Definitions:

Bearing Acreage: A vineyard is considered bearing when it reaches an age when it can normally be expected to produce a commercially significant crop (usually 3 - 5 years of age).

Expected Production: The total tons you anticipate harvesting. Consider the current condition of your vineyards, and assume average weather and pest infestations until harvest.

Expected Percent of Full Crop: A full crop is the yield you would expect to achieve under normal production conditions. This yield may or may not be the maximum production potential for your operation. Therefore, your Expected Percent of Full Crop may exceed 100%. Example: You estimate that your vineyards, under normal conditions, have a full crop average yield of 8.0 tons/acre. This year you project an average yield of 6.0 tons/acre, or $6/8 = 75$ percent of a full crop.
