

# Prospective Plantings

ISSN: 1949-159X

---

Released March 31, 2016, by the National Agricultural Statistics Service (NASS), Agricultural Statistics Board, United States Department of Agriculture (USDA).

## **Corn Planted Acreage Up 6 Percent from 2015 Soybean Acreage Down Less Than 1 Percent All Wheat Acreage Down 9 Percent All Cotton Acreage Up 11 Percent**

**Corn** planted area for all purposes in 2016 is estimated at 93.6 million acres, up 6 percent from last year. If realized, this will represent the highest planted acreage in the United States since 2013, and will be the third highest planted acreage in the United States since 1944.

**Soybean** planted area for 2016 is estimated at 82.2 million acres, down less than 1 percent from last year. Compared with last year, planted acreage intentions are down or unchanged in 23 of the 31 estimating States.

**All wheat** planted area for 2016 is estimated at 49.6 million acres, down 9 percent from 2015. The 2016 winter wheat planted area, at 36.2 million acres, is down 8 percent from last year and down 1 percent from the previous estimate. Of this total, about 26.2 million acres are Hard Red Winter, 6.60 million acres are Soft Red Winter, and 3.37 million acres are White Winter. Area planted to other spring wheat for 2016 is estimated at 11.3 million acres, down 14 percent from 2015. Of this total, about 10.7 million acres are Hard Red Spring wheat. The intended Durum planted area for 2016 is estimated at 2.00 million acres, up 3 percent from the previous year.

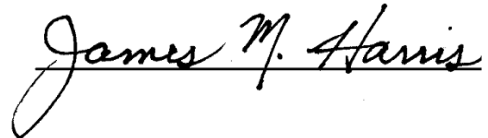

**All cotton** planted area for 2016 is estimated at 9.56 million acres, 11 percent above last year. Upland area is estimated at 9.35 million acres, up 11 percent from 2015. American Pima area is estimated at 215,000 acres, up 36 percent from 2015.

## Winter Weather Summary

**Highlights:** A strong El Niño brought some widely expected winter weather impacts to the United States, but also provided some surprises. For example, atmospheric warmth in part supplied by the balmy central and eastern equatorial Pacific Ocean contributed to the Nation’s warmest December-February period on record. Similarly, the contiguous United States experienced its wettest winter since the record-setting El Niño of 1997-98. However, El Niño’s impacts on the Western winter wet season were somewhat reversed, with wetter conditions in the Pacific Northwest and drier weather in the Southwest. In addition, uncharacteristically wet conditions affected much of the Midwest, especially in December. The cool conditions that often cover the South during El Niño were present only periodically, mainly in January and February.

In fact, December seemed like anything but a winter month, ranking first all-time for both United States warmth and wetness. The wet conditions peaked in late December, culminating in record flooding in parts of the middle Mississippi Valley. Despite the overall December warmth, a late-month blizzard on the southern High Plains proved devastating for livestock. Elsewhere, storms during December and January provided Western drought relief. Although many of January’s storms were focused across the West, several had impacts farther east. For example, a blizzard struck the Mid-Atlantic States on January 22-23, with significant snow extending as far west as the interior Southeast. Warmth returned to nearly all of the United States during February, while storminess largely vacated the West. Despite the lack of late-winter storms in the West, overall United States drought coverage plunged from more than one-third (34.8 percent) of the Lower 48 States on October 20, 2015, to approximately one-seventh (14.3 percent) of the Country on March 1, 2016.

**Historical Perspective:** Given the warming influence of El Niño and the lack of sustained cold waves, it was not surprisingly the warmest United States winter during the period of record that began in 1895-96. According to preliminary information provided by the National Centers for Environmental Information (NCEI), the Nation’s winter average temperature of 36.8°F was 4.6°F above the 1901-2000 mean, edging the 1999-2000 standard of 36.5°F. It was the warmest winter on record in all six New England States, and among the ten warmest in 28 other States. All 48 States were in the “warm” half of the historical distribution; Nevada and Utah were the “coolest” States, each reporting its 41<sup>st</sup> warmest winter.

