id.* n.22.

Final Rule will not have a significant economic impact on a substantial number of small entities.

VI. Document Availability

73. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through FERC's Home Page (http://www.ferc.gov) and in FERC's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington DC 20426.

74. From FERC's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

75. User assistance is available for eLibrary and the FERC's website during normal business hours from FERC Online Support at (202) 502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

VII. Effective Date and Congressional Notification

76. These regulations are effective [insert date 60 days from publication in **FEDERAL REGISTER**]. The Commission has determined, with the concurrence of the

Administrator of the Office of Information and Regulatory Affairs of OMB, that this rule is not a "major rule" as defined in section 351 of the Small Business Regulatory Enforcement Fairness Act of 1996.

By direction of the Commission. Commissioner Norris is dissenting in part and concurring in part with a separate statement attached.

(S E A L)

Kimberly D. Bose,
Secretary.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Transmission Planning Reliability Standards Docket No. RM11-18-000

(Issued April 19, 2012)

NORRIS, Commissioner, *dissenting in part and concurring in part*:

The continued implementation and evolution of the mandatory reliability standards program enacted by Congress in 2005 has been at the forefront of our agenda since I arrived at the Commission in 2010. As we have grappled with the difficult issues raised by proposed new or revised standards, and as I have discussed these issues with regulated industry, state regulators, and the public, I have consistently heard a common theme: mandatory reliability standards come with costs that consumers ultimately must bear.

As I have thought about this issue, it has become clear to me that in any discussion of a new or revised mandatory reliability standard, there is always a tradeoff between the level of reliability to be achieved by that standard and the costs that the standard will impose. However, that tradeoff is rarely discussed explicitly in the standards development process or during the Commission's review of standards. But, we know that it is an implicit consideration of entities participating in the standards development process. I believe it is more appropriate to make those considerations, where they are relevant, explicit. Therefore, I have advocated for an open dialogue between NERC, the industry, and the Commission to consider the connection between the mandatory standards we approve to maintain and improve the reliability of the Bulk Power System and the costs required to meet those standards.

However, I have perceived some hesitancy in openly addressing costs when considering reliability matters. This is not surprising, as there are no easy answers to these tough questions, and regulators and industry charged with assuring reliability will always be hesitant to be perceived as sacrificing reliability in an effort to save on costs. While I am not advocating for a cost-benefit threshold for approving reliability standards, I do not believe that we can ignore the costs of proposed mandatory reliability standards as we consider whether they are "just, reasonable, not unduly discriminatory or preferential, and in the public interest".[1] These are issues with real world implications,

[1] *See* 16 U.S.C. 824o(d)(2).

not just for the reliability and security of our Nation's electric grid, but for the day-to-day struggles of local communities to balance the economic realities of many competing obligations.

I am compelled to raise these issues in this proceeding because I believe that the Transmission Planning (TPL) Reliability Standard footnote 'b' addressed in today's order presents a stark example of the tradeoffs that sometimes must be made between increasing levels of reliability and the costs that come with achieving them. As such, I hope my comments today will help generate a dialogue on how economics and reliability fit together when considering mandatory reliability standards.

In today's order, I agree with the majority's decision to remand proposed TPL footnote 'b' because it is vague, potentially unenforceable, and lacks adequate safeguards to determine when planning to shed firm load would be permitted. However, I am concerned that, in allowing for an exception to the TPL standards requirement that firm load must be maintained under N-1 scenarios, the order does not sufficiently recognize that this is both an economic and reliability issue, and must allow for a balancing of the economic and reliability considerations involved.

There may be cases where planning to avoid shedding firm load in all N-1 scenarios will impose significant costs on customers, with perhaps little added reliability benefit for those customers. In such instances, I believe that wholesale transmission customers and local communities with retail load service should be empowered to consider the economic tradeoffs between incurring costs to avoid shedding firm load versus planning to shed firm load, as long as that decision does not adversely impact the reliability of the Bulk Power System. Simply put, if a customer seeks to avoid significant costs, and can do so without impacting its neighbors, the customer should be making that decision. Today's order fails to adequately acknowledge the economic consequences of having to invest in significant facility upgrades to avoid shedding firm load under certain N-1 scenarios that may be rare or unlikely and that would have only local impacts.[2]

---

[2] *Transmission Planning Reliability Standards*, Order No. 762, 139 FERC ¶ 61,060, at P 33 (2012) ("With regard to NERC's comment that the decision to interrupt local load is essentially an economic decision that is a quality of service issue, not a reliability issue, the Commission notes that in Order No. 693, we dismissed the argument that… such interruption is based largely on the matter of economics, not reliability.") I also note that the brief Commission findings in Order No. 693 failed to acknowledge or sufficiently address this issue, leaving the uncertainty we are still faced with today. *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 1791-1794 (2007).

Accordingly, in my view, the Commission should have directed NERC to revise footnote 'b' to address two broad concerns. First, wholesale transmission customers and retail load should have the ability to choose whether to shed firm load during an N-1 contingency where that decision will not adversely impact the Bulk Power System. Second, the decision to shed firm load must be validated to ensure that there is no adverse impact on the Bulk Power System. Absent this reliability check, the planning of firm load shedding should not be permitted, because reliability of the Bulk Power System is paramount. While NERC, the Regional Entity, and/or the local planning authority must be involved in the reliability check, these entities would not be expected to be involved in the economic decision.

Additionally, I agree with various comments filed in response to the NOPR that firm load shedding is and should be used rarely or infrequently. I do not expect that any new process that NERC may propose to determine whether firm load shedding is permitted would result in a rush by entities seeking to plan to shed firm load. In other words, I do not expect this exception to "swallow the rule" under the TPL standards that firm load may not be planned to be shed for N-1 contingencies.

Finally, the concerns I note above regarding the failure to consider both the economic and reliability aspects of a decision to plan to shed firm load extend to the specific guidance provided in the order. The guidance in the order with respect to what would constitute an allowable exception fails to provide a realistic means for entities to balance these economic and reliability considerations. Instead, I would have provided that an entity could submit its plan to shed firm load for a single contingency to its relevant regulatory authority or governing body prior to any actual interruption.[3] The politically accountable regulatory authority or governing body would have then made the determination, based upon economics and in the best interests of its customers, as to whether firm load shedding should be permitted. Those determinations would be subject to oversight and review by NERC, the Regional Entity, and/or the planning authority to ensure that they will not adversely impact the Bulk Power System.[4]

[3] *See e.g.*, Duke Energy Corporation Dec. 22, 2011 Comments, Docket No. RM11-18-000.

[4] NERC may propose an alternative to Commission guidance that is equally efficient and effective at addressing the Commission's reliability concerns. Order No. 693 at P 31.

For these reasons, I respectfully dissent in part and concur in part.

____

John R. Norris, Commissioner

Document Content(s)

Standards Announcement

Project 2010-11 – TPL Table 1 Order
TPL-002-1c, footnote ‘b’ and TPL-001-2a, footnote 12

Initial Ballot open through 8 p.m. Monday, November 19, 2012

Now Available

A single initial ballot is open for revisions to a single footnote that is incorporated into two standards (**TPL-002-1c**– System Performance Following Loss of a Single BES Element for footnote ‘b’, and **TPL-001-2a** – Transmission System Planning Performance Requirements for footnote 12) through **8 p.m. Eastern Monday, November 19, 2012.**

Please note that, aside from the proposed revisions to the footnote and changes to conform the Enforcement Dates section to the current language approved by NERC legal to cover all of the jurisdictions in which NERC standards are mandatory, no other revisions have been made to either standard. The scope of the drafting team’s assignment is limited to addressing changes to the single footnote.

Instructions
Members of the ballot pools associated with this project may log in and submit their votes for the footnote in both standards by clicking here.

Next Steps
The drafting team will consider all comments received during the formal comment period and initial ballot and, if needed, make revisions to the footnote. If the comments do not show the need for significant revisions, the footnote will proceed to successive ballot.

Background
FERC Order No. 762, issued April 19, 2012, remanded TPL-002-0b to NERC as vague, unenforceable and not responsive to the previous Commission directives on this matter. The Standards Committee directed the Standards Drafting Team (SDT) to revise footnote ‘b’ in accordance with the directives of Orders No. 693 and 762. The SDT was also charged with revising the corresponding footnote 12 of TPL-001-2 in order to prevent the remand of TPL-001-2.

In revising the footnotes, the SDT adopted a philosophy of minimal changes to the actual footnote itself. This was done to minimize confusion as to what was changed, for ease of reading and following the footnote, and for formatting within the actual standards documents. Instead, the SDT revised the footnote by developing an attachment to the footnote containing changes in response to the Commission orders. It should be noted that attachments to standards are an extension of the Requirements and thus are binding to applicable entities.

Project 2010-11 is an important part of the ERO's strategic goal to be responsive to regulatory authority directives in an expeditious manner in order to reduce the amount of standards-related directives and to provide an adequate level of reliability.

Additional information can be found on the project page.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

TPL-002-1c, footnote ‘b’ and TPL-001-2a, footnote 12

Formal Comment Period Open: October 5 – November 19, 2012

Upcoming
Initial Ballot: November 9 – November 19, 2012

Now Available

A formal comment period for a revisions to a single footnote that is incorporated into two standards (**TPL-002-1c**– System Performance Following Loss of a Single BES Element as footnote ‘b’, and **TPL-001-2a** – Transmission System Planning Performance Requirements as footnote 12) is open through **8 p.m. Eastern on Monday, November 19, 2012.**

Please note that, aside from the proposed revisions to the footnote and changes to conform the Enforcement Dates section to the current language approved by NERC Legal to cover all of the jurisdictions in which NERC standards are mandatory, no other revisions have been made to either standard. The scope of the drafting team’s assignment is limited to addressing changes to the single footnote.

Instructions for Joining Ballot Pool(s)

Registered Ballot Body members must join the ballot pool to be eligible to vote in balloting of a footnote that is included in standard **TPL-002-1c** as footnote ’b’, **TPL-001-2a** as footnote 12. Registered Ballot Body members may join the ballot pool at the following page: Join Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using the “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list server.) The ballot pool list server for this ballot pool is: bp-2010-11_TPL_ftb_in@nerc.com

The ballot pool is open **through 8 a.m. Eastern on Monday, November 5, 2012.**

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Monday, November 19, 2012.** Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

A single initial ballot for the footnote in both standards will be conducted Friday, November 9, 2012 through 8 p.m. Monday, November 19, 2012.

TVA Transmission Reliability Engineering and Controls
Tim Ponseti, VP
Yes
TVA agrees with the general text; however, TVA believes that the 75 MW limit is too low. TVA believes that a better limit would be 100 MW - which is the amount for load shedding required to be reported under OE-417 under emergency operational policy. This would allow some future load growth as well as any possible new loads that may develop quickly in which a utility may not have time to complete necessary projects in a corrective action plan.
No
TVA recommends that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. Since the average use given in the survey was 19 MW and there is no evidence of harm to the BES reliability resulting from that use, there is no reason to require a stakeholder process for amounts less than 25 MW. This is consistent with the value cited in Section III.
No
TVA would like to propose that this Stakeholder process be postponed in the event that a transmission fix for a load drop issue was already planned within the next 2 or 3 years. Thus the stakeholder process would only occur for projects that had no fix planned within the next couple of years. TVA is also not sure how to satisfactorily address “health, safety, and welfare of the community” - TVA would appreciate some guidance on how to properly address this. TVA believes that item 1.b of Section II could contain CEII information and should have limited distribution. The appropriate non-disclosure agreements would need to be developed to prevent widespread publication of the information.
No
TVA believes that the requirements of 25 MW as well as any Bulk contingency over 300-kV is much too burdensome. TVA believes that only larger load drops (such as 50 MW and above) should require ERO review.
Please see responses to question #2,3, and 4. TVA believes that only load drops of higher magnitudes go thru the Stakeholder and regulatory review.
Group
Northeast Power Coordinating Council
Guy Zito
No
The 75MW of Firm Demand interruption is retail load that is being dropped. Dropping load in the general sense should not be endorsed, but it is recogn ized that there are special situations where it cannot be avoided. If a regulator responsible for retail load is comfortable with greater than 75MW being dropped in a rare situation, there should not be a requirement to build out of the situation. Provided there is no widespread, adverse effect on the reliability of the interconnected BES, the effect of a firm demand interruption on customers is under the purview of the applicable regulatory authority that is responsible for local transmission and retail service over the load to be curtailed. There is no technical basis for the 75MW figure. It was included as a result of a Section 1600 Data Request, and is an arbitrary value. There should not be a limit without a technically supportable reliability based reason.
There are no limits on non-consequential load loss for Single Contingency P2-2 and P2-3 (HV only), multiple

Contingencies P4 and P5 (HV only), and P6 and P7. Footnote 12 allows limited non-consequential load loss for single contingency P1, Multiple Contingency P3. Non-consequential load loss is not allowed for P2-2 and P2-3 (EHV), and P4 and P5 (EHV). Considering the EHV Facilities, it is not reasonable to accept some non-consequential load loss for single contingency P1 and P2-3, and then deny it for Multiple Contingency categories P4 and P5 which are statistically less frequent than the former. Also, the Multiple Contingency P7 (for which there is no limit on non-consequential load loss) is more frequent than P2-3, P4 and P5. This technical irregularity must be reviewed and addressed.

In this section the reference to Customers should only be Customers of Transmission and not open ended for any customer. Once it is sold wholesale the TP wouldn’t know where it is being sent to. We would also note that under some jurisdictions that there is a minimum duration threshold for keeping historical data on some of these events that are being requested under this section. Need to add language to accommodate these thresholds so as not to contradict what is being asked for by the regulatory bodies.
No
Section III is superfluous if the regulatory bodies are attending the open stakeholder process. This section should be removed due to the fact that if there is an issue or question on these events they should be addressed in the open stakeholder meeting. Not sure why the team decided to add the ERO as an entity to check after the regulatory body has approved the use. We feel like if there needs to bee coordination between affected entities that they could participate in the open stakeholder process as well. You could add that they include possible affected entities to the invite list of the open meeting to discuss these footnote applications under section 1.
Individual
Kenn Backholm
Public Utility District No.1 of Snohomish County
No
We believe the survey significantly underestimated the use of Non-Consequential Load Shedding because the survey asked about past usage of footnote b under Version 001, not about planned load shedding in TPL version 002 or the proposed footnote 12. TPL version 002 added several new contingencies, and also changed the Non Consequential Load shedding applicability for several contingencies. We have 4 specific concerns, followed by several suggested edits: 1) Analyzing the contingencies “P1.4 Loss of a Shunt Device” and “P2.1 Opening of a line section w/o a fault” are new requirements that will lead to increased use of footnote 12. It is common on fringes of the interconnected system to have weak sources. Significant utility investment will be redirected to remediate these fringe performance issues due to the P2.1 and its associated restrictions for firm load shedding and no RAS or UVLS mitigation. This is a low probability and low impact to the main grid contingency with a high mitigation cost, given the new mitigation restrictions. 2) Contingencies “P2.2 Bus Section fault” and “P2.3 Internal Breaker Fault” were previously defined as category “C multiple contingencies” with the restriction that the Firm Load shedding must be planned/controlled. However Version 002 no longer allows dropping nonconsequential load for EHV but removes all restrictions for HV load shedding. Since these contingencies result in opening the same breakers as category P1 contingencies, the use of footnote 12 should be consistent with P1. 3) Contingencies P3.1-P3.4 were previously defined as category “C multiple contingencies” with Firm loading shedding allowed. In version

2, these contingencies have been changed from allowing planned load shedding to only allowing Non-Consequential load shedding per footnote 12. Although this does not directly impact our utility, the survey results do not include utilities using "must-run" generation. 4) As demonstrated by multiple questions at the last webinar, many utilities do not understand the definition of Non-Consequential Loads, and therefore may not have correctly reported the usage of Non-Consequential Load Shedding. The v2 changes cascade to the unfortunate conclusion that UVLS and RAS are no longer permitted as cost effective transmission performance mitigation, despite new low probability contingencies that drive performance problems at the edges of the network. -Proposed changes: A) Change the maximum amount from 75 MW to 300 MW. Several other standards including CIP have a strong technical basis for selecting 300 MW as the maximum limit for load shedding programs. B) Footnote 12 on contingency 2.1 should be replaced with a new footnote 15 that reads " 15. For this contingency, load which is served radial from a remaining single source line may be shed as if it were Consequential Load." This change would acknowledge that while P2.1 does involve just one element, the likelihood of occurrence is similar to bus section faults, so the resulting system performance requirements should be similar. C) The first two sentences of footnote 12 should be deleted. Remove the first sentence because it is general in nature and is a basic tenant of any load-serving utility. Remove the second sentence because column 7 of Table 1 explicitly states where Non-Consequential Load Loss is allowed. D) The third sentence of footnote 12 should have the words "under footnote 12" added. Without this addition, all Non Consequential Load Loss including the allowed loss for P4, P5 and P6 would still be subject to Appendix 1. The revised sentence would read "When Non-Consequential Load Loss is used under footnote 12 within the Near-Term …"
No
In the first sentence, remove the words "as an element of a Corrective Action Plan." There are cases on the fringes of the system where Non-Consequential Load Loss is the preferred alternative in both the long term and short term, not as a temporary patch. Requiring the stakeholder process as part of Corrective Action Plan implies that using footnote 12 cannot be the long term choice. Since a Corrective Action Plan is a "list of actions and an associated timetable for implementation to remedy a specific problem," using this term removes the stakeholders ability to evaluated the costs and benefits and instead requires them to treat this a problem where the only solution is building new facilities.
No
We suggest removing section 2b "Assessment…health, safety…" for three reasons: 1)All outages have a negative impact on the community. Outages under footnote 12 do not inherently have more significant impact per MWhr lost than other outages allowed per Table 1. By requiring additional analysis for a similar societal impact, this provision discriminates against utilities at the fringes of the system. 2) While reminding planners to consider that their decisions do have real impacts to real people is a laudable goal, including this provision opens the door to significant legal liability and regulatory uncertainty. 3) An appendix to a footnote is the wrong place to introduce such a significant requirement. The Adequate Level of Reliability Task Force would be a more appropriate venue for this idea.
No
1) Similar to our comment on question 2, please remove the words "as an element of a Corrective Action Plan" from the first sentence. There are cases on the fringes of the system where Non-Consequential Load Loss is the preferred alternative in both the long term and short term, not as a temporary patch. Since a Corrective Action Plan is a "list of actions and an associated timetable for implementation to remedy a specific problem," using this term removes the stakeholders ability to evaluate the costs and benefits and instead requires them to treat this a problem where the only solution is building new facilities. 2) For any specific use of footnote b, there could be several applicable regulatory authorities such as small municipalities or public utility districts. The standard should clarify whether the planner must show evidence that every authority did not object, or whether the planner only needs to show that less that 25 MW was not rejected by the regulatory authorities. To accomplish this clarification, we propose: A) In Section III paragraph 1 and paragraph 5 change "regulatory authority or governing body" to "regulatory authorities or governing bodies." B) Add a sentence to bullet 2 to read "If multiple regulatory authorities or governing bodies are responsible for retail electric service issues, only the portion of Non-Consequential Load Loss exceeding 25 MW is subject to section III."
Public Utility District No.1 of Snohomish County generally disagrees with the October 2012 revision of TPL Table 1 Steady State & Stability Performance Footnotes (Planning Events and Extreme Events). "Footnote b) An objective of the planning process is to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. In limited circumstances, Firm Demand may be interrupted throughout the planning horizon to ensure that BES performance requirements are met. However, when interruption of Firm Demand is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the use of Firm Demand interruption meets the conditions shown in Attachment 1. In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW." "Footnote 12. An objective of the planning process is to minimize the likelihood

and magnitude of Non-Consequential Load Loss following Contingency events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed ‘75’ MW.” The proposed revisions require that a Transmission Planner or Planning Coordinator provide assurance that the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the interruptions of firm demand under TPL-002 footnote ‘b’ or TPL-001 footnote ‘12’ if the voltage level of the contingency is greater than 300 kV with certain sub-conditions or if the planned interruption of firm demand under these footnotes is greater than 25 MVA. In addition, under no case can planned Non-Consequential Load Loss exceed 75 MW. The magnitude and duration of load loss is a Level of Service (“LOS”) or Customer Service issue that is the jurisdiction of Public Utility Commissions and Local Electric Utility and Municipality boards. The boards and commissions represent their customers which often have diverse service and rate expectations that often are a result of local industry requirements, geography, urban/rural characteristics, and other factors of the particular service territory. Boards and commissions hold public meetings seeking input on various utility matters that often address services and rates. The rate impacts for customers are important; often more important than the service levels depending on the particular customer or customer class. Local boards and commissions are very close to these issues and weigh the input provided through public testimony to best represent their customer needs over the region they represent and have jurisdiction under state and local codes to address. The 75 MW Non-Consequential Load Loss threshold and the required NERC process do not resolve or address a reliability issue. The TPL footnotes address service requirements and should not be part of a NERC Reliability Standard any more than mandating specific System Average Interruption Frequency Index ("SAIFI") and System Average Interruption Duration Index ("SAIDI"). The Non-Consequential Load Loss requirement is an economic driven threshold that is not consistent throughout North America due to diverse customer needs and expectations. For instance, in some areas it may make economic sense and receive local approval to fund a $100 million system reinforcement to mitigate 1 in 20 year (5 percent chance of occurring) 76 MW Non-Consequential Load Loss exposure. However there are many communities that could not justify or support multi-million facilities to mitigate a 1 in 20 year event that may cause the Non-Consequential Load Loss of 76 MW of load. Public Utility District No.1 of Snohomish County supports removing the Non-Consequential Load Loss thresholds from the TPL Reliability Standards and allow the local boards and commissions to continue to address Customer Service Level issues as they are closest to the customers’ needs and have jurisdiction over this issue.

No
(1) Change the wording at the end of the first sentence from “following Contingency events” to “following Contingency events and Contingency events during the planned (maintenance) outage of any bulk electric equipment)”. This would remind Transmission Planners and Planning Coordinators to include the consideration of planned outages at demand levels for which the outage would be performed. (2) Raise the maximum load dropping threshold for the footnote from 75 MW to 100 MW. A 100 MW threshold is reasonable because the DOE uses the intentional dropping of more than 100 MW as one of the thresholds for determininge when enough load is dropped to justify a formal system event analysis. (3) Add a sentence at the end of the footnote to read, “This footnote does not apply to any load that is not NERC registered (e.g. load that does not meet the greater than 25 MW NERC registration criterion). (4) If a portion of the non-consequential load loss used to mitigate a contingency is controllable by a demand side load management system, can it be excluded from the “Firm Demand interruption” in TPL-002-1c Table I footnote ‘b’ and/or ”Non-Consequential Load Loss” in TPL-001-2a Table 1 footnote 12? Does it have to be curtailed on a pre-contingent basis in order to be excluded from the non-consequential load total, or can it be excluded even if the curtailment happens through action of the UVLS? Does this load count towards the 25 MW and 75 MW thresholds? RECOMMENDATION: When describing “interruption of firm demand” or “non-consequential load loss” in footnote ‘b’ add the language “not counting load shed on a pre-contingent basis”. This would be added to the last sentence of footnote ‘b’ if it indeed should not be counted towards the 75 MW threshold. Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion. (5) If multiple companies own portions of the non-consequential load loss a used to mitigate a contingency at a single substation does each company’s load portion count towards the 25 MW and 75 MW thresholds or does the total load at the substation count? For example, 100% of the load at a substation is set to trip with automatic UVLS. Company A, B, and C own load amounts X, Y, and Z at the substation. Is the amount of load counted towards the 25 MW and 75 MW thresholds X+Y+Z, or is each counted separately? RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote ‘b’ could read “In no case can the planned Firm Demand interruption from under footnote ‘b’ exceed 75 MW from one entity.” Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion.

Yes
(1) In Attachment 1 Section I, what is the definition of a “stakeholder”? Which NERC functional entities would be included (TO, TOP, LSE)? Are the public residential and/or business owners that are affected included in the definition? Some parties may assume that local government representatives or residential or business owners are included as stakeholders. We believe it is most appropriate for the Transmission Owners, Transmission Operators, and Load-Serving Entities to objectively evaluate the risks of load shedding in a local area against the cost impact of a large transmission project on the rate base. RECOMMENDATION: Define stakeholder to be “affected Transmission Owners, Transmission Operators, and Load-Serving Entities.” (2) In Attachment 1 Section I item 1, what does “including applicable regulatory authorities” refer to? Is this the same body that “applicable regulatory authority or governing body” refers to in Section III? Are these requirements still applicable if the 25 MW threshold in Section III is not passed? RECOMMENDATION: Attachment 1 Section I Item 1 could read “… including applicable regulatory authorities or governing bodies responsible for retail electric service issues as described in Section III. A less vague statement allows the important parties to be included in every instance Attachment 1 is used.
No
Remove Item 2b because it requires the assessment of the footnote application impact on the potential health, safety, and welfare of the community. These types of assessments should be eliminated because they are not electric system reliability matters and were not stipulated by FERC.
No
(1) In Attachment 1 Section III, what is the definition of “applicable regulatory authority or governing body”? Is this the state PSC or PUC? Is it the Regional Reliability Organization (RRO)? Is it the Reliability Coordinator (RC)? RECOMMENDATION: Depending on the answer to the above question, define “applicable regulatory authority or governing body” more precisely. The language could read “applicable regulatory authority or governing body responsible for retail electric service such as the state Public Services Commission or Public Utilities Commission”. A less vague statement allows the important parties to be included in every instance Attachment 1 is used. (2) In Attachment 1, if non-consequential load loss is planned at multiple bulk delivery points to mitigate the same contingency should the total load loss count towards the 25 MW and 75 MW thresholds or should the loads be counted individually? EXAMPLE: There are two load serving substations (X load at substation B and Y load at substation C) on a long 115 kV line with 230/115 kV transformation at each end (substation A and substation D). Automatic under-voltage load shedding is in place at substations B and C, the UVLS relays at each substation making load trip decisions based on local voltage (i.e. independent operation). If one end of the 115 kV line trips and 115 kV voltage is below allowable levels at both substations X and Y, then the total load tripped by UVLS will be X+Y. Does the X+Y value count towards the 25 MW and 75 MW thresholds or are X and Y counted separately? What if X load is dropped for one contingency and Y load is dropped for a different contingency, is the total load counted X+Y or each load separately? RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote ‘b’ could read “In no case can the planned Firm Demand interruption under footnote ‘b’ exceed 75 MW for any single contingency.” Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion. (3) If non-consequential load loss is planned at multiple bulk delivery points in close proximity to mitigate different contingencies should the total load loss count towards the 25 MW and 75 MW thresholds or should the loads be compared individually? For example, there are two load serving substations (X load at substation B and Y load at substation C) on a networked 115 kV line with 230/115 kV transformation at both ends (substation A and substation D). Automatic under-voltage load shedding is in place at substations B and C that would trip X amount of load if one end of the 115 kV line tripped and 115 kV voltage was below allowable levels, and would trip Y amount of load if the other end of the 115 kV line tripped and 115 kV voltage was below allowable levels. Does the X+Y value count towards the 25 MW and 75 MW thresholds or are X and Y counted separately? In addition to the aforementioned contingencies, if the 115 kV line between substations B and C opens, both loads X and Y will trip. Now does the X+Y value count towards the 25 MW and 75 MW thresholds? (4) In Attachment 1, if UVLS relaying is programmed at a sub to trip the load in stages at multiple voltage setpoints, such that only a fraction of the load is tripped for a given contingency, is the entirety of the load still counted towards the 25 MW and 75 MW thresholds? EXAMPLE: Substation B has X load that will trip if the BES voltage gets to 0.92 p.u. and Y that will trip if the BES voltage gets to 0.88 p.u. If only X amount of load is required to mitigate a single contingency in the near-term TPL assessment, is X load counted towards the 25 MW and 75 MW thresholds or is X+Y load counted? Is there a difference if the Y load is at a different, nearby substation with both loads having the aforementioned tripping logic? RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote ‘b’ could read “In no case can the planned Firm Demand interruption under footnote ‘b’ (as demonstrated in the near-term horizon analysis) exceed 75 MW.” Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion
1. In TPL-002-1c Table I and TPL-001-2a Table 1 can “Firm Demand interruption” or “Non-Consequential Load Loss” be initiated by a manual event such as operator action or does it need to be automatic? RECOMMENDATION: In TPL-002-1c Table I footnote ‘b’ add a sentence stating “Acceptable methods to enact Firm Demand Interruption may include manual or automatic processes that can be initiated within a reasonable timeframe”

No
The 75 MW threshold is too low. No technical justification has been given for choosing 75 MW. It should be a significantly higher value for TPL-002. Currently AZPS does not use non-consequential load dropping to meet any standard but this option should be preserved. There could be times when alternate to the load dropping would be building a new transmission line costing hundreds of millions of dollar for a very low probability scenario of high load conditions. The threshold value should be 100 MW or more.
Yes
No
Item 2b: Reference to health, safety, and welfare is unnecessary. All demand interruption are going to have some impact on health, safety, and welfare. The impact is subjective and will simply result in unnecessary study reports by consultants and will act as a road block.
No
The threshold of 25 MW in item 2 of section III is too low. It should be same as the maximum allowed value in foot note b. In addition, AZPS does not agree that no objection assurance by the Regional Entity should be required. Once the process has been fully vetted by the stakeholders, including the regulatory authority for retail service, there is absolutely no need for Regional Entity involvement. There would be no adverse affect of non-consequential load tripping on the BES. Hence no reason for Regional Entity involvement is needed.
The following comment relates to Table 1. It is not clear why footnote 12 applies only to P2-1. The events P2-2, P2-3, P4, P5 are much less probable and the footnote 12 should be applicable to all these events. Why is that loss of non-consequential load is allowed for line tripping without fault but not for a bus fault which is much less likely and could result into same line trip. Similar arguments apply to other scenarios listed above.

No
We believe the survey significantly underestimated the use of Non-Consequential Load Shedding because the survey asked about past usage of footnote b under Version 001, not about planned load shedding in TPL version 002 or the proposed footnote 12. TPL version 002 added several new contingencies, and also changed the Non Consequential Load shedding applicability for several contingencies. We have 4 specific concerns, followed by several suggested edits: 1) Analyzing the contingencies “P1.4 Loss of a Shunt Device” and “P2.1 Opening of a line section w/o a fault” are new requirements that will lead to increased use of footnote 12. It is common on fringes of the interconnected system to have weak sources. Significant utility investment will be redirected to remediate these fringe performance issues due to the P2.1 and its associated restrictions for firm load shedding and no RAS or UVLS mitigation. This is a low probability and low impact to the main grid contingency with a high mitigation cost, given the new mitigation restrictions. 2) Contingencies “P2.2 Bus Section fault” and “P2.3 Internal Breaker Fault” were previously defined as category “C multiple contingencies” with the restriction that the Firm Load shedding must be planned/controlled. However Version 002 no longer allows dropping nonconsequential load for EHV but removes all restrictions for HV load shedding. Since these contingencies result in opening the same breakers as category P1 contingencies, the use of footnote 12 should be consistent with P1. 3) Contingencies P3.1-P3.4 were previously defined as category “C multiple contingencies” with Firm loading shedding allowed. In version 2, these contingencies have been changed from allowing planned load shedding to only allowing Non-Consequential load shedding per footnote 12. Although this does not directly impact our utility, the survey results do not include utilities using “must-run” generation. 4) As demonstrated by multiple questions at the last webinar, many utilities do not understand the definition of Non-Consequential Loads, and therefore may not have correctly reported the usage of Non-Consequential Load Shedding. The v2 changes cascade to the unfortunate conclusion that UVLS and RAS are no longer permitted as cost effective transmission performance mitigation, despite new low probability contingencies that drive performance problems at the edges of the network. -Proposed changes: A) Change the maximum amount from 75 MW to 300 MW. Several other standards including CIP have a strong technical basis for selecting 300 MW as the maximum limit for load shedding programs. B) Footnote 12 on contingency 2.1 should be replaced with a new footnote 15 that reads “ 15. For this contingency, load which is served radial from a remaining single source line may be shed as if it were Consequential Load.” This change would acknowledge that while P2.1 does involve just one element, the likelihood of occurrence is similar to bus section faults, so the resulting system performance requirements should be similar. C) The first two sentences of footnote 12 should be deleted. Remove the first sentence because it is general in nature and is a basic tenant of any load-serving utility. Remove the second sentence because column 7 of Table 1 explicitly states where Non-Consequential Load Loss is allowed. D) The third sentence of footnote 12 should have the words “under footnote 12” added. Without this addition, all Non Consequential Load Loss including the allowed loss for P4, P5 and P6 would still be subject to Appendix 1. The revised sentence would read “When Non-Consequential Load Loss is used under footnote 12 within the Near-Term …”
No

In the first sentence, remove the words "as an element of a Corrective Action Plan." There are cases on the fringes of the system where Non-Consequential Load Loss is the preferred alternative in both the long term and short term, not as a temporary patch. Requiring the stakeholder process as part of Corrective Action Plan implies that using footnote 12 cannot be the long term choice. Since a Corrective Action Plan is a "list of actions and an associated timetable for implementation to remedy a specific problem," using this term removes the stakeholders ability to evaluated the costs and benefits and instead requires them to treat this a problem where the only solution is building new facilities.
No
We suggest removing section 2b "Assessment…health, safety…" for three reasons: 1)All outages have a negative impact on the community. Outages under footnote 12 do not inherently have more significant impact per MWhr lost than other outages allowed per Table 1. By requiring additional analysis for a similar societal impact, this provision discriminates against utilities at the fringes of the system. 2) While reminding planners to consider that their decisions do have real impacts to real people is a laudable goal, including this provision opens the door to significant legal liability and regulatory uncertainty. 3) An appendix to a footnote is the wrong place to introduce such a significant requirement. The Adequate Level of Reliability Task Force would be a more appropriate venue for this idea.
No
1) Similar to our comment on question 2, please remove the words "as an element of a Corrective Action Plan" from the first sentence. There are cases on the fringes of the system where Non-Consequential Load Loss is the preferred alternative in both the long term and short term, not as a temporary patch. Since a Corrective Action Plan is a "list of actions and an associated timetable for implementation to remedy a specific problem," using this term removes the stakeholders ability to evaluate the costs and benefits and instead requires them to treat this a problem where the only solution is building new facilities. 2) For any specific use of footnote b, there could be several applicable regulatory authorities such as small municipalities or public utility districts. The standard should clarify whether the planner must show evidence that every authority did not object, or whether the planner only needs to show that less that 25 MW was not rejected by the regulatory authorities. To accomplish this clarification, we propose: A) In Section III paragraph 1 and paragraph 5 change "regulatory authority or governing body" to "regulatory authorities or governing bodies." B) Add a sentence to bullet 2 to read "If multiple regulatory authorities or governing bodies are responsible for retail electric service issues, only the portion of Non-Consequential Load Loss exceeding 25 MW is subject to section III."

#1. It is unclear what factors must be met in order to be an affected stakeholder under the Stakeholder Process in Attachment 1? This process appears to be devoid of any objective factors that can assist an entity in determining whether a party is a stakeholder or not. NERC should define what an "affected stakeholder" is or list factors to assist industry in making such a determination. #2. In Standard TPL-002-1c, Attachment 1, Section I. "Stakeholder Process," there was a section added at the end of this subsection that is three lines in length. This section states that a stakeholder process does not need to be repeated unless there has been a "material change." It is clear from the latest webinar presentation on this Project that this language is not "clear and unambiguous". NERC does not present any metrics, whether qualitative or quantitative, to guide industry as to when a material change occurs to an application of footnote 'b.' Without any metrics to guide industry, it is bewildering that NERC reasons that entities will consistently interpret what a material change constitutes. Therefore, SECI believes that this provision is in conflict with the NERC Rules of Procedure and FERC Order 762. #3. In Standard TPL-002-1c, Attachment 1, Section I. "Stakeholder Process," the requirement that the process "shall be documented" was deleted from the first paragraph. It does not appear to be reasonable that a process that is not written, nor known to any stakeholder, meets the common understanding of "open and transparent." Seminole believes that the requirement that the process be documented and that documents be available to potential affected parties be reinstated into the Standard.

No
Given that it is deemed that a stakeholder procress is required, there is no rationale for a maximum level. The stakeholders are in the best position to judge the appropriate level of allowable curtailment.
No
A stakeholder process should not be required in jurisdictions where a legislation already authorizes interruptions, as consent of stakeholders cannot override legislation.
No
The word 'assure' should be 'ensure' in the opening paragraph of III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required.
(1) Effective Date section 5: The language used in the revision that was made is fine, however, where the language has been placed in the section is confusing. The language has been added to the end of the sentence that starts 'in those jurisdictions where regulatory approval is not required' and lumped those two concepts together. In our mind, there should be 3 separate concepts 1) where regulatory approval required 2) where regulatory approval not required and 3) as may otherwise be approved by applicable laws. (2) Corresponding changes do not appear to have been made, TPL 1 and TPL 2 are not consistent in terms of the language used in the Effective Date section or the Attachment 1 (the sections to which changes were made since last circulation).

The limitation of Non-Consequential load loss to the 25 MW-75 MW level with a hard limit at 75 MW is arbitrary and give no deference to the cost of the cure. In the West the high cost of a fix may not be in the public interest. The 75 MW hard high limit should be replaced with a soft 75 MW limit but allowing higher levels if the governing body or regulatory authority approves it.

NERC Functional Model definitions for Planning Authorities and Transmission Planners do not include the types of activities being proposed in "Attachment 1." How is it appropriate to mandate to functional entities functions that are outside those defined in the NERC functional model?
No
In the NERC Glossary of Terms, Interruptible Demand is defined as "Demand that the end-use customer makes available to its Load-Serving Entity via contract or agreement for curtailment." The process described in Attachment 1 creates an agreement between stakeholders (aka "end-use customers") and their transmission providers. Thus, if the process described in Attachment 1 is followed, the "Firm Demand" referenced would be reclassified as "Interruptible Demand." In essence, "Footnote b" does not allow the interruption of Firm Demand. It merely requires that if interruption of Demand is required, it can only be Interruptible Demand. If this was the intention of FERC, NERC, and the Drafting Team, why didn't the drafting team just state "Interruption of Firm Demand is not allowed"?
No
How would section III of "Attachment 1" be applied to entities that only deliver wholesale electric service and no retail electric service?
It is not clear how transmission projects with long lead times (such as T-lines) would be handled by "Footnote b". Is it the drafting team's intent to make it acceptable for a TP to plan for shedding Firm Demand in the Near Term

Planning Horizon without meeting the conditions shown in “Attachment 1” when a mitigating project is planned that cannot be constructed in the Near Term Planning Horizon?
Individual

ATC recommends the following alternative language for both Footnote ‘b’ (Table 1 in TPL-002-1c [page 6]) and Footnote ‘12’ (Table 1 in TPL-001-2a [page 14]: (1) Change the wording at the end of the first sentence from “following Contingency events” to “following Contingency events for the prior condition of all equipment in service or during the planned (maintenance) outage of any bulk electric system equipment”. This would remind Transmission Planners and Planning Coordinators to include the consideration of planned outages at demand levels for which the outage would be performed. (2) In the last sentence of the footnote, raise the maximum load dropping threshold for the footnote from 75 MW to 100 MW. A 100 MW threshold is reasonable because the DOE uses the intentional dropping of more than 100 MW as one of the thresholds for determining when enough load is dropped to justify a formal system event analysis. (3) Add a sentence at the end of the footnote to read, “This footnote does not apply to any load that is not NERC registered (e.g. load that does not meet the greater than 25 MW NERC registration criterion).
Yes
No
ATC recommends the following change in Section II of Attachment 1 applicable to both standards TPL-002-1c [page 8] and TLP-001-2a [page16]: Remove Item 2b altogether because it requires the assessment of the footnote application impact on the potential health, safety, and welfare of the community. These types of assessments should not be required in the Standards because they are not electric system reliability matters and were not stipulated within the FERC Order762.
Yes
Individual
John Collins
Platte River Power Authority
No
We do not support a maximum threshold. 1) It is not appropriate to enforce a one size fits all maximum value that might unnecessarily over-burden some communities. 2) The public process proposed in this standard provides significant transparency from the transmission utilities and opportunity for community input to decisions that will impact both the community's reliability and rates. 3) Leave the maximum capacity threshold decisions to local regulatory commissions and Boards of Directors.
Yes
Although these descriptive steps for a public process seem out of place in a reliability standard, Section 1 is in line with the planning principles of FERC Order 890.
Yes
No
See answer to Question 1.
Individual
Don Jones
Texas Reliability Entity
Yes
Attachment 1, section I (Stakeholder Process) should be clarified to specify which ‘responsible entity’ needs to utilize or develop a transparent stakeholder process. For example, if a contingency event in Entity A’s system causes Entity B to have to shed non-consequential firm load to meet the BES performance requirements, which Entity is responsible for ensuring the required review? TRE proposes adding the following sentence to the first paragraph to assign responsibility for this type of scenario: “The Planning Coordinator or Transmission Planner accountable for the contingency event will be responsible for implementing the stakeholder process and regulatory review.”
Yes

In Section II, part 1b, TRE suggests replacing 'applicable rating' with 'steady state performance requirments', to account for all the BES performance requirements (in particular, steady-state and post-contingency voltages) for which the footnote may be utilized.
Yes
1. TRE requests clarification whether the 25 MW limit of Non-consequential Load Loss (Section III (2)) applies to a single contingency event for a specific Transmission Planner's region or to the entire Planning Coordinator area. For example, if a single contingency requires multiple Transmisson Planners to shed load, is each Transmission Planner allowed to drop up to 25 MW of load before requiring regulatory review? Or did the SDT intend to require the Transmission Planners/Planning Coordinator to submit the plan for regulatory review if the total load shed for the single contingency equals or exceeds 25 MW? 2. TRE feels that the requirement in Section III that the Planning Coordinator or Transmission Planner must submit information to the ERO for a determination of whether there are "any Adverse Reliability Impacts" is overly burdensome to industry, assuming that this refers to the new definition of "Adverse Reliability Impact" (limited to Instability and Cascading). It is extremely unlikely that any such impacts will result from application of this footnote, and any that might occur will be identified in the stakeholder process. If the ERO determination step is retained, then a timeline should be included for completion of the ERO determination process.

It appears that a least common denominator approach was used to develop the upper limit of 75 MW. Only 1 out of 18 respondents would drop 75 MW of load, and only two respondents would drop 61-70 MW of load. Our review of the data request responses concludes that only 22% of the respondents that presently utilize footnote "b" would drop more than 50 MW, and only 33% of the respondents that use footnote "b" would drop more than 40 MW. The proposed 75 MW limit is too high and is not supported by the responses to the data request. An upper limit of 40 MW is more appropriate, based on the data responses.
No
It is our opinion that that the stakeholder process should be conducted at least once every five years if non-consequential load is planned to be dropped as part of the Corrective Action Plan to meet single contingency events. If conditions have not materially changed since the last review, this information should still be communicated to the stakeholders.
Yes
We believe that item 1b of Section II would contain critical electric infrastructure information (CEII) and should have limited distribution. The appropriate non-disclosure agreements would need to be developed to prevent widespread publication of the material.
No
The responses to the data request indicate that 33% of the respondents that use footnote "b" would drop 20 MW or less for single contingency events. Based on the data, we believe that the threshold for reporting should be 20 MW instead of 25 MW. As noted above in the response to item 1, we also believe that an upper limit of 40 MW should be established, again based on the responses to the data request. We find this proposed stakeholder process unique because we are inviting retail regulatory authorities to become involved in the compliance process for a handful of utilities now, but potentially for more in the future. We are unaware of any other standards where a state governmental agency is needed to grant permission for utilities to utilize certain aspects of the standard. We believe that this proposed process would potentially set a bad precedent, is not good policy for either the regulators or the transmission planners, and does not belong in a NERC standard.
It might be helpful to probe further with the respondents who have no planned upgrades identified to address the dropping of non-consequential load to see what relevant system upgrades might entail, and the estimated costs associated with such upgrades, to address such situations.
Individual
Cheryl Moseley
Electric Reliability Council of Texas, Inc.
No
As an initial matter, ERCOT does not believe the planning process should allow for nonconsequential load shedding under single contingency conditions. Accordingly, ERCOT takes no position on the proposed maximum load shedding amount. Even though the NERC BoT approved the Stakeholder Process, ERCOT does not believe that the Stakeholder Process should be included as an Attachment to a footnote to a reliability standard. Also, there is an inconsistency in the terminology used in the footnotes relative to the load shed – firm demand and non-consequential load are both used. Non-consequential load is the correct term and the language should be consistent. Although it is ERCOT's position that non-consequential load should not be allowed to be shed under single contingency conditions from a planning perspective, if the SDT elects to retain a vehicle for such exceptions,

it should establish objective, reliability based criteria that lend themselves to inclusion in a reliability standard. This is consistent with the general approach for reliability standards, which prescribe the "what", not the "how". If the exceptions are based on objective criteria that are known upfront, and those criteria reflect appropriate reliability based technical justifications, then the risk of unwarranted exceptions to the general prohibition due to misuse of the exception process is mitigated. Furthermore, the exception process should be external to the NERC Reliability Standards (e.g. in the Rules of Procedure), which should merely reference authorized exceptions granted pursuant to that process. With respect to the stakeholder process, in no case should a reliability standard mandate a stakeholder process in any respect, procedural or substantive. In ISO/RTO regions, stakeholder processes fall within ISO/RTO governance matters. These issues are beyond the purview of NERC Reliability Standards. In other regions, although the relevant functional entities do not have stakeholder processes analogous to ISOs/RTOs, any relevant processes are similarly beyond the scope of the reliability standards. Accordingly, the SDT should eliminate all revisions related to the establishment of a stakeholder process. As discussed in response to question 5, FERC is not requiring this approach, but rather has only provided guidance with respect to ways to possibly bring the prior proposal in line with applicable regulatory approval standards for reliability standards. Additionally, as a general matter, substantive reliability standards requirements should not be imbedded within a footnote to a requirement. In this case, not only is there a substantive requirement imbedded in the footnote, there is also a substantial attachment (which must become part of the enforceable standard requirements}… and, to make it worse, the attachment is an attachment to the footnote, rather than an attachment to and referred to by a reliability standard requirement.
No
Please see ERCOT's response to Question 1 – stakeholder processes are not appropriate for NERC standards.
No
Please see ERCOT's response to question 1-the NERC Reliability Standards should not contain requirements related to stakeholder processes, whether they are procedural or substantive. If an exception process is retained, it should be outside of the NERC Reliability Standards (e.g. in the Rules of Procedure). To the extent the proposed standard inappropriately retains the stakeholder related aspects, ERCOT also provides the following comments on Section II-the ERCOT comments are in parentheses for easy reference and distinction relative to the proposed requirements. II. Information for Inclusion in Item #3 of the Stakeholder Process The responsible entity shall document the planned use of Firm Demand interruption under footnote 'b' which must include the following: (ERCOT COMMENT: This is all that is needed for this. The documentation would be relative to the objective criteria developed for this purpose.) 1. Conditions under which Firm Demand interruption under footnote 'b' would be necessary: a. System Load level and estimated annual hours of exposure at or above that Load level b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency (ERCOT COMMENT: "1" is not necessary if objective criteria are developed as benchmarks for the exception process. In that case, exceptions would only be allowed if the objective criteria were met, regardless of the underlying assumptions related to conditions and contingencies.) 2. Amount of Firm Demand MW to be interrupted with: a. The estimated number and type of customers affected b. Assessment of the effect of the use of Firm Demand interruption under footnote 'b' on the health, safety, and welfare of the community (ERCOT COMMENT: The considerations reflected in a and b are inappropriate for a reliability standard. Appropriate considerations for reliability standards are related to the reliability performance of the system. The considerations in a and b are more akin to quality of service issues better suited for regional policy discussions. It is not within the purview of the SDT to address those matters.) 3. Estimated frequency of Firm Demand interruption under footnote 'b' based on historical Performance (ERCOT COMMENT: Historical performance is irrelevant. If the SDT is going to retain revisions that accommodate non-consequential load shedding, then the only relevant metrics are the objective criteria that set the benchmarks for such exceptions.) 4. Expected duration of Firm Demand interruption under footnote 'b' based on historical performance (ERCOT COMMENT: See ERCOT response to "3" above.) 5. Future plans to mitigate the need for Firm Demand interruption under footnote 'b' (ERCOT COMMENT: This is redundant to the requirement in the reliability standards that requires a plan to resolve any violations identified in the planning process. Furthermore, if load shedding is allowed, this requirement doesn't make sense. Presumably the idea behind allowing these exceptions is to obviate the prospective need for other alternatives. If that is not the case, then there is no need to allow the exceptions, because the transmission upgrades to mitigate the need for load shedding can be established in the planning horizon.) 6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 'b' (ERCOT COMMENT: The basis for the load shedding exception is to provide a means to meet the TPL performance requirements in the context of a planning assessment. Accordingly, this is redundant to the planning assessments, the point of which is to identify and resolve performance issues.) 7. Alternatives to Firm Demand interruption considered and the rationale for not selecting those alternatives under footnote 'b' (ERCOT COMMENT: Load shedding exceptions should be based on objective criteria and be reviewed pursuant to a process external to the NERC reliability standards. Alternative discussions could be part of that external process.) 8. Assessment of potential overlapping uses of footnote 'b' including overlaps with adjacent Transmission Planners and Planning Coordinators (ERCOT COMMENT: It is not clear what this means. Each functional entity performs assessments relative to its own system. This appears to introduce a vague regional transmission planning requirement with no structure or rules for such assessments.)
No
If non-consequential load shedding is allowed for single contingency conditions, as discussed above, it should be

based on objective critieria. As such, there is no need for the proposed stakeholder process, including the Section Ill instances requiring regulatory review. Furthermore, establishing approval roles in planning processes for entities other than the relevant functional entities conflicts with the appropriate roles, and appropriate separation of those roles, of the relevant entities (i.e. the planning authority and the state regulatory body and NERC RE). Typically a functional entity performs the functional activity, and others relevant to the proposed process in the standard perform compliance and regulatory oversight of the functional performance. This is a practical concern, and also potentially raises conflicts between governing authorities that create the separation of roles, where, typically, the relevant authorities establish a functional entity as the planning entity, and NERC and its REs and state regulators (as relevant – e.g. in ERCOT) are charged with compliance and regulatory oversight. As with the other stakeholder process sections, that section should be eliminated.
The SDT is not required to utilize the stakeholder approach by Order 762 or any other relevant FERC orders. FERC merely provided guidance as to how the rejected proposal could be improved. However, if the SDT elects to pursue an exception process, such exceptions should be based on objective criteria, and the process should be external to the NERC Reliability Standards (e.g. in the Rules of Procedure). In Order 693, FERC directed NERC to clarify footnote (b) to prohibit shedding firm load except for consequential load loss (Order 693 at PP 1773, 1794 and 1797}. In a related compliance order, FERC reaffirmed its position. (130 FERC 61,200 (March 18, 2010) at PP 8-10 (Compliance Order)) In a subsequent order, FERC clarified that its Order 693 directive did not preclude consideration of specific comments related to planning the system based on load shedding at the "fringes" of a system. (131 FERC 61,231 (June 11, 2010) at P 21 (Clarification Order)) FERC held that regional variances for case-specific circumstances or a case-specific exception process to plan for the loss of firm service "at the fringes of various systems" would be acceptable. (131 FERC 61,231 (June 11, 2010) at P 21 (Clarification Order)) However, FERC also stated that it viewed the basis for such exceptions as economic, not reliability, with the justification being that it was not economic to invest in the bulk electric system to serve all non-consequential load customers under some single contingency conditions. (Order 693 at P 1792) FERC made clear that any such regional differences or case specific exception processes cannot reflect the lowest common denominator, and, they must be technically justified, and such justification must be strong. (Clarification Order at P 21, See also Order 693 at P 1794) This is consistent with FERC's position that this is a matter of "fundamental issue of transmission service". (Order 693 at P 1793) In recognizing that meeting firm demand under single contingency conditions is fundamental to transmission service, FERC noted that NERC's definition of firm transmission service is the "highest quality (priority) service offered to customers ... that anticipates no planned interruption." (Order 693 at P 1793) Against this background, NERC filed revisions to footnote b that allowed transmission plans to shed non-consequential load under single contingency conditions, provided appropriate process applied to such planning determinations/outcomes. In Order No. 762, {139 FERC 11 61,060 (April 19, 2012)) FERC rejected the approach proposed by NERC and provided guidance on acceptable approaches to footnote b. However, FERC did not endorse or mandate any particular approach. Rather, it merely urged "NERC to develop in a timely manner an appropriate modification that is responsive to the Commission's directives in Order No. 693 and our concerns set forth in this Final Rule." (Order 762 at P21) FERC stated that in order for any such proposal to have merit, it must be technically justified and must not reflect the lowest common denominator. As discussed, the proposed stakeholder approach is not appropriate for NERC Reliability Standards. The SDT should abandon that approach and consider simple revisions to footnote b that reference a case by case exception process based on objective criteria that is external to the NERC Reliability Standards (e.g. Rules of Procedure). Alternatively, it should develop revisions to the continent-wide standards that clarify that non-consequential load shedding is not generally permitted for single contingency conditions, but, consistent with FERC's orders, exceptions could be established pursuant to regional rules based on the need/appropriateness in a particular region. Consistent with the above discussion, if the SDT elects to pursue revisions that accommodate shedding non-consequential load in transmission planning for single contingency conditions, it should abandon the stakeholder process approach. The establishment of exceptions is better suited for regional rules or pursuant to a process outside of the reliability standards - e.g. via the Rules of Procedure, because such a process is not suited for a continent-wide reliability standard. Regardless of whether the issue is addressed via an external process, or left to regional variances, this issue needs to be addressed in a relatively timely manner because the uncertainty is affecting planning processes.

No
We disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no widespread, adverse effect on the reliability of the interconnected bulk electric system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its delegated agencies responsible for local transmission and retail service over the load to be curtailed. If it is decided to proceed with the 75 MW or any other value, we propose replacing the sentence, in the footnote and in attachment one, section III that reads: "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW." with "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss under footnote 12 for a non-US Registered Entity should be determined by the applicable Regulatory Authority or Governmental Authority or its delegated agency in that is responsible for retail electric service issues in that jurisdiction."

