HIV Surveillance Report

# **HIV** Surveillance **Report**

Volume 26

## **Diagnoses of HIV Infection in the United States and Dependent Areas, 2014**

National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention  
Division of HIV/AIDS Prevention

The *HIV Surveillance Report* is published annually by the Division of HIV/AIDS Prevention, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention, Centers for Disease Control and Prevention (CDC), U.S. Department of Health and Human Services, Atlanta, Georgia.

Data are presented for diagnoses of HIV infection reported to CDC through July 2015.

The *HIV Surveillance Report* is not copyrighted and may be used and reproduced without permission. Citation of the source is, however, appreciated.

<b>Web Addresses for Reports of State and Local HIV Surveillance</b>		123

The Centers for Disease Control and Prevention (CDC) collects, analyzes, and disseminates surveillance data on HIV infection; these data are one of the nation's primary sources of information on HIV in the United States. The annual surveillance report, published by the Division of HIV/AIDS Prevention (DHAP), summarizes information about diagnosed HIV infection in the United States and dependent areas. HIV surveillance data are used by CDC's public health partners in other federal agencies, health departments, nonprofit organizations, academic institutions, and the general public to help focus prevention efforts, plan services, allocate resources, develop policy, and monitor trends in HIV infection.

Estimated numbers and rates of diagnoses of HIV infection during 2010–2014 are included from all 50 states, the District of Columbia, and 6 U.S. dependent areas (American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the U.S. Virgin Islands).

During 2010–2014, the annual estimated number and rate of diagnoses of HIV infection in the United States remained stable. Estimated numbers and rates of diagnoses of HIV infection increased in some subgroups and decreased in others. Variations in trends among groups are expected and may be due to differences in testing behaviors, targeted HIV testing initiatives, or changes in the numbers of new HIV infections in some subgroups.

## REPORT CHANGES

In response to requests for expanded data from our partners, this report now includes tables that provide additional stratifications by transmission category and race/ethnicity. Tables 5a/b and 6a/b display data on diagnoses of HIV infection and stage 3 (AIDS), respectively, by transmission category and selected characteristics for each racial/ethnic group. Tables 14a/b display data on deaths of persons with diagnosed HIV infection, by race/ethnicity and selected characteristics; Tables 15a/b display data on deaths of persons with diagnosed HIV infection ever classified as stage 3 (AIDS), by race/ethnicity and selected characteristics.

## DEFINITIONS AND DATA SPECIFICATIONS

In 2014, the HIV surveillance case definition was revised to adapt to changes in diagnostic criteria used by laboratories and clinicians. The laboratory criteria for defining a confirmed case of HIV infection were changed to accommodate multitest algorithms that do not include previously required tests (e.g., Western blot). New to the case definition is the inclusion of criteria for differentiating HIV-1 and HIV-2 infections and for recognizing early HIV infection (stage 0), during which viral loads may be high enough and CD4 T-lymphocyte counts low enough to be confused with stage 3 (AIDS). In addition, the revised definition consolidates the staging systems for adults/adolescents and children, simplifies surveillance criteria for opportunistic illnesses (OIs) indicative of stage 3, and incorporates revisions of clinical criteria (i.e., medical record documentation) for reporting diagnoses without laboratory evidence. Because retroactive implementation of some features (e.g., the new staging system) of the 2014 case definition would be impractical, the following criteria were used to classify cases in this report:

- Cases diagnosed before 2014 were classified according to the 2008 HIV case definition.
- Cases diagnosed in 2014 were classified according to the 2014 HIV case definition.

The new CD4-based criteria for stage 3 (AIDS) among children resulted in a large increase in the number of stage 3 (AIDS) classifications among pediatric cases diagnosed during 2014. Before implementation of the 2014 revised case definition, an OI diagnosis was required for a pediatric case to meet the criteria for stage 3 classification.

The term *diagnosis of HIV infection* is defined as a diagnosis of HIV infection regardless of the stage of disease (stage 0, 1, 2, 3 [AIDS], or unknown) and refers to all persons with a diagnosis of HIV infection. The term *HIV infection, stage 3 (AIDS)*, and its condensed version—*stage 3 (AIDS)*—refer specifically to persons with diagnosed HIV whose infection was classified as stage 3 (AIDS) during a given year (for diagnoses) or whose infection has ever been classified as stage 3 (AIDS) (for prevalence and deaths). For more

information on the stages of HIV infection, please review the Technical Notes.

The data on diagnoses of HIV infection reflect the date of diagnosis (diagnosed by December 31, 2014; reported to CDC as of July 31, 2015), not the date of report to CDC. Similarly, the data specific to stage 3 (AIDS) reflect the first date the criteria for stage 3 (AIDS) were met. HIV diagnoses do not necessarily represent new infections (incidence): some infections may be classified as recent; others may be classified as longstanding. Because of reporting delays, the actual number of cases diagnosed in a given year may be higher than the numbers of diagnoses of HIV infection (unadjusted) presented for recent years; however, fluctuations in the numbers of diagnoses for a calendar year typically subside after 2 to 3 years of reporting. Where indicated, counts of diagnoses and deaths have been statistically adjusted (estimated) to correct for delays in reporting, but not for incomplete reporting.

## HIGHLIGHTS OF ANALYSES

The statements in this section, unless otherwise indicated, are based on estimated (statistically adjusted) data. All rates are per 100,000 population. The standard used for reporting trends in numbers and rates is based on an increase or a decrease of 5% or more during the specified time frame (e.g., when comparing 2010 and 2014). Exceptions to this standard were made where numbers were small or rates were based on small numbers.

Please read all table titles and footnotes carefully to ensure a complete understanding of the displayed data.

