

BETTER BUILDINGS, BETTER PLANTS CHALLENGE

OMB Control No. 1910-5141 Exp. Date 6/30/2019

Reporting Form Field	Instructions
Company Name:	Provide the name of the organization that has committed to the Water Savings Initiative
Company Contact Name:	Provide the name of the person at the organization who is responsible and knowledgeable for the information reported on this form.
	Provide the title of the person named as the Company Contact
	Provide the address for the organizational contact.
	Provide the phone number for the organizational contact.
	Provide the email address for the organizational contact.
NAICs of Participating Plants:	Provide the 6-digit North American Industry Classification Codes (NAICs) for the facilities that are under the scope of the pledge effort. If more than 1 NAICS code describes the facilities, please provide up to 3. To find your NAICs code, please visit: http://www.naics.com/search.htm. If you do not know your six digit code, please provide your 3 digit NAICS code.
	Identify the current reporting year, in YYYY format.
Baseline Year:	Identify the start and end month/yr of the baseline year for your pledge agreement. Please use MM/YYYY format. For the Baseline Reporting Form, the baseline year identified here should correspond to the Year of Reported Data.
Number of Participating Facilities:	Identify the number of facilities that are represented in the organization's baseline year and current pledge year.
Number of participating facilities that are manufacturing plants	Of the Number of Participating Facilities, indicate the number that are manufacturing plants.

	Provide the water intake in thousands of gallons by water source. Indicate if the intake for each source is determined through metering or estimatation techniques. Also indicate if reduction in the water intake from this source is included in the organization's water reduction target for the Water Savings Initiative. Definitions of each category are (note: Per EPA secondary drinking water standard, 'freshwater' is water containing less than 500 milligrams per liter of total dissolved solids): Water utility (public or private): Freshwater purchased from a local water department Surface freshwater, including self-supplied: Freshwater that collects on the surface of the ground. Surface freshwater sources include water in rivers, streams, creeks, lakes, and reservoirs Ground freshwater, including self-supplied: Freshwater beneath the earth's surface Other freshwater: Freshwater sources not listed Total saline water intake (e.g., ocean water): Total all water intake from sources located outside of the facility with greater than 500 milligrams/liter of dissolved solids. Salt water, such as sea/ocean water, intake would be included here. Rainwater: Rainfall water captured and used onsite Externally supplied recycled: Also referred to as reclaimed water, water from an external source that has been used for elsewhere, treated as required, and supplied to the facility for use. This excludes water recycled on-site and re-used at the facility. Examples include purchased municipality grey water or water used by an adjacent business. Total water intake: Total all the water intake for the facilities included in the Water Savings Initiative. This should be the sum of the preceeding rows
	Sum the water sources covered under the scope of your water savings commitment. NOTE: DOE does not require rainwater or on-site recycled water to be included in this total
	Identify the baseline adjustment due to Increase/Decrease in the Number of Facilities Reporting Relative to Baseline Year or other operational changes, if applicable. This is only required for current year reporting and not required for baseline year reporting.
	Reasons can include changes to the plant portfolio (e.g., acquisitions or closures), significant process changes that impact water consumption (e.g., new product line), or other operational changes since the baseline year that impact water consumption
	Indicate the unit(s) for the water intensity metric(s) used for tracking water reduction for the Water Savings Initiative. Examples include thousand gallons/ton of product, thousand gallons/labor hours. If different metrics are used at various facilities, please list up to three. If using an absolute metric, please indicate the unit of intake being used (e.g., thousand gallons). If using a regression-based approach, leave this field blank.
	Indicate the water intensity at the organization level (if one exists) for the baseline year. This is the water intensity against which progress towards target achievement is calculated. If water intensity improvements are calculated at the plant level and rolled up to the organization level, leave this field blank.
Annual improvement in water intensity for current year (%):	Provide the change in water intensity experienced in current year. A simple way of calculating this value is to subtract last year's Total Change in Water Intensity from the current year's Total Change in Water Intensity.
Total change In water intensity (%):	Provide the total change in water intensity since the baseline year. This value can be calculated with the following equation: Total Improvement in Water Intensity (%) = (Water Intensity _{Baseline Year} Water Intensity _{Current Year}) / Water Intensity _{Baseline Year}
	Briefly describe the data and calculations to determine the reported water intensity improvement, especially the process through which facility-level metrics are rolled up to the corporate level
employed during the previous year to decrease water intensity.	Briefly describe, in general, the range of technologies, strategies and practices employed since the baseline year that resulted in a reduction in water intensity. If possible, identify systems and/or facilities that were impacted, approximate water savings, and implementation cost. Optional details: geographic location, industry, and additional descriptive details about the projects.

Facility-Level Water Performance (Applies to Companies with Multiple Plants)

Please mark down the number of facilities that have achieved the level of "Water Intensity Performance Level" indicated in the left hand column of the table. Facility-level water intensity should be measured on a cumulative basis against the organization's baseline year. Please ensure that all plants in the current year portfolio are accounted for.
