

## Supporting Statement B

### Collection of Information Employing Statistical Methods

**1. Describe (including a numerical estimate) the potential respondent universe and any sampling or other respondent selection methods to be used. Data on the number of entities (e.g., establishments, State and local government units, households, or persons) in the universe covered by the collection and in the corresponding sample are to be provided in tabular form for the universe as a whole and for each of the strata in the proposed sample. Indicate expected response rates for the collection as a whole. If the collection had been conducted previously, include the actual response rate achieved during the last collection.**

**a. Respondent Universe.** The respondent universe for paid and denied claims comprises fifty-two State Workforce Agencies (SWAs), employers, and third parties. Within each SWA, the universe for paid claims is defined as all intrastate and interstate weeks paid (or offset) in the State Unemployment Insurance (UI), Unemployment Compensation for Federal Employees (UCFE), and Unemployment Compensation for Ex-servicemembers (UCX) programs. For denied claims, each SWA defines three universes of formal, documented denial decisions or determinations of ineligibility for benefits. These denial decisions are based on (a) monetary issues; (b) separation issues; and (c) nonseparation, or "continuing eligibility" issues.

#### **b. Sampling Methodology.**

##### BAM Paid Claims

SWAs select systematic random samples of paid UI claims each week and use the results of the BAM paid claims investigations to estimate accurately the number and dollar value of proper and improper payments (overpayments and underpayments), and their rates of occurrence. BAM paid claims also provides information that can be used for program improvement, including the type of payment error, error cause, responsible party, point of detection within the system, and the actions of claimants, employers, and agencies prior to the BAM investigation.

The Department has supplied each SWA with software that performs quality assurance edits of the sampling frames and randomly selects the BAM paid claims samples. Each week a random sample is selected of both intrastate and interstate original payments (including combined wage claims) made for a week of unemployment under the State UI, UCX or UCFE programs. A sample of 360 cases per year is pulled in the ten states with the smallest UI program workloads (defined as average annual UI weeks paid during the most recent five calendar years) and 480 cases per year in the other states. State BAM staff audit each selected claim, examining all aspects of a claimant's eligibility to receive unemployment compensation during the sampled week. In their investigation, staff verify wages used to establish monetary entitlements, the claimant's reason for being unemployed, efforts to find work during the week and any other factors which would have affected the claimant's entitlement to a benefit during the sampled week or the amount of the benefit paid. Effective January 2008, paid claims selected for BAM must be matched with the National Directory of New Hires. The findings are then coded and entered into a database that is maintained on a computer located in each SWA. The Department uploads state BAM results (minus claimant Social Security Number) to a database maintained by the ETA Office of Workforce Security. The Department publishes annual performance results and uses the data for various analytical and evaluative purposes.

## BAM Denied Claims

Each week, SWAs select systematic random samples from the three separate sampling frames constructed from the universes of claims for UI for which eligibility was denied for monetary, separation, or nonseparation reasons. Samples are selected using the same sampling frame edit and sample selection software used for paid claims. The Department estimates the accuracy of decisions to deny claimants UI, based on the results of the case investigations for these samples.

Investigation of BAM denied claims follows the paid claims case investigation methodology. It evaluates denials accuracy by investigating random samples of each of the three types of denials. All states sample a minimum of 150 cases of each type of denial in each calendar year. State BAM staff review agency records and contact claimants, employers, and all other relevant parties to verify information in agency records or obtain additional information pertinent to the determination that denies eligibility. Unlike the investigation of paid claims, in which all prior determinations affecting claimant eligibility for the compensated week selected for the sample are evaluated, the investigation of denied claims is limited to the issue upon which the denial determination is based.

The Department distributes a table of random start numbers to use with the BAM paid and denied claims sample selection software. A separate random number is provided for each sample pull (paid claims, monetary denials, separation denials, nonseparation denials) for each of the 52 weekly samples.

Scope: Both paid and denied intrastate and interstate claims in the State UI, UCFE, and UCX programs are included in the sampling frames. Paid and denied interstate claims are included in the sampling frames of the interstate liable state. The “liable” state is the state which pays the UI benefits (that is, that state’s Unemployment Trust Fund is charged). The “agent” state is the state that processes the UI claim.

Operational Definitions of Sampling Frames: Unless otherwise stated, definitions refer to those used in ET Handbook 401, 4th edition. ETA report cell references are those used in ET Handbook 402, 5th edition.

### (1) Paid Weeks

Include only paid or compensated weeks that fall into all of the following: a) regular program type (UI, UCFE, UCX, or any combination thereof), b) weeks for which the payments/offsets are original payments (defined as the first valid payment/offset made by a state agency to a claimant for that week; offsets would normally recover overpayments established for previous weeks), c) weeks for which “total” or “part-total” payments/offsets are made, and d) weeks for which payments/offsets/intercepted payments are made to intrastate claimants, to interstate claimants by the liable state, or for combined wage claims.

