## **Crop Production**

Released June 10, 2016, by the National Agricultural Statistics Service (NASS), Agricultural Statistics Board, United States Department of Agriculture (USDA).

## Winter Wheat Production Up 6 Percent from May Orange Production Up Slightly from May

**Winter wheat** production is forecast at 1.51 billion bushels, up 6 percent from the May 1 forecast and up 10 percent from 2015. Based on June 1 conditions, the United States yield is forecast at 50.5 bushels per acre, up 2.7 bushel from last month and up 8 bushels from last year. If realized, this will be the highest yield on record for the United States.

Hard Red Winter production, at 938 million bushels, is up 9 percent from last month. Soft Red Winter, at 355 million bushels, is down less than 1 percent from the May forecast. White Winter, at 214 million bushels, is up 3 percent from last month. Of the White Winter production, 19.0 million bushels are Hard White and 195 million bushels are Soft White.

**The United States all orange** forecast for the 2015-2016 season is 5.83 million tons, up slightly from the previous forecast but down 8 percent from the 2014-2015 final utilization. The Florida all orange forecast, at 81.4 million boxes (3.66 million tons), is up slightly from last month's forecast but down 16 percent from last season's final utilization. Early, midseason, and Navel varieties in Florida are forecast at 36.1 million boxes (1.63 million tons), unchanged from last month but down 24 percent from last season's final utilization. The Florida Valencia orange forecast, at 45.3 million boxes (2.04 million tons), is up 1 percent from last month but down 9 percent from last season's final utilization.

**Florida frozen concentrated orange juice (FCOJ)** yield forecast for the 2015-2016 season is final at 1.41 gallons per box at 42.0 degrees Brix, unchanged from the previous month's forecast but down 6 percent from last season's final yield of 1.50 gallons per box. The early and midseason portion is final at 1.35 gallons per box, down 5 percent from last season's final yield of 1.42 gallons per box. The Valencia portion is final at 1.47 gallons per box, down 1 percent from the previous forecast and down 7 percent from last year's final yield of 1.58 gallons per box. All projections of yield assume the processing relationships this season will be similar to those of the past several seasons.

This report was approved on June 10, 2016.

## Winter Wheat for Grain Objective Yield Data

The National Agricultural Statistics Service is conducting objective yield surveys in 10 winter wheat-producing States during 2016. Randomly selected plots in winter wheat for grain fields are visited monthly from May through harvest to obtain specific counts and measurements. Data in this table are based on counts from this survey.

### Winter Wheat Objective Yield Percent of Samples Processed in the Lab - United States: 2012-2016

[Blank data cells indicate estimation period has not yet begun]

| Year | June                | July                | August              |

<sup>1</sup> Includes winter wheat in the hard dough stage or beyond and are considered mature or almost mature.

### **May Weather Summary**

A high-latitude atmospheric blocking pattern led to cool, showery weather in many parts of the United States, with consistent warmth mainly confined to the Nation's northern tier. Some of the most persistent rain fell across the Plains, slowing fieldwork but maintaining mostly adequate to locally excessive soil moisture for rangeland, pastures, winter wheat, and spring-sown crops. By May 29, nearly two-thirds of the Nation's pastures (66 percent) and winter wheat (63 percent) were rated in good to excellent condition, the highest for both at this time of year since 2010.

In contrast, drier conditions developed across the Great Lakes Region, leading to more fieldwork opportunities. Following earlier corn and soybean planting delays in the eastern Corn Belt due to cool, damp field conditions, fieldwork accelerated in late May. During the week ending May 29, producers in Ohio planted 41 percent of their intended soybean acreage, jumping from 22 to 63 percent, and 33 percent of their corn. Delays persisted, however, in the southwestern Corn Belt.

Meanwhile, warmth in the Northwest contrasted with cool conditions in the Southwest. Northwestern warmth promoted a rapid crop development pace, while occasional showers maintained favorable growing conditions for winter wheat and spring-sown crops. Higher elevations of the West, primarily from the Great Basin to the central Rockies, received some late-season snow.

Elsewhere, developing drought across the interior Southeast contrasted with wet weather and fieldwork delays in the western Gulf Coast region and the middle and southern Atlantic States. Torrential rainfall induced some late-month flooding along and near the Texas coast.

