Released June 12, 2018, by the National Agricultural Statistics Service (NASS), Agricultural Statistics Board, United States Department of Agriculture (USDA).

### Winter Wheat Production Up 1 Percent from May Forecast Orange Production Unchanged

Winter wheat production is forecast at 1.20 billion bushels, up 1 percent from the May 1 forecast but down 6 percent from 2017. As of June 1, the United States yield is forecast at 48.4 bushels per acre, up 0.3 bushel from last month but down 1.8 bushels from last year's average yield of 50.2 bushels per acre.

Hard Red Winter production, at 650 million bushels, is up 1 percent from last month. Soft Red Winter, at 316 million bushels, is up slightly from the May forecast. White Winter, at 232 million bushels, is up 2 percent from last month. Of the White Winter production, 21.8 million bushels are Hard White and 210 million bushels are Soft White.

The United States all orange forecast for the 2017-2018 season is 3.89 million tons, unchanged from last month but down 23 percent from the 2016-2017 final utilization. The Florida all orange forecast, at 45.0 million boxes (2.02 million tons), is unchanged from last month but down 35 percent from last season's final utilization. Early, midseason, and Navel varieties in Florida are forecast at 19.0 million boxes (853,000 tons), unchanged from last month but down 43 percent from last season's final utilization. The Florida Valencia orange forecast, at 26.0 million boxes (1.17 million tons), is unchanged from last month but down 27 percent from last season's final utilization. California and Texas orange production forecasts were carried forward from the previous month.

This report was approved on June 12, 2018.

Secretary of Agriculture Designate Robert Johansson Agricultural Statistics Board Chairperson Joseph L. Parsons

#### Winter Wheat for Grain Objective Yield Data

The National Agricultural Statistics Service is conducting objective yield surveys in 10 winter wheat-producing States during 2018. Randomly selected plots in winter wheat for grain fields are visited monthly from May through harvest to obtain specific counts and measurements. Data in this table are based on counts from this survey.

#### **May Weather Summary**

Consistent warmth and erratic rainfall highlighted an unusual May. In fact, 2018 featured the Nation's warmest May on record. Unlike previous years, however, such as 1934, 1936, and 2012, when near-record to record-setting May warmth was accompanied by rapidly developing drought, sufficient rain fell in many areas during May 2018 to forestall major drought concerns.

Notable exceptions included the southern High Plains and the Southwest, where ongoing drought and hot conditions hastened winter wheat maturation but increased stress on rangeland, pastures, and rain-fed summer crops. By June 3, Arizona led the United States with 94 percent of its rangeland and pastures rated in very poor to poor condition, followed by New Mexico (68 percent), Colorado (40 percent), and Texas (37 percent). May dryness was also noted in a few other regions, including much of New England, the western Gulf Coast region, portions of the mid-South, and a few Midwestern pockets.

In contrast, exceptionally wet weather prevailed in the middle and southern Atlantic States, hampering fieldwork and potentially reducing the quality of crops such as hay, fruits, and winter wheat. On June 3, topsoil moisture was rated at least one-half surplus in Delaware (68 percent), Maryland (60 percent), Virginia (56 percent), and North Carolina (51 percent). Elsewhere, above-normal May rainfall was also observed across the northern and central High Plains and the northern Intermountain West, generally benefiting winter grains and spring-sown crops.

The pervasive May warmth promoted a rapid pace of summer crop emergence and development, especially across the Plains and Midwest. More than two-thirds (68 percent) of the Nation's soybean acreage had emerged by June 3—the quickest pace since 2012. In drier areas, such as Texas, the warmth also favored fieldwork. More than one-third (35 percent) of the Texas winter wheat crop had been harvested by June 3.