Exclude weeks that all waiting weeks, weeks for which supplemental payments are made, weeks with stop payments, and all weeks paid under the Short Time Compensation (STC) [Workshare], Extended Benefits (EB), Trade Readjustment Allowance (TRA), Disaster Unemployment Assistance (DUA) programs, any temporary Federal-State supplemental compensation programs, or other special programs, such as

## Emergency Unemployment Compensation.

### (2) Monetary Denials

Include all initial claims that meet the definition for inclusion in the ETA 5159 Claims and Activities report on lines 101 (State UI), 102 (UCFE, No UI), and 103 (UCX only), for item 2 (new intrastate, excluding transitional), item 6 (transitional), and item 7 (interstate received as liable state) and for which eligibility was denied because of:

- Insufficient wages,
- Insufficient hours/weeks/days,
- Failure of high quarter wage test,
- Requalification wage requirement, or
- Other state monetary eligibility requirement

Exclude denied claims made under the Short Time Compensation (STC) (Workshare), Extended Benefits (EB), Trade Readjustment Allowance (TRA), Disaster Unemployment Assistance (DUA), or any temporary Federal-State supplemental compensation programs.

### (3) Separation Denials

Include all separation determinations that meet the definition for inclusion in the ETA 9052 Nonmonetary Determinations Time Lapse (Detection Date) report in cells c1 (intrastate), c5 (interstate), and c193 (multi-claimant) and for which eligibility was denied based on any of the following issues:

- Voluntary quit (either personal or work connected),
- Discharge,
- Labor dispute, or
- Other separation issue reportable under definitions in ET Handbook 401

Exclude denied claims made under the STC, EB, TRA, DUA, or any temporary Federal-State supplemental compensation programs.

### (4) Nonmonetary-Nonseparation Denials

Include all nonmonetary-nonseparation determinations that meet the definition for inclusion in the ETA 9052 Nonmonetary Determinations Time Lapse (Detection Date) report in cells c97 (intrastate), c101 (interstate), and c193 (multiclient) and for which eligibility was denied based on any of the following issues:

- Able and/or available to work,
- Actively seeking work,
- Disqualifying/unreported income,
- Refusal of suitable work or offer of job referral,
- Refusal of referral to profiling services,

- Failure to report,
- Failure to register with the employment service, or
- Other nonseparation eligibility issue (for example, alien status, athlete, school employee, seasonality, removal of disqualification, and determination of whether claimant's activities or status constitutes service or employment).

Exclude denied claims made under the STC, EB, TRA, DUA, or any temporary Federal-State supplemental compensation programs.

Frequency and Timing:

SWAs create a sampling frame file each week for all four universes. For paid claims, the survey population is selected from all weeks for which payments are made or offsets applied during a period that begins at 12:00 a.m. on Sunday and ends at 11:59 p.m. on Saturday. This interval is defined by the run time(s) of the computer programs that issue the checks or apply offsets.

The sampling frame for separation and nonseparation denied claims includes all decisions to deny UI claims issued during the period 12:00 a.m. Sunday to 11:59 p.m. Saturday. The date of the determination is the date printed on the determination notice. If no notice is issued, it is the date that the denial action was entered into the agency's record system or that a permanent stop payment order was issued.

The sampling frame for monetary denied claims is constructed slightly differently as it is possible that a UI claim may initially be denied for insufficient wages but subsequently become monetarily eligible upon the addition of wages from out-of-state employers (combined wage claims), Federal wages (UCFE and/or UCX programs), or as a result of the application of alternate base period formulas. In order to allow time for SWAs to request and receive Federal, out of state, and recently earned wage credits, the sampling frame for monetary denials is constructed two weeks after the week ending date of the initial claim. For example, the sampling frame for batch 201210 (March 4 - 10, 2012) will consist of new initial and transitional claims filed on or before February 25 for which the most recent determination issued between February 19 and March 10 denies monetary eligibility.

**c. Case Investigation.** BAM paid and denied claims case investigations are conducted according to the methods and procedures documented in ET Handbook 395; case investigation procedures for both paid and denied claims are described in detail in chapter VI, except as noted in chapter VIII for denied claims investigations. The information that is collected is specified in the data collection instruments (DCIs) for both paid and denied claims.

BAM investigators collect DCI information from SWA records, claimant questionnaires, and interviews with employers and other the parties with information relevant to the paid or denied claim. The investigator then records this information in an automated database, which consists of individual data records for each sampled paid claim and denial.

All paid and denied claims investigations involve one state investigator and one claimant. The person whose claim was either paid or denied is contacted in-person, by telephone, or by mail. BAM investigators obtain Information from employers (and their representatives) and "third parties" -- persons other than the claimant or employer, such as a doctor, school, or labor union, who possess information pertinent to the paid or denied case.

Unlike the investigation of paid claims, in which all decisions affecting claimant eligibility that precede the compensated week selected for the sample are evaluated, the investigation of denied claims is limited to the issue upon which the denial decision was based. For example, if a continued week claim is denied because the agency determined the claimant was not available for work, then only the availability issue will be investigated. The monetary, separation and any other nonmonetary determinations which could have affected eligibility for the week claimed will not be investigated. SWAs have the flexibility to conduct the investigation of both paid denied claims for UI by in-person interview, telephone, mail or fax, as they deem appropriate.

## **2. Describe the procedures for the collection of information including:**

**a. Stratification and Sample Selection.** For both paid and denied claims, each state's sample is stratified by week (which BAM refers to as a batch). For denied claims, samples are selected from sampling frames for each of the three types of denials (monetary, separation, and nonseparation). Systematic samples are selected weekly using software and random start numbers provided by the Department. Annual estimates are weighted to reflect the sample stratification. The formulae used to produce weighted estimates for paid and denied claims accuracy rates are in Attachment B-1.