## **May Agricultural Summary**

Temperatures were above normal along the northern United States, facilitating fieldwork in the Pacific Northwest and the Upper Midwest. Conversely, below average temperatures were prevalent from the central Rocky Mountains to the mid-Atlantic. Some areas of the Southwest, lower Great Plains, and middle Mississippi Valley recorded average temperatures more than 2°F below normal. With the exception of portions of the Southwest, Texas, and most of the Atlantic Coast States where rainfall totaled 200 percent or more above average, precipitation was near normal throughout much of the country. Some areas in Texas, Louisiana, and Virginia recorded rainfall over 6 inches above normal for the month of May. Southeast Texas received heavy rainfall later in the month, with some locations recording in excess of 9 inches of precipitation, causing record flooding.

As May began, corn planting progress was well ahead of historical averages in the central Corn Belt but progress continued to lag behind normal in the western Corn Belt. By May 1, producers had planted 45 percent of this year's corn crop, equal to last year but 15 percentage points ahead of the 5-year average. By May 1, thirteen percent of the Nation's corn crop was emerged, 6 percentage points ahead of last year and 5 percentage points ahead of the 5-year average. By May 15, seventy-five percent of this year's corn crop was planted, 7 percentage points behind last year but 5 percentage points ahead of the 5-year average. Forty-three percent of the Nation's corn crop had emerged by May 15, five percentage points ahead of the 5-year average. Forty-three percent of the Nation's corn crop had emerged by May 15, five percentage points behind last year but 9 percentage points ahead the 5-year average. By mid-month, Minnesota respondents reported that 53 percent complete by May 29, equal to last year but 2 percentage points ahead of the 5-year average. Seventy-eight percent of this year's corn crop had emerged by May 29, three percentage points behind last year but 3 percentage points ahead of the 5-year average. By the end of May, at least 90 percent of the corn had emerged in Iowa, Minnesota, Missouri, North Carolina, and Tennessee. Overall, 72 percent of the corn crop was reported in good to excellent condition on May 29, two percentage points below the same time last year.

Planting of sorghum advanced to 23 percent complete by May 1, five percentage points behind last year and 3 percentage points behind the 5-year average. Planting progress was behind normal for most estimating States, with only Missouri and Oklahoma ahead of the 5-year average. By May 22, thirty-seven percent of the sorghum crop was planted, 3 percentage points behind last year and 6 percentage points behind the 5-year average. Progress in the leading sorghum-producing State of Kansas remained behind historical levels, with 6 percent planted by May 22, ten percentage points behind the 5-year average. Producers had planted 44 percent of this year's sorghum crop by May 29, two percentage points ahead of

last year but 7 percentage points behind the 5-year average. Advances of 25 percentage points or more was observed in Nebraska, New Mexico, and South Dakota during the last full week of the month.

Oat seeding advanced to 78 percent complete by May 1, three percentage points behind last year but 13 percentage points ahead of the 5-year average. Fifty-six percent of the crop had emerged by May 1, three percentage points ahead of last year and 9 percentage points ahead of the 5-year average. Producers had planted 94 percent of this year's oat crop by May 15, slightly behind last year but 11 percentage points ahead of the 5-year average. The planting of oats was nearly complete Nationwide, with all estimating States, except North Dakota and Ohio, having at least 90 percent of the intended acreage planted by the second week of the month. Eighty-one percent of the oat crop was emerged by May 15, slightly ahead of last year and 15 percentage points ahead of the 5-year average. Ninety-five percent of the oat crop was emerged by May 29, slightly ahead of last year and 9 percentage points ahead of the 5-year average. By the end of the month, 30 percent of the oat crop was at or beyond the heading stage, slightly ahead of last year average points behind the 5-year average. In Texas, the oat harvest was 17 percent complete, 22 percentage points behind the 5-year average, due to wet conditions. Overall, 73 percent of the oat crop was reported in good to excellent condition on May 29, up slightly from the total rated in these two categories on May 8 and 5 percentage points better than at the same time last year.

