General Comment

I am submitting a citizens petition against the companies that are putting out Phillips and Equate Milk of Magnesia. There is a chemical compound that is being used in Phillips and now recently in Equate's Milk of Magnesia under "inactive ingredients" called Sodium Hypochlorite. This is a chemical compound that is commonly used as a disinfectant or a bleaching agent. What makes this even more dangerous is that after you take a dose of Milk of Magnesia, you are asked to drink 8 oz. of water, and when you add water to Sodium Hypochlorite it turns into what is commonly known as "liquid bleach". This is a chemical that has absolutely no business being in any product that we are going to be putting into our bodies. I can see this as no more than a possible cost cutting move by both of the companies that are responsible for putting out Milk of Magnesia. I can understand using the purified water they are using as an inactive ingredient for cost cutting, but what possible use can a chemical that is no more than common bleach be used for in this product??? I am asking the FDA to please look into this and do something about it before someone ends up dying.
