

# LEMAS Nonresponse Bias Report

## Introduction

We examine two features in this nonresponse bias report. First, we calculate the effect size as a measure of the difference between the respondents and the population. Additionally, we compare non-response weighted and design weighted estimates for a few outcomes to empirically examine the effect of nonresponse weighting.

## Effect Size: Comparing Respondents to the Frame

We compare respondents to the frame on two characteristics – agency size (using data on frame) and population served within each agency type. We use the categories of agency sized that were used in strata construction and the population served as documented in the analysis file. **Table 1** shows the Cohen’s effect size for the two variables for each agency type. There were no separate agency size strata for state agencies, so that analysis was not conducted.

**Table 1: Nonresponse Effect Size<sup>1</sup>**

Agency Type	Agency Size Effect Size	Population Served Effect Size
Local Police	0.08	0.08
Sheriff	0.07	0.07
State	N/A	0.03

Generally, an effect size is defined as small if it is less than 0.2. As shown in Table 1, all of the effect sizes are lower than that threshold, meaning that they are all considered small, Thus, we do not have evidence of a statistical difference between the respondents and the frame.

---

<sup>1</sup> Detailed calculations are in the attached appendix.

## Effect of Nonresponse Bias Weighting

When constructing analysis weights, nonresponse adjustment was used. If this adjustment affects estimates significantly, it can be a sign of nonresponse bias. We compare the estimates for 5 outcomes for estimates under design weights compared to estimates under analysis weights.

**Table 2: Comparison of Estimates Using Design and Analysis Weights**

Estimate	Weight	Local Police	Sheriff	State
<b>Average FTS</b>	Design	41.2	59.9	1,138.4
	Analysis	38.2	57.9	1,138.4
<b>% Female Chiefs</b>	Design	2.9	1.0	6.8
	Analysis	2.9	0.9	6.8
<b>Average number hours required for training</b>	Design	984.5	895.4	1479.3
	Analysis	968.0	890.5	1479.3
<b>Operating Budget Per Sworn Officer</b>	Design	1,268,334	2,574,389	201,175
	Analysis	1,300,040	2,608,018	201,175
<b>Operating Budget Per Resident</b>	Design	5,038	1,889	43
	Analysis	5,331	1,933	43

There does not appear to be a significant impact on the estimates when using the non-response adjusted analysis weights compared to the design weights. Thus, there is no evidence of significant nonresponse bias.

Table 1. Nonresponse bias effect size for local police departments, LEMAS 2016

Variable	Released Eligible Sample		Respondents		Nonrespondents		Diff in Percent (Resp vs. Nonresp)	Diff in Percent (Resp vs. Overall)	z(i)	Effect size