**b. Estimation Procedure.** See Attachment B-1 for the formulae used to estimate paid and denied claims accuracy rates and sampling variances.

**c. Degree of Accuracy Needed.** The Department has adopted a standard for data publication that the 95% confidence interval (roughly two times the standard error of estimate) will be estimated and displayed for each estimated accuracy rate. Attachment B-2 displays the estimated rates and sampling errors for calendar year (CY) 2011 BAM paid claims results for the following types of overpayments:

**Annual Report Rate** - The annual report rate includes fraud, nonfraud recoverable overpayments, nonfraud nonrecoverable overpayments, official action taken to reduce future benefits, and payments that are technically proper due to finality or other rules. The rate excludes payments determined to be "technically" proper due to law/rules requiring formal warnings for unacceptable work search efforts. All causes and responsible parties are included in this rate.

**Operational Rate** - The operational overpayment rate includes those overpayments that the states are reasonably expected to detect and establish for recovery -- fraud and nonfraud recoverable overpayments, excluding work search, employment service (ES) registration, base period wage issues and miscellaneous causes, such as benefits paid during a period of disqualification, redeterminations, and back pay awards.

**Fraud** - The definition of unemployment compensation fraud varies from state to state. The rate includes all causes and responsible parties.

Attachment B-3 displays the estimated rates and sampling errors for CY 2011 BAM denied claims results for monetary, separation, and nonseparation issues.

**d. Unusual problems requiring specialized sampling procedures.** BAM paid and denied claims does not involve any unusual problems requiring specialized sampling procedures.

**e. Use of periodic data collection to reduce burden.** Less frequent data collection cycles would not be an appropriate means for reducing burden. This issue is addressed in Part A of the Justification, section A-6. To make reliable estimates of accuracy in a highly seasonal program such as UI, sampling must occur continuously. BAM paid and denied claims samples are drawn weekly. The continuous investigation of these samples, with regular data entry, also provides up-to-date information on accuracy to facilitate continuous improvement. Because the samples are weekly, they can be aggregated over various time periods for analytical purposes.

**3. Describe methods to maximize response rates and to deal with issues of non-response. The accuracy and reliability of information collected must be shown to be adequate for intended uses. For collections based on sampling, a special justification must be provided for any collection that will not yield "reliable" data that can be generalized to the universe studied.**

Because claimants are required to provide information concerning their continued eligibility for UI benefits, nonresponse to the BAM claimant questionnaire can affect eligibility for benefit payments. The response rate for claimant contacts (that is, the percentage of claimant questionnaires completed) for BAM paid claims is approximately 93 percent. It is more difficult to obtain a complete questionnaire from claimants who were denied benefits. Some of these individuals have returned to work or have relocated and are unavailable for interview.

Even if claimant information cannot be obtained directly, BAM investigators can obtain sufficient information from SWA records, and other relevant parties in order to reach an informed decision concerning the accuracy of the decision to deny benefits. The BAM investigators verify all information provided by UI recipients or obtained from automated file systems and other agency records. They contact all employers for whom the claimant worked before becoming unemployed or who provided part-time work during the claims series or were contacted in job search, as well as interested third parties, such as labor unions or employment agencies. The national case completion rate when all contacts are considered has consistently been over 99 percent for both paid and denied claims.

In FY 2014, although the percentage of claimant questionnaires completed varied considerably by sample type, states were able to complete nearly all of their cases based on agency documentation, employer, and third party information. The following table summarizes claimant response by data collection method. Attachment B-4 displays the response rates for the CY 2011 BAM paid claims samples, and Attachment B-5 displays the response rates for the CY 2011 BAM denied claims samples.

<b>BAM Case Completion and Claimant Interview Method -- IPIA 2014</b>								
<b>Sample Type</b>	<b>Cases Sampled</b>	<b>Valid Cases*</b>	<b>Cases Completed**</b>	<b>Percent Complete</b>	<b>In-Person</b>	<b>Tele-Phone</b>	<b>Mail</b>	<b>No Clmnt. Inter.</b>
<b>Paid Claims</b>	23,705	23,667	23,666	100.00%	11.87%	38.98%	40.80%	8.36%
<b>Monetary</b>	8,271	7,921	7,919	99.97%	0.50%	47.95%	21.63%	29.92%
<b>Separation</b>	7,971	7,879	7,879	100.00%	0.51%	44.45%	25.54%	29.51%
<b>Nonseparation</b>	8,083	7,859	7,852	99.91%	0.71%	48.12%	28.12%	23.02%

\* Cases sampled minus cases deleted because they did not meet the definition for inclusion in the survey population and denied claims that were withdrawn by the claimant. Valid cases exclude paid and denied claim cases for Florida batch range 201327 through 201426.

---

\*\*To meet IPFA reporting timetables, the database was frozen on 10/29/2014. The number of valid cases completed is those signed off by the BAM program's supervisor by the close of business on 10/28/2014.

\* Cases sampled minus cases deleted because they did not meet the definition for inclusion in the survey population and denied claims that were withdrawn by the claimant.

The Department is acutely aware of the importance of claimant response to the BAM questionnaire and has established a Federal-State workgroup to examine the issue of claimant nonresponse. The Department has drafted an advisory, which is currently in Department clearance, to issue guidance to address the specific issues of adjudicating work search and reporting errors when the claimant fails to respond to the BAM audit questionnaire.