#### **May Agricultural Summary**

May was warmer than normal for much of the Nation. From the Mid-Atlantic, through the Great Lakes, to northern Texas, temperatures were 6°F or more above normal. Temperatures were similarly warm in the Northern Plains and northern Rockies. Precipitation was above normal in much of the Southeast, with nearly all of Florida receiving 7 or more inches of rain. Two or more inches of precipitation fell across much of the Rockies during the month, but the Colorado Basin remained dry. The drought in the Colorado Basin and southern Plains continued through the month, though conditions did improve in parts of Texas and Oklahoma.

By May 6, corn producers had planted 39 percent of the Nation's corn acreage, 6 percentage points behind the previous year and 5 percentage points behind the 5-year average. Eight percent of the Nation's corn acreage had emerged by May 6, six percentage points behind both the previous year and the 5-year average. Producers had planted 81 percent of the Nation's corn acreage by May 20, one percentage point behind the previous year but equal to the 5-year average. Fifty percent of the Nation's corn acreage had emerged by May 20, one percentage point behind the previous year but 3 percentage points ahead of the 5-year average. By June 3, producers had planted 97 percent of the Nation's corn acreage, 2 percentage points ahead of both the previous year and the 5-year average. Eighty-six percent of the Nation's corn acreage had emerged by June 3, two percentage points ahead of the previous year and 3 percentage points ahead of the 5-year average. As of June 3, seventy-eight percent of the Nation's corn acreage was rated in good to excellent condition, 10 percentage points above the same time last year.

Fifteen percent of the Nation's soybean acreage was planted by May 6, two percentage points ahead of both the previous year and the 5-year average. Ten percent of the Nation's soybean acreage had emerged by May 13, three percentage points ahead of the previous year and 4 percentage points ahead of the 5-year average. By May 20, fifty-six percent of the Nation's soybean acreage was planted, 6 percentage points ahead of the previous year and 12 percentage points ahead of the 5-year average. Twenty-six percent of the Nation's soybean acreage had emerged by May 20, nine percentage points ahead of the previous year and 11 percentage points ahead of the 5-year average. Producers had planted 87 percent of the Nation's soybean acreage by June 3, six percentage points ahead of the previous year and 12 percentage points ahead of the 5-year average. Sixty-eight percent of the Nation's soybean acreage had emerged by June 3, thirteen percentage points ahead of the previous year and 16 percentage points ahead of the 5-year average. As of June 3, seventy-five percent of the

Nation's soybean acreage was rated in good to excellent condition.

By May 6, thirty-three percent of the Nation's winter wheat acreage was headed, 16 percentage points behind the previous year and 8 percentage points behind the 5-year average. As of May 6, thirty-four percent of the 2018 winter wheat acreage was reported in good to excellent condition, 19 percentage points below the same time the previous year. Sixty-one percent of the Nation's winter wheat acreage had reached the headed stage by May 20, ten percentage points behind the previous year and 3 percentage points behind the 5-year average. By June 3, eighty-three percent of the Nation's winter wheat acreage had reached the headed stage, 3 percentage points behind the previous year but equal to the 5-year average. Five percent of the 2018 winter wheat acreage was harvested by June 3, four percentage points behind the previous year but 1 percentage point ahead of the 5-year average. As of June 3, thirty-seven percent of the 2018 winter wheat acreage was reported in good to excellent condition, 12 percentage points below the same time last year.

Nationwide, 20 percent of the cotton acreage was planted by May 6, equal to both the previous year and the 5-year average. Fifty-two percent of the cotton acreage was planted by May 20, three percentage points ahead of the previous year and 7 percentage points ahead of the 5-year average. By June 3, seventy-six percent of the cotton acreage was planted, two percentage points behind the previous year but equal to the 5-year average. Nine percent of the Nation's cotton acreage had reached the squaring stage by June 3, one percentage point behind the previous year but 3 percentage points ahead of the 5-year average. As of June 3, forty-two percent of the 2018 cotton acreage was rated in good to excellent condition, 19 percentage points below the same time last year.

