In 2009, the FDA informed the public that: "Men who have had sex with men since 1977 have an HIV prevalence . . . 60 times higher than the general population, 800 times higher than first time blood donors and 8000 times higher than repeat blood donors."

So why in the world would you want to run such a high likelihood of contaminating the blood supply with HIV? Why do that to the innocent children and others who have not engaged in risky behavior - only to be infected by blood from those who have?

Please let common sense win the day over political correctness.