In addition, in order to reduce nonresponse error and maintain coding consistency, the Department will continue to conduct training for BAM supervisors and investigators and hold Federal-State peer reviews of completed BAM audits to ensure that coding accurately reflects state law and policy and that states are following the BAM methodology.

In order to reduce respondent burden and maximize claimant response, the number of data elements collected for DCA is significantly smaller than the amount of data collected for BAM paid claims. Because only information relevant to the monetary, separation, or nonseparation denial issue is verified, the number of data elements per case is one-third or less of the number collected for BAM paid claims, which investigates decisions at all three points in the UI claims process. In addition, SWAs follow up the initial claimant contact with a sufficient number of call-backs and re-contact attempts to demonstrate that a reasonable attempt was made to obtain the information.

SWAs administering the BAM program are encouraged to:

- Use all available data collection methods -- in-person, telephone, mail, e-mail, and fax -- to complete their investigations;
- Be as flexible as feasible in accommodating the schedules of claimants, employers, and other relevant parties;
- Develop clear and concise questionnaires and scripts which clearly explain the purpose of the data collection effort and minimize the time commitment of the respondent. To this end the Department shares examples and prototype case investigation materials in order to disseminate best practices as widely as possible;
- Clearly inform the respondents that the confidentiality of the information they provide will be strictly maintained and that any information that can identify an individual, such as a claimant's social security number, will not be shared with the Department's or any other state's record systems; and
- Emphasize to respondents that the major objective of the BAM program is the improvement of the UI system, and that their cooperation will contribute to insuring that individuals who are in fact eligible for UI benefits receive them.

**4. Describe any tests of procedures or methods to be undertaken. Testing is encouraged as an effective means of refining collections of information to minimize burden and improve utility. Tests must be approved if they call for answers to identical questions from 10 or more respondents. A proposed test or set of test may be submitted for approval separately or in combination with the main collection of information.**

#### Paid Claims

In 1991 the Department of Labor completed a pilot test of the feasibility and cost-effectiveness of telephone contacts in lieu of in-person interviews with claimants, employers, and third parties. Four states participated in the pilot test, giving a wide range of economic, social and geographical environments. The pilot showed that the telephone was reasonably effective in detecting overpayment and underpayment errors: the patterns of erroneous payments by type and cause were basically the same as detected by the in-person control investigations. Although the rate of dollars overpaid discovered by the two methods in one state was virtually identical, in the other three the telephone estimate was only 60% of the in-person estimate. The pilot showed that the telephone methodology was very effective for certain aspects of BAM investigations, but less so for others. It also showed that BAM investigations could be done considerably less expensively by telephone--at about half the cost, confirming the estimate from a similar pilot project conducted in Idaho in the late 1980s.

#### Denied Claims

In 1987 the Department completed a five-state pilot test of using the BAM field-check methodology for determining the accuracy of benefit denial decisions. Three different sampling designs were evaluated in the 1986-87 pilot: (1) separate sampling frames for monetary, separation, and nonseparation (continuing eligibility) denials and a single sampling frame for all paid claims; (2) separate sampling frames for denials and decisions to affirm eligibility at the monetary, separation, and nonseparation points of determination in the UI claims process; and (3) a longitudinal approach, in which claimants were sampled at the time that the initial claim was filed, and eligibility determinations (either to deny or affirm eligibility) were investigated as they occurred during the claims process. The 1997-98 DCA pilot was based on model 1, which was the simplest design and preserved the design used for BAM paid claims. As noted in Part A, the Department has relied on results of the 1997-98 DCA pilot to estimate case-completion times and burden hours for national implementation of DCA.

**5. Provide the name and telephone number of individuals consulted on statistical aspects of the design and the name of the agency unit, contractor(s), grantee(s), or other person(s) who will actually collect and/or analyze the information for the agency.**

The following individuals collect and analyze the paid and denied claims data and may be contacted for further information:

Ross Miller  
Employment and Training Administration  
Office of Unemployment Insurance  
Phone: 202-693-3178  
E-mail: [miller.ross@dol.gov](mailto:miller.ross@dol.gov)

## Estimation Procedure for Benefit Accuracy Measurement

### BAM Paid Claims

#### 1. Ratio Estimate of Overpayment Rate

The parameter to be estimated,  $R_o$ , is the ratio of Unemployment Insurance (UI) benefits overpaid to total UI benefits paid:  $R_o = Y/X$ , where  $Y$  = Total dollars overpaid in the population and  $X$  = Total UI benefits paid in the population.

$R_o$  is estimated by the sample ratio:

$$r_o = \left( \sum_{h=1}^H \left( N_h / m_h \right) \sum_{i=1}^{m_h} y_{hi} \right) / \left( \sum_{h=1}^H \left( N_h / m_h \right) \sum_{i=1}^{m_h} x_{hi} \right)$$

where:

$H$  = Number of batches (weekly samples) in the period for which the estimate is being made.

$N_h$  = Total number of UI payments in the population for batch  $h$ . (Note: This value is available from state automated record systems and does not have to be estimated.)

$m_h$  = Number of completed sample cases in batch  $h$ .

$x_{hi}$  = Amount of UI benefits paid/offset for the  $i^{\text{th}}$  case in batch  $h$ .

$y_{hi}$  = Dollars overpaid for the  $i^{\text{th}}$  case in batch  $h$ .