### Diagnoses of HIV Infection and Diagnoses of Infection Classified as Stage 3 (AIDS)

#### Diagnoses of HIV infection

From 2010 through 2014, the annual estimated number and the rate of diagnoses of HIV infection in the United States remained stable (Table 1a). In 2014, the estimated rate was 13.8.

- **Age group:** From 2010 through 2014, the rate for persons aged 25–29 years increased. The rates for children (aged less than 13 years) and persons aged 13–14, 15–19, 35–39, 40–44, 45–49, 50–54, 55–59, and 60–64 years decreased. The rates for persons aged 20–24, 30–34, and 65 years and older remained stable. In 2014, the highest rate was for persons aged 25–29 years

(35.8), followed by the rate for persons aged 20–24 years (34.3).

- **Race/ethnicity:** From 2010 through 2014, the rates for American Indians/Alaska Natives and Asians increased. The rates for blacks/African Americans, Native Hawaiians/other Pacific Islanders, and persons of multiple races decreased. The rates for Hispanics/Latinos and whites remained stable. In 2014, the rates were 49.4 for blacks/African Americans, 18.4 for Hispanics/Latinos, 15.4 for persons of multiple races, 10.6 for Native Hawaiians/other Pacific Islanders, 9.5 for American Indians/Alaska Natives, 6.2 for Asians, and 6.1 for whites. Please use caution when interpreting data for Native Hawaiians/other Pacific Islanders: the numbers are small.
- **Sex:** From 2010 through 2014, the rate for female adults and adolescents decreased; the rate for males remained stable. In 2014, males accounted for 81% of all diagnoses of HIV infection among adults and adolescents. The rate for male adults and adolescents was 27.4, and the rate for females was 6.1.
- **Transmission category:** From 2010 through 2014, among male adults and adolescents, the annual number of diagnosed HIV infections attributed to male-to-male sexual contact increased. The number of infections attributed to injection drug use, male-to-male sexual contact *and* injection drug use, or heterosexual contact decreased. Among female adults and adolescents, the number of infections attributed to injection drug use or heterosexual contact decreased. In 2014, among male and female adults and adolescents, the diagnosed infections attributed to male-to-male sexual contact (70%, including male-to-male sexual contact *and* injection drug use) and those attributed to heterosexual contact (24%) accounted for approximately 94% of diagnosed HIV infections in the United States.
- **Region:** From 2010 through 2014, the rates of diagnoses of HIV infection in the Northeast and the South decreased; the rates in the Midwest and the West remained stable. In 2014, rates were 18.5 in the South, 14.2 in the Northeast, 11.2 in the West, and 8.2 in the Midwest.

## Stage 3 (AIDS)

From 2010 through 2014, the annual estimated number and the estimated rate of infections classified as stage 3 (AIDS) in the United States decreased (Table 2a). In 2014, the estimated rate of infections classified as stage 3 (AIDS) was 6.6.

- **Age group:** From 2010 through 2014, the rates for all age groups except children (aged less than 13 years) decreased. In 2014, the highest rate was for persons aged 45–49 years (13.7), followed by the rate for persons aged 40–44 years (12.9). Because of the change in case definition, the trend among children (aged less than 13 years) was not assessed.
- **Race/ethnicity:** From 2010 through 2014, rates for all race/ethnicity groups decreased. In 2014, the rates were 25.4 for blacks/African Americans, 12.6 for persons of multiple races, 7.7 for Hispanics/Latinos, 4.0 for American Indians/Alaska Natives, 3.5 for Native Hawaiians/other Pacific Islanders, 2.7 for whites, and 2.1 for Asians. Please use caution when interpreting data for Native Hawaiians/other Pacific Islanders: the numbers are small.
- **Sex:** From 2010 through 2014, the rates for male and female adults and adolescents decreased. In 2014, males accounted for 75% of all infections classified as stage 3 (AIDS) among adults and adolescents. The 2014 rate for males was 12.0; the 2014 rate for females was 3.8.
- **Transmission category:** From 2010 through 2014, the annual number of infections classified as stage 3 (AIDS) among male adults and adolescents with HIV infection attributed to male-to-male sexual contact, injection drug use, male-to-male sexual contact *and* injection drug use, or heterosexual contact decreased. The number of infections classified as stage 3 (AIDS) among female adults and adolescents with HIV infection attributed to injection drug use or heterosexual contact decreased.
- **Region:** From 2010 through 2014, the rates of infections classified as stage 3 (AIDS) in the 4 regions of the United States decreased. In 2014, rates were 9.2 in the South, 6.8 in the Northeast, 4.7 in the West, and 3.9 in the Midwest.

## Deaths

### Deaths of persons with diagnosed HIV infection

From 2010 through 2013 in the United States, the annual estimated number and rate of deaths of persons with diagnosed HIV infection decreased (Table 12a). In 2013, the estimated rate of deaths of persons with diagnosed HIV infection was 5.1. Deaths of persons with diagnosed HIV infection may be due to any cause (i.e., may or may not be related to HIV infection).