No
The process presented in Section I is overly prescriptive. If a section that prescribes the principles of a stakeholder process is required, then for non-US entities this section should simply require that the process must be approved by the applicable Regulatory Authority or Governmental Authority or its delegated agency that is responsible for local transmission and retail service for the load to be curtailed in that jurisdiction.
No
The process presented in Section II is overly prescriptive. If a section that prescribes the information requirements for a stakeholder process is required, then for non-US entities this section should simply require that the process information requirements must be in accordance with the requirements of the applicable Regulatory Authority or Governmental Authority or its delegated agency that is responsible for local transmission and retail service in that jurisdiction.
No
The process presented in Section III is overly prescriptive and duplicates information not necessary for its intended purpose. As stated in Q1, we disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard, and propose alternate language in our response to Q1. If this section is required to address a review of the use of footnote 12 to ensure that there are no wide-spread adverse reliability impacts on the bulk power system, then it should be limited to the information required for that purpose. Provided there is local support for the use of Non-Consequential Load Loss under footnote 12, only information items 6 and 8 from section II are relevant for this assessment—the remainder are not required for this section and should be deleted. Items 1 and 2 complicate this section and are unneccesary. They should be replaced by a phrase such as "for those planning events where the use of footnote 12 is referenced." We disagree with the need to submit this information to the ERO for a determination of whether there are any Adverse Reliability impacts caused by the use of Non-Consequential Load Loss. This will introduce a new type of review at the ERO that will create uneccesary delays and burden, and is inconsistent with (and not required for) all of the other performance requirements in the TPL standards. Submitting the analysis to the adjacent Planning Coordinators and Tranmission Planners, and any functional entity that requests it, as called for in requirement R8 of TPL-001-2 should be sufficient.
(1) We'd like to reiterate our support for allowing load interruption for a single contingency with sufficient review/oversight and under acceptable conditions, including no adverse impact on the reliability of the bulk electric system. The reliability aspects (BES performance requirements) should be reviewed for acceptability by the adjacent Planning Coordinators and Transmission Planners. However, issues pertaining to economics or externalities which may not be directly reliability-related are always available for review and debate by the stakeholders via the regulatory processes and subject to approval by the regulatory authority of each jurisdiction (particularly those in Canada and Mexico). (2) Furthermore, we request that Table 1 of TPL-001-2a (previous TPL-001-2 approved by the NERC BOT) be corrected for EHV contingencies in P2, P4 and P5 categories to allow the application of footnote 12 that is allowed for the P1 events. If a load is allowed to be interrupted for a single EHV transmission line contingency (Category P1), it should be allowed to interrupt the same load if the primary breaker fails (the event becomes category P4) and the fault is cleared by other breakers. Similarly, if the same breaker has an internal fault or there is a fault on the same bus section (Category P2) or there is a failure of a relay (Category P5), which results in the loss of the same EHV transmission line, it should be allowed to interrupt the same load. Events in P2, P4, and P5 can involve more elements and can be more onerouse and stressful to the system than the P1 events, and if use of footnote 12 is permitted in the less stressful P1 events, it must also be permitted in P2, P4 and P5 events. This issue has been raised by many entities in previous occasions and we believe the STD has not provided a convincing response. (3) We suggest that NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve them. Accordingly, we believe that the focus of foot note 'b', and footnote 12 should be that interruption of load must not have a widespread, adverse impact on the reliability of the interconnected BES. A continent-wide reliability standard should not concern itself with the reliability of supply or supply continuity for local load, as that is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed. If NERC and/or FERC believe that MW threshold needs to be addressed within NERC Standard for US registered entities then the standard must clearly state that the requirement is for US registered entities only.

LCRA TSC disagrees with the October 2012 revision of TPL Table 1 Steady State & Stability Performance Footnotes (TPL-002-1c, footnote 'b' and TPL-001-2a footnote 12). The proposed stakeholder process required to be conducted during each Planning Assessment is overly burdensome. Further, it is not clear from the proposed process that a key concern expressed by the Commission with respect to use of Firm Demand load shedding is addressed - Notice to Firm Demand Customers. In addition, the proposed stakeholder process introduces several questions that need to be further clarified. For example: 1) Who defines the processes and procedures to be used? 2) Who is/are the decision maker(s)? 3) Who determines if the processes and procedures were followed? 4) Who carries out the administrative tasks (such as notice, securing meeting space,….)? 5) Who can participate? Does someone need to demonstrate a material interest in order to participate? 6) What are the means of participation (accepted forms of communication, timelines…)? 7) What are the criteria for decision-making? 8) What is the process for dispute resolution? How would does an Attachment become part of a NERC Standard? Should Attachment 1 be a requirement? In addition, support is needed for the bright-line 25 MW level. Lastly, the statement, "Before a Firm Demand interruption under footnote 'b' is allowed to be utilized as an element of a Corrective Action Plan in Year One of the Planning Assessment," implies that Firm Demand interruption may be used for years two through five of the Planning Assessment without the stakeholder process.

Duke Energy
Greg Rowland
No
Regarding the maximum capacity item, we believe that 75 MW is much too low. While Duke Energy has not historically used the footnote, setting the upper limit at 75 MW raises a concern. An upper limit of 75 MW severely limits the ability of a Transmission Planner to use the footnote. The 75 MW limit appears to be the maximum reported in the survey. The survey is a snapshot in time and to assume that there never have been nor never will be situations where the correct decision of a Transmission Planner and its stakeholders would be to exceed the 75 MW limit is illogical. The 75 MW limit is likely to create a situation where a Transmission Planner is forced to convert a network line to radial in order to remain in compliance with the standard, to the detriment of reliability to customers. The key to understanding use of the footnote is realizing that, in most cases, using the footnote is extremely unlikely to result in customer outages, because the probablility of the initiating contingency occurring under conditions requiring additional load shed is very low. A more reasonable upper limit would be the 300 MW limit that is established as the threshold for DOE Disturbance Reporting. It is also important to remember that no matter what upper limit is established, Non-consequential Load Loss of 25 MW or greater cannot be included in Year One of the Planning Assessment if the applicable regulatory authority or governing body responsible for retail electric service issues objects.

No
There is no reliability benefit with an establish MW threshold. Implementing any threshold is descriptive and the standard should depict an outcome not the means of the outcome.
1) The decision of necessary infrastructure addition versus a determination of load shed in lieu of costly transmission should be determined at the Public Utility Commission or Local Board of Directors not through a laod level limitation. 2) There are no impacts to the BES for load shedding actions where it is determined that it is confined to a set boundaryand demonstrate to not lead to cascading, uncrontrolled separation or blackout. 3) Where a concern that a stakeholder process be "gamed" to allow the unscrupulous entity to claim notification of affected stakeholders was followed should not dictate a continent-wide standard direction for other stakeholders.

Yes
Yes
No
BPA does not support including information under Section II.2.b, an assessment of the use of Non-Consequential Load Loss on the health, safety, and welfare of the community. It would be nearly impossible for a planner to predict this in a future case since it is hard to predict what loads will actually materialize in the future. In addition, this information does not support reliability of the BES since reliability of the transmission system is assessed by meeting required technical performance for certain contingencies and under certain conditions.
No
For use of Non-Consequential Load Loss in Year One of the Planning Assessment, BPA believes that assurance received from the applicable regulatory authority or governing body responsible for retail electric service issues is adequate and submission to the ERO for a determination of adverse impact is unnecessary. The local utility and regulators are better positioned to determine adverse impacts on an individual system, whereas the ERO would have to develop a process and criteria for assessing adverse impacts.

MidAmerican supports NSRF comments with one change. The proposed NSRF addition of “consideration of planned outages at demand levels for which the outage would be performed” to the text of footnote “b” after “following Contingency events” should not be added. If the addition is made, a reasonable time frame clarification is necessary and should be added such as “greater than 6 months”. The proposed change would then read “consideration of planned outages greater than 6 months or longer at demand levels for which the outage would be performed”.
Yes
However, see the NSRF comments

Item III of Attachment I should be deleted completely. Non ERO regulatory review is not necessary. Applicable regulatory authority or governing bodies responsible for retail electric service issues are stakeholders which may participate in the stakeholder process. Further, there are concerns compliance may not be possible because item III makes non-NERC applicable regulatory authorities or governing bodies responsible for retail electric service issues part of a NERC mandatory compliance without consequence to the said non-NERC governing bodies. Non-NERC entities are not constrained by NERC mandatory laws and penalties and aren't compelled to perform actions to meet NERC compliance. This opens a risk to any NERC regulated entities governed by such regulatory or governing bodies that do not or may not feel compelled to have a process for the NERC regulatory review specified in item III of attachment I.

New England States Committee on Electricity (NESCOE)
No
The New England States Committee on Electricity (NESCOE) appreciates the opportunity to comment on NERC's proposed revisions to Transmission Planning (TPL) Reliability Standards relating to permissible applications of planned load interruption. NESCOE is New England's Regional State Committee and is governed by a board appointed by the six New England Governors. These comments reflect the collective view of the six New England states. The issue of planned, limited load interruption rests at the central intersection of cost and reliability. It illustrates the fundamental balance that Commissioner Norris details in Order No. 762: the tradeoffs between "increasing levels of reliability and the costs that come along with achieving them." Transmission Planning Reliability Standards, Order No. 762, 139 FERC ¶ 61,060 (April 19, 2012) (Norris, Comm'r. concurring in part and dissenting in part) at 2. NESCOE agrees with Commissioner Norris that, as a general matter, this balancing should translate to a more explicit consideration of costs in the NERC standard development process. Id. at 1. The language in footnote "b"—and corresponding footnote 12 of TPL-001-2—implicitly recognizes cost considerations in transmission planning by tolerating limited load shedding under defined circumstances. NESCOE offers below comments and suggestions in response to the SDT's questions. These responses reflect NESCOE's interest in planning for a robust bulk electric system while taking into account the magnitude of risk that a solution is intended to address and the costs associated with competing solutions. NESCOE appreciates the work of the SDT in attempting to respond to the Commission's directives and the time constraints under which the SDT was required to make changes to footnote "b." However, NESCOE is concerned that establishing a bright-line maximum capacity threshold that is an absolute ceiling is overly prescriptive and unnecessary to meet the Commission's directives. In Order 762, the Commission rejected the contention that regional stakeholder processes should unilaterally determine the appropriate criteria to apply in planning to interrupt firm load. Order 762 at P 32. However, provided that technical parameters are in place, the Commission stated that it would be "amenable" to regional stakeholders establishing such criteria if, for example, NERC or the applicable Regional Entity "developed an exception process that provides flexibility in decisions based" on their expert view of regional considerations. Id. The SDT's proposal, however, would impose a one-size-fits-all requirement that forecloses a regional discussion of the quantitative and qualitative considerations that may justify an exception to the proposed 75 MW maximum capacity value. Such a regional discussion in ongoing in New England. In 2010, ISO New England introduced to stakeholders a draft Transmission Planning Load Interruption Guideline. The Guideline noted that load interruption should not be the principal tool to address transmission system reliability violations and highlighted the priority of reliable service. However, applying quantitative and qualitative criteria, the Guideline proposed for stakeholder discussion various levels of controlled load interruption in N-1-1 conditions—potentially up to hundreds of megawatts—that may be tolerated under clearly defined conditions. NESCOE did not take a view of the Guideline when it was presented for review and does not do so here. For now, the Guideline remains in draft form following stakeholder comment in 2011. However, imposition of a maximum capacity threshold that is an absolute ceiling for N-1 events and potentially, through revisions to footnote 12, N-1-1 events, would prematurely limit important regional discussions of this issue. A better approach, and one which the Commission appears amenable, would be to accompany any bright-line value with an exception process. There is recent precedent supporting such an approach: NERC proposed changes to its Rules of Procedure to accommodate exceptions to the proposed 100 kV bright-line Bulk Electric System definition. Separately, the footnote references Attachment 1 to the respective planning standards, which requires a stakeholder process review of the utilization of planned interruption. Such review is only triggered if utilization is sought in the Near-Term Transmission Planning Horizon, even though the footnote permits utilization of load interruption throughout the planning horizon. NESCOE does not support this limiting language, which is at tension with an open and transparent planning process over the entire planning horizon. The term "Near-Term" should be stricken or further justification should be provided.
No
NESCOE appreciates the efforts of the SDT in developing a stakeholder process for considering the use of load interruption in system planning. NESCOE especially appreciates the heightened role accorded to states in light of jurisdictional issues raised by the prospect of shedding load and implications for retail customers. States must be intimately involved in weighing reliability considerations against the economic implications of alternative approaches. Regarding the language in Section I, see the comments above regarding striking "Near-Term" in this context. NESCOE also suggests that additional clarity is needed regarding the intended meaning of "applicable regulatory authorities or governing bodies responsible for retail electric service issues." This language potentially implicates state agencies beyond public utility commissions (e.g., state consumer advocates, attorneys general) and could create confusion for state agencies as well as transmission planners that are required to provide notice to such entities and, pursuant to Section III, provide a process for regulatory review. Instead, the SDT should revise the language to read "electric retail regulatory authorities," a term with clear meaning that the Commission has itself used. See, e.g., Order 719.

Yes
NESCOE agrees with the list provided in Section II. Regarding item #7, in the interest of explicit direction, NESCOE suggests adding at the end of the sentence the following language: "and cost comparisons of all alternatives."
No
NESCOE is concerned that the 25 MW minimum value for regulatory review lacks sufficient technical justification. NESCOE understands that the SDT used responses to data requests to establish this 25 MW value, which is based on the average number of MWs that entities applying footnote "b" reported using in transmission planning. This may be a good starting point, but additional analysis is warranted. Specifically, the analysis should consider a more direct nexus to the system, such as substation design criteria. Additionally, as detailed above, Attachment 1 should provide clarity regarding the meaning of "applicable regulatory authorities." Moreover, clarification is required regarding the initial triggering factor for regulatory review. Section III states that the regulatory review process is required before the footnote can be utilized in "Year One" of the planning horizon. Does this mean that such regulatory review only applies to year one or does it apply to year one and beyond? If the former, NERC needs to provide a clear rationale for restricting such review when limiting factors are already applied (i.e., voltages greater than 300 kV or a 25 MW minimum threshold value).
Group
Tri-State G&T
Chris Pink
1. It is not clear how transmission projects with long lead times (such as T-lines) would be handled by "Footnote b". In other words, it is not clear if it is acceptable for a TP to plan for shedding Firm Demand in the Near Term Planning Horizon without meeting the conditions shown in "Attachment 1" when a mitigating project is planned that cannot be constructed in the Near Term Planning Horizon. 2. NERC Functional Model definitions for Planning Authorities and Transmission Planners do not include the types of activities being proposed in "Attachment 1." As written, this standard mandates functions on functional entities that are outside those defined by the NERC Functional Model. 3. In the NERC Glossary of Terms, Interruptible Demand is defined as "Demand that the end-use customer makes available to its Load-Serving Entity via contract or agreement for curtailment." The process described in Attachment 1 creates an agreement between stakeholders (aka "end-use customers") and their transmission providers for shedding Demand. Thus, if the process described in Attachment 1 is followed, the "Firm Demand" referenced in "Footnote b" would be reclassified as "Interruptible Demand." In essence, Firm Demand would not be interrupted. If this was the intention of FERC, NERC, and the Drafting Team, the standard should just state "Interruption of Firm Demand is not allowed." 4. It is not clear how section III of "Attachment 1" would be applied to entities that only deliver wholesale electric service and not retail electric service.

Frederick R Plett
Massachusetts Attorney General
No
Although I voted for this Footnote, I do have concerns. 1) There is no reliability benefit to the 75MVA threshold limit. There should be no limit in the standard – it should be between stakeholders to decide that limit, not nationally imposed. 2) Any such agreement to consider non-consequential losses should have no impact to the BES especially when maintained in a confined boundary. 3) This takes away local decision making of PUC/ Local Board decision making; 4) FERC's concern that a few entities would disguise the "stakeholder" process to shed load is unfounded and should not be applied on a continent-wide basis. FERC is trying to impose tighter standards than the industry wants.
Yes
Yes
No
The 75 MW and 25 MW limits do not belong there. It would be best if the limits were established by stakeholder consensus and by state rulemakings.
Individual
Richard Vine
California Independent System Operator

No
While we have voted in favor of supporting the changes to the footnote and to move forward with the adoption of the standard, we remain concerned that there is not a good foundation for concluding that loss of load over 75 MW poses a reliability risk to the system compared to some higher MW threshold. Instead, the 75 MW capacity threshold is simply based on the current maximum planned loss of Non-Consequential Load. While we support minimizing reliance on Non-Consequential Load Loss, there may be scenarios where such reliance is unavoidable in the near-term, and therefore may be needed until capital upgrades can be put in place. At a minimum, the footnote or standard should provide for an exception process, should it be necessary for a planned Non-Consequential Load Loss of greater than 75 MW.
Yes
There is no basis to support only allowing the utilization of the footnote in the Near-Term Transmission Planning Horizon of the Planning Assessment. The footnote itself should not explicitly restrict its utilization to only the Near-Term horizon. Often, in the long-term planning horizon, when approval for transmission addition or reinforcement cannot be obtained for a variety of reasons, utilization of the footnote is considered and adopted, subject to stakeholder's and regulatory authority's approvals. Note that it is impractical to add or reinforce transmission facilities in a near-term planning (e.g. Year One) time frame and hence the proposed provision does not allow for utilizing the footnote for the interim period before new or reinforced transmission facilities are put in place. We suggest to remove the word "Near-Term".
Yes
Yes
Despite a public consultation process that includes the regulator(s), the standard then calls for notification to the regulator(s) and only moving forward once the regulator indicates that it does not oppose the shedding of load ("once assurance has been received that…"). This is still requiring the regulator to do something, and could be problematic if no response is provided by the regulator. How would one address silence on the part of the regulator?
A concern with the new TPL-001-2 standard is what we see as being the elimination of the existing footnote c, the footnote that qualified Category C load shedding as "may be necessary". The wording under the new TPL-001-2 appears that load shedding is the unqualified expectation of the criteria for C contingencies.

Yes
No
We recommend that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. Since the average use given in the survey was 19 MW and there is no evidence of harm to the BES reliability resulting from that use, there is no reason to require a stakeholder process for amounts less than 25 MW. This is consistent with the value cited in Section III.
No
We believe that item 1.b of Section II would contain CEII information and should have limited distribution. The appropriate non-disclosure agreements would need to be developed to prevent widespread publication of the information.
Yes
Individual
Randy MacDonald
NB Power Transmission
No
We disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no widespread, adverse effect on the reliability of the interconnected bulk electric system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its delegated agencies responsible for local transmission and retail service over the load to be curtailed.
No
The process in Attachment 1 is overly prescriptive. Attachment 1, if retained, needs only to stipulate that the proposed utilization of the footnote be reviewed through an open and transparent stakeholder process in compliance with the applicable regulatory authority oversight.

PNM voted yes to the Standard as a whole but would like the SDT to consider the following concern: Part II.2.b of Attachment 1 that requires an assessment of the effect of the use of Non-Consequential Load Loss under Footnote B on the health, safety, and welfare of the community, and PNM believes that assessments of this nature are entirely subjective and will be difficult to comply with and even more difficult to audit. It is our belief that this criteria should be removed from the Standard prior to its ultimate submittal to NERC.

SCE believes that the maximum capacity threshold should be increased from 75 MW to 250 MW, as 250 MW is the limit utilized by the California Independent System Operator (CAISO) for a consequential load drop for a single contingency. The CAISO has a rigorous transmission planning process that allows it to plan for and permit load shedding up to 250 MW.
Yes
The Stakeholder Process in Section I of Attachment 1 is similar to the method effectively used by the CAISO to manage and incorporate stakeholder input in its annual transmission planning process.
No
SCE participates in the rigorous CAISO annual transmission planning process that considers the information included in the proposed Section II of Attachment 1. However, the proposed language in Section II.2.b. “Assessment of the effect of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community,” seems overly broad and confusing. The California Public Utility Commission (CPUC) and CAISO presently consider these items before approving transmission plans. It is unclear what type of information would be required in order to meet the seemingly broad request contained in Section II.2.b. SCE believes that the language of Section II.2.b. should be removed from Attachment 1, or alternatively, the language should be revised to specifically exempt critical loads, such as hospitals, fire department facilities, law enforcement facilities, and correctional facilities.
No
As applied to SCE’s service territory, Section III of Attachment 1 appears to require written acknowledgement and approval by the CPUC of each and every Firm Demand interruption authorized by the CAISO’s annual transmission plan. In California, the CPUC is notified of and invited to every CAISO meeting on transmission planning, but the CPUC generally does not provide specific written assurances or agreement on detailed elements of the CAISO transmission plan. SCE believes that a general approval of the overall plan from the regulatory body should be adequate.
Footnote “b”/Footnote 12 as currently written does not provide for an exemption to allow for the use of Firm Demand interruption as a short-term solution to transmission problems. Many entities would benefit from being allowed to use Footnote “b”/Footnote 12 as a temporary solution in response to construction delays until facilities to mitigate an N-1 contingency identified in a Planning Assessment can be installed. Under the current proposal, the stakeholder process will provide very little value in attempting to resolve such a problem. In fact, the current Footnote “b”/Footnote 12 could result in a stakeholder process that may actually slow the implementation of mitigation measures for the system.

We do not agree with setting a MW limit for non-consequential load loss. The allowable amount should be determined and approved by the jurisdiction of the area(s) whose load is affected. The intent of the TPL standard and this footnote is to ensure that if non-sequential load loss is accounted for or relied up to ensure BES reliability (as assessed in the planning horizon), that such a decision needs to be approved by the appropriate jurisdiction. Non-consequential load loss being applied or considered to achieve BES reliability in planning assessment is in itself not a BES reliability concern that rises up to a continent-wide reliability standard.
No
(1) The process presented in Section I of Attachment I is overly prescriptive. This Section needs only to stipulate that the proposed utilization of the footnote be reviewed through an open and transparent stakeholder process developed and/or approved by the jurisdiction (a Regional Entity or regulatory authority) of the area(s) whose load is affected area. (2) There is no basis to support allowing the utilization of the footnote in the Near-Term Transmission Planning Horizon of the Planning Assessment only. The footnote itself should not explicitly restrict its utilization to only the Near-Term horizon. Often, in the long-term planning horizon, when approval for transmission addition or reinforcement cannot be obtained for whatever reasons, utilization of the footnote is considered and adopted, subject to stakeholder's and regulatory authority's approvals. Note that it is impractical to add or reinforce transmission facilities in a near-term planning (e.g. Year 0ne) time frame and hence the proposed provision does not allow for utilizing the footnote for the interim period before new or reinforced transmission facilities are put in place. We suggest removing the word "Near-Term".
No
We do not agree with the need for Section II (and Attachment I as a whole) at all. The footnote, or Attachment I, should only stipulate that when Non-Consequential Load Loss is needed to ensure that BES performance requirements are met, then regulatory approval from local jurisdiction needs to be provided with demonstration that the approval was obtained through an open stakeholder process.

The complex stakeholder process described in Attachment 1 should be required only if the amount of planned load shed exceeds 25 MW or the contingency is greater than 300 kV. Since the average use given in the survey was 19 MW and there is no evidence of harm to the BES reliability resulting from that use, there is no good reason to require such a stakeholder process for amounts less than 25 MW. The stakeholder process should only be required for larger amounts of load.

We do not support a maximum threshold of 75 MW or any MW level. It is not appropriate to enforce a one size fits all maximum value. There are no apparent reliability benefits from implementing a capacity loss limitation...why not pick 300 MW? Also we are not sure what prompted the additional distinction of allowing the load shedding only in the near-term planning horizon...please elaborate.
No
A public process seems out of place in a reliability standard.

We believe that item 1.b of Section II may contain Critical Energy Infrastructure Information (CEII) and should have limited distribution. The appropriate non-disclosure agreements would be required in order to prevent widespread publication of the information.
Yes
While the current revisions improve the processes described, we have concerns regarding the revisions to TPL002-1 b. SCE&G has significant concern with the proposed revision to TPL Table 1, Footnote B. The current Footnote B states "Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems". The phrase "without impacting the overall reliability of the interconnected transmission systems" is important to the TPL standards to ensure that ERO standards do not dictate the level of service to specific customers. Service to specific customers and load pockets is jurisdictional to State Commissions. ERO standards should not compromise this jurisdiction. SCE&G believes that any proposed revisions to Footnote B must maintain the concept that planned or controlled interruption of electric supply to customers, whether they are radial or network, is allowed as long as it does not impact the overall reliability of the interconnected transmission systems. The proposed revision eliminates this concept

The draft footnote states that interruption "is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1." Attachment 1 appears to impermissibly require State participation in federal transmission planning processes. Further, it places the ERO in a Transmission Planning role, which exceeds the limits of the ERO's functions under Section 215 of the Federal Power Act. The current language

appears to conflict with (1) federal statutes that are clear that wholesale electric transmission issues are matters of federal, and not state, jurisdiction, (2) orders of the Federal Energy Regulatory Commission ("FERC") regarding the role and independence Regional Transmission Organizations ("RTOs") with regard to transmission planning, and (3) Section 215 which limits NERC's authority to regulate "users, owners and operators" of the Bulk-Electric System. Further, the conditions appear to conflict with Section 215 of the Federal Power Act by placing the ERO in a transmission planning role and providing it with regulatory or functional oversight regarding the substance of transmission planning decisions. The ERO has the authority to develop and enforce standards, but is not a transmission planning entity and does not have the authority to substitute its judgment for registered Planning Authorities and Transmission Planners regarding the planning or operation of the bulk power system. Where a review is sought of planning entities' determinations, per FERC-filed Tariffs, they may be brought before FERC under Section 206 of the Federal Power Act. Because the footnote, and the associated Attachment appear to be in conflict with FERC Tariff and other statutory provisions, they should be removed. The footnote itself states, "An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events." The objective statement within the standard does not appear to create a requirement and should be removed.
Yes
No
Section II, 2.a states that studies must address the estimated number and type of customers affected by Non-Consequential Load Shedding. This language should be removed for three reasons. (1) This appears to be inappropriate for a reliability standard. The specific number and type of customers within a set number of MWs that are electrically acceptable do not impact the reliability of the bulk electric system (as defined by Section 215 of the Federal Power Act). (2) Even if the number and type of affected customers were an appropriate process question for an ERO standard, the number and type of customers may change depending on particular system configuration at the time of the load shedding. For example, a substation may be reconfigured to address other system issues such as maintenance and a certain number of MWs of load being interrupted, while still electrically acceptable from a system reliability perspective, may impact different numbers and types of customers. (3) Assuming that the number and type of customers affected were an appropriate metric, the Transmission Planner in many cases will not be the appropriate entity to address these concerns. The Transmission Owner, Distribution Provider or Load Serving Entities would be the appropriate entities to address customer affects. Section II, 2.b should be revised to delete the reference to "health, safety, and welfare of the community." It is inappropriate for a NERC Standard to require planners to address the "health, safety, and welfare of the community." NERC's authority appears limited to regulating the "reliability" of the bulk electric system. Section 215 specifies that NERC's authority it to establish Reliability Standards necessary to ensure an "adequate level of reliability." Reliability Standards may specify the "design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation." Section 215 defines "reliable operation" as "operating the elements of the BPS within equipment and electrical system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements." Establishing this requirement is also arbitrary, because it is inconsistent with other transmission planning requirements. For example, the same load could be shed directly as the consequence of a fault and no such assessment is required. In addition, Transmission Planners can plan for the shedding of radial load with no assessment of health, safety and welfare. Section II, requirements 3 and 4 discuss estimating frequency and duration of Non-Consequential Load Loss based on historical performance. This provision is inconsistent with the manner in which transmission system planning is conducted and should be removed. The transmission system planning process uses deterministic not probabilistic assessments. While a power system may utilize these factors in assessing where the use of non-consequential load loss may be acceptable in terms of providing service, these factors do not inform reliability risks to the bulk electric system where the loss of load is found to be electrically acceptable in terms of system reliability (i.e., no thermal, voltage, or stability issues are created or exacerbated and no instability, uncontrolled separation, or cascading failures result).
No
This provision violates both the federal and state jurisdictional split over transmission facilities, and would violate several FERC orders directing the independence of RTOs in the regional system planning process. Said another way, the determinations of a federal transmission planning entity may not be required through an ERO standard to be subject to non-jurisdictional review and approval by state entities. Further, the provision violates Section 215 of the Federal Power Act, as the ERO cannot require the review of a particular transmission system plan by state entities. The following language should therefore be deleted from Section III of Attachment 1: "Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must assure that the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 12… ." Overall, the order of Section III is also notable. During year, two through ten of the overall planning horizon the standard allows for Non-Consequential Load Loss without state approval. In the first year of the assessment, approval becomes required for Non-Consequential Load Loss. In year one, even if mandating state participation and decisional authority in a federal planning process was legally

permissible, it is too late to allow for any other alternative as transmission planning, siting and construction of non-load loss alternatives would not be completed in the needed period. If there were non-load loss alternatives available, the use of non-consequential load loss would not be necessary, but it would also not be part of a transmission plan. The Regional Entities with NERC oversight perform periodic audits and require self-certification of the planning process. By virtue of the audit and self-certification process, NERC has the ability to monitor the use of Non-Consequential Load Loss in planning assessments. In addition to being notable for the year one timing, Section III seems incomplete. In the case where there is objection to Non-Consequential Load Shedding, the process appears to end without resolution. The submission to the ERO "for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss" conflcts with federal law and orders of the Federal Energy Regulatory Commission. As noted above, the ERO is not a planning entity and does not have authority to displace the reliability planning performed by planning entities. Transmission planning entities are those directed by FERC to make the determinations regarding adverse reliability impacts. If any entity wishes to challenge those determinations, it may do so before FERC under Section 215 of the Federal Power Act. Further, this provision would conflict with orders of the FERC regarding the independence of RTOs to conduct the regional transmission planning process. A reliability standard may not change the scope or meaning of federal statutes nor may it contradict or collaterally attack orders of the Federal Energy Regulatory Commission. For these reasons, this provision should be removed from the attachment to the proposed standard.
In summary, the main footnote is unobjectionable, but this standard as proposed has misplaced jurisdictional authority under Section 215 of the Federal Power Act for both states and the ERO through several of the process points and conditions set out in the attachment to the stardard. The removal of references is required for the standard to comport with the law. These revisions to the standard can be made, which would then allow the draft standard to comply with FERC's further guidance and the other legal limitations described above.

FMPA has two issues: 1. What is the technical justification for 75 MW? There is no other metric in use similar to it. FMPA believes that, if the stakeholder process reveals that the stakeholders are willing to accept decreased service continuity to save money on their electric bills, why should that be limited to 75 MW which has nothing to do with BES reliability. BES reliability will not be impacted until load shedding gets near to the largest single loss of source contingency in relation to supply / demand mismatch. Other standards have chosen the low value of 300 MW as indicative, (e.g., CIP v5 for UFLS, EOP-004 for disturbance reporting); hence, FMPA recommends that the maximum amount of load shedding be 300 MW. 2. The footnote should also address a process whereby the transmission customer agrees to conditional firm service if the Transmission Planner / Transmission Service Provider (TSP) plans on curtailing firm service to that customer following a single contingency. The TSP should not be able to unilaterally degrade service from a state where it was not conditional to a state where it is conditional.

Dropping load in the general sense should not be endorsed, but it is recognized that there are special situations where it cannot be avoided. Provided there is no widespread, adverse effect on the reliability of the interconnected BES, the effect of a firm demand interruption on customers is under the purview of the applicable regulatory authority that is responsible for local transmission and retail service over the load to be curtailed, and the TPL standard should not put a limit at 75 MW.
Even if the SDT said it is not in its scope, the following difficulty with the application of note 12 needs to be addressed by NERC. There are no limit on non-consequential load loss for Single Contingency P2-2, and P2-3. (HV

only), multiple Contingencies P4 and P5 (HV only), and P6 and P7. The note 12 allows limited non-consequential load loss for single contingency P1, Multiple Contingency P3. Non-consequential load loss is not allowed for P2-2 and P2-3. (EHV), and P4 and P5 (EHV). Considering the EHV Facilities, it is not reasonable to accept some non-consequential load loss for single contingency P1 and P2-3, and then deny it for Multiple Contingency categories P4 and P5 which are statistically less frequent than the former. Also, the Multiple Contingency P7 (for which there is no limit on non-consequential load loss) is more frequent than P2-3, P4 and P5. This technical irregularity must be reviewed and addressed.

As NARUC stated plainly in its Comments filed in FERC Docket No. RM11-18 (Dec. 20, 2011), “not only does the law require that the States maintain authority over distribution level reliability, States are in the best position to guide load shedding so that it has the least negative impact on the State’s customers and the operation of the local distribution system.” Id at p. 4. Given the twin responsibilities of FERC to maintain bulk system reliability and the states to ensure reliable and affordable service to retail load, NARUC supports the portion of the standard that requires notification and consultation with state and local regulators. However, the maximum capacity threshold (set at 75 MW) is problematic. In this instance, it appears that the 75 MW maximum capacity threshold is merely a reflection of antidotal information from five data request responders and as such is not technically justified. NARUC is not poised to offer an alternative; given that the state/local regulator is consulted in this process, the maximum capacity threshold should just be dropped. States should be able to authorize an 80 MW exception, or whatever level is reasonable, under specific circumstances if local economics and reliability warrant it.
No
It appears that the 25 MW minimum value is merely a reflection of antidotal information from a small number of data request responders and as such is not technically justified. NARUC is not poised to offer an alternative; given that the State/local regulator is consulted in this process, States should be appraised if any load is anticipated to be shed under any planning criteria. Thus, no mimimum value should be set.

No. We believe footnote b in NERC TPL 002-1 and/or footnote 12 in TPL-001-2 should be eliminated because the intent of these standards is not to rely on non-consequential firm load shedding after a single contingency event. However, if these footnotes are not eliminated, there should be some limitation on how much firm load shed is allowed. We object to any level higher than the proposed 75 MW level and would prefer a level below 75 MW, but won’t object to the proposed 75 MW level if the footnotes are not eliminated.
No

No. MISO objects to a stakeholder process as outlined in Attachment 1. See our comments under Question 5.
No
No. MISO objects to a stakeholder process as outlined in Attachment 1. See our comments under Question 5.
No
No. MISO objects to a stakeholder process as outlined in Attachment 1. See our comments under Question 5.
We do not support using a stakeholder process to determine if Non-conseqeuntial Load Loss is appropriate following a single contingency event as a means to satisfy the standard. Stakeholder processes will nearly always result in disagreements. The parties that may be responsible for payment of upgrade costs will not necessarily line up with the parties adversely impacted by the alternative load loss. If the stakeholder process includes all stakeholders, there may be many more stakeholders impacted by upgrade costs based on broader benefits and/or cost sharing than stakeholders impacted by the alternative load loss. This will result in the majority decision of a stakeholder body to most often be one that supports load shed (until it is their turn to be the load that is shed). On the other hand, if the stakeholder process is limited to only the stakeholders directly impacted by the proposed load shed, to the extent those stakeholders pay only a small part of the upgrade costs, they will always select a potentially costly upgrade to avoid load shed. The point is, we do not believe that it possible to have a fair and impartial stakeholder process to correctly determine if and when load shed is acceptable to assist in satisfying a single contingency standard. Since the general intents of the existing TPL-002-1 standard and proposed TPL-001-2 standard are not to rely on any shedding of non-consequenital load to meet a single contingency event, in the event that footnote b of TPL 002-1 or footnote 12 of TPL 001-2 is not eliminated, we believe that it should be narrowly focused only on those situations for which the original footnote was developed: interruption of service to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, where the overall reliability of the interconnected transmission system is not impacted. We propose that footnote b and footnote 12 be modified as follows to ensure it is not misapplied: "An objective of the planning process is to avoid Non-Consequential Load Loss following Contingency events. In limited circumstances, Non-Consequential Load Loss may be needed within the planning horizon to ensure that BES performance requirements are satisfied. However, Non-consequential Load Loss cannot be used to avoid cascading outages or to maintain system stability. Non-consequential Load Loss also cannot be used to avoid a thermal loading or voltage limit violation on an EHV facility. When Non-Consequential Load Loss is utilized within the planning horizon to address BES performance requirements, such interruption cannot exceed 75 MW and is limited to the following circumstances: • Non-consequential Load Loss is allowed for load served by a radial transmission line to avoid voltage limit violations on the radial transmission line following a single contingency event anywhere on the system.. • Non-consequential load shed is allowed for load within a local area served by not more than two transmission lines and/or transformers to avoid a thermal loading issue or voltage issue in the local area, including the transmission lines and/or transformers supplying the area, for a loss of one of the transmission lines or transformers supplying the area, so long as there are no thermal loading or voltage violations outside the local area." We believe the language above maintains acceptable reliability on the bulk electric system by limiting load shed and violations that require load shed to radial areas or areas that would be served radially following the single contingency. We therefore highly recommend that Attachment I be eliminated entirely and that the footnotes either be eliminated or replaced with the modified version above.

1. MPC QUESTION: If a portion of the non-consequential load loss used to mitigate a contingency is controllable by a demand side load management system, can it be excluded from the "Firm Demand interruption" in TPL-002-1c Table I footnote 'b' and/or "Non-Consequential Load Loss" in TPL-001-2a Table 1 footnote 12? a. Would this load count towards the 25 MW and 75 MW thresholds? b. Would it have to be curtailed on a pre-contingent basis in order to be excluded from the non-consequential load total, or can it be excluded even if the curtailment happens through action of the UVLS? c. RECOMMENDATION: When describing "interruption of firm demand" or "non-consequential load loss" in footnote 'b' add the language "not counting load shed on a pre-contingent basis". This would be added to the last sentence of footnote 'b' if it indeed should not be counted towards the 75 MW threshold. Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion. 2. MPC QUESTION: If multiple companies own portions of the non-consequential load loss used to mitigate a contingency at a single substation, does each company's load count towards the 25 MW and 75 MW thresholds or does the total load at the substation count? a. EXAMPLE: 100% of the load at a substation is set to trip with automatic UVLS. Company A, B, and C own load amounts X, Y, and Z at the substation. i. Is the amount of load counted towards the 25 MW and 75 MW thresholds X+Y+Z, or is each counted separately? b. RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote 'b' could read "In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW from one entity." Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion.

No
1. MPC QUESTION: In Attachment 1 Section I, what is the definition of a "stakeholder"? a. Is this intended to apply to multiple NERC functional entities (DP, TO, TOP, LSE), public residential customers, and/or business owners that are affected by system contingencies? b. RECOMMENDATION: Define stakeholder to be "affected Transmission Owners, Transmission Operators, Distribution Providers, and Load-Serving Entities." We believe it is most appropriate for the Transmission Owners, Transmission Operators, Distribution Providers, and Load-Serving Entities to objectively evaluate the risks of load shedding in a local area against the cost impact of a large transmission project on the rate base. 2. MPC QUESTION: In Attachment 1 Section I item 1, what does "including applicable regulatory authorities" refer to? a. Is this the same body that "applicable regulatory authority or governing body" refers to in Section III? b. Are these requirements still applicable if the 25 MW threshold in Section III is not passed? c. RECOMMENDATION: Attachment 1 Section I Item 1 could read "… including applicable regulatory authorities or governing bodies responsible for retail electric service as described in Section III. A clearly defined statement allows the Transmission Planner and Planning Coordinator to identify the appropriate parties to be included in every instance Attachment 1 is used.
No
1. MPC QUESTION/COMMENT: In Attachment 1 Section II item 2b, "Assessment of the effect … on the health, safety, and welfare of the community" is vague. Clarification is requested. a. RECOMMENDATION: Remove Item 2b because it requires the assessment of the footnote application impact on the potential health, safety, and welfare of the community. These types of assessments should be eliminated because they are not electric system reliability matters and were not stipulated by FERC. In the event that the Standards Development teams choses to keep item 2b, then add language semi-defining this as follows in Attachment 1 Section II Item 2b "...health, safety, and welfare of the community as determined by impact on critical health and emergency services." This allows the Transmission Planner and Planning Coordinator to identify the appropriate parties affected by the contingency to be analyzed in every instance Attachment 1 is used.
No
1. MPC QUESTION: In Attachment 1 Section III, what is the definition of "applicable regulatory authority or governing body"? a. Is this the state Public Service Commission or Public Utilities Commission, the Regional Reliability Organization (RRO), and/or the Reliability Coordinator (RC)? b. RECOMMENDATION: Depending on the answer to the above question, define "applicable regulatory authority or governing body" more precisely. The language could read "applicable regulatory authority or governing body responsible for retail electric service such as the state Public Services Commission or Public Utilities Commission". A clearly defined statement allows the Transmission Planner and Planning Coordinator to identify the appropriate parties to be included in every instance Attachment 1 is used. 2. MPC QUESTION: In Attachment 1, if non-consequential load loss is planned at multiple bulk delivery points to mitigate the same contingency should the total load loss count towards the 25 MW and 75 MW thresholds or should the loads be counted individually? a. EXAMPLE: There are two load serving substations (X load at substation B and Y load at substation C) on a long 115 kV line with 230/115 kV transformation at each end (substation A and substation D). Automatic under-voltage load shedding is in place at substations B and C, the UVLS relays at each substation making load trip decisions based on local voltage (i.e. independent operation). If one end of the 115 kV line trips and 115 kV voltage is below allowable levels at both substations X and Y, then the total load tripped by UVLS will be X+Y. i. Does the X+Y value count towards the 25 MW and 75 MW thresholds or are X and Y counted separately? ii. What if X load is dropped for one contingency and Y load is dropped for a different contingency, is the total load counted X+Y or each load separately? b. RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote 'b' could read "In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for any single contingency." Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This clarification would explain much more clearly what is counted towards the two thresholds and decrease confusion. 3. MPC QUESTION: In Attachment 1, if UVLS relaying is programmed at a sub to trip the load in stages at multiple voltage setpoints, such that only a fraction of the load is tripped for a given contingency, is the entirety of the load still counted towards the 25 MW and 75 MW thresholds? a. EXAMPLE: Substation B has X load that will trip if the BES voltage gets to 0.92 p.u. and Y that will trip if the BES voltage gets to 0.88 p.u. i. If only X amount of load is required to mitigate a single contingency in the near-term TPL assessment, is X load counted towards the 25 MW and 75 MW thresholds or is X+Y load counted? ii. Is there a difference if the Y load is at a different, nearby substation with both loads having the aforementioned tripping logic? b. RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote 'b' could read "In no case can the planned Firm Demand interruption under footnote 'b' (as demonstrated in the near-term horizon analysis) exceed 75 MW at a single substation." Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion.
1. MPC QUESTION: In TPL-002-1c Table I and TPL-001-2a Table 1 can "Firm Demand interruption" or "Non-Consequential Load Loss" be initiated by a manual event, such as operator action, or does it need to be automatic, such as Under Voltage Load Shedding? a. RECOMMENDATION: In TPL-002-1c Table I footnote 'b', add a sentence stating "Acceptable methods to enact Firm Demand Interruption may include manual or automatic processes that can be initiated within a reasonable timeframe"

We disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no adverse effect on the reliability of the interconnected bulk power system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed. We propose replacing the sentence, in the footnote and in attachment one, section III that reads: "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW." with "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss under footnote 12 for a Registered Entity that is a Canadian Entity (or a Mexican Entity) should be implemented in a manner that is consistent with/or under the direction of the Applicable Governmental Authority or its agency in Canada (or Mexico).
No
No. The process presented in Section I is overly prescriptive. If a section that prescribes the principles of a stakeholder process is required, then for Canadian entities this section should simply state that any threshold should be established in a manner consistent with other service levels that apply to local transmission and retail service for the load to be curtailed. Corrective action plans can rarely be implemented in a one-year time frame, and in some cases, limited use of Non-consequential Load Loss will be preferable to unaffordable transmission enhancements, therefore we believe that the use of footnote 'b'/'12' should not be limited to the Near-Term Transmission Planning Horizon. We propose that the phrase "the Near-Term Transmission Planning Horizon of" be deleted from the opening paragraph.
No
No. The process presented in Section II is overly prescriptive. If a section that prescribes the information requirements for a stakeholder process is required, then for Canadian entities this section should simply state that any threshold should be established in a manner consistent with other service levels that apply to local transmission and retail service for the load to be curtailed.
No
No. The process presented in Section III is overly prescriptive and requires information not necessary to the intended purpose. As state in Q1, we disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard, and propose alternate language as stated in Q1 comments. If this section must deal with a review of the use of footnote 'b'/'12' to ensure that there are no adverse reliability impacts on the bulk power system, then it should be limited to the information required for that purpose. Provided there is local support for the use of Non-Consequential Load Loss under footnote 'b'/'12', only information items 6 and 8 from section II are relevant for this assessment—the remainder are not required for this section and should be deleted. As stated in Q2 above, the use of footnote 'b'/'12' shouldn not be limited to the Near-Term Planning Horizon. We propose that the words "in Year One of the Planning Assesssment"be deleted. Items 1 and 2 complicate this section and are unneccesary. They should be replaced by a phrase such as "for those planning events where the use of footnote 'b'/'12' is referenced". We disagree with the need to submit to the ERO for a determination of whether there are any adverse reliability impacts caused by the use of Non-Consequential Load Loss. This will introduce a new type of review at the ERO that will create uneccesary delays and burden, and is inconsistent with and not required for all of the other performance requirements in the TPL standards. Submitting the analysis to the adjacent Planning Coordinators and Tranmission Planners, and any functional entity that requests it, as called for in requirement R8 of TPL001-2 should be sufficient.
(1) We'd like to reiterate our support for allowing load interruption for a single contingency with sufficient review/oversight and under acceptable conditions, including no adverse impact on the reliability of the interconnected bulk power system. The reliability aspects (BES performance requirements) should be reviewed for acceptability by the adjacent Planning Coordinators and Transmission Planners. However, issues pertaining to

economics or externalities which may not be directly reliability-related are always available for review and debate by the stakeholders via the regulatory processes and subject to approval by the regulatory authority of each jurisdiction (including those in Canada and Mexico). (2) Furthermore, we request that Table 1 of TPL-001-3 (previous TPL-001-2 approved by NERC BOT) be corrected for EHV contingencies in P2, P4 and P5 categories to allow the application of footnote 'b'/'12' that is allowed for the P1 events. Events in P2, P4, and P5 can involve more elements and can be more onerous and stressful to the system than the P1 events, and if use of footnote 'b'/'12' is permitted in the less stressful P1 events, it should also be permitted in P2, P4 and P5 events. (3) We suggest that NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve it. Accordingly, we believe that the focus of footnote 'b', and footnote 12 should be that interruption of load must not have an adverse impact on the reliability of the interconnected bulk power system. A continent-wide standard should not concern itself with the reliability of supply or supply continuity for local load, as that is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed. As mentioned above, NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve it. In this regard, we believe that Attachment 1 is not necessary because it prescribes a process which goes beyond the outcome of the standard and dictates how stakeholdering must be carried out. The individual jurisdiction should establish the process for ensuring compliance with the standard and decide to what extent a stakeholdering process is necessary to establish the acceptable level of load rejection for the area in a manner consistent with local transmission established service levels.

No
The 75MW of Firm Demand interruption is retail load that is being dropped. Dropping load in the general sense should not be endorsed, but it is recognized that there are special situations where it cannot be avoided. If a regulator responsible for retail load is comfortable with greater than 75MW being dropped in a rare situation, there should not be a requirement to build out of the situation. Provided there is no widespread, adverse effect on the reliability of the interconnected BES, the effect of a firm demand interruption on customers is under the purview of the applicable regulatory authority that is responsible for local transmission and retail service over the load to be curtailed. There is no technical basis for the 75 MW figure with respect to reliability impact. Although, the value was developed by the SDT as a result of their review of Section 1600 Data Request, there was no reliability based analysis performed to identify whether the 75 MW is reasonable number. It is possible that a number either larger or lower could be identified if a reliability and cost-effective analysis is conducted.
No
The current document includes the language: 2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW. This gives no concept of how long customers could expect to be out of service and hence whether this would be an appropriate approach. Suggest using a value that is based on energy, i.e., MWh. A value of 600MWh would represent 25 MW out for 24 hours, or could be 60 MW out for 10 hours, etc. This would seem to provide a more valuable understanding the true impact to customers in assessing the health, safety and welfare. It is also expected that if Demand Resources are being used that they would be excluded from the term "non-consequencial" load, and that the value being discussed is only that in addition to any Demand Resources being used.

No
"Contingency events" should be replaced by "Planning Events." Why would load shedding be limited only for certain circumstances in the Near-Term Transmission Planning Horizon? The Near Term is likely the period when the least can be done to avoid load shedding due to the time required for permitting and construction of facilities. A maximum capacity threshold is reasonable, whether 75 MW or a lower value.
No
"Stakeholders" is undefined – would this be the same stakeholder body identified in the planning process of the Open Access Transmission Tariff?
No
Regarding the documentation required for item 2.b, how are "health, safety, and welfare of the community" to be assessed? What are the metrics? How would compliance with this provision be evaluated?
No
Why would a retail service regulator approve a 300 kV and above performance issue?

A one-paragraph footnote encompassing a 2-page attachment is cumbersome for a Reliability Standard.

(1) We disagree with placing an upper limit on the amount of firm load shed. Conceptually, it seems like a good idea but we do not believe that such a threshold could ever consider all of the potential issues that could arise and would cause the need to plan to shed firm load. This is especially true considering that the SAR clarifies that the upper threshold will be based on the existing planned load shedding values. Future issues cannot be considered by the information contained in the data request. Consider a situation in which a new transmission line was included in Planning Assessment but cannot be built because right of ways cannot be obtained. Should an upper limit be placed on planned load shed in such a situation? (2) We disagree with the threshold of 75 MW. In Order No. 762, the Commission discussed the "blend concept," where it "envisioned the planner would consider up to 100 MW of planned Firm Demand interruption along with other options to resolve the system performance criteria violation and submit its documentation and explanation to the entity deciding whether the planned load shed is acceptable." (emphasis added) Even the Commission envisioned using higher thresholds. Furthermore, the data appears to show that one instance of Non-Consequential Load Loss would be immediately out of compliance because it is actual 75.2 MW not 75 MW. If the upper threshold is too close to 75 MW, any load growth might also compel the instance to be disqualified. If the SDT plans to keep the upper limit, we suggest increasing the amount to at least 100 MW.
No
(1) Many RTOs have well organized stakeholder processes that could be utilized to satisfy Attachment 1. Because the TPL standards apply to both the PC and TP, one may conclude that both functions need to have a stakeholder process. Rather, we think that the TP should be able to rely on its PC's stakeholder process. We recommend clarifying Attachment 1 that it is acceptable for the TP to rely on the PC's process and that both entities are not required to have redundant processes. The most important point is that stakeholders have an opportunity to participate.
No
(1) Adding the word "effect" on the health, safety, and welfare of the community creates more confusion regarding what is needed for the assessment. We recommend removing the effect clause from Section II. (2) We disagree that the Transmission Planner should be required to provide an assessment at all on the health, safety and welfare of the community. Attachment 1, Section 2a identifies the types of customers that are impacted without needing a formal assessment. Stakeholders will have an opportunity to provide information on impacts of planned load shedding through either the Transmission Planner's stakeholder comment process or through the local regulatory agency's stakeholder comment process. Further, these planned interruptions of firm demand are expected to be short in nature so any impact would be de minimis. Finally, an assessment on the health, safety and welfare of the community is an unnecessary burden on the registered entity and is better suited for local governments that can speak through the stakeholder process. (3) Bullet 3 is based on available historical information. While this seems reasonable, we have concerns because of the rare instances that Non-Consequential Load Shed actually occurs. If a TP uses Non-Consequential Load Shed for the first time, there is no historical information. What would be an acceptable basis for the first use of Non-Consequential Load Shed when the entity is without historical information? (4) Expected time duration of the planned load shed is too speculative and should not be required because any duration will likely be a guess. When actual contingencies occur, the time of restoration varies and any time that was selected prior to the event is not likely to be correct. We do not see the value in predicting the duration time because there is too much uncertainty about how long an outage will really last. The SDT needs to clarify what is expected for the duration of the planned load shed. (5) While we appreciate that the response to our comments clarified the intent is that "Possible future plans could include a decision not to mitigate the need for Firm Demand interruption," the language in the Attachment simply does not reflect this. The Attachment specifically states "Future plans to mitigate the need for Non-Consequential Load Loss." A decision not to mitigate the need for Firm Demand interruption is not a future plan to mitigate. Consequently, Attachment 1, section II.5 will need to be modified to implement this intent. Otherwise, this language is certain to be interpreted as requiring a mitigation plan.
No
(1) We disagree with the threshold of 75 MW, as mentioned above.
(1) The SDT needs to consider the connection between the developing standards to maintain and improve reliability with the costs required to meet those standards. We believe there is an imbalance of the costs associated with meeting compliance for the current draft standard with proposed benefit of maintaining reliability of the BPS. This standard is a good candidate for the CEAP initiative to determine the cost benefits of reliability. (2) The standard needs to allow more flexibility regarding the use of planned load shed to address transmission performance issues in the planning horizon. It needs to recognize that these planned load shedding events may only be preliminary decisions for addressing problems that are several years away. If there is little chance that the planned shed load will ever be relied upon in the operating time horizon, there should be much less stringent requirements. For instance, if a PC or TP relies on planned load shed for year five of the planning horizon but year

one does not utilize the planned load shed, they have four years to develop another solution. Why should an entity expend great effort and resources for year five when another solution will likely be developed within that time period? (3) What does “materially changed” mean and what degree of a change would be considered material in the Attachment 1 stakeholder process? The SDT should clarify specific conditions in Section II that would constitute a material change. (4) Thank you for the opportunity to comment.

I am voting NO because there is no technical basis for use of the 75 and 25 MW absolute threshold values, regardless of the size of the utility's load, referenced in the proposed standard. WECC's past experience with implementation of arbitrary magnitudes for requirements (e.g., the 5% and 7% arbitrary magnitude contingency reserve requirements), has proved to be problematic. I would suggest investigating a technical basis for using a relative requirement, such as percentage of the utility's load, maybe 5% and 2.5%, respectively, and that it be based on technical requirements similar to those found in Table 1 of the WECC Criteria TPL-001-WECC-CRT-2. Thank you.