Nationwide, barley producers had seeded 57 percent of the Nation's crop by May 1, thirteen percentage points behind last year but 10 percentage points ahead of the 5-year average. By May 1, emergence was evident in 29 percent of the Nation's barley acreage, 4 percentage points behind last year but 11 percentage points ahead of the 5-year average. By May 15, ninety percent of the barley crop was seeded, 3 percentage points behind last year but 19 percentage points ahead of the 5-year average. By May 15, sixty-eight percent of the barley had emerged, equal to last year but 26 percentage points, or more than two weeks, ahead of the 5-year average. Emergence was over 15 percentage points ahead of the 5-year average in all estimating States except Washington. Nationwide, 97 percent of the barley crop was sown by May 29, three percentage points behind last year but 9 percentage points ahead of the 5-year average. Eighty-eight percent of the barley crop had emerged by May 29, four percentage points behind last year but 19 percentage points ahead of the 5-year average. Overall, 77 percent of the barley crop was reported in good to excellent condition on May 29, two percentage points better than the May 15 ratings and 3 percentage points better than at the same time last year.

By May 1, heading of the winter wheat crop had advanced to 42 percent complete, 3 percentage points ahead of last year and 8 percentage points ahead of the 5-year average. Heading advanced to 57 percent complete by May 8, five percentage points ahead of last year and 13 percentage points ahead of the 5-year average. Seventy-three percent of the wheat crop was headed in Kansas by May 8, twenty-seven percentage points ahead of the 5-year average. By May 22, seventy-five percent of this year's winter wheat crop was at or beyond the heading stage, slightly ahead of last year and 9 percentage points ahead of the 5-year average. In Texas, damage of wheat due to hail was reported in areas of the Northern Low Plains and Edwards Plateau. Nationally, heading of this year's winter wheat crop advanced to 84 percent complete by May 29, two percentage points ahead of last year and 8 percentage points ahead of the 5-year average. In Washington, 76 percent was headed by the end of the month, 36 percentage points ahead of the 5-year average. Wet conditions have delayed the harvest of winter wheat in Texas, with 11 percent harvested by May 29, six percentage points behind the 5-year average. Overall, 63 percent of the winter wheat crop was reported in good to excellent condition on May 29, up 2 percentage points from the beginning of the month and 19 percentage points better than at the same time last year.

Fifty-four percent of the spring wheat crop was seeded by May 1, fifteen percentage points behind last year but 15 percentage points ahead of the 5-year average. By May 1, twenty-two percent of the spring wheat crop was emerged, 2 percentage points behind last year but 8 percentage points ahead of the 5-year average. At the beginning of the month, emergence was ahead of the 5-year average in all 6 estimating States. Nationally, 89 percent of the spring wheat crop was seeded by May 15, three percentage points behind last year but 25 percentage points ahead of the 5-year average. By May 15, sixty percent of the spring wheat crop had emerged, 3 percentage points behind last year but 24 percentage points ahead of the 5-year average. Ninety-five percent of the Nation's spring wheat crop was seeded by May 22, equal to last year but 18 percentage points ahead of the 5-year average. The Nation's spring wheat was 88 percent emerged by the end of the month, equal to last year but 22 percentage points ahead of the 5-year average. Emergence was well ahead of normal in Minnesota and North Dakota, where progress was 28 and 32 percentage points ahead of the 5-year average,

respectively. Overall, 79 percent of the spring wheat crop was reported in good to excellent condition by month's end, 8 percentage points better than at the same time last year.

By May 1, seventy-two percent of the rice crop was seeded, 17 percentage points ahead of last year and 16 percentage points ahead of the 5-year average. Nationally, emergence advanced to 55 percent complete at the beginning of the month, 21 percentage points ahead of last year and 16 percentage points ahead of the 5-year average. Nationally, 87 percent of the rice crop was seeded by May 15, equal to last year but 8 percentage points ahead of the 5-year average. By May 15, seventy-six percent of the Nation's crop had emerged, 11 percentage points ahead of last year and 14 percentage points ahead of the 5-year average. Planting of the 2016 rice crop was 98 percent complete by May 29, three percentage points ahead of last year and 2 percentage points ahead of the 5-year average pace. Eighty-seven percent of the rice crop was emerged by May 29, slightly behind last year but 2 percentage points ahead of the 5-year average. Overall, 66 percent of the rice crop was reported in good to excellent condition on May 29, nine percentage points better than the May 8 estimate but 2 percentage points lower than at the same time last year.