- **Age group:** From 2010 through 2013, the rate of deaths for persons aged 65 years and older increased. The rates of deaths for persons aged 15–19, 20–24, 30–34, 35–39, 40–44, 45–49, and 50–54 years decreased. The rates for children (aged less than 13 years at death) and persons aged 13–14, 25–29, 55–59, and 60–64 years remained stable.
- **Race/ethnicity:** From 2010 through 2013, the rates of deaths for all race/ethnicity groups decreased: American Indians/Alaska Natives, Asians, blacks/African Americans, Hispanics/Latinos, Native Hawaiians/other Pacific Islanders, whites, and persons of multiple races. In 2013, the highest rate of deaths was for blacks/African Americans: 19.4. Please use caution when interpreting data for Native Hawaiians/other Pacific Islanders: the numbers are small.
- **Sex and transmission category:** From 2010 through 2013, the rates of deaths for male and female adults and adolescents decreased. The number of deaths among males with diagnosed HIV infection attributed to perinatal transmission increased. The number of deaths among males with infection attributed to injection drug use, male-to-male sexual contact *and* injection drug use, or heterosexual contact decreased. The number of deaths among males with diagnosed HIV infection attributed to male-to-male sexual contact remained stable. The number of deaths among females with infection attributed to injection drug use or heterosexual contact decreased. The number of deaths among female adults and adolescents with infection attributed to perinatal transmission remained stable. Please use caution when interpreting trend data for persons with infection attributed to perinatal transmission: the numbers are small.

- **Region:** From 2010 through 2013, the rates of deaths in the 4 regions of the United States decreased. In 2013, the rate was 7.7 in the Northeast, 6.4 in the South, 3.3 in the West, and 2.8 in the Midwest.

### Deaths of persons with infection ever classified as stage 3 (AIDS)

From 2010 through 2013 in the United States, the annual estimated number and rate of deaths of persons with infection ever classified as stage 3 (AIDS) decreased (Table 13a). In 2013, the estimated rate of deaths of persons with stage 3 (AIDS) was 4.1.

Deaths of persons with stage 3 (AIDS) may be due to any cause.

- **Age group:** From 2010 through 2013, the rate of deaths among persons aged 65 years and older increased. Rates of deaths among persons aged 15–19, 20–24, 30–34, 35–39, 40–44, 45–49, and 50–54 years decreased. Rates among children (aged less than 13 years) and among persons aged 13–14, 25–29, 55–59, and 60–64 years remained stable.
- **Race/ethnicity:** From 2010 through 2013, the rates of death for American Indians/Alaska Natives, blacks/African Americans, Hispanics/Latinos, Native Hawaiians/other Pacific Islanders, and persons of multiple races decreased. The rates of deaths for Asians and whites remained stable. The highest death rate was for blacks/African Americans: 15.3. Please use caution when interpreting data for Native Hawaiians/other Pacific Islanders: the numbers are small.
- **Sex and transmission category:** From 2010 through 2013, the overall rates for male and female adults and adolescents decreased. The number of deaths among males with stage 3 (AIDS) whose HIV infection was attributed to perinatal transmission increased. The number of deaths among males with infection attributed to injection drug use, male-to-male sexual contact *and* injection drug use, or heterosexual contact decreased. The number of deaths among males with infection attributed to male-to-male sexual contact remained stable. Among female adults and adolescents, the number of deaths with infection attributed to injection drug use or heterosexual contact decreased. The number of

deaths among females with infection attributed to perinatal transmission remained stable. Please use caution when interpreting data for persons with infection attributed to perinatal transmission: the numbers are small.

- **Region:** From 2010 through 2013, the rates of deaths in the 4 regions of the United States decreased. In 2013, the rate was 6.1 in the Northeast, 5.1 in the South, 2.7 in the West, and 2.2 in the Midwest.

## Survival

### Survival after a diagnosis of HIV infection

Unadjusted data on diagnoses of HIV infection made during 2005–2010 in the United States were used to describe the proportions of persons surviving 12, 24, and 36 months after a diagnosis of HIV infection (Table 16a).

- **Year of diagnosis:** Survival increased with the year of diagnosis for diagnoses made during 2005–2010, although year-to-year differences were small.
- **Age group:** Survival decreased as age at diagnosis increased, particularly among persons aged 50 years and older at time of diagnosis.
- **Race/ethnicity:** Survival was greatest among Native Hawaiian/other Pacific Islanders, followed by Asians, Hispanics/Latinos, whites, and persons of multiple races. Survival was lowest among American Indians/Alaska Natives and blacks/African Americans.
- **Transmission category:** Survival was greatest among children regardless of transmission category; survival was slightly lower among children with diagnosed HIV infection attributed to perinatal exposure. Among adults and adolescents, survival was greatest among males with diagnosed HIV infection attributed to male-to-male sexual contact, females with infection attributed to heterosexual contact, and males with infection attributed to male-to-male sexual contact *and* injection drug use. Survival was intermediate among male adults and adolescents with infection attributed to heterosexual contact. Survival was lowest among male and female adults and adolescents with infection attributed to injection drug use.

- **Region:** Survival was greatest among persons residing in the Midwest and the West, followed by those in the Northeast and the South.

### Survival after stage 3 (AIDS) classification

Unadjusted data from diagnosed infections classified as stage 3 (AIDS) during 2005–2010 in the United States were used to describe persons surviving 12, 24, and 36 months after stage 3 (AIDS) classification (Table 17a).

- **Year of diagnosis:** In general, survival increased with the year of diagnosis for diagnoses made during 2005–2010, although year-to-year differences were small.
- **Age group:** In general, survival decreased as age at diagnosis increased, particularly among persons aged 35 years and older. Survival was greatest for persons aged 13–14 years and persons aged 15–19 years at the time of stage 3 (AIDS) classification.
- **Race/ethnicity:** Survival was greatest among Native Hawaiians/other Pacific Islanders, followed by Asians, Hispanics/Latinos, persons of multiple races, whites, blacks/African Americans, and American Indians/Alaska Natives.
- **Transmission category:** Survival was greatest among children with infection attributed to perinatal transmission, followed by male adults and adolescents with infection attributed to male-to-male sexual contact. Survival was intermediate among male adults and adolescents with infection attributed to male-to-male sexual contact *and* injection drug use and among male and female adults and adolescents with infection attributed to heterosexual contact. Survival was lowest among male and female adults and adolescents with infection attributed to injection drug use.
- **Region:** Survival was greatest among persons residing in the West, followed by those in the Northeast and the Midwest. Survival was lowest in the South.