Although the maximum capacity value is used for planning purposes, how does this correlate with operational standards/issues that may require that value be greater. The planning studies look at very specific seasonal conditions on the system and may not necessarily look at all the states of the transmission system during the normal business day. If an operational event requiring a greater value of Non-Consequential Load Loss (NCLL) is executed and the specific outage was not considered in a planning study, how will this affect compliance with the planning standard. There was no technical rationale by the SDT for selecting the maximum value, thus a limit should not be set and should be left as a general discussion issue in the Stakeholder Process due to the many unforeseen issues that may arise.
Yes
The possibility of NCLL is always present, whether in the planning or operational arena. Section I (#5) should however specifically state that in the dispute resolution process a stakeholder does not have right of refusal for NCLL. This should be especially true when a transmission project has been proposed and NCLL in the interim is required due to the regulatory process, equipment lead time, etc. preventing the completion of project at an earlier time.
No
Section II should be left as part of the resolution in the dispute process and should not be made a requirement. Some in particular include: § II.1. - this should be based only on applicable contingencies or conditions that could require NCLL. Having to include the estimated hours at or above a load level may not always be the most effective way to convey why NCLL will be used and adds little to the argument of why or why not it needs to be used. § II.2.a - This may not always be apparent to the TO serving a wholesale transmission customers (REC, MUNICIPAL,

etc.). This should be eliminated since it does little in emphasizing the need for NCLL. § II.2.b - The "effect" of the use of NCLL may not always be apparent, because it is a perceived condition of what could happen that can be interpreted differently. I agree that it should be mentioned in the Stakeholder process outlining the locations where NCLL will take place and let the dispute process identify and assess the health, safety and welfare of the community. How do you assess the effect in the Planning of NCLL. The effect should be identified by the party being affected and resolved in the dispute process. § II.3 & 4. - This needs to be eliminated. Expected frequency and duration of NCLL based on historical performance DOES NOT GUARANTEE future performance and does little in emphasizing the need for NCLL. II.8 - This should be addressed by the Regional Planning Authority in their regional studies.
No
It does not appear that an entity has any options if the applicable regulatory authority or governing body objects to the use of NCLL in year one. This could potentially occur as a result of load patterns and generation issues submitted by an LSE not necessarily having BES elements and the only solution is to implement NCLL. In year one, it is too late to build any necessary and NCLL may be the only alternative.
Setting limits on the amount of NCLL only sets the stage for failure in the compliance of NERC standards and fails to take note of what is really the issue; the planning of a transmission system that is both reliable and economically viable for all stakeholders and customers. It should be emphasized that the use NCLL in a “planning process” is only assuming the conditions set in the study will exist and in no way reflects the conditions seen during the day to day operation of the transmission system. Xcel Energy is concerned about the previous ability on loss of load in anticipation of the next outage (previously C3 now P6). For TPL-003, loss of load in anticipation of the next system outage was covered under footnote B. Footnote 9 now states, “…the re-dispatch does not result in any Non-Consequential Load Loss. “ This is a large increase in requirements of the transmission system to operate. As written, it appears that footnote 12 is NOT applicable to P6 contingencies. Please clarify is this is the intent.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments

Project Revision of TPL-002 footnote 'b' and TPL-001 footnote 12

The Project 2010-11 Drafting Team thanks all commenters who submitted comments on the proposed standards, TPL-002-1c and TPL-001-2a. The standards were posted for a 45-day public comment period from October 5, 2012 through November 19, 2012 with the initial ballot period from November 9, 2012 to November 19, 2012. There were 61 sets of comments, including comments from approximately 149 different people from approximately 112 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

Summary: The drafting team made the following revisions in response to comments:

TPL-002-1c: footnote b - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.

TPL-001-2a: footnote 12 **-** An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following ~~Contingency~~ planning events.

TPL-001-2a: footnote 12 - However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1.

Section II, Bullet 2b. ~~Assessment~~ An explanation of the effect of the use of Firm Demand interruption under footnote 'b' on the health, safety, and welfare of the community

Section II, Bullet #5. Future plans to ~~mitigate~~ alleviate the need for Firm Demand interruption under footnote 'b'

Section III, first paragraph: Before a Firm Demand interruption under footnote 'b' is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ~~assure~~ ensure that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues do~~es~~ not object to the use of Firm Demand interruption under footnote 'b' if either:

Section III, last paragraph: Once assurance has been received that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues do~~es~~ not object to the use of Firm Demand interruption under footnote 'b', the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 'b' for Firm Demand interruption.

A number of respondents continue to question the legality of the proposed standards. The general line of thought in those comments is that NERC is imposing itself into the local planning process in violation of existing statutes. The SDT does not believe that to be the case and has responded accordingly to those commenters.

Many commenters questioned the use of a stakeholder process at all. Those commenters expressed the opinion that the FERC Order did not mandate the use of the stakeholder process. The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach.

In addition, many commenters chose to question already approved facets of the proposed TPL-001-2a standard. These commenters are questioning the application (or non-application) of footnote 12 for various planning events. TPL-001-2 was previously approved by the industry and the NERC Board of Trustees. The SAR for this project took that approval as the starting point for the specific discussion of footnote 'b'/12 and does not allow for review of previously approved applications of the footnote.

The SDT is requesting that the project be moved to a successive ballot.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

1. **Do you agree with the text in the body of the footnote including the maximum capacity threshold? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. For the maximum capacity item, please supply any technical rationale for your comment along with limiting conditions and any current criteria in use at your entity.**

Summary Consideration: The majority of the comments received for this question were handled with explanations of the SDT intent or clarifications of the constraints under which the SDT was working. There were a number of comments however concerning the justification of the threshold values. The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. DOE and other thresholds can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach.

There were several comments regarding the application of footnote 12 within Table 1 of proposed TPL-001-2a. Such discussion is out of scope for this project as defined in the Standards Authorization Request (SAR). TPL-001-2 has been approved by the industry through the standards development process and by the NERC Board of Trustees. Nothing in this project affects where footnote 12 is applied within Table 1. The only change being proposed is to the details of how to utilize footnote 12 as shown in the proposed Attachment 1.

The following clarifications to language were made due to comments received:

TPL-002-1c: footnote b) ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.

TPL-001-2a: footnote 12 **-** An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following ~~Contingency~~ planning events.

TPL-001-2a: footnote 12 - However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1.

Organization	Yes or No	Question 1 Comment

Organization	Yes or No	Question 1 Comment
MRO NSRF USACE	No	(1) Change the wording at the end of the first sentence from "following Contingency events" to "following Contingency events and Contingency events during the planned (maintenance) outage of any bulk electric equipment)". This would remind Transmission Planners and Planning Coordinators to include the consideration of planned outages at demand levels for which the outage would be performed. (2) Raise the maximum load dropping threshold for the footnote from 75 MW to 100 MW. A 100 MW threshold is reasonable because the DOE uses the intentional dropping of more than 100 MW as one of the thresholds for determininge when enough load is dropped to justify a formal system event analysis. (3) Add a sentence at the end of the footnote to read, "This footnote does not apply to any load that is not NERC registered (e.g. load that does not meet the greater than 25 MW NERC registration criterion). (4) If a portion of the non-consequential load loss used to mitigate a contingency is controllable by a demand side load management system, can it be excluded from the "Firm Demand interruption" in TPL-002-1c Table I footnote 'b' and/or "Non-Consequential Load Loss" in TPL-001-2a Table 1 footnote 12? Does it have to be curtailed on a pre-contingent basis in order to be excluded from the non-consequential load total, or can it be excluded even if the curtailment happens through action of the UVLS? Does this load count towards the 25 MW and 75 MW thresholds? RECOMMENDATION: When describing "interruption of firm demand" or "non-consequential load loss" in footnote 'b' add the language "not counting load shed on a pre-contingent basis". This would be added to the last sentence of footnote 'b' if it indeed should not be counted towards the 75 MW threshold. Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-

Organization	Yes or No	Question 1 Comment
		2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion. (5) If multiple companies own portions of the non-consequential load loss a used to mitigate a contingency at a single substation does each company's load portion count towards the 25 MW and 75 MW thresholds or does the total load at the substation count? For example, 100% of the load at a substation is set to trip with automatic UVLS. Company A, B, and C own load amounts X, Y, and Z at the substation. Is the amount of load counted towards the 25 MW and 75 MW thresholds X+Y+Z, or is each counted separately? RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote 'b' could read "In no case can the planned Firm Demand interruption from under footnote 'b' exceed 75 MW from one entity." Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion.
Response: (1) The SDT intended the first sentence to be a fundamental statement of planning principle and thus believes that the suggested wording is redundant and therefore not required. Consideration of planned outages at demand levels for which the outage is performed is covered in proposed TPL-001-2a, Requirement R1 where it is stated that models must represent actual System conditions as well as in Requirement R2, Part 2.1.3 which clearly states that analysis is to be done when known outages are scheduled. No change made. (2) The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. DOE thresholds can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made. (3) Load that is served from the entity's transmission system is considered as applicable Load in this standard regardless of the		

Organization	Yes or No	Question 1 Comment
underlying registration situation. No change made. (4) Proposed TPL-002-1c states in the footnote that: "It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or *Demand-Side Management Load*" (emphasis added). This makes it clear that Demand-Side Management Load is not to be considered as Non-Consequential Load. In proposed TPL-001-2a, the proposed definition of Non-Consequential Load includes the term 'Interruptible Load' which as defined in the NERC Glossary includes demand to be curtailed that the end-use customer makes available through contract or agreement. Thus, the concept is covered in proposed TPL-001-2a as well. However, upon reviewing the comments, the SDT has seen that Demand that is not included as Firm Demand for footnote 'b' could be clarified as shown below. TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load. (5) "Ownership" of the Non-Consequential Load Loss is not a relevant factor; all thresholds mentioned in the footnote are related to the total Non-Consequential Load Loss. No change made.		
ACES Power Marketing Standards Collaborators	No	(1) We disagree with placing an upper limit on the amount of firm load shed. Conceptually, it seems like a good idea but we do not believe that such a threshold could ever consider all of the potential issues that could arise and would cause the need to plan to shed firm load. This is especially true considering that the SAR clarifies that the upper threshold will be based on the existing planned load shedding values. Future issues cannot be considered by the information contained in the data request. Consider a situation in which a new transmission line was included in Planning Assessment but cannot be built because right of ways cannot be obtained. Should an upper limit be placed on planned load shed in such a situation? (2) We disagree with the threshold of 75 MW. In Order No. 762, the Commission discussed the "blend concept," where it "envisioned the planner would consider up to 100 MW of planned Firm Demand interruption along with other options to resolve the system performance

Organization	Yes or No	Question 1 Comment
		criteria violation and submit its documentation and explanation to the entity deciding whether the planned load shed is acceptable." (emphasis added) Even the Commission envisioned using higher thresholds. Furthermore, the data appears to show that one instance of Non-Consequential Load Loss would be immediately out of compliance because it is actual 75.2 MW not 75 MW. If the upper threshold is too close to 75 MW, any load growth might also compel the instance to be disqualified. If the SDT plans to keep the upper limit, we suggest increasing the amount to at least 100 MW.
Response: (1) The SDT understands the problematic nature of future considerations in setting threshold values. However, the SDT believes it is unrealistic to consider the allowable usage of footnote 'b' in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. No change made. (2) The SDT believes that the threshold selected is consistent with the data supplied in the data request within reasonable limits. Increasing the threshold to 100 MW is not consistent with the data supplied and the SDT believes that such an action would be viewed as a non-acceptable least common denominator approach. No change made.		
Minnkota Power Cooperative Otter Tail Power Company	No	1. MPC QUESTION: If a portion of the non-consequential load loss used to mitigate a contingency is controllable by a demand side load management system, can it be excluded from the "Firm Demand interruption" in TPL-002-1c Table I footnote 'b' and/or "Non-Consequential Load Loss" in TPL-001-2a Table 1 footnote 12? a. Would this load count towards the 25 MW and 75 MW thresholds? b. Would it have to be curtailed on a pre-contingent basis in order to be excluded from the non-consequential load total, or can it be excluded even if the curtailment happens through action of the UVLS? c. RECOMMENDATION: When describing "interruption of firm demand" or "non-consequential load loss" in footnote 'b' add the language "not counting load shed on a pre-contingent basis". This would be added to the

Organization	Yes or No	Question 1 Comment
		last sentence of footnote 'b' if it indeed should not be counted towards the 75 MW threshold. Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion. 2. MPC QUESTION: If multiple companies own portions of the non-consequential load loss used to mitigate a contingency at a single substation, does each company's load count towards the 25 MW and 75 MW thresholds or does the total load at the substation count? a. EXAMPLE: 100% of the load at a substation is set to trip with automatic UVLS. Company A, B, and C own load amounts X, Y, and Z at the substation. i. Is the amount of load counted towards the 25 MW and 75 MW thresholds X+Y+Z, or is each counted separately? b. RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote 'b' could read "In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW from one entity." Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion.

Response: (1) Proposed TPL-002-1c states in the footnote that: "It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or *Demand-Side Management Load*" (emphasis added). This makes it clear that Demand-Side Management Load is not to be considered as Non-Consequential Load. In proposed TPL-001-2a, the proposed definition of Non-Consequential Load includes the term 'Interruptible Load' which as defined in the NERC Glossary includes demand to be curtailed that the end-use customer makes available through contract or agreement. Thus, the concept is covered in proposed TPL-001-2a as well. However, upon reviewing the comments, the SDT has seen that Demand that is not included as Firm Demand for footnote 'b' could be clarified as shown below.

TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm

Organization	Yes or No	Question 1 Comment
Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load. (2) "Ownership" of the Non-Consequential Load Loss is not a relevant factor; all thresholds mentioned in the footnote are related to the total Non-Consequential Load Loss. No change made.		
Iberdrola USA	No	"Contingency events" should be replaced by "Planning Events." Why would load shedding be limited only for certain circumstances in the Near-Term Transmission Planning Horizon? The Near Term is likely the period when the least can be done to avoid load shedding due to the time required for permitting and construction of facilities. A maximum capacity threshold is reasonable, whether 75 MW or a lower value.
Response: The SDT agrees that 'Contingency events' should be replaced by 'planning events' in proposed TPL-001-2a where the terminology in the performance tables uses 'planning' instead of 'Contingency'. However, such a change is not warranted in proposed TPL-002-1c where the 'planning' terminology was never used. TPL-001-2a: footnote 12 - An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following ~~Contingency~~ planning events. Footnote 'b' is not limited to the Near-Term Transmission Planning Horizon since the footnote recognizes that Firm Demand can be interrupted throughout the entire planning horizon. No change made. Thank you for your support.		
Massachusetts Attorney General	No	Although I voted for this Footnote, I do have concerns. 1) There is no reliability benefit to the 75MVA threshold limit. There should be no limit in the standard - it should be between stakeholders to decide that limit, not nationally imposed. 2) Any such agreement to consider non-consequential losses should have no impact to the BES especially when maintained in a confined boundary.

Organization	Yes or No	Question 1 Comment
		3) This takes away local decision making of PUC/ Local Board decision making; 4) FERC's concern that a few entities would disguise the "stakeholder" process to shed load is unfounded and should not be applied on a continent-wide basis. FERC is trying to impose tighter standards than the industry wants.
Response: (1) **T**he SDT believes it is unrealistic to consider the allowable usage of footnote 'b' in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. No change made. (2) The SDT agrees that it normally should not have an impact. However, the purpose of the footnote is to ensure that it will not have an impact. No change made. (3) The SDT disagrees. The PUC/Local Board would typically be part of the "applicable regulatory authorities or governing bodies responsible for retail electric service issues" shown in Attachment 1, Section I, Bullet 1. The same body would be expected to be the entity involved in Attachment 1, Section III. Therefore, the PUC/Local Board would be a primary participant in the proposed process. No change made. (4) The conditions placed on the stakeholder process will provide consistency in the application of footnote 'b' on a continent-wide basis. No change made.		
Xcel Energy	No	Although the maximum capacity value is used for planning purposes, how does this correlate with operational standards/issues that may require that value be greater. The planning studies look at very specific seasonal conditions on the system and may not necessarily look at all the states of the transmission system during the normal business day. If an operational event requiring a greater value of Non-Consequential Load Loss (NCLL) is executed and the specific outage was not considered in a planning study, how will this affect compliance with the planning standard. There was no technical rationale by the SDT for selecting the maximum value, thus a limit should not be set and should be left as a general

Organization	Yes or No	Question 1 Comment
		discussion issue in the Stakeholder Process due to the many unforeseen issues that may arise.
Response: The commenter correctly points out that this is a planning standard. Operational standards have their own sets of requirements. The proposed requirements for TPL-001-2a state that models utilized must reflect System conditions anticipated for the period in question. If the planner has done this, there should be no question as to whether they are fulfilling the requirements of the standard. No change made. The SDT believes it is unrealistic to consider the allowable usage of footnote 'b' in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. The limit selected was derived from the data received for the data request. Use of actual data is the technical rationale in the selection of the threshold. No change made.		
Electric Reliability Council of Texas, Inc.	No	As an initial matter, ERCOT does not believe the planning process should allow for nonconsequential load shedding under single contingency conditions. Accordingly, ERCOT takes no position on the proposed maximum load shedding amount. Even though the NERC BoT approved the Stakeholder Process, ERCOT does not believe that the Stakeholder Process should be included as an Attachment to a footnote to a reliability standard. Also, there is an inconsistency in the terminology used in the footnotes relative to the load shed - firm demand and non-consequential load are both used. Non-consequential load is the correct term and the language should be consistent. Although it is ERCOT's position that non-consequential load should not be allowed to be shed under single contingency conditions from a planning perspective, if the SDT elects to retain a vehicle for such exceptions, it should establish objective, reliability based criteria that lend themselves to inclusion in a reliability standard. This is consistent with the general approach for reliability standards, which prescribe the "what", not the

Organization	Yes or No	Question 1 Comment
		"how". If the exceptions are based on objective criteria that are known upfront, and those criteria reflect appropriate reliability based technical justifications, then the risk of unwarranted exceptions to the general prohibition due to misuse of the exception process is mitigated. Furthermore, the exception process should be external to the NERC Reliability Standards (e.g. in the Rules of Procedure), which should merely reference authorized exceptions granted pursuant to that process. With respect to the stakeholder process, in no case should a reliability standard mandate a stakeholder process in any respect, procedural or substantive. In ISO/RTO regions, stakeholder processes fall within ISO/RTO governance matters. These issues are beyond the purview of NERC Reliability Standards. In other regions, although the relevant functional entities do not have stakeholder processes analogous to ISOs/RTOs, any relevant processes are similarly beyond the scope of the reliability standards.Accordingly, the SDT should eliminate all revisions related to the establishment of a stakeholder process. As discussed in response to question 5, FERC is not requiring this approach, but rather has only provided guidance with respect to ways to possibly bring the prior proposal in line with applicable regulatory approval standards for reliability standards. Additionally, as a general matter, substantive reliability standards requirements should not be imbedded within a footnote to a requirement. In this case, not only is there a substantive requirement imbedded in the footnote, there is also a substantial attachment (which must become part of the enforceable standard requirements}... and, to make it worse, the attachment is an attachment to the footnote, rather than an attachment to and referred to by a reliability standard requirement.
Response: ERCOT is free to adopt a position of not allowing Non-Consequential Load shed in its reliability footprint. An entity can		

Organization	Yes or No	Question 1 Comment
always do more than the requirements stated. No change made. The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. The use of footnotes and attachments is an acceptable mechanism for use in Reliability Standards and both mechanisms have been used before. No change made. The SDT believes that the terminology is consistent. Non-Consequential Load is a newly defined term that only applies to proposed TPL-001-2a. It is not appropriate to use this terminology in proposed TPL-002-1c which predates proposed TPL-001-2a. No change made. The SDT has set up criteria for consideration in the potential usage of footnote 'b' for planning purposes in Attachment 1, Section II, Bullets 1 through 8. The criteria described are objective. The process describes what must be done to allow for the usage of footnote 'b' in the planning process. No change made. The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. If the ISO/RTO has an existing process that meets the requirements, it is free to use such process as stated in Attachment 1, Section I. No change made. Footnotes and attachments are acceptable mechanisms for use in Reliability Standards and both mechanisms have been used before. No change made.		
National Association of Regulatory Utility Commissioners	No	As NARUC stated plainly in its Comments filed in FERC Docket No. RM11-18 (Dec. 20, 2011), "not only does the law require that the States maintain authority over distribution level reliability, States are in the best position to guide load shedding so that it has the least negative impact on the State's customers and the operation of the local distribution system." Id at p. 4. Given the twin responsibilities of FERC to maintain bulk system reliability and the states to ensure reliable and affordable service to retail load, NARUC supports the portion of the standard that requires notification and consultation with state and local regulators. However,

Organization	Yes or No	Question 1 Comment
		the maximum capacity threshold (set at 75 MW) is problematic. In this instance, it appears that the 75 MW maximum capacity threshold is merely a reflection of antidotal information from five data request responders and as such is not technically justified. NARUC is not poised to offer an alternative; given that the state/local regulator is consulted in this process, the maximum capacity threshold should just be dropped. States should be able to authorize an 80 MW exception, or whatever level is reasonable, under specific circumstances if local economics and reliability warrant it.
Response: The data request is not anecdotal information. All of the Transmission Planners in the continental United States supplied their data in response to the data request. The SDT believes it is unrealistic to consider the allowable usage of footnote 'b' in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. Given the participation of appropriate regulatory bodies in both Sections I and III, the SDT believes that the current threshold is the best possible solution. No change made.		
American Transmission Company	No	ATC recommends the following alternative language for both Footnote 'b' (Table 1 in TPL-002-1c [page 6]) and Footnote '12' (Table 1 in TPL-001-2a [page 14]:(1) Change the wording at the end of the first sentence from "following Contingency events" to "following Contingency events for the prior condition of all equipment in service or during the planned (maintenance) outage of any bulk electric system equipment". This would remind Transmission Planners and Planning Coordinators to include the consideration of planned outages at demand levels for which the outage would be performed. (2) In the last sentence of the footnote, raise the maximum load dropping threshold for the footnote from 75 MW to 100 MW. A 100 MW threshold is reasonable because the DOE uses the intentional dropping of more than 100 MW as one of the thresholds for determining when enough load is dropped to justify a formal system event analysis.

Organization	Yes or No	Question 1 Comment
		(3) Add a sentence at the end of the footnote to read, "This footnote does not apply to any load that is not NERC registered (e.g. load that does not meet the greater than 25 MW NERC registration criterion).
Response: (1) Consideration of planned outages at demand levels for which the outage is performed is covered in proposed TPL-001-2a, Requirement R1 where it is stated that models must represent actual System conditions as well as in Requirement R2, Part 2.1.3 which states that analysis is to be done when known outages are scheduled. No change made. (2) The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. DOE thresholds can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a least common denominator approach and would thus be rejected. No change made. (3) Load that is served from the entity's transmission system is considered as applicable Load in this standard regardless of the underlying registration situation. No change made.		
Hydro QuÃ©bec TransÃ‰nergie	No	Dropping load in the general sense should not be endorsed, but it is recognized that there are special situations where it cannot be avoided. Provided there is no widespread, adverse effect on the reliability of the interconnected BES, the effect of a firm demand interruption on customers is under the purview of the applicable regulatory authority that is responsible for local transmission and retail service over the load to be curtailed, and the TPL standard should not put a limit at 75 MW.
Manitoba Hydro	No	Given that it is deemed that a stakeholder procress is required, there is no rationale for a maximum level. The stakeholders are in the best position to judge the appropriate level of allowable curtailment.
Response: The SDT believes it is unrealistic to consider the allowable usage of footnote 'b' in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. No		

Organization	Yes or No	Question 1 Comment
change made.		
Florida Municipal Power Agency Lakeland Electric Gainesville Regional Utilities	No	FMPA has two issues:1. What is the technical justification for 75 MW? There is no other metric in use similar to it. FMPA believes that, if the stakeholder process reveals that the stakeholders are willing to accept decreased service continuity to save money on their electric bills, why should that be limited to 75 MW which has nothing to do with BES reliability. BES reliability will not be impacted until load shedding gets near to the largest single loss of source contingency in relation to supply / demand mismatch. Other standards have chosen the low value of 300 MW as indicative, (e.g., CIP v5 for UFLS, EOP-004 for disturbance reporting); hence, FMPA recommends that the maximum amount of load shedding be 300 MW. 2. The footnote should also address a process whereby the transmission customer agrees to conditional firm service if the Transmission Planner / Transmission Service Provider (TSP) plans on curtailing firm service to that customer following a single contingency. The TSP should not be able to unilaterally degrade service from a state where it was not conditional to a state where it is conditional.
Response: The SDT believes it is unrealistic to consider the allowable usage of footnote ‘b’ in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote ‘b’. Other thresholds can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made. An entity can always approach a customer to request to a change in the type of service provided, with or without the consideration of footnote ‘b’ utilization. The institution of the formal process proposed here would bring the transmission customer into the decision making process which makes any condition open and transparent and which may initiate discussions on service type as		

Organization	Yes or No	Question 1 Comment
referenced above. No change made.		
Modesto Irrigation District	No	I am voting NO because there is no technical basis for use of the 75 and 25 MW absolute threshold values, regardless of the size of the utility's load, referenced in the proposed standard. WECC's past experience with implementation of arbitrary magnitudes for requirements (e.g., the 5% and 7% arbitrary magnitude contingency reserve requirements), has proved to be problematic. I would suggest investigating a technical basis for using a relative requirement, such as percentage of the utility's load, maybe 5% and 2.5%, respectively, and that it be based on technical requirements similar to those found in Table 1 of the WECC Criteria TPL-001-WECC-CRT-2.Thank you.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. Utilizing a percentage of an entity's Load may be problematic – when dealing with a small entity it could be a small value but still of rather large import and if dealing with a large entity could result in significant amounts of Load shed being planned. The FERC Order states that a percentage approach would not be appropriate for the aforementioned reasons. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.		
Ameren	No	It appears that a least common denominator approach was used to develop the upper limit of 75 MW. Only 1 out of 18 respondents would drop 75 MW of load, and only two respondents would drop 61-70 MW of load. Our review of the data request responses concludes that only 22% of the respondents that presently utilize footnote "b" would drop more than 50 MW, and only 33% of the respondents that use footnote "b" would drop more than 40 MW. The proposed 75 MW limit is too high and is not supported by the responses to the data request. An upper limit of 40 MW is more appropriate, based on the data responses.

Organization	Yes or No	Question 1 Comment
Response: Based on the comments received, the majority of the industry does not agree that a lower threshold would be appropriate. The SDT does not believe that a least common denominator approach was utilized. The value selected is a reasonable limit based on the data received, potential vagaries in future considerations, and undefined system configurations that may arise. No change made.		
MidAmerican Energy Company	No	MidAmerican supports NSRF comments with one change. The proposed NSRF addition of "consideration of planned outages at demand levels for which the outage would be performed" to the text of footnote "b" after "following Contingency events" should not be added. If the addition is made, a reasonable time frame clarification is necessary and should be added such as "greater than 6 months". The proposed change would then read "consideration of planned outages greater than 6 months or longer at demand levels for which the outage would be performed".
Response: The SDT is not proposing to adopt the suggested change of the MRO NSRF. Please see the response to MRO NSRF above.		
Midwest Independent Transmission System Operator, Inc.	No	No. We believe footnote b in NERC TPL 002-1 and/or footnote 12 in TPL-001-2 should be eliminated because the intent of these standards is not to rely on non-consequential firm load shedding after a single contingency event. However, if these footnotes are not eliminated, there should be some limitation on how much firm load shed is allowed. We object to any level higher than the proposed 75 MW level and would prefer a level below 75 MW, but won't object to the proposed 75 MW level if the footnotes are not eliminated.
Response: The SDT believes that the wording of the footnote states that Non-Consequential Load shedding should not be the intent but recognizes that particular circumstances may result in such a planned action. The 75 MW level is being retained. No change made.		
Duke Energy	No	Regarding the maximum capacity item, we believe that 75 MW is much too low. While Duke Energy has not historically used the footnote, setting

Organization	Yes or No	Question 1 Comment
		the upper limit at 75 MW raises a concern. An upper limit of 75 MW severely limits the ability of a Transmission Planner to use the footnote. The 75 MW limit appears to be the maximum reported in the survey. The survey is a snapshot in time and to assume that there never have been nor never will be situations where the correct decision of a Transmission Planner and its stakeholders would be to exceed the 75 MW limit is illogical. The 75 MW limit is likely to create a situation where a Transmission Planner is forced to convert a network line to radial in order to remain in compliance with the standard, to the detriment of reliability to customers. The key to understanding use of the footnote is realizing that, in most cases, using the footnote is extremely unlikely to result in customer outages, because the probablility of the initiating contingency occurring under conditions requiring additional load shed is very low. A more reasonable upper limit would be the 300 MW limit that is established as the threshold for DOE Disturbance Reporting. It is also important to remember that no matter what upper limit is established, Non-consequential Load Loss of 25 MW or greater cannot be included in Year One of the Planning Assessment if the applicable regulatory authority or governing body responsible for retail electric service issues objects.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. DOE thresholds can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.		
Southern California Edison Company	No	SCE believes that the maximum capacity threshold should be increased from 75 MW to 250 MW, as 250 MW is the limit utilized by the California Independent System Operator (CAISO) for a consequential load drop for a single contingency. The CAISO has a rigorous transmission planning

Organization	Yes or No	Question 1 Comment
		process that allows it to plan for and permit load shedding up to 250 MW.
Response: The footnote only applies to Non-Consequential Load Loss. Upon reviewing the comments, the SDT has seen that Demand that is not included as Firm Demand for footnote ‘b’ could be clarified as shown below. TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.		
Arizona Public Service Company	No	The 75 MW threshold is too low. No technical justification has been given for choosing 75 MW. It should be a significantly higher value for TPL-002. Currently AZPS does not use non-consequential load dropping to meet any standard but this option should be preserved. There could be times when alternate to the load dropping would be building a new transmission line costing hundreds of millions of dollar for a very low probability scenario of high load conditions. The threshold value should be 100 MW or more.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote ‘b’. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.		
Northeast Power Coordinating Council	No	The 75MW of Firm Demand interruption is retail load that is being dropped. Dropping load in the general sense should not be endorsed, but it is recogn ized that there are special situations where it cannot be avoided. If a regulator responsible for retail load is comfortable with greater than 75MW being dropped in a rare situation, there should not be a requirement to build out of the situation. Provided there is no widespread, adverse effect on the reliability of the interconnected BES, the effect of a firm demand interruption on customers is under the purview of the applicable regulatory authority that is responsible for local

Organization	Yes or No	Question 1 Comment
		transmission and retail service over the load to be curtailed. There is no technical basis for the 75MW figure. It was included as a result of a Section 1600 Data Request, and is an arbitrary value. There should not be a limit without a technically supportable reliability based reason.
National Grid	No	The 75MW of Firm Demand interruption is retail load that is being dropped. Dropping load in the general sense should not be endorsed, but it is recognized that there are special situations where it cannot be avoided. If a regulator responsible for retail load is comfortable with greater than 75MW being dropped in a rare situation, there should not be a requirement to build out of the situation. Provided there is no widespread, adverse effect on the reliability of the interconnected BES, the effect of a firm demand interruption on customers is under the purview of the applicable regulatory authority that is responsible for local transmission and retail service over the load to be curtailed. There is no technical basis for the 75 MW figure with respect to reliability impact. Although, the value was developed by the SDT as a result of their review of Section 1600 Data Request, there was no reliability based analysis performed to identify whether the 75 MW is reasonable number. It is possible that a number either larger or lower could be identified if a reliability and cost-effective analysis is conducted.
Response: The SDT believes it is unrealistic to consider the allowable usage of footnote ‘b’ in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. No change made. The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote ‘b’. All of the Transmission Planners in the continental United States supplied their data in response to the data request. The SDT believes that any deviation from the threshold derived from the actual		

Organization	Yes or No	Question 1 Comment
data may be viewed as a non-acceptable least common denominator approach. No change made.		
ISO New England	No	The draft footnote states that interruption "is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1." Attachment 1 appears to impermissibly require State participation in federal transmission planning processes. Further, it places the ERO in a Transmission Planning role, which exceeds the limits of the ERO's functions under Section 215 of the Federal Power Act. The current language appears to conflict with (1) federal statutes that are clear that wholesale electric transmission issues are matters of federal, and not state, jurisdiction, (2) orders of the Federal Energy Regulatory Commission ("FERC") regarding the role and independence Regional Transmission Organizations ("RTOs") with regard to transmission planning, and (3) Section 215 which limits NERC's authority to regulate "users, owners and operators" of the Bulk-Electric System. Further, the conditions appear to conflict with Section 215 of the Federal Power Act by placing the ERO in a transmission planning role and providing it with regulatory or functional oversight regarding the substance of transmission planning decisions. The ERO has the authority to develop and enforce standards, but is not a transmission planning entity and does not have the authority to substitute its judgment for registered Planning Authorities and Transmission Planners regarding the planning or operation of the bulk power system. Where a review is sought of planning entities' determinations, per FERC-filed Tariffs, they may be brought before FERC under Section 206 of the Federal Power Act. Because the footnote, and the associated Attachment appear to be in conflict with FERC Tariff and other statutory provisions, they should be removed. The footnote itself states, "An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events." The objective statement within the

Organization	Yes or No	Question 1 Comment
		standard does not appear to create a requirement and should be removed.
Response: The SDT does not believe that the footnote violates any regulations concerning transmission planning since there is no federal process as cited in the comment. The proposed process simply brings stakeholders, including local regulators, to the table in an open and transparent manner while setting criteria for when footnote 'b' can potentially be utilized. The ERO is not participating in the planning process. The role of the ERO is restricted to a determination of whether the planned utilization of footnote 'b' will cause an Adverse Reliability Impact to the BES. The ERO has no further role in the transmission planning process beyond that determination. No change made. The SDT believes that the objective statement referenced is an important consideration in the over-all planning process and thus should be retained. It sets the over-all tone and approach that should be followed. No change made.		
Deseret Generation & Transmission	No	The limitation of Non-Consequential load loss to the 25 MW-75 MW level with a hard limit at 75 MW is arbitrary and give no deference to the cost of the cure. In the West the high cost of a fix may not be in the public interest. The 75 MW hard high limit should be replaced with a soft 75 MW limit but allowing higher levels if the governing body or regulatory authority approves it.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. The SDT believes it is unrealistic to consider the allowable usage of footnote 'b' in the planning process without a hard cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. No change made.		
New England States Committee on Electricity (NESCOE)	No	The New England States Committee on Electricity (NESCOE) appreciates the opportunity to comment on NERC's proposed revisions to Transmission Planning (TPL) Reliability Standards relating to permissible applications of planned load interruption. NESCOE is New England's Regional State Committee and is governed by a board appointed by the

Organization	Yes or No	Question 1 Comment
		six New England Governors. These comments reflect the collective view of the six New England states.The issue of planned, limited load interruption rests at the central intersection of cost and reliability. It illustrates the fundamental balance that Commissioner Norris details in Order No. 762: the tradeoffs between “increasing levels of reliability and the costs that come along with achieving them.” Transmission Planning Reliability Standards, Order No. 762, 139 FERC Â¶ 61,060 (April 19, 2012) (Norris, Comm’r. concurring in part and dissenting in part) at 2. NESCOE agrees with Commissioner Norris that, as a general matter, this balancing should translate to a more explicit consideration of costs in the NERC standard development process. Id. at 1. The language in footnote “b”- and corresponding footnote 12 of TPL-001-2-implicitly recognizes cost considerations in transmission planning by tolerating limited load shedding under defined circumstances. NESCOE offers below comments and suggestions in response to the SDT’s questions. These responses reflect NESCOE’s interest in planning for a robust bulk electric system while taking into account the magnitude of risk that a solution is intended to address and the costs associated with competing solutions. NESCOE appreciates the work of the SDT in attempting to respond to the Commission’s directives and the time constraints under which the SDT was required to make changes to footnote “b.” However, NESCOE is concerned that establishing a bright-line maximum capacity threshold that is an absolute ceiling is overly prescriptive and unnecessary to meet the Commission’s directives. In Order 762, the Commission rejected the contention that regional stakeholder processes should unilaterally determine the appropriate criteria to apply in planning to interrupt firm load. Order 762 at P 32. However, provided that technical parameters are in place, the Commission stated that it would be “amenable” to regional stakeholders establishing such criteria if, for example, NERC or the applicable Regional Entity “developed an exception process that

Organization	Yes or No	Question 1 Comment
		provides flexibility in decisions based" on their expert view of regional considerations. Id. The SDT's proposal, however, would impose a one-size-fits-all requirement that forecloses a regional discussion of the quantitative and qualitative considerations that may justify an exception to the proposed 75 MW maximum capacity value. Such a regional discussion in ongoing in New England. In 2010, ISO New England introduced to stakeholders a draft Transmission Planning Load Interruption Guideline. The Guideline noted that load interruption should not be the principal tool to address transmission system reliability violations and highlighted the priority of reliable service. However, applying quantitative and qualitative criteria, the Guideline proposed for stakeholder discussion various levels of controlled load interruption in N-1-1 conditions-potentially up to hundreds of megawatts-that may be tolerated under clearly defined conditions. NESCOE did not take a view of the Guideline when it was presented for review and does not do so here. For now, the Guideline remains in draft form following stakeholder comment in 2011. However, imposition of a maximum capacity threshold that is an absolute ceiling for N-1 events and potentially, through revisions to footnote 12, N-1-1 events, would prematurely limit important regional discussions of this issue. A better approach, and one which the Commission appears amenable, would be to accompany any bright-line value with an exception process. There is recent precedent supporting such an approach: NERC proposed changes to its Rules of Procedure to accommodate exceptions to the proposed 100 kV bright-line Bulk Electric System definition. Separately, the footnote references Attachment 1 to the respective planning standards, which requires a stakeholder process review of the utilization of planned interruption. Such review is only triggered if utilization is sought in the Near-Term Transmission Planning Horizon, even though the footnote permits utilization of load interruption throughout

Organization	Yes or No	Question 1 Comment
		the planning horizon. NESCOE does not support this limiting language, which is at tension with an open and transparent planning process over the entire planning horizon. The term “Near-Term” should be stricken or further justification should be provided.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote ‘b’. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. The SDT believes it is unrealistic to consider the allowable usage of footnote ‘b’ in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. The SDT believes that the referenced exception process is what is being proposed. The proposed process sets up an open and transparent process for allowing such Load shed in specific conditions and with specific limitations. Any future revisions to footnote 12 will be accomplished through the approved standards development process and any discussion on changing threshold values would be part of that process. No change made. Footnote ‘b’ is not limited to the Near-Term Transmission Planning Horizon since the footnote recognizes that Firm Demand can be interrupted throughout the entire planning horizon. As drafted, the standard defines the stakeholder process as mandatory for the Near-Term Transmission Planning Horizon since there may not be time to implement other corrective actions but does not limit its use in the Long-Term Transmission Planning Horizon. How individual entities reflect the Long-Term Transmission Planning Horizon situations in its individual stakeholder processes is left to the entity to determine. No change made.		
Sacramento Municipal Utility District	No	There is no reliability benefit with an establish MW threshold. Implementing any threshold is descriptive and the standard should depict an outcome not the means of the outcome.
Response: The SDT believes it is unrealistic to consider the allowable usage of footnote ‘b’ in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. No change made.		
Public Utility District No.1 of Snohomish	No	We believe the survey significantly underestimated the use of Non-Consequential Load Shedding because the survey asked about past usage

Organization	Yes or No	Question 1 Comment
County Tacoma Power MEAG Power City of Austin Clark Public Utilities		of footnote b under Version 001, not about planned load shedding in TPL version 002 or the proposed footnote 12. TPL version 002 added several new contingencies, and also changed the Non Consequential Load shedding applicability for several contingencies. We have 4 specific concerns, followed by several suggested edits: 1) Analyzing the contingencies “P1.4 Loss of a Shunt Device” and “P2.1 Opening of a line section w/o a fault” are new requirements that will lead to increased use of footnote 12. It is common on fringes of the interconnected system to have weak sources. Significant utility investment will be redirected to remediate these fringe performance issues due to the P2.1 and its associated restrictions for firm load shedding and no RAS or UVLS mitigation. This is a low probability and low impact to the main grid contingency with a high mitigation cost, given the new mitigation restrictions. 2) Contingencies “P2.2 Bus Section fault” and “P2.3 Internal Breaker Fault” were previously defined as category “C multiple contingencies” with the restriction that the Firm Load shedding must be planned/controlled. However Version 002 no longer allows dropping nonconsequential load for EHV but removes all restrictions for HV load shedding. Since these contingencies result in opening the same breakers as category P1 contingencies, the use of footnote 12 should be consistent with P1. 3) Contingencies P3.1-P3.4 were previously defined as category “C multiple contingencies” with Firm loading shedding allowed. In version 2, these contingencies have been changed from allowing planned load shedding to only allowing Non-Consequential load shedding per footnote 12. Although this does not directly impact our utility, the survey results do not include utilities using “must-run” generation. 4) As demonstrated by multiple questions at the last webinar, many

Organization	Yes or No	Question 1 Comment
		utilities do not understand the definition of Non-Consequential Loads, and therefore may not have correctly reported the usage of Non-Consequential Load Shedding. The v2 changes cascade to the unfortunate conclusion that UVLS and RAS are no longer permitted as cost effective transmission performance mitigation, despite new low probability contingencies that drive performance problems at the edges of the network. -Proposed changes: A) Change the maximum amount from 75 MW to 300 MW. Several other standards including CIP have a strong technical basis for selecting 300 MW as the maximum limit for load shedding programs. B) Footnote 12 on contingency 2.1 should be replaced with a new footnote 15 that reads " 15. For this contingency, load which is served radial from a remaining single source line may be shed as if it were Consequential Load." This change would acknowledge that while P2.1 does involve just one element, the likelihood of occurrence is similar to bus section faults, so the resulting system performance requirements should be similar. C) The first two sentences of footnote 12 should be deleted. Remove the first sentence because it is general in nature and is a basic tenant of any load-serving utility. Remove the second sentence because column 7 of Table 1 explicitly states where Non-Consequential Load Loss is allowed. D) The third sentence of footnote 12 should have the words "under footnote 12" added. Without this addition, all Non Consequential Load Loss including the allowed loss for P4, P5 and P6 would still be subject to Appendix 1. The revised sentence would read "When Non-Consequential Load Loss is used under footnote 12 within the Near-Term ..."
Response: The SDT could not reasonably request data for unknown future conditions. The only viable mechanism for data input was the data request as it was formulated.		

Organization	Yes or No	Question 1 Comment
1) The SDT disagrees that planning events P1.4 and P2.1 are 'new' requirements in proposed TPL-001-2a. These requirements were previously approved by the industry and NERC Board of Trustees. No change made. **2)** The SDT disagrees that P2.2 and P2.3 planning events will open the same breakers as P1 planning events. For the EHV planning events cited, the standard approved by the industry and the NERC Board of Trustees accepted a raising of the bar by not allowing Non-Consequential Load Loss for these events. This posting of proposed TPL-001-2a does not change the application of the footnote. No change made. **3)** For the P3.1 – P3.4 planning events, the standard approved by the industry and the NERC Board of Trustees accepted a raising of the bar by not allowing Non-Consequential Load Loss for these events. This posting of proposed TPL-001-2a does not change the application of the footnote. No change made. **4)** Discussion of the proposed definition of Non-Consequential Load was provided during the various postings of proposed TPL-001-2. The SDT has received no comments from other utilities regarding confusion over the definition. Single Contingencies are not low probability events. No change made. A) The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. DOE thresholds such as the 300 MW referenced above can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made. B) For planning event P2.1, the standard approved by the industry and the NERC Board of Trustees accepted a raising of the bar by not allowing Non-Consequential Load Loss for these events. This posting of proposed TPL-001-2a does not change the application of the footnote. No change made. C) The SDT believes that such statements are important to set the tone and approach to be taken with the planning standards. No change made. D) The SDT agrees and has made the suggested clarification. TPL-001-2a: footnote 12 - However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1.		
Independent Electricity System Operator	No	We disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is

Organization	Yes or No	Question 1 Comment
		no adverse effect on the reliability of the interconnected bulk power system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed.We propose replacing the sentence, in the footnote and in attachment one, section III that reads:"In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW." with "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss under footnote 12 for a Registered Entity that is a Canadian Entity (or a Mexican Entity) should be implemented in a manner that is consistent with/or under the direction of the Applicable Governmental Authority or its agency in Canada (or Mexico).
Hydro One Networks Inc.	No	We disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no widespread, adverse effect on the reliability of the interconnected bulk electric system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its delegated agencies responsible for local transmission and retail service over the load to be curtailed.If it is decided to proceed with the 75 MW or any other value, we propose replacing the sentence, in the footnote and in attachment one, section III that reads:"In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW." with "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss under footnote 12 for a non-US Registered Entity should be determined by the applicable Regulatory Authority or Governmental Authority or its delegated agency in that is responsible for retail electric service issues in that jurisdiction."

Organization	Yes or No	Question 1 Comment
Response: Canadian entities are allowed to adopt ERO Reliability Standards, reject them outright, or adapt them for their own use within the confines of provincial regulations. Nothing has changed in that regard with this proposed standard. The effective date language covers the situation. No change made.		
NB Power Transmission	No	We disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no widespread, adverse effect on the reliability of the interconnected bulk electric system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its delegated agencies responsible for local transmission and retail service over the load to be curtailed.
NBSO	No	We do not agree with setting a MW limit for non-consequential load loss. The allowable amount should be determined and approved by the jurisdiction of the area(s) whose load is affected. The intent of the TPL standard and this footnote is to ensure that if non-sequential load loss is accounted for or relied up to ensure BES reliability (as assessed in the planning horizon), that such a decision needs to be approved by the appropriate jurisdiction. Non-consequential load loss being applied or considered to achieve BES reliability in planning assessment is in itself not a BES reliability concern that rises up to a continent-wide reliability standard.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. DOE thresholds such as 300 MW can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.		

Organization	Yes or No	Question 1 Comment
Western Area Power Administration	No	We do not support a maximum threshold of 75 MW or any MW level. It is not appropriate to enforce a one size fits all maximum value. There are no apparent reliability benefits from implementing a capacity loss limitation...why not pick 300 MW? Also we are not sure what prompted the additional distinction of allowing the load shedding only in the near-term planning horizon...please elaborate.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote ‘b’. DOE thresholds such as 300 MW can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made. Footnote ‘b’ is not limited to the Near-Term Transmission Planning Horizon since the footnote recognizes that Firm Demand can be interrupted throughout the entire planning horizon. No change made.		
Platte River Power Authority	No	We do not support a maximum threshold. 1) It is not appropriate to enforce a one size fits all maximum value that might unnecessarily over-burden some communities. 2) The public process proposed in this standard provides significant transparency from the transmission utilities and opportunity for community input to decisions that will impact both the community's reliability and rates. 3) Leave the maximum capacity threshold decisions to local regulatory commissions and Boards of Directors.
Response: (1) The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value		

Organization	Yes or No	Question 1 Comment
for the amount of Load that could be planned to be shed under footnote ‘b’. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made. (2) Thank you for your support. (3) The SDT believes it is unrealistic to consider the allowable usage of footnote ‘b’ in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. Local regulators are involved in the process through the wording in Attachment 1, Sections I and III. No change made.		
California Independent System Operator	No	While we have voted in favor of supporting the changes to the footnote and to move forward with the adoption of the standard, we remain concerned that there is not a good foundation for concluding that loss of load over 75 MW poses a reliability risk to the system compared to some higher MW threshold. Instead, the 75 MW capacity threshold is simply based on the current maximum planned loss of Non-Consequential Load. While we support minimizing reliance on Non-Consequential Load Loss, there may be scenarios where such reliance is unavoidable in the near-term, and therefore may be needed until capital upgrades can be put in place. At a minimum, the footnote or standard should provide for an exception process, should it be necessary for a planned Non-Consequential Load Loss of greater than 75 MW.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote ‘b’. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. The SDT believes that the referenced exception process is what is being proposed. The proposed process sets up an open and transparent process for allowing such Load shed in specific conditions and with specific limitations. No change made.		
Tri-State Generation & Transmission Association	No	

Organization	Yes or No	Question 1 Comment
LCRA Transmission Service Corporation	No	
Response: Without a specific comment, the SDT is unable to respond.		
TVA Transmission Reliability Engineering and Controls	Yes	TVA agrees with the general text; however, TVA believes that the 75 MW limit is too low. TVA believes that a better limit would be 100 MW - which is the amount for load shedding required to be reported under OE-417 under emergency operational policy. This would allow some future load growth as well as any possible new loads that may develop quickly in which a utility may not have time to complete necessary projects in a corrective action plan.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. DOE thresholds can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.

Response: Thank you for your support.		

2. **Do you agree with the description and components of the Stakeholder Process in Section I of Attachment 1? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.**

Summary Consideration: There was little or no commonality in the comments submitted and the responses are mainly statements clarifying SDT intent as shown in the individual responses.

The following change was made due to industry comment:

TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.

Organization	Yes or No	Question 2 Comment
Southern Company	No	The complex stakeholder process described in Attachment 1 should be required only if the amount of planned load shed exceeds 25 MW or the contingency is greater than 300 kV. Since the average use given in the survey was 19 MW and there is no evidence of harm to the BES reliability resulting from that use, there is no good reason to require such a stakeholder process for amounts less than 25 MW. The stakeholder process should only be required for larger amounts of load.
SCE&G	No	No, We recommend that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. Since the average use given in the survey was 19 MW and there is no evidence of harm to the BES reliability resulting from that use, there is no reason to require a stakeholder process for amounts less than 25 MW. This is consistent with the value cited in Section III.
TVA Transmission Reliability Engineering and Controls	No	TVA recommends that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. Since the average use given in the survey was 19 MW and there is no evidence of harm to the BES reliability resulting

Organization	Yes or No	Question 2 Comment
		from that use, there is no reason to require a stakeholder process for amounts less than 25 MW. This is consistent with the value cited in Section III.
SERC EC Planning Standards Subcommittee Associated Electric Cooperative	No	We recommend that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. Since the average use given in the survey was 19 MW and there is no evidence of harm to the BES reliability resulting from that use, there is no reason to require a stakeholder process for amounts less than 25 MW. This is consistent with the value cited in Section III.
Response: The SDT disagrees that the proposed process is complex or unnecessary. The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. The SDT believes that all uses of footnote 'b' should go through the stakeholder process. No change made.		
Seminole Electric Cooperative, Inc.	No	#1.It is unclear what factors must be met in order to be an affected stakeholder under the Stakeholder Process in Attachment 1? This process appears to be devoid of any objective factors that can assist an entity in determining whether a party is a stakeholder or not. NERC should define what an "affected stakeholder" is or list factors to assist industry in making such a determination. #2.In Standard TPL-002-1c, Attachment 1, Section I. "Stakeholder Process," there was a section added at the end of this subsection that is three lines in length. This section states that a stakeholder process does not need to be repeated unless there has been a "material change." It is clear from the latest webinar presentation on this Project that this language is not "clear and unambiguous". NERC does not present any metrics, whether qualitative or quantitative, to guide industry as to when a material change occurs to an application of footnote 'b.' Without any metrics to guide industry, it is bewildering that NERC reasons that entities will consistently interpret what a material change constitutes. Therefore, SECI believes that this provision is in conflict with the NERC Rules of Procedure and FERC Order

Organization	Yes or No	Question 2 Comment
		762. #3.In Standard TPL-002-1c, Attachment 1, Section I. “Stakeholder Process,” the requirement that the process “shall be documented” was deleted from the first paragraph. It does not appear to be reasonable that a process that is not written, nor known to any stakeholder, meets the common understanding of “open and transparent.” Seminole believes that the requirement that the process be documented and that documents be available to potential affected parties be reinstated into the Standard.
Response: 1. The SDT believes that the planning entity is in the best position to identify affected stakeholders and that any attempt to codify a list of such stakeholders in the proposed standards could lead to errors due to the necessity of having to adopt a one size fits all approach. No change made. 2. The SDT believes that the planning entity has the best understanding of when a change would become material. With the large range of design philosophies and geographic difference between the entities within NERC, it is not practical to adopt a single one size fits all approach. In addition, since the use of footnote ‘b’ will be a part of the entity’s Corrective Action Plans, interested stakeholders will have the opportunity to question the continued use of footnote ‘b’. No change made. 3. The SDT believes the ‘documented’ terminology is unnecessarily redundant since the entity must be able to demonstrate compliance to its Compliance Enforcement Authority. It should not be necessary to mandate that an entity has to document a process. No change made.		
NBSO	No	(1) The process presented in Section I of Attachment I is overly prescriptive. This Section needs only to stipulate that the proposed utilization of the footnote be reviewed through an open and transparent stakeholder process developed and/or approved by the jurisdiction (a Regional Entity or regulatory authority) of the area(s) whose load is affected area. (2) There is no basis to support allowing the utilization of the footnote in the Near-Term Transmission Planning Horizon of the Planning Assessment only. The footnote itself should not explicitly restrict its utilization to only the Near-Term horizon. Often, in the long-term planning horizon, when approval for transmission addition

Organization	Yes or No	Question 2 Comment
		or reinforcement cannot be obtained for whatever reasons, utilization of the footnote is considered and adopted, subject to stakeholder's and regulatory authority's approvals. Note that it is impractical to add or reinforce transmission facilities in a near-term planning (e.g. Year One) time frame and hence the proposed provision does not allow for utilizing the footnote for the interim period before new or reinforced transmission facilities are put in place. We suggest removing the word "Near-Term".
Response: (1) FERC remanded the standard because they wanted the stakeholder process better defined, including a blend of quantitative and qualitative criteria for allowing curtailment of Firm Demand and assurance that BES reliability would be maintained. The balloted draft added the indicated detail and specificity to the already approved approach. No change made. (2) Footnote 'b' is not limited to the Near-Term Transmission Planning Horizon since the footnote recognizes that Firm Demand can be interrupted throughout the entire planning horizon. As drafted, the standard defines the stakeholder process as mandatory for the Near-Term Transmission Planning Horizon since there may not be time to implement other corrective actions but does not limit its use in the Long-Term Transmission Planning Horizon. How individual entities reflect the Long-Term Transmission Planning Horizon situations in its individual stakeholder process is left to the entity to determine. No change made.		
ACES Power Marketing Standards Collaborators	No	(1) Many RTOs have well organized stakeholder processes that could be utilized to satisfy Attachment 1. Because the TPL standards apply to both the PC and TP, one may conclude that both functions need to have a stakeholder process. Rather, we think that the TP should be able to rely on its PC's stakeholder process. We recommend clarifying Attachment 1 that it is acceptable for the TP to rely on the PC's process and that both entities are not required to have redundant processes. The most important point is that stakeholders have an opportunity to participate.
Response: The SDT believes that it has covered this possibility in the revised language posted for this draft allowing an entity to use an existing process as long as it meets the criteria. Such usage is not restricted to a particular entity and as long as each entity is able to demonstrate that it meets the items in Section I, entities can share the same process. No change made.		
Minnkota Power Cooperative	No	1. MPC QUESTION: In Attachment 1 Section I, what is the definition of a

Organization	Yes or No	Question 2 Comment
Otter Tail Power Company		"stakeholder"? a. Is this intended to apply to multiple NERC functional entities (DP, TO, TOP, LSE), public residential customers, and/or business owners that are affected by system contingencies? b. RECOMMENDATION: Define stakeholder to be "affected Transmission Owners, Transmission Operators, Distribution Providers, and Load-Serving Entities." We believe it is most appropriate for the Transmission Owners, Transmission Operators, Distribution Providers, and Load-Serving Entities to objectively evaluate the risks of load shedding in a local area against the cost impact of a large transmission project on the rate base. 2. MPC QUESTION: In Attachment 1 Section I item 1, what does "including applicable regulatory authorities" refer to? a. Is this the same body that "applicable regulatory authority or governing body" refers to in Section III? b. Are these requirements still applicable if the 25 MW threshold in Section III is not passed? c. RECOMMENDATION: Attachment 1 Section I Item 1 could read "... including applicable regulatory authorities or governing bodies responsible for retail electric service as described in Section III. A clearly defined statement allows the Transmission Planner and Planning Coordinator to identify the appropriate parties to be included in every instance Attachment 1 is used.
Response: 1. The SDT believes that affected stakeholders should include the list of NERC functional entities and others. Transmission customers, Planning Coordinators, Transmission Planners, and regulatory authorities with retail jurisdiction should typically be included. The SDT believes that the planning entity has the best understanding of who an affected stakeholder will be and that any attempt to codify a list of such stakeholders in the proposed standards could lead to errors due to the necessity of having to adopt a one size fits all approach. No change made.		

