

5. QI Measures

Produce quality improvement (QI) measures using electronic health record (EHR) data (or alternative means) for the following 4 metrics (at a minimum):

- The percentage of patients on long-term opioid therapy who are taking 90 MMEs or more per day.
- The percentage of patients on long-term opioid therapy who received a prescription for a benzodiazepine.
- The percentage of patients with a new opioid prescription with documentation that a PDMP was checked prior to prescribing.
- The percentage of patients with a new opioid prescription with documentation that a urine drug test was performed prior to prescribing.

Each participating health care organization will be asked to submit these aggregate reports quarterly during project implementation.