Nonresponse is assumed to be random.

#### 2. Sampling Variance of Ratio Estimate of Overpayment Rate

The following formula will be used to estimate the sampling variance of the ratio estimate of the BAM paid claims overpayment rate.

(Note: Because the sampling fractions,  $f_h = m_h/N_h$ , are negligible, the term  $(1-f_h)$  has been omitted from the equations.)

$$\begin{aligned} \text{estVar}(r_o) &= \frac{\sum_{h=1}^H [(N_h^2/m_h)(s_{yh}^2 + r_o^2 * s_{xh}^2 - 2 * r_o * s_{yxh})]}{N^2 \bar{X}^2} \\ &= \frac{\sum_{h=1}^H [(N_h^2/m_h)(s_{yh}^2 + r_o^2 * s_{xh}^2 - 2 * r_o * s_{yxh})]}{X^2} \end{aligned}$$

where:

$$s_{yh}^2 = \frac{\left( \sum_{i=1}^{m_h} y_{hi}^2 \right) - \left[ \left( \sum_{i=1}^{m_h} y_{hi} \right)^2 / m_h \right]}{(m_h - 1)}$$

is the sample variance of the dollars overpaid;

$$s_{xh}^2 = \frac{\left( \sum_{i=1}^{m_h} x_{hi}^2 \right) - \left[ \left( \sum_{i=1}^{m_h} x_{hi} \right)^2 / m_h \right]}{(m_h - 1)}$$

is the sample variance of the dollars paid/offset; and

$$s_{yxh} = \frac{\left( \sum_{i=1}^{m_h} \langle x_{hi} * y_{hi} \rangle \right) - \left[ \left( \sum_{i=1}^{m_h} x_{hi} \right) \left( \sum_{i=1}^{m_h} y_{hi} \right) / m_h \right]}{(m_h - 1)}$$

is the sample covariance of the dollars overpaid and the dollars paid/offset.

X = Total population dollars paid/offset for the H batches.

(Note: This value is available from state automated record systems and does not have to be estimated.)

### 3. Ratio Estimate of Overpayment Rate for Subgroups

The parameter to be estimated,  $R_{ok}$ , is the ratio of Unemployment Insurance (UI) benefits overpaid to total UI benefits paid for population subgroup  $k$ :  $R_{ok} = Y_k/X_k$ , where  $Y_k$ =Total dollars overpaid in the population for the  $k^{\text{th}}$  subgroup and  $X_k$ =Total UI benefits paid in the population for the  $k^{\text{th}}$  subgroup.

$R_{ok}$  is estimated by the sample ratio:

$$r_{ok} = \left( \sum_{h=1}^H \left( N_h / m_h \right) \sum_{i=1}^{m_h} y_{hik} \right) / \left( \sum_{h=1}^H \left( N_h / m_h \right) \sum_{i=1}^{m_h} x_{hik} \right)$$

where:

$x_{hik}$  = Amount of UI benefits paid/offset for the  $i^{\text{th}}$  case in the  $k^{\text{th}}$  subgroup in batch  $h$ .

$$\begin{aligned} x_{hik} &= x_{hi}, \text{ for } h_i \text{ in the } k^{\text{th}} \text{ subgroup, and} \\ x_{hik} &= 0, \text{ for } h_i \text{ not in the } k^{\text{th}} \text{ subgroup} \end{aligned}$$

$y_{hik}$  = Dollars overpaid for the  $i^{\text{th}}$  case in the  $k^{\text{th}}$  subgroup in batch  $h$ .

$$\begin{aligned} y_{hik} &= y_{hi}, \text{ for } h_i \text{ in the } k^{\text{th}} \text{ subgroup, and} \\ y_{hik} &= 0, \text{ for } h_i \text{ not in the } k^{\text{th}} \text{ subgroup} \end{aligned}$$

Nonresponse is assumed to be random.

### 4. Sampling Variance of Ratio Estimate of Overpayment Rate for Subgroups

The following formula will be used to estimate the sampling variances of the ratio estimate of the overpayment rate for subgroups.

(Note: Because the sampling fractions,  $f_h = m_h/N_h$ , are negligible, the term  $(1-f_h)$  has been omitted from the equations.)

$$\text{estVar}(r_{ok}) = \frac{\sum_{h=1}^H \left[ \left( N_h^2 / m_h \right) \left( s_{yh(k)}^2 + r_{ok}^2 * s_{xh(k)}^2 - 2 * r_{ok} * s_{yhx(k)} \right) \right]}{X_k^2}$$

where:

$$S_{yh(k)}^2 = \frac{\left( \sum_{i=1}^{m_h} y_{hik}^2 \right) - \left[ \left( \sum_{i=1}^{m_h} y_{hik} \right)^2 / m_h \right]}{(m_h - 1)}$$

is the sample variance of the dollars overpaid in the k<sup>th</sup> subgroup;

$$S_{xh(k)}^2 = \frac{\left( \sum_{i=1}^{m_h} x_{hik}^2 \right) - \left[ \left( \sum_{i=1}^{m_h} x_{hik} \right)^2 / m_h \right]}{(m_h - 1)}$$

is the sample variance of the dollars paid/offset in the k<sup>th</sup> subgroup; and

$$S_{yxh(k)} = \frac{\left( \sum_{i=1}^{m_h} \langle x_{hik} * y_{hik} \rangle \right) - \left[ \left( \sum_{i=1}^{m_h} x_{hik} \right) \left( \sum_{i=1}^{m_h} y_{hik} \right) / m_h \right]}{(m_h - 1)}$$

is the sample covariance of the dollars overpaid and the dollars paid/offset.

$$X_k' = \sum_{h=1}^H \left[ \left( N_h / m_h \right) x_{hk} \right]$$

is the estimated total dollars paid/offset for the H batches.