Planting of the 2016 soybean crop advanced to 8 percent complete by May 1, two percentage points behind last year but 2 percentage points ahead of the 5-year average. By May 8, twenty-three percent of the soybeans were planted, 3 percentage points behind last year but 7 percentage points ahead of the 5-year average. With the planting of corn nearly complete, many Minnesota producers moved on to the planting of soybeans during the first week of the month, planting 40 percent of the intended soybean crop during that week. By May 22, producers had planted 56 percent of this year's soybean crop, equal to last year but 4 percentage points ahead of the 5-year average. By May 22, twenty-two percent of the soybean crop was emerged, 5 percentage points behind last year but slightly ahead of the 5-year average. Due to poor field conditions early in the planting season, emergence in Indiana, Michigan, and Ohio continued to lag their respective 5-year averages during the third week of the month. By May 29, seventy-three percent of the Nation's soybean crop was planted, 5 percentage points ahead of last year and 7 percentage points ahead of the 5-year average. By the end of the month, wet conditions slowed the planting pace in the central Great Plains, with planting progress 27 percentage points behind the 5-year average in Kansas and 9 percentage points behind in Nebraska. Nationally, 45 percent of the soybean crop was emerged by May 29, slightly ahead of last year and 5 percentage points ahead of the 5-year average.

Nationally, peanut producers had planted 12 percent of this year's crop by May 1, three percentage points ahead of last year and 2 percentage points ahead of the 5-year average. By May 15, peanut producers had planted 46 percent of this year's crop, 5 percentage points ahead of last year and 6 percentage points ahead of the 5-year average. By May 29, producers had planted 80 percent of this year's peanut crop, slightly ahead of both last year and the 5-year average. Planting progress of 20 percentage points or more was observed in North Carolina, South Carolina, Texas, and Virginia during the last week of the month.

By May 15, eleven percent of this year's sunflower crop was planted, 2 percentage points ahead of last year and 7 percentage points ahead of the 5-year average. North Dakota producers had planted 21 percent of their crop by May 15, fourteen percentage points ahead of the 5-year average. By May 29, sunflower producers had planted 45 percent of this year's crop, 18 percentage points ahead of last year and 21 percentage points ahead of the 5-year average. North Dakota sunflowers were 67 percent planted by May 29, an increase of 21 percentage points during the final week of the month.

Nationally, cotton producers had planted 16 percent of the cotton crop by May 1, slightly ahead of last year but 2 percentage points behind the 5-year average. Nationally, 40 percent of the cotton crop was planted by May 15, eight percentage points ahead of last year and slightly ahead of the 5-year average. Dry conditions in the Southeast facilitated rapid planting, which advanced more than 20 percentage points in Arkansas, Mississippi, Tennessee, and the Carolinas. By May 29, fifty-nine percent of the cotton crop was planted, 2 percentage points ahead of last year but 10 percentage points behind the 5-year average. Wet conditions in the southern Great Plains hindered planting progress. By month's end, Kansas cotton planting was 35 percentage points, or nearly 3 weeks, behind the 5-year average pace. Texas planting progress was 15 percentage points behind the 5-year average. Nationally, 5 percent of the cotton crop was squaring by month's end, 3 percentage points ahead of last year but equal to the 5-year average.

By May 1, sugarbeet producers had planted 80 percent of the Nation's crop, 11 percentage points behind last year but 32 percentage points ahead of the 5-year average. At the beginning of the May, planting in Minnesota was more than

3 weeks ahead of the 5-year average pace. Producers had planted 97 percent of this year's sugarbeet crop by May 15, three percentage points behind last year but 23 percentage points ahead of the 5-year average. Producers had planted 95 percent or more of the sugarbeet crop in Michigan, Minnesota, and North Dakota.

