We must remove all weak links that have been, or will be proposed, to allow buoys to part from vertical lines during entanglement. The buoys are the only guaranteed means of identifying the gear type and where it was fished, and could also work as a toggle producing drag to pull gear free from the whale. The buoys are more visible to survey teams and can facilitate disentanglement by teams more easily monitoring a whale. There are certainly entanglement scenarios where the buoy could increase line wrapping on an appendage but if all effort is made to part off the trawl with weak links the buoy remaining on could work to pull line free before it tightens around the rostrum or flippers.

Weak line has become the focus of much risk reduction. The work in our Lab has shown that whales do have upper limits to the force they produce while swimming, so completely agree with this risk reduction strategy. There appear to be several weak sleeves and/or other proposed modifications put in gear to weaken it. But the initial goal was to prompt line manufacturers to provide line that would achieve that reduction. During the plan roll out call there was a comment made by (I think) a MA fisher that the weak line they had purchased was not being recognized as meeting the goals of the plan. Moving to the actual line being weak along the entire length must be the goal of the plan. Inserting a weak sleeve, etc. along the line does not provide full risk reduction. If weak line has already been manufactured it has to be acceptable to the plan.

A large component of the plan is the implementation of restricted areas. Opening these areas appears to be dependent on NARW sightings for the trigger. Tying any plan component to the distribution of NARWs conflicts with the development of coastwide management. If there were structured restrictions and even closures that were in place and could be implemented in near-real time after agreed upon triggers, I feel these management strategies would achieve required take reductions. As it is stated in the current plan, action is based on unaccountable decisions from GARFO management.

Now a note about process. It is unacceptable to the concept of a Take Reduction *TEAM* that a single entity represented on the team can act outside of the team meeting to stop the process. Being represented on the team, then acting outside of the team to alter the plan in their best interests, MUST STOP! Many are at risk of losing interest in being involved in any TRT if the real plan is developed outside of team input.

I understand the complexities of producing a plan (and this one is not even in the water) but the final results are far different from the meeting in Providence and, more importantly, I don't see how they will reach the ever increasing need for serious injury and mortality reductions in this population.

I do appreciate all the effort you personally have expended to get us to this point!

Best

Docket No. 201221–0351
Proposed Rule: Taking of Marine Mammals Incidental to Commercial Fishing Operations; Atlantic Large Whale Take Reduction Plan Regulations; Atlantic Coastal Fisheries Cooperative Management Act Provisions; American Lobster Fishery

To: Mr. Ben Friedman (Deputy Under Secretary for Operations, performing the duties of Under Secretary of Commerce for Oceans and Atmosphere and NOAA Administrator)

Cc: NOAA Fisheries - Paul Doremus (Acting Assistant Administrator for Fisheries), Sam Rauch (Deputy Assistant Administrator for Regulatory Programs), Cisco Werner (Director of Scientific Programs and Chief Science Advisor), Donna Wieting (Director of NOAA Fisheries Office of Protected Resources), Evan Howell (Director of NOAA Fisheries' Office of Science and Technology), Karen Hyun (NOAA Chief of Staff), and Colleen Coogan (Marine Mammal and Sea Turtle Branch Chief, Greater Atlantic Regional Fisheries Office)

February 25, 2021

Dear Mr. Friedman:

We represent a group of scientists with extensive expertise in the biology of large whales, oceanography, and fisheries. We are writing to express our serious concerns about the proposed rule titled *Taking of Marine Mammals Incidental to Commercial Fishing Operations; Atlantic Large Whale Take Reduction Plan Regulations; Atlantic Coastal Fisheries Cooperative Management Act Provisions; American Lobster Fishery* put forward by NOAA Fisheries to reduce entanglement risk to North Atlantic right whales (NARW) caused by Northeast crab and lobster trap/pot fisheries (https://www.govinfo.gov/content/pkg/FR-2020-12-31/pdf/2020-28775.pdf). Whales continue to be impacted by entanglement and NARWs are known to be dying at an increasing and unsustainable rate. Just since October 2020 there have been three NARW observed in U.S. waters with serious entanglements - none could be disentangled, and all are likely to die. The proposed rule represents a dramatic weakening of the recommendations made by the Atlantic Large Whale Take Reduction Team (ALWTRT) in April 2019 as a path towards achieving reduction in entanglement risk.