In the preceding formulas,

$x_{hik} = x_{hi}$ , for  $hi$  in the  $k$ th subgroup, and  
 $x_{hik} = 0$ , for  $hi$  *not* in the  $k$ th subgroup;

$y_{hik} = y_{hi}$ , for  $hi$  in the  $k$ th subgroup, and  
 $y_{hik} = 0$ , for  $hi$  *not* in the  $k$ th subgroup

$x_{hk} =$  Amount of UI benefits paid/offset in the  $k$ <sup>th</sup> subgroup in the sample in batch  $h$ .

## 5. Ratio Estimate of Proper Payment Rate

The parameter to be estimated,  $R_p$ , is the ratio of Unemployment Insurance (UI) benefits properly paid to total UI benefits paid:  $R_p = Z/X$ , where  $Z$  = Total dollars properly paid in the population and  $X$  = Total UI benefits paid in the population.

$R_p$  is estimated by the sample ratio:

$$r_p = \left( \sum_{h=1}^H \left( N_h / m_h \right) \sum_{i=1}^{m_h} z_{hi} \right) / \left( \sum_{h=1}^H \left( N_h / m_h \right) \sum_{i=1}^{m_h} x_{hi} \right)$$

where  $H$ ,  $N_h$ ,  $m_h$ , and  $x_{hi}$  are defined as in 1., above, and

$z_{hi}$  = Dollars properly paid (dollars paid - dollars overpaid) for the  $i^{\text{th}}$  case in batch  $h$ .

## 6. Sampling Variance of Ratio Estimate of Proper Payment Rate

The following formula will be used to estimate the sampling variance of the ratio estimate of the BAM paid claims proper payment rate.

(Note: Because the sampling fractions,  $f_h = m_h / N_h$ , are negligible, the term  $(1 - f_h)$  has been omitted from the equations.)

$$\text{estVar}(r_p) = \frac{\sum_{h=1}^H \left[ \left( N_h^2 / m_h \right) \left( s_{zh}^2 + r_p^2 * s_{xh}^2 - 2 * r_p * s_{zxh} \right) \right]}{X^2}$$

where  $H$ ,  $N_h$ ,  $m_h$ ,  $X$ , and  $s_{xh}^2$  are defined as in 1. and 2., above;

$s_{zh}^2$  is the sample variance of the dollars properly paid; and

$s_{zxh}$  is the sample covariance of the dollars properly paid and dollars paid.

## 7. Ratio Estimate of Proper Payment Rate for Subgroups

The parameter to be estimated,  $R_{pk}$ , is the ratio of Unemployment Insurance (UI) benefits properly paid to total UI benefits paid for population subgroup  $k$ :  $R_{pk} = Z_k / X_k$ , where  $Z_k$  = Total dollars properly paid in the population for the  $k^{\text{th}}$  subgroup and  $X_k$  = Total UI benefits paid in the population for the  $k^{\text{th}}$  subgroup.

$R_{pk}$  is estimated by the sample ratio  $r_{pk}$  which is defined as the estimator  $r_{ok}$  in section 3, above, except that:

$z_{hik}$  = Dollars properly paid (dollars paid - dollars overpaid) for the  $i^{\text{th}}$  case in the  $k^{\text{th}}$  subgroup in batch  $h$ .

$$\begin{aligned} z_{hik} &= z_{hi}, \text{ for } h_i \text{ in the } k^{\text{th}} \text{ subgroup, and} \\ z_{hik} &= 0, \text{ for } h_i \text{ not in the } k^{\text{th}} \text{ subgroup} \end{aligned}$$

### 8. Sampling Variance of Ratio Estimate of Proper Payment Rate for Subgroups

The following formula will be used to estimate the sampling variances of the ratio estimate of the proper payment rate for subgroups.

(Note: Because the sampling fractions,  $f_h = m_h/N_h$ , are negligible, the term  $(1-f_h)$  has been omitted from the equations.)

$$\text{estVar}(r_{pk}) = \frac{\sum_{h=1}^H [(N_h^2/m_h)(s_{zh(k)}^2 + r_{pk}^2 * s_{xh(k)}^2 - 2 * r_{pk} * s_{zxh(k)})]}{X_k'^2}$$

where  $H$ ,  $N_h$ ,  $m_h$ ,  $X_k'^2$ , and  $s_{xh(k)}^2$  are defined as in 1. and 4., above;

$s_{zh(k)}^2$  is the sample variance of the dollars properly paid in the  $k^{\text{th}}$  subgroup; and

$s_{zxh(k)}$  is the sample covariance of the dollars properly paid and dollars paid in the  $k^{\text{th}}$  subgroup.

### 9. Ratio Estimate of Underpayment Rate

The parameter to be estimated,  $R_u$  is the ratio of Unemployment Insurance (UI) benefits underpaid to total UI benefits paid:  $R_u = U/X$ , where  $U$  = Total dollars underpaid in the population and  $X$  = Total UI benefits paid in the population.