Twenty-nine percent of the Nation's sorghum acreage was planted by May 6, one percentage point behind the previous year but equal to the 5-year average. Thirty-nine percent of the Nation's sorghum acreage was planted by May 20, three percentage points ahead of the previous year and 1 percentage point ahead of the 5-year average. By June 3, sixty-one percent of the Nation's sorghum acreage was planted, 8 percentage points ahead of the previous year and seven percentage points ahead of the 5-year average. Producers in Texas had planted 95 percent of the State's intended sorghum acreage by June 3, four percentage points ahead of the previous year and 12 percentage points ahead of the 5-year average.

Producers seeded 68 percent of the 2018 rice acreage by May 6, eight percentage points behind the previous year and 1 percentage point behind the 5-year average. By May 6, forty-four percent of the Nation's rice acreage had emerged, 20 percentage points behind the previous year and 6 percentage points behind the 5-year average. Ninety-three percent of the Nation's 2018 rice acreage had been seeded by May 20, three percentage points ahead of the previous year and 4 percentage points ahead of the 5-year average. By May 20, seventy-four percent of the Nation's rice acreage had emerged, 3 percentage points behind the previous year but equal to the 5-year average. By June 3, ninety-five percent of the Nation's rice acreage had emerged, 5 percentage points ahead of the previous year and 4 percentage points ahead of the 5-year average. As of June 3, seventy-four percent of the Nation's rice acreage was rated in good to excellent condition, 8 percentage points above the same time last year.

Nationally, oat producers had seeded 56 percent of this year's acreage by May 6, twenty-one percentage points behind the previous year and 18 percentage points behind the 5-year average. Thirty-four percent of the Nation's oat acreage had emerged by May 6, twenty-three percentage points behind the previous year and 20 percentage points behind the 5-year average. Oat producers had seeded 86 percent of this year's intended acreage by May 20, eight percentage points behind the previous year and 5 percentage points behind the 5-year average. Sixty-seven percent of the Nation's oat acreage had emerged by May 20, fourteen percentage points behind the previous year and 10 percentage points behind the 5-year average. Twenty-five percent of the Nation's oat acreage was headed by May 20, three percentage points ahead of the previous year but equal to the 5-year average. Oat producers had seeded 98 percent of this year's acreage by June 3, one percentage point behind the previous year but equal to the 5-year average. Ninety percent of the Nation's oat acreage had emerged by June 3, five percentage points behind the previous year and 3 percentage points behind the 5-year average. Thirty-one percent of the Nation's oat acreage was headed by June 3, three percentage points behind the previous year and two percentage points behind the 5-year average. As of June 3, sixty-five percent of the Nation's oat acreage was rated in good to excellent condition, 3 percentage points above the same time last year.

Forty-two percent of the Nation's barley crop was planted by May 6, eight percentage points behind the previous year and

17 percentage points behind the 5-year average. By May 6, thirteen percent of the Nation's barley acreage had emerged, 11 percentage points behind the previous year and 17 percentage points behind the 5-year average. Eighty-one percent of the Nation's barley was planted by May 20, six percentage points behind the previous year and 3 percentage points behind the 5-year average. By May 20, forty-five percent of the Nation's barley acreage had emerged, 12 percentage points behind the previous year and 13 percentage points behind the 5-year average. Ninety-seven percent of the Nation's barley crop was planted by June 3, one percentage point behind the previous year but 2 percentage points ahead of the 5-year average. By June 3, eighty-two percent of the Nation's barley acreage had emerged, 1 percentage point behind both the previous year and the 5-year average. As of June 3, seventy-nine percent of the Nation's barley acreage was rated in good to excellent condition, 10 percentage points above the same time last year.

By May 6, thirty percent of the spring wheat acreage was seeded, 21 percentage points behind both the previous year and the 5-year average. Four percent of the Nation's spring wheat crop had emerged by May 6, fifteen percentage points behind the previous year and 18 percentage points behind the 5-year average. Seventy-nine percent of the Nation's spring wheat acreage was seeded by May 20, nine percentage points behind the previous year and 1 percentage point behind the 5-year average. Thirty-seven percent of the Nation's spring wheat crop had emerged by May 20, twenty-two percentage points behind the previous year and 15 percentage points behind the 5-year average. By June 3, ninety-seven percent of the spring wheat acreage was seeded, 2 percentage points behind the previous year but 3 percentage points ahead of the 5-year average. Eighty-one percent of the Nation's spring wheat had emerged by June 3, seven percentage points behind the previous year and 1 percentage point behind the 5-year average. Seventy percent of the Nation's spring wheat crop was rated in good to excellent condition, 15 percentage points above the same time last year.

