

Attachment F - Sample Reentry Testing Scenario

	<p>As you remember over 5 months ago, an accident at the nuclear power plant resulted in contamination of a 50 square mile area of our community. The accident resulted in significant amounts of radioactive contamination in the community. The nuclear reactor was shut down and secured and there have been no additional releases of radioactive materials since the initial accident.</p> <p>Residents were asked to evacuate their community and relocate to another area. Restrictions were placed on various food and agricultural products produced in this area.</p>
	<p>Over the last several months, local, state and federal authorities have continued clean-up activities in the community and radioactive contamination has been significantly reduced.</p> <p>In addition, teams of federal, state and local radiation experts continuously measure and monitor the radiation levels in the community.</p>
	<p>The monitoring of the radiation levels in much of the evacuated area confirms that only minimal levels of radioactive contamination remain in the environment.</p> <p>Because of these low levels of contamination, these areas have been cleared for residents to return to their homes and businesses.</p>