### Prevalence: Persons Living with Diagnosed HIV Infection and Persons Living with Infection Ever Classified as Stage 3 (AIDS)

#### Prevalence of diagnosed HIV infection

From 2010 through 2013, the estimated number of persons in the United States living with diagnosed HIV infection increased (Table 18a). At the end of 2013, an estimated 933,941 persons in the United States were living with diagnosed HIV infection. The estimated prevalence rate of diagnosed HIV infection was 295.1.

- **Age group:** At the end of 2013, persons aged 45–49 and persons aged 50–54 years made up the largest percentage of persons living with diagnosed HIV (17% each). The highest rate (754.3) was among persons aged 45–49 years, followed by those aged 50–54 (717.2) and those aged 40–44 (565.7). From 2010 through 2013, the largest percentage increase in rates (41%) was among persons aged 65 years and older (from 84.0 in 2010 to 118.5 in 2013).
- **Race/ethnicity:** At the end of 2013, the highest rate (1,018.1) and the largest percentage (43%) were those among blacks/African Americans. Among the remaining race/ethnicity groups, the rates were 523.5 for persons of multiple races, 350.8 for Hispanics/Latinos, 162.8 for Native Hawaiians/other Pacific Islanders, 150.3 for whites, 123.2 for American Indians/Alaska Natives, and 70.9 for Asians.
- **Sex and transmission category:** At the end of 2013, the estimated rates were 547.4 for male adults and adolescents, 167.7 for female adults and adolescents, and 4.6 for children (aged less than 13 years at year-end 2013). Among a total of 705,165 males (aged 13 years and older at year-end 2013), 70% of infections were attributed to male-to-male sexual contact, 11% to injection drug use, 10% to heterosexual contact, 7% to male-to-male sexual contact *and* injection drug use, and 1% to perinatal transmission. Among a total of 226,361 females (aged 13 years and older at year-end 2013), 74% of infections were attributed to heterosexual contact, 23% to injection drug use, and 2% to perinatal transmission. Among a total of 2,415 children aged less than 13 years at year-end 2013, 83% of infections were attributed to perinatal transmission.

- **Region:** At year-end 2013, the prevalence rates were 420.5 in the Northeast, 343.6 in the South, 241.2 in the West, and 165.3 in the Midwest.

- **Region:** At year-end 2013, the prevalence rates were 247.9 in the Northeast, 182.3 in the South, 140.0 in the West, and 84.8 in the Midwest.

### Prevalence of stage 3 (AIDS)

From 2010 through 2013, the estimated number of persons living with infection ever classified as stage 3 (AIDS) increased (Table 19a). At the end of 2013, an estimated 516,401 persons in the United States were living with infection ever classified as stage 3 (AIDS). The estimated prevalence rate of infections classified as stage 3 (AIDS) was 163.2.

- **Age group:** At the end of 2013, the highest rate (456.8) and the largest percentage (20%) were those among persons aged 50–54 years, followed by persons aged 45–49 (454.6 and 19%, respectively). From 2010 through 2013, the largest percentage increase in rates (41%) was among persons aged 65 years and older (from 56.7 in 2010 to 79.7 in 2013).
- **Race/ethnicity:** At the end of 2013, the highest rate (554.8) and the largest percentage (42%) were those among blacks/African Americans. Among the remaining race/ethnicity groups, the rates were 318.5 for persons of multiple races, 205.5 for Hispanics/Latinos, 88.1 for Native Hawaiians/other Pacific Islanders, 80.9 for whites, 64.7 for American Indians/Alaska Natives, and 36.9 for Asians.
- **Sex and transmission category:** At the end of 2013, the estimated rates were 306.0 for male adults and adolescents, 90.4 for female adults and adolescents, and 0.5 for children (aged less than 13 years). Among a total of 394,124 males (aged 13 years and older at year-end 2013), 65% of infections were attributed to male-to-male sexual contact, 14% to injection drug use, 12% to heterosexual contact, 8% to male-to-male sexual contact *and* injection drug use, and 1% to perinatal transmission. Among a total of 122,005 females (aged 13 years and older at year-end 2013), 71% of infections were attributed to heterosexual contact, 26% to injection drug use, and 2% to perinatal transmission. Among a total of 272 children aged less than 13 years at year-end 2013, 94% of infections were attributed to perinatal transmission.

## SURVEILLANCE OF HIV INFECTION

This report includes case report data from 50 states, the District of Columbia, and 6 U.S. dependent areas (American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the U.S. Virgin Islands) in which laws or regulations require confidential reporting to the jurisdiction (not to CDC), by name, for adults, adolescents, and children with confirmed diagnoses of HIV infection. After the removal of personally identifiable information, data from these reports were submitted to CDC. Although AIDS cases have been reported to CDC since 1981, the implementation of HIV infection reporting has differed from state to state. All states, the District of Columbia, and 6 U.S. dependent areas had fully implemented name-based HIV infection reporting by April 2008.

Please use caution when interpreting data on diagnoses of HIV infection. HIV surveillance reports may not be representative of all persons with HIV because not all infected persons have been (1) tested or (2) tested at a time when the infection could be detected and diagnosed. Also, some states offer anonymous HIV testing; the results of anonymous tests are not reported to the confidential name-based HIV registries of state and local health departments. Therefore, reports of confidential test results may not represent all persons who tested positive for HIV infection. In addition, testing patterns are influenced by many factors, including the extent to which testing is routinely offered to specific groups and the availability of, and access to, medical care and testing services. The data presented in this report provide a minimum estimate of persons for whom HIV infection has been diagnosed and reported to the surveillance system. Finally, because surveillance practices among jurisdictions differ, the reporting and the updating of a person's clinical and vital status differ among states. The completeness of reporting of HIV infection is estimated at more than 80% [1].