$R_u$  is estimated by the sample ratio:

$$r_u = \left( \sum_{h=1}^H (N_h/m_h) \sum_{i=1}^{m_h} u_{hi} \right) / \left( \sum_{h=1}^H (N_h/m_h) \sum_{i=1}^{m_h} x_{hi} \right)$$

where  $H$ ,  $N_h$ ,  $m_h$ , and  $x_{hi}$  are defined as in 1., above, and

$u_{hi}$  = Dollars underpaid for the  $i^{\text{th}}$  case in batch  $h$ .

### 10. Sampling Variance of Ratio Estimate of Underpayment Rate

The following formula will be used to estimate the sampling variance of the ratio estimate of the BAM paid claims underpayment rate.

(Note: Because the sampling fractions,  $f_h = m_h/N_h$ , are negligible, the term  $(1-f_h)$  has been omitted from the equations.)

$$\text{estVar}(r_u) = \frac{\sum_{h=1}^H [(N_h^2/m_h)(s_{uh}^2 + r_u^2 * s_{xh}^2 - 2 * r_u * s_{uxh})]}{X^2}$$

where  $H$ ,  $N_h$ ,  $m_h$ ,  $X$ , and  $s_{xh}^2$  are defined as in 1. and 2., above;

$s_{uh}^2$  is the sample variance of the dollars underpaid; and

$s_{uxh}$  is the sample covariance of the dollars underpaid and dollars paid.

### 11. Ratio Estimate of Underpayment Rate for Subgroups

The parameter to be estimated,  $R_{uk}$ , is the ratio of Unemployment Insurance (UI) benefits underpaid to total UI benefits paid for population subgroup  $k$ :  $R_{uk} = U_k/X_k$ , where  $U_k$ =Total dollars underpaid in the population for the  $k^{\text{th}}$  subgroup and  $X_k$ =Total UI benefits paid in the population for the  $k^{\text{th}}$  subgroup.

$R_{uk}$  is estimated by the sample ratio  $r_{uk}$  which is defined as the estimator  $r_{ok}$  in section 3, above, except that:

$u_{hik}$  = Dollars underpaid for the  $i^{\text{th}}$  case in the  $k^{\text{th}}$  subgroup in batch  $h$ .

$$\begin{aligned} u_{hik} &= u_{hi}, \text{ for } hi \text{ in the } k^{\text{th}} \text{ subgroup, and} \\ u_{hik} &= 0, \text{ for } hi \text{ not in the } k^{\text{th}} \text{ subgroup} \end{aligned}$$

### 12. Sampling Variance of Ratio Estimate of Underpayment Rate for Subgroups

The following formula will be used to estimate the sampling variances of the ratio estimate of the underpayment rate for subgroups.

(Note: Because the sampling fractions,  $f_h = m_h/N_h$ , are negligible, the term  $(1-f_h)$  has been omitted from the equations.)

$$\text{estVar}(r_{uk}) = \frac{\sum_{h=1}^H [(N_h^2/m_h)(s_{uh(k)}^2 + r_{uk}^2 * s_{xh(k)}^2 - 2 * r_{uk} * s_{uxh(k)})]}{X_k'^2}$$

where H,  $N_h$ ,  $m_h$ ,  $X_k'^2$ , and  $s_{xh(k)}^2$  are defined as in 1. and 4., above;

$s_{uh(k)}^2$  is the sample variance of the dollars underpaid in the  $k^{\text{th}}$  subgroup; and

$s_{uxh(k)}$  is the sample covariance of the dollars underpaid and dollars paid in the  $k^{\text{th}}$  subgroup.

**Confidence Intervals**

The 95% confidence interval for any estimated ratio  $r_\theta$  (1, 3, 5, 7, 9, or 11, above) is:

$$r_\theta - (1.96 * \sqrt{\text{estVar}(r_\theta)})$$

$$r_\theta + (1.96 * \sqrt{\text{estVar}(r_\theta)})$$

**Coefficient of Variation**

The coefficient of variation (cv) of an estimate  $r_\theta$  is:

$$cv(r_\theta) = \frac{\sqrt{\text{VAR}(r_\theta)}}{E(r_\theta)}$$

$$cv(r_\theta) = \frac{SE(r_\theta)}{E(r_\theta)}$$

**BAM Denied Claims****Equations for Case Error Estimates**

The following notation will be used:

$H$  = the number of weeks (batches) in the period for which the estimate is being made.

$N_h$  = the number of denied claims in week  $h$ .

$X_h$  = the number of claims in week  $h$  which were erroneously denied.

$P_h$  =  $X_h/N_h$  = the proportion of claims in week  $h$  which were erroneously denied.

$N.$  =  $\sum_{h=1}^H N_h$  = total number of denied claims in the period.

$X.$  =  $\sum_{h=1}^H X_h$  = total number of claims erroneously denied in the period.

The parameter to be estimated,  $P$ , is the proportion of claims erroneously denied during the period. Estimates will be made for each of the three denial universes -- monetary, separation, and nonseparation. We wish to estimate:

$$P = X./N. = N^{-1} \sum_{h=1}^H N_h P_h$$

Now let

$m_h$  = the number of completed sample claims for week  $h$ .

$m.$  =  $\sum_{h=1}^H m_h$  = total number of completed sample claims in the period.

$x_h$  = the number of claims in week  $h$  which were erroneously denied.

