Submitter Info

Comment: i believe this is a scam. it doesnt matter what went on in 1960 or in any year up to 2015 or 2016. because that is when the issue arrived. we do know climate change is a major f3dctor in causing insect growth sot hat all kinds of insects will be coming here that formerly could not live in usa because the climate did not permit. we need to figure out how to fight this huge problem, 1960 records wont provide any help with that issue at all. its just more meandering wasteful unnecessary cdc trying to look like they are busy doing "something". this colelction is entirely unnecessary. 1960 was not the problem. the rome study in 1950 where they told the world that cllimate change would make changes in our environment is the issue. they predicted this 56 years ago or so. its comign true. you cant have climate warming and extremes without insects being able to proliferate. they are the most poplous living things on earth. we need new thinking here. not new spending. closing down the budget for this compleetely insane waste of american tax dollars. *