## STAGES OF HIV INFECTION

Both the 2008 and 2014 HIV case definitions were used to classify HIV infection among adults and adolescents and among children [2, 3].

The 2008 case definition was used to classify cases diagnosed from the beginning of the epidemic through 2013. For adults and adolescents, this definition incorporates an HIV infection staging system that includes AIDS (HIV infection, stage 3). The 2008 stages of HIV infection are defined as follows:

- **HIV infection, stage 1:** No AIDS-defining condition and either CD4 count of  $\geq 500$  cells/ $\mu$ L or CD4 percentage of total lymphocytes of  $\geq 29$ .
- **HIV infection, stage 2:** No AIDS-defining condition and either CD4 count of 200–499 cells/ $\mu$ L or CD4 percentage of total lymphocytes of 14–28.
- **HIV infection, stage 3 (AIDS):** Documentation of an AIDS-defining condition or either a CD4 count of  $< 200$  cells/ $\mu$ L or CD4 percentage of total lymphocytes of  $< 14$ . Documentation of an AIDS-defining condition supersedes a CD4 count or percentage that would not, by itself, be the basis for a stage 3 (AIDS) classification.
- **HIV infection, stage unknown:** No reported information on AIDS-defining conditions and no information available on CD4 count or percentage.

The 2014 case definition was used to classify cases diagnosed in 2014. It is similar to the 2008 case definition except for the following: (1) inclusion of criteria for stage 0, (2) the inclusion of CD4 testing criteria for stage 3 in children, and (3) changes in the cutoffs for CD4 percentage of total lymphocytes used for classification of stages 1 and 2 in persons aged 6 years and older. The stages of HIV infection in the 2014 case definition are based on age-specific CD4+ T-lymphocyte counts or percentages of total lymphocytes and are defined as follows:

- **HIV infection, stage 0:** First positive HIV test result within 6 months after a negative HIV test result. The stage remains stage 0 until 6 months after the first positive test result. After 6 months, the stage may be reclassified as 1, 2, 3, or unknown if based on a CD4+ T-lymphocyte

result or the diagnosis of an OI. The diagnosis of an AIDS-defining condition or a low CD4 test result before the 6 months have elapsed does not change the stage from stage 0 to stage 3.

- **HIV infection, stages 1, 2, and 3:** Documentation of an AIDS-defining condition (excluding stage 0 as described above) is stage 3. Otherwise, the stage is determined by the lowest CD4 test result [3, p 7].
- **HIV infection, stage unknown:** No reported information on AIDS-defining conditions and no information available on CD4 count or percentage.

The new CD4-based criteria for stage 3 (AIDS) among children resulted in an increase in the number of annual stage 3 (AIDS) classifications among pediatric cases diagnosed during 2014. Before implementation of the 2014 revised case definition, an OI diagnosis was required for a pediatric case to meet the criteria for stage 3 classification.

In this report, the term *diagnosis of HIV infection* is defined as a diagnosis of HIV infection regardless of the stage of disease (stage 0, 1, 2, 3 [AIDS], or unknown) and refers to all persons with a diagnosis of HIV infection. The term HIV infection, *stage 3 (AIDS)*, and its condensed version—*stage 3 (AIDS)*—refer specifically to persons with diagnosed HIV whose infection was classified as stage 3 (AIDS) during a given year (for diagnoses) or whose infection has ever been classified as stage 3 (AIDS) (for prevalence and deaths).

## TABULATION AND PRESENTATION OF DATA

The data in this report include information received by CDC through July 31, 2015. The data are organized into 4 sections.

- Section 1 (Tables 1a/b–11): numbers (statistically adjusted [estimated] and unadjusted) and rates (adjusted) of diagnoses of HIV infection (any stage) and diagnoses of infection classified as stage 3 (AIDS)
- Section 2 (Tables 12a/b–17a/b): numbers (statistically adjusted and unadjusted) and rates (adjusted) of deaths and proportions (unadjusted) of survival among persons with diagnosed HIV infection (any stage) and persons with infection ever classified as stage 3 (AIDS)

- Section 3 (Tables 18a/b–21a/b): numbers (statistically adjusted and unadjusted) and rates (adjusted) of prevalence (i.e., data on persons living with diagnosed HIV infection [any stage] and data on persons living with infection ever classified as stage 3 [AIDS])
- Section 4 (Tables 22–27): numbers (statistically adjusted and unadjusted) and rates (adjusted) of diagnoses and prevalence of HIV infection (any stage) and diagnoses and prevalence of infection classified as stage 3 (AIDS), presented by state and metropolitan statistical area (MSA)

Many tables in the 2014 report present data in 2 formats. Tables in the first format—labeled “a”—exclude data from the dependent areas (American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the U.S. Virgin Islands). Tables in the second format—labeled “b”—include data from the dependent areas.

Please use caution when interpreting reported numbers less than 12, as well as estimated numbers and accompanying rates and trends based on these numbers: the underlying relative standard errors are greater than 30%, so the numbers are considered unreliable.

## Diagnoses of HIV Infection and of Infection Classified as Stage 3 (AIDS)

This report is based on diagnoses of HIV infection that the 50 states, the District of Columbia, and 6 U.S. dependent areas reported to CDC as of July 31, 2015. Data from all areas are included in tables displaying numbers (unadjusted), estimated numbers, and estimated rates of diagnoses of HIV infection and of diagnoses of infection classified as stage 3 (AIDS), by selected characteristics, area of residence, and MSA (Tables 1a/b–11, 16a/b, 17a/b, 22, 23, 26, and 27).