This weakening of the proposed take reduction strategy runs counter to all scientific analysis, particularly in light of the well documented and ongoing reduction in the population size of this critically endangered species (https://www.narwc.org/report-cards.html). Furthermore, entanglement mortality continues at unsustainable levels and much of it goes undetected. For every right whale carcass observed, almost three more deaths go undocumented (https://conbio.onlinelibrary.wiley.com/doi/full/10.1111/csp2.346). Finally, NOAA's report on the increasing frequency of serious injuries from entanglements (https://repository.library.noaa.gov/view/noaa/21249) demonstrates that the problem is getting worse, not better. If the current rate of population decline does not change (approximately 20 whales per year over the last 5 years), the North Atlantic right whale will be functionally extinct in less than two decades. In light of this scientific information, we strongly urge NOAA leadership to revisit and considerably strengthen the proposed rule.

We specifically suggest the following:

1) **The 60% target of reduced risk outlined in the proposed rule should be increased to 80%**

   Rapid and effective management action is critical to turn the trajectory of this species around. We recommend increasing the risk reduction in the U.S. lobster and crab fishery to 80%, applying additional measures in other U.S. fixed gear fisheries, and working closely with the Canadian government to implement similar risk reduction goals in their fisheries. These actions will provide the best chance of achieving the risk reduction targets mandated by the Endangered Species Act and the Marine Mammal Protection Act (MMPA). The recent Biological Opinion (https://www.fisheries.noaa.gov/bulletin/draft-biological-opinion-10-fishery-management-plans-released) estimates the current proposed rule will not reduce U.S. entanglements below the Potential Biological Removal level of 0.8 individuals annually as mandated by the MMPA. Only rapid and sustained actions such as those described herein can change the trajectory of the NARW population.

2) **Endline reductions, closures, and 1700 lb ropes should be considered as interim measures as ropeless gear becomes a more viable option**
   The concerns about ropes and entanglements of large whales is a long standing problem. As Johnson et al. stated in 2005, "…any line rising into the water column poses a significant entanglement risk" (https://onlinelibrary.wiley.com/doi/abs/10.1111/j.1748-7692.2005.tb01256.x). In recent years, a tremendous amount of effort by engineers, fishers, and scientists has led to promising options to address this threat with gear technology. We ask NOAA leadership to acknowledge that ropeless gear may nearly eliminate the risk of large whale entanglements and support an economically viable fishing industry. Government investment to accelerate the development and evaluation of ropeless fishing is urgently needed, which should include plans for experimental fisheries in closed areas by January 2022. Support for these investments must consider the use of subsidies to help shift all members of the industry affected by closures to this option by January 2024. These goals should be endorsed by NOAA Fisheries

to signal the agency's support of ropeless fishing and to encourage investment and development by commercial manufacturers. Ropeless retrieval systems are functional today, but a universal solution to monitor a fishery without buoys marking endlines and address gear conflict issues does not yet exist and must be developed with the support of NOAA Fisheries quickly. ***These investments will benefit fishermen and whales, and should be a top priority.*** In the meantime, scaled-up efforts to reduce the total number of endlines, to implement closures and to use 1700 lb ropes/weak insertions should be considered the best interim options for reducing risk and impact.

3) **Where vertical lines continue to be necessary, endline strength should be reduced to 1700 lbs throughout the entire length, not just the upper portion**
Rope strength plays a critical role in entanglement risk and injury severity (see https://conbio.onlinelibrary.wiley.com/doi/10.1111/cobi.12590), and the ALWTRT came to near consensus in April 2019 in requesting that vertical lines with a breaking strength of 1700 lb, either entirely or with weak links inserted every 40 feet, be used throughout the lobster and crab industry to reduce risk. This recommendation has been weakened in the proposed rule such that weak rope/weak insertions are now only being proposed for the top half or top third of an endline with only one to two weak insertions required independent of endline length. The original ALWTRT agreement as it pertains to weakened vertical lines, which would require use of 1,700 lb rope or sleeves through the entire endline length, should be reinstated and applied throughout lobster and crab fisheries as a part of this rulemaking and expanded to other fixed gear fisheries in the near future.