## **Crop Comments**

**Winter wheat:** Production is forecast at 1.51 billion bushels, up 6 percent from the May 1 forecast and up 10 percent from 2015. Based on June 1 conditions, the United States yield is forecast at a record 50.5 bushels per acre, up 2.7 bushel from last month and up 8 bushels from last year. As of May 29, sixty-three percent of the winter wheat crop in the 18 major producing States was rated in good to excellent condition, 19 percentage points better than at the same time last year. Nationally, 84 percent of the winter wheat crop was headed by May 29, eight percentage points ahead of the 5-year average pace.

Forecasted head counts from the objective yield survey in the six Hard Red Winter States (Colorado, Kansas, Montana, Nebraska, Oklahoma, and Texas) are above last year's level in Kansas, Montana, Nebraska, and Oklahoma but below in Colorado and Texas. Wet weather across much of the Nation in May has delayed harvest in the Southern Great Plains and Southeast.

Forecasted head counts from the objective yield survey in the three Soft Red Winter States (Illinois, Missouri, and Ohio) are above last year's levels in Missouri and Ohio but below in Illinois.

Forecasted head counts from the objective yield survey in Washington are above last year. Eighty-one percent of the Washington crop was rated in mostly fair to good condition as of May 29.

**Durum wheat:** Production of Durum wheat in Arizona and California is forecast at a collective 15.2 million bushels, down 25 percent from last year. In Arizona, 14 percent of the acreage was harvested by May 29, two percentage points ahead of last year and 5 percentage points ahead of the 5-year average.

**Prunes (dried plums):** California's 2016 prune production forecast is 45,000 dried tons, down 55 percent from last year. Growers reported storms with cold, wet, and windy weather during the bloom and adverse conditions for bees during the height of the pollination period. If the forecast is realized, this year's crop will be the smallest production on record since estimates began in 1920.

**Florida citrus:** In the citrus growing region reported, daily high temperatures were about average for this time of the year. All reporting stations had highs varying from the upper 80's on most days to over 90 degrees a few days. Morning lows were mostly in the 60s and 70s. Rainfall was well above average in most of the citrus growing region. Five of seventeen monitored rain stations had totals of over ten inches of rainfall. The most precipitation fell in the Western Region. Joshua (Desoto County) had the highest amount at 11.74 inches, followed by Vero Beach (Indian River County) at 11.31 inches. According to the May 31, 2016 U.S. Drought Monitor, all citrus growing counties were drought free.

Weekly Valencia orange harvest is relatively over for the season. Growers are now turning their attention to next season's crop. Most healthy trees are holding fruit golf ball size or larger. Many citrus growers are replacing trees or entire groves severely impacted by greening. As caretakers are taking out old non-productive trees, they are leaving younger healthy trees in hope of a productive crop for next season. Other grove activities included topping and hedging after harvest, irrigation, fertilizing, spraying, mowing, and brush removal.

**California citrus:** Navel and Valencia oranges continued to be harvested. Navel oranges were being packed for the domestic market, with late varieties exported to Asia and Central America. The Valencia orange harvest accelerated. The Navel crop continued to mature with the warmer weather with some quality issues reported. Most Navel oranges were packed for the domestic market with late varieties being exported. Cara Cara oranges, grapefruit, and lemons continued to be harvested, packed, and shipped to foreign and domestic markets. Seedless tangerines remained netted to prevent cross pollination. Citrus groves continued to be irrigated. By month's end, Cara Cara orange harvest was almost over, with shipments primarily being domestic due to quality concerns.