## Deaths

Persons reported to the National HIV Surveillance System are assumed alive unless their deaths have been reported to CDC. Death data include deaths of persons with diagnosed HIV infection (Tables 12a/b and 14a/b) or with infection ever classified as stage 3 (AIDS) (Tables 13a/b and 15a/b) regardless of the cause of death. Because of delays in the reporting of deaths, 4 years (2010–2013) of death data are displayed. The exclusion of data from the most recent

year allowed at least 18 months for deaths to be reported to CDC. The estimated numbers and rates of deaths resulted from statistical adjustment for delays in reporting. Please use caution when interpreting trend data on the estimated numbers of deaths: the estimates for the most recent year are most subject to uncertainty.

### **Survival Analyses**

The Kaplan-Meier method was used to estimate the probability of survival for 12, 24, and 36 months after a diagnosis of HIV infection (Tables 16a/b) or after a diagnosis of infection classified as stage 3 (AIDS) (Tables 17a/b). To allow at least 3 years from the time of diagnosis to deaths occurring through December 31, 2013 (reported to CDC by July 31, 2015), table data were limited to persons whose diagnosis was made during 2005–2010. Data for each HIV reporting area were included in the survival tables beginning with the first full calendar year after implementation of code-based or name-based HIV infection reporting.

### **Prevalence: Persons Living with Diagnosed HIV Infection and Persons Living with Infection Ever Classified as Stage 3 (AIDS)**

Because of delays in the reporting of deaths, 4 years of prevalence data are displayed. The data reflect persons living with diagnosed HIV infection, regardless of stage of disease, (Tables 18a/b, 20a/b, 24, and 26) and persons living with infection ever classified as stage 3 (AIDS) (Tables 19a/b, 21a/b, 25, and 27) at the end of a given year during 2010–2013. The exclusion of data from the most recent year allowed at least 18 months for deaths to be reported and for these deaths to be factored into calculations of prevalence.

### **Age**

The designation “adults and adolescents” refers to persons aged 13 years and older; the designation “children” refers to persons aged less than 13 years. For presentations of data on persons living with diagnosed HIV infection (Tables 18a/b, 20a/b, and 24) and presentations of data on persons living with infection classified as stage 3 (AIDS) (Tables 19a/b, 21a/b, and 25), the age-group assignment (e.g., 20–24 years) or the age designation (e.g., “adults and adolescents”) is based on the person’s age as of December 31 of the

specified year. For presentations of data on deaths of persons with diagnosed HIV infection (Tables 12a/b and 14a/b) and deaths of persons with infection classified as stage 3 (AIDS) (Tables 13a/b and 15a/b), age-group assignment is determined by the person’s age at the time of death. For all other tables, the age designation or the specific age-group assignment is based on the person’s age at the time of diagnosis (HIV infection or infection classified as stage 3 [AIDS]).

Age-group designations for transmission categories in tables displaying data on prevalence and on deaths are based on a person’s age at the end of the specified year or age at death, respectively. That is, the transmission categories among “adults and adolescents” in these tables include persons who were children at the time of diagnosis but who were aged 13 years and older during the specified year or at death.

### **Sex**

Sex designations in this report are based on a person’s sex at birth. *Transgender* is an umbrella term that is used to identify persons whose sex assigned at birth does not match current gender identity or expression. Data for transgender persons are not presented in this report because information on gender identity (a person’s internal understanding of his or her gender or the gender with which a person identifies) is not consistently collected or documented in the data sources used by HIV reporting jurisdictions. HIV surveillance personnel collect this information, when available, from sources such as case report forms submitted by health care or HIV testing providers and medical records, or by matching with other databases (e.g., Ryan White program data) in the health department. In May 2012, CDC issued guidance to state and local programs on methods for collecting data on transgender persons and working with transgender-specific data. However, characterization of HIV infection among transgender persons may require supplemental data from special studies.

### **Race and Ethnicity**

In the *Federal Register* [4] for October 30, 1997, the Office of Management and Budget (OMB) announced the Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity. Implementation by January 1, 2003, was mandated. At a minimum, data on the following race categories should be collected:

- American Indian or Alaska Native
- Asian
- black or African American
- Native Hawaiian or other Pacific Islander
- white

Additionally, systems must be able to retain information when multiple race categories are reported. In addition to data on race, data on 2 categories of ethnicity should be collected:

- Hispanic or Latino
- not Hispanic or Latino

The Asian or Pacific Islander category displayed in annual surveillance reports published prior to the 2007 surveillance report was split into 2 categories:

(1) Asian and (2) Native Hawaiian or other Pacific Islander. The Asian category (in tables where footnoted) includes the cases in Asians/Pacific Islanders (referred to as legacy cases) that were reported before the implementation of the new race categories in 2003 (e.g., cases of HIV infection that were diagnosed and reported to CDC before 2003 but that progressed to AIDS after 2003) and a small percentage of cases that were reported after 2003 but that were reported according to the old race category (Asian/Pacific Islander). In tables of diagnoses of HIV infection during 2010–2014, the Asian category does not include Asian/Pacific Islander cases because these cases were diagnosed after 2003 and were reported to CDC in accordance with OMB’s Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity [4].

This report also presents data for persons for whom multiple race categories are reported. In this report, persons categorized by race were not Hispanic or Latino. The number of persons reported in each race category may, however, include persons whose ethnicity was not reported.