Organization	Yes or No	Question 2 Comment
2. a. Yes, it is the same as those in Section III. b. Yes, these requirements are applicable for each circumstance of planned use of footnote b. The SDT believes that the use of the stakeholder process is necessary each time that an entity utilizes footnote b. c. The SDT did not accept your recommendation. The SDT believes that the suggested change may be too limiting since it refers to a single governing body. No change made.		
Western Area Power Administration	No	A public process seems out of place in a reliability standard.
Response: FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. No change made.		
Manitoba Hydro	No	A stakeholder process should not be required in jurisdictions where a legislation already authorizes interruptions, as consent of stakeholders cannot override legislation.
Response: The SDT does not believe that the consent of stakeholders will override legislation. The proposed process provides an opportunity for affected stakeholders, including regulators, to have the necessary information to fully understand the impacts of the planned use of footnote b. If the applicable regulator does not object to the planned use of footnote b, it may be used. No change made.		
Iberdrola USA	No	“Stakeholders” is undefined - would this be the same stakeholder body identified in the planning process of the Open Access Transmission Tariff?
Response: In many instances, the affected stakeholders would be the same stakeholders identified in the Open Access Transmission Tariff planning process. However, the SDT believes that the planning entity has the best understanding of who an affected stakeholder will be and that any attempt to codify a list of such stakeholders in the proposed standards could lead to errors due to the necessity of having to adopt a one size fits all approach. No change made.		

Organization	Yes or No	Question 2 Comment
Public Utility District No.1 of Snohomish County MEAG Power City of Austin Clark Public Utilities Tacoma Power	No	In the first sentence, remove the words “as an element of a Corrective Action Plan.” There are cases on the fringes of the system where Non-Consequential Load Loss is the preferred alternative in both the long term and short term, not as a temporary patch. Requiring the stakeholder process as part of Corrective Action Plan implies that using footnote 12 cannot be the long term choice. Since a Corrective Action Plan is a “list of actions and an associated timetable for implementation to remedy a specific problem,” using this term removes the stakeholders ability to evaluated the costs and benefits and instead requires them to treat this a problem where the only solution is building new facilities.
Response: The stakeholder process is not required as part of a Corrective Plan. What the attachment states is that use of the footnote cannot be part of the Corrective Action Plan unless it has gone through the process. And the SDT disagrees that inclusion of this language ever requires a construction solution. Bullet #7 in Section II requires that alternatives to Load shed be presented for process participants to see as well as providing the rationale for not selecting those alternatives. Cost and benefits can certainly be part of this rationale. No change made.		
Ameren	No	It is our opinion that that the stakeholder process should be conducted at least once every five years if non-consequential load is planned to be dropped as part of the Corrective Action Plan to meet single contingency events. If conditions have not materially changed since the last review, this information should still be communicated to the stakeholders.
Response: The SDT did not want to present repetitive information and unduly burden the planning entity or the stakeholder in this process. However, an entity can always do more than what is required in the standard. No change made.		
Tri-State Generation & Transmission Association	No	NERC Functional Model definitions for Planning Authorities and Transmission Planners do not include the types of activities being proposed in “Attachment 1.” How is it appropriate to mandate to functional entities functions that are outside those defined in the NERC functional model?
Response: The NERC Functional Model is a guideline for activities required of cited functional entities. It is periodically updated as		

Organization	Yes or No	Question 2 Comment
conditions change. While the activities mentioned in the standard may not be explicitly spelled out in the NERC Functional Model, the SDT does not believe that they are out of scope for either a Planning Coordinator or a Transmission Planner. No change made.		
New England States Committee on Electricity (NESCOE)	No	NESCOE appreciates the efforts of the SDT in developing a stakeholder process for considering the use of load interruption in system planning. NESCOE especially appreciates the heightened role accorded to states in light of jurisdictional issues raised by the prospect of shedding load and implications for retail customers. States must be intimately involved in weighing reliability considerations against the economic implications of alternative approaches. Regarding the language in Section I, see the comments above regarding striking "Near-Term" in this context. NESCOE also suggests that additional clarity is needed regarding the intended meaning of "applicable regulatory authorities or governing bodies responsible for retail electric service issues." This language potentially implicates state agencies beyond public utility commissions (e.g., state consumer advocates, attorneys general) and could create confusion for state agencies as well as transmission planners that are required to provide notice to such entities and, pursuant to Section III, provide a process for regulatory review. Instead, the SDT should revise the language to read "electric retail regulatory authorities," a term with clear meaning that the Commission has itself used. See, e.g., Order 719.
Response: Please see the response to question 1. The SDT believes that there may be instances where other regulatory bodies may want to be involved in the stakeholder process. The SDT disagrees that the proposed language will create confusion for state agencies or transmission planners. The SDT believes that the planning entity has the best understanding of who an affected stakeholder will be and that any attempt to codify a list of such stakeholders in the proposed standards could lead to errors due to the necessity of having to adopt a one size fits all approach. No change made.		
Independent Electricity System Operator	No	No. The process presented in Section I is overly prescriptive. If a section that prescribes the principles of a stakeholder process is required, then for Canadian entities this section should simply state that any threshold should be established in

Organization	Yes or No	Question 2 Comment
		a manner consistent with other service levels that apply to local transmission and retail service for the load to be curtailed. Corrective action plans can rarely be implemented in a one-year time frame, and in some cases, limited use of Non-consequential Load Loss will be preferable to unaffordable transmission enhancements, therefore we believe that the use of footnote 'b'/'12' should not be limited to the Near-Term Transmission Planning Horizon. We propose that the phrase "the Near-Term Transmission Planning Horizon of" be deleted from the opening paragraph.
Response: Canadian entities are allowed to adopt ERO Reliability Standards, reject them outright, or adapt them for their own use within the confines of provincial regulations. Nothing has changed in that regard with this proposed standard. The effective date language covers the situation. No change made. The SDT agrees that it may be difficult to implement construction options in a one year time frame and that the limited use of Non-Consequential Load Loss may be an acceptable option. Footnote 'b' is not limited to Year One or to the Near-Term Transmission Planning Horizon since the footnote recognizes that Firm Demand can be interrupted throughout the entire planning horizon. As drafted, the standard defines the stakeholder process as mandatory for the Near-Term Transmission Planning Horizon since there may not be time to implement other corrective actions but does not limit its use in the Long-Term Transmission Planning Horizon. How individual entities reflect the Long-Term Transmission Planning Horizon situations in its individual stakeholder process is left to the entity to determine. No change made.		
Midwest Independent Transmission System Operator, Inc.	No	No. MISO objects to a stakeholder process as outlined in Attachment 1. See our comments under Question 5.
Response: Please see response to question 5.		
Electric Reliability Council of Texas, Inc.	No	Please see ERCOT's response to Question 1 - stakeholder processes are not appropriate for NERC standards.
Response: Please see response to question 1.		

Organization	Yes or No	Question 2 Comment
Public Service Company of New Mexico	No	PNM voted yes to the Standard as a whole but would like the SDT to consider the following concern: Part II.2.b of Attachment 1 that requires an assessment of the effect of the use of Non-Consequential Load Loss under Footnote B on the health, safety, and welfare of the community, and PNM believes that assessments of this nature are entirely subjective and will be difficult to comply with and even more difficult to audit. It is our belief that this criteria should be removed from the Standard prior to its ultimate submittal to NERC.
Response: The SDT understands the concerns and has clarified the wording accordingly. The intent of the SDT is that this action should be analogous to that required in approved EOP-001-2.1b. Section II, Bullet 2b. ~~Assessment~~ A description of the effect of the use of Firm Demand interruption under footnote 'b' on the health, safety, and welfare of the community		
NB Power Transmission	No	The process in Attachment 1 is overly prescriptive. Attachment 1, if retained, needs only to stipulate that the proposed utilization of the footnote be reviewed through an open and transparent stakeholder process in compliance with the applicable regulatory authority oversight.
Response: FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. No change made.		
Hydro One Networks Inc.	No	The process presented in Section I is overly prescriptive. If a section that prescribes the principles of a stakeholder process is required, then for non-US entities this section should simply require that the process must be approved by the applicable Regulatory Authority or Governmental Authority or its delegated agency that is responsible for local transmission and retail service for the load to be curtailed in that jurisdiction.
Response: Canadian entities are allowed to adopt ERO Reliability Standards, reject them outright, or adapt them for their own use		

Organization	Yes or No	Question 2 Comment
within the confines of provincial regulations. Nothing has changed in that regard with this proposed standard. The effective date language covers the situation. No change made.		
LCRA Transmission Service Corporation	No	
Response: Without specific comments, the SDT is unable to respond.		
Xcel Energy	Yes	The possibility of NCLL is always present, whether in the planning or operational arena. Section I (#5) should however specifically state that in the dispute resolution process a stakeholder does not have right of refusal for NCLL. This should be especially true when a transmission project has been proposed and NCLL in the interim is required due to the regulatory process, equipment lead time, etc. preventing the completion of project at an earlier time.
Response: Bullet #5 does not require specific attributes of the dispute resolution process. The SDT believes that the attributes of the stakeholder process should be defined by the entity during the development of the stakeholder process. No change made.		
MRO NSRF USACE MidAmerican Energy Company	Yes	(1) In Attachment 1 Section I, what is the definition of a "stakeholder"? Which NERC functional entities would be included (TO, TOP, LSE)? Are the public residential and/or business owners that are affected included in the definition? Some parties may assume that local government representatives or residential or business owners are included as stakeholders. We believe it is most appropriate for the Transmission Owners, Transmission Operators, and Load-Serving Entities to objectively evaluate the risks of load shedding in a local area against the cost impact of a large transmission project on the rate base. RECOMMENDATION: Define stakeholder to be "affected Transmission Owners, Transmission Operators, and Load-Serving Entities." (2) In Attachment 1 Section I item 1, what does "including applicable regulatory authorities" refer to? Is this the same body that "applicable regulatory authority or governing body" refers to in Section III? Are these requirements still applicable if the

Organization	Yes or No	Question 2 Comment
		25 MW threshold in Section III is not passed? RECOMMENDATION: Attachment 1 Section I Item 1 could read "... including applicable regulatory authorities or governing bodies responsible for retail electric service issues as described in Section III. A less vague statement allows the important parties to be included in every instance Attachment 1 is used.
Response: (1) In many instances, the affected stakeholders would be the same stakeholders identified in the Open Access Transmission Tariff planning process. However, the SDT believes that the planning entity has the best understanding of who an affected stakeholder will be and that any attempt to codify a list of such stakeholders in the proposed standards could lead to errors due to the necessity of having to adopt a one size fits all approach. No change made. (2) The term applies to any applicable, interested regulatory authority and is not necessarily the same body as mentioned in Section III. Conversely, the regulatory body cited in Section III would certainly be one of the regulatory bodies referred to in Section I. If the result of Section I is that the entity is not going to move forward with the plan, then Section III will never occur. No change made.		
Texas Reliability Entity	Yes	Attachment 1, section I (Stakeholder Process) should be clarified to specify which 'responsible entity' needs to utilize or develop a transparent stakeholder process. For example, if a contingency event in Entity A's system causes Entity B to have to shed non-consequential firm load to meet the BES performance requirements, which Entity is responsible for ensuring the required review? TRE proposes adding the following sentence to the first paragraph to assign responsibility for this type of scenario: "The Planning Coordinator or Transmission Planner accountable for the contingency event will be responsible for implementing the stakeholder process and regulatory review."
Response: The SDT believes that the current terminology is clear in that it is the entity that plans to utilize the footnote that needs to initiate the process. No change made.		
California Independent System Operator	Yes	There is no basis to support only allowing the utilization of the footnote in the Near-Term Transmission Planning Horizon of the Planning Assessment. The footnote itself should not explicitly restrict its utilization to only the Near-Term horizon. Often, in the long-term planning horizon, when approval for transmission addition or

Organization	Yes or No	Question 2 Comment
		reinforcement cannot be obtained for a variety of reasons, utilization of the footnote is considered and adopted, subject to stakeholder's and regulatory authority's approvals. Note that it is impractical to add or reinforce transmission facilities in a near-term planning (e.g. Year One) time frame and hence the proposed provision does not allow for utilizing the footnote for the interim period before new or reinforced transmission facilities are put in place. We suggest to remove the word "Near-Term".
Response: Footnote 'b' is not limited to the Near-Term Transmission Planning Horizon since the footnote recognizes that Firm Demand can be interrupted throughout the entire planning horizon. As drafted, the standard defines the stakeholder process as mandatory for the Near-Term Transmission Planning Horizon since there may not be time to implement other corrective actions but does not limit its use in the Long-Term Transmission Planning Horizon. How individual entities reflect the Long-Term Transmission Planning Horizon situations in its individual stakeholder process is left to the entity to determine. No change made.		
Southern California Edison Company	Yes	The Stakeholder Process in Section I of Attachment 1 is similar to the method effectively used by the CAISO to manage and incorporate stakeholder input in its annual transmission planning process.
Platte River Power Authority	Yes	Although these descriptive steps for a public process seem out of place in a reliability standard, Section 1 is in line with the planning principles of FERC Order 890.
Southwest Power Pool Reliability Standards Development Team	Yes	
Duke Energy	Yes

Modesto Irrigation District	Yes	
Response: Thank you for your support.		

3. **Do you agree with the Information for Inclusion in the Stakeholder Process contained in Section II of Attachment1? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.**

Summary Consideration: Most of the commenters asked questions about the intent of the SDT in particular areas and the SDT has provided individual responses accordingly.

There was one major overriding concern about Section II, Bullet 2b on the assessment on public health and safety. The SDT has clarified its intent and also pointed out that the action required for this bullet item is analogous to what is already required in approved EOP-001-2.1b.

Some commenters also questioned the use of the term 'mitigate' in Section II, Bullet 5. The SDT has clarified this language.

The following clarifying changes have been made due to industry comments:

TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.

Section II, Bullet 2b. ~~Assessment~~ An explanation of the effect of the use of Firm Demand interruption under footnote 'b' on the health, safety, and welfare of the community

Section II, Bullet #5. Future plans to ~~mitigate~~ alleviate the need for Firm Demand interruption under footnote 'b'

Organization	Yes or No	Question 3 Comment
TVA Transmission Reliability Engineering and Controls	No	TVA would like to propose that this Stakeholder process be postponed in the event that a transmission fix for a load drop issue was already planned within the next 2 or 3 years. Thus the stakeholder process would only occur for projects that had no fix planned within the next couple of years. TVA is also not sure how to satisfactorily address "health, safety, and welfare of the community" - TVA would appreciate some guidance on how to properly address this.

Organization	Yes or No	Question 3 Comment
		TVA believes that item 1.b of Section II could contain CEII information and should have limited distribution. The appropriate non-disclosure agreements would need to be developed to prevent widespread publication of the information.
Response: ~~:~~The SDT believes that the stakeholder process should occur whenever footnote ‘b’ is proposed to be utilized. The construction option in later years will be a part of the information provided in the stakeholder process for review. In this case, there will only need to be one review through the stakeholder process, if there are no material changes before the construction option is completed. No change made. The SDT understands the concerns and has clarified the wording accordingly. The intent of the SDT is that this action should be analogous to that required in approved EOP-001-2.1b. Section II, Bullet 2b. ~~Assessment~~ An explanation of the effect of the use of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community If an entity believes that CEII information is involved then the entity should use the appropriate mechanisms to protect that information while still providing the basics of the information needed for the process to continue. No change made.		
ACES Power Marketing Standards Collaborators	No	(1) Adding the word “effect” on the health, safety, and welfare of the community creates more confusion regarding what is needed for the assessment. We recommend removing the effect clause from Section II. (2) We disagree that the Transmission Planner should be required to provide an assessment at all on the health, safety and welfare of the community. Attachment 1, Section 2a identifies the types of customers that are impacted without needing a formal assessment. Stakeholders will have an opportunity to provide information on impacts of planned load shedding through either the Transmission Planner’s stakeholder comment process or through the local regulatory agency’s stakeholder comment process. Further, these planned interruptions of firm demand are expected to be short in nature so any impact would be de minimis. Finally, an assessment on the health, safety and welfare of the community is an unnecessary burden on the registered entity and is better suited for local governments that can speak through the stakeholder process.

Organization	Yes or No	Question 3 Comment
		(3) Bullet 3 is based on available historical information. While this seems reasonable, we have concerns because of the rare instances that Non-Consequential Load Shed actually occurs. If a TP uses Non-Consequential Load Shed for the first time, there is no historical information. What would be an acceptable basis for the first use of Non-Consequential Load Shed when the entity is without historical information? (4) Expected time duration of the planned load shed is too speculative and should not be required because any duration will likely be a guess. When actual contingencies occur, the time of restoration varies and any time that was selected prior to the event is not likely to be correct. We do not see the value in predicting the duration time because there is too much uncertainty about how long an outage will really last. The SDT needs to clarify what is expected for the duration of the planned load shed. (5) While we appreciate that the response to our comments clarified the intent is that "Possible future plans could include a decision not to mitigate the need for Firm Demand interruption," the language in the Attachment simply does not reflect this. The Attachment specifically states "Future plans to mitigate the need for Non-Consequential Load Loss." A decision not to mitigate the need for Firm Demand interruption is not a future plan to mitigate. Consequently, Attachment 1, section II.5 will need to be modified to implement this intent. Otherwise, this language is certain to be interpreted as requiring a mitigation plan.

Response: (1) and (2) The SDT understands the concerns and has clarified the wording accordingly. The intent of the SDT is that this action should be analogous to that required in approved EOP-001-2.1b.

> Section II, Bullet 2b. ~~Assessment~~ An explanation of the effect of the use of Firm Demand interruption under footnote 'b' on the health, safety, and welfare of the community

(3) Historical performance is not limited to Contingencies which result in Non-Consequential Load Loss. The estimated frequency should be based on an entity's average historical performance of similar Facilities applied to the specific Element being evaluated. No change made.

Organization	Yes or No	Question 3 Comment
(4) The expected duration could be a range of values based on various assumptions. In the planning environment the entity should be able to analyze the situation and determine an expected duration for which an interruption would be in place. No change made. (5) The SDT agrees and has changed the language accordingly. 5. Future plans to ~~mitigate~~ alleviate the need for Firm Demand interruption under footnote 'b'		
Minnkota Power Cooperative Otter Tail Power Company	No	1. MPC QUESTION/COMMENT: In Attachment 1 Section II item 2b, "Assessment of the effect ... on the health, safety, and welfare of the community" is vague. Clarification is requested.a. RECOMMENDATION: Remove Item 2b because it requires the assessment of the footnote application impact on the potential health, safety, and welfare of the community. These types of assessments should be eliminated because they are not electric system reliability matters and were not stipulated by FERC. In the event that the Standards Development teams choses to keep item 2b, then add language semi-defining this as follows in Attachment 1 Section II Item 2b "...health, safety, and welfare of the community as determined by impact on critical health and emergency services." This allows the Transmission Planner and Planning Coordinator to identify the appropriate parties affected by the contingency to be analyzed in every instance Attachment 1 is used.
American Transmission Company	No	ATC recommends the following change in Section II of Attachment 1 applicable to both standards TPL-002-1c [page 8] and TLP-001-2a [page16]:Remove Item 2b altogether because it requires the assessment of the footnote application impact on the potential health, safety, and welfare of the community. These types of assessments should not be required in the Standards because they are not electric system reliability matters and were not stipulated within the FERC Order762.
Bonneville Power Administration	No	BPA does not support including information under Section II.2.b, an assessment of the use of Non-Consequential Load Loss on the health, safety, and welfare of the community. It would be nearly impossible for a planner to predict this in a future case since it is hard to predict what loads will actually materialize in the future. In addition, this information does not support reliability of the BES since reliability of

Organization	Yes or No	Question 3 Comment
		the transmission system is assessed by meeting required technical performance for certain contingencies and under certain conditions.
Arizona Public Service Company	No	Item 2b: Reference to health, safety, and welfare is unnecessary. All demand interruption are going to have some impact on health, safety, and welfare. The impact is subjective and will simply result in unnecessary study reports by consultants and will act as a road block.
Iberdrola USA	No	Regarding the documentation required for item 2.b, how are “health, safety, and welfare of the community” to be assessed? What are the metrics? How would compliance with this provision be evaluated?
MRO NSRF MidAmerican Energy Company USACE	No	Remove Item 2b because it requires the assessment of the footnote application impact on the potential health, safety, and welfare of the community. These types of assessments should be eliminated because they are not electric system reliability matters and were not stipulated by FERC.
Southern California Edison Company	No	SCE participates in the rigorous CAISO annual transmission planning process that considers the information included in the proposed Section II of Attachment 1. However, the proposed language in Section II.2.b. “Assessment of the effect of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community,” seems overly broad and confusing. The California Public Utility Commission (CPUC) and CAISO presently consider these items before approving transmission plans. It is unclear what type of information would be required in order to meet the seemingly broad request contained in Section II.2.b. SCE believes that the language of Section II.2.b. should be removed from Attachment 1, or alternatively, the language should be revised to specifically exempt critical loads, such as hospitals, fire department facilities, law enforcement facilities, and correctional facilities.
Public Utility District No.1 of	No	We suggest removing section 2b “Assessment...health, safety...” for three reasons:

Organization	Yes or No	Question 3 Comment
Snohomish County MEAG Power Clark Public Utilities		1)All outages have a negative impact on the community. Outages under footnote 12 do not inherently have more significant impact per MWhr lost than other outages allowed per Table 1. By requiring additional analysis for a similar societal impact, this provision discriminates against utilities at the fringes of the system. 2) While reminding planners to consider that their decisions do have real impacts to real people is a laudable goal, including this provision opens the door to significant legal liability and regulatory uncertainty. 3) An appendix to a footnote is the wrong place to introduce such a significant requirement. The Adequate Level of Reliability Task Force would be a more appropriate venue for this idea.
Tacoma Power City of Austin	No	We suggest removing section 2b “Assessment...health, safety...” for three reasons: 1)All outages have a negative impact on the community. Outages under footnote 12 do not inherently have more significant impact per MWhr lost than other outages allowed per Table 1. By requiring additional analysis for a similar societal impact, this provision discriminates against utilities at the fringes of the system. 2) While reminding planners to consider that their decisions do have real impacts to real people is a laudable goal, including this provision opens the door to significant legal liability and regulatory uncertainty. 3) An appendix to a footnote is the wrong place to introduce such a significant requirement. The Adequate Level of Reliability Task Force would be a more appropriate venue for this idea.
Response: The SDT understands the concerns and has clarified the wording accordingly. The intent of the SDT is that this action should be analogous to that required in approved EOP-001-2.1b. Section II, Bullet 2b. ~~Assessment~~ An explanation of the effect of the use of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community		
Tri-State Generation & Transmission Association	No	In the NERC Glossary of Terms, Interruptible Demand is defined as “Demand that the end-use customer makes available to its Load-Serving Entity via contract or agreement for curtailment.” The process described in Attachment 1 creates an agreement between stakeholders (aka “end-use customers”) and their transmission providers. Thus, if the process described in Attachment 1 is followed, the “Firm

Organization	Yes or No	Question 3 Comment
		Demand" referenced would be reclassified as "Interruptible Demand." In essence, "Footnote b" does not allow the interruption of Firm Demand. It merely requires that if interruption of Demand is required, it can only be Interruptible Demand. If this was the intention of FERC, NERC, and the Drafting Team, why didn't the drafting team just state "Interruption of Firm Demand is not allowed"?
Response: Upon reviewing the comments, the SDT has seen that a clarification for Demand that is not included as Firm Demand for footnote 'b' could be clarified as shown below. TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.		
Independent Electricity System Operator	No	No. The process presented in Section II is overly prescriptive. If a section that prescribes the information requirements for a stakeholder process is required, then for Canadian entities this section should simply state that any threshold should be established in a manner consistent with other service levels that apply to local transmission and retail service for the load to be curtailed.
Hydro One Networks Inc.	No	The process presented in Section II is overly prescriptive. If a section that prescribes the information requirements for a stakeholder process is required, then for non-US entities this section should simply require that the process information requirements must be in accordance with the requirements of the applicable Regulatory Authority or Governmental Authority or its delegated agency that is responsible for local transmission and retail service in that jurisdiction.
Response: Canadian entities are allowed to adopt ERO Reliability Standards, reject them outright, or adapt them for their own use within the confines of provincial regulations. Nothing has changed in that regard with this proposed standard. The effective date language covers the situation. No change made.		
Midwest Independent Transmission System Operator,	No	No. MISO objects to a stakeholder process as outlined in Attachment 1. See our

Organization	Yes or No	Question 3 Comment
Inc.		comments under Question 5.
Response: Please see response to question 5.		
Electric Reliability Council of Texas, Inc.	No	Please see ERCOT's response to question 1-the NERC Reliability Standards should not contain requirements related to stakeholder processes, whether they are procedural or substantive. If an exception process is retained, it should be outside of the NERC Reliability Standards (e.g. in the Rules of Procedure). To the extent the proposed standard inappropriately retains the stakeholder related aspects, ERCOT also provides the following comments on Section II-the ERCOT comments are in parentheses for easy reference and distinction relative to the proposed requirements.II. Information for Inclusion in Item #3 of the Stakeholder ProcessThe responsible entity shall document the planned use of Firm Demand interruption under footnote 'b' which must include the following: (ERCOT COMMENT: This is all that is needed for this. The documentation would be relative to the objective criteria developed for this purpose.) 1. Conditions under which Firm Demand interruption under footnote 'b' would be necessary:a. System Load level and estimated annual hours of exposure at or above that Load levelb. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency(ERCOT COMMENT: "1" is not necessary if objective criteria are developed as benchmarks for the exception process. In that case, exceptions would only be allowed if the objective criteria were met, regardless of the underlying assumptions related to conditions and contingencies.) 2. Amount of Firm Demand MW to be interrupted with:a. The estimated number and type of customers affectedb. Assessment of the effect of the use of Firm Demand interruption under footnote 'b' on the health, safety, and welfare of the community(ERCOT COMMENT: The considerations reflected in a and b are inappropriate for a reliability standard. Appropriate considerations for reliability standards are related to the reliability performance of the system. The considerations in a and b are more akin to quality of service issues better suited for

Organization	Yes or No	Question 3 Comment
		regional policy discussions. It is not within the purview of the SDT to address those matters.) 3. Estimated frequency of Firm Demand interruption under footnote 'b' based on historicalPerformance (ERCOT COMMENT: Historical performance is irrelevant. If the SDT is going to retain revisions that accommodate non-consequential load shedding, then the only relevant metrics are the objective criteria that set the benchmarks for such exceptions.) 4. Expected duration of Firm Demand interruption under footnote 'b' based on historical performance(ERCOT COMMENT: See ERCOT response to "3" above.) 5. Future plans to mitigate the need for Firm Demand interruption under footnote 'b'(ERCOT COMMENT: This is redundant to the requirement in the reliability standards that requires a plan to resolve any violations identified in the planning process.Furthermore, if load shedding is allowed, this requirement doesn't make sense. Presumably the idea behind allowing these exceptions is to obviate the prospective need for other alternatives. If that is not the case, then there is no need to allow the exceptions, because the transmission upgrades to mitigate the need for load shedding can be established in the planning horizon.) 6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 'b'(ERCOT COMMENT: The basis for the load shedding exception is to provide a means to meet the TPL performance requirements in the context of a planning assessment. Accordingly, this is redundant to the planning assessments, the point of which is to identify and resolve performance issues.) 7. Alternatives to Firm Demand interruption considered and the rationale for not selecting those alternatives under footnote 'b'(ERCOT COMMENT: Load shedding exceptions should be based on objective criteria and be reviewed pursuant to a process external to the NERC reliability standards. Alternative discussions could be part of that external process.)

Organization	Yes or No	Question 3 Comment
		8. Assessment of potential overlapping uses of footnote 'b' including overlaps with adjacent Transmission Planners and Planning Coordinators(ERCOT COMMENT: It is not clear what this means. Each functional entity performs assessments relative to its own system. This appears to introduce a vague regional transmission planning requirement with no structure or rules for such assessments.)
Response: Please see response to question 1. The SDT believes that the criteria in Section II are objective and represent the information that a stakeholder will want to see for assistance in determining their position on proposed planned actions. The SDT reminds the commenter that this process will involve some parties that are not experts in interpreting assessments and that these parties will need information that may be considered redundant or superfluous in other settings. Items such as historical performance would fall into this realm. No change made. The SDT has revised the language of bullet #5 due to other comments received. 5. Future plans to ~~mitigate~~ alleviate the need for Firm Demand interruption under footnote 'b' Bullet #8 does not introduce a regional planning requirement. It is consistent with Requirement R8 in proposed TPL-001-2a that mandate sharing of Planning Assessments. No change made.		
Xcel Energy	No	Section II should be left as part of the resolution in the dispute process and should not be made a requirement. Some in particular include:Â§ II.1. - this should be based only on applicable contingencies or conditions that could require NCLL. Having to include the estimated hours at or above a load level may not always be the most effective way to convey why NCLL will be used and adds little to the argument of why or why not it needs to be used. Â§ II.2.a - This may not always be apparent to the TO serving a wholesale transmission customers (REC, MUNICIPAL, etc.). This should be eliminated since it does little in emphasizing the need for NCLL. Â§ II.2.b - The "effect" of the use of NCLL may not always be apparent, because it is a perceived condition of what could happen that can be interpreted differently. I agree that it should be mentioned in the Stakeholder process outlining the locations

Organization	Yes or No	Question 3 Comment
		where NCLL will take place and let the dispute process identify and assess the health, safety and welfare of the community. How do you assess the effect in the Planning of NCLL. The effect should be identified by the party being affected and resolved in the dispute process. Â§ II.3 & 4. - This needs to be eliminated. Expected frequency and duration of NCLL based on historical performance DOES NOT GUARANTEE future performance and does little in emphasizing the need for NCLL. II.8 - This should be addressed by the Regional Planning Authority in their regional studies.
Response: The SDT disagrees and believes that the criteria in Section II represent the information that a stakeholder will want to see for assistance in determining their position on proposed planned actions. The SDT reminds the commenter that this process will involve some parties that are not experts in interpreting assessments and that these parties will need information that may be considered redundant or superfluous in other settings. Items such as historical performance would fall into this realm. No change made.		
ISO New England	No	Section II, 2.a states that studies must address the estimated number and type of customers affected by Non-Consequential Load Shedding. This language should be removed for three reasons.(1) This appears to be inappropriate for a reliability standard. The specific number and type of customers within a set number of MWs that are electrically acceptable do not impact the reliability of the bulk electric system (as defined by Section 215 of the Federal Power Act). (2) Even if the number and type of affected customers were an appropriate process question for an ERO standard, the number and type of customers may change depending on particular system configuration at the time of the load shedding. For example, a substation may be reconfigured to address other system issues such as maintenance and a certain number of MWs of load being interrupted, while still electrically acceptable from a system reliability perspective, may impact different numbers and types of customers. (3) Assuming that the number and type of customers affected were an appropriate metric, the Transmission Planner in many cases will not be the

Organization	Yes or No	Question 3 Comment
		appropriate entity to address these concerns. The Transmission Owner, Distribution Provider or Load Serving Entities would be the appropriate entities to address customer affects. Section II, 2.b should be revised to delete the reference to "health, safety, and welfare of the community." It is inappropriate for a NERC Standard to require planners to address the "health, safety, and welfare of the community." NERC's authority appears limited to regulating the "reliability" of the bulk electric system. Section 215 specifies that NERC's authority it to establish Reliability Standards necessary to ensure an "adequate level of reliability." Reliability Standards may specify the "design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation." Section 215 defines "reliable operation" as "operating the elements of the BPS within equipment and electrical system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements." Establishing this requirement is also arbitrary, because it is inconsistent with other transmission planning requirements. For example, the same load could be shed directly as the consequence of a fault and no such assessment is required. In addition, Transmission Planners can plan for the shedding of radial load with no assessment of health, safety and welfare. Section II, requirements 3 and 4 discuss estimating frequency and duration of Non-Consequential Load Loss based on historical performance. This provision is inconsistent with the manner in which transmission system planning is conducted and should be removed. The transmission system planning process uses deterministic not probabilistic assessments. While a power system may utilize these factors in assessing where the use of non-consequential load loss may be acceptable in terms of providing service, these factors do not inform reliability risks to the bulk electric system where the loss of load is found to be electrically acceptable in terms of system reliability (i.e., no thermal, voltage, or stability issues are created or

Organization	Yes or No	Question 3 Comment
		exacerbated and no instability, uncontrolled separation, or cascading failures result).
Response: The SDT believes that the criteria in Section II represent the information that a stakeholder will want to see for assistance in determining their position on proposed planned actions. The SDT reminds the commenter that this process will involve some parties that are not experts in interpreting assessments and that these parties will need information that may be considered redundant or superfluous in other settings. Items such as historical performance would fall into this realm. No change made. The SDT understands the concerns and has clarified the wording. The intent of the SDT is that this action should be analogous to that required in approved EOP-001-2.1b. Section II, Bullet 2b. ~~Assessment~~ An explanation of the effect of the use of Firm Demand interruption under footnote 'b' on the health, safety, and welfare of the community The SDT believes that the criteria in Section II represent the information that a stakeholder will want to see for assistance in determining their position on proposed planned actions. The SDT reminds the commenter that this process will involve some parties that are not experts in interpreting assessments and that these parties will need information that may be considered redundant or superfluous in other settings. Items such as historical performance would fall into this realm. No change made.		
SCE&G	No	We believe that item 1.b of Section II may contain Critical Energy Infrastructure Information (CEII) and should have limited distribution. The appropriate non-disclosure agreements would be required in order to prevent widespread publication of the information.
SERC EC Planning Standards Subcommittee Associated Electric Cooperative	No	We believe that item 1.b of Section II would contain CEII information and should have limited distribution. The appropriate non-disclosure agreements would need to be developed to prevent widespread publication of the information.
Response: If an entity believes that CEII information is involved then the entity should use the appropriate mechanisms to protect that information while still providing the basics of the information needed for the process to continue. No change made.		
NBSO	No	We do not agree with the need for Section II (and Attachment I as a whole) at all. The footnote, or Attachment I, should only stipulate that when Non-Consequential Load Loss is needed to ensure that BES performance requirements are met, then

Organization	Yes or No	Question 3 Comment
		regulatory approval from local jurisdiction needs to be provided with demonstration that the approval was obtained through an open stakeholder process.
Response: The SDT believes that the criteria in Section II represent the information that a stakeholder will want to see for assistance in determining their position on proposed planned actions. The SDT reminds the commenter that this process will involve some parties that are not experts in interpreting assessments and that these parties will need information that may be considered redundant or superfluous in other settings. Items such as historical performance would fall into this realm. No change made.		
LCRA Transmission Service Corporation	No	
NB Power Transmission	No	
Response: Without specific comments, the SDT is unable to respond.		
Texas Reliability Entity	Yes	In Section II, part 1b, TRE suggests replacing 'applicable rating' with 'steady state performance requirments', to account for all the BES performance requirements (in particular, steady-state and post-contingency voltages) for which the footnote may be utilized.
Response: Applicable ratings are the basis for the performance requirements in Table 1 of proposed TPL-001-2a. Therefore, the SDT believes that the existing terminology correctly addresses the performance issue. No change made.		
Southwest Power Pool Reliability Standards Development Team	Yes	In this section the reference to Customers should only be Customers of Transmission and not open ended for any customer. Once it is sold wholesale the TP wouldn't know where it is being sent to. We would also note that under some jurisdictions that there is a minimum duration threshold for keeping historical data on some of these events that are being requested under this section. Need to add language to accommodate these thresholds so as not to contradict what is being asked for by the regulatory bodies.
Response: The SDT disagrees that the only customers that should be considered are wholesale customers. The total number of		

Organization	Yes or No	Question 3 Comment
customers affected is information that helps other stakeholders understand the full impact of the planned usage of footnote 'b'. The SDT also disagrees that the Transmission Planner will not know where the Load will be lost. The Transmission Planner cannot evaluate the impacts of interrupting Firm Demand without knowing where the Load is connected to the BES system. The historical information is not related to historical planned Load interruption, but rather the historical performance of similar Facilities. However, If an entity does not have its own historical information available then it should use other available data to make its best estimate of what the values will be. No change made.		
New England States Committee on Electricity (NESCOE)	Yes	NESCOE agrees with the list provided in Section II. Regarding item #7, in the interest of explicit direction, NESCOE suggests adding at the end of the sentence the following language: "and cost comparisons of all alternatives."
Response: Cost considerations will be part of a rationale for selection or non-selection of an alternative. The SDT believes the current terminology captures this concept. No change made.		
Ameren	Yes	We believe that item 1b of Section II would contain critical electric infrastructure information (CEII) and should have limited distribution. The appropriate non-disclosure agreements would need to be developed to prevent widespread publication of the material.
Response: If an entity believes that CEII information is involved then the entity should use the appropriate mechanisms to protect that information while still providing the basics of the information needed for the process to continue. No change made.

Modesto Irrigation District	Yes	
Response: Thank you for your support.		

4. Do you agree with the text in Section III of Attachment 1? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: The majority of the comments received here are similar to those submitted for question 1 and similar responses have been provided.

The following clarifying changes were made due to industry comments:

TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.

Attachment 1, Section III, first paragraph: Before a Firm Demand interruption under footnote 'b' is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ~~assure~~ ensure that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues do~~es~~ not object to the use of Firm Demand interruption under footnote 'b' if either:

Attachment 1, Section III, last paragraph: Once assurance has been received that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues do~~es~~ not object to the use of Firm Demand interruption under footnote 'b', the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 'b' for Firm Demand interruption.

Organization	Yes or No	Question 4 Comment
Public Utility District No.1 of Snohomish County MEAG Power City of Austin Clark Public Utilities	No	1) Similar to our comment on question 2, please remove the words "as an element of a Corrective Action Plan" from the first sentence. There are cases on the fringes of the system where Non-Consequential Load Loss is the preferred alternative in both the long term and short term, not as a temporary patch. Since a Corrective Action Plan is a "list of actions and an associated timetable for implementation to remedy a specific problem," using this term removes the stakeholders ability to evaluate the costs and benefits and instead requires them to treat this a problem where the only solution is building new facilities.

Organization	Yes or No	Question 4 Comment
		2) For any specific use of footnote b, there could be several applicable regulatory authorities such as small municipalities or public utility districts. The standard should clarify whether the planner must show evidence that every authority did not object, or whether the planner only needs to show that less that 25 MW was not rejected by the regulatory authorities. To accomplish this clarification, we propose: A) In Section III paragraph 1 and paragraph 5 change "regulatory authority or governing body" to "regulatory authorities or governing bodies." B) Add a sentence to bullet 2 to read "If multiple regulatory authorities or governing bodies are responsible for retail electric service issues, only the portion of Non-Consequential Load Loss exceeding 25 MW is subject to section III."
Tacoma Power	No	1) Similar to our comment on question 2, please remove the words "as an element of a Corrective Action Plan" from the first sentence. There are cases on the fringes of the system where Non-Consequential Load Loss is the preferred alternative in both the long term and short term, not as a temporary patch. Since a Corrective Action Plan is a "list of actions and an associated timetable for implementation to remedy a specific problem," using this term removes the stakeholders ability to evaluate the costs and benefits and instead requires them to treat this a problem where the only solution is building new facilities. 2) For any specific use of footnote b, there could be several applicable regulatory authorities such as small municipalities or public utility districts. The standard should clarify whether the planner must show evidence that every authority did not object, or whether the planner only needs to show that less that 25 MW was not rejected by the regulatory authorities. To accomplish this clarification, we propose: A) In Section III paragraph 1 and paragraph 5 change "regulatory authority or governing body" to "regulatory authorities or governing bodies." B) Add a sentence to bullet 2 to read "If multiple regulatory authorities or governing bodies are responsible for retail electric service issues, only the portion of Non-Consequential Load Loss exceeding 25 MW is subject to section III."

Organization	Yes or No	Question 4 Comment
Response: (1) The SDT disagrees. When alternatives and the rationale for selection or non-selection of those alternatives are presented, cost factors can certainly be part of the rationale. In proposed TPL-001-2a, Requirement R2, Part 2.7.1, a list of possible actions that could be included in a Corrective Action Plan is provided. This list shows several alternatives that do not require the building of new Facilities. No change made. (2) The SDT agrees that the plural use of the terms shown in A) above should be consistent throughout the document and has made corresponding changes to reflect this. The SDT does not agree with the proposed change shown in B). The footnote is applicable for a single Contingency and ownership or jurisdictional concerns do not come into play. The total value of Load affected by the single Contingency is the correct value to determine if the situation is subject to Section III. Attachment 1, Section III, first paragraph: Before a Firm Demand interruption under footnote 'b' is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ~~assure~~ ensure that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues do~~es~~ not object to the use of Firm Demand interruption under footnote 'b' if either: Attachment 1, Section III, last paragraph: Once assurance has been received that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues do~~es~~ not object to the use of Firm Demand interruption under footnote 'b', the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 'b' for Firm Demand interruption.		
MRO NSRF USACE	No	(1) In Attachment 1 Section III, what is the definition of "applicable regulatory authority or governing body"? Is this the state PSC or PUC? Is it the Regional Reliability Organization (RRO)? Is it the Reliability Coordinator (RC)? RECOMMENDATION: Depending on the answer to the above question, define "applicable regulatory authority or governing body" more precisely. The language could read "applicable regulatory authority or governing body responsible for retail electric service such as the state Public Services Commission or Public Utilities Commission". A less vague statement allows the important parties to be included in every instance Attachment 1 is used. (2) In Attachment 1, if non-consequential load loss is planned at multiple bulk delivery points to mitigate the same contingency should the total load loss count

Organization	Yes or No	Question 4 Comment
		towards the 25 MW and 75 MW thresholds or should the loads be counted individually? EXAMPLE: There are two load serving substations (X load at substation B and Y load at substation C) on a long 115 kV line with 230/115 kV transformation at each end (substation A and substation D). Automatic under-voltage load shedding is in place at substations B and C, the UVLS relays at each substation making load trip decisions based on local voltage (i.e. independent operation). If one end of the 115 kV line trips and 115 kV voltage is below allowable levels at both substations X and Y, then the total load tripped by UVLS will be X+Y. Does the X+Y value count towards the 25 MW and 75 MW thresholds or are X and Y counted separately? What if X load is dropped for one contingency and Y load is dropped for a different contingency, is the total load counted X+Y or each load separately? RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote 'b' could read "In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for any single contingency." Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion. (3) If non-consequential load loss is planned at multiple bulk delivery points in close proximity to mitigate different contingencies should the total load loss count towards the 25 MW and 75 MW thresholds or should the loads be compared individually? For example, there are two load serving substations (X load at substation B and Y load at substation C) on a networked 115 kV line with 230/115 kV transformation at both ends (substation A and substation D). Automatic under-voltage load shedding is in place at substations B and C that would trip X amount of load if one end of the 115 kV line tripped and 115 kV voltage was below allowable levels, and would trip Y amount of load if the other end of the 115 kV line tripped and 115 kV voltage was below allowable levels. Does the X+Y value count towards the 25 MW and 75 MW thresholds or are X and Y counted separately? In addition to the aforementioned contingencies, if the 115 kV line between substations B and C opens, both loads X and Y will trip. Now does the X+Y value count towards the 25

Organization	Yes or No	Question 4 Comment
		MW and 75 MW thresholds? (4) In Attachment 1, if UVLS relaying is programmed at a sub to trip the load in stages at multiple voltage setpoints, such that only a fraction of the load is tripped for a given contingency, is the entirety of the load still counted towards the 25 MW and 75 MW thresholds? EXAMPLE: Substation B has X load that will trip if the BES voltage gets to 0.92 p.u. and Y that will trip if the BES voltage gets to 0.88 p.u. If only X amount of load is required to mitigate a single contingency in the near-term TPL assessment, is X load counted towards the 25 MW and 75 MW thresholds or is X+Y load counted? Is there a difference if the Y load is at a different, nearby substation with both loads having the aforementioned tripping logic? RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote 'b' could read "In no case can the planned Firm Demand interruption under footnote 'b' (as demonstrated in the near-term horizon analysis) exceed 75 MW." Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain much more clearly what is counted towards the two thresholds and decrease confusion
Minnkota Power Cooperative Otter Tail Power Company	No	1. MPC QUESTION: In Attachment 1 Section III, what is the definition of "applicable regulatory authority or governing body"? a. Is this the state Public Service Commission or Public Utilities Commission, the Regional Reliability Organization (RRO), and/or the Reliability Coordinator (RC)? b. RECOMMENDATION: Depending on the answer to the above question, define "applicable regulatory authority or governing body" more precisely. The language could read "applicable regulatory authority or governing body responsible for retail electric service such as the state Public Services Commission or Public Utilities Commission". A clearly defined statement allows the Transmission Planner and Planning Coordinator to identify the appropriate parties to be included in every instance Attachment 1 is used. 2. MPC QUESTION: In Attachment 1, if non-consequential load loss is planned at multiple bulk delivery points to mitigate the same contingency should the total load loss count towards the 25 MW and 75 MW thresholds or should the loads be

Organization	Yes or No	Question 4 Comment
		counted individually? a. EXAMPLE: There are two load serving substations (X load at substation B and Y load at substation C) on a long 115 kV line with 230/115 kV transformation at each end (substation A and substation D). Automatic under-voltage load shedding is in place at substations B and C, the UVLS relays at each substation making load trip decisions based on local voltage (i.e. independent operation). If one end of the 115 kV line trips and 115 kV voltage is below allowable levels at both substations X and Y, then the total load tripped by UVLS will be X+Y. i. Does the X+Y value count towards the 25 MW and 75 MW thresholds or are X and Y counted separately? ii. What if X load is dropped for one contingency and Y load is dropped for a different contingency, is the total load counted X+Y or each load separately? b. RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote ‘b’ could read “In no case can the planned Firm Demand interruption under footnote ‘b’ exceed 75 MW for any single contingency.” Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This clarification would explain much more clearly what is counted towards the two thresholds and decrease confusion. 3. MPC QUESTION: In Attachment 1, if UVLS relaying is programmed at a sub to trip the load in stages at multiple voltage setpoints, such that only a fraction of the load is tripped for a given contingency, is the entirety of the load still counted towards the 25 MW and 75 MW thresholds? a. EXAMPLE: Substation B has X load that will trip if the BES voltage gets to 0.92 p.u. and Y that will trip if the BES voltage gets to 0.88 p.u. i. If only X amount of load is required to mitigate a single contingency in the near-term TPL assessment, is X load counted towards the 25 MW and 75 MW thresholds or is X+Y load counted? ii. Is there a difference if the Y load is at a different, nearby substation with both loads having the aforementioned tripping logic? b. RECOMMENDATION: In TPL-002-1c, the last sentence in Table I footnote ‘b’ could read “In no case can the planned Firm Demand interruption under footnote ‘b’ (as demonstrated in the near-term horizon analysis) exceed 75 MW at a single substation.” Similar language could be added in Attachment 1 Section III in regards to the 25 MW and 75 MW thresholds and in TPL-001-2a as well. This would explain

Organization	Yes or No	Question 4 Comment
		much more clearly what is counted towards the two thresholds and decrease confusion.
Response: (1) The SDT believes that any attempt to more specifically enumerate regulatory bodies will result in the exact opposite effect of what is stated in that inevitably there will be a one-off situation that doesn't fit the statement. The SDT believes that the entity will know who needs to be involved and will take the appropriate steps to make certain that the correct parties are involved. No change made. (2) Footnote 'b' only applies to single Contingencies so the SDT believes that adding the suggested words would be redundant. In the specific example cited, if the actions taken are the result of the same single Contingency, then the total value of the Load shed would be applicable. No change made. (3) If the Load shed is the result of different Contingencies, the proximity doesn't matter and the Load would be counted separately. (4) The SDT believes that the suggested wording would be redundant. Only Load shed due to a single Contingency is applicable here. No change made.		
ACES Power Marketing Standards Collaborators	No	(1) We disagree with the threshold of 75 MW, as mentioned above.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.		
Southern California Edison Company	No	As applied to SCE's service territory, Section III of Attachment 1 appears to require written acknowledgement and approval by the CPUC of each and every Firm Demand interruption authorized by the CAISO's annual transmission plan. In California, the CPUC is notified of and invited to every CAISO meeting on transmission planning, but the CPUC generally does not provide specific written assurances or agreement on detailed elements of the CAISO transmission plan. SCE believes that a general approval of the overall plan from the regulatory body should

Organization	Yes or No	Question 4 Comment
		be adequate.
Response: The SDT disagrees that formal approval is required for every instance of Firm Demand interruption as Section III only applies for Load over 25 MW. Obtaining assurance from regulators that they do not object will undoubtedly occur in different ways. Some regulators may provide written assurances or agreement but that is not required by the standard. No change made.		
Bonneville Power Administration	No	For use of Non-Consequential Load Loss in Year One of the Planning Assessment, BPA believes that assurance received from the applicable regulatory authority or governing body responsible for retail electric service issues is adequate and submission to the ERO for a determination of adverse impact is unnecessary. The local utility and regulators are better positioned to determine adverse impacts on an individual system, whereas the ERO would have to develop a process and criteria for assessing adverse impacts.
Response: The remand Order made it clear that oversight was required for instances where use of footnote 'b' was proposed. The ERO is aware of the proposed responsibility and has accepted this role if the industry approves. No change made.		
Tri-State Generation & Transmission Association	No	How would section III of "Attachment 1" be applied to entities that only deliver wholesale electric service and no retail electric service?
Response: The SDT believes that the wholesale customer will be one of the stakeholders included in the process and any use of the footnote must go through the stakeholder process. No change made.		
Modesto Irrigation District	No	I am voting NO because there is no technical basis for use of the 75 and 25 MW absolute threshold values, regardless of the size of the utility's load, referenced in the proposed standard. WECC's past experience with implementation of arbitrary magnitudes for requirements (e.g., the 5% and 7% arbitrary magnitude contingency reserve requirements), has proved to be problematic. I would suggest investigating a technical basis for using a relative requirement, such as percentage of the utility's load, maybe 5% and 2.5%, respectively, and that it be based on technical requirements similar to those found in Table 1 of the WECC Criteria TPL-001-WECC-

Organization	Yes or No	Question 4 Comment
		CRT-2.Thank you.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. Utilizing a percentage of an entity's Load may be problematic – when dealing with a small entity it could be a small value but still of rather large import and if dealing with a large entity could result in significant amounts of Load shed being planned. And, the FERC Order states that a percentage approach would not be appropriate for the aforementioned reasons. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.		
Electric Reliability Council of Texas, Inc.	No	If non-consequential load shedding is allowed for single contingency conditions, as discussed above, it should be based on objective critieria. As such, there is no need for the proposed stakeholder process, including the Section Ill instances requiring regulatory review. Furthermore, establishing approval roles in planning processes for entities other than the relevant functional entities conflicts with the appropriate roles, and appropriate separation of those roles, of the relevant entities (i.e. the planning authority and the state regulatory body and NERC RE). Typically a functional entity performs the functional activity, and others relevant to the proposed process in the standard perform compliance and regulatory oversight of the functional performance. This is a practical concern, and also potentially raises conflicts between governing authorities that create the separation of roles, where, typically, the relevant authorities establish a functional entity as the planning entity, and NERC and its REs and state regulators (as relevant - e.g. in ERCOT) are charged with compliance and regulatory oversight. As with the other stakeholder process sections, that section should be eliminated.
Response: The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted		

Organization	Yes or No	Question 4 Comment
draft added detail and specificity to the already approved approach. No change made. The SDT believes that the role provided to regulatory bodies is consistent with current practices in the industry today. While formal approval may not be provided by some regulatory bodies as pointed out in other comments, Section III does not require formal approval but rather a lack of dissent. No change made.		
National Association of Regulatory Utility Commissioners	No	It appears that the 25 MW minimum value is merely a reflection of antidotal information from a small number of data request responders and as such is not technically justified. NARUC is not poised to offer an alternative; given that the State/local regulator is consulted in this process, States should be appraised if any load is anticipated to be shed under any planning criteria. Thus, no mimimum value should be set.
Response: The data request is not anecdotal information. All of the Transmission Planners in the continental United States supplied their data in response to the data request. The SDT believes it is unrealistic to consider the allowable usage of footnote 'b' in the planning process without a cap on the amount of Load planned to be shed. The SDT also believes that such a position is consistent with the wording in the Order. Absent any alternative suggestion and given the participation of appropriate regulatory bodies in both Sections I and III, the SDT believes that the current threshold is the best possible solution. No change made.		
Xcel Energy	No	It does not appear that an entity has any options if the applicable regulatory authority or governing body objects to the use of NCLL in year one. This could potentially occur as a result of load patterns and generation issues submitted by an LSE not necessarily having BES elements and the only solution is to implement NCLL. In year one, it is too late to build any necessary and NCLL may be the only alternative.
Response: While the requirement is not mandatory until Year One, the SDT believes that it would be a good practice to move forward as soon as an entity knows it is contemplating usage of the footnote. That way, alternatives can be openly discussed before time becomes an overriding concern. The instance described above points to the need for the stakeholder process as this process will facilitate closer coordination with the Load-Serving Entities providing the information and the applicable regulators. No change made.		

Organization	Yes or No	Question 4 Comment
MidAmerican Energy Company	No	Item III of Attachment I should be deleted completely. Non ERO regulatory review is not necessary. Applicable regulatory authority or governing bodies responsible for retail electric service issues are stakeholders which may participate in the stakeholder process. Further, there are concerns compliance may not be possible because item III makes non-NERC applicable regulatory authorities or governing bodies responsible for retail electric service issues part of a NERC mandatory compliance without consequence to the said non-NERC governing bodies. Non-NERC entities are not constrained by NERC mandatory laws and penalties and aren't compelled to perform actions to meet NERC compliance. This opens a risk to any NERC regulated entities governed by such regulatory or governing bodies that do not or may not feel compelled to have a process for the NERC regulatory review specified in item III of attachment I.
Response: The SDT believes that the role provided to regulatory bodies is consistent with current practices in the industry today. While formal approval may not be provided by some regulatory bodies as pointed out in other comments, Section III does not require formal approval but rather a lack of dissent. No change made.		
New England States Committee on Electricity (NESCOE)	No	NESCOE is concerned that the 25 MW minimum value for regulatory review lacks sufficient technical justification. NESCOE understands that the SDT used responses to data requests to establish this 25 MW value, which is based on the average number of MWs that entities applying footnote “b” reported using in transmission planning. This may be a good starting point, but additional analysis is warranted. Specifically, the analysis should consider a more direct nexus to the system, such as substation design criteria. Additionally, as detailed above, Attachment 1 should provide clarity regarding the meaning of “applicable regulatory authorities.” Moreover, clarification is required regarding the initial triggering factor for regulatory review. Section III states that the regulatory review process is required before the footnote can be utilized in “Year One” of the planning horizon. Does this mean that such regulatory review only applies to year one or does it apply to year one and beyond?