4) **A mechanism should be developed to allow vertical line closures to expeditiously be extended spatially or temporally based on scientific observations that include computer modeling**
Fisheries closures that eliminate vertical lines in the water column are the most effective tool for mitigating risk of entanglements of right whales where the two overlap in space and time. Right whales have shifted their distribution dramatically in the past 10 years and their movements have become more difficult to predict as a result of climate change. As new aggregation areas are identified from direct observations, acoustic detections, and/or modelling, it is important to have a rapid regulatory response method to change, expand, or extend closures as needed and allow ropeless fishing in these closed areas. A network of closures should occur throughout the species range, and protect a sufficiently large enough area to help recover the population.

As academic members of the Atlantic Large Whale Take Reduction Team and scientists who study large whales, oceanography, and fisheries issues, we recognize the tremendous challenge facing NOAA Fisheries to prevent the extinction of the NARW while minimizing the economic impact upon fisheries. We believe that, for the fishing industry and NARWs to coexist, the transition to fully weak rope and ropeless gear requires immediate government support to help fishers procure new gear. No further delays or concessions that undermine the ability of proposed measures to prevent NARWs from going extinct should be allowed in implementing strong, effective and enforceable rules. If an 80% reduction in risk cannot be accomplished in this rulemaking effort, NOAA Fisheries should request the Atlantic Large Whale Take Reduction team to immediately consider additional measures for these fisheries during 2021 discussions.

Thank you for considering our request. We will each be providing more detailed comments to the proposed rule.

Sincerely,

Appendix 7.3

Transcripts from Public Information Sessions and Public Hearings

In January 2021, we held four public information sessions and in February 2021, we held four public hearings, all virtual due to the global pandemic. The sessions were organized by region, though everyone was welcome to attend any session. Although the purpose of the January meetings was to provide information and answer questions, we accepted oral comments on the proposed rule and the Draft Environmental Impact Statement (DEIS) at all eight meetings. See Tables 1.5 and 1.6 for a breakdown of participants that attended the information sessions and public hearings.

Information Sessions

1. Rhode Island, Southern Massachusetts and LMA3, Tuesday, January 12, 2021, 6:30-8:30 pm
2. Massachusetts (Outer Cape and LMA1) and New Hampshire (LMA1), Wednesday, January 13, 2021, 6:30-8:30 pm
3. Southern Maine, Tuesday, January 19, 2021, 6:30-8:30 pm
4. Northern Maine, Wednesday, January 20, 2021, 6:30-8:30 pm

Public Hearings

1. Rhode Island, Southern Massachusetts and LMA3, Tuesday, February 16, 2021, 6:30-8:30 pm
2. Massachusetts (Outer Cape and LMA1) and New Hampshire (LMA1), Wednesday, February 17, 2021, 6:30-8:30 pm
3. Southern Maine, Tuesday, February 23, 2021, 6:30-8:30 pm
4. Northern Maine, Wednesday, February 24, 2021, 6:30-8:30 pm

A total of 211 people provided comments through these informational sessions and public hearings. Of these, at least 58 identified themselves as fishermen on the calls. About 77 commenters voiced support for this rule or strengthening this rule, while 44 generally opposed the rule or questioned the need for a rule. Many people had questions or wanted clarification on particular parts of the rule, but did not specifically voice either support or opposition.

Can you jump back to that slide and go through that for us? Oh, well, Kara will have to jump back to the slides.

Yeah, can you, Can you say which slide one more time for me?

The Trawl-up slide for preferred alternatives. So in LMA 2 between 3 and 12 nautical miles, It was 15 traps per trawl, I believe. And beyond 12 nautical miles, it's 25 traps per trawl. Yeah.

OK, you say that one more time for me?

So in LMA 2, between 3 and 12 nautical miles, it will be requiring 15 traps per trawl and beyond 12 nautical miles, 25 traps per trawl.

OK, thank you.

That was slide 20, for people who are following in the slide deck.