**California noncitrus fruits and nuts:** In Napa County, sulfur applications on grapes and the suckering of grape vines continued. In Fresno County, rain and cloudy weather prolonged the bloom period for grapes. Growers continued to monitor the grape crop for powdery mildew and proactively applied fungicide programs as needed. Grape bloom was completed by mid-month. Cherries and apricots were being harvested and peach orchards were being thinned. Pesticide sprays on almond and pistachio orchards continued. Canopy management including shoot separation, shoot thinning, and leaf removal was completed, in order to improve the canopy microclimate. Walnut orchard irrigation continued. Sprays were administered to eliminate the weeds. Other controls such as mowing were also being utilized to manage weeds. In Madera County, applications of fungicide and micronutrients were applied to grapes. Vines were at full bloom or setting berries. Pesticide sprays were applied to tree fruit orchards. Fungicide and miticide applications on almond orchards were completed. In Stanislaus County, stone fruit continued to be thinned and orchards were irrigated. Early varieties of apricots, peaches, nectarines, and plums were harvested. Reflective plastic was placed in some orchards to help promote color. Summer pruning was started in some stone fruit orchards. The cherry harvest was going strong early in the month with small amounts being exported. Leaves were pulled from grape vines to improve air flow and sun light. Almond trees were showing rapid growth. In Tulare County, apricots, early peaches, and nectarines were harvested. Later varieties of stone fruit continued to be thinned and irrigated. Olive bloom was completed by mid-month. Pistachios and stored almonds continued to be packed and shipped to domestic and foreign markets. Almond trees showed rapid nut development. Cherry harvest slowed down significantly throughout several counties. In Merced County, husk fly traps were placed in almond orchards. In Sutter and Yuba Counties, almonds were developing quickly. Pistachio orchards received nutrient sprays.

**Grapefruit:** The United States 2015-2016 grapefruit crop is forecast at 825,000 tons, unchanged from last month's forecast but down 7 percent from last season's final utilization. In Florida, expected production, at 10.9 million boxes, is unchanged from last month but down 16 percent from last year. California and Texas grapefruit production forecasts were carried forward from the previous forecast.

**Tangerines and mandarins:** The United States tangerine and mandarin crop is forecast at 948,000 tons, up slightly from last month and up 11 percent from last season's final utilization. If realized, this will be the largest production since records began in 1964-1965. The Florida forecast is up 1 percent from the previous month but down 37 percent from last year's utilized production. The California tangerine and mandarin production forecast was carried forward from the previous forecast. Estimates for Arizona have been discontinued.

**Tangelos:** Florida's tangelo forecast is 390,000 boxes (18,000 tons), unchanged from last month but down 41 percent from last season's final utilization. The production is the lowest since the 1958-1959 season.

**Hops:** Area strung for harvest in 2016 for Washington, Oregon, and Idaho is forecast at 51,115 acres, 17 percent more than the 2015 crop of 43,633 acres. Washington, with 37,475 acres for harvest, accounts for 73 percent of the United States total acreage. Oregon hop growers plan to string 7,669 acres, or 15 percent of the United States total for 2016, with Idaho hop growers accounting for the remaining 12 percent, or 5,971 acres strung for harvest. Acreage increased in all three States from 2015 and, if realized, will be record high in Idaho, Washington and the United States.

The 2016 crop in the Pacific Northwest was reported as good. Erratic weather has resulted in higher disease pressure from downy and powdery mildew. Warm spring weather resulted in early runoff of Cascade Mountain snowpack. Growers expected to manage any potential water shortages with efficient drip irrigation systems.

**Sugarbeets:** Production of sugarbeets for the 2015 crop year is revised to 35.4 million tons, up slightly from the January end of season estimate and 13 percent above 2014. Planted area totaled 1.16 million acres, unchanged from the previous estimate. Harvested area totaled 1.15 million acres, up slightly from the previous estimate. The United States yield, at 30.9 tons per acre, is up slightly from the previous estimate and up 3.6 tons per acre from 2014.

**Sugarcane:** Production of sugarcane for sugar and seed in 2015 is revised to 32.3 million tons, down 3 percent from the March estimate but up 6 percent from 2014. Area harvested for sugar and seed totaled 887,300 acres for the 2015 crop year, down 4,400 acres from March but up 18,800 acres from the previous year. Yield for sugar and seed is estimated at 36.4 tons per acre, down 0.9 ton from the previous estimate but up 1.4 tons from 2014.

**Sweet potatoes:** Production of sweet potatoes in 2015 totaled 31.0 million cwt, unchanged from the *Crop Production 2015 Summary* released in January 2016 but up 5 percent from the previous year. Growers harvested 153,100 acres, up 13 percent from 2014. Yield per acre, at 203 cwt, is unchanged from January but down 16 cwt from the previous year.