Meanwhile, the Nation experienced its 12th-wettest winter—and wettest December-February period since the record-wet El Niño winter of 1997-98. December-February precipitation averaged 8.05 inches across the Lower 48 States, 119 percent of normal. It was the 39th-driest winter in Louisiana and Wyoming, but among the ten wettest winters in Washington, Nebraska, three Midwestern States, and four Southeastern States.

**December:** Record-setting December warmth covered much of the Midwest and East, while heavy to record-setting precipitation fell across the Northwest, mid-South, and upper Midwest. Relentless precipitation further eased or eradicated Northwestern drought, but southern California and the Desert Southwest received little December moisture. Farther east, an already wet pattern in the Nation’s mid-section culminated in a late-month deluge that drove the Mississippi River to record-high levels from Cape Girardeau, Missouri, to Thebes, Illinois. Record-breaking crests were also noted along several Mississippi River tributaries, especially in Missouri.

The wetness across the mid-South and lower Midwest increased concerns about soft red winter wheat due to standing water and lowland flooding. During December, the portion of Illinois’ winter wheat rated in good to excellent condition fell from 67 to 58 percent. Excessively wet conditions also plagued parts of the Southeast, hampering final harvest and winter wheat planting efforts. In North Carolina, only 42 percent of the winter wheat was rated in good to excellent condition at the end of December, down from 69 percent on November 29.

Unusual warmth accompanied the general wetness across the eastern half of the Country. In the Southeast, warm conditions allowed winter grains and cool-season pastures to continue to develop. Farther north, periods of snow blanketed the upper Midwest, despite above-normal temperatures. Occasional snow also fell across the Plains, providing winter wheat with some moisture and insulation. On the southern High Plains, however, a late-month blizzard caused significant livestock losses due to bitter cold and wind-driven snow.

According to NCEI, the contiguous United States experienced unprecedented December warmth and wetness. The

Nation's monthly average temperature of 38.6°F was 6.0°F above the 1901-2000 mean and easily topped the December 1939 standard of 37.7°F. It was the warmest December on record in Iowa, Minnesota, and Missouri, along with every State east of the Mississippi River. Meanwhile, December precipitation averaged 3.93 inches, 167 percent of normal. Another El Niño-influenced December, 1982, slipped to second place on the all-time list with 3.76 inches. Two States, Iowa and Wisconsin, weathered their wettest December, and it was among the ten wettest in eighteen other States stretching from Washington and Oregon to the Carolinas and Georgia.

**January:** Frequent storms, in part fueled by a strong El Niño, further dented Western drought and maintained generally adequate to locally excessive soil moisture across the central and eastern United States.

In early January and again at month's end, a southward shift in the storm track brought significant precipitation to southern California and the Southwest. For the remainder of January, storms primarily crossed the Northwest, with meaningful precipitation often falling as far south as northern and central California. By the end of January, the average water content of the high-elevation Sierra Nevada snowpack stood at 20 inches, about 115 percent of average for the date.

Meanwhile, wet weather in southern Florida resulted in numerous January rainfall records and adversely affected winter vegetables and other crops. At times, high winds accompanied southern Florida's heavy rain. Farther north, a major winter storm on January 22-23 produced freezing rain in parts of the Carolinas and heavy snow from the interior Southeast to the northern Mid-Atlantic States.

Some of the coldest air of the season trailed the storm into the Southeast from January 23-25, although Florida's citrus belt escaped without a significant freeze. Elsewhere, near- to above-normal temperatures dominated the Country during January, with colder-than-normal conditions mostly limited to the Southeast and areas blanketed by the January 22-23 snowfall.

Amid the overall stormy January pattern, a few areas began to turn dry. However, drier-than-normal January conditions across the southern Plains, mid-south, and parts of the Southeast were mostly favorable, following the excessive rainfall and flooding of October-December 2015. At the end of January, USDA categorized more than two-thirds of the winter wheat in good to excellent condition in several major production States, including Oklahoma (74 percent good to excellent); Ohio (74 percent); Michigan (73 percent); Montana (72 percent); Indiana (71 percent); and South Dakota (67 percent). In contrast, North Carolina's wheat continued to struggle from the effects of autumn wetness and delayed planting; only 36 percent of the State's crop was rated good to excellent on January 31.