Nationally, peanut producers had planted 23 percent of this year's peanut acreage by May 6, equal to the previous year but 5 percentage points ahead of the 5-year average. By May 20, peanut producers had planted 63 percent of this year's peanut acreage, one percentage point behind the previous year but 8 percentage points ahead of the 5-year average. Peanut producers had planted 83 percent of this year's peanut acreage by June 3, six percentage points behind the previous year and 4 percentage points behind the 5-year average. As of June 3, fifty-nine percent of the Nation's peanut acreage was rated in good to excellent condition, 13 percentage points below the same time last year.

By May 6, sixty-six percent of the Nation's sugarbeet acreage was planted, 4 percentage points behind the previous year but 3 percentage points ahead of the 5-year average. By May 20, sugarbeet plantings were virtually complete with ninety-five percent of the Nation's sugarbeet acreage planted, 1 percentage point behind the previous year but 6 percentage points ahead of the 5-year average.

Twelve percent of Nation's intended 2018 sunflower acreage was planted by May 20, five percentage points behind the previous year but equal to the 5-year average. By June 3, forty-nine percent of sunflower acreage had been planted, nine percentage points behind the previous year but 8 percentage points ahead of the 5-year average. Sunflower planting was ahead of the 5-year average in all estimating States.

#### **Crop Comments**

Winter wheat: Production is forecast at 1.20 billion bushels, up 1 percent from the May 1 forecast but down 6 percent from 2017. As of June 1, the United States yield is forecast at 48.4 bushels per acre, up 0.3 bushel from last month but down 1.8 bushels from last year's average yield of 50.2 bushels per acre. As of June 3, thirty-seven percent of the winter wheat crop in the 18 major producing States was rated in good to excellent condition, 12 percentage points lower than at the same time last year. Conversely, 35 percent of the winter wheat crop in the 18 major producing States was rated in very poor to poor condition, 20 percentage points higher than at the same time last year. Nationally, 83 percent of the winter wheat crop was headed by June 3, the same as the 5-year average pace. As of June 3, five percent of the 2018 winter wheat acres had been harvested in the 18 major producing States. Harvest was underway in Arkansas, California, North Carolina, Oklahoma, and Texas. Record high yields are expected in Kentucky, Michigan, and Tennessee.

Forecasted head counts from the objective yield survey in the six Hard Red Winter States (Colorado, Kansas, Montana, Nebraska, Oklahoma, and Texas) are above last year's level in Texas but below in Colorado, Kansas, Montana, Nebraska,

and Oklahoma. As of June 3, Kansas, Oklahoma, and Texas winter wheat was rated 49 percent, 63 percent, and 58 percent, in very poor to poor condition, compared with 16 percent, 11 percent, and 16 percent, in good to excellent condition, respectively. Drought conditions were prevalent across parts of Colorado, Kansas, Oklahoma, and Texas.

Forecasted head counts from the objective yield survey in the three Soft Red Winter States (Illinois, Missouri, and Ohio) are below last year's levels in Missouri, but above last year's levels in Illinois and Ohio.

Forecasted head counts from the objective yield survey in Washington are above last year. As of June 3, Idaho, Oregon, and Washington winter wheat was rated 74 percent, 67 percent, and 89 percent, in good to excellent condition, respectively. In Idaho, a warm May led to favorable conditions. In Oregon, conditions in parts of the State worsened from moderate to severe drought from May to June.