Organization	Yes or No	Question 4 Comment
		If the former, NERC needs to provide a clear rationale for restricting such review when limiting factors are already applied (i.e., voltages greater than 300 kV or a 25 MW minimum threshold value).

Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote ‘b’. Other considerations can be a point of reference or sanity check but in and of themselves are not sufficient for setting a threshold in this matter. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach and that no further research is required. No change made.

The SDT believes that any attempt to more specifically enumerate regulatory bodies will result in the exact opposite effect of what is stated in that inevitably there will be a one-off situation that doesn’t fit the statement. The SDT believes that the entity will know who needs to be involved and will take the appropriate steps to make certain that the correct parties are involved. The only mandated trigger for review is the need to have met the stipulations of the footnote and attachment prior to utilizing Load shed for single Contingencies in a Corrective Action Plan in Year One. While the requirement is not mandatory until Year One, the SDT believes that it would be a good practice to move forward as soon as an entity knows it is contemplating usage of the footnote. That way, alternatives can be openly discussed before time becomes an overriding concern. No change made.

As stated, the review is only required prior to utilizing the footnote in a Corrective Action Plan in Year One. The SDT believes this terminology is clear and understood. No change made.

Organization	Yes or No	Question 4 Comment
Independent Electricity System Operator	No	No. The process presented in Section III is overly prescriptive and requires information not necessary to the intended purpose.As state in Q1, we disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard, and propose alternate language as stated in Q1 comments.If this section must deal with a review of the use of footnote ‘b’/’12’ to ensure that there are no adverse reliability impacts on the bulk power system, then it should be limited to the information required for that purpose. Provided there is local support for the use of Non-Consequential Load Loss under footnote ‘b’/’12’, only information items 6 and 8 from section II are relevant for this assessment-the remainder are not required for this section and should be deleted.

Organization	Yes or No	Question 4 Comment
		As stated in Q2 above, the use of footnote ‘b’/’12’ shouldn not be limited to the Near-Term Planning Horizon. We propose that the words “in Year One of the Planning Assesssment”be deleted.Items 1 and 2 complicate this section and are unneccesary. They should be replaced by a phrase such as “for those planning events where the use of footnote ‘b’/’12’ is referenced”. We disagree with the need to submit to the ERO for a determination of whether there are any adverse reliability impacts caused by the use of Non-Consequential Load Loss. This will introduce a new type of review at the ERO that will create uneccesary delays and burden, and is inconsistent with and not required for all of the other performance requirements in the TPL standards. Submitting the analysis to the adjacent Planning Coordinators and Tranmission Planners, and any functional entity that requests it, as called for in requirement R8 of TPL001-2 should be sufficient.
Response: Please see the response to question 1. Please see the response to question 2. The remand Order made it clear that oversight was required for instances where use of footnote ‘b’ was proposed. The ERO is aware of the proposed responsibility and has accepted this role if the industry approves. The SDT believes that Requirement R8 of proposed TPL-001-2a is an important concept for sharing information and potentially resolving local differences, but it does not necessarily provide the wider area view that the ERO could provide. No change made.		
Midwest Independent Transmission System Operator, Inc.	No	No. MISO objects to a stakeholder process as outlined in Attachment 1. See our comments under Question 5.
Response: Please see response to question 5.		
Southwest Power Pool Reliability Standards Development Team	No	Section III is superfluous if the regulatory bodies are attending the open stakeholder process. This section should be removed due to the fact that if there is an issue or question on these events they should be addressed in the open stakeholder

Organization	Yes or No	Question 4 Comment
		meeting. Not sure why the team decided to add the ERO as an entity to check after the regulatory body has approved the use. We feel like if there needs to bee coordination between affected entities that they could participate in the open stakeholder process as well. You could add that they include possible affected entities to the invite list of the open meeting to discuss these footnote applications under section 1.
Response: The invitees to the stakeholder process should include all applicable entities and would be expected to include applicable regulatory bodies as shown. However, there is existing protocol for relationships between functional entities and regulatory bodies that goes beyond the extent of Section I and that is out of the purview of the SDT. That difference as well as the difference in Load levels between Sections I and III is what drove the SDT to produce the draft as posted. No change made. The remand Order made it clear that oversight was required for instances where use of footnote ‘b’ was proposed. The ERO is aware of the proposed responsibility and has accepted this role if the industry approves. No change made. The invitees to the stakeholder process should include all applicable entities and would be expected to include applicable regulatory bodies as shown. However, there is existing protocol for relationships between functional entities and regulatory bodies that goes beyond the extent of Section I and that is out of the purview of the SDT. That difference as well as the difference in Load levels between Sections I and III is what drove the SDT to produce the draft as posted. No change made.

NBSO	No	See our comments under Q2 and Q3, above.
Response: Please see responses to questions 2 and 3.		
Massachusetts Attorney General	No	The 75 MW and 25 MW limits do not belong there. It would be best if the limits were established by stakeholder consensus and by state rulemakings.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.		
National Grid	No	The current document includes the language: 2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW.This gives no concept of how long customers could expect to be out of service and hence whether this would be an appropriate approach. Suggest using a value that is based on energy, i.e., MWh. A value of 600MWh would represent 25 MW out for 24 hours, or could be 60 MW out for 10 hours, etc. This would seem to provide a more valuable understanding the true impact to customers in assessing the health, safety and welfare. It is also expected that if Demand Resources are being used that they would be excluded from the term "non-consequencial" load, and that the value being discussed is only that in addition to any Demand Resources being used.
Response: The Section 1600 data request showed that entities were reporting footnote 'b' usage strictly in terms of MW. Therefore, the SDT decided to stay with existing terminology in this regard. In addition, duration is one of the factors required in Section II so the time element will be known to process participants. No change made. Upon reviewing the comments, the SDT has seen that Demand that is not included as Firm Demand for footnote 'b' could be clarified		

Organization	Yes or No	Question 4 Comment
as shown below. TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.		
Hydro One Networks Inc.	No	The process presented in Section III is overly prescriptive and duplicates information not necessary for its intended purpose.As stated in Q1, we disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard, and propose alternate language in our response to Q1.If this section is required to address a review of the use of footnote 12 to ensure that there are no wide-spread adverse reliability impacts on the bulk power system, then it should be limited to the information required for that purpose. Provided there is local support for the use of Non-Consequential Load Loss under footnote 12, only information items 6 and 8 from section II are relevant for this assessment-the remainder are not required for this section and should be deleted. Items 1 and 2 complicate this section and are unneccesary. They should be replaced by a phrase such as “for those planning events where the use of footnote 12 is referenced.” We disagree with the need to submit this information to the ERO for a determination of whether there are any Adverse Reliability impacts caused by the use of Non-Consequential Load Loss. This will introduce a new type of review at the ERO that will create uneccesary delays and burden, and is inconsistent with (and not required for) all of the other performance requirements in the TPL standards. Submitting the analysis to the adjacent Planning Coordinators and Tranmission Planners, and any functional entity that requests it, as called for in requirement R8 of TPL-001-2 should be sufficient.
Response: Please see the response to question 1. Items 1 and 2 place the constraints in the process that separate the less restrictive procedure outlined in Section I from the more		

Organization	Yes or No	Question 4 Comment
restrictive procedure in Section III. The suggested change would require the same level of review for any use of the footnote. The SDT does not believe that this is where the industry wants to go based on comments received. No change made. The remand Order made it clear that oversight was required for instances where use of footnote ‘b’ was proposed. The ERO is aware of the proposed responsibility and has accepted this role if the industry approves. Therefore, the SDT believes that there will not be any undue delays. The SDT believes that Requirement R8 of proposed TPL-001-2a is an important concept for sharing information and potentially resolving local differences, but it does not necessarily provide the wider area view that the ERO could provide. No change made.		
Ameren	No	The responses to the data request indicate that 33% of the respondents that use footnote “b” would drop 20 MW or less for single contingency events. Based on the data, we believe that the threshold for reporting should be 20 MW instead of 25 MW. As noted above in the response to item 1, we also believe that an upper limit of 40 MW should be established, again based on the responses to the data request. We find this proposed stakeholder process unique because we are inviting retail regulatory authorities to become involved in the compliance process for a handful of utilities now, but potentially for more in the future. We are unaware of any other standards where a state governmental agency is needed to grant permission for utilities to utilize certain aspects of the standard. We believe that this proposed process would potentially set a bad precedent, is not good policy for either the regulators or the transmission planners, and does not belong in a NERC standard.
Response: The SDT believes that the threshold selected is consistent with the data supplied in the data request within reasonable limits. No change made. Please see response to question 1. The SDT believes that the role provided to regulatory bodies is consistent with current practices in the industry today. While formal approval may not be provided by some regulatory bodies as pointed out in other comments, Section III does not require formal approval but rather a lack of dissent. No change made.		

Organization	Yes or No	Question 4 Comment
Arizona Public Service Company	No	The threshold of 25 MW in item 2 of section III is too low. It should be same as the maximum allowed value in foot note b. In addition, AZPS does not agree that no objection assurance by the Regional Entity should be required. Once the process has been fully vetted by the stakeholders, including the regulatory authority for retail service, there is absolutely no need for Regional Entity involvement. There would be no adverse affect of non-consequential load tripping on the BES. Hence no reason for Regional Entity involvement is needed.
Response: The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a least common denominator approach and would thus be rejected. No change made. The remand Order made it clear that oversight was required for instances where use of footnote 'b' was proposed. The ERO has been proposed as the best choice to provide such oversight. No change made.		
Manitoba Hydro	No	The word 'assure' should be 'ensure' in the opening paragraph of III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required.
Response: The SDT agrees and has made the change suggested. Section III, first paragraph: Before a Firm Demand interruption under footnote 'b' is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ~~assure~~ ensure that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues do~~es~~ not object to the use of Firm Demand interruption under footnote 'b' if either:		
ISO New England	No	This provision violates both the federal and state jurisdictional split over transmission facilities, and would violate several FERC orders directing the

Organization	Yes or No	Question 4 Comment
		independence of RTOs in the regional system planning process. Said another way, the determinations of a federal transmission planning entity may not be required through an ERO standard to be subject to non-jurisdictional review and approval by state entities. Further, the provision violates Section 215 of the Federal Power Act, as the ERO cannot require the review of a particular transmission system plan by state entities. The following language should therefore be deleted from Section III of Attachment 1: "Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must assure that the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 12... ." Overall, the order of Section III is also notable. During year, two through ten of the overall planning horizon the standard allows for Non-Consequential Load Loss without state approval. In the first year of the assessment, approval becomes required for Non-Consequential Load Loss. In year one, even if mandating state participation and decisional authority in a federal planning process was legally permissible, it is too late to allow for any other alternative as transmission planning, siting and construction of non-load loss alternatives would not be completed in the needed period. If there were non-load loss alternatives available, the use of non-consequential load loss would not be necessary, but it would also not be part of a transmission plan. The Regional Entities with NERC oversight perform periodic audits and require self-certification of the planning process. By virtue of the audit and self-certification process, NERC has the ability to monitor the use of Non-Consequential Load Loss in planning assessments. In addition to being notable for the year one timing, Section III seems incomplete. In the case where there is objection to Non-Consequential Load Shedding, the process appears to end without resolution. The submission to the ERO "for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss" conflcts with

Organization	Yes or No	Question 4 Comment
		federal law and orders of the Federal Energy Regulatory Commission. As noted above, the ERO is not a planning entity and does not have authority to displace the reliability planning performed by planning entities. Transmission planning entities are those directed by FERC to make the determinations regarding adverse reliability impacts. If any entity wishes to challenge those determinations, it may do so before FERC under Section 215 of the Federal Power Act. Further, this provision would conflict with orders of the FERC regarding the independence of RTOs to conduct the regional transmission planning process. A reliability standard may not change the scope or meaning of federal statutes nor may it contradict or collaterally attack orders of the Federal Energy Regulatory Commission. For these reasons, this provision should be removed from the attachment to the proposed standard.
Response: The SDT believes that the role provided to regulatory bodies is consistent with current practices in the industry today. The SDT does not believe that the footnote violates any regulations concerning transmission planning. The proposed process simply brings stakeholders including local regulators to the table in an open and transparent manner. No change made. While the requirement is not mandatory for use in a Corrective Action Plan until Year One, the SDT believes that it would be a good practice to move forward as soon as an entity knows it is contemplating usage of the footnote. And nothing in the document precludes such action. Since the applicable regulator would be at the table and would therefore see potential uses of the footnote prior to Year One, the stakeholder process provides the opportunity to get any potential timing issues out before they become a impediment. Furthermore, the remand Order made it clear that oversight was required for instances where use of footnote 'b' was proposed. This would imply that FERC does not believe that audit and self-certification is sufficient in this matter. No change made. The ERO is not participating in the planning process. The role of the ERO is restricted to a determination of whether the planned utilization of footnote 'b' will cause an Adverse Reliability Impact to the BES. The ERO has no further role in the transmission planning process beyond that determination. No change made.		
TVA Transmission Reliability Engineering and Controls	No	TVA believes that the requirements of 25 MW as well as any Bulk contingency over 300-kV is much too burdensome. TVA believes that only larger load drops (such as 50 MW and above) should require ERO review.
Response: The SDT believes that the threshold selected is consistent with the data supplied in the data request. Increasing the		

Organization	Yes or No	Question 4 Comment
threshold to 50 MW is not consistent with the data supplied and the SDT believes that such an action would be viewed as a non-acceptable least common denominator approach. No change made.		
Iberdrola USA	No	Why would a retail service regulator approve a 300 kV and above performance issue?
Response: The voltage level is not the significant issue; the significant issue is making certain that the regulator understands that the transmission plan is to shed Load for a single Contingency so that they can understand the implications of the proposed actions and properly evaluate other available alternatives.		
LCRA Transmission Service Corporation	No	
NB Power Transmission	No	
Response: Without specific comments, the SDT is unable to respond.		
Texas Reliability Entity	Yes	1. TRE requests clarification whether the 25 MW limit of Non-consequential Load Loss (Section III (2)) applies to a single contingency event for a specific Transmission Planner's region or to the entire Planning Coordinator area. For example, if a single contingency requires multiple Transmisson Planners to shed load, is each Transmission Planner allowed to drop up to 25 MW of load before requiring regulatory review? Or did the SDT intend to require the Transmission Planners/Planning Coordinator to submit the plan for regulatory review if the total load shed for the single contingency equals or exceeds 25 MW? 2. TRE feels that the requirement in Section III that the Planning Coordinator or Transmission Planner must submit information to the ERO for a determination of whether there are "any Adverse Reliability Impacts" is overly burdensome to industry, assuming that this refers to the new definition of "Adverse Reliability Impact" (limited to Instability and Cascading). It is extremely unlikely that any such impacts will result from application of this footnote, and any that might occur will

Organization	Yes or No	Question 4 Comment
		be identified in the stakeholder process. If the ERO determination step is retained, then a timeline should be included for completion of the ERO determination process.
Response: The footnote is written on a single Contingency basis so the latter instance of the comment is correct – the plan should be submitted if the total Load shed is greater than or equal to 25 MW. Such a determination may be considered unlikely but the SDT believes that the remand Order made it clear that oversight was required for instances where use of footnote ‘b’ was proposed. The ERO is aware of the proposed responsibility and has accepted this role if the industry approves. Therefore, the SDT does not believe that a timeline is required. No change made.		
California Independent System Operator	Yes	Despite a public consultation process that includes the regulator(s), the standard then calls for notification to the regulator(s) and only moving forward once the regulator indicates that it does not oppose the shedding of load (“once assurance has been received that...”). This is still requiring the regulator to do something, and could be problematic if no response is provided by the regulator. How would one address silence on the part of the regulator?
Response: The SDT believes that Sections I and III represent two separate and distinct instances of the process. In Section I, the regulator is just one of perhaps many interested and applicable parties. However, in Section III, where larger values of Load are involved, there is a more formal role for regulators to play. Each local situation is unique – in some there may be formal approval provided, in others just a lack of dissent. If the regulator is silent on the proposal, the entity can move forward with the plan. No change made.		
Lincoln Electric System	Yes	While supportive of Section III, LES believes the language in the last paragraph could be further enhanced with the following changes [located in brackets] to ensure a complete and accurate record is provided to the ERO."Once [written] assurance has been received that the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 'b', the Planning Coordinator or Transmission Planner must submit the [written assurance and] information outlined

Organization	Yes or No	Question 4 Comment
		in items II.1 through II.8 above to the ERO...".
Response: The SDT does not believe it is appropriate to add 'written assurance' as the requirement only involves lack of dissent. No change made.		
Duke Energy	Yes	
SERC EC Planning Standards Subcommittee Associated Electric Cooperative	Yes

Response: Thank you for your support.		

5. If you have any other comments on this Standard that you haven't already mentioned above, please provide them here:

Summary Consideration: The comments supplied for question 5 are basically repetitive of what was stated for previous questions. Responses are provided consistent to what was stated above.

The following changes have been made due to industry comments:

TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load.

Organization	Question 5 Comment
Independent Electricity System Operator	(1) We'd like to reiterate our support for allowing load interruption for a singlecontingency with sufficient review/oversight and under acceptable conditions, including no adverse impact on the reliability of the interconnected bulk power system. The reliability aspects (BES performance requirements) should be reviewed for acceptability by the adjacent Planning Coordinators and Transmission Planners. However, issues pertaining to economics or externalities which may not be directly reliability-related are always available for review and debate by the stakeholders via the regulatory processes and subject to approval by the regulatory authority of each jurisdiction (including those in Canada and Mexico). (2) Furthermore, we request that Table 1 of TPL-001-3 (previous TPL-001-2 approved by NERC BOT) be corrected for EHV contingencies in P2, P4 and P5 categories to allow the application of footnote 'b'/'12' that is allowed for the P1 events. Events in P2, P4, and P5 can involve more elements and can be more onerous and stressful to the system than the P1 events, and if use of footnote 'b'/'12' is permitted in the less stressful P1 events, it should also be permitted in P2, P4 and P5 events. (3) We suggest that NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve it. Accordingly, we believe that the focus of footnote 'b', and footnote 12 should be that interruption of load must not have an adverse impact on the reliability of the interconnected bulk power system. A continent-wide standard should not concern itself with the reliability of supply or supply continuity for local load, as that is the

Organization	Question 5 Comment
	responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed.As mentioned above, NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve it. In this regard, we believe that Attachment 1 is not necessary because it prescribes a process which goes beyond the outcome of the standard and dictates how stakeholdering must be carried out. The individual jurisdiction should establish the process for ensuring compliance with the standard and decide to what extent a stakeholdering process is necessary to establish the acceptable level of load rejection for the area in a manner consistent with local transmission established service levels.
Hydro One Networks Inc.	(1) We'd like to reiterate our support for allowing load interruption for a single contingency with sufficient review/oversight and under acceptable conditions, including no adverse impact on the reliability of the bulk electric system. The reliability aspects (BES performance requirements) should be reviewed for acceptability by the adjacent Planning Coordinators and Transmission Planners. However, issues pertaining to economics or externalities which may not be directly reliability-related are always available for review and debate by the stakeholders via the regulatory processes and subject to approval by the regulatory authority of each jurisdiction (particularly those in Canada and Mexico). (2) Furthermore, we request that Table 1 of TPL-001-2a (previous TPL-001-2 approved by the NERC BOT) be corrected for EHV contingencies in P2, P4 and P5 categories to allow the application of footnote 12 that is allowed for the P1 events. If a load is allowed to be interrupted for a single EHV transmission line contingency (Category P1), it should be allowed to interrupt the same load if the primary breaker fails (the event becomes category P4) and the fault is cleared by other breakers. Similarly, if the same breaker has an internal fault or there is a fault on the same bus section (Category P2) or there is a failure of a relay (Category P5), which results in the loss of the same EHV transmission line, it should be allowed to interrupt the same load. Events in P2, P4, and P5 can involve more elements and can be more onerouse and stressful to the system than the P1 events, and if use of footnote 12 is permitted in the less stressful P1 events, it must also be permitted in P2, P4 and P5 events. This issue has been raised by many entities in previous occasions and we believe the STD has not provided a convincing response.

Organization	Question 5 Comment
	(3) We suggest that NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve them. Accordingly, we believe that the focus of foot note 'b', and footnote 12 should be that interruption of load must not have a widespread, adverse impact on the reliability of the interconnected BES. A continent-wide reliability standard should not concern itself with the reliability of supply or supply continuity for local load, as that is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed. If NERC and/or FERC believe that MW threshold needs to be addressed within NERC Standard for US registered entities then the standard must clearly state that the requirement is for US registered entities only.
Response: (1) Thank you for your support. (2) Such discussion is out of scope for this project since TPL-001-2 has been approved by the industry through the standards development process and by the NERC Board of Trustees. Nothing in this project affects where footnote 12 is applied within Table 1. The only change being proposed is to the details of how to utilize footnote 12 as shown in the proposed Attachment 1. No change made. (3) FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand, and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. Canadian entities are allowed to adopt ERO Reliability Standards, reject them outright, or adapt them for their own use within the confines of provincial regulations. Nothing has changed in that regard with this proposed standard. No change made.	
Manitoba Hydro	(1) Effective Date section 5: The language used in the revision that was made is fine, however, where the language has been placed in the section is confusing. The language has been added to the end of the sentence that starts 'in those jurisdictions where regulatory approval is not required' and lumped those two concepts together. In our mind, there should be 3 separate concepts 1) where regulatory approval required 2) where regulatory approval not required and 3) as may otherwise be approved by applicable laws. (2) Corresponding changes do not appear to have been made, TPL 1 and TPL 2 are not consistent in terms of the language used in the Effective Date section or the Attachment 1 (the sections to

Organization	Question 5 Comment
	which changes were made since last circulation).
Response: (1) The language used in the effective date section is provided by NERC Legal and was designed to take into account the situations raised in the comment. No change made. (2) The SDT wishes to point out that the language may be slightly different due to the specific circumstances regarding definitions, etc., in the timeframe relevant to the two standards. However, the SDT believes that the language used in the two standards is consistent. Without specific references the SDT is unable to respond further. No change made.	
ACES Power Marketing Standards Collaborators	(1) The SDT needs to consider the connection between the developing standards to maintain and improve reliability with the costs required to meet those standards. We believe there is an imbalance of the costs associated with meeting compliance for the current draft standard with proposed benefit of maintaining reliability of the BPS. This standard is a good candidate for the CEAP initiative to determine the cost benefits of reliability. (2) The standard needs to allow more flexibility regarding the use of planned load shed to address transmission performance issues in the planning horizon. It needs to recognize that these planned load shedding events may only be preliminary decisions for addressing problems that are several years away. If there is little chance that the planned shed load will ever be relied upon in the operating time horizon, there should be much less stringent requirements. For instance, if a PC or TP relies on planned load shed for year five of the planning horizon but year one does not utilize the planned load shed, they have four years to develop another solution. Why should an entity expend great effort and resources for year five when another solution will likely be developed within that time period? (3) What does "materially changed" mean and what degree of a change would be considered material in the Attachment 1 stakeholder process? The SDT should clarify specific conditions in Section II that would constitute a material change. (4) Thank you for the opportunity to comment.
Response: (1) Cost factors are one of the elements in the list of criteria in Section II. Costs of different alternatives will be part of the information provided and rationales for selection or non-selection of alternatives should include consideration of costs. The CEAP	

Organization	Question 5 Comment
initiative is still a work in progress and will not be ready for use in the timeframe of this project. No change made. (2) The SDT agrees that more flexibility is needed in the longer term; therefore, in the Long-Term Transmission Planning Horizon the stakeholder process is not required, and its use is limited to the Near-Term Transmission Planning Horizon. However, the SDT believes that it is appropriate for planners to share future information in Section II so stakeholders are aware of any potential Load shed. No change made. (3) The SDT believes that the planning entity has the best understanding of when a change would become material. With the large range of design philosophies and geographic difference between the entities within NERC, it is not practical to adopt a single one size fits all approach. In addition, since the use of footnote 'b' will be a part of the entity's Corrective Action Plans, interested stakeholders will have the opportunity to question the continued use of footnote 'b'. No change made.	
Sacramento Municipal Utility District	1) The decision of necessary infrastructure addition versus a determination of load shed in lieu of costly transmission should be determined at the Public Utility Commission or Local Board of Directors not through a laod level limitation. 2) There are no impacts to the BES for load shedding actions where it is determined that it is confined to a set boundaryand demonstrate to not lead to cascading, uncrontrolled separation or blackout. 3) Where a concern that a stakeholder process be "gamed" to allow the unscrupulous entity to claim notification of affected stakeholders was followed should not dictate a continent-wide standard direction for other stakeholders.
Response: 1) FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. No change made. 2) The use of Footnote 'b' as proposed provides assurance that there is no Adverse Reliability Impact. No change made. 3) The conditions placed on the stakeholder process will provide consistency in the application of footnote 'b' on a continent-wide basis. No change made.	
Tri-State G&T	1. It is not clear how transmission projects with long lead times (such as T-lines) would be handled

Organization	Question 5 Comment
	by "Footnote b". In other words, it is not clear if it is acceptable for a TP to plan for shedding Firm Demand in the Near Term Planning Horizon without meeting the conditions shown in "Attachment 1" when a mitigating project is planned that cannot be constructed in the Near Term Planning Horizon. 2. NERC Functional Model definitions for Planning Authorities and Transmission Planners do not include the types of activities being proposed in "Attachment 1." As written, this standard mandates functions on functional entities that are outside those defined by the NERC Functional Model. 3. In the NERC Glossary of Terms, Interruptible Demand is defined as "Demand that the end-use customer makes available to its Load-Serving Entity via contract or agreement for curtailment." The process described in Attachment 1 creates an agreement between stakeholders (aka "end-use customers") and their transmission providers for shedding Demand. Thus, if the process described in Attachment 1 is followed, the "Firm Demand" referenced in "Footnote b" would be reclassified as "Interruptible Demand." In essence, Firm Demand would not be interrupted. If this was the intention of FERC, NERC, and the Drafting Team, the standard should just state "Interruption of Firm Demand is not allowed." 4. It is not clear how section III of "Attachment 1" would be applied to entities that only deliver wholesale electric service and not retail electric service.

Response: 1. Any instance of proposed Load shed for a single Contingency situation in a Planning Assessment must meet the conditions of footnote 'b'. No change made.

2. The NERC Functional Model is a guideline for activities required of cited functional entities. It is periodically updated as conditions change. While the activities mentioned in the standard may not be explicitly spelled out in the NERC Functional Model, the SDT does not believe that they are out of scope for either a Planning Coordinator or a Transmission Planner. No change made.

3. Upon reviewing the comments, the SDT has seen that Demand that is not included as Firm Demand for footnote 'b' could be clarified as shown below.

TPL-002-1c: footnote b) - ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if it is~~: (1) Demand directly served by the Elements removed from service as a result of the

Organization	Question 5 Comment
Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load. 4. The SDT believes that the wholesale customer will be one of the stakeholders included in the process and any use of the footnote must go through the stakeholder process. No change made.	
MRO NSRF USACE MidAmerican Energy Company	1. In TPL-002-1c Table I and TPL-001-2a Table 1 can “Firm Demand interruption” or “Non-Consequential Load Loss” be initiated by a manual event such as operator action or does it need to be automatic? RECOMMENDATION: In TPL-002-1c Table I footnote ‘b’ add a sentence stating “Acceptable methods to enact Firm Demand Interruption may include manual or automatic processes that can be initiated within a reasonable timeframe”
Minnkota Power Cooperative Otter Tail Power Company	1. MPC QUESTION: In TPL-002-1c Table I and TPL-001-2a Table 1 can “Firm Demand interruption” or “Non-Consequential Load Loss” be initiated by a manual event, such as operator action, or does it need to be automatic, such as Under Voltage Load Shedding? a. RECOMMENDATION: In TPL-002-1c Table I footnote ‘b’, add a sentence stating “Acceptable methods to enact Firm Demand Interruption may include manual or automatic processes that can be initiated within a reasonable timeframe”
Response: Whether an action is automatic or manual is of no concern with regard to footnote ‘b’ as long as manual actions are executable within the time duration applicable to the Facility Ratings. No change made.	
California Independent System Operator	A concern with the new TPL-001-2 standard is what we see as being the elimination of the existing footnote c, the footnote that qualified Category C load shedding as “may be necessary”. The wording under the new TPL-001-2 appears that load shedding is the unqualified expectation of the criteria for C contingencies.
Response: The SDT clarified the expectations for the former Category ‘C’ Contingencies when it developed proposed TPL-001-2. TPL-001-2 was approved by the industry through the standards development process and by the NERC Board of Trustees. Nothing in this project affects where footnote 12 is applied within Table 1. The only change being proposed is to the details of how to utilize footnote 12 as shown in the proposed Attachment 1. Any discussions concerning the application of the footnote within the performance table are therefore out of scope for this project. No change made.	

Organization	Question 5 Comment
Iberdrola USA	A one-paragraph footnote encompassing a 2-page attachment is cumbersome for a Reliability Standard.
Response: The SDT made every effort to make the revisions required to be as simple as possible while meeting the requirements of the remand Order. No change made.	
BC Hydro and Power Authority	BC Hydro appreciates the efforts of the SDT in revising standards TPL-002-1c - System Performance Following Loss of a Single BES Element (footnote b) and TPL-001-2a - Transmission System Planning Performance Requirements (footnote 12). BC Hydro votes YES in support of this ballot and wishes to provide the following two comments:1.At this time BC Hydro has concerns about the level of stakeholder consultation that might be required as a result of the implementation of this standard and will bring this concern to the attention of our regulator if necessary. 2.At this time BC Hydro has concerns about the instances for which regulatory review of non-consequential load loss under footnote 12 is required and will discuss those with our regulator if necessary.
Response: 1. and 2. The SDT understands your situation and comment and appreciates your overall support.	
Hydro QuÃ©bec TransÃ‰nergie	Even if the SDT said it is not in its scope, the following difficulty with the application of note 12 needs to be addressed by NERC. There are no limit on non-consequential load loss for Single Contingency P2-2. and P2-3. (HV only), multiple Contingencies P4 and P5 (HV only), and P6 and P7. The note 12 allows limited non-consequential load loss for single contingency P1, Multiple Contingency P3. Non-consequential load loss is not allowed for P2-2 and P2-3. (EHV), and P4 and P5 (EHV). Considering the EHV Facilities, it is not reasonable to accept some non-consequential load loss for single contingency P1 and P2-3, and then deny it for Multiple Contingency categories P4 and P5 which are statistically less frequent than the former. Also, the Multiple Contingency P7 (for which there is no limit on non-consequential load loss) is more frequent than P2-3, P4 and P5. This technical irregularity must be reviewed and addressed.

Organization	Question 5 Comment
Northeast Power Coordinating Council	There are no limits on non-consequential load loss for Single Contingency P2-2 and P2-3 (HV only), multiple Contingencies P4 and P5 (HV only), and P6 and P7. Footnote 12 allows limited non-consequential load loss for single contingency P1, Multiple Contingency P3. Non-consequential load loss is not allowed for P2-2 and P2-3 (EHV), and P4 and P5 (EHV). Considering the EHV Facilities, it is not reasonable to accept some non-consequential load loss for single contingency P1 and P2-3, and then deny it for Multiple Contingency categories P4 and P5 which are statistically less frequent than the former. Also, the Multiple Contingency P7 (for which there is no limit on non-consequential load loss) is more frequent than P2-3, P4 and P5. This technical irregularity must be reviewed and addressed.
Response: TPL-001-2 was approved by the industry through the standards development process and by the NERC Board of Trustees. Nothing in this project affects where footnote 12 is applied within Table 1. The only change being proposed is to the details of how to utilize footnote 12 as shown in the proposed Attachment 1. No change made.	
Southern California Edison Company	Footnote "b"/Footnote 12 as currently written does not provide for an exemption to allow for the use of Firm Demand interruption as a short-term solution to transmission problems. Many entities would benefit from being allowed to use Footnote "b"/Footnote 12 as a temporary solution in response to construction delays until facilities to mitigate an N-1 contingency identified in a Planning Assessment can be installed. Under the current proposal, the stakeholder process will provide very little value in attempting to resolve such a problem. In fact, the current Footnote "b"/Footnote 12 could result in a stakeholder process that may actually slow the implementation of mitigation measures for the system.
Response: The SDT does not agree that the footnote does not provide for the use of Firm Demand interruption as a short-term solution to transmission problems. That has always been the point of the footnote and nothing in this project has changed that intent. The only changes are to the method in which the footnote is invoked. No change made.	
ISO New England	In summary, the main footnote is unobjectionable, but this standard as proposed has misplaced jurisdictional authority under Section 215 of the Federal Power Act for both states and the ERO through several of the process points and conditions set out in the attachment to the stardard. The removal of references is required for the standard to comport with the law. These revisions to

Organization	Question 5 Comment
	the standard can be made, which would then allow the draft standard to comply with FERC's further guidance and the other legal limitations described above.
Response: The SDT believes that the role provided to regulatory bodies is consistent with current practices in the industry today. The SDT does not believe that the footnote violates any regulations concerning transmission planning. The proposed process simply brings stakeholders including local regulators to the table in an open and transparent manner while setting criteria for when footnote 'b' can potentially be utilized. The ERO is not participating in the planning process. The role of the ERO is restricted to a determination of whether the planned utilization of footnote 'b' will cause an Adverse Reliability Impact to the BES. The ERO has no further role in the transmission planning process beyond that determination. No change made.	
Ameren	It might be helpful to probe further with the respondents who have no planned upgrades identified to address the dropping of non-consequential load to see what relevant system upgrades might entail, and the estimated costs associated with such upgrades, to address such situations.
Response: The SDT used the Section 1600 data request process to the best of its ability within the limited timeframe afforded to this project. No change made.	
LCRA Transmission Service Corporation	LCRA TSC disagrees with the October 2012 revision of TPL Table 1 Steady State & Stability Performance Footnotes (TPL-002-1c, footnote 'b' and TPL-001-2a footnote 12). The proposed stakeholder process required to be conducted during each Planning Assessment is overly burdensome. Further, it is not clear from the proposed process that a key concern expressed by the Commission with respect to use of Firm Demand load shedding is addressed - Notice to Firm Demand Customers. In addition, the proposed stakeholder process introduces several questions that need to be further clarified. For example: 1) Who defines the processes and procedures to be used? 2) Who is/are the decision maker(s)? 3) Who determines if the processes and procedures were followed?

Organization	Question 5 Comment
	4) Who carries out the administrative tasks (such as notice, securing meeting space,....)? 5) Who can participate? Does someone need to demonstrate a material interest in order to participate? 6) What are the means of participation (accepted forms of communication, timelines...)? 7) What are the criteria for decision-making? 8) What is the process for dispute resolution? How would does an Attachment become part of a NERC Standard? Should Attachment 1 be a requirement? In addition, support is needed for the bright-line 25 MW level. Lastly, the statement, "Before a Firm Demand interruption under footnote 'b' is allowed to be utilized as an element of a Corrective Action Plan in Year One of the Planning Assessment," implies that Firm Demand interruption may be used for years two through five of the Planning Assessment without the stakeholder process.

Response: Stakeholders representing the interests of Firm Demand customers would certainly be among the parties involved in Section I of the stakeholder process. No change made.

1) through 8) There is not a one-size-fits-all response to these questions for a continent-wide standard. The SDT provided the key components of an open and transparent stakeholder process while allowing variations that may be required due to differing structures and frameworks across the continent. Therefore, the answers to these questions may be different for each individual stakeholder process.

Attachments have been used in the past in other standards and are an accepted part of a standard.

The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote 'b' by planners. This data was then to be utilized by the SDT as part of its consideration in arriving at a maximum value for the amount of Load that could be planned to be shed under footnote 'b'. The 25 MW threshold was directly derived from this data. The SDT believes that any deviation from the threshold derived from the actual data may be viewed as a non-acceptable least common denominator approach. No change made.

Organization	Question 5 Comment
The SDT disagrees with the statement made by the commenter. Firm Demand interruption must go through the process for any year in the Near-Term Transmission Planning Horizon as is clearly stated in the main body of the footnote. No change made.	
TVA Transmission Reliability Engineering and Controls	Please see responses to question #2,3, and 4. TVA believes that only load drops of higher magnitudes go thru the Stakeholder and regulatory review.
Response: Please see responses to questions 2, 3, and 4.	
Public Utility District No.1 of Snohomish County MEAG Power City of Austin Clark Public Utilities	Public Utility District No.1 of Snohomish County generally disagrees with the October 2012 revision of TPL Table 1 Steady State & Stability Performance Footnotes (Planning Events and Extreme Events). "Footnote b) An objective of the planning process is to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. In limited circumstances, Firm Demand may be interrupted throughout the planning horizon to ensure that BES performance requirements are met. However, when interruption of Firm Demand is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the use of Firm Demand interruption meets the conditions shown in Attachment 1. In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW.""Footnote 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed '75' MW."

Organization	Question 5 Comment
	The proposed revisions require that a Transmission Planner or Planning Coordinator provide assurance that the applicable regulatory authority or governing body responsible for retail electric service issues does not object to the interruptions of firm demand under TPL-002 footnote ‘b’ or TPL-001 footnote ‘12’ if the voltage level of the contingency is greater than 300 kV with certain sub-conditions or if the planned interruption of firm demand under these footnotes is greater than 25 MVA. In addition, under no case can planned Non-Consequential Load Loss exceed 75 MW.The magnitude and duration of load loss is a Level of Service (“LOS”) or Customer Service issue that is the jurisdiction of Public Utility Commissions and Local Electric Utility and Municipality boards. The boards and commissions represent their customers which often have diverse service and rate expectations that often are a result of local industry requirements, geography, urban/rural characteristics, and other factors of the particular service territory. Boards and commissions hold public meetings seeking input on various utility matters that often address services and rates. The rate impacts for customers are important; often more important than the service levels depending on the particular customer or customer class. Local boards and commissions are very close to these issues and weigh the input provided through public testimony to best represent their customer needs over the region they represent and have jurisdiction under state and local codes to address.The 75 MW Non-Consequential Load Loss threshold and the required NERC process do not resolve or address a reliability issue. The TPL footnotes address service requirements and should not be part of a NERC Reliability Standard any more than mandating specific System Average Interruption Frequency Index ("SAIFI") and System Average Interruption Duration Index ("SAIDI"). The Non-Consequential Load Loss requirement is an economic driven threshold that is not consistent throughout North America due to diverse customer needs and expectations. For instance, in some areas it may make economic sense and receive local approval to fund a $100 million system reinforcement to mitigate 1 in 20 year (5 percent chance of occurring) 76 MW Non-Consequential Load Loss exposure. However there are many communities that could not justify or support multi-million facilities to mitigate a 1 in 20 year event that may cause the Non-Consequential Load Loss of 76 MW of load. Public Utility District No.1 of Snohomish County supports removing the Non-Consequential Load Loss thresholds from the TPL Reliability Standards and allow the local boards and commissions to continue to address Customer Service Level issues as they are closest to the customers’ needs and have jurisdiction over this issue.

Organization	Question 5 Comment
Response: The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. The proposed standards include the local regulatory bodies at every step in the process. This will allow those bodies to have input at every step. The SDT believes that the proposed changes to the standards are in alignment with the charge that was given to it. No change made.	
Xcel Energy	Setting limits on the amount of NCLL only sets the stage for failure in the compliance of NERC standards and fails to take note of what is really the issue; the planning of a transmission system that is both reliable and economically viable for all stakeholders and customers. It should be emphasized that the use NCLL in a "planning process" is only assuming the conditions set in the study will exist and in no way reflects the conditions seen during the day to day operation of the transmission system. Xcel Energy is concerned about the previous ability on loss of load in anticipation of the next outage (previously C3 now P6). For TPL-003, loss of load in anticipation of the next system outage was covered under footnote B. Footnote 9 now states, "...the re-dispatch does not result in any Non-Consequential Load Loss. " This is a large increase in requirements of the transmission system to operate. As written, it appears that footnote 12 is NOT applicable to P6 contingencies. Please clarify is this is the intent.
Response: The SDT does not believe that it needs to add language emphasizing that there is a difference between planning and operations when these standards are clearly planning standards. No change made. The SDT disagrees that there was a previous ability to shed Load in anticipation of the next Contingency. Footnote 'b' only allowed curtailment of firm transfers in preparation for the next Contingency. In addition, footnote 12 is not applicable for P6 planning events since Non-Consequential Load loss is allowed. No change made.	
Arizona Public Service Company	The following comment relates to Table 1. It is not clear why footnote 12 applies only to P2-1. The events P2-2, P2-3, P4, P5 are much less probable and the footnote 12 should be applicable to all these events. Why is that loss of non-consequential load is allowed for line tripping without fault but not for a bus fault which is much less likely and could result into same line trip. Similar

Organization	Question 5 Comment
	arguments apply to other scenarios listed above.
Response: TPL-001-2 was approved by the industry through the standards development process and by the NERC Board of Trustees. Nothing in this project affects where footnote 12 is applied within Table 1. The only change being proposed is to the details of how to utilize footnote 12 as shown in the proposed Attachment 1. Any discussions concerning the application of the footnote within the performance table are therefore out of scope for this project. No change made.	
Electric Reliability Council of Texas, Inc.	The SDT is not required to utilize the stakeholder approach by Order 762 or any other relevant FERC orders. FERC merely provided guidance as to how the rejected proposal could be improved. However, if the SDT elects to pursue an exception process, such exceptions should be based on objective criteria, and the process should be external to the NERC Reliability Standards (e.g. in the Rules of Procedure).In Order 693, FERC directed NERC to clarify footnote (b) to prohibit shedding firm load except for consequential load loss (Order 693 at PP 1773, 1794 and 1797}. In a related compliance order, FERC reaffirmed its position. (130 FERC 61,200 (March 18, 2010) at PP 8-10 (Compliance Order)) In a subsequent order, FERC clarified that its Order 693 directive did not preclude consideration of specific comments related to planning the system based on load shedding at the “fringes" of a system. (131 FERC 61,231 (June 11, 2010) at P 21 (Clarification Order)) FERC held that regional variances for case-specific circumstances or a case-specific exception process to plan for the loss of firm service “at the fringes of various systems" would be acceptable. (131 FERC 61,231 (June 11, 2010) at P 21 (Clarification Order)) However, FERC also stated that it viewed the basis for such exceptions as economic, not reliability, with the justification being that it was not economic to invest in the bulk electric system to serve all non-consequential load customers under some single contingency conditions. (Order 693 at P 1792) FERC made clear that any such regional differences or case specific exception processes cannot reflect the lowest common denominator, and, they must be technically justified, and such justification must be strong. (Clarification Order at P 21, See also Order 693 at P 1794) This is consistent with FERC's position that this is a matter of "fundamental issue of transmission service". (Order 693 at P 1793) In recognizing that meeting firm demand under single contingency conditions is fundamental to transmission service, FERC noted that NERC's definition of firm transmission service is the "highest quality (priority) service offered to customers ... that anticipates no planned interruption." (Order 693 at P 1793)Against this background, NERC filed

Organization	Question 5 Comment
	revisions to footnote b that allowed transmission plans to shed non-consequential load under single contingency conditions, provided appropriate process applied to such planning determinations/outcomes. In Order No. 762, {139 FERC 11 61,060 (April 19, 2012)) FERC rejected the approach proposed by NERC and provided guidance on acceptable approaches to footnote b. However, FERC did not endorse or mandate any particular approach. Rather, it merely urged "NERC to develop in a timely manner an appropriate modification that is responsive to the Commission's directives in Order No. 693 and our concerns set forth in this Final Rule." (Order 762 at P21) FERC stated that in order for any such proposal to have merit, it must be technically justified and must not reflect the lowest common denominator.As discussed, the proposed stakeholder approach is not appropriate for NERC Reliability Standards. The SDT should abandon that approach and consider simple revisions to footnote b that reference a case by case exception process based on objective criteria that is external to the NERC Reliability Standards (e.g. Rules of Procedure). Alternatively, it should develop revisions to the continent-wide standards that clarify that non-consequential load shedding is not generally permitted for single contingency conditions, but, consistent with FERC's orders, exceptions could be established pursuant to regional rules based on the need/appropriateness in a particular region.Consistent with the above discussion, if the SDT elects to pursue revisions that accommodate shedding non-consequential load in transmission planning for single contingency conditions, it should abandon the stakeholder process approach. The establishment of exceptions is better suited for regional rules or pursuant to a process outside of the reliability standards - e.g. via the Rules of Procedure, because such a process is not suited for a continent-wide reliability standard. Regardless of whether the issue is addressed via an external process, or left to regional variances, this issue needs to be addressed in a relatively timely manner because the uncertainty is affecting planning processes.

Response: FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. The SDT has set up criteria for consideration in the potential usage of footnote ‘b’ for planning purposes in Attachment 1, Section II, Bullets 1 through 8. The criteria described are objective. The process described does not tell a entity how to go about its business but only describes what must be done to allow for the usage of footnote ‘b’ in the planning process. The SDT believes that the referenced exception process is what is being proposed. The proposed process sets up an open and transparent process for allowing such Load shed in

Organization	Question 5 Comment
specific conditions and with specific limitations. Any future revisions to footnote 12 will be accomplished through the approved standards development process and any discussion on changing threshold values would be part of that process. No change made.	
Midwest Independent Transmission System Operator, Inc.	We do not support using a stakeholder process to determine if Non-conseqeuntial Load Loss is appropriate following a single contingency event as a means to satisfy the standard. Stakeholder processes will nearly always result in disagreements. The parties that may be responsible for payment of upgrade costs will not necessarily line up with the parties adversely impacted by the alternative load loss. If the stakeholder process includes all stakeholders, there may be many more stakeholders impacted by upgrade costs based on broader benefits and/or cost sharing than stakeholders impacted by the alternative load loss. This will result in the majority decision of a stakeholder body to most often be one that supports load shed (until it is their turn to be the load that is shed). On the other hand, if the stakeholder process is limited to only the stakeholders directly impacted by the proposed load shed, to the extent those stakeholders pay only a small part of the upgrade costs, they will always select a potentially costly upgrade to avoid load shed. The point is, we do not believe that it possible to have a fair and impartial stakeholder process to correctly determine if and when load shed is acceptable to assist in satisfying a single contingency standard. Since the general intents of the existing TPL-002-1 standard and proposed TPL-001-2 standard are not to rely on any shedding of non-consequenital load to meet a single contingency event, in the event that footnote b of TPL 002-1 or footnote 12 of TPL 001-2 is not eliminated, we believe that it should be narrowly focused only on those situations for which the original footnote was developed: interruption of service to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, where the overall reliability of the interconnected transmission system is not impacted. We propose that footnote b and footnote 12 be modified as follows to ensure it is not misapplied:"An objective of the planning process is to avoid Non-Consequential Load Loss following Contingency events. In limited circumstances, Non-Consequential Load Loss may be needed within the planning horizon to ensure that BES performance requirements are satisfied. However, Non-consequential Load Loss cannot be used to avoid cascading outages or to maintain system stability. Non-consequential Load Loss also cannot be used to avoid a thermal loading or voltage limit violation on an EHV facility. When Non-Consequential Load Loss is utilized within the planning horizon to address BES performance requirements, such interruption cannot exceed 75 MW and is limited to the

Organization	Question 5 Comment
	following circumstances: o Non-consequential Load Loss is allowed for load served by a radial transmission line to avoid voltage limit violations on the radial transmission line following a single contingency event anywhere on the system.. o Non-consequential load shed is allowed for load within a local area served by not more than two transmission lines and/or transformers to avoid a thermal loading issue or voltage issue in the local area, including the transmission lines and/or transformers supplying the area, for a loss of one of the transmission lines or transformers supplying the area, so long as there are no thermal loading or voltage violations outside the local area."We believe the language above maintains acceptable reliability on the bulk electric system by limiting load shed and violations that require load shed to radial areas or areas that would be served radially following the single contingency. We therefore highly recommend that Attachment I be eliminated entirely and that the footnotes either be eliminated or replaced with the modified version above.
Response: FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. No change made.	
SCE&G	While the current revisions improve the processes described, we have concerns regarding the revisions to TPL002-1 b. SCE&G has significant concern with the proposed revision to TPL Table 1, Footnote B. The current Footnote B states "Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems". The phrase "without impacting the overall reliability of the interconnected transmission systems" is important to the TPL standards to ensure that ERO standards do not dictate the level of service to specific customers. Service to specific customers and load pockets is jurisdictional to State Commissions. ERO standards should not compromise this jurisdiction. SCE&G believes that any proposed revisions to Footnote B must maintain the concept that planned or controlled interruption of electric supply to customers, whether they are radial or network, is allowed as long as it does not impact the overall reliability of the interconnected transmission systems. The proposed revision eliminates this concept

Organization	Question 5 Comment
Response: The SDT believes that the suggested wording is redundant as the quoted statement is the basis for standards activities. No change made.	

END OF REPORT

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR approved by SC in May 2012.
2. Initial comment period July 31, 2012 – August 29, 2012.
3. Initial ballot and comment period October 5, 2012 – November 19, 2012.

Proposed Action Plan and Description of Current Draft:

The SDT is working to address FERC's remand of the proposed clarification of TPL-002, Table 1 — footnote 'b', regarding the planned or controlled interruption of electric supply where a single Contingency occurs on a Transmission System. That footnote is captured here as footnote 12.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Successive ballot	December 2012
2. Recirculation ballot	January 2013
3. BOT approval	February 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

A. Introduction

1. **Title: Transmission System Planning Performance Requirements**

2. **Number: TPL-001-2a**

3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.

4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

   Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

   For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2a:

   - P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
   - P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
   - P2-1
   - P2-2 (above 300 kV)
   - P2-3 (above 300 kV)
   - P3-1 through P3-5
   - P4-1 through P4-5 (above 300 kV)
   - P5 (above 300 kV)

B. Requirements

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities

1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.

1.1.3. New planned Facilities and changes to existing Facilities

1.1.4. Real and reactive Load forecasts

1.1.5. Known commitments for Firm Transmission Service and Interchange

1.1.6. Resources (supply or demand side) required for Load

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.

- Duration or timing of known Transmission outages.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past

studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Special Protection Systems
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the

use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.

3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.

b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.

c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.

d. Simulate Normal Clearing unless otherwise specified.

e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

f. Applicable Facility Ratings shall not be exceeded.

g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.

h. Planning event P0 is applicable to steady state only.

i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.

b. Simulate Normal Clearing unless otherwise specified.

Steady State	Stability
1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments. 2. Local area events affecting the Transmission System such as: a. Loss of a tower line with three or more circuits.[11] b. Loss of all Transmission lines on a common Right-of-Way[11]. c. Loss of a switching station or substation (loss of one voltage level plus transformers). d. Loss of all generating units at a generating station. e. Loss of a large Load or major Load center. 3. Wide area events affecting the Transmission System based on System topology such as: a. Loss of two generating stations resulting from conditions such as: i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation. ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments. 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing. e. 3Ø internal breaker fault. f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss. 2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria. 3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss. 4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service. 5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers. 6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground. 7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point. 8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker. 9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. 10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing. 11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less. 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW. 13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder’s satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
    a. The estimated number and type of customers affected

   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community

3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

<u>III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required</u>

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW.

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

C. Measures

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.
R2	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.
R3	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P7) in	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1.

	Lower VSL	Moderate VSL	High VSL	Severe VSL
		OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R3, Part 3.3.	OR The responsible entity did not perform studies to determine that the BES meets the performance requirements for the P0 or P1 categories in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R4	The responsible entity did not identify planning events as described in Requirement R4, Part 4.4 or extreme events as described in Requirement R4, Part 4.5.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for one of the categories (P1 through P7) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R4, Part 4.2 to assess the impact of extreme events.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for two of the categories (P1 through P7) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R4, Part 4.3.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for three or more of the categories (P1 through P7) in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R5	N/A	N/A	N/A	The responsible entity does not have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, or the transient voltage response for its System.
R6	N/A	N/A	N/A	The responsible entity failed to define and document the criteria or methodology for System instability used within its analysis as described in Requirement R6.

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R7	N/A	N/A	N/A	The Planning Coordinator, in conjunction with each of its Transmission Planners, failed to determine and identify individual or joint responsibilities for performing required studies.
R8	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 90 days but less than or equal to 120 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 30 days but less than or equal to 40 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 120 days but less than or equal to 130 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 40 days but less than or equal to 50 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 130 days but less than or equal to 140 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 50 days but less than or equal to 60 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 140 days following its completion. OR The responsible entity did not distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners. OR The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 60 days following the request. OR The responsible entity did not distribute its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing.

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
1	03/17/2001	Revision of TPL-001-0 to modify only Table 1 footnote b. Approved by Board of Trustees	Project 2006-02 – revision to address FERC directive
2	To be Determined	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2a	February 2013	Address remand of proposed footnote 'b' pursuant to FERC Order RM06-16-009	Revised

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR approved by SC in May 2012.
2. Initial comment period July 31, 2012 – August 29, 2012.
~~2.~~3. Initial ballot and comment period October 5, 2012 – November 19, 2012.

Proposed Action Plan and Description of Current Draft:

The SDT is working to address FERC's remand of the proposed clarification of TPL-002, Table 1 — footnote 'b', regarding the planned or controlled interruption of electric supply where a single Contingency occurs on a Transmission System. That footnote is captured here as footnote 12.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. ~~Initial~~Successive ballot	~~October~~ December 2012
2. Recirculation ballot	~~December 2012~~January 2013
3. BOT approval	February 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**

2. **Number:** **TPL-001-2a**

3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.

4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where ~~-~~regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

   Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

   For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2a:

   - P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
   - P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
   - P2-1
   - P2-2 (above 300 kV)
   - P2-3 (above 300 kV)
   - P3-1 through P3-5
   - P4-1 through P4-5 (above 300 kV)
   - P5 (above 300 kV)

B. Requirements

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities

1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.

1.1.3. New planned Facilities and changes to existing Facilities

1.1.4. Real and reactive Load forecasts

1.1.5. Known commitments for Firm Transmission Service and Interchange

1.1.6. Resources (supply or demand side) required for Load

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.

- Duration or timing of known Transmission outages.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past

studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Special Protection Systems
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the

use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.

