parechovirus (HPeV3) infections among young infants has been identified,
primarily in and around the metropolitan area of Kansas City (in both Kansas and
Missouri). As of 08 August 2014, 14 cases have been identified since 03 June
2014 (including nine cases in Kansas and four cases in Missouri). Molecular
testing of six CSF specimens at the Centers for Disease Control and Prevention
has confirmed HPeV3 in all six specimens; sequencing is in progress, but
sequences appear to be matching or similar.<o:p></o:p></p><p

Epi-Aid to assist both Kansas and Missouri investigate this potential cluster.
The primary objectives of this Epi-Aid request are to determine the scope and
extent of the current cluster of HPeV3 infections, identify potential common
factors or risk factors among cases, and develop recommendations to potentially
reduce the risk of additional cases. In addition, plans for potential
prospective data collection will need to be determined.<o:p></o:p></p><p

methods will include retrospective medical record reviews of all cases
identified to date and potentially of new cases identified prospectively (which
will involve multiple hospitals and other health care providers), interviews of
parent(s) of cases, and laboratory testing of older siblings.<o:p></o:p></p><p