**Durum wheat:** Production of Durum wheat in Arizona and California is forecast at a collective 12.0 million bushels, up 5 percent from 2017. In Arizona, 29 percent of the acreage was harvested by June 3, slightly ahead of last year and 8 percentage points ahead of the 5-year average. The Arizona crop was rated at 79 percent in the good to excellent categories, 9 percentage points below the 5-year average.

**Florida citrus:** In the citrus growing region, daily high temperatures were reported as average or above average all month, ranging from the mid-80s to low 90s on most days. Nighttime lows were in the 60s and 70s. Rainfall was well above average in the citrus growing region. All monitored stations had at least twice the normal precipitation for this time of the year. Several stations in the Western and Northern area and the Indian River District had over twelve inches of rain. Towards the end of the month, subtropical storm Alberto moved across the Gulf of Mexico, running parallel to the western shore of Florida. The rainfall associated with the storm resulted in removal of abnormal dryness across the complete State. According to the June 5, 2018 United States Drought Monitor, the entire citrus region was drought free.

Valencia harvest is relatively over for the season. Growers were concentrating on next year's crop. With a dry bloom period and recent spring rainfall, fruit was holding and progressing well on the citrus trees. Oranges were reported as golf ball size and larger, while grapefruit were about as large as tennis balls. Irrigation was cut back some due to the rainfall over several days. Spraying was heavier during the first of the month when dry weather prevailed. Caretakers and grove owners sprayed nutritionals, summer oils, put down herbicides, and put out fertilizer. Some growers were mowing after harvest, taking care of young trees, cleaning ditches, and performing general grove maintenance.

**California citrus:** The harvest of late variety Navel oranges continued with some growers reporting grading issues. Valencia oranges were harvested. Seedless tangerine groves remained netted for the bloom. Grapefruit harvest was wrapping up. Some citrus trees were being planted and older trees were trimmed and skirted.

California noncitrus fruits and nuts: Vineyards continued to leaf-out and progress into the early stages of flowering. Leaf removal was ongoing in some vineyards. Immature fruit on early stone fruit varieties were thinned. New orchards were being planted. Cherries were sizing well and some early varieties were harvested. By mid-month, the cherry harvest was well underway. Pomegranates, persimmons, olives, and kiwis were blooming. Kiwi pollen was being collected to be used to pollenate other blocks. Towards the end of May, grapes were developing. Some early apricots were harvested. Walnut and pistachio bloom was ongoing. Almonds were developing well. Almond and walnuts were irrigated. Pesticides and fungicides were applied to some almond groves. Weed control continued.

**Grapefruit:** The United States 2017-2018 grapefruit crop is forecast at 553,000 tons, down 1 percent from last month and 21 percent below last season's final utilization. In Florida, expected production, at 3.88 million boxes (165,000 tons), is down 2 percent from last month and down 50 percent from last year. California and Texas grapefruit production forecasts were carried forward from the previous month.

**Tangerines and mandarins:** The United States tangerine and mandarin crop is forecast at 876,000 tons, unchanged from last month but down 15 percent from last season's final utilization. The Florida tangerine and mandarin forecast, at 750,000 boxes (36,000 tons) is unchanged from last month but down 54 percent from the previous year. The California tangerine and mandarin forecast was carried forward from the previous month.

**Prunes (dried plums):** California's 2018 prune production is forecast at 80,000 dried tons, down 24 percent from last year. Some locations experienced inclement weather during the bloom and pollination time which negatively impacted the 2018 expected production.

**Cherries, Tart:** United States tart cherry production is forecast at 353 million pounds, up 48 percent from the 2017 production.

In Michigan, the largest tart cherry producing State, growers were expecting an above average crop. Weather conditions were favorable for a quick bloom period with high temperatures in May. Utah growers reported an above average crop this year. Warmer weather conditions were favorable for an early bloom. In New York, weather conditions were also favorable and the crop was off to a good start. Growers reported a good crop with an average bloom.

In Washington, growers reported moderate spring temperatures and moisture and expected harvest to begin later than normal. In Wisconsin, snow storms and cool temperatures lead to a delay in the crop this year. Growers reported that they expected a good crop, although there was some concern about potential damage from invasive flies.