OK, Brian. I'm coming back to you. Let's try this again. You are unmuted, You'll have to unmute yourself.

OK, can we hear me now?

Yes.

Hey, Hello, everyone. Just the LMA2 question, also a conservation equivalency question. If we were able to get a proven 1700lb breaking strength for the top 75% of our vertical lines, joined with, uh, a knot at the 25% mark from the bottom, which would also weaken it, could that be considered a conservation equivalency to perhaps two installed weak links or breakaway insertions?

That is definitely a conservation equivalency to the weak insertions, because that's full, Weak rope what we consider to be full, weak rope. Scott has suggested that it gets equal, or greater risk reduction, if all of the LMA 2 boats did that then, then the trawling up suggestions that are in place right now, it's difficult for us to determine how much risk reduction we get if just the Rhode Island boats do that. I'm not sure if you're fishing from Rhode Island, but that's a proposal we've heard from Rhode Island. But that is something that we would look into trying to figure out how to analyze that, and consider that as an alternative. As a conservation equivalency alternative

OK, Yeah, now you, you stated that, that might actually give a greater conservation equivalency. so, ah, certainly not looking for more than the 1700, but maybe the percentage of the vertical line, you know, through it through a model, if it could be adjusted, where maybe it was, you know, 60%, instead of 75%, if that met the conservation equivalency barrier. Just, you know, I know we have to find the exact rope that that is. And I know it's not a designated line diameter, but, you know, before the public comment period, even, we need to kind of diagnose what that might be for an option. For the industry, you know, in the in perhaps the 12 Mile and in industry of LMA 2. And I am fishing out of Rhode Island, so, I am speaking on behalf of them.

So, out of Rhode Island right now, what's proposed is a 15 trap trawl out to 12 miles?

Correct.

And that, that's not what you're fishing now?

And, but, I thought that also included two weak link insertions.

Yeah, as well as two weak insertions.

While also trawling up.

That's right.

Yeah, OK, All right. Yeah.

I just was looking at, you know, some of the discussions we've had through industry, um, and in some of the small boat size, obviously a 15 trap trawl, you know, as you've heard through, you know, from industry and through your meetings, 15 traps might be larger then, then a boat could handle. I've talked to several of them today, you know, they say, Obviously they'll do it, it needs to be done if it needs to be done, but wondering what risk reduction would get us to a 12 trap trawl and what another preferred possible alternative could be to allow them to maybe trawl up to just 12 traps. And just for the future, I know nobody's poised to answer that question right now, but if that could be a model run that gets done in the future.

Well, I'll tell you are well represented by a Scott O and also by the TRT members, including Peter, who's now an alternate. And I'm sure they're going to make us run those for you in the near future. So, we will work on that with them.

Yup, OK, yup, I, I have spoken with both of them also today. And was just bringing up, but it's a question at this point for the group. Just, you know, just so it didn't come from out of nowhere, wasn't a rug pulled out from under anybody's feet. So, I just wanted to have the potential of that proposal on the table. While we're formulating, you know, I've been involved in lots of processes. And, and, and once the modeling has done, a lot of times, there's no longer any input. We're just trying to adjust it. So, while we're still somewhat early, wanted to just get that on the table, please.

And, you know, it's difficult because I think in our in our data there aren't very many vessels, fishing are fewer than 12 trap trawls already. So, there wouldn't be much. There'll be no credit for the 12 trap trawl component of that. And all of the risk reduction would have to come from or very little I should say I shouldn't say none. Maybe, maybe not enough to be calculated, actually, if it's only a couple of boats, Out of all the boats fishing there,

OK.

It will be tricky but will work with Scott and, and actually the analysts in Rhode Island also have a good understanding of your fishery, so we'll work with them to see.

Yeah, no, that's appreciated. I mean, I, I discussed it with 3, 3 individual people today that do that, so. So, the number zero is, is not, is not a number, you know, there is some percentage of it, and, you know, if the equivalency doesn't get met, I completely understand, I just, you know, as representing them a little bit, I wanted to make sure that they know their voice was heard to some extent, obviously, from a greater safety point. So. Yeah, I think, I think that was my main question, actually. What were those two things, the content, and, you know, how to achieve some potential different conservation equivalency. So, I appreciate your time. Hopefully, there'll be a few more questions from the gallery and informational session and people should not be shy to ask questions if they have them. So, thank you.