By February 2, the United States drought coverage of 15.5 percent represented the smallest area drought extent since October 26, 2010. As recently as October 20, 2015, contiguous United States drought coverage stood at 34.8 percent. In January, most of the remaining Western drought was only apparent when looking at long-term indicators such as below-average reservoir storage, groundwater shortages, and tree mortality.

According to NCEI, the contiguous United States experienced its 34th-warmest, and 36th-driest January during the 122-year period of record. The Nation's monthly average temperature of 32.2°F was 2.1°F above the 1901-2000 mean. State temperature rankings ranged from the 33rd-coolest January in West Virginia to the 11th-warmest January in Maine. Meanwhile, January precipitation averaged 2.03 inches, 88 percent of normal. However, Florida's precipitation averaged 5.96 inches, 201 percent of normal, marking its fourth-wettest January. California (6.16 inches, 145 percent of normal) experienced its wettest January since 2010. It was also California's wettest October-January period (13.62 inches; 117 percent of normal) since 2009-10. In contrast, Ohio noted its ninth-driest January.

**February:** For the second time in 3 months, warmth stretched nearly coast to coast, with only small sections of the southern Atlantic States experiencing cooler-than-normal weather. Unlike December, when unprecedented warmth covered areas from the Mississippi Valley to the East Coast, February's record-setting high temperatures were focused across the Plains.

As a result, winter wheat prematurely broke dormancy across the central and southern Plains, leaving the crop vulnerable to potential spring freezes. On the northern Plains, where February temperatures averaged more than 10°F above normal in some locations, wheat lost some winter hardiness and was often buffeted by breezy conditions. The Plains' most

impressive warm spells peaked on February 18 and 27, with numerous monthly record highs established on both dates. During February, the portion of the winter wheat crop rated in good to excellent condition declined in Texas, from 49 to 40 percent, in part due to short-term dryness. Pockets of dryness also developed elsewhere across the southern half of the Plains. In contrast, early-month snowfall provided wheat with beneficial moisture across much of Nebraska, eastern Colorado, and northwestern Kansas.

Uncharacteristic of a strong, mature El Niño, February was unusually dry across much of the West. During February, the average water content of the high-elevation Sierra Nevada snowpack was nearly steady at 20 to 22 inches, with only minor storms affecting key watersheds. Since February is typically an important month for Sierra Nevada snowpack accumulation, the percent of historic average dropped from about 115 percent of average on February 1 to just 85 percent by month's end. Farther north, occasional precipitation benefited Northwestern winter grains.

Meanwhile, mild, occasionally stormy conditions prevailed across the Midwest, although a mid-month cold snap briefly resulted in some of the coldest weather of the season. Overwintering conditions remained mostly favorable for Midwestern wheat, with more than two-thirds of the crop rated in good to excellent condition at the end of February in Ohio (72 percent) and Indiana (67 percent).

Similarly, the mid-month cold spell interrupted an otherwise mild regime in the Northeast, while cool conditions were a little more persistent in the Southeast. An abundance of precipitation fell during February across most of the eastern one-third of the Country, with some of the heaviest rain occurring in the coastal Carolinas. Severe weather outbreaks were noted across portions of the South and East on February 2-3, 15-16, and 23-24. From the Ohio Valley into the Northeastern and Mid-Atlantic States, some of the precipitation—especially around mid-month—fell as snow, sleet, or freezing rain.

By February 29, only one-eighth (12.5 percent) of the Country was covered by snow, compared to 60.2 percent at the end of February 2015. At the same time, just 14.3 percent of the Nation was experiencing drought on March 1, according to the United States Drought Monitor. Drought coverage across the contiguous United States had not been lower in more than 5 years, since October 2010.

According to NCEI, the contiguous United States experienced its seventh-warmest, 46th-driest February during the 122-year period of record. The Nation's monthly average temperature of 39.5°F was 5.7°F above the 1901-2000 mean, while the average precipitation of 1.93 inches was 91 percent of normal. Overall, it was the Nation's warmest February since 2000. All States reported a February average temperature in the upper (warm) half of the historical distribution. For a dozen States across the western and central United States, as well as three States in New England, temperatures were among the ten highest respective February values on record. In Montana, where the monthly average temperature of 33.6°F was 12.3°F above the 20th century mean, it was the second-warmest February behind 1991. Meanwhile, State precipitation rankings ranged from the 14th-driest February in California to top-ten values for February wetness in New Hampshire, New York, Maine, and Vermont. California's monthly precipitation averaged 1.14 inches, just 30 percent of normal.

