SUPPORTING STATEMENT

# SOCIOECONOMICS OF GUIDED WILDLIFE VIEWING OPERATIONS IN THE MONTEREY BAY NATIONAL MARINE SANCTUARY 

OMB CONTROL No. 0648-xxxx

## B. COLLECTIONS OF INFORMATION EMPLOYING STATISTICAL METHODS

#### Abstract

1. Describe (including a numerical estimate) the potential respondent universe and any sampling or other respondent selection method to be used. Data on the number of entities (e.g. establishments, State and local governmental units, households, or persons) in the universe and the corresponding sample are to be provided in tabular form. The tabulation must also include expected response rates for the collection as a whole. If the collection has been conducted before, provide the actual response rate achieved.

We estimate the population of commercial whale watching and marine wildlife observation operations in the relevant portions of the Monterey Bay Study Area to number 56 or fewer. This information was obtained through consultation with data procured from InfoUSA, ${ }^{1}$ a private company that makes demographic data on businesses commercially available in the United States. A thorough Internet search for relevant businesses in the study area was also performed to crosscheck the information obtained from InfoUSA. These businesses will serve as the starting point for identification of relevant businesses. We anticipate the possibility that some of the identified businesses will no longer be in operation and that new businesses may be now open. To ensure that the entire population of whale and wildlife viewing operations are included, researchers will also ask for referrals to other businesses from respondents and project partners in the region. However, researchers do not anticipate the total number of operations to exceed 56.

The business owner will determine who the best person to complete the survey or specific portions of the survey is. This person may be the business owner, manager and/or captain. Because the number of whale and marine wildlife watching operations is somewhat low in the Monterey Bay study region, we have opted to complete a census of these operations. During a previous application of this survey method in a study area for CINMS in 1999, researchers achieved a $100 \%$ response rate from recreation operators. In the most recent application of this survey methodology for the Flower Garden Banks National Marine Sanctuary in Texas, a 100\% response rate was also achieved. Thus, we also expect an $85 \%$ to $100 \%$ response rate in the Monterey Bay study.

[^0]| Whale and Marine <br> Wildlife <br> Operations | Sample Size <br> (Population Census) | Expected <br> Response Rate |
| :---: | :---: | :---: |
| 56 | 56 | $85 \%$ to $100 \%$ |

2. Describe the procedures for the collection, including: the statistical methodology for stratification and sample selection; the estimation procedure; the degree of accuracy needed for the purpose described in the justification; any unusual problems requiring specialized sampling procedures; and any use of periodic (less frequent than annual) data collection cycles to reduce burden.

## Statistical Analysis

Data analysis will be geared toward understanding the attributes of our target population, their cost and earnings, as well as the spatial distribution of where they take customers to view whales or other marine wildlife. Attribute profiles for the population will be summarized using basic univariate descriptive statistics. Cost and earnings for this population will be gathered and reported. Finally, the mapped data will be visualized by converting data into points or polygons.

## Degree of Accuracy Needed for the Purpose Described in the Justification

As we expect to obtain a census, the statistics will have no sampling error. Therefore, the issue of degree of accuracy is not applicable.

## Unusual Problems Requiring Specialized Sampling Procedures

We do not anticipate any unusual problems that require specialized sampling procedures.
3. Describe the methods used to maximize response rates and to deal with nonresponse. The accuracy and reliability of the information collected must be shown to be adequate for the intended uses. For collections based on sampling, a special justification must be provided if they will not yield "reliable" data that can be generalized to the universe studied.

We anticipate an $85-100 \%$ response rate of the target population, based on past applications of the same methods of information collections by other National Marine Sanctuaries. Further, in the past, researchers have had no item non-response, even for income questions. However, to ensure the anticipated level of participation, researchers plan to issue letters to each respondent operator explaining the purpose of the project, the type of information needed, and why the information is needed. These letters will be followed by telephone contact from a member of the data collection team. The team members will call the respondent to answer any questions the respondent might have, as well as to schedule the interview and provide guidance on the type of documents needed during the collection. We anticipate that this population, meaning whale and marine wildlife watching operations, will be highly motivated and eager to participate in this study. The socio-economic
information expected to be gathered from this study has never been collected before in the Monterey Bay region. Having this information will certainly help inform MBNMS about how non-consumptive recreation businesses in the Sanctuary could be affected by any future regulations, and thus, we expect that these business operators will view their participation in the survey as a way to have their needs understood. For the reasons described above, we do not expect non-response bias to be a significant issue for this collection.

## 4. Describe any tests of procedures or methods to be undertaken. Tests are encouraged as

 effective means to refine collections, but if ten or more test respondents are involved OMB must give prior approval.Many of the survey questions, those related to the economic data, in particular, and the research methods proposed for this collection have been repeatedly deployed in past information collections by NOAA. This and similar cost and earnings studies are largely standard and, therefore, well tested. The only modifications made to the survey instrument for this collection have been to tailor the application to the MBNMS. These modifications, however, have been minor.
5. Provide the name and telephone number of individuals consulted on the statistical aspects of the design, and the name of the agency unit, contractor(s), grantee(s), or other person(s) who will actually collect and/or analyze the information for the agency.

## NOAA Project Leads

Dr. Bob Leeworthy was the primary advisor on the statistical aspects of the study design. Dr. Leeworthy is Chief Economist with the Office of National Marine Sanctuaries. He is an expert in this area of research and application. Generally, the NOAA Project Leads will provide guidance, mentorship and oversight to the Bren Student(s), who will be responsible for data collection and analysis.

## Project Lead

Dr. Vernon R. (Bob) Leeworthy
Chief Economist
NOAA/NOS/Office of National Marine Sanctuaries
1305 East West Highway, SSMC4
Silver Spring, MD 20910
Telephone: (301) 713-7261
Fax: (301) 713-0404
E-mail: Bob.Leeworthy@noaa.gov

## Project Co-Lead

Dr. Danielle Schwarzmann
Economist
NOAA/NOS/Office of National Marine Sanctuaries
1305 East West Hwy., SSMC4, 11th floor
Silver Spring, MD 20910
Telephone: 301-713-7254
Fax: 301-713-0404
E-mail: Danielle.Schwarzmann@noaa.gov

## Project Co-Lead

Ms. Karen Grimmer
Resource Protection Coordinator
Monterey Bay National Marine Sanctuary
99 Pacific Street, Bldg 455a
Monterey, CA 93940
Telephone: (831) 647-4253
Fax: (831) 647-4250
Email: Karen.grimmer@noaa.gov

Possible Co-Lead
Nadine Heck, PhD
Institute of Marine Sciences
University of California Santa Cruz
Phone: 607-379-5982
Email: nheck@ucsc.edu
