class=MsoNormal></p><p class=MsoNormal>A potential cluster of  
parechovirus (HPeV3) infections among young infants has been identified,  
primarily in and around the metropolitan area of Kansas City (in both Kansas and  
Missouri). As of 08 August 2014, 14 cases have been identified since 03 June  
2014 (including nine cases in Kansas and four cases in Missouri). Molecular  
testing of six CSF specimens at the Centers for Disease Control and Prevention  
has confirmed HPeV3 in all six specimens; sequencing is in progress, but  
sequences appear to be matching or similar.</p><p  
class=MsoNormal></p><p class=MsoNormal>Kansas is requesting an  
Epi-Aid to assist both Kansas and Missouri investigate this potential cluster.  
The primary objectives of this Epi-Aid request are to determine the scope and  
extent of the current cluster of HPeV3 infections, identify potential common  
factors or risk factors among cases, and develop recommendations to potentially  
reduce the risk of additional cases. In addition, plans for potential  
prospective data collection will need to be determined.</p><p  
class=MsoNormal></p><p class=MsoNormal>Potential investigation  
methods will include retrospective medical record reviews of all cases  
identified to date and potentially of new cases identified prospectively (which  
will involve multiple hospitals and other health care providers), interviews of  
parent(s) of cases, and laboratory testing of older siblings.</p><p