### Geographic Designations

Geographic designations reflect the area of residence at the time of diagnosis of HIV infection or at the time of stage 3 (AIDS) classification. The 4 regions of residence used in this report are defined by the U.S. Census Bureau as follows:

**Northeast:** Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont

**Midwest:** Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin

**South:** Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia

**West:** Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming

**U.S. dependent areas:** American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the U.S. Virgin Islands

### Metropolitan Statistical Areas

In the *Federal Register* for June 28, 2010, the OMB published revised standards for defining MSAs in federal statistical activities [5]. These standards, which provided for the identification of MSAs in the United States and Puerto Rico, replaced the 2000 standards. The adoption of the new standards was effective as of June 28, 2010. On February 28, 2013, the OMB announced new MSA delineations based on the new standards and Census 2010 data [6]. Tables 26 (data on diagnosed HIV infection) and 27 (data on stage 3 [AIDS]) present numbers and rates of diagnoses and of prevalence, by MSA, for areas with populations of 500,000 or more. The MSAs listed in these tables were defined according to the OMB’s most recent update (February 2013) of statistical areas [6].

### Transmission Categories

*Transmission category* is the term for the classification of cases that summarizes a person’s possible HIV risk factors; the summary classification results from selecting, from the presumed hierarchical order of probability, the 1 (single) risk factor most likely to have been responsible for transmission. For surveillance purposes, a diagnosis of HIV infection is counted only once in the hierarchy of transmission categories. Persons with more than 1 reported risk factor for HIV infection are classified in the transmission category listed first in the hierarchy. The exception is men who had sexual contact with other men

and injected drugs; this group makes up a separate transmission category.

Persons whose transmission category is classified as male-to-male sexual contact include men who have ever had sexual contact with other men (i.e., homosexual contact) and men who have ever had sexual contact with both men and women (i.e., bisexual contact). Persons whose transmission category is classified as heterosexual contact are persons who have ever had heterosexual contact with a person known to have, or to be at high risk for, HIV infection (e.g., an injection drug user). The heterosexual contact category excludes men who have ever had sexual contact with both men and women.

Tables of prevalence data and tables of death data include a separate transmission category of adults and adolescents with HIV infection attributed to perinatal transmission. The category includes persons infected through perinatal transmission but aged 13 years and older during the specified year or at death.

Cases of HIV infection reported without a risk factor listed in the hierarchy of transmission categories are classified as “no identified risk (NIR)” [7]. Cases classified as NIR include cases that are being followed up by local health department staff; cases in persons whose risk-factor information is missing because they died, declined to be interviewed, or were lost to follow-up; and cases in persons who were interviewed or for whom other follow-up information was available but for whom no risk factor was identified.

Because a substantial proportion of cases of HIV infection are reported to CDC without an identified risk factor, multiple imputation is used to assign a transmission category [8]. Multiple imputation is a statistical approach in which each missing transmission category is replaced with a set of plausible values that represent the uncertainty about the true, but missing, value [9]. The plausible values are analyzed by using standard procedures, and the results from these analyses are then combined to produce the final results. In tables displaying transmission categories, multiple imputation was used for adults and adolescents, but not for children (because the number of cases in children is small, missing transmission categories were not imputed).

## Reporting Delays

Reporting delays (time between diagnosis or death and the reporting of diagnosis or death to CDC) may differ among demographic and geographic categories; for some, delays in reporting have been as long as several years. The statistical adjustment of the data on diagnoses and deaths is based on estimates of reporting-delay distributions, which are calculated by using a modified semiparametric life-table statistical procedure. This procedure takes into account differences in reporting delays due to sex, race/ethnicity, HIV transmission categories, geographic area (i.e., reporting city, state, or dependent area; region of residence), the size of the MSA, and the type of facility where the diagnosis was made or death occurred [10]. The statistical adjustment of data on diagnoses takes into consideration the information reported from the state or dependent area where the diagnosis was made; the statistical adjustment of data on deaths takes into consideration the information from the state where the death occurred. No adjustments are made for incomplete reporting.

## Rates

Rates per 100,000 population were calculated for (1) the numbers of diagnoses of HIV infection and the numbers of infections classified as stage 3 (AIDS), (2) the numbers of deaths of persons with diagnosed HIV infection and deaths of persons with infection ever classified as stage 3 (AIDS), and (3) the numbers of persons living with diagnosed HIV infection and persons living with infection ever classified as stage 3 (AIDS).

The population denominators used to compute the rates for the 50 states, the District of Columbia, and Puerto Rico were based on the Vintage 2014 postcensal estimates file (for years 2010–2014) from the U.S. Census Bureau [11]. The population denominators for American Samoa, Guam, the Northern Mariana Islands, the Republic of Palau, and the U.S. Virgin Islands were based on estimates and projections from the U.S. Census Bureau’s International Data Base [12]. Each rate was calculated by dividing the estimated total number of diagnoses (or deaths or prevalence) for the calendar year by the population for that calendar year and then multiplying the result by 100,000. The denominators used for calculating the rates specific to age, sex, and race/ethnicity were

computed by applying the appropriate vintage estimates for age, sex, and race/ethnicity for the 50 states and the District of Columbia [11]. The same method was used to calculate the denominators for Puerto Rico, with the exception of race/ethnicity estimates; these data are not available for Puerto Rico (see next paragraph). For the other 5 U.S. dependent areas, estimates from the U.S. Census Bureau's International Data Base were used for age- and sex-specific population denominators [12].

CDC currently does not provide subpopulation rates by race/ethnicity for the 6 U.S. dependent areas because the U.S. Census Bureau does not collect information from all dependent areas. Rates for transmission categories are not provided in this report because of the absence of denominator data from the U.S. Census Bureau, the source of data used for calculating all rates in this report.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>d</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>e</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>f</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>b</sup> From the beginning of the epidemic through 2014.