**Attachment B-1**

$\hat{P}_h = x_h / m_h$  = proportion of sample claims in week  $h$  which were erroneously denied.

If it is assumed that non-response is "at random", then  $E(\hat{p}_h) = E(x_h / m_h) = X_h / N_h = P_h$ .

It follows that  $\hat{P} = N^{-1} \sum_{h=1}^H N_h \hat{P}_h$  is unbiased for P. Furthermore, as sampling is independent within each week (stratum), it follows that

where  $f_h = m_h/N_h$ . The usual estimator for  $var(\hat{P})$  is

$$\hat{var}(\hat{P}) = N^{-2} \sum_{h=1}^H N_h^2 (1 - f_h) \frac{\hat{P}_h(1 - \hat{P}_h)}{(m_h - 1)}.$$

If  $f_h$  is negligible then

$$\hat{var}(\hat{P}) = N^{-2} \sum_{h=1}^H N_h^2 \frac{\hat{P}_h(1 - \hat{P}_h)}{(m_h - 1)}$$

can be used for variance estimation.

### Proportions for Subgroups

The proportion of denial actions which were incorrectly decided may be estimated for population subgroups, for example UI program (State UI, UCFE, UCX), filing method (in-person, telephone, mail), or demographic classifications.

Building on the notation above, for the  $k^{\text{th}}$  subgroup and the  $h^{\text{th}}$  week let

- $N_{hk}$  = the number of denied claims.
- $X_{hk}$  = the number of claims were erroneously denied.
- $P_{hk}$  =  $X_{hk}/N_{hk}$  = the proportion of claims which were erroneously denied.

Then for the  $k^{\text{th}}$  subgroup we have

$$N_{\bullet k} = \sum_{h=1}^H N_{hk} = \text{total number of denied claims in the period.}$$

$$X_{\bullet k} = \sum_{h=1}^H X_{hk} = \text{total number of claims erroneously denied in the period.}$$

The parameter to be estimated,  $P_{\bullet k}$ , is the proportion of claims erroneously denied during the period for subgroup  $k$ . Analogous to previous work, we can write

$$P_{\bullet k} = X_{\bullet k} / N_{\bullet k} = N_{-k}^{-1} \sum_{h=1}^H N_{hk} P_{hk} .$$

Note that neither  $X_{\bullet k}$  nor  $N_{\bullet k}$  is known. For the  $k^{\text{th}}$  subgroup,  $h^{\text{th}}$  week, let

- $m_{hk}$  = the number of completed sample claims for week  $h$ .
- $X_{hk}$  = the number of claims in week  $h$  which were erroneously denied.

Assuming nonresponse is "at random",  $\hat{X}_{-k} = \sum_{h=1}^H \frac{N_h}{m_h} X_{hk}$  is unbiased for  $X_{\bullet k}$  and

$$\hat{N}_{-k} = \sum_{h=1}^H \frac{N_h}{m_h} m_{hk} \text{ is unbiased for } N_{\bullet k} . \text{ The ratio estimator } \hat{P}_{-k} = \hat{X}_{-k} / \hat{N}_{-k} \text{ is}$$

approximately unbiased for  $P_{\bullet k}$ , and

$$\text{var}(\hat{P}_{-k}) \cong N_{-k}^{-2} \sum_{h=1}^H (1 - f_{hk}) \frac{N_h^2 \theta_{hk}}{m_h} [ P_{hk} (1 - P_{hk}) + (1 - \theta_{hk}) (P_{hk} - P_{\bullet k})^2 ]$$

where  $f_{hk} = m_{hk} / N_{hk}$  and  $\theta_{hk} = N_{hk} / N_h$ . Assuming that  $f_{hk}$  is negligible, an estimate for the variance is given by

$$\hat{\text{var}}(\hat{P}_{-k}) = \hat{N}_{-k}^{-2} \sum_{h=1}^H \frac{N_h^2 \hat{\theta}_{hk}}{(m_h - 1)} [ \hat{P}_{hk} (1 - \hat{P}_{hk}) + (1 - \hat{\theta}_{hk}) (\hat{P}_{hk} - \hat{P}_{\bullet k})^2 ]$$

where

$$\hat{\theta}_{hk} = m_{hk} / m_h \text{ and}$$

$$\hat{P}_{hk} = \begin{cases} X_{hk} / m_{hk} & \text{if } m_{hk} > 0 \\ 0 & \text{otherwise} \end{cases} .$$

### Confidence Intervals

The 95% confidence interval for any estimate (u) is:

$$u - ( 1.96 * \sqrt{\text{VAR}(u)} )$$

$$u + ( 1.96 * \sqrt{\text{VAR}(u)} )$$

### Coefficient of Variation

The coefficient of variation (cv) of an estimate u is:

$$cv(u) = \frac{\sqrt{\text{VAR}(u)}}{E(u)}$$

$$cv(u) = \frac{SE(u)}{E(u)}$$

## Footnotes

-----

\* Excludes cases not meeting DCA definition for inclusion in population, withdrawn claims, and claims for which monetary eligibility was established upon receipt of CWC, UCFE, and/or UCX wage credits.

# Adjusted rate excludes erroneous denials that were corrected by agency and claims for which eligibility was established through appeal prior to DCA case completion.

Prepared by ETA Office of Unemployment Insurance on 02 Dec 14.