Cherries, Sweet: United States sweet cherry production is forecast at 319,900 tons, down 26 percent from 2017.

In Washington and Oregon, cool and wet weather and an extended bloom hampered pollination and led to a lighter fruit set of early varieties. Growers were concerned about the extent of fruit drop in early varieties through harvest. In California, growers reported a warm winter across the State and damaging frost over several days in late February, followed by heavy rains in March that impacted much of the crop.

In Michigan, growers were expecting an above average crop. Weather conditions were reported as favorable, as higher temperatures promoted a quick blooming period during late spring.

**Maple syrup:** The 2018 United States maple syrup production totaled 4.16 million gallons, down 3 percent from the previous year. The number of taps is estimated at 13.7 million, up 3 percent from the 2017 total. Yield per tap is estimated to be 0.304 gallon, down 5 percent from the previous season.

The earliest sap flow reported was January 7 in Pennsylvania. The latest sap flow reported to open the season was March 1 in Minnesota. On average, the season lasted 42 days, compared with 37 days in 2017. The 2017 United States average price per gallon was \$33.00, down \$2.00 from 2016. Value of production, at \$141 million for 2017, was down 4 percent from the previous season.

#### **Statistical Methodology**

Wheat survey procedures: Objective yield and farm operator surveys were conducted between May 25 and June 7 to gather information on expected yield as of June 1. The objective yield survey was conducted in 10 States that accounted for 73 percent of the 2017 winter wheat production. Farm operators were interviewed to update previously reported acreage data and seek permission to randomly locate two sample plots in selected winter wheat fields. The counts made within each sample plot depended upon the crop's maturity. Counts such as number of stalks, heads in late boot, and number of emerged heads were made to predict the number of heads that will be harvested. The counts are used with similar data from previous years to develop a projected biological yield. The average harvesting loss is subtracted to obtain a net yield. The plots are revisited each month until crop maturity when the heads are clipped, threshed, and weighed. After the farm operator has harvested the sample field, another plot is sampled to obtain current year harvesting loss.

The farm operator survey was conducted primarily by telephone with some use of mail, internet, and personal interview. Approximately 3,900 producers were interviewed during the survey period and asked questions about the probable yield on their operation. These growers will continue to be surveyed throughout the growing season to provide indications of average yields.

Orange survey procedures: The orange objective yield survey for the June 1 forecast was conducted in Florida, which produced about 61 percent of the United States production last season. In August and September 2017, the number of bearing trees and the number of fruit per tree is determined. In August and subsequent months, fruit size measurement and fruit droppage surveys are conducted, which combined with the previous components are used to develop the current forecast of production. California and Texas conduct grower surveys on a quarterly basis in October, January, April, and July. California also conducts objective measurement surveys in September for Navel oranges and in March for Valencia oranges.

Wheat estimating procedures: National and State level objective yield and grower reported data were reviewed for reasonableness and consistency with historical estimates. The survey data were also reviewed considering weather patterns and crop progress compared to previous months and previous years. Each Regional Field Office submits their analysis of the current situation to the Agricultural Statistics Board (ASB). The ASB uses the survey data and the State analyses to prepare the published June 1 forecasts.

**Orange estimating procedures:** State level objective yield indications for Florida oranges were reviewed for errors, reasonableness, and consistency with historical estimates. The Florida Field Office submits its analysis of the current situation to the Agricultural Statistics Board (ASB). The ASB uses the Florida survey data and their analysis to prepare the published June 1 forecast. The June 1 orange production forecasts for California and Texas are carried forward from April.

**Revision policy:** The June 1 production forecast will not be revised; instead, a new forecast will be made each month throughout the growing season. End-of-season wheat estimates are made after harvest. At the end of the wheat marketing season, a balance sheet is calculated using carryover stocks, production, exports, millings, feeding, and ending stocks. Revisions are then made if the balance sheet relationships or other administrative data warrant changes. End-of-season orange estimates will be published in the *Citrus Fruits Summary* released in August. The orange production estimates are based on all data available at the end of the marketing season, including information from marketing orders, shipments, and processor records. Allowances are made for recorded local utilization and home use.

