                <comment>Several stratified layers starting at a depth ≤6 inches
 (15 cm) from the soil surface. At
least one of the layers has value of 3 or less and chroma of 1 or less, or it is
 muck,
mucky peat, peat, or a mucky modified mineral texture. The remaining layers hav
</comment>

e
chroma of 2 or less. For any sandy material that constitutes the layer with val
ue of 3 or
less and chroma of 1 or less, at least 70 percent of the visible soil particles
must be
masked with organic material, viewed through a 10x or 15x hand lens. Observed
without a hand lens, the particles appear to be close to 100 percent masked.

Use of this indicator may require assistance from a trained soil scientist with
local
experience. A stratified layer is depositional and not pedogenic. An undisturb
ed sample
must be observed. Individual strata are dominantly less than 1 inch (2.5 cm) th
ick. A
hand lens is an excellent tool to aid in the identification of this indicator.
Many alluvial
soils have stratified layers at greater depths; these soils do not meet the requ
irements
of this indicator. Many alluvial soils have stratified layers at the required d
epths but do
not have chroma of 2 or less; these do not meet the requirements of this indicat
or.</comment>

;: 2, "2": ""}">
                <comment>A layer that has a depleted matrix with 60 percent or m
ore chroma of 2 or less and that has
a minimum thickness of either:

a. 2 inches (5 cm) if the 2 inches starts at a depth ≤4 inches (10 cm) from the
soil surface, or
b. 6 inches (15 cm), starting at a depth ≤10 inches (25 cm) from the soil surfac
e.

A, E, and calcic horizons may have low chromas and high values and may therefore
 be
mistaken for a depleted matrix; however, they are excluded from the concept of d
epleted
matrix unless the soil has common or many distinct or prominent redox concentrat
ions
occurring as soft masses or pore linings. The low-chroma matrix must be the res
ult of
wetness and not a weathering or parent material feature.</comment>

                <comment>A layer with a depleted or gleyed matrix that has 60 pe
rcent or more chroma of 2 or less, starting at a
depth ≤12 inches (30 cm) from the soil surface, and having a minimum thickness o
f either:

a. 6 inches (15 cm), or
b. 2 inches (5 cm) if the 2 inches consists of fragmental soil material.

Organic, loamy, or clayey layer(s) above the depleted or gleyed matrix must have value of 3 or less
and chroma of 2 or less starting at a depth ≤6 inches (15 cm) from the soil surface and extend to the
depleted or gleyed matrix. Any sandy material above the depleted or gleyed matrix must have value
of 3 or less and chroma of 1 or less starting at a depth ≤6 inches (15 cm) from the soil surface and
extend to the depleted or gleyed matrix. Viewed through a 10x or 15x hand lens, at least 70 percent
of the visible sand particles must be masked with organic material. Observed without a hand lens, the
sand particles appear to be close to 100 percent masked. A, E, and calcic horizons may have low
chromas and high values and may therefore be mistaken for a depleted matrix; however, they are
excluded from the concept of depleted matrix unless the soil has common or many distinct or
prominent redox concentrations occurring as soft masses or pore linings. The low-chroma matrix must
be the result of wetness and not a weathering or parent material feature.</comment>

		<comment>A layer at least 6 inches (15 cm) thick with a depleted
 or gleyed matrix that has 60 percent or more chroma
of 2 or less starting below 12 inches (30 cm) of the surface. The layer(s) abov
e the depleted or gleyed
matrix and starting at a depth <6 inches (15 cm) from the soil surface must h
ave value of 2.5 or less and
chroma of 1 or less to a depth of at least 12 inches (30 cm) and value of 3 or l
ess and chroma of 1 or less in
any remaining layers above the depleted or gleyed matrix. In any sandy material
 above the depleted or
gleyed matrix, at least 70 percent of the visible soil particles must be masked

with organic material, viewed
through a 10x or 15x hand lens. Observed without a hand lens, the particles app
ear to be close to 100
percent masked. A, E, and calcic horizons may have low chromas and high values
and may therefore be
mistaken for a depleted matrix; however, they are excluded from the concept of d
epleted matrix unless the
soil has common or many distinct or prominent redox concentrations occurring as
soft masses or pore linings.
The low- chroma matrix must be the result of wetness and not a weathering or par
ent material feature.</comment>