## Crop Comments

**Corn:** Growers intend to plant 93.6 million acres of corn for all purposes in 2016, up 6 percent from last year and up 3 percent from 2014. If realized, this will be the third highest planted acreage in the United States since 1944. Compared with last year, planted acreage is expected to be up or unchanged in 41 of the 48 estimating States. The increase in planted acres is mainly due to the expectation of higher returns in 2016 compared with other crops. Acreage increases of 400,000 or more compared with last year are expected in Illinois, Iowa, Kansas, and North Dakota.

**Sorghum:** Growers intend to plant 7.22 million acres of sorghum for all purposes in 2016, down 15 percent from last year. Kansas and Texas, the leading sorghum producing States, account for 74 percent of the expected United States acreage. As of March 20, Texas growers had planted 22 percent of their expected acreage, 16 percentage points ahead of last year but identical to the five-year average.

**Oats:** Area seeded to oats for the 2016 crop year is estimated at 2.75 million acres, down 11 percent from 2015. If realized, United States planted acres will be the third lowest on record. Record low planted acreage is estimated in Arkansas, California, Colorado, Idaho, Illinois, Iowa, Oregon, Pennsylvania, Texas, and Wyoming.

**Barley:** Producers intend to seed 3.14 million acres of barley for the 2016 crop year, down 12 percent from the previous year. If realized, this will be the fourth smallest seeded area on record. In Montana, the planted area is expected to be up 4 percent from 2015. In North Dakota, planted acreage is expected to decrease by 29 percent from last year.

**Winter wheat:** The 2016 winter wheat planted area is estimated at 36.2 million acres, down 8 percent from 2015 and down 1 percent from the previous estimate. States with notable acreage decreases from the previous year are Colorado, Kansas, Oklahoma, South Dakota, and Texas, while notable increases occurred in the Great Lakes region. Record low acreage is estimated for Nebraska, New Jersey, and Utah. Of the total acreage, about 26.2 million acres are Hard Red Winter, 6.60 million acres are Soft Red Winter, and 3.37 million acres are White Winter.

**Durum wheat:** Area seeded to Durum wheat for 2016 is estimated at 2.00 million acres, up 3 percent from 2015. Planted acreage is expected to increase in Montana and North Dakota, the two largest Durum-producing States. If realized, planted acres will tie a record low in South Dakota.

**Other spring wheat:** Growers intend to plant 11.3 million acres, down 14 percent from 2015. If realized, this will represent the lowest United States acreage since 1972. Of the total, about 10.7 million acres are Hard Red Spring wheat. Compared with last year, acreage increases are expected in Idaho, Nevada, Oregon, and Utah. Acreage decreases are expected in Colorado, Minnesota, Montana, North Dakota, South Dakota, and Washington. If realized, planted acres will be a record low in Colorado.

**Rice:** Area planted to rice in 2016 is expected to total 3.06 million acres, up 17 percent from 2015. Lower prices for competing commodities is contributing to the expected increase in rice acres compared with last year. The expected acres planted to long grain rice in Arkansas, Louisiana, Mississippi, Missouri, and Texas account for the increase in both long grain and all rice planted acres. Arkansas, the largest long grain producing State, is expected to increase long grain acres by 35 percent. Medium and short grain acres are expected to decline by 17 and 16 percent, respectively from 2015. California, the largest medium and short grain producing State, is expected to increase medium grain acres by 3 percent in 2016.

**Hay:** Producers intend to harvest 54.3 million acres of all hay in 2016, down slightly from 2015. Harvested area of all hay is expected to hold steady or decline in all Western States, except Oregon and Utah. Increases in harvested acreage are expected in many Upper and Middle Mississippi Valley, Tennessee Valley, and Mid-Atlantic States. In the Northeast, several States expect harvested acreage to remain unchanged from last year.

A record low for all hay harvested area is expected in California, Illinois, Indiana, Michigan, New Hampshire, New York, Pennsylvania, Vermont, and Wisconsin in 2016.

