### **General Comments:**

This docket is well described and documented. Data collection procedure is well detailed to achieve the goals of the study.

### **Part A: Final**

Nothing found to note a comment.

### **Part B: Final**

Data collection method and procedures are well detailed. The universe count and sampling size are well defined.

The stated response rate of 100 percent is obviously excellent for Dairy census. However, is there a reason that there is no attempt to account for a missing response should it occur? Is it difficult to explain a change in the estimate due to a late response? Perhaps an imputation routine could be developed for anyone that does not respond in time. However, it sounds like nonresponse does not occur very often.

Are there any concerns with data confidentiality? Do you suppress estimates if only one or two facility reports an item? Perhaps the data is never that thin.