3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity’s individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.

b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.

c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.

d. Simulate Normal Clearing unless otherwise specified.

e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

f. Applicable Facility Ratings shall not be exceeded.

g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.

h. Planning event P0 is applicable to steady state only.

i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault [8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No
				HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker) [8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker [10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency *(Fault plus relay failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant relay[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device [6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.

b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
   a. Loss of a tower line with three or more circuits.[11]
   b. Loss of all Transmission lines on a common Right-of-Way[11].
   c. Loss of a switching station or substation (loss of one voltage level plus transformers).
   d. Loss of all generating units at a generating station.
   e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
   a. Loss of two generating stations resulting from conditions such as:
      i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
      ii. Loss of the use of a large body of water as the cooling source for generation.
      iii. Wildfires.
      iv. Severe weather, e.g., hurricanes, tornadoes, etc.
      v. A successful cyber attack.
      vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
   b. Other events based upon operating experience that may result in wide area disturbances.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
   a. 3Ø fault on generator with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
   b. 3Ø fault on Transmission circuit with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
   c. 3Ø fault on transformer with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
   d. 3Ø fault on bus section with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
   e. 3Ø internal breaker fault.
   f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following ~~Contingency~~ planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. .The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
    a. The estimated number and type of customers affected

b. ~~Assessment~~An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community

3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to ~~mitigate~~alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ~~assure~~ ensure that the applicable regulatory ~~authority~~authorities or governing ~~body~~bodies responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW.

Once assurance has been received that the applicable regulatory ~~authority~~authorities or governing ~~body~~bodies responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

C. Measures

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.
R2	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.
R3	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P7) in	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1.

	Lower VSL	Moderate VSL	High VSL	Severe VSL
		OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R3, Part 3.3.	OR The responsible entity did not perform studies to determine that the BES meets the performance requirements for the P0 or P1 categories in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R4	The responsible entity did not identify planning events as described in Requirement R4, Part 4.4 or extreme events as described in Requirement R4, Part 4.5.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for one of the categories (P1 through P7) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R4, Part 4.2 to assess the impact of extreme events.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for two of the categories (P1 through P7) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R4, Part 4.3.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for three or more of the categories (P1 through P7) in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R5	N/A	N/A	N/A	The responsible entity does not have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, or the transient voltage response for its System.
R6	N/A	N/A	N/A	The responsible entity failed to define and document the criteria or methodology for System instability used within its analysis as described in Requirement R6.

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R7	N/A	N/A	N/A	The Planning Coordinator, in conjunction with each of its Transmission Planners, failed to determine and identify individual or joint responsibilities for performing required studies.
R8	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 90 days but less than or equal to 120 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 30 days but less than or equal to 40 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 120 days but less than or equal to 130 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 40 days but less than or equal to 50 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 130 days but less than or equal to 140 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 50 days but less than or equal to 60 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 140 days following its completion. OR The responsible entity did not distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners. OR The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 60 days following the request. OR The responsible entity did not distribute its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing.

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
1	03/17/2001	Revision of TPL-001-0 to modify only Table 1 footnote b. Approved by Board of Trustees	Project 2006-02 – revision to address FERC directive
2	To be Determined	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2a	February 2013	Address remand of proposed footnote ‘b’ pursuant to FERC Order RM06-16-009	Revised

Implementation Plan for TPL-001-2a

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-2a — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-2a, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
TPL-001-2a — Transmission System Planning Performance Requirements	Transmission Planner	Planning Coordinator
	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2a:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

TPL-001-1a, TPL-002-1c, TPL-003-1b, and TPL-004-1a are being retired as they are replaced in their entirety by TPL-001-2a. TPL-005-0 and TPL-006-0.1 are being retired because their requirements are adequately covered by the revised TPL-001-2a and NERC's Rules of Procedure, Section 800. TPL-001-1a, TPL-002-1c, TPL-003-1b, TPL-004-1a, TPL-005-0 and TPL-006-0.1 are being retired on midnight of the day immediately prior to the Effective Date of TPL-001-2a in the particular jurisdictions in which TPL-001-2a is becoming effective. However, during this 24-month period, all aspects of TPL-001-1a through TPL-006-0.1 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-2a requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes

into effect   on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-2a 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-1a, TPL-002-1c, TPL-003-1b and TPL-004-1a because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-2a, the performance requirements associated with the following events represent "raising the bar":

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This "raising the bar" is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon has been provided

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR approved by SC in May 2012.
2. Initial comment period July 31, 2012 – August 29, 2012.
3. Initial ballot and comment period October 5, 2012 – November 19, 2012

Proposed Action Plan and Description of Current Draft:

The SDT is working to address FERC's remand of the proposed clarification of TPL-002, Table 1 — footnote 'b', regarding the planned or controlled interruption of electric supply where a single Contingency occurs on a Transmission System. Table 1 appears in the first four of the current TPL standards but footnote 'b' only applies to TPL-002. Therefore, only TPL-002 is being posted for industry comment at this time. When the footnote has been approved, all four of the applicable TPL standards will be filed with the Commission.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Successive ballot	December 2012
2. Recirculation ballot	January 2013
3. BOT approval	February 2013

A. Introduction

1. Title: **System Performance Following Loss of a Single Bulk Electric System Element (Category B)**

2. Number: TPL-002-1c

3. Purpose: System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.

4. Applicability:

4.1. Planning Authority

4.2. Transmission Planner

5. Effective Date: The application of revised Footnote 'b' in Table 1 will take effect on the first day of the first calendar quarter, 60 months after approval by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. All other requirements remain in effect per previous approvals. The existing Footnote 'b' remains in effect until the revised Footnote 'b' becomes effective.

B. Requirements

R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I. To be valid, the Planning Authority and Transmission Planner assessments shall:

R1.1. Be made annually.

R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.

R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.1. Be performed and evaluated only for those Category B contingencies that would produce the more severe System results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.

R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.

R1.3.4. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.

R1.3.5. Have all projected firm transfers modeled.

R1.3.6. Be performed and evaluated for selected demand levels over the range of forecast system Demands.

R1.3.7. Demonstrate that system performance meets Category B contingencies.

R1.3.8. Include existing and planned facilities.

R1.3.9. Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.

R1.3.10. Include the effects of existing and planned protection systems, including any backup or redundant systems.

R1.3.11. Include the effects of existing and planned control devices.

R1.3.12. Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

R1.4. Address any planned upgrades needed to meet the performance requirements of Category B of Table I.

R1.5. Consider all contingencies applicable to Category B.

R2. When System simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-002-1_R1, the Planning Authority and Transmission Planner shall each:

R2.1. Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:

R2.1.1. Including a schedule for implementation.

R2.1.2. Including a discussion of expected required in-service dates of facilities.

R2.1.3. Consider lead times necessary to implement plans.

R2.2. Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.

R3. The Planning Authority and Transmission Planner shall each document the results of its Reliability Assessments and corrective plans and shall annually provide the results to its respective Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

M1. The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-1_R1 and TPL-002-1_R2.

M2. The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-002-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.
Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

	Single Pole Block, Normal Clearing[e]: 4. Single Pole (dc) Line	Yes	No[b]	No
C Event(s) resulting in the loss of two or more (multiple) elements.	SLG Fault, with Normal Clearing[e]: 1. Bus Section 2. Breaker (failure or internal Fault)	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG or 3Ø Fault, with Normal Clearing[e], Manual System Adjustments, followed by another SLG or 3Ø Fault, with Normal Clearing[e]: 3. Category B (B1, B2, B3, or B4) contingency, manual system adjustments, followed by another Category B (B1, B2, B3, or B4) contingency	Yes	Planned/ Controlled[c]	No
	Bipolar Block, with Normal Clearing[e]: 4. Bipolar (dc) Line Fault (non 3Ø), with Normal Clearing[e]: 5. Any two circuits of a multiple circuit towerline[f]	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG Fault, with Delayed Clearing[e] (stuck breaker or protection system failure): 6. Generator 7. Transformer 8. Transmission Circuit 9. Bus Section	Yes Yes Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c]	No No No No

D [d] Extreme event resulting in two or more (multiple) elements removed or Cascading out of service	3Ø Fault, with Delayed Clearing[e] (stuck breaker or protection system failure): 1. Generator 2. Transmission Circuit 3. Transformer 4. Bus Section - - - - - - - - - - 3Ø Fault, with Normal Clearing[e]: 5. Breaker (failure or internal Fault) - - - - - - - - - - 6. Loss of towerline with three or more circuits 7. All transmission lines on a common right-of way 8. Loss of a substation (one voltage level plus transformers) 9. Loss of a switching station (one voltage level plus transformers) 10. Loss of all generating units at a station 11. Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.	Evaluate for risks and consequences. ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.

a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.

b) An objective of the planning process is to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. For purposes of this footnote, the following are not counted as Firm Demand t: (1) Demand directly served by the Elements removed from service as a result of the Contingency, and (2) Interruptible Demand or Demand-Side Management Load. In limited circumstances, Firm Demand may be interrupted throughout the planning horizon to ensure that BES performance requirements are met. However, when interruption of Firm Demand is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the use of Firm Demand interruption meets the conditions shown in Attachment 1. In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW.

c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.

d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.

e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.

f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Firm Demand interruption under footnote 'b' is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 'b' is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Firm Demand interruption under footnote 'b'
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Firm Demand interruption under footnote 'b' (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 'b' utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Firm Demand interruption under footnote 'b' which must include the following:

1. Conditions under which Firm Demand interruption under footnote 'b' would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Firm Demand MW to be interrupted with:
    a. The estimated number and type of customers affected

   b. An explanation of the effect of the use of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community
3. Estimated frequency of Firm Demand interruption under footnote ‘b’ based on historical performance
4. Expected duration of Firm Demand interruption under footnote ‘b’ based on historical performance
5. Future plans to alleviate the need for Firm Demand interruption under footnote ‘b’
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote ‘b’
7. Alternatives to Firm Demand interruption considered and the rationale for not selecting those alternatives under footnote ‘b’
8. Assessment of potential overlapping uses of footnote ‘b’ including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Interruptions of Firm Demand under Footnote ‘b’ is Required

Before a Firm Demand interruption under footnote ‘b’ is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues does not object to the use of Firm Demand interruption under footnote ‘b’ if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Firm Demand interruptions under footnote ‘b’, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Firm Demand interruption under footnote ‘b’ is greater than or equal to 25 MW

In no case can the planned Firm Demand interruption under footnote ‘b’ exceed 75 MW.

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues does not object to the use of Firm Demand interruption under footnote ‘b’, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote ‘b’ for Firm Demand interruption.

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from MISO on August 9, 2007:

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed "Planning Coordinator" (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former "Planning Authority" name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

– Under the Functional Model, the Planning Coordinator "Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system" while the Transmission Planner "Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans." A PC's selection of "critical system conditions" and its associated generation dispatch falls within the purview of "methodology."

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

> **M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2]."

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a "valid assessment" means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term "planned outages" means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard1?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a "contingency" as defined in the *NERC Glossary of Terms Used in Standards.*

Appendix 2

Requirement Number and Text of Requirement
R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following **Category B of Table 1** (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s). **R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
Background Information for Interpretation
Requirement R1.3 and sub-requirement R1.3.10 of standard TPL-002-0a contain three key obligations: 1. That the assessment is supported by "study and/or system simulation testing that addresses each the following categories, showing system performance following Category B of Table 1 (single contingencies)." 2. "…these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s)." 3. "Include the effects of existing and planned protection systems, including any backup or redundant systems." *Category B of Table 1 (single Contingencies) specifies:* Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault. Single Pole Block, Normal Clearing[e]: 4. Single Pole (dc) Line *Note e specifies*: e) Normal Clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay. The NERC Glossary of Terms defines Normal Clearing as "A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems."
Conclusion
TPL-002-0a requires that System studies or simulations be made to assess the impact of single Contingency operation with Normal Clearing. TPL-002-0a R1.3.10 does require that all elements expected to be removed from service through normal operations of the Protection Systems be removed in simulations. This standard does not require an assessment of the Transmission System performance due to a Protection System failure or Protection System misoperation. Protection System failure or Protection System misoperation is addressed in TPL-003-0 — System Performance following Loss of Two or More Bulk

Electric System Elements (Category C) and TPL-004-0 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).

TPL-002-0a R1.3.10 does not require simulating anything other than Normal Clearing when assessing the impact of a Single Line Ground (SLG) or 3-Phase (3Ø) Fault on the performance of the Transmission System.

In regards to PacifiCorp's comments on the material impact associated with this interpretation, the interpretation team has the following comment:

Requirement R2.1 requires "a written summary of plans to achieve the required system performance," including a schedule for implementation and an expected in-service date that considers lead times necessary to implement the plan. Failure to provide such summary may lead to noncompliance that could result in penalties and sanctions.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR approved by SC in May 2012.
2. Initial comment period July 31, 2012 – August 29, 2012.
3. ~~2.~~Initial ballot and comment period October 5, 2012 – November 19, 2012

Proposed Action Plan and Description of Current Draft:

The SDT is working to address FERC's remand of the proposed clarification of TPL-002, Table 1 — footnote 'b', regarding the planned or controlled interruption of electric supply where a single Contingency occurs on a Transmission System. Table 1 appears in the first four of the current TPL standards but footnote 'b' only applies to TPL-002. Therefore, only TPL-002 is being posted for industry comment at this time. When the footnote has been approved, all four of the applicable TPL standards will be filed with the Commission.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. ~~Initial~~Successive ballot	~~October~~ December 2012
2. Recirculation ballot	~~December 2012~~January 2013
3. BOT approval	February 2013

A. Introduction

1. Title: **System Performance Following Loss of a Single Bulk Electric System Element (Category B)**

2. Number: TPL-002-1c

3. Purpose: System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.

4. Applicability:

4.1. Planning Authority

4.2. Transmission Planner

5. Effective Date: The application of revised Footnote 'b' in Table 1 will take effect on the first day of the first calendar quarter, 60 months after approval by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. All other requirements remain in effect per previous approvals. The existing Footnote 'b' remains in effect until the revised Footnote 'b' becomes effective.

B. Requirements

R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I. To be valid, the Planning Authority and Transmission Planner assessments shall:

R1.1. Be made annually.

R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.

R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.1. Be performed and evaluated only for those Category B contingencies that would produce the more severe System results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.

R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.

R1.3.4. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.

R1.3.5. Have all projected firm transfers modeled.

R1.3.6. Be performed and evaluated for selected demand levels over the range of forecast system Demands.

R1.3.7. Demonstrate that system performance meets Category B contingencies.

R1.3.8. Include existing and planned facilities.

R1.3.9. Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.

R1.3.10. Include the effects of existing and planned protection systems, including any backup or redundant systems.

R1.3.11. Include the effects of existing and planned control devices.

R1.3.12. Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

R1.4. Address any planned upgrades needed to meet the performance requirements of Category B of Table I.

R1.5. Consider all contingencies applicable to Category B.

R2. When System simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-002-1_R1, the Planning Authority and Transmission Planner shall each:

R2.1. Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:

R2.1.1. Including a schedule for implementation.

R2.1.2. Including a discussion of expected required in-service dates of facilities.

R2.1.3. Consider lead times necessary to implement plans.

R2.2. Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.

R3. The Planning Authority and Transmission Planner shall each document the results of its Reliability Assessments and corrective plans and shall annually provide the results to its respective Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

M1. The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-1_R1 and TPL-002-1_R2.

M2. The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-002-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.
Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0a	October 23, 2008	Added Appendix 1 – Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO	Revised
0b	November 5, 2009	Added Appendix 2 – Interpretation of R1.3.10 approved by BOT on November 5, 2009	Addition
1b	April 2010	Revised footnote 'b' pursuant to FERC Order RM06-16-009.	Revised
1c	February 2013	Address remand of proposed footnote 'b' pursuant to FERC Order RM06-16-009	Revised

Table I. Transmission System Standards — Normal and Emergency Conditions

Category	Contingencies	System Limits or Impacts		
	Initiating Event(s) and Contingency Element(s)	System Stable and both Thermal and Voltage Limits within Applicable Rating [a]	Loss of Demand or Curtailed Firm Transfers	Cascading Outages
A No Contingencies	All Facilities in Service	Yes	No	No
B Event resulting in the loss of a single element.	Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault.	 Yes Yes Yes Yes	 No [b] No [b] No [b] No [b]	 No No No No
	Single Pole Block, Normal Clearing [e]: 4. Single Pole (dc) Line	Yes	No [b]	No
C Event(s) resulting in the loss of two or more (multiple) elements.	SLG Fault, with Normal Clearing [e]: 1. Bus Section 2. Breaker (failure or internal Fault)	Yes Yes	Planned/ Controlled [c] Planned/ Controlled [c]	No No
	SLG or 3Ø Fault, with Normal Clearing [e], Manual System Adjustments, followed by another SLG or 3Ø Fault, with Normal Clearing [e]: 3. Category B (B1, B2, B3, or B4) contingency, manual system adjustments, followed by another Category B (B1, B2, B3, or B4) contingency	Yes	Planned/ Controlled [c]	No
	Bipolar Block, with Normal Clearing [e]: 4. Bipolar (dc) Line Fault (non 3Ø), with Normal Clearing [e]: 5. Any two circuits of a multiple circuit towerline [f]	Yes Yes	Planned/ Controlled [c] Planned/ Controlled [c]	No No
	SLG Fault, with Delayed Clearing [e] (stuck breaker or protection system failure): 6. Generator 7. Transformer 8. Transmission Circuit 9. Bus Section	Yes Yes Yes Yes	Planned/ Controlled [c] Planned/ Controlled [c] Planned/ Controlled [c] Planned/ Controlled [c]	No No No No

D [d] Extreme event resulting in two or more (multiple) elements removed or Cascading out of service	3Ø Fault, with Delayed Clearing[e] (stuck breaker or protection system failure): 1. Generator 3. Transformer 2. Transmission Circuit 4. Bus Section 3Ø Fault, with Normal Clearing[e]: 5. Breaker (failure or internal Fault) 6. Loss of towerline with three or more circuits 7. All transmission lines on a common right-of way 8. Loss of a substation (one voltage level plus transformers) 9. Loss of a switching station (one voltage level plus transformers) 10. Loss of all generating units at a station 11. Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.	Evaluate for risks and consequences. ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.

a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.

b) An objective of the planning process is to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. ~~It is recognized that Firm~~ For purposes of this footnote, the following are not counted as Firm Demand ~~will be interrupted if itt is~~: (1) Demand directly served by the Elements removed from service as a result of the Contingency, ~~or~~and (2) Interruptible Demand or Demand-Side Management Load. In limited circumstances, Firm Demand may be interrupted throughout the planning horizon to ensure that BES performance requirements are met. However, when interruption of Firm Demand is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the use of Firm Demand interruption meets the conditions shown in Attachment 1. In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW.

c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.

d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.

e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.

f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Firm Demand interruption under footnote ‘b’ is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote ‘b’ is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Firm Demand interruption under footnote ‘b’
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Firm Demand interruption under footnote ‘b’ (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder’s satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote ‘b’ utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Firm Demand interruption under footnote ‘b’ which must include the following:

1. Conditions under which Firm Demand interruption under footnote ‘b’ would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Firm Demand MW to be interrupted with:
    a. The estimated number and type of customers affected

   b. ~~Assessment~~ An explanation of the effect of the use of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community
3. Estimated frequency of Firm Demand interruption under footnote ‘b’ based on historical performance
4. Expected duration of Firm Demand interruption under footnote ‘b’ based on historical performance
5. Future plans to ~~mitigate~~ alleviate the need for Firm Demand interruption under footnote ‘b’
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote ‘b’
7. Alternatives to Firm Demand interruption considered and the rationale for not selecting those alternatives under footnote ‘b’
8. Assessment of potential overlapping uses of footnote ‘b’ including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Interruptions of Firm Demand under Footnote ‘b’ is Required

Before a Firm Demand interruption under footnote ‘b’ is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ~~assure~~ensure that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues does not object to the use of Firm Demand interruption under footnote ‘b’ if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Firm Demand interruptions under footnote ‘b’, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Firm Demand interruption under footnote ‘b’ is greater than or equal to 25 MW

In no case can the planned Firm Demand interruption under footnote ‘b’ exceed 75 MW.

Once assurance has been received that the applicable regulatory ~~authority~~ authorities or governing ~~body~~bodies responsible for retail electric service issues does not object to the use of Firm Demand interruption under footnote ‘b’, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote ‘b’ for Firm Demand interruption.

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from MISO on August 9, 2007:

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed "Planning Coordinator" (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former "Planning Authority" name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

– Under the Functional Model, the Planning Coordinator "Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system" while the Transmission Planner "Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans." A PC's selection of "critical system conditions" and its associated generation dispatch falls within the purview of "methodology."

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

> **M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2]."

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a "valid assessment" means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term "planned outages" means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard1?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a "contingency" as defined in the *NERC Glossary of Terms Used in Standards.*

Appendix 2

Requirement Number and Text of Requirement
R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following **Category B of Table 1** (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s). **R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
Background Information for Interpretation
Requirement R1.3 and sub-requirement R1.3.10 of standard TPL-002-0a contain three key obligations: 1. That the assessment is supported by “study and/or system simulation testing that addresses each the following categories, showing system performance following Category B of Table 1 (single contingencies).” 2. “…these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).” 3. “Include the effects of existing and planned protection systems, including any backup or redundant systems.” *Category B of Table 1 (single Contingencies) specifies:* Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault. Single Pole Block, Normal Clearing[e]: 4. Single Pole (dc) Line *Note e specifies*: e) Normal Clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay. The NERC Glossary of Terms defines Normal Clearing as “A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems.”
Conclusion
TPL-002-0a requires that System studies or simulations be made to assess the impact of single Contingency operation with Normal Clearing. TPL-002-0a R1.3.10 does require that all elements expected to be removed from service through normal operations of the Protection Systems be removed in simulations. This standard does not require an assessment of the Transmission System performance due to a Protection System failure or Protection System misoperation. Protection System failure or Protection System misoperation is addressed in TPL-003-0 — System Performance following Loss of Two or More Bulk

Electric System Elements (Category C) and TPL-004-0 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).

TPL-002-0a R1.3.10 does not require simulating anything other than Normal Clearing when assessing the impact of a Single Line Ground (SLG) or 3-Phase (3Ø) Fault on the performance of the Transmission System.

In regards to PacifiCorp's comments on the material impact associated with this interpretation, the interpretation team has the following comment:

Requirement R2.1 requires "a written summary of plans to achieve the required system performance," including a schedule for implementation and an expected in-service date that considers lead times necessary to implement the plan. Failure to provide such summary may lead to noncompliance that could result in penalties and sanctions.

Implementation Plan for Project 2010-11: TPL Table 1 Order

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no new definitions in the proposed standards.

Compliance with Standards

Standards	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Authority
TPL-001-1: System Performance Under Normal (No Contingency) Conditions (Category A) TPL-002-1c: System Performance Following Loss of a Single Bulk Electric System Element (Category B) TPL-003-1: System Performance Following Loss of Two or More Bulk Electric System Elements (Category C) TPL-004-1: System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

The application of revised Footnote ‘b’ in Table 1 will take effect on the first day of the first calendar quarter, 60 months after approval by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. All other

requirements remain in effect per previous approvals. The existing Footnote ‘b’ remains in effect until the revised Footnote ‘b’ becomes effective.

All other requirements remain in effect as per previous approvals.

Project 2010-11 Revision of TPL-002 footnote 'b' and TPL-001 Footnote 12

Unofficial Comment Form

Please **DO NOT** use this form for submitting comments. Please use the electronic form located at the link below to submit comments on the Standard. The electronic comment form must be completed by 8:00 p.m. ET, **January 11, 2013**.

If you have questions, please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

Project page

Background Information

This posting is soliciting formal comment.

FERC Order No. 762 issued April 19, 2012 remanded TPL-002-1b as vague, unenforceable, and not responsive to the previous Commission directives on this matter. The Standards Committee directed the Standards Drafting Team (SDT) to revise footnote 'b' in accordance with the directives of Orders No. 693 and 762. The SDT was also charged with revising the corresponding footnote 12 of TPL-001-2 in order to prevent the remand of TPL-001-2.

The NERC Board of Trustees approved version of TPL-002-1b was used as a starting point for these deliberations. This was done because when FERC remanded the standard it was not because it contained a stakeholder process, but because the stakeholder process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand, and did not assure that BES reliability would be maintained. Thus, the initial balloted draft was designed to respond to those criticisms by adding the necessary detail and specificity to the already approved approach.

TPL-001-2 has been approved by the industry through the standards development process and by the NERC Board of Trustees. The Standards Authorization Request (SAR) for this project recognized this fact and thus did not allow for any changes to the utilization of footnote 12. Nothing in this project changes the application of footnote 12 within Table 1 of TPL-001-2.

The remand order from FERC requested that a Section 1600 data request be made to provide data on the actual usage of footnote ‘b’ by planners. The SDT utilized the data received in reaching its determination of the threshold values applied in the footnote and believes that the data request results provide a sufficient technical rationale for the threshold values. Furthermore, the SDT believes that any deviation from the thresholds derived from the actual data may be viewed as unacceptable in addressing the directives in Orders .

The proposed stakeholder process does not eliminate or reduce the role of local regulatory authorities, nor does it impose on local regulatory proceedings. The proposed stakeholder process was designed to incorporate an open and transparent proceeding to the potential utilization of footnote ‘b’ with all affected parties involved in the discussions. Local regulatory authorities are still free to perform their legislative mandates.

The SDT has made a number of clarifying changes to the footnote and Attachment based on comments received from the initial ballot posting. These changes include clarifying that Consequential Load Loss and Demand-Side Management programs are not affected by application of the footnote. The questions in this comment form are restricted to these changes. There have been no changes to the Implementation Plan originally filed with the respective standards.

The SDT requests that commenters refrain from repeating comments submitted in the previous posting. The SDT has noted those comments and responded to them to the best of its ability within the project constraints.

You do not have to answer all questions. Enter All Comments in Simple Text Format. Bullets, numbers, and special formatting will not be retained.

Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree with changes made to the body of the footnote? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

☐ Yes

☐ No

Comments:

2. Do you agree with the changes contained in Section II of Attachment 1? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

☐ Yes
☐ No
Comments:

3. Do you agree with changes contained in Section III of Attachment 1? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

☐ Yes
☐ No

4. If you have any other comments on this Standard that you haven't already mentioned above, and that are not simply reiterating previous comments that the SDT has already responded to, please provide them here:

Comments:

Standards Announcement

Project 2010-11– TPL Table 1 Order
TPL-002-1c, footnote ‘b’ and TPL-001-2a, footnote 12

Successive Ballot is now open through Friday, January 11, 2013

Now Available

A successive ballot is now open for revisions to a single footnote that is incorporated into two standards (**TPL-002-1c**– System Performance Following Loss of a Single BES Element for footnote ‘b’, and **TPL-001-2a** – Transmission System Planning Performance Requirements for footnote 12) through **8 p.m. Eastern Friday, January 11, 2013.**

Please note that, aside from the proposed revisions to the footnote and changes to conform the Enforcement Dates section to the current language approved by NERC legal to cover all of the jurisdictions in which NERC standards are mandatory, no other revisions have been made to either standard. The scope of the drafting team’s assignment is limited to addressing changes to the single footnote.

Instructions

Members of the ballot pools associated with this project may log in and submit their vote for the footnote by clicking here.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and successive ballot and, if needed, make revisions to the footnote. If the comments do not show the need for significant revisions, the footnote will proceed to recirculation ballot.

As a reminder, the drafting team will hold a webinar to review the revisions on Tuesday, January 8, 2013, from 1:00 to 3:00 p.m. Eastern. Please click here to register for this webinar.

Background

FERC Order No. 762, issued April 19, 2012, remanded TPL-002-0b to NERC as vague, unenforceable and not responsive to the previous Commission directives on this matter. The Standards Committee directed the Standards Drafting Team (SDT) to revise footnote ‘b’ in accordance with the directives of

Orders No. 693 and 762. The SDT was also charged with revising the corresponding footnote 12 of TPL-001-2 in order to prevent the remand of TPL-001-2.

In revising the footnotes, the SDT adopted a philosophy of minimal changes to the actual footnote itself. This was done to minimize confusion as to what was changed, for ease of reading and following the footnote, and for formatting within the actual standards documents. Instead, the SDT revised the footnote by developing an attachment to the footnote containing changes in response to the Commission orders. It should be noted that attachments to standards are an extension of the Requirements and thus are binding to applicable entities.

Project 2010-11 is an important part of the ERO's strategic goal to be responsive to regulatory authority directives in an expeditious manner in order to reduce the amount of standards-related directives and to provide an adequate level of reliability.

Additional information can be found on the project page.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Project 2010-11– TPL Table 1 Order
TPL-002-1c, footnote ‘b’ and TPL-001-2a, footnote 12

Successive Ballot Results

Now Available

A successive ballot window for revisions to a single footnote that is incorporated into two standards (**TPL-002-1c**– System Performance Following Loss of a Single BES Element for footnote ‘b’, and **TPL-001-2a** – Transmission System Planning Performance Requirements for footnote 12) concluded at **8 p.m**. **Eastern on Friday, January 11, 2013.**

Voting statistics for each ballot are listed below, and the Ballot Results page provides a link to the detailed results.

Approval
Quorum: 85.47% Approval: 65.77%

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the footnote. If the comments do not show the need for significant revisions, the footnote will proceed to a recirculation ballot.

Background

FERC Order No. 762, issued April 19, 2012, remanded TPL-002-0b to NERC as vague, unenforceable and not responsive to the previous Commission directives on this matter. The Standards Committee directed the Standards Drafting Team (SDT) to revise footnote ‘b’ in accordance with the directives of Orders No. 693 and 762. The SDT was also charged with revising the corresponding footnote 12 of TPL-001-2 in order to prevent the remand of TPL-001-2.

In revising the footnotes, the SDT adopted a philosophy of minimal changes to the actual footnote itself. This was done to minimize confusion as to what was changed, for ease of reading and following the footnote, and for formatting within the actual standards documents. Instead, the SDT revised the footnote by developing an attachment to the footnote containing changes in response to the Commission orders. It should be noted that attachments to standards are an extension of the Requirements and thus are binding to applicable entities.

Project 2010-11 is an important part of the ERO's strategic goal to be responsive to regulatory authority directives in an expeditious manner in order to reduce the amount of standards-related directives and to provide an adequate level of reliability.

Additional information can be found on the project page.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson, Standards Development Administrator, at monica.benson@nerc.net or at 404-446-2560.

Individual
Frederick R Plett
Massachusetts Attorney General
No
The SDT ignored a lot of feedback concerning the inappropriateness of a 75 MW threshold. IT remains inappropriate and an appropriate level should be decided by local stakeholder processes.
Yes
No
Don't buy the 75 MW or the 25 MW thresholds.
Group
SERC EC Planning Standards Subcommittee
Jim Kelley
PowerSouth Energy Cooperative
Yes
Yes
Yes
Change "does" to "do" in the last sentence of the first paragraph and in the first sentence of the last paragraph in Section III of Attachment 1.
We continue to recommend that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. We believe that this simplification would be less burdensome and would enhance industry acceptance of the revision, while still meeting regulatory guidance. The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

Entergy Services, Inc. (Transmission)
No

Attachment 1 is overly burdensome and concerns local reliability issues better left to local regulators. A planned or unplanned loss of 25 MW is inconsequential to the reliability of the BES. The footnote could be simplified to exclude attachment 1 as follows: An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to 25 MW and notice must be given to applicable regulatory authorities or governing bodies responsible for retail electric service issues within 30 days of the completion of the assessment which includes the use of footnote 12.
No
Attachment 1 is overly burdensome and unnecessary.
No
Attachment 1 is overly burdensome and unnecessary.
Yes
If Attachment 1 must remain, Entergy would support the SERC PSS suggestion to limit the application of Attachment 1 (the stakeholder process) to only those situations where the non-consequential load at risk is above 25MW.

No
Planned interruptions of Firm Demand in response to a Single Contingency (as directed in Footnote b of TPL-002 Table 1, and Footnote 12 of TPL-001-2), is not an acceptable corrective action to mitigate reliability issues on the BES system. The Interconnected System should be designed and operated with enough transfer capacity to be able to withstand, at a minimum, a single contingency event without service interruptions to customer load. Systems must be designed and operated so that the impact of any single contingency can be mitigated by re-dispatching available system resources without the need to implement load shedding.

Dropping load generally should not be endorsed, but it is recognized that there are special situations where it cannot be avoided. If a regulator responsible for load is comfortable with greater than 75MW being dropped in a rare situation, there should not be a requirement to build out of the situation. Provided there is no widespread, adverse effect on the reliability of the interconnected BES, the effect of a interruption on customers is under the purview of the applicable regulatory authority that is responsible for local transmission and retail service over the load to be curtailed. NERC must acknowledge that jurisdictional authorities can decide on the parameters for planning events that do not have an impact on the reliability of interconnected BES . There are no limits on non-consequential load loss for Single Contingency P2-2 and P2-3 (HV only), multiple Contingencies P4 and P5 (HV only), and P6 and P7. Footnote 12 allows limited non-consequential load loss for single contingency P1, Multiple Contingency P3. Non-consequential load loss is not allowed for P2-2 and P2-3 (EHV), and P4 and P5 (EHV). Considering the extensive EHV Facilities in the Canadian regions of NPCC, it is not reasonable to accept some non-consequential load loss for single contingency P1 and P2-3, and then deny it for Multiple Contingency categories P4 and P5 which are statistically less frequent than the former. Also, the Multiple Contingency P7 (for which there is no limit on non-consequential load loss) is more frequent than P2-3, P4 and P5. This technical irregularity must be reviewed and addressed. This comment was submitted for the last posting.

Under section II items 3 and 4 the wording (frequency and duration) seems to implicate that the planners will be determining these events in a probabilistic manor. If the probability of these events is anything other than 0 planners will have to accommodate for those events in their planning assessments regardless of how small the probability is for that event.

While Western agrees in general with what is proposed in Footnote b; I do not agree with stipluating 2 requirements in the proposed Footnote b: The 75 MW load threshold; the Attachment 1 Stakeholder process. The 75 MW seems low and NERC should condsider using a 300 MW threshold similar to that used in CIP-002 and EOP-004 requirements.
Yes
No
See response to Question 1.
Yes
I believe that the 75 MW limit is abetrary and could be too low given particular circumstances, like the maginitude of recent load growth in the area, regulatory hurdles in building new transmission, etc. I also believe that the Attachment 1 stakeholder process is not needed, since it is already covered by the FERC Ordered 890 planning process.

We recommend that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. We believe that this simplification would be less burdensome and would enhance industry acceptance of the revision, while still meeting regulatory guidance.

Central Lincoln
Yes
Central Lincoln has not paid much attention to this standard, since it is not applicable to this entity's registered functions. However, we are disturbed by the direction the standard is taking. The slides from the recent webinar (http://www.nerc.com/docs/Standards/dt/footnoteb_webinar_20130108_final.pdf) state that "The 75 MW cap will require construction of major Transmission projects." This is in direct conflict with the definition of "reliability standard" as provided in section 215 of the FPA where it states "...the term does not include any requirement to enlarge such facilities or to construct new transmission capacity..." The webinar slide does offer alternatives to construction, but we don't see those providing any reliability benefit. Some of the suggestions apparently only relate to contract language, which cannot possibly relate in any way to "reliable operation" as defined in section 215. Central Lincoln is is concerned that the revised language oversteps the bounds of the "reliability standard" definition under Section 215 of the Federal power Act and into customer service issues that are better served by, and under the jurisdiction of, state and local utility boards and commissions.

ERCOT believes that the revisions to the footnote b attachment are an improvement from the previous version. However, ERCOT does not believe that the SDT provided a technical rationale for disagreeing with the comments that we previously submitted. We fundamentally disagree with the approach of defining a stakeholder process in the attachment to a footnote in a reliability standard. While footnotes and attachments have been used in other standards we believe that this application is not appropriate. ERCOT believes that the footnote should be removed altogether as it does not meet the objectives of FERC Order 693. We also believe that FERC did not mandate that a stakeholder process be used. As stated in the January 8 NERC Industry Webinar, 90% of planning entities have not used the existing footnote b over a planning horizon of 13 years. To incorporate an attachment to a footnote with a complicated and prescriptive stakeholder process to address a few instances seems to be a least common denominator approach to planning which is opposed to FERC's direction. Consistent with the approach of TPL-001-2, ERCOT recommends raising the bar on reliability and removing the footnote from the standard.

There are jurisdictional issues with the footnote and attachment as written. These will be described in further detail throughout this document. The footnote itself states, “An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events.” A standard should not have requirements described as objectives, this language is extremely subjective.
No
Section II, 2.a, states that studies must address the estimated number and type of customers affected by Non-Consequential Load Shedding. The Transmission Planner in many cases will not be the appropriate entity to address these concerns. The Transmission Owner, Distribution Provider or Load Serving Entities would be the appropriate entities to address customer affects. Explaining effects on the “health, safety, and welfare of the community” is required under the footnote in Section II, 2.b. The same load could be shed directly as the consequence of a fault and no such assessment is required. In addition, Transmission Planners can shed radial load with no assessment of health and welfare. In addition to the practical considerations listed, once again here the standard infringes on Section 215 responsibilities where State authority over the “safety, adequacy and reliability of the electric system in that state” is mandated. This section should be deleted. Section II, requirements 3 and 4 discuss estimating frequency and duration of Non-Consequential Load Loss based on historical performance. The planning process uses deterministic not probabilistic assessments. This section should be deleted.
The footnote states “Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 12 if either…”. Section 215 of the Federal Power Act clearly delineates Federal, State and Local authority. State and Local requirements should not be introduced into a NERC standard. In addition to the jurisdictional issues, proving that the “applicable regulatory authority or governing body” does not object is more difficult than proving that they simply approved the use of non-consequential load loss. The SDT should remove all references to State and Local authority from the standard. Overall, the order of Section III is also notable. During year, two through ten of the overall planning horizon the standard allows for Non-Consequential Load Loss without approval. In the first year of the assessment, approval becomes required for Non-Consequential Load Loss. At this point, it is too late to allow for any other alternative. The Regional Entities with NERC oversight perform periodic audits and require self-certification of the planning process. By virtue of the audit and self-certification process, NERC has the ability to monitor the use of Non-Consequential Load Loss in planning assessments. State and Local approval of practices called for in ERO Standards is inappropriate. In addition to being notable for the year one timing, Section III seems incomplete. In the case where there is objection to Non-Consequential Load Shedding, the process appears to end without resolution.
In summary, this standard as proposed has misplaced jurisdictional authority under Section 215 of the Federal Power Act. The removal of references to State and Local authorities in the standard is required.

Disagree with no change to the 75 MW threshold, but agree with the minor changes that were made since last posting. I request your consideration of a 300 MW threshold similar to that used in CIP-002 and EOP-004. Since there is a directive for some threshold, and in an attempt to reduce the likelihood of over-burdening smaller communities, the 300 MW level would be a more reasonable threshold for the BES.

Tacoma Power
Yes
Yes
Yes
While Tacoma Power appreciates NERC's attempt to address both footnotes with the same drafting team, Tacoma Power is voting negative on the revisions to footnote "b" in TPL-002-1c and the corresponding footnote 12 of TPL-001-2. However, Tacoma Power would vote affirmative if a re-circulation ballot was limited strictly to footnote "b" in TPL-002-1c. TPL-001-2 considered new types

of outages not considered by TPL version 1, such as P2-1. Although TPL-001-2 was approved by the industry, the proposed modifications to footnote 12 in TPL-001-2 are significantly more onerous than footnote 12 in TPL-001-2. Furthermore, since TPL-001-2 is not yet enforceable, some Transmission Planners still do not realize that automatic relay actions are considered Non Consequential Load Loss. In addition, Tacoma Power identified over 100 MW of load in multiple locations that would be shed in accordance with footnote 12 in TPL-001-2. Unfortunately, the structure of the Section 1600 data request did not allow for the submittal of footnote 12 related data. Since it is clear that the potential impact of the footnote 12 revision has not been addressed due to the compressed timeline, Tacoma Power believes that by separating the two standards, NERC can meet the FERC mandated deadline for footnote b while still continuing the drafting process to achieve true industry consensus on footnote 12. Please note that FERC orders 693 and 762 require addressing only footnote "b" by the using the Expedited Standards Development Process. Earlier FERC orders discuss "single contingencies" as type Category B in TPL-002-1; FERC has not addressed Non Consequential Load Shedding for the lower probability "single contingencies" (i.e. P2-1) in TPL-001-2. Approving the revisions to footnote 12 would result in negligible reliability gains at an unreasonable cost for customers on the fringes of the power system, without affording local jurisdictional cost benefit analysis. Tacoma Power is also concerned that the revised language oversteps the bounds of the "reliability standard" definition under Section 215 of the Federal Power Act. These revisions tread on customer service issues that are better served by, and under the jurisdiction of, state and local utility boards and commissions. For details on Tacoma Power's concerns please see the comments submitted during the initial ballot. However, in the spirit of moving this process forward, Tacoma Power would vote to approve the revisions to solely TPL-002-1c if balloted separately from TPL-001-2. Tacoma Power appreciates the opportunity to provide comments, and thanks you for consideration of our comments.

We do not agree with setting a MW limit for non-consequential load loss. The allowable amount should be determined and approved by the jurisdiction of the area(s) whose load is affected. The intent of the TPL standard and this footnote is to ensure that if non-sequential load loss is accounted for or relied up to ensure BES reliability (as assessed in the planning horizon), that such a decision needs to be approved by the appropriate jurisdiction
Group

Yes
(1) We continue to disagree with the 75 MW capacity limit threshold. There is no need for a 75 MW cap because registered entities and local-level policy makers are in the best position to determine an appropriate capacity limit, as stated in the FERC order and in previous feedback. However, if the drafting team decides to move forward with a cap, we suggest using a cap that would reflect all data points from the Section 1600 data request to be under the threshold. The findings to the data request contained a data point at 75.2 MW, which would be over the proposed threshold. We understand this data point, in essence, has been omitted because the use of non-consequential load shedding for the 75.2 MW data point is expected to terminate soon. If the drafting team intends to use the data that represents the actual usage of footnote ‘b’ by planning coordinators, then the team should take into account the highest data point and adjust the threshold to at least 76 MW regardless of the length of time the data point is needed. Again, local decision makers are better equipped to make this type of determination. (2) However, in the spirit of moving forward with this project we will support the changes and thank the drafting team for their efforts.
No
(1) Thank you for making the changes to Section II of Attachment 1. We believe the modification of removing “assessments” and replacing it with “explanation” provides more flexibility regarding how a registered entity can demonstrate the impacts the health, safety and welfare of the community. (2) However, we still believe that the word “alleviate” in bullet 5 requires the same actions as the word “mitigate.” There are instances where no action is required based on a variety of factors. We recommend the following: “Future plans, if necessary, to mitigate/alleviate the need for Non-Consequential Load Loss under footnote 12, unless a determination was made not to mitigate/alleviate, then an explanation why.”
Yes
Yes
(1) In regard to the changes relating to Demand-Side Management, we agree with the wording, “For purposes of this footnote, the following are not counted as Firm Demand: (1) Demand directly served by the Elements removed from service as a result of a Contingency, or (2) Interruptible Demand or Demand-Side Management Load.” However, the most recent change has created some confusion by replacing “or” with “and” that potentially and inadvertently may exclude the use of DSM in all locations but on the facilities removed from service. This would render DSM ineffective. Now, the both (1) and (2) must occur in order to not be counted as Firm Demand. We recommend changing the wording back to “or” so each option (1) OR (2) is independently excluded from Firm Demand for footnote b. Connecting the options with the word “and” changes the meaning and requires entities to meet both option (1) and option (2) to be excluded from Firm Demand. Demand directly served by the Elements removed from service as a result of a Contingency should be excluded, as should Interruptible Demand or Demand-Side Management Load regardless of its location. A registered entity does not need to have both for the exclusion. (2) Thank you for the opportunity to comment.

NARUC
Diane Barney

NARUC
No
As stated before, if there is no reliability threat to the bulk system there is no need for the 75 MW limit on the anticipated amount of load to be shed. As long as the regulator responsible for the retail load subject to being shed is notified of the situation, the situation can be appropriately addressed at the local level.
Group
MRO NSRF
WILL SMITH
MIDWEST RELIABILITY ORGANIZATION
Yes
No
The drafting team over specified the Section II stakeholder information process and continues to disregard comments that item 2b be removed from several utilities over several footnote “b” revisions. The goal of Attachment 1 as stated by the drafting team chair was to place “meaningful” parameters around footnote b. The words in 2b on “health, safety, and welfare” are beyond the scope of NERC standards, and are not defined sufficiently in the standard to make the requirement meaningful. The NSRF recommends that if the drafting team doesn’t eliminate 2b, they delete the words “on the health, safety, and welfare of the community” as going beyond NERC jurisdiction, FERC directives, and the SAR. The drafting team response that similar words exist in another standard is not a reason to the ambiguous words in the TPL Attachment 1.
No
The NSRF believes that the standards drafting team did clarify in the webinar that the 25 MW and 75 MW footnote “b” values were separate from interruptible load, and consequential load loss and would not be counted towards the 25 and 75 MW thresholds. However, the NSRF recommends that Attachment 1 also clearly contain an explicit statement “the 25 MW and 75 MW footnote “b” values are separate from consequential load loss, interruptible load, and are not to be counted towards the 25 MW and 75 MW thresholds.”
Yes
Some entities remain concerned over a potential conflict and mismatch of impacts introduced by Section III and the inclusion of non-regulated stakeholders versus NERC regulated entities. There was not a FERC directive to include section III. Section III overreaches the intent of the FERC order and the SAR to meet the FERC directive. The drafting team should show the specific FERC requirement and words in Order 693 that requires non-NERC regulatory reviews. The drafting team technically responded to a request that Section III be removed, but avoided the the fundamental issue. The fact that some existing non-NERC regulatory bodies may already have a consistent practice is not a reason to include non-NERC entities into a NERC framework. This creates a fundamental mismatch between NERC regulated entities that must follow NERC standards and stakeholders that are not compelled by NERC requirements. If Section III is not deleted, it is recommended that wording be added to allow the existing FERC Order 890 stakeholder meeting process be used to meet Attachment 1. Regulators attend these meetings and all stakeholders (including regulators) could be asked for their objections. If there was no response or a “lack of dissent”, this would be documented as meeting Attachment 1 to allow the use of footnote “b” without additional special procedures.

No
In this comment period Hydro One would like to reiterate its initial comments. Hydro One disagrees with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no widespread, adverse effect on the reliability of the interconnected bulk electric system, the effect on customers of a firm demand interruption is the responsibility of

the applicable regulatory authority or its delegated agencies responsible for local transmission and retail service over the load to be curtailed. If it is decided to proceed with the 75 MW or any other value, we propose replacing the sentence, in the footnote and in attachment one, section III that reads: “In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW.” with “In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss under footnote 12 for a non-US Registered Entity should be determined by the applicable Regulatory Authority or Governmental Authority or its delegated agency in that is responsible for retail electric service issues in that jurisdiction.”
No
As previously stated, we believe that the process presented in Section II is overly prescriptive. If a section that prescribes the information requirements for a stakeholder process is required, then for non-US entities this section should simply require that the process information requirements must be in accordance with the requirements of the applicable Regulatory Authority or Governmental Authority or its delegated agency that is responsible for local transmission and retail service in that jurisdiction.
No
The process presented in Section III is overly prescriptive and duplicates information not necessary for its intended purpose. As stated in Q1, we disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard, and propose alternate language in our response to Q1. If this section is required to address a review of the use of footnote 12 to ensure that there are no wide-spread adverse reliability impacts on the bulk power system, then it should be limited to the information required for that purpose. Provided there is local support for the use of Non-Consequential Load Loss under footnote 12, only information items 6 and 8 from section II are relevant for this assessment—the remainder are not required for this section and should be deleted. Items 1 and 2 complicate this section and are unnecessary. They should be replaced by a phrase such as “for those planning events where the use of footnote 12 is referenced.” We disagree with the need to submit this information to the ERO for a determination of whether there are any Adverse Reliability impacts caused by the use of Non-Consequential Load Loss. This will introduce a new type of review at the ERO that will create unnecessary delays and burden, and is inconsistent with (and not required for) all of the other performance requirements in the TPL standards. Submitting the analysis to the adjacent Planning Coordinators and Transmission Planners, and any functional entity that requests it, as called for in requirement R8 of TPL-001-2 should be sufficient.
Yes
As previously stated in our response to Question #1, Hydro One would like to reiterate our position presented during the initial comment period. We believe that the SDTs response to our initial comments did not correctly address the issues because it did not recognize the Reliability Standards framework that is effective in the Province of Ontario and possibly other Canadian provinces.

Yes
While ITC is voting yes for this “successive ballot”, we are doing so in the interest of ensuring that TPL 001-2 becomes fully effective as soon as possible. TPL001-2 is a major improvement to previous standards and insuring it becomes fully effective is important to ITC and the industry. However, we have concerns that we would like to be noted. Because footnote B has been highlighted and expanded, there is the possibility of future “unintended consequences”. It is highly likely that interveners or others may attempt to stop or slow down needed corrective action plans, that do not rely on load shedding, by suggesting that planners use this stakeholder process before proposing projects. We suggest both NERC and FERC be prepared to deal with these unintended consequences. We also concur in entirety with the comments MISO is proposing to make for this project. They are consistent with past comments ITC has made and do discuss in some detail the potential “unintended consequences” this detailed footnote may cause.
Group
Western Area Power Administration - Transmission Owner
Lloyd A. Linke
Western Area Power Administration

No
While Western generally agrees with the proposed modification to footnote b, Western does not support the 75 MW threshold and Attachment 1 Stakeholer process. The 75 MW threshold seems to low and if a threshold it needed the drafting team should consider using a 300 MW threshold similar to that used in CIP-002, EOP-004, DOE OE-417 reporting, and NERC event analysis process. The stakeholder process seems to be duplicative, considering there FERC Order 890 planning process.
Yes
No
See answer to Question 1.
Yes
Western believes that the 75 MW limit is arbitrary and could be to low given particular circumstances, like the magnitude of recent load growth in the area, regulatory hurdles in building new transmission, etc. We also believe that the Attachment 1 stakeholder process is not needed, since it is already covered by the FERC Order 890 process.
Individual
Mark Westendorf
MISO
No
MISO does not object to the changes made to the body of the footnote since the previous draft. However, as a general matter, MISO cannot support the current language of Footnote 12. Because the intent of the TPL standards is not to rely on non-consequential firm load shedding after a single contingency event, MISO does not agree that footnote b in NERC TPL-002-1 and/or footnote 12 in TPL-001-2 should be included in these standards. Nonetheless, if these footnotes are included, MISO agrees that there should be some limitation on how much firm load shed is allowed under these footnotes and would not object to the proposed 75 MW level if the footnotes are included.
No
Regarding the use of “explanation” in place of “assessment,” MISO understands that the purpose of this change is to reduce the need for entities to hire expensive consultants and to incur other substantial costs in assessing demographic data and impacts on an affected area. However, as written, this word change potentially places more of a burden on responsible entities. An assessment is an analysis performed using available facts and data while an explanation implies full knowledge. MISO therefore recommends that “assessment” be retained and that a footnote explaining the meaning of that term be added. More generally, however, MISO has concerns regarding the use of a stakeholder process such as the one outlined in Attachment 1 and cannot support the Footnote or Attachment 1 at this time. Please refer to our comments under Question 4 for a more detailed description of these concerns.
No
MISO does not object to the changes made to Section III. However, more generally, MISO has concerns regarding the use of a stakeholder process such as the one outlined in Attachment 1 and cannot support the Footnote or Attachment 1 at this time. Please refer to our comments under Question 4 for a more detailed description of these concerns.
Yes
As previously stated, it is the general intent of the existing TPL-002-1 standard and proposed TPL-001-2 standard to not rely on any shedding of Non-Consequenital Load to meet a single contingency event. Accordingly, MISO submits that footnote b of TPL-002-1 and footnote 12 of TPL-001-2 should be struck. However, in the event that the footnotes in question are not eliminated, the footnote should be narrowly focused only on those situations for which the original footnote was developed, i.e., the interruption of service to radial customers or some local area Network customers connected to or supplied by the Faulted element or by the affected area, where the overall reliability of the interconnected transmission system is not impacted. MISO therefore proposes the following alternate language for footnote b and footnote 12 to ensure it is not misapplied: “An objective of the planning process is to avoid Non-Consequential Load Loss following Contingency events. In limited circumstances, Non-Consequential Load Loss may be needed within the planning horizon to ensure that BES performance requirements are satisfied. However, Non-consequential Load shed cannot be used to avoid cascading outages or to maintain system stability. Non-consequential load shed also cannot be used to avoid a thermal loading or voltage limit violation on an extra high voltage (EHV) facility. When Non-Consequential Load Loss is utilized within the transmission planning horizon to address BES performance requirements, such interruption cannot exceed 75 MW and is limited to the following circumstances: • Non-consequential Load shed is allowed for load served by a radial transmission line to avoid voltage limit violations on the radial transmission line following a single contingency event. • Non-consequential load shed is allowed for load within a local area served by not more than two Transmission Circuits and/or Transformers to avoid a thermal loading issue or voltage issue within the local area, including the Transmission Circuits and/or Transformers directly supplying the local area, for a loss of a single element within the local area, including one of the Transmission Circuits or Transformers directly supplying the local area, so long as there are no thermal loading or voltage violations outside the local area.” MISO believes the language above would ensure the continuing reliability of the Bulk Electric System by limiting load shed and violations that require load shed to radial areas or areas that would be served radially following the single contingency. In addition, MISO has significant concerns regarding use of a stakeholder process to determine if non-conseqeuntial load shedding is appropriate following a single contingency event, as expressed in MISO’s comments on previous drafts of this Project. In particular, MISO has concerns regarding whether such a stakeholder process could be sufficiently open and transparent given the many, competing interests of the responsible entity and affected stakeholders. Without such sufficient openness and transparency, it is likely that stakeholder processes will not result in consistent determinations of the appropriateness of the application of footnote b in NERC TPL-002-1 and/or footnote 12 in TPL-001-2. Stated differently, MISO is concerned that such stakeholder processes will always be subject to the biases of the participating parties, with the sheer number of parties determining the outcome of the process. As an example, should a particular process be dominated by parties that may be responsible for payment of upgrades but that are not impacted by the alternative load shed, those stakeholders impacted by the alternative load loss would be relegated to a minority position, resulting in majority-imposed stakeholder decisions to shed load. On the other hand, if the stakeholder process is limited to only the stakeholders directly impacted by the proposed load shed, to

the extent those stakeholders pay only a small part of the upgrade costs, they will always choose to avoid load shed – even if such decision requires a potentially costly upgrade. Consequently, MISO has concerns that the inclusion of a requirement for a fair and impartial stakeholder process to determine if and when load shed is acceptable to assist in satisfying a single contingency standard is not realistically attainable. MISO therefore recommends that Attachment I be eliminated and that the footnotes either be eliminated or replaced with the modified version above.