**Soybeans:** Growers intend to plant 82.2 million acres in 2016, down less than 1 percent from last year. Compared with last year, planted acreage intentions are down or unchanged in 23 of the 31 estimating States. Decreases of 200,000 acres or more are anticipated in Louisiana, Minnesota, and Mississippi. Compared with last year, the largest increase in acreage is expected in Missouri. If realized, the planted area in North Dakota, Pennsylvania, and Wisconsin will be the largest on record.

**Peanuts:** Growers intend to plant 1.48 million acres in 2016, down 9 percent from the previous year. The expected decrease in planted area is largely driven by price concerns due to the large supply of peanuts. Over the last two years, growers increased peanut acres in many States due to relatively low prices of other crops creating a large supply going into the 2016 crop year. In Georgia, the largest peanut-producing State, expected planted area is down 7 percent from 2015.

**Sunflower:** Growers intend to plant a total of 1.69 million acres in 2016, down 9 percent from last year. If realized, planted area for the Nation will be the fourth lowest since 1977. Area intended for oil type varieties, at 1.44 million acres,

is down 7 percent from 2015. The area intended for non-oil varieties, estimated at 249,400 acres, is down 19 percent from last year and will be the lowest since 1987, if realized.

Compared with last year, growers in six of the eight major sunflower-producing States expect a decline in sunflower acreage this year. Producers in South Dakota, the leading sunflower-producing State, intend to plant 605,000 acres, down more than 70,000 acres from last year.

**Canola:** Producers intend to plant 1.75 million acres in 2016, down 2 percent from 2015. Despite the decline, planted area in the United States will be the third largest on record, if realized. Compared with last year, planted area is expected to decrease in three of the major canola-producing States, with acreage in Oklahoma expected to decrease 50,000 acres from the previous year. Producers in North Dakota, the leading canola-producing State, intend to plant 1.45 million acres this year, an increase of 40,000 acres from 2015.

**Flaxseed:** Producers intend to plant 390,000 acres of flaxseed in 2016, down 73,000 acres, or 16 percent less than was planted in 2015. Acreage in North Dakota, the largest flaxseed-producing State, is down 17 percent or 70,000 acres from the previous year.

**Cotton:** Growers intend to plant 9.56 million acres in 2016, up 11 percent from last year. Despite the expected increase, if realized, this will be the seventh lowest planted acreage on record in the United States. Upland area is expected to total 9.35 million acres, up 11 percent from 2015. American Pima area is expected to total 215,000 acres, up 36 percent from 2015.

Growers in all States except North Carolina, South Carolina, and Virginia are expected to increase planted acreage from last year. If realized, upland cotton planted area in California for 2016 will be a record low.

**Sugarbeets:** Area expected to be planted to sugarbeets for the 2016 crop year is estimated at 1.16 million acres, virtually unchanged from 2015. Intended plantings are below the previous year in five of the eleven estimating States and above in three States.

**Tobacco:** United States all tobacco area for harvest in 2016 is expected to be 314,450 acres, down 4 percent from 2015. Flue-cured tobacco, at 209,000 acres, is 4 percent below 2015 and accounts for 66 percent of this year's total tobacco acreage. Total light air-cured tobacco type area, at 80,750 acres, is virtually unchanged from 2015. Burley tobacco, at 79,150 acres, is up slightly from last year.

Fire-cured tobacco, at 17,350 acres, is down 2 percent from 2015. Dark air-cured tobacco, at 5,950 acres, is 4 percent below last year. Cigar filler tobacco, at 1,400 acres is down 13 percent from the previous year.

**Spring potatoes:** Area planted to spring potatoes is expected to be 55,000 acres for the 2016 season, down 22 percent from 2015. Beginning with the 2016 season, Arizona was removed from the spring potato estimating program, and North Carolina was moved to the summer potato estimating program.

**Sweet potatoes:** Planted area of sweet potatoes in 2016 is expected to be 169,400 acres, up 8 percent from the previous year. January ending temperatures were above the norm in Mississippi. Rainy conditions during February and March either halted any field preparation, or made it sporadic at best. North Carolina's February topsoil moisture was rated 46 percent adequate and 54 percent surplus making it difficult to progress with field preparation.