**Maple syrup:** The 2016 United States maple syrup production totaled 4.21 million gallons, up 23 percent from the previous year. The number of taps is estimated at 12.6 million, up 5 percent from the 2015 total. Yield per tap is estimated to be 0.335 gallon, up 17 percent from the previous season's yield. Pennsylvania reported a record high number of taps in 2016, while Massachusetts and Vermont reported record high production.

Producers were encouraged to tap earlier this season by the warmer than normal temperatures. The earliest sap flow reported was January 1 in Pennsylvania, Vermont and West Virginia. The latest sap flow reported to open the season was February 15 in Minnesota. On average, the season lasted 33 days, compared with 26 days in 2015.

The 2015 United States average price per gallon was \$36.70, up \$0.30 from 2014. Value of production, at \$126 million for 2015, was up 8 percent from the previous season. Beginning in 2016, Indiana, Minnesota, and West Virginia were added to the maple syrup estimating program.

## **Statistical Methodology**

**Wheat survey procedures:** Objective yield and farm operator surveys were conducted between May 25 and June 7 to gather information on expected yield as of June 1. The objective yield survey was conducted in 10 States that accounted for 68 percent of the 2015 winter wheat production. Farm operators were interviewed to update previously reported acreage data and seek permission to randomly locate two sample plots in selected winter wheat fields. The counts made within each sample plot depended upon the crop's maturity. Counts such as number of stalks, heads in late boot, and number of emerged heads were made to predict the number of heads that will be harvested. The counts are used with similar data from previous years to develop a projected biological yield. The average harvesting loss is subtracted to obtain a net yield. The plots are revisited each month until crop maturity when the heads are clipped, threshed, and weighed. After the farm operator has harvested the sample field, another plot is sampled to obtain current year harvesting loss.

The farm operator survey was conducted primarily by telephone with some use of mail, internet, and personal interview. Approximately 4,500 producers were interviewed during the survey period and asked questions about the probable yield on their operation. These growers will continue to be surveyed throughout the growing season to provide indications of average yields.

**Orange survey procedures:** The orange objective yield survey for the June 1 forecast was conducted in Florida, which accounts for about 63 percent of the United States production. Bearing tree numbers are determined at the start of the season based on a tree inventory survey conducted every year combined with special surveys. From mid-July to mid-September, the number of fruit per tree is determined. In August and subsequent months, fruit size measurement and fruit droppage surveys are conducted, which combined with the previous components and are used to develop the current forecast of production. California and Texas conduct grower and packer surveys on a quarterly basis in October, January, April, and July. California also conducts objective measurement surveys in September for Navel oranges and in March for Valencia oranges.

**Wheat estimating procedures:** National and State level objective yield and grower reported data were reviewed for reasonableness and consistency with historical estimates. The survey data were also reviewed considering weather patterns and crop progress compared to previous months and previous years. Each Regional Field Office submits their analysis of the current situation to the Agricultural Statistics Board (ASB). The ASB uses the survey data and the State analyses to prepare the published June 1 forecasts.

**Orange estimating procedures:** State level objective yield estimates for Florida oranges were reviewed for errors, reasonableness, and consistency with historical estimates. The Florida Field Office submits its analysis of the current situation to the Agricultural Statistics Board (ASB). The ASB uses the Florida survey data and their analysis to prepare the published June 1 forecast. The June 1 orange production forecasts for California and Texas are carried forward from April.

**Revision policy:** The June 1 production forecast will not be revised; instead, a new forecast will be made each month throughout the growing season. End-of-season wheat estimates are made after harvest. At the end of the wheat marketing season, a balance sheet is calculated using carryover stocks, production, exports, millings, feeding, and ending stocks. Revisions are then made if the balance sheet relationships or other administrative data warrant changes. End-of-season orange estimates will be published in the *Citrus Fruits Summary* released in September. The orange production estimates are based on all data available at the end of the marketing season, including information from marketing orders, shipments, and processor records. Allowances are made for recorded local utilization and home use.

