

The Army Corps of Engineers (ACoE) is requesting an increase of 5,000 responses annually, or a total of 10,000 responses for the next two years, to establish a new burden cap. The burden requested in the original submission underestimated the number of responses and hours necessary to complete the purpose of the various hurricane evacuation behavior surveys over the lifetime of the 3-year generic ICR approval. The increased burden will accommodate future ICs on hurricane evacuation patterns in affected parts of the United States.