Northeast Utilities
No
Northeast Utilities does not support the use of non-consequential demand interruption throughout the planning horizon. Even with the 75 MW limit, NU believes that this language seems to encourage operational workarounds and adds burdens for operators of the system. Lastly, NU believes this use of non-consequential load loss during the planning horizon is not consistent with planning a highly reliable bulk electric system and thus does not support non-consequential load loss for planning purposes.
Individual
Patricia Robertson
BC Hydro
Yes
BC Hydro appreciates the efforts of the SDT in revising standards TPL-002-1c – System Performance Following Loss of a Single BES Element (footnote b) and TPL-001-2a – Transmission System Planning Performance Requirements (footnote 12). BC Hydro votes YES in support of this ballot and wishes to provide the following two comments: 1.At this time BC Hydro has concerns about the level of stakeholder consultation that might be required as a result of the implementation of this standard and will bring this concern to the attention of our regulator if necessary. 2.At this time BC Hydro has concerns about the instances for which regulatory review of non-consequential load loss under footnote 12 is required and will discuss those with our regulator if necessary.
Individual
Teresa Czyz
Georgia Transmission Corp.
Yes
Since this question refers to both footnote b (TPL-002-1c) and footnote 12 (TPL-001-2a), and the changes to the footnotes are not identical, the question should be split into two. Regarding footnote b: An excerpt from footnote b reads “For purposes of this footnote, the following are not counted as Firm Demand (1) Demand directly served by the Elements removed from service as a result of the Contingency …” However, what is being described is in fact Firm Demand (That portion of the Demand that a power supplier is obligated to provide except when system reliability is threatened or during emergency conditions) that is Consequential Load Loss (All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.). Therefore, why not use the terms Consequential Load Loss and Non-Consequential Load Loss? Regarding footnote 12: The replacing the NERC defined “Contingency” event with the undefined “planning” event necessitates a new definition. The intent of the change is unclear.

Footnote b contains no technical basis for allowing load dropping. It is completely based on an administrative procedure. This is not

responsive to paragraphs 17 and 32 of the FERC remand order. A technical basis has to be proposed. The "temporarily radial" concept that was proposed in earlier drafts will address this problem. It will give a technical basis for when load dropping would be allowed. If a technical basis is developed like FERC requires, then there is no need for a stakeholder process. The stakeholder process is not a bright line criteria which can be enforced; it will change depending on the make-up of stakeholders and therefore create inconsistencies across the grid. This approach should never be used in a reliability standard. NERC adopted the ANSI standard process as the bench mark in developing its reliability standards. ANSI does not use stakeholder processes. We propose that the stakeholder process be eliminated. Create a technical basis for when load dropping can be utilized. Keep the 75 MW maximum amount of load that can be dropped.
Individual
Si Truc PHAN
Hydro-Quebec TransEnergie
No
Hydro-Québec TransÉnergie (HQT) remains unconvinced that a MW threshold needs to be part of footnote 12. This is not a BES reliability issue but only a matter of service continuity to be addressed by TO/PA/RC with local regulatory authorities.
No
HQT still considers that the non application of footnote 12 to categories P2 (breaker fault), P4 (stuck breaker) and P5 (failure of a non redundant relay) is not correct, when the footnote is applied to other categories such as P3, P6 and P7 (loss of double-circuit lines). The SDT has indicated that the applicability of footnote 12 to categories P2, P4 and P5 is not included in Project 2012-11. However, looking at related Project 2006-02 where footnote 12 was brought up to Table 1, the matter of applicability was not discussed in detail and the SDT did not clearly explain why Non-Consequential Load Loss was not allowed for contingencies less frequent than those for which it is allowed (internal breaker faults or stuck breakers are less probable than double-circuit line faults). Discussion on this matter should not be dismissed.

Independent Electricity System Operator
No
Please note that the Independent Electricity System Operator (IESO), an RTO/ISO registered under Industry Segment 2, has filed an appeal with respect to NERC's response to our similar comments submitted to the previous ballot on this project. We disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no widespread adverse effect on the reliability of the interconnected bulk power system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed. To recognize NERC's role as the ERO for Ontario and the Memorandum of Understanding between NERC and the Ontario Energy Board, the IESO proposed replacing the sentence, in the footnote and in attachment one, section III that reads: "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW." with "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss under footnote 12 for a Registered Entity that is a Canadian Entity (or a Mexican Entity) should be implemented in a manner that is consistent with/or under the direction of the Applicable Governmental Authority or its agency in Canada (or Mexico). Under this language, both the amount of non-consequential load loss, and the process under which that amount was arrived at, including stakeholder consultations, would be determined by the relevant Canadian jurisdiction, in this case Ontario. This change will make the standard acceptable in Ontario's legislative framework, in which NERC standards come into force automatically unless, by order of the Ontario Energy Board, a standard is stayed and remanded back to NERC for further consideration. The responses to the IESO's comments in the previous ballot were inaccurate as to this key feature of the Ontario reliability framework, as addressed in the IESO appeal. An alternate solution to this issue, which would • be consistent with the intent of the responses to the IESO comments on the previous ballot, • respect the Ontario reliability framework, and • resolve the IESO January 9, 2013 appeal; and is appropriate given that these changes are being driven by a U.S. FERC remand order to NERC, would be to make the following highlighted clarifications to footnotes 'b' and 12: With respect to Standard TPL-002-1c — footnote 'b' b) An objective of the planning process is to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm For purposes of this footnote, the following are not counted as Firm Demand will be interrupted

if itt is: (1) Demand directly served by the Elements removed from service as a result of the Contingency, orand (2) Interruptible Demand or Demand-Side Management Load. In limited circumstances, Firm Demand may be interrupted throughout the planning horizon to ensure that BES performance requirements are met. However, for U.S. registered entities when interruption of Firm Demand is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the use of Firm Demand interruption meets the conditions shown in Attachment 1. In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for U.S. registered entities. With respect to Standard TPL-001-2a — footnote 12: 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, for U.S. registered entities when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for U.S. registered entities.
No
No. The process presented in Section II is overly prescriptive. If a section that prescribes the information requirements for a stakeholder process is required, then for Canadian entities this section should simply state that any threshold should be established in a manner consistent with other service levels that apply to local transmission and retail service for the load to be curtailed, for the reasons described in Q1.
No
The process presented in Section III is overly prescriptive and requires information not necessary to the intended purpose. As stated in Q1, we disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard, and propose alternate language as stated in Q1 comments and supporting reasons. If this section must deal with a review of the use of footnote 'b'/'12' to ensure that there are no widespread adverse reliability impacts on the bulk power system, then it should be limited to the information required for that purpose. Provided there is local support for the use of Non-Consequential Load Loss under footnote 'b'/'12', only information items 6 and 8 from section II are relevant for this assessment—the remainder are not required for this section and should be deleted. The use of footnote 'b'/'12' should not be limited to the Near-Term Planning Horizon. We propose that the words "in Year One of the Planning Assesssment" be deleted. Items 1 and 2 complicate this section and are unnecessary. They should be replaced by a phrase such as "for those planning events where the use of footnote 'b'/'12' is referenced". We disagree with the need to submit to the ERO for a determination of whether there are any adverse reliability impacts caused by the use of Non-Consequential Load Loss. This will introduce a new type of review at the ERO that will create unnecessary delays and burden, and is inconsistent with and not required for all of the other performance requirements in the TPL standards. Submitting the analysis to the adjacent Planning Coordinators and Transmission Planners, and any functional entity that requests it, as called for in requirement R8 of TPL001-2 should be sufficient.
(1) The IESO reiterate its support for allowing load interruption for a single contingency with sufficient review/oversight and under acceptable conditions, including no widespread adverse impact on the reliability of the interconnected bulk power system. The reliability aspects (BES performance requirements) should be reviewed for acceptability by the adjacent Planning Coordinators and Transmission Planners. However, issues pertaining to economics or externalities which may not be directly reliability-related are always available for review and debate by the stakeholders via the regulatory processes and subject to approval by the regulatory authority of each jurisdiction (including those in Canada and Mexico). (2) Furthermore, we request that Table 1 of TPL-001-3 (previous TPL-001-2 approved by NERC BOT) be corrected for EHV contingencies in P2, P4 and P5 categories to allow the application of footnote 'b'/'12' that is allowed for the P1 events. Events in P2, P4, and P5 can involve more elements and can be more onerous and stressful to the system than the P1 events, and if use of footnote 'b'/'12' is permitted in the less stressful P1 events, it should also be permitted in P2, P4 and P5 events. There continues to be confusion as to this inconsistency, and to how this is to be applied (as discussed at the last webinar). (3) We suggest that NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve it. Accordingly, we believe that the focus of footnote 'b', and footnote 12 should be that interruption of load must not have a widespread, adverse impact on the reliability of the interconnected bulk power system. A continent-wide standard should not concern itself with the reliability of supply or supply continuity for local load, as that is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed. As mentioned above, NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve it. In this regard, we believe that Attachment 1 is not necessary because it prescribes a process which goes beyond the outcome of the standard and dictates how stakeholdering must be carried out. The individual jurisdiction should establish the process for ensuring compliance with the standard and decide to what extent a stakeholdering process is necessary to establish the acceptable level of load rejection for the area in a manner consistent with local transmission established service levels. (4) The process presented in Section I is overly prescriptive. If a section that prescribes the principles of a stakeholder process is required, then for Canadian entities this section should simply state that any threshold should be established in a manner consistent with other service levels that apply to local transmission and retail service for the load to be curtailed, as described in Q1 and for the reasons stated therein. Corrective action plans can rarely be implemented in a one-year time frame, and in some cases, limited use of Non-consequential Load Loss will be preferable to unaffordable transmission enhancements, therefore we believe that the use of footnote 'b'/'12' should not be limited to the Near-Term Transmission Planning Horizon. We propose that the phrase "the Near-Term Transmission Planning Horizon of" be deleted from the opening paragraph.

The reasons for the “negative” vote are enumerated in our prior comments. In summary: 1. Attachment 1 is cumbersome and inappropriate, and should be stricken entirely. 2. All non-consequential load loss for all single-element contingencies should be temporary, with an action plan to avoid such load loss in the future. 3. All actions following single-element contingencies should be an attempt to restore lost customer service, not interrupt more customers.

We do not agree with the imposition of a maximum limit on the amount of planned Firm Demand interruption under footnote b. This addition is overly prescriptive, unnecessary, and can have unintended consequences on service reliability. Assigning a fixed “not to exceed” number of MW in a continent-wide standard is overly prescriptive. A single number cannot account for variation even within one BA Area. A fixed maximum number of MW for Non-Consequential Load Loss under Footnote b in TPL-002 (and footnote 12 in TPL-001-3) is not necessary. The first sentence of this footnote states, “[a]n objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events”. It is clear that the spirit of the TPL Standard is to minimize the likelihood and magnitude of Firm Demand interruption. Adding a fix maximum number of MW would seem unnecessary at best. At worst, it could have unintended consequences. Without a fixed maximum Non-Consequential Load Loss, the Transmission Planner understands that the objective is to minimize the magnitude of the planned interruption under footnote b (TPL-001-3, footnote 12). Adding a maximum number of MW of planned Firm Demand loss could have the effect of giving “safe harbor” to allow planned loss of that amount of load under Footnote b. The Transmission Planner may now have more difficulty in avoiding Non-Consequential Firm Demand Loss that is less than the “not to exceed” amount.
No
Suggest removing item 5, “A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder’s satisfaction”. Given that the “applicable regulatory authorities or governing bodies responsible for retail electric service issues” are only one of the many affected stakeholders, it is unclear how this dispute resolution process would treat stakeholders with different concerns. For example, how would such a dispute resolution process take into account the cost-benefit balance of load loss, which is the responsibility of the authorities responsible for retail rates, if such an authority is only one of the many stakeholders subject to dispute resolution?
No
We disagree with the inclusion of the information in Section II.2.a (the estimated number and type of customers affected) and II.2.b (An assessment of the use of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community). We suggest removing them. Section II.2.a is an administrative process and not needed for reliability of the Bulk Power System. Section II.2.b is vague and can be interpreted numerous ways, which make compliance difficult. It can also become a legal liability issue for the service provider, even if that loss of load is judged to be a prudent decision by the “applicable regulatory authorities or governing bodies responsible for retail electric service issues”.

1. In the last submittal for comments, the following comment was made: It was not clear how transmission projects with long lead times (such as T-lines) would be handled by “Footnote b.” In other words, it is not clear if it is acceptable for a TP to plan for

shedding Firm Demand in the Near Term Planning Horizon without meeting the conditions shown in “Attachment 1” when a mitigating project is planned that cannot be constructed in the Near Term Planning Horizon. The The Standard Drafting Team (SDT) provided the following response: Any instance of proposed load shed for a single Contingency situation in a Planning Assessment must meet the conditions of footnote ‘b.’ No Change made. From the above comments, we believe there is a situation where the Bulk Electric System (BES) reliability is compromised while stakeholder process proceeds.
No
2. As stated previously, NERC Functional Model definitions for Planning Authorities and Transmission Planners do not include the types of activities being proposed in “Attachment 1.” As written, this standard mandates functions on functional entities that are outside those defined by the NERC Functional Model. The SDT acknowledged this by stating that “the NERC Functional Model is a guideline for activities required of cited functional entities.” As such, we still believe that obligations should not be required of entities outside of the NERC Functional Model descriptions.
No
3. Previously, it was commented that it is unclear how section III of “Attachment 1” would be applied to entities that only deliver wholesale electric service and not retail electric service. The response provided by the SDT stated the following: The SDT believes that the wholesale customer will be one of the stakeholders included in the process and any use of footnote must go through the stakeholder process. No change made. If the wholesale customer is one of the stakeholders, the standard needs to add wholesale customers into the language as part of Attachment I. For example, it should read as follows: Coordinator must ensure that the applicable regulatory authorities, wholesale customers, or governing bodies responsible for retail electric service issues does not object to the use of Firm Demand interruptions under footnote ‘b’…

We are accepting the standard as written because our current practices are better then the prescribed maximum limit. However, we believe the appropriate limit should be determined on a case by case basis with the state regulator input. This standard as written, does give us the flexibility to do this.
Individual

Yes
While we are not satisfied with the responses to our previous comments, we have chosen to not reiterate them here. Instead, we feel that the need to continue with any modification to Footnote b seems moot considering FERC's recent approval of the revised BES definition. Specifically, we believe exclusions E1 and E3, regarding radial systems and local networks, resolves FERC's original directive on ambiguity with footnote b. We recommend the team consider abandoning this project, and request that NERC staff request relief from FERC on the related directives, as they have been overcome by the modified BES definition.

Consideration of Comments

Project 2010-11 Revision of TPL-002 footnote 'b'

The Project 2010-11 TPL Table 1 Order Drafting Team thanks all commenters who submitted comments on the proposed standards, TPL-002. The standard was posted for a 30-day public comment period from December 12, 2012 through January 11, 2013. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 49 sets of comments, including comments from approximately 132 different people from approximately 48 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

Summary Consideration:

The SDT made one change to the proposed standards to address industry comments. This change was made in the main body of the footnote to address a specific jurisdictional concern for non-US entities.

> **TPL-001-2a and TPL-002-1c (main body of the footnote) -** In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

In order to avoid confusion, a duplicative statement on the applicability of the 75 MW constraint was deleted from Section III.

The SDT also corrected the grammar in Section III, changing 'does' to 'do' in the applicable sentences, as follows:

> **Section III –** "… the applicable regulatory authorities or governing bodies responsible for retail electric service issues do~~es~~ not object …"

In addition, in the course of researching industry comments, a typo was discovered and corrected as follows:

> **TPL-002-1c: footnote 'b' –** "…For purposes of this footnote, the following are not counted as Firm Demand~~t~~: (1) …"

No other changes were made.

While the revision for non-US registered entities qualifies as a significant change to the standards, the Standards Committee has decided that since the indicated change was simply for a jurisdictional issue, and did not change the technical content or intent of the standard, that this project can be moved forward to the recirculation ballot stage.

Unresolved minority issues:

Some respondents continue to raise jurisdictional concerns with the proposed standards. The general line of thought in those comments is that NERC is imposing itself into the local planning process in violation of existing statutes. The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. In Order 693, FERC clearly stated that it has jurisdiction over matters that involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote ‘b’ solution acknowledges these facts and the SDT believes it is an appropriate response to FERC directives on this matter.

Many commenters questioned the use of a stakeholder process at all. Those commenters expressed the opinion that the FERC Order did not mandate the use of the stakeholder process. The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach, in order to address these concerns.

A few commenters indicated disagreement with the 75 MW limit the proposed standards place on the amount of Non-Consequential Load that can be planned to be shed for a single contingency, with some commenters indicating that the limit should be higher than the proposed limit while others indicated that planning to shed load was inconsistent with planning for a reliable bulk power system.

Finally, some commenters continue to question facets of the proposed TPL-001-2a standard previously approved by the industry and the NERC Board of Trustees. These commenters are questioning the application (or non-application) of footnote 12 for various planning events. . The SAR for this project took the approved TPL-001-2 as the starting point for the specific discussion of footnote ‘b’/12 and does not allow for review of previously approved applications of the footnote, which were developed and reached ballot pool consensus and Board approval in a previous effort.

All comments submitted may be reviewed in their original format on the standard’s project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

1. **Do you agree with changes made to the body of the footnote? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comment**

Summary Consideration: In general, the SDT has responded to the individual comments and there are no technical changes proposed to the standards as a result of comments. However, the SDT has responded to a request from Canadian entities to make a change to the main body of the footnotes to address specific jurisdictional concerns for non-US registered entities.

> **TPL-001-2a and TPL-002-1c** (main body of the footnote) **-** In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

While the revision for non-US registered entities qualifies as a significant change to the standards, the Standards Committee has decided that since the indicated change was simply for a jurisdictional issue, and did not change the technical content or intent of the standard, that this project can be moved forward to the recirculation ballot stage.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	Dropping load generally should not be endorsed, but it is recognized that there are special situations where it cannot be avoided. If a regulator responsible for load is comfortable with greater than 75MW being dropped in a rare situation, there should not be a requirement to build out of the situation. Provided there is no widespread, adverse effect on the reliability of the interconnected BES, the effect of a interruption on customers is under the purview of the applicable regulatory authority that is responsible for local transmission and retail service over the load to be curtailed. NERC must acknowledge that jurisdictional authorities can decide on the parameters for planning events that do not have an impact on the reliability of interconnected BES . There are no limits on non-consequential load loss for Single Contingency

Organization	Yes or No	Question 1 Comment
		P2-2 and P2-3 (HV only), multiple Contingencies P4 and P5 (HV only), and P6 and P7. Footnote 12 allows limited non-consequential load loss for single contingency P1, Multiple Contingency P3. Non-consequential load loss is not allowed for P2-2 and P2-3 (EHV), and P4 and P5 (EHV). Considering the extensive EHV Facilities in the Canadian regions of NPCC, it is not reasonable to accept some non-consequential load loss for single contingency P1 and P2-3, and then deny it for Multiple Contingency categories P4 and P5 which are statistically less frequent than the former. Also, the Multiple Contingency P7 (for which there is no limit on non-consequential load loss) is more frequent than P2-3, P4 and P5. This technical irregularity must be reviewed and addressed. This comment was submitted for the last posting.
Response: The SDT has previously pointed out that building is not the sole source of remedy for the situation. Examples of other allowable actions were specifically provided in the January 8, 2013 webinar (http://www.nerc.com/docs/Standards/dt/footnoteb_webinar_20130108_final.pdf). No change made. The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. And when such decisions do not involve any aspect of BES operation or reliability, such situations would not come under the purview of footnote 'b' as standards only apply to the BES unless stated otherwise. However, in Order 693, FERC clearly stated that it has jurisdiction over matters that involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made. Table 1 in the proposed TPL-001-2 was previously approved by industry through the standards development process. As shown by this approval, the SDT and the industry disagree that there is a technical irregularity in Table 1. The Board of Trustees has also previously approved this proposed standard. Discussions on the applicability of footnote 12 in that standard were held during Project 2006-02 and are not part of this proceeding. No change made.		
Public Utility District No. 2 of Grant County, WA	No	GCPD abstains from voting on the revisions to footnote "b" in TPL-002-1c and the corresponding footnote 12 of TPL-001-2. GCPD is concerned that the revised language oversteps the bounds of the "reliability standard"

Organization	Yes or No	Question 1 Comment
		definition under Section 215 of the Federal Power Act and into customer service issues that are better served by, and under the jurisdiction of, state and local utility boards and commissions. However, in the spirit of moving this process forward, GCPD did not vote against the revised footnotes.
Santee Cooper	No	Santee Cooper will abstain from voting on the revisions to footnote "b" in TPL-002-1c and the corresponding footnote 12 of TPL-001-2. Santee Cooper is concerned that the revised language oversteps the bounds of the "reliability standard" definition under Section 215 of the Federal power Act and into customer service issues that are better served by, and under the jurisdiction of, state and local utility boards and commissions. However, in the spirit of moving this process forward, Santee Cooper will not vote against the revised footnotes.
Response: The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. And when such decisions do not involve any aspect of BES operation or reliability, such situations would not come under the purview of footnote 'b' as standards only apply to the BES unless stated otherwise. However, in Order 693, FERC clearly stated that it has jurisdiction over matters that involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made.		
Hydro One Networks Inc.	No	In this comment period Hydro One would like to reiterate its initial comments. Hydro One disagrees with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no widespread, adverse effect on the reliability of the interconnected bulk electric system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its delegated agencies responsible for local transmission and retail

Organization	Yes or No	Question 1 Comment
		service over the load to be curtailed. If it is decided to proceed with the 75 MW or any other value, we propose replacing the sentence, in the footnote and in attachment one, section III that reads:"In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW." with "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss under footnote 12 for a non-US Registered Entity should be determined by the applicable Regulatory Authority or Governmental Authority or its delegated agency in that is responsible for retail electric service issues in that jurisdiction."
Response: The SDT has made a change to the main body of the footnotes to address the concerns of non-US registered entities. **TPL-001-2a and TPL-002-1c** (main body of the footnote) **-** In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.		
NARUC	No	As stated before, if there is no reliability threat to the bulk system there is no need for the 75 MW limit on the anticipated amount of load to be shed. As long as the regulator responsible for the retail load subject to being shed is notified of the situation, the situation can be appropriately addressed at the local level.
Response: The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. In Order 693, FERC clearly stated that it has jurisdiction over matters that do involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made.		

Organization	Yes or No	Question 1 Comment
SCE&G	No	Comments previously submitted.
Response: Thank you for following the guidelines. Please see previous responses to this comment posted for the comment period ending November 19, 2012.		
Independent Electricity System Operator	No	Please note that the Independent Electricity System Operator (IESO), an RTO/ISO registered under Industry Segment 2, has filed an appeal with respect to NERC's response to our similar comments submitted to the previous ballot on this project. We disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard. Provided there is no widespread adverse effect on the reliability of the interconnected bulk power system, the effect on customers of a firm demand interruption is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed. To recognize NERC's role as the ERO for Ontario and the Memorandum of Understanding between NERC and the Ontario Energy Board, the IESO proposed replacing the sentence, in the footnote and in attachment one, section III that reads:"In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW." with "In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss under footnote 12 for a Registered Entity that is a Canadian Entity (or a Mexican Entity) should be implemented in a manner that is consistent with/or under the direction of the Applicable Governmental Authority or its agency in Canada (or Mexico).Under this language, both the amount of non-consequential load loss, and the process under which that amount was arrived at, including stakeholder consultations, would be determined by the relevant Canadian jurisdiction, in this case Ontario.

Organization	Yes or No	Question 1 Comment
		This change will make the standard acceptable in Ontario's legislative framework, in which NERC standards come into force automatically unless, by order of the Ontario Energy Board, a standard is stayed and remanded back to NERC for further consideration. The responses to the IESO's comments in the previous ballot were inaccurate as to this key feature of the Ontario reliability framework, as addressed in the IESO appeal. An alternate solution to this issue, which would o be consistent with the intent of the responses to the IESO comments on the previous ballot, o respect the Ontario reliability framework, and o resolve the IESO January 9, 2013 appeal; and is appropriate given that these changes are being driven by a U.S. FERC remand order to NERC, would be to make the following highlighted clarifications to footnotes 'b' and 12:With respect to Standard TPL-002-1c - footnote 'b' b) An objective of the planning process is to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm For purposes of this footnote, the following are not counted as Firm Demand will be interrupted if itt is: (1) Demand directly served by the Elements removed from service as a result of the Contingency, or and (2) Interruptible Demand or Demand-Side Management Load. In limited circumstances, Firm Demand may be interrupted throughout the planning horizon to ensure that BES performance requirements are met. However, for U.S. registered entities when interruption of Firm Demand is utilized within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to

Organization	Yes or No	Question 1 Comment
		circumstances where the use of Firm Demand interruption meets the conditions shown in Attachment 1. In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for U.S. registered entities. With respect to Standard TPL-001-2a - footnote 12:12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, for U.S. registered entities when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for U.S. registered entities.
Response: The SDT has made a change to the main body of the footnotes to address the concerns of non-US registered entities. **TPL-001-2a and TPL-002-1c** (main body of the footnote) **-** In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.		
Iberdrola USA	No	See comment to question 4 below.
Electric Reliability Council of Texas, Inc.	No	See response to question 4.
Response: See response to Q4.		
Tri-State G&T	No	1. In the last submittal for comments, the following comment was made: It was not clear how transmission projects with long lead times (such as T-lines) would be handled by "Footnote b." In other words, it is not clear

Organization	Yes or No	Question 1 Comment
		if it is acceptable for a TP to plan for shedding Firm Demand in the Near Term Planning Horizon without meeting the conditions shown in “Attachment 1” when a mitigating project is planned that cannot be constructed in the Near Term Planning Horizon. The Standard Drafting Team (SDT) provided the following response: Any instance of proposed load shed for a single Contingency situation in a Planning Assessment must meet the conditions of footnote ‘b.’ No Change made. From the above comments, we believe there is a situation where the Bulk Electric System (BES) reliability is compromised while stakeholder process proceeds.
Response: This standard ensures these items are addressed in planning prior to them becoming an issue in operations so the SDT believes that BES reliability is not being compromised. No change made.		
Western Area Power Administration - Transmission Owner	No	While Western generally agrees with the proposed modification to footnote b, Western does not support the 75 MW threshold and Attachment 1 Stakeholer process. The 75 MW threshold seems to low and if a threshold it needed the drafting team should consider using a 300 MW threshold similar to that used in CIP-002, EOP-004, DOE OE-417 reporting, and NERC event analysis process. The stakeholder process seems to be duplicative, considering there FERC Order 890 planning process.
WAPA-RMR	No	While Western agrees in general with what is proposed in Footnote b; I do not agree with stipluating 2 requirements in the proposed Footnote b: The 75 MW load threshold; the Attachment 1 Stakeholder process. The 75 MW seems low and NERC should condsider using a 300 MW threshold similar to that used in CIP-002 and EOP-004 requirements.
Response: The SDT established the limit based on the results of the Section 1600 data request which clearly pointed to 75 MW as a reasonable limit. While the SDT considered a higher limit value, the data collected does not justify such an action. The SDT used the		

Organization	Yes or No	Question 1 Comment
Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. The use of footnotes and attachments is an acceptable mechanism for use in Reliability Standards and both mechanisms have been used before. No change made. The phrase in Section I: "The responsible entity can utilize an existing process or develop a new process" was designed to allow an entity to use an existing process as long as it meets the requirements shown in Attachment 1. No change made.		
Massachusetts Attorney General	No	The SDT ignored a lot of feedback concerning the inappropriateness of a 75 MW threshold. IT remains inappropriate and an appropriate level should be decided by local stakeholder processes.
Response: The SDT established the limit based on the results of the Section 1600 data request which clearly pointed to a 75 MW limit. While the SDT considered a higher limit value, the data collected does not justify such an action. The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. In Order 693, FERC clearly stated that it has jurisdiction over matters that involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made.		
Entergy Services, Inc. (Transmission)	No	Attachment 1 is overly burdensome and concerns local reliability issues better left to local regulators. A planned or unplanned loss of 25 MW is inconsequential to the reliability of the BES. The footnote could be simplified to exclude attachment 1 as follows: An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES

Organization	Yes or No	Question 1 Comment
		performance requirements, such interruption is limited to 25 MW and notice must be given to applicable regulatory authorities or governing bodies responsible for retail electric service issues within 30 days of the completion of the assessment which includes the use of footnote 12.
Response: The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. In Order 693, FERC clearly stated that it has jurisdiction over matters that involve BES operations and reliability and the proposed footnote ‘b’ solution acknowledges that fact and is an appropriate response to subsequent FERC directives on this matter. No change made. The SDT disagrees that Attachment 1 is overly burdensome as it simply addresses items that would be part of a Transmission Planner’s normal workload. No change made. As approved by the Board of Trustees, all utilizations of footnote ‘b’ required the use of the stakeholder process. The current proposal does not, and should not, deviate from this premise. The Remand Order stated that quantitative criteria needed to be supplied for the stakeholder process and the current proposal provides that criteria. No change made.		
Consolidated Edison Co. of NY, Inc.	No	Planned interruptions of Firm Demand in response to a Single Contingency (as directed in Footnote b of TPL-002 Table 1, and Footnote 12 of TPL-001-2), is not an acceptable corrective action to mitigate reliability issues on the BES system. The Interconnected System should be designed and operated with enough transfer capacity to be able to withstand, at a minimum, a single contingency event without service interruptions to customer load. Systems must be designed and operated so that the impact of any single contingency can be mitigated by re-dispatching available system resources without the need to implement load shedding.
Response: The SDT believes that special circumstances may exist where such actions as described in footnote ‘b’ are appropriate to meet the performance requirements of TPL. The footnote allows for such circumstances to exist in a controlled and prescribed environment where such usages can be discussed and resolved in an open and transparent process. No change made.		

Organization	Yes or No	Question 1 Comment
SDG&E	No	Table 1, footnote b of TPL-002 allows the use of load shedding for the loss of a single element (Category B) under certain circumstances. SDG&E has been against the proposed changes because of the addition of a stakeholder process that allows outside entities to make reliability decisions which we would be held accountable for.
Response: The SDT believes that the described process allows for open and transparent discussion of the potential use of footnote 'b' in the planning environment and disagrees that anything in the proposed footnote provides outside entities with the ability to make reliability decisions. No change made.		
Platte River Power Authority	No	Disagree with no change to the 75 MW threshold, but agree with the minor changes that were made since last posting. I request your consideration of a 300 MW threshold similar to that used in CIP-002 and EOP-004. Since there is a directive for some threshold, and in an attempt to reduce the likelihood of over-burdening smaller communities, the 300 MW level would be a more reasonable threshold for the BES.
Response: The SDT established the limit based on the results of the Section 1600 data request which clearly pointed to a 75 MW limit. While the SDT considered a higher limit value, the data collected does not justify such an action. No change made.		
ISO New England Inc	No	There are jurisdictional issues with the footnote and attachment as written. These will be described in further detail throughout this document. The footnote itself states, "An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events." A standard should not have requirements described as objectives, this language is extremely subjective.
Response: The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. And when such decisions do not involve any aspect of BES operation or reliability, such situations would not come under the purview		

Organization	Yes or No	Question 1 Comment
of footnote ‘b’ as standards only apply to the BES unless stated otherwise. However, in Order 693, FERC clearly stated that it has jurisdiction over matters that do involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote ‘b’ solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made. The SDT does not believe that the stated objective serves as a requirement. No change made.		
MISO ITC JDRJC Associates LLC	No	MISO does not object to the changes made to the body of the footnote since the previous draft. However, as a general matter, MISO cannot support the current language of Footnote 12. Because the intent of the TPL standards is not to rely on non-consequential firm load shedding after a single contingency event, MISO does not agree that footnote b in NERC TPL-002-1 and/or footnote 12 in TPL-001-2 should be included in these standards. Nonetheless, if these footnotes are included, MISO agrees that there should be some limitation on how much firm load shed is allowed under these footnotes and would not object to the proposed 75 MW level if the footnotes are included.
Response: Thank you for your support. The SDT believes that special circumstances may exist where such actions as described in footnote ‘b’ are appropriate to meet the performance requirements of TPL. The footnote allows for such circumstances to exist in a controlled and prescribed environment where such usages can be discussed and resolved in an open and transparent process. No change made.		
Northeast Utilities	No	Northeast Utilities does not support the use of non-consequential demand interruption throughout the planning horizon. Even with the 75 MW limit, NU believes that this language seems to encourage operational workarounds and adds burdens for operators of the system. Lastly, NU believes this use of non-consequential load loss during the planning horizon is not consistent with planning a highly reliable bulk

Organization	Yes or No	Question 1 Comment
		electric system and thus does not support non-consequential load loss for planning purposes.
Response: The SDT believes that special circumstances may exist where such actions as described in footnote 'b' are appropriate to meet the performance requirements of TPL. The footnote allows for such circumstances to exist in a controlled and prescribed environment where such usages can be discussed and resolved in an open and transparent process. No change made.		
Hydro-Quebec TransEnergie	No	Hydro-QuÃ©bec TransÃ‰nergie (HQT) remains unconvinced that a MW threshold needs to be part of footnote 12. This is not a BES reliability issue but only a matter of service continuity to be addressed by TO/PA/RC with local regulatory authorities.
Response: The SDT Believes that the FERC Orders made it clear that the concept of dropping Non-Consequential Load for a N-1 Contingency must include MW thresholds. The SDT has made a change to the main body of the footnotes to address the concerns of non-US registered entities. **TPL-001-2a and TPL-002-1c** (main body of the footnote) **-** In no case can the planned Firm Demand interruption under footnote 'b' exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.		
Pacific gas and Electric Comapny	No	We do not agree with the imposition of a maximum limit on the amount of planned Firm Demand interruption under footnote b. This addition is overly prescriptive, unnecessary, and can have unintended consequences on service reliability. Assigning a fixed "not to exceed" number of MW in a continent-wide standard is overly prescriptive. A single number cannot account for variation even within one BA Area. A fixed maximum number of MW for Non-Consequential Load Loss under Footnote b in TPL-002 (and footnote 12 in TPL-001-3) is not necessary. The first sentence of this footnote states, "[a]n objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events". It is clear that the spirit

Organization	Yes or No	Question 1 Comment
		of the TPL Standard is to minimize the likelihood and magnitude of Firm Demand interruption. Adding a fix maximum number of MW would seem unnecessary at best. At worst, it could have unintended consequences. Without a fixed maximum Non-Consequential Load Loss, the Transmission Planner understands that the objective is to minimize the magnitude of the planned interruption under footnote b (TPL-001-3, footnote 12). Adding a maximum number of MW of planned Firm Demand loss could have the effect of giving "safe harbor" to allow planned loss of that amount of load under Footnote b. The Transmission Planner may now have more difficulty in avoiding Non-Consequential Firm Demand Loss that is less than the "not to exceed" amount.
Response: The development of a standard that allowed for the use of footnote 'b' without quantifiable criteria was not acceptable to FERC as shown in the Remand Order. There is no 'safe harbor' up to the identified limit since it will be discussed in an open and transparent stakeholder process that includes applicable regulators. No change made.		
ACES Standards Collaborators Brazos	Yes	(1) We continue to disagree with the 75 MW capacity limit threshold. There is no need for a 75 MW cap because registered entities and local-level policy makers are in the best position to determine an appropriate capacity limit, as stated in the FERC order and in previous feedback. However, if the drafting team decides to move forward with a cap, we suggest using a cap that would reflect all data points from the Section 1600 data request to be under the threshold. The findings to the data request contained a data point at 75.2 MW, which would be over the proposed threshold. We understand this data point, in essence, has been omitted because the use of non-consequential load shedding for the 75.2 MW data point is expected to terminate soon. If the drafting team intends to use the data that represents the actual usage of footnote 'b' by planning coordinators, then the team should take into account the highest data point and adjust the threshold to at least 76 MW regardless of the length of time the data point is needed. Again,

Organization	Yes or No	Question 1 Comment
		local decision makers are better equipped to make this type of determination. (2) However, in the spirit of moving forward with this project we will support the changes and thank the drafting team for their efforts.
Response: The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. In Order 693, FERC clearly stated that it has jurisdiction over matters that do involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. The SDT established the limit based on the results of the Section 1600 data request which clearly pointed to a 75 MW limit. While the SDT considered a higher limit value, the data collected does not justify such an action. No change made. Thank you for your support.		
Georgia Transmission Corp.	Yes	Since this question refers to both footnote b (TPL-002-1c) and footnote 12 (TPL-001-2a), and the changes to the footnotes are not identical, the question should be split into two. Regarding footnote b: An excerpt from footnote b reads "For purposes of this footnote, the following are not counted as Firm Demand (1) Demand directly served by the Elements removed from service as a result of the Contingency ..." However, what is being described is in fact Firm Demand (That portion of the Demand that a power supplier is obligated to provide except when system reliability is threatened or during emergency conditions) that is Consequential Load Loss (All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.). Therefore, why not use the terms Consequential Load Loss and Non-Consequential Load Loss? Regarding footnote 12: The replacing the NERC defined "Contingency" event with the undefined "planning" event necessitates a new definition.

Organization	Yes or No	Question 1 Comment
		The intent of the change is unclear.
Response: The issue is one of timing. The indicated terms are part of the proposed TPL-001-2 solution and were not in existence when TPL-002-1 was developed. Since the SDT cannot control how FERC will respond to the proposed solutions to this project, it is possible that TPL-002-1 could be approved prior to TPL-001-2. This would create considerable confusion as to the use of these terms. Therefore, the SDT wrote the proposed solutions separately. No change made. The wording change now makes the terminology consistent in both Table 1 and the text. No change made.		
Manitoba Hydro	Yes	Manitoba Hydro agrees that the changes add clarity to the footnote.

2. **Do you agree with the changes contained in Section II of Attachment 1? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments**

Summary Consideration: The SDT has responded to the individual comments and there are no changes proposed to the standards as a result of comments.

Organization	Yes or No	Question 2 Comment
ACES Standards Collaborators Brazos	No	(1) Thank you for making the changes to Section II of Attachment 1. We believe the modification of removing "assessments" and replacing it with "explanation" provides more flexibility regarding how a registered entity can demonstrate the impacts the health, safety and welfare of the community. (2) However, we still believe that the word "alleviate" in bullet 5 requires the same actions as the word "mitigate." There are instances where no action is required based on a variety of factors. We recommend the following: "Future plans, if necessary, to mitigate/alleviate the need for Non-Consequential Load Loss under footnote 12, unless a determination was made not to mitigate/alleviate, then an explanation why."
Response: Thank you for your support. This is an information section and not a requirement for a more permanent solution. Therefore, if there is no plan to alleviate then an entity simply documents that fact. No change made.		
MRO NSRF	No	The drafting team over specified the Section II stakeholder information process and continues to disregard comments that item 2b be removed from several utilities over several footnote "b" revisions. The goal of Attachment 1 as stated by the drafting team chair was to place "meaningful" parameters around footnote b. The words in 2b on "health, safety, and welfare" are beyond the scope of NERC standards, and are not defined sufficiently in the standard to make the

Organization	Yes or No	Question 2 Comment
		requirement meaningful. The NSRF recommends that if the drafting team doesn't eliminate 2b, they delete the words "on the health, safety, and welfare of the community" as going beyond NERC jurisdiction, FERC directives, and the SAR. The drafting team response that similar words exist in another standard is not a reason to the ambiguous words in the TPL Attachment 1.
Response: The SDT did not justify the retention of the subject phrase simply because similar words exist in another standard but because the burden and intent of the phrase in footnote 'b' is consistent with what entities are required to do in that other standard (the phrase is included in EOP-001 as part of a description of Load curtailment in Attachment 1 of EOP-001, which describes elements for consideration in developing emergency plans). The SDT believes that the changes made in this posting clarify the intent of this requirement. No change made.		
Hydro One Networks Inc.	No	As previously stated, we believe that the process presented in Section II is overly prescriptive. If a section that prescribes the information requirements for a stakeholder process is required, then for non-US entities this section should simply require that the process information requirements must be in accordance with the requirements of the applicable Regulatory Authority or Governmental Authority or its delegated agency that is responsible for local transmission and retail service in that jurisdiction.
Independent Electricity System Operator	No	No. The process presented in Section II is overly prescriptive. If a section that prescribes the information requirements for a stakeholder process is required, then for Canadian entities this section should simply state that any threshold should be established in a manner consistent with other service levels that apply to local transmission and retail service for the load to be curtailed, for the reasons described in Q1.
Response: The SDT has made a change to the main body of the footnotes to address the concerns of non-US registered entities. **TPL-001-2a and TPL-002-1c** (main body of the footnote) **-** In no case can the planned Firm Demand interruption under footnote		

Organization	Yes or No	Question 2 Comment
‘b’ exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.		
Tri-State G&T	No	2. As stated previously, NERC Functional Model definitions for Planning Authorities and Transmission Planners do not include the types of activities being proposed in “Attachment 1.” As written, this standard mandates functions on functional entities that are outside those defined by the NERC Functional Model. The SDT acknowledged this by stating that “the NERC Functional Model is a guideline for activities required of cited functional entities.”As such, we still believe that obligations should not be required of entities outside of the NERC Functional Model descriptions.
Response: The SDT stands by its previous response to this comment posted for the comment period ending November 19, 2012.		
SCE&G	No	Comments previously submitted.
Response: Thank you for following the guidelines. Please see previous responses to this comment posted for the comment period ending November 19, 2012.		
Iberdrola USA	No	See comment to question 4 below.
Electric Reliability Council of Texas, Inc.	No	See response to question 4.
Response: See response to Q4.		
Entergy Services, Inc. (Transmission)	No	Attachment 1 is overly burdensome and unnecessary.
Response: The SDT believes that Attachment 1 is an appropriate response to the FERC Orders. Without specifics the SDT is unable to		

Organization	Yes or No	Question 2 Comment
provide a more detailed response to your concerns. No change made.		
Manitoba Hydro	No	Any assessment or explanation is only speculation. Is the requirement any different? Item 5 raises an expectation that footnote 12 can only be used on an interim bases - this should be clarified.
Response: The SDT believes that the changes made in this posting clarify the intent of this requirement. No change made. The SDT believes that, in general, the use of footnote ‘b’ to meet TPL performance requirements should be an interim solution. However, in certain circumstances, the SDT realizes that the solution may be permanent. The SDT does not believe that the wording only allows for interim use. If the solution is to be permanent, then that information should be disclosed as part of the stakeholder process. No change made.		
ISO New England Inc	No	Section II, 2.a, states that studies must address the estimated number and type of customers affected by Non-Consequential Load Shedding. The Transmission Planner in many cases will not be the appropriate entity to address these concerns. The Transmission Owner, Distribution Provider or Load Serving Entities would be the appropriate entities to address customer affects. Explaining effects on the “health, safety, and welfare of the community” is required under the footnote in Section II, 2.b. The same load could be shed directly as the consequence of a fault and no such assessment is required. In addition, Transmission Planners can shed radial load with no assessment of health and welfare. In addition to the practical considerations listed, once again here the standard infringes on Section 215 responsibilities where State authority over the “safety, adequacy and reliability of the electric system in that state” is mandated. This section should be deleted. Section II, requirements 3 and 4 discuss estimating frequency and duration of Non-Consequential Load Loss based on historical performance. The planning

Organization	Yes or No	Question 2 Comment
		process uses deterministic not probabilistic assessments. This section should be deleted.
Response: The SDT believes that the indicated information is easily obtained by the Transmission Planner and that, in some cases, the Transmission Planner may already have this information for other tasks and responsibilities. No change made. The SDT agrees that such information is not required in other circumstances involving allowed Consequential Load Loss. However, this situation is different in that it involves Non-Consequential Load Loss. No change made. The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. And when such decisions do not involve any aspect of BES operation or reliability, such situations would not come under the purview of footnote 'b' as standards only apply to the BES unless stated otherwise. However, in Order 693, FERC clearly stated that it has jurisdiction over matters that do involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made. The SDT believes that the information shown in Section II is necessary to allow stakeholders to understand the usage of footnote 'b'. No change made.		
MISO ITC JDRJC Associates LLC	No	Regarding the use of "explanation" in place of "assessment," MISO understands that the purpose of this change is to reduce the need for entities to hire expensive consultants and to incur other substantial costs in assessing demographic data and impacts on an affected area. However, as written, this word change potentially places more of a burden on responsible entities. An assessment is an analysis performed using available facts and data while an explanation implies full knowledge. MISO therefore recommends that "assessment" be retained and that a footnote explaining the meaning of that term be added. More generally, however, MISO has concerns regarding the use of a stakeholder process such as the one outlined in Attachment 1 and cannot support the Footnote or Attachment 1 at this time. Please refer to our comments under Question 4 for a more detailed description of these concerns.

Organization	Yes or No	Question 2 Comment
Response: The SDT believes that the changes made in this posting clarify the intent of this requirement. No change made. Please see response to Q4.		
Pacific gas and Electric Comapny	No	Suggest removing item 5, “A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder’s satisfaction”. Given that the “applicable regulatory authorities or governing bodies responsible for retail electric service issues” are only one of the many affected stakeholders, it is unclear how this dispute resolution process would treat stakeholders with different concerns. For example, how would such a dispute resolution process take into account the cost-benefit balance of load loss, which is the responsibility of the authorities responsible for retail rates, if such an authority is only one of the many stakeholders subject to dispute resolution?
Response: Bullet #5 does not require specific attributes of the dispute resolution process. The SDT believes that the attributes of the dispute resolution process should be defined by the entity during the development of the stakeholder process. No change made.

3. **Do you agree with changes contained in Section III of Attachment 1? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.**

Summary Consideration: The SDT has responded to the individual comments and there are no technical changes proposed to the standards as a result of comments. However, to avoid confusion, the SDT has deleted the duplicative statement in Section III regarding the 75 MW limit. And, the SDT made a grammatical change in Section III changing 'does' to 'do' to correct the grammar in the applicable sentences.

Section III – "… the applicable regulatory authorities or governing bodies responsible for retail electric service issues do~~es~~ not object …"

Organization	Yes or No	Question 3 Comment
MRO NSRF	No	The NSRF believes that the standards drafting team did clarify in the webinar that the 25 MW and 75 MW footnote "b" values were separate from interruptible load, and consequential load loss and would not be counted towards the 25 and 75 MW thresholds. However, the NSRF recommends that Attachment 1 also clearly contain an explicit statement "the 25 MW and 75 MW footnote "b" values are separate from consequential load loss, interruptible load, and are not to be counted towards the 25 MW and 75 MW thresholds."
Response: The SDT does not believe that this suggestion adds any clarity. No change made.		
Hydro One Networks Inc.	No	The process presented in Section III is overly prescriptive and duplicates information not necessary for its intended purpose. As stated in Q1, we disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard, and propose alternate language in our response to Q1. If this section is required to address a review of the use of footnote 12 to ensure that there are no wide-spread adverse reliability impacts on the bulk power system, then it should be limited to the information required for that purpose. Provided there is local support for the use of Non-Consequential Load Loss under footnote

Organization	Yes or No	Question 3 Comment
		12, only information items 6 and 8 from section II are relevant for this assessment- the remainder are not required for this section and should be deleted. Items 1 and 2 complicate this section and are unnecessary. They should be replaced by a phrase such as "for those planning events where the use of footnote 12 is referenced." We disagree with the need to submit this information to the ERO for a determination of whether there are any Adverse Reliability impacts caused by the use of Non-Consequential Load Loss. This will introduce a new type of review at the ERO that will create unnecessary delays and burden, and is inconsistent with (and not required for) all of the other performance requirements in the TPL standards. Submitting the analysis to the adjacent Planning Coordinators and Transmission Planners, and any functional entity that requests it, as called for in requirement R8 of TPL-001-2 should be sufficient.
Response: The SDT does not believe the section is overly prescriptive or duplicative as described below. No change made. Please see response to Q1. The SDT believes that the information shown in Section II is necessary to allow stakeholders to understand the usage of footnote 'b'. If local regulators require additional information they can always request it. While the ERO may not need all of the information in Section II to perform its Adequate Reliability Impact evaluation, the SDT wanted to minimize the burden on entities by allowing the submittal of an information package that already existed. The ERO is aware of the proposed responsibility and has accepted this role if the industry approves. The SDT believes that it is the responsibility of the ERO to assess Adverse Reliability Impacts and is not an appropriate role for adjacent planners. No change made.		
Iberdrola USA	No	See comment to question 4 below.
Electric Reliability Council of Texas, Inc.	No	See response to question 4.
MISO ITC	No	MISO does not object to the changes made to Section III. However, more generally, MISO has concerns regarding the use of a stakeholder process such as the one outlined in Attachment 1 and cannot support the Footnote or Attachment 1 at this

Organization	Yes or No	Question 3 Comment
JDRJC Associates LLC		time. Please refer to our comments under Question 4 for a more detailed description of these concerns.
Response: See response to Q4.		
Tri-State G&T	No	3. Previously, it was commented that it is unclear how section III of "Attachment 1" would be applied to entities that only deliver wholesale electric service and not retail electric service. The response provided by the SDT stated the following: The SDT believes that the wholesale customer will be one of the stakeholders included in the process and any use of footnote must go through the stakeholder process. No change made. If the wholesale customer is one of the stakeholders, the standard needs to add wholesale customers into the language as part of Attachment I. For example, it should read as follows: Coordinator must ensure that the applicable regulatory authorities, wholesale customers, or governing bodies responsible for retail electric service issues does not object to the use of Firm Demand interruptions under footnote 'b'...
Response: The SDT believes that the planning entity has the best understanding of who an affected stakeholder will be and that any attempt to codify a list of such stakeholders in the proposed standards could lead to errors due to the necessity of having to adopt a one size fits all approach. No change made.		
Western Area Power Administration - Transmission Owner	No	See answer to Question 1.
WAPA-RMR	No	See response to Question 1.
Platte River Power Authority	No	See answer to Question 1.
Response: See response to Q1.		

Organization	Yes or No	Question 3 Comment
Massachusetts Attorney General	No	Don't buy the 75 MW or the 25 MW thresholds.
Response: The SDT established the values based on the results of the Section 1600 data request. While the SDT considered other values, the data collected did not justify such an action. No change made.		
Entergy Services, Inc. (Transmission)	No	Attachment 1 is overly burdensome and unnecessary.
Response: With no specifics provided, the SDT is unable to respond further. However, the SDT does not believe the process to be overly burdensome or unnecessary. No change made.		
SCE&G	No	Comments previously submitted.
Response: Thank you for following the guideline. Please see previous responses to this comment posted for the comment period ending November 19, 2012.		
Independent Electricity System Operator	No	The process presented in Section III is overly prescriptive and requires information not necessary to the intended purpose. As stated in Q1, we disagree with prescribing a fixed MW threshold for Non-Consequential Load Loss in a continent-wide standard, and propose alternate language as stated in Q1 comments and supporting reasons. If this section must deal with a review of the use of footnote 'b'/'12' to ensure that there are no widespread adverse reliability impacts on the bulk power system, then it should be limited to the information required for that purpose. Provided there is local support for the use of Non-Consequential Load Loss under footnote 'b'/'12', only information items 6 and 8 from section II are relevant for this assessment-the remainder are not required for this section and should be deleted. The use of footnote 'b'/'12' should not be limited to the Near-Term Planning Horizon. We propose that the words "in Year One of the Planning Assesssment" be deleted.

Organization	Yes or No	Question 3 Comment
		Items 1 and 2 complicate this section and are unnecessary. They should be replaced by a phrase such as “for those planning events where the use of footnote ‘b’/’12’ is referenced”. We disagree with the need to submit to the ERO for a determination of whether there are any adverse reliability impacts caused by the use of Non-Consequential Load Loss. This will introduce a new type of review at the ERO that will create unnecessary delays and burden, and is inconsistent with and not required for all of the other performance requirements in the TPL standards. Submitting the analysis to the adjacent Planning Coordinators and Transmission Planners, and any functional entity that requests it, as called for in requirement R8 of TPL001-2 should be sufficient.
Response: The SDT does not believe the section is overly prescriptive or duplicative as described below. No change made. Please see response to Q1. The use of the footnote is not limited to the Near-Term Transmission Planning Horizon since the main body of the footnote states that the footnote may be utilized “… throughput the planning horizon…”. An entity has the freedom to make a business decision concerning the use of footnote ‘b’ compared to other alternatives. An entity is free to determine when they want to assure that the local regulator does not object but it must do so no later than Year One of the Planning Assessment. No change made. The SDT believes that items 1 and 2 are needed to describe when an entity must assure that there are no regulatory objections. No change made. While the ERO may not need all of the information in Section II to perform its Adequate Reliability Impact evaluation, the SDT wanted to minimize the burden on entities by allowing the submittal of an information package that already existed. The ERO is aware of the proposed responsibility and has accepted this role if the industry approves. The SDT believes that it is the responsibility of the ERO to assess Adverse Reliability Impacts and is not an appropriate role for adjacent planners. No change made.		
Pacific gas and Electric Comapny	No	We disagree with the inclusion of the information in Section II.2.a (the estimated number and type of customers affected) and II.2.b (An assessment of the use of Firm Demand interruption under footnote ‘b’ on the health, safety, and welfare of the community). We suggest removing them. Section II.2.a is an administrative

Organization	Yes or No	Question 3 Comment
		process and not needed for reliability of the Bulk Power System. Section II.2.b is vague and can be interpreted numerous ways, which make compliance difficult. It can also become a legal liability issue for the service provider, even if that loss of load is judged to be a prudent decision by the "applicable regulatory authorities or governing bodies responsible for retail electric service issues".
Response: The SDT believes that the information shown in Section II is necessary to allow stakeholders to understand the usage of footnote 'b'. No change made.		
SDG&E	No	
Response: Without a specific comment, the SDT is unable to respond.		
ISO New England Inc		The footnote states "Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues does not object to the use of Non-Consequential Load Loss under footnote 12 if either...". Section 215 of the Federal Power Act clearly delineates Federal, State and Local authority. State and Local requirements should not be introduced into a NERC standard. In addition to the jurisdictional issues, proving that the "applicable regulatory authority or governing body" does not object is more difficult than proving that they simply approved the use of non-consequential load loss. The SDT should remove all references to State and Local authority from the standard. Overall, the order of Section III is also notable. During year, two through ten of the overall planning horizon the standard allows for Non-Consequential Load Loss without approval. In the first year of the assessment, approval becomes required for Non-Consequential Load Loss. At this point, it is too late to allow for any other alternative.