**Reliability:** To assist users in evaluating the reliability of the June 1 production forecast, the "Root Mean Square Error," a statistical measure based on past performance, is computed. The deviation between the June 1 production forecast and the final estimate is expressed as a percentage of the final estimate. The average of the squared percentage deviations for the latest 20-year period is computed. The square root of the average becomes statistically the "Root Mean Square Error." Probability statements can be made concerning expected differences in the current forecast relative to the final end-of-season estimate, assuming that factors affecting this year's forecast are not different from those influencing recent years.

The "Root Mean Square Error" for the June 1 winter wheat production forecast is 5.1 percent. This means that chances are 2 out of 3 that the current winter wheat production will not be above or below the final estimate by more than 5.1 percent. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 8.8 percent. Differences between the June 1 winter wheat production forecast and the final estimate during the past 20 years have averaged 65 million bushels, ranging from 4 million to 166 million bushels. The June 1 forecast has been below the final estimate 11 times and above 9 times. This does not imply that the June 1 winter wheat forecast this year is likely to understate or overstate final production.

The "Root Mean Square Error" for the June 1 orange production forecast is 1.8 percent. However, if you exclude the three abnormal production seasons (one freeze season and two hurricane seasons), the "Root Mean Square Error" is 1.9 percent. This means that chances are 2 out of 3 that the current orange production forecast will not be above or below the final estimates by more than 1.8 percent, or 1.9 percent when excluding abnormal seasons. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 3.1 percent, or 3.3 percent when excluding abnormal seasons.

Changes between the June 1 orange forecast and the final estimates during the past 20 years have averaged 121,000 tons (135,000 tons, excluding abnormal seasons), ranging from 5,000 tons to 368,000 tons (23,000 tons to 368,000 tons excluding abnormal seasons). The June 1 forecast for oranges has been below the final estimate 9 times and above 11 times (below 6 times and above 11 times, excluding abnormal seasons). The difference does not imply that the June 1 forecast this year is likely to understate or overstate final production.

#### **Access to NASS Reports**

For your convenience, you may access NASS reports and products the following ways:

- All reports are available electronically, at no cost, on the NASS web site: <a href="www.nass.usda.gov">www.nass.usda.gov</a>
- ➤ Both national and state specific reports are available via a free e-mail subscription. To set-up this free subscription, visit <a href="www.nass.usda.gov">www.nass.usda.gov</a> and click on "National" or "State" in upper right corner above "search" box to create an account and select the reports you would like to receive.

For more information on NASS surveys and reports, call the NASS Agricultural Statistics Hotline at (800) 727-9540, 7:30 a.m. to 4:00 p.m. ET, or e-mail: nass@nass.usda.gov.

The U.S. Department of Agriculture (USDA) prohibits discrimination against its customers, employees, and applicants for employment on the basis of race, color, national origin, age, disability, sex, gender identity, religion, reprisal, and where applicable, political beliefs, marital status, familial or parental status, sexual orientation, or all or part of an individual's income is derived from any public assistance program, or protected genetic information in employment or in any program or activity conducted or funded by the Department. (Not all prohibited bases will apply to all programs and/or employment activities.)

If you wish to file a Civil Rights program complaint of discrimination, complete the <u>USDA Program Discrimination</u> <u>Complaint Form</u> (PDF), found online at <u>www.ascr.usda.gov/filing-program-discrimination-complaint-usda-customer</u>, or at any USDA office, or call (866) 632-9992 to request the form. You may also write a letter containing all of the information requested in the form. Send your completed complaint form or letter to us by mail at U.S. Department of Agriculture, Director, Office of Adjudication, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, by fax (202) 690-7442 or email at <u>program.intake@usda.gov</u>.