<sup>c</sup> The criteria for stage 3 (AIDS) classification among pediatric cases were expanded in 2014 (see Technical Notes).

<sup>d</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>e</sup> Hispanics/Latinos can be of any race.

<sup>f</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>g</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>h</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>i</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

<b>Total<sup>i</sup></b>	<b>28,183</b>	<b>28,844</b>	<b>9.2</b>	<b>26,146</b>	<b>27,067</b>	<b>8.6</b>	<b>25,069</b>	<b>26,156</b>	<b>8.2</b>	<b>24,309</b>	<b>25,687</b>	<b>8.0</b>	<b>19,364</b>	<b>21,318</b>	<b>6.6</b>	<b>1,236,994</b>	<b>1,246,981</b>

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>b</sup> From the beginning of the epidemic through 2014.

<sup>c</sup> The criteria for stage 3 (AIDS) classification among pediatric cases were expanded in 2014 (see Technical Notes).

<sup>d</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>e</sup> Hispanics/Latinos can be of any race.

<sup>f</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>g</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>h</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>i</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>f</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>g</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>h</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Abbreviation: IDU, injection drug use.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

Reported numbers less than 12, as well as estimated numbers (and accompanying trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>b</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

<sup>f</sup> Hispanics/Latinos can be of any race.

Abbreviation: IDU, injection drug use.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

Reported numbers less than 12, as well as estimated numbers (and accompanying trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>b</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

<sup>f</sup> Hispanics/Latinos can be of any race.

Abbreviation: IDU, injection drug use.

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>b</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

<sup>f</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>g</sup> Hispanics/Latinos can be of any race.

Abbreviation: IDU, injection drug use.

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>b</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

<sup>f</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>g</sup> Hispanics/Latinos can be of any race.

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting.

<sup>b</sup> Entries include persons whose place of birth is not among those listed and persons whose place of birth is unknown.

<sup>c</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>d</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>e</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Deaths of persons with diagnosed HIV infection may be due to any cause.

Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>b</sup> From the beginning of the epidemic through 2013.

<sup>c</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>d</sup> Hispanics/Latinos can be of any race.

<sup>e</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>f</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>g</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis. Deaths of persons with a diagnosis of HIV infection may be due to any cause.

Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>f</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>g</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Deaths of persons with a diagnosis of HIV infection may be due to any cause.

Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>f</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>g</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis. Data exclude persons whose month of diagnosis or month of death is unknown.

See Technical Notes for method for calculating proportion of persons surviving.

<sup>a</sup> Hispanics/Latinos can be of any race.

<sup>b</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>c</sup> Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

<sup>d</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>b</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>c</sup> Hispanics/Latinos can be of any race.

<sup>d</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>e</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>f</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>b</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>c</sup> Hispanics/Latinos can be of any race.

<sup>d</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>e</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>f</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>b</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>c</sup> Hispanics/Latinos can be of any race.

<sup>d</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>e</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>f</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>f</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>g</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

Reported numbers less than 12, as well as estimated numbers (and accompanying trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>f</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>g</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays and missing transmission category, but not for incomplete reporting. Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

<sup>f</sup> Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

<sup>g</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> From the beginning of the epidemic through 2014.

<sup>b</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays, but not for incomplete reporting.

<sup>c</sup> Rates are per 100,000 population.

<sup>d</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays, but not for incomplete reporting. Rates are per 100,000 population.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited.

<sup>f</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Note. Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Includes Asian/Pacific Islander legacy cases (see Technical Notes).

<sup>b</sup> Hispanics/Latinos can be of any race.

<sup>c</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays, but not for incomplete reporting. Rates are per 100,000 population.

<sup>d</sup> Because the estimated totals were calculated independently of the corresponding values for each subpopulation, the subpopulation values may not sum to the totals shown here.

<sup>e</sup> Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited.

<sup>f</sup> Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Abbreviation: MSA, metropolitan statistical area.

*Note.* Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis. Because of the lack of U.S. census information for all U.S. dependent areas, table includes data for only the United States and Puerto Rico.

MSA definitions for this report can be found at <http://www.census.gov/population/metro/>.

Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays, but not for incomplete reporting. Rates are per 100,000 population.

<sup>b</sup> Based on estimated rate.

<sup>c</sup> Counts of diagnoses of HIV infection for the metropolitan divisions do not sum to the MSA total. MSA total includes data from 1 metropolitan division with population of <500,000.

<sup>d</sup> Includes persons whose county of residence is unknown. Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

**Table 27. Stage 3 (AIDS), 2014 and cumulative, and persons living with diagnosed HIV infection ever classified as stage 3 (AIDS) (prevalence), year-end 2013, by metropolitan statistical area of residence—United States and Puerto Rico**

Abbreviation: MSA, metropolitan statistical area.

Note. Because of the lack of U.S. census information for all U.S. dependent areas, table includes data for only the United States and Puerto Rico.

MSA definitions for this report can be found at <http://www.census.gov/population/metro/>.

Reported numbers less than 12, as well as estimated numbers (and accompanying rates and trends) based on these numbers, should be interpreted with caution because the numbers have underlying relative standard errors greater than 30% and are considered unreliable.

<sup>a</sup> From the beginning of the epidemic through 2014.

<sup>b</sup> Estimated numbers resulted from statistical adjustment that accounted for reporting delays, but not for incomplete reporting.

<sup>c</sup> Rates are per 100,000 population.

<sup>d</sup> Based on estimated rate.

<sup>e</sup> Counts of stage 3 (AIDS) classifications for the metropolitan divisions do not sum to the MSA total. MSA total includes data from 1 metropolitan division with population of <500,000.

<sup>f</sup> Includes persons whose county of residence is unknown. Because column totals for estimated numbers were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.
