Biological and Economic Analysis Division (7503P)

Diann Sims

TO: Karen Santora
Registration Branch 2
Special Review and Registration Division (7508P)

PRODUCT REVIEW PANEL: May 6, 2009

As part of the mitigation required in the reregistration eligibility decisions for the soil fumigants (i.e., chloropicrin, dazomet, metam potassium, metam sodium, and methyl bromide), EPA is requiring the soil fumigant registrants to develop and implement community outreach programs and first responder training programs for communities in high-use fumigant areas. This document describes the process developed by the Biological and Economic Analysis Division (BEAD) for identifying high-use fumigant areas at the county level.

Identifying high-use fumigant areas is a two step process because reliable fumigant use data are not available at the county level from publically available or from EPA proprietary sources. First, BEAD provided a ranking of fumigant use in each state using EPA proprietary data. Although state-level data are available from USDA-NASS, EPA

proprietary data are more robust. Second, high-use counties should be identified within those states using crop acreage as an indicator of usage. This step will be the registrant's responsibility. However, the process is described below. In addition, the excel file accompanying this document provides an example of this process using metam sodium (high use fumigant areas.exe).

State Ranking

The following describes the process for ranking fumigant use in each state. The average pounds applied across ten years (1999 -2008) was obtained from EPA proprietary data. Detailed data and calculations can be found in the accompanying excel file (high-use fumigant areas.exe). According to EPA proprietary data, Dazomet usage totals less than 100 pounds over the ten year period and, therefore, is not considered further for this purpose. Thresholds for identifying high-use states will be set by Special Review and Registration Division (SRRD). The following is an example of potential metam sodium/potassium high-use states identified through this process if the cutoff of 100,000 pounds is considered.

- Metam Sodium/Potassium: California, Washington, Idaho, Oregon, Wisconsin, Michigan, Florida, Minnesota, North Carolina, Virginia, Arizona, Nevada, Georgia, Colorado, and North Dakota

County Ranking

The registrants will be required to identify counties within each high-use state where fumigant use may be high using the following county ranking procedure developed by BEAD. Crop acreage is used as a surrogate indicator of fumigant usage because, at the county level, public fumigant use data are not available and EPA proprietary data are not suitable because those surveys may not include each county in a state or the number of observations are too low to adequately represent actual usage at the county level. Crop acreage can be obtained from the 2007 USDA Census of Agriculture. Acreages should be obtained for major use sites for each fumigant and then summed by county. A "major use site" is defined as having greater than five percent crop treated and/or at least one million pounds applied in the U.S. over two years (2004-2005). The following lists the major use sites by fumigant. SRRD will provide specific guidance for identifying high-use counties.

- Methyl Bromide: cantaloupes, peppers, squash, strawberries, tomatoes, watermelons.
- Metam Sodium/Potassium: artichokes, cabbage, cantaloupes, carrots, lettuce, onions, peanuts, peppers, potatoes, spinach, squash, tomatoes, watermelons.
- Chloropicrin: cantaloupes, peppers, squash, strawberries, sugar beets, tobacco, tomatoes, watermelons.