**Dry beans:** Area planted to dry beans in 2016 is expected to be 1.56 million acres, down 12 percent from the previous season. Expected area planted for all chickpeas is 246,000 acres, up 19 percent from last season. Small chickpeas, at 83,000 acres, is 15 percent above 2015, while large chickpeas, at 163,000 acres, increased 20 percent from the previous year. If realized, both small and all chickpea acreage will be a record high. Strong prices and demand have encouraged farmers to increase chickpea area.

Six of the 11 estimating States expect a decrease in planted acres from last year. The top four producing States in 2015, which included Michigan, Minnesota, Nebraska, and North Dakota, are expecting lower acreage than a year ago.

**Lentils:** Area planted for the 2016 crop year is expected to total 850,000 acres, up 72 percent from 2015. Prospective plantings are up in all program States which includes Idaho, Montana, North Dakota, and Washington. Montana's anticipated area is up 113 percent from 2015, while North Dakota growers expect to plant 45 percent more acres than a year ago. If realized, planted acreage will be record high in Montana and the United States. Strong prices and demand have been reported.

**Dry edible peas:** Area planted for the 2016 crop year is expected to total 1.42 million acres, up 24 percent from 2015. If realized, this will be a record high planted area. Prospective plantings are up in North Dakota and Oregon, but down in Idaho, Montana, and Washington. If realized, North Dakota's expected planted area, at 640,000 acres, will be a record high. Nebraska and South Dakota were added to the estimating program this year.

**Austrian winter peas:** Intended planted area for 2016 is estimated at 31,000 acres, down 9 percent from 2015. Growers in Idaho indicated an acreage increase, while Montana farmers anticipate lower plantings from a year ago. No planted acreage change is anticipated in Oregon.

## Statistical Methodology

**Survey Procedures:** The acreage estimates in this report are based primarily on surveys conducted during the first two weeks of March. The March Agricultural Survey is a probability survey that includes a sample of over 83,000 farm operators selected from a list of producers that ensures all operations in the United States have a chance to be selected. These operators were contacted by mail, internet, telephone, or personal interview to obtain information on crop acreage intentions for the 2016 crop year.

**Estimating Procedures:** National, Regional, State, and grower reported data were reviewed for reasonableness and consistency with historical estimates. Each Regional Field Office submits their analysis of the current situation to the Agricultural Statistics Board (ASB). Survey data are compiled to the National level and are reviewed at this level independently of each State's review. Acreage estimates were based on survey data and the historical relationship of official estimates to the survey data.

**Revision Policy:** Acreage estimates in the *Prospective Plantings* report will not be revised. These estimates are intended to reflect grower intentions as of the survey period. New acreage estimates will be made based on surveys conducted in June when crop acreages have been established or planting intentions are firm. These new estimates will be published in the *Acreage* report scheduled for June 30, 2016. Winter wheat is an exception. Since winter wheat was seeded prior to the March survey, any changes in estimates in this report are considered revisions. The estimate of the harvested acreage of winter wheat will be published on May 10, 2016, along with the first production forecast of the crop year.

**Reliability:** The survey used to make acreage estimates is subject to sampling and non-sampling errors that are common to all surveys. Sampling errors represent the variability between estimates that would result if many different samples were surveyed at the same time. Sampling errors for major crops are generally between 1.0 and 3.0 percent, but they cannot be applied directly to the acreage published in this report to determine confidence intervals because the official estimates represent a composite of information from more than a single source.

Non-sampling errors cannot be measured directly. They may occur due to incorrect reporting and/or recording, data omissions or duplications, and errors in processing. To minimize non-sampling errors, vigorous quality controls are used in the data collection process and all data are carefully reviewed for consistency and reasonableness.

To assist users in evaluating the reliability of acreage estimates in this report, the "Root Mean Square Error," a statistical measure based on past performance, is computed. The deviations between the acreage estimates in this report and the final estimates are expressed as a percentage of the final estimates. The average of squared percentage deviations for the latest 20 year period is computed. The square root of the average becomes statistically the "Root Mean Square Error." Probability statements can be made concerning expected differences in the current estimates relative to the final end of season estimates, assuming that factors affecting this year's estimates are not different from those influencing recent years. For example, the "Root Mean Square Error" for the corn planted estimate is 1.5 percent. This means that chances are 2 out of 3 that the current corn acreage estimate will not be above or below the final estimate by more than 1.5 percent. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 2.6 percent.