Organization	Yes or No	Question 3 Comment
		The Regional Entities with NERC oversight perform periodic audits and require self-certification of the planning process. By virtue of the audit and self-certification process, NERC has the ability to monitor the use of Non-Consequential Load Loss in planning assessments. State and Local approval of practices called for in ERO Standards is inappropriate. In addition to being notable for the year one timing, Section III seems incomplete. In the case where there is objection to Non-Consequential Load Shedding, the process appears to end without resolution.
Response: In Order 693, FERC clearly stated that it has jurisdiction over matters that involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. The footnote does not place requirements on local regulators but rather provides them an opportunity to participate in the stakeholder process. No change made. An entity has the freedom to make a business decision concerning the use of footnote 'b' compared to other alternatives. An entity is free to determine when they want to assure that the local regulator does not object but it must do so no later than Year One of the Planning Assessment. No change made. Without the details now contained in the proposed footnote, there is no guarantee that NERC would have the information to monitor the use of Non-Consequential Load Loss. The footnote does not place requirements on local regulators but rather provides them an opportunity to participate in the stakeholder process. No change made. If there is an objection by the regulators, then an entity cannot utilize footnote 'b' as proposed as part of the Corrective Action Plan for Year One. No change made.		
Ameren	Yes	We find no substantive changes to section III, and still believe that no objection from a regulatory body requires, at a minimum, a tacit approval.
Response: The SDT believes that there are a variety of practices employed by regulatory bodies. Therefore, it is determined by the planning entity and the applicable regulatory bodies as to how to show 'no objection'. No change made.		

Organization	Yes or No	Question 3 Comment
SERC EC Planning Standards Subcommittee	Yes	Change "does" to "do" in the last sentence of the first paragraph and in the first sentence of the last paragraph in Section III of Attachment 1.
Response: The SDT agrees and has made the suggested grammatical change. **Section III** – "… the applicable regulatory authorities or governing bodies responsible for retail electric service issues do~~es~~ not object …"

Response: Thank you for your support.		

4. **If you have any other comments on this Standard that you haven't already mentioned above, and that are not simply reiterating previous comments that the SDT has already responded to, please provide them here:**

Summary Consideration: The SDT has responded to the individual comments and there are no changes proposed to the standards as a result of comments. However, the SDT did uncover a typo that has been corrected as shown below.

TPL-002-1c: footnote 'b' – "…For purposes of this footnote, the following are not counted as Firm Demand~~t~~: (1) …"

Organization	Yes or No	Question 4 Comment
Hydro-Quebec TransEnergie	No	HQT still considers that the non application of footnote 12 to categories P2 (breaker fault), P4 (stuck breaker) and P5 (failure of a non redundant relay) is not correct, when the footnote is applied to other categories such as P3, P6 and P7 (loss of double-circuit lines). The SDT has indicated that the applicability of footnote 12 to categories P2, P4 and P5 is not included in Project 2012-11. However, looking at related Project 2006-02 where footnote 12 was brought up to Table 1, the matter of applicability was not discussed in detail and the SDT did not clearly explain why Non-Consequential Load Loss was not allowed for contingencies less frequent than those for which it is allowed (internal breaker faults or stuck breakers are less probable than double-circuit line faults). Discussion on this matter should not be dismissed.
Response: Table 1 in the proposed TPL-001-2 was previously approved by industry through the standards development process. The Board of Trustees has also previously approved this proposed standard. Discussions on the applicability of footnote 12 in that standard were held during Project 2006-02 and are not part of this proceeding. No change made.

Response: Without a specific comment, the SDT is unable to respond.		
ACES Standards Collaborators Brazos	Yes	(1) In regard to the changes relating to Demand-Side Management, we agree with the wording, "For purposes of this footnote, the following are not counted as Firm Demand: (1) Demand directly served by the Elements removed from service as a result of a Contingency, or (2) Interruptible Demand or Demand-Side Management Load." However, the most recent change has created some confusion by replacing "or" with "and" that potentially and inadvertently may exclude the use of DSM in all locations but on the facilities removed from service. This would render DSM ineffective. Now, the both (1) and (2) must occur in order to not be counted as Firm Demand. We recommend changing the wording back to "or" so each option (1) OR (2) is independently excluded from Firm Demand for footnote b. Connecting the options with the word "and" changes the meaning and requires entities to meet both option (1) and option (2) to be excluded from Firm Demand. Demand directly served by the Elements removed from service as a result of a Contingency should be

Organization	Yes or No	Question 4 Comment
		excluded, as should Interruptible Demand or Demand-Side Management Load regardless of its location. A registered entity does not need to have both for the exclusion. (2) Thank you for the opportunity to comment.
Response: The SDT does not agree that 'and' excludes the use of both items 1 and 2 since this is a list of options. However, while researching your suggestion, the SDT discovered a typo in the language when the previous red-line was converted to a clean copy. This has been corrected as shown. **TPL-001-2c: footnote 'b'** – "…For purposes of this footnote, the following are not counted as Firm Demand~~t~~: (1) …"		
Hydro One Networks Inc.	Yes	As previously stated in our response to Question #1, Hydro One would like to reiterate our position presented during the initial comment period. We believe that the SDTs response to our initial comments did not correctly address the issues because it did not recognize the Reliability Standards framework that is effective in the Province of Ontario and possibly other Canadian provinces.
Response: Please see the response to Q1.		
MISO ITC JDRJC Associates LLC	Yes	As previously stated, it is the general intent of the existing TPL-002-1 standard and proposed TPL-001-2 standard to not rely on any shedding of Non-Consequenital Load to meet a single contingency event. Accordingly, MISO submits that footnote b of TPL-002-1 and footnote 12 of TPL-001-2 should be struck. However, in the event that the footnotes in question are not eliminated, the footnote should be narrowly focused only on those situations for which the original footnote was developed, i.e., the interruption of service to radial customers or some local area Network customers connected to or supplied by the Faulted element or by the affected area, where the overall reliability of the interconnected transmission system is not impacted. MISO therefore proposes the following alternate language for footnote b and footnote 12 to ensure it is not misapplied:"An objective of the planning process is to avoid Non-Consequential Load Loss following Contingency

Organization	Yes or No	Question 4 Comment
		events. In limited circumstances, Non-Consequential Load Loss may be needed within the planning horizon to ensure that BES performance requirements are satisfied. However, Non-consequential Load shed cannot be used to avoid cascading outages or to maintain system stability. Non-consequential load shed also cannot be used to avoid a thermal loading or voltage limit violation on an extra high voltage (EHV) facility. When Non-Consequential Load Loss is utilized within the transmission planning horizon to address BES performance requirements, such interruption cannot exceed 75 MW and is limited to the following circumstances: o Non-consequential Load shed is allowed for load served by a radial transmission line to avoid voltage limit violations on the radial transmission line following a single contingency event. o Non-consequential load shed is allowed for load within a local area served by not more than two Transmission Circuits and/or Transformers to avoid a thermal loading issue or voltage issue within the local area, including the Transmission Circuits and/or Transformers directly supplying the local area, for a loss of a single element within the local area, including one of the Transmission Circuits or Transformers directly supplying the local area, so long as there are no thermal loading or voltage violations outside the local area." MISO believes the language above would ensure the continuing reliability of the Bulk Electric System by limiting load shed and violations that require load shed to radial areas or areas that would be served radially following the single contingency. In addition, MISO has significant concerns regarding use of a stakeholder process to determine if non-conseqeuntial load shedding is appropriate following a single contingency event, as expressed in MISO's comments on previous drafts of this Project. In particular, MISO has concerns regarding whether such a stakeholder process could be sufficiently open and transparent given the many, competing interests of the responsible entity and affected stakeholders. Without such sufficient openness and transparency, it is likely that stakeholder processes will not result in consistent determinations of the appropriateness of the application of footnote b in NERC TPL-002-1 and/or footnote 12 in TPL-001-2. Stated differently, MISO is concerned that such stakeholder processes will always be subject to the

Organization	Yes or No	Question 4 Comment
		biases of the participating parties, with the sheer number of parties determining the outcome of the process. As an example, should a particular process be dominated by parties that may be responsible for payment of upgrades but that are not impacted by the alternative load shed, those stakeholders impacted by the alternative load loss would be relegated to a minority position, resulting in majority-imposed stakeholder decisions to shed load. On the other hand, if the stakeholder process is limited to only the stakeholders directly impacted by the proposed load shed, to the extent those stakeholders pay only a small part of the upgrade costs, they will always choose to avoid load shed - even if such decision requires a potentially costly upgrade. Consequently, MISO has concerns that the inclusion of a requirement for a fair and impartial stakeholder process to determine if and when load shed is acceptable to assist in satisfying a single contingency standard is not realistically attainable. MISO therefore recommends that Attachment I be eliminated and that the footnotes either be eliminated or replaced with the modified version above.
Response: The SDT believes that the suggested language adopts a one-size fits all approach that is not conducive to a continent-wide standard. The footnote allows for circumstances outside of the suggested language scenarios, as well as those described in the suggestion, to be resolved utilizing an open and transparent process. No change made. The SDT believes that the inclusion of stakeholders including regulators provides an appropriate method for addressing the issues that the commenter has raised. No change made.		
BC Hydro	Yes	BC Hydro appreciates the efforts of the SDT in revising standards TPL-002-1c - System Performance Following Loss of a Single BES Element (footnote b) and TPL-001-2a - Transmission System Planning Performance Requirements (footnote 12). BC Hydro votes YES in support of this ballot and wishes to provide the following two comments: 1.At this time BC Hydro has concerns about the level of stakeholder consultation that might be required as a result of the implementation of this standard and will bring this concern to the attention of our regulator if necessary. 2.At this time BC Hydro has concerns about the instances for which regulatory

Organization	Yes or No	Question 4 Comment
		review of non-consequential load loss under footnote 12 is required and will discuss those with our regulator if necessary.
Response: The SDT appreciates your overall support. In addition, please see the changes shown in Q1 for non-US registered entities.		
Central Lincoln Flathead	Yes	Central Lincoln has not paid much attention to this standard, since it is not applicable to this entity's registered functions. However, we are disturbed by the direction the standard is taking. The slides from the recent webinar (http://www.nerc.com/docs/Standards/dt/footnoteb_webinar_20130108_final.pdf) state that "The 75 MW cap will require construction of major Transmission projects." This is in direct conflict with the definition of "reliability standard" as provided in section 215 of the FPA where it states "...the term does not include any requirement to enlarge such facilities or to construct new transmission capacity..." The webinar slide does offer alternatives to construction, but we don't see those providing any reliability benefit. Some of the suggestions apparently only relate to contract language, which cannot possibly relate in any way to "reliable operation" as defined in section 215. Central Lincoln is is concerned that the revised language oversteps the bounds of the "reliability standard" definition under Section 215 of the Federal power Act and into customer service issues that are better served by, and under the jurisdiction of, state and local utility boards and commissions.
Response: The statement from the January 8, 2013 webinar is a concern that industry had raised during the course of the project, which the SDT had captured on a slide in order to respond to the concern during the webinar. The SDT pointed out that building is not the sole source of remedy for the situation and provided specific examples in the webinar (http://www.nerc.com/docs/Standards/dt/footnoteb_webinar_20130108_final.pdf (slide 13)). In Order 693, FERC clearly stated that it has jurisdiction over matters that do involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made.		
Electric Reliability Council of Texas, Inc.	Yes	ERCOT believes that the revisions to the footnote b attachment are an improvement from the previous version. However, ERCOT does not believe that the

Organization	Yes or No	Question 4 Comment
		SDT provided a technical rationale for disagreeing with the comments that we previously submitted. We fundamentally disagree with the approach of defining a stakeholder process in the attachment to a footnote in a reliability standard. While footnotes and attachments have been used in other standards we believe that this application is not appropriate. ERCOT believes that the footnote should be removed altogether as it does not meet the objectives of FERC Order 693. We also believe that FERC did not mandate that a stakeholder process be used. As stated in the January 8 NERC Industry Webinar, 90% of planning entities have not used the existing footnote b over a planning horizon of 13 years. To incorporate an attachment to a footnote with a complicated and prescriptive stakeholder process to address a few instances seems to be a least common denominator approach to planning which is opposed to FERC's direction. Consistent with the approach of TPL-001-2, ERCOT recommends raising the bar on reliability and removing the footnote from the standard.
Response: The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. The use of footnotes and attachments is an acceptable mechanism for use in Reliability Standards and both mechanisms have been used before. No change made. The SDT believes that special circumstances may exist where such actions as described in footnote 'b' are appropriate to meet the performance requirements of TPL. The footnote allows for such circumstances to exist in a controlled and prescribed environment where such usages can be discussed and resolved in an open and transparent process. No change made.		
Southern Company	Yes	Footnote b contains no technical basis for allowing load dropping. It is completely based on an administrative procedure. This is not responsive to paragraphs 17 and 32 of the FERC remand order. A technical basis has to be proposed. The "temporarily radial" concept that was proposed in earlier drafts will address this problem. It will give a technical basis for when load dropping would be allowed. If a technical basis is developed like FERC requires, then there is no need for a

Organization	Yes or No	Question 4 Comment
		stakeholder process. The stakeholder process is not a bright line criteria which can be enforced; it will change depending on the make-up of stakeholders and therefore create inconsistencies across the grid. This approach should never be used in a reliability standard. NERC adopted the ANSI standard process as the bench mark in developing its reliability standards. ANSI does not use stakeholder processes. We propose that the stakeholder process be eliminated. Create a technical basis for when load dropping can be utilized. Keep the 75 MW maximum amount of load that can be dropped.
Response: The SDT believes that the proposed approach is responsive to the Remand Order since it contains quantitative criteria and a more well-defined stakeholder process. The temporary radial concept was discussed by the SDT but abandoned due to industry comments that pointed to the difficulties in adopting this concept on a continent-wide basis. The attachment is enforceable as a clear set of expectations has been described. The conclusions reached as a result of following the stakeholder process may be different due to local configurations, constraints, and expectations of applicable regulatory bodies. No change made.		
WAPA-RMR	Yes	I believe that the 75 MW limit is abetrary and could be too low given particular circumstances, like the maginitude of recent load growth in the area, regulatory hurdles in building new transmission, etc. I also believe that the Attachment 1 stakeholder process is not needed, since it is already covered by the FERC Ordered 890 planning process.
Western Area Power Administration - Transmission Owner	Yes	Western believes that the 75 MW limit is arbitrary and could be to low given particular circumstances, like the magnitude of recent load growth in the area, regulatory hurdles in building new transmission, etc. We also believe that the Attachment 1 stakeholder process is not needed, since it is already covered by the FERC Order 890 process.
Response: The SDT established the limit based on the results of the Section 1600 data request which clearly pointed to a 75 MW limit. While the SDT considered a higher limit value, the data collected does not justify such an action. The SDT used the Board of Trustees approved standard as a starting point for this draft. FERC remanded the standard; not because it contained a stakeholder		

Organization	Yes or No	Question 4 Comment
process, but because the process was not well defined, did not include quantitative and qualitative criteria for allowing curtailment of Firm Demand and did not assure that BES reliability would be maintained. The balloted draft added detail and specificity to the already approved approach. The use of footnotes and attachments is an acceptable mechanism for use in Reliability Standards and both mechanisms have been used before. No change made. The phrase in Section I: "The responsible entity can utilize an existing process or develop a new process" was designed to allow an entity to use an existing process as long as it meets the requirements shown in Attachment 1. No change made.		
Entergy Services, Inc. (Transmission)	Yes	If Attachment 1 must remain, Entergy would support the SERC PSS suggestion to limit the application of Attachment 1 (the stakeholder process) to only those situations where the non-consequential load at risk is above 25MW.
Response: As approved by the Board of Trustees, all utilizations of footnote 'b' required the use of the stakeholder process. The current proposal does not, and should not, deviate from this premise. The Remand Order stated that quantitative criteria needed to be supplied for the stakeholder process and the current proposal provides that criteria. No change made.		
Manitoba Hydro	Yes	Manitoba Hydro cannot support the Footnote B attachment which imposes a stakeholder process not required in Manitoba.
Response: The open and transparent stakeholder process is a new requirement for all entities in response to the need to clarify footnote 'b'. No change made.		
seattle city light	Yes	SCL abstains from voting on the revisions to footnote "b" in TPL-002-1c and the corresponding footnote 12 of TPL-001-2.Â SCL is concerned that the revised language oversteps the bounds of the "reliability standard" definition under Section 215 of the Federal power Act and into customer service issues that are better served by, and under the jurisdiction of,Â state and local utility boards and commissions (for details on SCL's concerns please see the comments submitted during the initial ballot).Â However, in the spirit of moving this process forward, SCL will not vote against the revised footnotes.
Public Utility District No.1 of	Yes	The Public Utility District No.1 of Snohomish County will abstain from voting on the

Organization	Yes or No	Question 4 Comment
Snohomish County		revisions to footnote "b" in TPL-002-1c and the corresponding footnote 12 of TPL-001-2. The Public Utility District No.1 of Snohomish County is concerned that the revised language oversteps the bounds of the "reliability standard" definition under Section 215 of the Federal power Act and into customer service issues that are better served by, and under the jurisdiction of, state and local utility boards and commissions (for details on the Public Utility District No.1 of Snohomish County's concerns please see the comments submitted during the initial ballot). However, in the spirit of moving this process forward, the Public Utility District No.1 of Snohomish County will not vote against the revised footnotes.
ISO New England Inc		In summary, this standard as proposed has misplaced jurisdictional authority under Section 215 of the Federal Power Act. The removal of references to State and Local authorities in the standard is required.
National Grid	Yes	We are accepting the standard as written because our current practices are better then the prescribed maximum limit. However, we believe the appropriate limit should be determined on a case by case basis with the state regulator input. This standard as written, does give us the flexibility to do this.
Response: The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. And when such decisions do not involve any aspect of BES operation or reliability, such situations would not come under the purview of footnote 'b' as standards only apply to the BES unless stated otherwise. However, in Order 693, FERC clearly stated that it has jurisdiction over matters that do involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made.		
New Brunswick System Operator		We do not agree with setting a MW limit for non-consequential load loss. The allowable amount should be determined and approved by the jurisdiction of the area(s) whose load is affected. The intent of the TPL standard and this footnote is to ensure that if non-sequential load loss is accounted for or relied up to ensure BES reliability (as assessed in the planning horizon), that such a decision needs to be

Organization	Yes or No	Question 4 Comment
		approved by the appropriate jurisdiction
Response: Please see the changes shown in Q1 to account for jurisdictional differences for non-US registered entities.		
MRO NSRF	Yes	Some entities remain concerned over a potential conflict and mismatch of impacts introduced by Section III and the inclusion of non-regulated stakeholders versus NERC regulated entities. There was not a FERC directive to include section III. Section III overreaches the intent of the FERC order and the SAR to meet the FERC directive. The drafting team should show the specific FERC requirement and words in Order 693 that requires non-NERC regulatory reviews. The drafting team technically responded to a request that Section III be removed, but avoided the the fundamental issue. The fact that some existing non-NERC regulatory bodies may already have a consistent practice is not a reason to include non-NERC entities into a NERC framework. This creates a fundamental mismatch between NERC regulated entities that must follow NERC standards and stakeholders that are not compelled by NERC requirements. If Section III is not deleted, it is recommended that wording be added to allow the existing FERC Order 890 stakeholder meeting process be used to meet Attachment 1. Regulators attend these meetings and all stakeholders (including regulators) could be asked for their objections. If there was no response or a "lack of dissent", this would be documented as meeting Attachment 1 to allow the use of footnote "b" without additional special procedures.
Response: The phrase in Section I: "The responsible entity can utilize an existing process or develop a new process" was designed to allow an entity to use an existing process as long as it meets the criteria shown in Attachment 1. No change made.		
Iberdrola USA	Yes	The reasons for the "negative" vote are enumerated in our prior comments. In summary: 1. Attachment 1 is cumbersome and inappropriate, and should be stricken entirely. 2. All non-consequential load loss for all single-element contingencies should be temporary, with an action plan to avoid such load loss in the future.

Organization	Yes or No	Question 4 Comment
		3. All actions following single-element contingencies should be an attempt to restore lost customer service, not interrupt more customers.
Response: The transparency provided by the stakeholder process will meet the regulatory guidance provided on this issue. The limited use of footnote 'b' as shown by the data collected in response to the Section 1600 data request indicates relatively few instances where footnote 'b' would be used. For this reason, the SDT believes that the proposed approach strikes the right balance. . No change made. The SDT agrees that this is often the normal course of action. However, the SDT has not mandated this course of action since there could be circumstances that may arise where the continued use of footnote 'b' may be the best over-all solution for all concerned. No change made. The SDT believes that special circumstances may exist where such actions as described in footnote 'b' are appropriate to meet the performance requirements of TPL. The footnote allows for such circumstances to exist in a controlled and prescribed environment where such usages can be discussed and resolved in an open and transparent process. No change made.		
Southwest Power Pool Reliability Standards Development Group Kansas City Power & Light	Yes	Under section II items 3 and 4 the wording (frequency and duration) seems to implicate that the planners will be determining these events in a probabilistic manor. If the probability of these events is anything other than 0 planners will have to accommodate for those events in their planning assessments regardless of how small the probability is for that event.
Response: The SDT does not agree that the wording requires a probabilistic determination. The planning method utilized to make the determination is left up to the planner however this information is necessary to allow stakeholders to understand the usage of footnote 'b'. No change made.		
ITC	Yes	While ITC is voting yes for this "successive ballot", we are doing so in the interest of ensuring that TPL 001-2 becomes fully effective as soon as possible. TPL001-2 is a major improvement to previous standards and insuring it becomes fully effective is important to ITC and the industry. However, we have concerns that we would like to be noted. Because footnote B has been highlighted and expanded, there is the possibility of future "unintended consequences". It is highly likely that interveners

Organization	Yes or No	Question 4 Comment
		or others may attempt to stop or slow down needed corrective action plans, that do not rely on load shedding, by suggesting that planners use this stakeholder process before proposing projects. We suggest both NERC and FERC be prepared to deal with these unintended consequences. We also concur in entirety with the comments MISO is proposing to make for this project. They are consistent with past comments ITC has made and do discuss in some detail the potential "unintended consequences" this detailed footnote may cause.
Response: The SDT believes that special circumstances may exist where such actions as described in footnote 'b' are appropriate to meet the performance requirements of TPL. The footnote allows for such circumstances to exist in a controlled and prescribed environment where such usages can be discussed and resolved in an open and transparent process. No change made.		
Xcel Energy	Yes	While we are not satisfied with the responses to our previous comments, we have chosen to not reiterate them here. Instead, we feel that the need to continue with any modification to Footnote b seems moot considering FERC's recent approval of the revised BES definition. Specifically, we believe exclusions E1 and E3, regarding radial systems and local networks, resolves FERC's original directive on ambiguity with footnote b. We recommend the team consider abandoning this project, and request that NERC staff request relief from FERC on the related directives, as they have been overcome by the modified BES definition.
Response: The SDT believes that there may be portions of the BES, even with the proposed revised BES definition, where it may still be appropriate to address performance issues using footnote 'b' for Non-Consequential Load Loss. No change made.		
Independent Electricity System Operator		(1) The IESO reiterate its support for allowing load interruption for a single contingency with sufficient review/oversight and under acceptable conditions, including no widespread adverse impact on the reliability of the interconnected bulk power system. The reliability aspects (BES performance requirements) should be reviewed for acceptability by the adjacent Planning Coordinators and Transmission Planners. However, issues pertaining to economics or externalities which may not be directly reliability-related are always available for review and

Organization	Yes or No	Question 4 Comment
		debate by the stakeholders via the regulatory processes and subject to approval by the regulatory authority of each jurisdiction (including those in Canada and Mexico). (2) Furthermore, we request that Table 1 of TPL-001-3 (previous TPL-001-2 approved by NERC BOT) be corrected for EHV contingencies in P2, P4 and P5 categories to allow the application of footnote ‘b’/’12’ that is allowed for the P1 events. Events in P2, P4, and P5 can involve more elements and can be more onerous and stressful to the system than the P1 events, and if use of footnote ‘b’/’12’ is permitted in the less stressful P1 events, it should also be permitted in P2, P4 and P5 events. There continues to be confusion as to this inconsistency, and to how this is to be applied (as discussed at the last webinar). (3) We suggest that NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve it. Accordingly, we believe that the focus of footnote ‘b’, and footnote 12 should be that interruption of load must not have a widespread, adverse impact on the reliability of the interconnected bulk power system. A continent-wide standard should not concern itself with the reliability of supply or supply continuity for local load, as that is the responsibility of the applicable regulatory authority or its agencies responsible for local transmission and retail service over the load to be curtailed. As mentioned above, NERC Standards and their requirements should focus on what is the anticipated outcome rather than how to achieve it. In this regard, we believe that Attachment 1 is not necessary because it prescribes a process which goes beyond the outcome of the standard and dictates how stakeholdering must be carried out. The individual jurisdiction should establish the process for ensuring compliance with the standard and decide to what extent a stakeholdering process is necessary to establish the acceptable level of load rejection for the area in a manner consistent with local transmission established service levels. (4) The process presented in Section I is overly prescriptive. If a section that prescribes the principles of a stakeholder process is required, then for Canadian entities this section should simply state that any threshold should be established in

Organization	Yes or No	Question 4 Comment
		a manner consistent with other service levels that apply to local transmission and retail service for the load to be curtailed, as described in Q1 and for the reasons stated therein. Corrective action plans can rarely be implemented in a one-year time frame, and in some cases, limited use of Non-consequential Load Loss will be preferable to unaffordable transmission enhancements, therefore we believe that the use of footnote ‘b’/’12’ should not be limited to the Near-Term Transmission Planning Horizon. We propose that the phrase “the Near-Term Transmission Planning Horizon of” be deleted from the opening paragraph.
Response: The SDT believes that it is the responsibility of the ERO to assess Adverse Reliability Impacts and is not an appropriate role for adjacent planners. The proposed stakeholder process allows all stakeholders, including regulators, will have the necessary information required for the indicated reviews. No change made. Table 1 in the proposed TPL-001-2 was previously approved by industry through the standards development process. As shown by this approval, the SDT and the industry disagree that there is a technical irregularity in Table 1. The Board of Trustees has also previously approved this proposed standard. Discussions on the applicability of footnote 12 in that standard were held during Project 2006-02 and are not part of this proceeding. No change made. The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. And when such decisions do not involve any aspect of BES operation or reliability, such situations would not come under the purview of footnote ‘b’ as standards only apply to the BES unless stated otherwise. In addition, please see the changes shown in Q1 to address jurisdictional concerns for non-US registered entities. No change made. Please see the changes shown in Q1 to address jurisdictional concerns for non-US registered entities. The use of the footnote is not limited to the Near-Term Transmission Planning Horizon since the main body of the footnote states that the footnote may be utilized “… throughput the planning horizon…”. No change made.		
SERC EC Planning Standards Subcommittee		We continue to recommend that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. We believe that this simplification would be less burdensome and would enhance industry acceptance of the revision, while still meeting regulatory guidance. The comments expressed

Organization	Yes or No	Question 4 Comment
		herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
TVA Transmission Reliability Engineering and Controls		We recommend that up to 25 MW of planned interruption be allowed without triggering the need for a stakeholder process. We believe that this simplification would be less burdensome and would enhance industry acceptance of the revision, while still meeting regulatory guidance.
Response: As approved by the Board of Trustees, all utilizations of footnote ‘b’ required the use of the stakeholder process. The current proposal does not, and should not, deviate from this premise. The Remand Order stated that quantitative criteria needed to be supplied for the stakeholder process and the current proposal provides that criteria. No change made.		
Tacoma Power		While Tacoma Power appreciates NERC's attempt to address both footnotes with the same drafting team, Tacoma Power is voting negative on the revisions to footnote "b" in TPL-002-1c and the corresponding footnote 12 of TPL-001-2. However, Tacoma Power would vote affirmative if a re-circulation ballot was limited strictly to footnote "b" in TPL-002-1c. TPL-001-2 considered new types of outages not considered by TPL version 1, such as P2-1. Although TPL-001-2 was approved by the industry, the proposed modifications to footnote 12 in TPL-001-2 are significantly more onerous than footnote 12 in TPL-001-2. Furthermore, since TPL-001-2 is not yet enforceable, some Transmission Planners still do not realize that automatic relay actions are considered Non Consequential Load Loss. In addition, Tacoma Power identified over 100 MW of load in multiple locations that would be shed in accordance with footnote 12 in TPL-001-2. Unfortunately, the structure of the Section 1600 data request did not allow for the submittal of footnote 12 related data. Since it is clear that the potential impact of the footnote 12 revision has not been addressed due to the compressed timeline, Tacoma Power believes that by separating the two standards, NERC can meet the FERC mandated deadline for footnote b while still continuing the drafting process to achieve true industry consensus on footnote 12. Please note that FERC orders 693 and 762 require

Organization	Yes or No	Question 4 Comment
		addressing only footnote "b" by the using the Expedited Standards Development Process. Earlier FERC orders discuss "single contingencies" as type Category B in TPL-002-1; FERC has not addressed Non Consequential Load Shedding for the lower probability "single contingencies" (i.e. P2-1) in TPL-001-2. Approving the revisions to footnote 12 would result in negligible reliability gains at an unreasonable cost for customers on the fringes of the power system, without affording local jurisdictional cost benefit analysis. Tacoma Power is also concerned that the revised language oversteps the bounds of the "reliability standard" definition under Section 215 of the Federal Power Act. These revisions tread on customer service issues that are better served by, and under the jurisdiction of, state and local utility boards and commissions. For details on Tacoma Power's concerns please see the comments submitted during the initial ballot. However, in the spirit of moving this process forward, Tacoma Power would vote to approve the revisions to solely TPL-002-1c if balloted separately from TPL-001-2.Tacoma Power appreciates the opportunity to provide comments, and thanks you for consideration of our comments.
Response: Any information gleaned from a Section 1600 data request based on application of footnote 12 would have been speculative prior to the implementation of the new TPL-001-2. From the review of the comments submitted, it does not appear that separation of the standards would be a consensus view. No change made. The proposed solution allows for input and participation at every step of the process by local jurisdictional authorities. And when such decisions do not involve any aspect of BES operation or reliability, such situations would not come under the purview of footnote 'b' as standards only apply to the BES unless stated otherwise. However, in Order 693, FERC clearly stated that it has jurisdiction over matters that do involve BES operations and reliability. Furthermore, these orders mandate the ERO to write standards and requirements to address all aspects of BES operations and reliability in support of these goals. The proposed footnote 'b' solution acknowledges these facts and is an appropriate response to subsequent FERC directives on this matter. No change made.		

END OF REPORT

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR approved by SC in May 2012.
2. Initial comment period July 31, 2012 – August 29, 2012.
3. Initial ballot and comment period October 5, 2012 – November 19, 2012.
4. Successive ballot and comment period December 10, 2012 – January 11, 2013

Proposed Action Plan and Description of Current Draft:

The SDT is working to address FERC's remand of the proposed clarification of TPL-002, Table 1 — footnote 'b', regarding the planned or controlled interruption of electric supply where a single Contingency occurs on a Transmission System. That footnote is captured here as footnote 12.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Recirculation ballot	January 2013
2. BOT approval	February 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**

2. **Number:** **TPL-001-3**

3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.

4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

   Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

   For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-3, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-3:

   - P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
   - P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
   - P2-1
   - P2-2 (above 300 kV)
   - P2-3 (above 300 kV)
   - P3-1 through P3-5
   - P4-1 through P4-5 (above 300 kV)
   - P5 (above 300 kV)

B. Requirements

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities

1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.

1.1.3. New planned Facilities and changes to existing Facilities

1.1.4. Real and reactive Load forecasts

1.1.5. Known commitments for Firm Transmission Service and Interchange

1.1.6. Resources (supply or demand side) required for Load

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.

- Duration or timing of known Transmission outages.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past

studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Special Protection Systems
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the

use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.

3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.

b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.

c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.

d. Simulate Normal Clearing unless otherwise specified.

e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

f. Applicable Facility Ratings shall not be exceeded.

g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.

h. Planning event P0 is applicable to steady state only.

i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault [8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No
				HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker) [8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker [10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency *(Fault plus relay failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant relay[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device [6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

<table>
<tr><th colspan="2">Table 1 – Steady State & Stability Performance Extreme Events</th></tr>
<tr><td colspan="2">Steady State & Stability
For all extreme events evaluated:
a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
b. Simulate Normal Clearing unless otherwise specified.</td></tr>
<tr><td>Steady State
1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
a. Loss of a tower line with three or more circuits.[11]
b. Loss of all Transmission lines on a common Right-of-Way[11].
c. Loss of a switching station or substation (loss of one voltage level plus transformers).
d. Loss of all generating units at a generating station.
e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
a. Loss of two generating stations resulting from conditions such as:
i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
ii. Loss of the use of a large body of water as the cooling source for generation.
iii. Wildfires.
iv. Severe weather, e.g., hurricanes, tornadoes, etc.
v. A successful cyber attack.
vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
b. Other events based upon operating experience that may result in wide area disturbances.</td>
<td>Stability
1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
a. 3Ø fault on generator with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
b. 3Ø fault on Transmission circuit with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
c. 3Ø fault on transformer with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
d. 3Ø fault on bus section with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
e. 3Ø internal breaker fault.
f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances</td></tr>
</table>

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, &

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
67), and tripping (#86, & 94).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. .The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
    a. The estimated number and type of customers affected

b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community

3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
    a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
    b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

C. Measures

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.
R2	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.
R3	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1. Version History

Version	Date	Action	Change Tracking
1	03/17/2001	Revision of TPL-001-0 to modify only Table 1 footnote b. Approved by Board of Trustees	Project 2006-02 – revision to address FERC directive
2	To be Determined	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2a	February 2013	Address remand of proposed footnote 'b' pursuant to FERC Order RM06-16-009	Revised

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR approved by SC in May 2012.
2. Initial comment period July 31, 2012 – August 29, 2012.
3. Initial ballot and comment period October 5, 2012 – November 19, 2012.
4. Successive ballot and comment period December 10, 2012 – January 11, 2013

Proposed Action Plan and Description of Current Draft:

The SDT is working to address FERC's remand of the proposed clarification of TPL-002, Table 1 — footnote 'b', regarding the planned or controlled interruption of electric supply where a single Contingency occurs on a Transmission System. That footnote is captured here as footnote 12.

Future Development Plan:

Anticipated Actions	Anticipated Date
~~Successive ballot~~	~~December 2012~~
1. Recirculation ballot	January 2013
2. BOT approval	February 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**

2. **Number:** **TPL-001-~~2a~~3**

3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.

4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

   Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

   For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-~~2~~3, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-~~2a~~3:

   - P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
   - P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
   - P2-1
   - P2-2 (above 300 kV)
   - P2-3 (above 300 kV)
   - P3-1 through P3-5
   - P4-1 through P4-5 (above 300 kV)
   - P5 (above 300 kV)

B. Requirements

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities

1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.

1.1.3. New planned Facilities and changes to existing Facilities

1.1.4. Real and reactive Load forecasts

1.1.5. Known commitments for Firm Transmission Service and Interchange

1.1.6. Resources (supply or demand side) required for Load

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.

- Duration or timing of known Transmission outages.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past

studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Special Protection Systems
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the

use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.

3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.

b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.

c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.

d. Simulate Normal Clearing unless otherwise specified.

e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

f. Applicable Facility Ratings shall not be exceeded.

g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.

h. Planning event P0 is applicable to steady state only.

i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault [8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No
				HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker) [8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker [10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency *(Fault plus relay failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant relay[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device [6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.

b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
    a. Loss of a tower line with three or more circuits.[11]
    b. Loss of all Transmission lines on a common Right-of-Way[11].
    c. Loss of a switching station or substation (loss of one voltage level plus transformers).
    d. Loss of all generating units at a generating station.
    e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
    a. Loss of two generating stations resulting from conditions such as:
        i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
        ii. Loss of the use of a large body of water as the cooling source for generation.
        iii. Wildfires.
        iv. Severe weather, e.g., hurricanes, tornadoes, etc.
        v. A successful cyber attack.
        vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
    b. Other events based upon operating experience that may result in wide area disturbances.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
    a. 3Ø fault on generator with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
    b. 3Ø fault on Transmission circuit with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
    c. 3Ø fault on transformer with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
    d. 3Ø fault on bus section with stuck breaker[10] or a relay failure[13] resulting in Delayed Fault Clearing.
    e. 3Ø internal breaker fault.
    f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, &

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
67), and tripping (#86, & 94).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. .The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
   a. Date, time, and location for the meeting
   b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
   c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
   a. System Load level and estimated annual hours of exposure at or above that Load level
   b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
   a. The estimated number and type of customers affected

   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do~~es~~ not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

~~In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW.~~

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do~~es~~ not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

C. Measures

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.
R2	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.
R3	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P7) in	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1.

	Lower VSL	Moderate VSL	High VSL	Severe VSL
		OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	Table 1. The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for three or more of the categories (P1 through P7) in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R5	N/A	N/A	N/A	The responsible entity does not have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, or the transient voltage response for its System.
R6	N/A	N/A	N/A	The responsible entity failed to define and document the criteria or methodology for System instability used within its analysis as described in Requirement R6.

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R7	N/A	N/A	N/A	The Planning Coordinator, in conjunction with each of its Transmission Planners, failed to determine and identify individual or joint responsibilities for performing required studies.
R8	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 90 days but less than or equal to 120 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 30 days but less than or equal to 40 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 120 days but less than or equal to 130 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 40 days but less than or equal to 50 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 130 days but less than or equal to 140 days following its completion. OR, The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 50 days but less than or equal to 60 days following the request.	The responsible entity distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 140 days following its completion. OR The responsible entity did not distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners. OR The responsible entity distributed its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 60 days following the request. OR The responsible entity did not distribute its Planning Assessment results to functional entities having a reliability related need who requested the Planning Assessment in writing.

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
1	03/17/2001	Revision of TPL-001-0 to modify only Table 1 footnote b. Approved by Board of Trustees	Project 2006-02 – revision to address FERC directive
2	To be Determined	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2a	February 2013	Address remand of proposed footnote 'b' pursuant to FERC Order RM06-16-009	Revised

Implementation Plan for TPL-001-3

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-3 — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-3, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Coordinator
TPL-001-3 — Transmission System Planning Performance Requirements	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-3:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

TPL-001-1a, TPL-002-2b, TPL-003-1b, and TPL-004-1a are being retired as they are replaced in their entirety by TPL-001-3. TPL-005-0 and TPL-006-0.1 are being retired because their requirements are adequately covered by the revised TPL-001-3 and NERC's Rules of Procedure, Section 800. TPL-001-1a, TPL-002-2b, TPL-003-1b, TPL-004-1a, TPL-005-0 and TPL-006-0.1 are being retired on midnight of the day immediately prior to the Effective Date of TPL-001-3 in the particular jurisdictions in which TPL-001-3 is becoming effective. However, during this 24-month period, all aspects of TPL-001-1a through TPL-006-0.1 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-2a requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes

into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-3 ‘raises the bar’ in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-1a, TPL-002-2b, TPL-003-1b and TPL-004-1a because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-3, the performance requirements associated with the following events represent “raising the bar”:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This “raising the bar” is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon has been provided

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Implementation Plan for TPL-001-~~2a~~3

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-~~2a~~ 3 — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-~~2a~~3, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
TPL-001-~~2a~~ 3 — Transmission System Planning Performance Requirements	Transmission Planner	Planning Coordinator
	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-~~2a~~3:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

TPL-001-1a, TPL-002-~~1c~~2b, TPL-003-1b, and TPL-004-1a are being retired as they are replaced in their entirety by TPL-001-~~2a~~3. TPL-005-0 and TPL-006-0.1 are being retired because their requirements are adequately covered by the revised TPL-001-~~2a~~ 3 and NERC's Rules of Procedure, Section 800. TPL-001-1a, TPL-002-~~1c~~2b, TPL-003-1b, TPL-004-1a, TPL-005-0 and TPL-006-0.1 are being retired on midnight of the day immediately prior to the Effective Date of TPL-001-~~2a~~3 in the particular jurisdictions in which TPL-001-~~2a~~ 3 is becoming effective. However, during this 24-month period, all aspects of TPL-001-1a through TPL-006-0.1 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-2a requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-~~2a~~ 3 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-1a, TPL-002-~~1c~~2b, TPL-003-1b and TPL-004-1a because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-~~2a~~3, the performance requirements associated with the following events represent "raising the bar":

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This "raising the bar" is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon has been provided

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Implementation Plan for Project 2010-11: TPL Table 1 Order

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Revision to Sections of Approved Standards and Definitions

There are no new definitions in the proposed standards.

Compliance with Standards

Standards	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Authority
TPL-001-1: System Performance Under Normal (No Contingency) Conditions (Category A) TPL-002-2b: System Performance Following Loss of a Single Bulk Electric System Element (Category B) TPL-003-1: System Performance Following Loss of Two or More Bulk Electric System Elements (Category C) TPL-004-1: System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

The application of revised Footnote ‘b’ in Table 1 will take effect on the first day of the first calendar quarter, 60 months after approval by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. All other

requirements remain in effect per previous approvals. The existing Footnote ‘b’ remains in effect until the revised Footnote ‘b’ becomes effective.

All other requirements remain in effect as per previous approvals.

Standards Announcement

Project 2010-11– TPL Table 1 Order
TPL-002-2b, footnote ‘b’ and TPL-001-3, footnote 12

Recirculation Ballot is now open through 8 p.m. Thursday, January 31, 2013

Now Available

A recirculation ballot is now open for revisions to a single footnote that is incorporated into two standards (**TPL-002-2b**– System Performance Following Loss of a Single BES Element for footnote ‘b’, and **TPL-001-3** – Transmission System Planning Performance Requirements for footnote 12) through **8 p.m. Eastern Thursday, January, 31, 2013**.

IMPORTANT NOTICE (PLEASE READ): This recirculation ballot includes a substantive change to TPL-002-2b (formerly referred to as TPL-002-1c), footnote b and TPL-001-3 (formerly referred to as TPL-001-2a), footnote 12 to address applicability to registered entities in Canada and Mexico. The change adds text to the footnotes and Attachment 1 that addresses jurisdictional differences – specifically, that the 75 MW limit on planned, non-consequential load loss included in the footnotes and Attachment would not apply to Canadian or Mexican registered entities. The inclusion of this substantive change during a recirculation ballot was approved by the Standards Committee as a deviation from the Standard Processes Manual to provide NERC with an opportunity to meet a February 2013 deadline from the Federal Energy Regulatory Commission.

Please also note that NERC has identified that the drafting team was given incorrect guidance on the proper numbering of the standards to account for the revision to be consistent with the NERC Standards Numbering Convention**. The standards versions have been updated to reflect the appropriate numbering convention and are now identified as TPL-002-2b and TPL-001-3.**

Instructions

In the recirculation ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the recirculation ballot window. If a ballot pool member does not participate in the recirculation ballot, that member’s vote cast in the previous ballot will be carried over as that member’s vote in the recirculation ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the footnote by clicking here.

Next Steps

Voting results will be posted and announced after the ballot window closes. If approved, the footnote will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Background

FERC Order No. 762, issued April 19, 2012, remanded TPL-002-0b to NERC as vague, unenforceable and not responsive to the previous Commission directives on this matter. The Standards Committee directed the Standards Drafting Team (SDT) to revise footnote 'b' in accordance with the directives of Orders No. 693 and 762. The SDT was also charged with revising the corresponding footnote 12 of TPL-001-2 in order to prevent the remand of TPL-001-2.

In revising the footnotes, the SDT adopted a philosophy of minimal changes to the actual footnote itself. This was done to minimize confusion as to what was changed, for ease of reading and following the footnote, and for formatting within the actual standards documents. Instead, the SDT revised the footnote by developing an attachment to the footnote containing changes in response to the Commission orders. It should be noted that attachments to standards are an extension of the Requirements and thus are binding to applicable entities.

Project 2010-11 is an important part of the ERO's strategic goal to be responsive to regulatory authority directives in an expeditious manner in order to reduce the amount of standards-related directives and to provide an adequate level of reliability.

Additional information can be found on the project page.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process, including the appeals process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson,
Standards Development Administrator, at monica.benson@nerc.net or at 404-446-2560.

Recirculation Ballot Results

Now Available

A recirculation ballot for revisions to a single footnote that is incorporated into two standards (**TPL-002-2b**– System Performance Following Loss of a Single BES Element for footnote ‘b’, and **TPL-001-3** – Transmission System Planning Performance Requirements for footnote 12) concluded at **8 p.m. Eastern on Thursday, January, 31, 2013**.

Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results.

Approval
Quorum: 88.55% Approval: 69.63%

Next Steps

The footnote will be presented to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Background

FERC Order No. 762, issued April 19, 2012, remanded TPL-002-0b to NERC as vague, unenforceable and not responsive to the previous Commission directives on this matter. The Standards Committee directed the Standards Drafting Team (SDT) to revise footnote ‘b’ in accordance with the directives of Orders No. 693 and 762. The SDT was also charged with revising the corresponding footnote 12 of TPL-001-2 in order to prevent the remand of TPL-001-2.

In revising the footnotes, the SDT adopted a philosophy of minimal changes to the actual footnote itself. This was done to minimize confusion as to what was changed, for ease of reading and following the footnote, and for formatting within the actual standards documents. Instead, the SDT revised the footnote by developing an attachment to the footnote containing changes in response to the Commission orders. It should be noted that attachments to standards are an extension of the Requirements and thus are binding to applicable entities.

Project 2010-11 is an important part of the ERO's strategic goal to be responsive to regulatory authority directives in an expeditious manner in order to reduce the amount of standards-related directives and to provide an adequate level of reliability.

Standard Drafting Team Roster for NERC Standards Development Project 2011-10

Project 2010-11 TPL Table 1

Name and Title	Company and Address	Contact Info	Bio
John Odom, Chair Vice President of Planning and Operations	Florida Reliability Coordinating Council, Inc. 1408 N. Westshore Blvd., Suite 1002 Tampa, FL 33607-4512	(813)207-7985 jodom@ frcc.com	John Odom is Vice President of Planning and Operations at the Florida Reliability Coordinating Council (FRCC). John joined FRCC in May, 2005 after 26 years at Progress Energy Corporation (PEF). He is responsible for oversight of all Member Services Activities, including the FRCC standing committees, FRCC Reliability Coordinator, and Planning Authority function. Additionally, he oversees the Regional Entity functions of reliability assessment, situational awareness, training, certification of system operators, and event analysis. From 2001 – 2007, John was the FRCC Representative on the NERC Reliability Assessment Subcommittee (RAS). John is currently the chair of the Assess Future Transmission Needs Standards Drafting Team (AFTNSDT), which is re-writing the existing TPL-001 through TPL-006.
Douglas Hohlbaugh, Vice Chair Standards Development Manager	FirstEnergy Corp. 76 South Main Street 10th Floor Akron, Ohio 44308	(330) 384-4698 hohlbaughdg@ firstenergycorp. com	Doug Hohlbaugh holds a Bachelor of Science in Electrical Engineering from Akron University (1989) and a Professional Engineering license in the state of Ohio. His 20 plus years experience in the electric utility industry has involved the transmission business of FirstEnergy with a focus on transmission planning. His work experience includes various technical positions in transmission and distribution, as well as sales and marketing experience with FirstEnergy's (FE) unregulated energy services Existing responsibilities include the Reliability Standards Development Lead of the FirstEnergy FERC Compliance Department including oversight of newly proposed and/or revised reliability standards governing the bulk electric transmission system. The responsibilities include overseeing and ensuring timely implementation of all new reliability standard development projects at both the North American Electric Reliability Corporation (NERC) and Reliability First Corporation (RFC) having impact on a variety of FE business units which support the reliable operation of the bulk transmission system.
D. Darrin Church Principal Engineer Bulk Transmission Planning	Tennessee Valley Authority 1101 Market Street MR 5G-C Chattanooga, Tennessee 37402-2801	423) 751-6899 (423) 751-3453 Fx ddchurch@tva. gov	Darrin Church is a Principal Bulk Planning Engineer in TVA's Transmission Planning Department. Darrin has 15 years experience in Bulk Transmission Planning along with 5 years previous experience in planning relaying and protection schemes. Responsibilities include insuring reliability of TVA's 500 kV, 230 kV, 161 kV, and 115 kV transmission systems which include initiating capital projects required to maintain an adequate and reliable transmission system per NERC Reliability Standards.

William Harm Senior Consultant	PJM Interconnection, L.L.C. 955 Jefferson Ave Valley Forge Corporate Center Norristown, Pennsylvania 19403-2497	(610) 666-8868 harm@pjm.com	Bill Harm has over 35 years of industry experience with PJM through various assignments involving real time operation, operations planning, and transmission planning. Mr. Harm's current responsibilities involve performance assessment and policy development responsibilities. He either has or continues to represent PJM in various industry forums and groups, including RFC, NERC, and the ISO/RTO forums. He earned a Bachelor and Maters of Science Degree in Electrical Engineering from Drexel University and is a registered professional Engineer in the Commonwealth of PA.
Julius Horvath Manager Planning & Operations	Wind Energy Transmission Texas, LLC	(512)496-9186 julius.horvath@windenergyoftexas.com	Julius Horvath is currently the Planning and Operations Manager at Wind Energy Transmission Texas, LLC (WETT), in Austin, Texas. Julius has over 12 years of utility experience at the Bonneville Power Administration, Wind Energy Transmission Texas, LLC, Lonestar Transmission, LLC and the Lower Colorado River Authority in Transmission Planning. Julius is a Registered Profession Engineer in the State of Texas.
Robert A. Jones Project Manager, Stability Studies	Southern Company Services P.O. Box 2641 Birmingham, Alabama 35291	(205) 257-6148 rajones@southernco.com	Robert Jones obtained a BSEE degree from the University of Alabama in 1973 and a MSEE degree from University of Alabama – Birmingham in 1978. He has worked for 37 years for Southern Company Services. Eighteen of those years have been in Transmission Planning. The last 15 years, he has been responsible for stability studies for Southern Company.
Brian K. Keel Manager, Transmission System Planning	Salt River Project MS POB100 PO Box 52025 Phoenix, Arizona 85072	602-236-0970 brian.keel@srpnet.com	Brian Keel has a Bachelor and Master Degrees in Electrical Engineering, specializing in power systems, from the University of Illinois. Brian was employed by Duke Power for over one year and PSI Energy for 8 years. Brian has been at SRP since 1998 and is currently the Manager of Transmission System Planning. Brian has Chaired four groups within WECC mainly concentrating on transmission reliability. Brian is a current member of the NERC TADS Work Group.
R. W. Mazur Manager System Planning Department	Manitoba Hydro 12-1146 Waverly Street P.O. Box 815 Winnipeg, Manitoba R3C 2P4	(204) 474-3113 rwmazur@hydro.mb.ca	Ronald W. Mazur obtained his Bachelor of Science in Electrical Engineering degree in 1971, and his Masters of Science in Electrical Engineering degree in 1989, both from the University of Manitoba. Ron Mazur is a registered professional engineer with the Association of Professional Engineers and Geoscientists of Manitoba. Ron joined Manitoba Hydro in 1974, where he worked in station design for 5 years, and in system performance (operations) for 6 years, and in system planning since 1986. He is currently the Manager of the System Planning Department responsible for the expansion planning of Manitoba Hydro's transmission system (100 kV and above) and the HVDC system. Ron is a Canadian representative on the NERC Planning Committee, and Chair of the Planning Committee of the Midwest Reliability Organization.
Thomas C. Mielnik Manager Electric System Planning	MidAmerican Energy Co. 106 East Second Street Davenport, Iowa 52808	(563) 333-8129 tcmielnik@midamerican.com	Thomas Mielnik has over 37 years experience in Electric Utility Planning. He has been the Manager of Electric System Planning for MEC from 1995 to the present. He was a member of the NERC ATC Working Group from 1996 to 1999 and is a Registered Professional Engineer.

Bernie M Pasternack, President, P.E.	Transmission Strategies 4347 Harborough Rd Upper Arlington, Ohio 43220	(614) 459-5806 bmpasternack@ att.net	Bernie Pasternack was employed by the AEP Service Corporation for over 41 years, where he spent his entire career in various aspects of transmission planning and asset management. After retiring from AEP in June 2010, he formed his own consulting practice, providing services to the electric utility industry. He holds BEE and MSEE degrees from Rensselaer Polytechnic Institute and an MBA from Fairleigh Dickinson University. Before retiring from AEP, Bernie was responsible for the planning and management of AEP's transmission assets. His department provided the analytical and planning services for the entire AEP System, eleven operating companies, and a transmission network consisting of transmission facilities ranging in voltage from 23 kV to 765 kV. This system spans eleven states and three reliabilty regions (RFC, SPP, and ERCOT). Bernie was also responsible for providing input to policy making decisions relative to AEP's transmission strategy and business plan. Bernie directed the analytical and planning services provided to the eleven operating companies. Such services included future system performance appraisal and planning studies, IPP interconnection studies, and all analytical studies dealing with the steady-state and dynamic operation of interconnected power systems. Based on an evaluation of the results of these studies, the Transmission Planning group developed and recommended capital improvement projects and programs for the reinforcement of the AEP System transmission network. In parallel with these efforts, the Transmission Asset Engineering group developed capital rehabilitation programs and set maintenance guidelines to maintain the health of AEP's transmission assests. During his career, Bernie has made significant contributions to a variety of industry organizations including IEEE, CIGRE, EPRI, EEI, ECAR/RFC, and NERC. He was a member of the EEI Transmission Policy TF and AEP's representative on the Reliability First Corporation Reliability Committee. Bernie has also played an active role in many NERC activities over the past twenty years, including its Planning Committee and a number of its subcommittees, working groups, and standards drafting teams.
Bob Pierce Senior Engineer	Duke Energy 526 South Church Street MC EC10Q Charlotte, North Carolina 28201-1006	(980) 373-6480 bob.pierce@ duke- energy.com	Robert (Bob) Pierce is a Consulting Engineer at Duke Energy where he specializes in Bulk System Planning, NERC standards, and FERC regulations. He holds a B.S. in Nuclear Engineering from Pennsylvania State University and a M.S. in Electrical Engineering from the University of North Carolina-Charlotte. Mr. Pierce is a registered Professional Engineer with 13 years Transmission Planning experience and a total of 31 years of power system experience.

Dana Walters Director of Reliability and Economic Planning	NYISO 10 Krey Blvd., Rensselaer, NY 12144	518-356-8582 DWalters@NYISO.com	Dana Walters is currently Director of Reliability and Economic Planning at the NYISO. However, at the time of the work effort he was a Manager in the Transmission Planning group at National Grid. Mr. Walters has 36 year of experience in the Electric Utility industry. Most of his experience involves various aspects of Transmission Planning. This includes topics such as analytical studies of thermal, stability, short circuit, generator interconnections, and lightning protection. Other areas of experience include involvement in investment planning, tariff design, consulting, production cost analysis, and distribution planning. In his role as a Transmission Planner, Mr. Walters has been involved in numerous committees and working groups at the NERC, NPCC, and ISO levels. Mr. Walters has a Masters in Engineering Management from Northeastern University and a Bachelor in Electrical Engineering with a focus in Power Systems also from Northeastern University. Mr. Walters is a registered professional engineer in New Hampshire and is a member of IEEE.