**Reliability:** To assist users in evaluating the reliability of the June 1 production forecast, the "Root Mean Square Error," a statistical measure based on past performance, is computed. The deviation between the June 1 production forecast and the final estimate is expressed as a percentage of the final estimate. The average of the squared percentage deviations for the latest 20-year period is computed. The square root of the average becomes statistically the "Root Mean Square Error." Probability statements can be made concerning expected differences in the current forecast relative to the final end-of-season estimate, assuming that factors affecting this year's forecast are not different from those influencing recent years.

The "Root Mean Square Error" for the June 1 winter wheat production forecast is 5.7 percent. This means that chances are 2 out of 3 that the current winter wheat production will not be above or below the final estimate by more than 5.7 percent. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 9.8 percent. Differences between the June 1 winter wheat production forecast and the final estimate during the past 20 years have averaged 73 million bushels, ranging from 4 million to 242 million bushels. The June 1 forecast has been below the final estimate 11 times and above 9 times. This does not imply that the June 1 winter wheat forecast this year is likely to understate or overstate final production.

The "Root Mean Square Error" for the June 1 orange production forecast is 1.6 percent. However, if you exclude the three abnormal production seasons (one freeze season and two hurricane seasons), the "Root Mean Square Error" is 1.7 percent. This means that chances are 2 out of 3 that the current orange production forecast will not be above or below the final estimates by more than 1.6 percent, or 1.7 percent when excluding abnormal seasons. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 2.8 percent, or 3.0 percent when excluding abnormal seasons.

Changes between the June 1 orange forecast and the final estimates during the past 20 years have averaged 127,000 tons (142,000 tons, excluding abnormal seasons), ranging from 5,000 tons to 368,000 tons (23,000 tons to 368,000 tons excluding abnormal seasons). The June 1 forecast for oranges has been below the final estimate 8 times and above 12 times (below 5 times and above 12 times, excluding abnormal seasons). The difference does not imply that the June 1 forecast this year is likely to understate or overstate final production.

## **USDA**, National Agricultural Statistics Service Information Contacts

Listed below are the commodity statisticians in the Crops Branch of the National Agricultural Statistics Service to contact for additional information. E-mail inquiries may be sent to nass@nass.usda.gov

| Lance Honig, Chief, Crops Branch  | (202) 720-2127 |
|---|----------------|
|   |                |
| Anthony Prillaman, Head, Field Crops Section                            | (202) 720-2127 |
| Angie Considine – Cotton, Cotton Ginnings, Sorghum                      | (202) 720-5944 |
| Tony Dahlman – Oats, Soybeans   | (202) 690-3234 |
| Chris Hawthorn - Corn, Flaxseed, Proso Millet                           | (202) 720-9526 |
| James Johanson – County Estimates, Hay                                  | (202) 690-8533 |

## Access to NASS Reports

For your convenience, you may access NASS reports and products the following ways:

- > All reports are available electronically, at no cost, on the NASS web site: <u>www.nass.usda.gov</u>
- Both national and state specific reports are available via a free e-mail subscription. To set-up this free subscription, visit <u>www.nass.usda.gov</u> and click on "National" or "State" in upper right corner above "search" box to create an account and select the reports you would like to receive.

For more information on NASS surveys and reports, call the NASS Agricultural Statistics Hotline at (800) 727-9540, 7:30 a.m. to 4:00 p.m. ET, or e-mail: nass@nass.usda.gov.

The U.S. Department of Agriculture (USDA) prohibits discrimination against its customers, employees, and applicants for employment on the basis of race, color, national origin, age, disability, sex, gender identity, religion, reprisal, and where applicable, political beliefs, marital status, familial or parental status, sexual orientation, or all or part of an individual's income is derived from any public assistance program, or protected genetic information in employment or in any program or activity conducted or funded by the Department. (Not all prohibited bases will apply to all programs and/or employment activities.)

If you wish to file a Civil Rights program complaint of discrimination, complete the <u>USDA Program Discrimination</u> <u>Complaint Form</u> (PDF), found online at <u>http://www.ascr.usda.gov/complaint\_filing\_cust.html</u>, or at any USDA office, or call (866) 632-9992 to request the form. You may also write a letter containing all of the information requested in the form. Send your completed complaint form or letter to us by mail at U.S. Department of Agriculture, Director, Office of Adjudication, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, by fax (202) 690-7442 or email at program.intake@usda.gov.