Also, shown in the following table is a 20 year record for selected crops of the difference between the *Prospective Plantings* planted acreage estimates and the final estimates. Using corn again as an example, changes between the intentions estimates and the final estimates during the past 20 years have averaged 1.04 million acres, ranging from 32,000 acres to 3.07 million acres. The prospective plantings estimates have been below the final estimate 7 times and above 13 times. This does not imply that the planted estimate this year is likely to understate or overstate the final estimate.

## Reliability of Prospective Plantings Planted Acreage Estimates

[Based on data for the past twenty years]

Crop	Root mean square error	90 percent confidence interval	Difference between forecast and final estimate				
			Thousand acres			Years	
			Average	Smallest	Largest	Below final	Above final
	(percent)	(percent)	(1,000 acres)	(1,000 acres)	(1,000 acres)	(number)	(number)
Barley .....	7.1	12.3	234	31	455	5	15
Corn for grain .....	1.5	2.6	1,042	32	3,073	7	13
Oats .....	7.0	12.1	189	21	660	3	17
Sorghum for grain .....	9.4	16.2	655	31	2,471	13	7
Soybeans for beans .....	2.1	3.6	1,290	25	3,296	10	10
Upland cotton .....	6.4	11.0	620	6	2,115	11	9
Wheat							
Winter wheat .....	1.8	3.0	592	52	1,290	7	13
Durum wheat .....	20.5	35.4	241	15	1,028	12	8
Other spring .....	6.4	11.0	709	12	2,543	10	10

## USDA, National Agricultural Statistics Service Information Contacts

Listed below are the commodity statisticians in the Crops Branch of the National Agricultural Statistics Service to contact for additional information. E-mail inquiries may be sent to [nass@nass.usda.gov](mailto:nass@nass.usda.gov)

Lance Honig, Chief, Crops Branch .....	(202) 720-2127
Anthony Prillaman, Head, Field Crops Section .....	(202) 720-2127
Angie Considine – Cotton, Cotton Ginnings, Sorghum .....	(202) 720-5944
Tony Dahlman – Oats, Soybeans .....	(202) 690-3234
Chris Hawthorn – Corn, Flaxseed, Proso Millet .....	(202) 720-9526

Chris Singh – Apples, Apricots, Plums, Prunes, Tobacco .....	(202) 720-4288

## Access to NASS Reports

For your convenience, you may access NASS reports and products the following ways:

- All reports are available electronically, at no cost, on the NASS web site: <http://www.nass.usda.gov>
- Both national and state specific reports are available via a free e-mail subscription. To set-up this free subscription, visit <http://www.nass.usda.gov> and click on “National” or “State” in upper right corner above “search” box to create an account and select the reports you would like to receive.

For more information on NASS surveys and reports, call the NASS Agricultural Statistics Hotline at (800) 727-9540, 7:30 a.m. to 4:00 p.m. ET, or e-mail: [nass@nass.usda.gov](mailto:nass@nass.usda.gov).

The U.S. Department of Agriculture (USDA) prohibits discrimination against its customers, employees, and applicants for employment on the basis of race, color, national origin, age, disability, sex, gender identity, religion, reprisal, and where applicable, political beliefs, marital status, familial or parental status, sexual orientation, or all or part of an individual's income is derived from any public assistance program, or protected genetic information in employment or in any program or activity conducted or funded by the Department. (Not all prohibited bases will apply to all programs and/or employment activities.)

If you wish to file a Civil Rights program complaint of discrimination, complete the [USDA Program Discrimination Complaint Form](#) (PDF), found online at [http://www.ascr.usda.gov/complaint\\_filing\\_cust.html](http://www.ascr.usda.gov/complaint_filing_cust.html), or at any USDA office, or call (866) 632-9992 to request the form. You may also write a letter containing all of the information requested in the form. Send your completed complaint form or letter to us by mail at U.S. Department of Agriculture, Director, Office of Adjudication, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, by fax (202) 690-7442 or email at [program.intake@usda.gov](mailto:program.intake@usda.gov).