Thanks for your example, Brian.

Yep, and we have one Mark, I'm coming to you. You are unmuted, you can just unmute yourself and ask a question.

I had, uh, I think it's pertinent. Do the wind farm constructions continue in this proposed south of Martha's Vineyard closed area when we can't have access to it? Do they still continue to do their construction during this closure?

Um, Mark, that's a good question and I know I can contact you so I can get you information on what their plans are. I have not been involved in the wind farm Construction, Endangered Species Act consultations. What we do through our rulemaking, you know, under the Marine Mammal Protection Act, it's specific to commercial fishing. So our rulemaking, my team, does not affect what goes on in that area. Um, so I don't know what the construction restrictions are, what the seasonal component of that is or even what the status of that project is. But I work near people who do that so I can get that information for you and I'll see if I can get that before even our further are next public meeting tomorrow night.

OK, Thank you. I didn't know if this was within the realm, but thanks Colleen.

Yeah. It's outside of the scope of the Take Reduction Team, which is really specific to the US. Commercial fisheries,

OK.

There's a lot of recovery actions and other actions going on outside of the scope of this rule. That's one of them. Thanks, Mark.

Yes.

OK, Gary, I'm coming to you next. You are unmuted, you can ask your question.

Oh, yeah, you got me?

Yes we can hear you.

Ok, Yeah. I kind of agree with Brian, I fish out of Saconnet Point, Little Compton, Rhode Island Waters Lobster Management Area 2. I'm kind of getting long in the tooth. I've got a 40 footer I fish by myself and I don't lobster anymore, just Black sea bass, I use 10 trap trawls. There's another gentleman, Westport, I believe, he fishes 10 trap trawls also. That's what's safe for me to fish on my boat. So if there is a equivalency concern I think, that it should be brought in, because I start two miles off the beach in May, and by December, I'm 15 miles off the beach. So me, it would be a hardship, to keep adding onto that trawl all the time, so it would be an unsafe situation and 10 traps is what I fish without any safety concerns. So, I just wanted to make that comment.

OK, I will let you know that right now, these rules affect only Lobster and Jonah crab fishermen, but you know. It's smart to be paying attention now, because starting this Spring, we're going to be looking at all the other, um, at all the all the other regions down to Florida and all the other fisheries, Gill net and trap pots. So that's good to know and we'll know be talking about that soon with the Take reduction team. Also, if you're fishing out to 15 miles, that means as currently proposed that would include a 25 trap trawl area, which would sounds like it would be very burdensome for your vessel.

Yeah, That would be, uh, definitely unsafe , like I say, I fish by myself and I fish because I enjoy to fish. The only thing else I want to say is the Coast Guard sometimes gets a little anxious when they come aboard. And you try to tell them that it's a sea bass pot not a lobster pot. It doesn't seem to matter to them. It's a pot to them. A pot to some people is a pot, whether it's a sea bass pot or a lobster pot. And when you try to tell them, no, there's a sea bass pot and then maybe And they do catch lobsters, there is no doubt about it. So if it comes up and they're on board while you're hauling the gear and it's got a lobster in it, they're going to consider that a lobster pot. So I have that concern also.

All right. And from the, from the point of a whale, it doesn't matter what the pot is, it's the buoy line, and the configurations, that, that impact. So, um, so ultimately, we will be, including all those other fisheries in these rules as well within the next year or so. We'll be proposing new measures and they, and we would want them to be consistent. So Yep smart for you to kind of get in on these measures, because this would be your future too.

Thank you very much, I appreciate that.

Thank you for the comments.

Colleen, we have no more questions, but we have a comment from Russell, Russell, I'm coming to unmute you.

Do you want to jump to the comments slide? A couple of these questions have been more like comments, and we are recording all this, so. So, you know, we're documenting this, oh, it's very similar. Just put, comment in the, in the comment field, in the question field if you want to comment. And I'm sorry, Russell, your comment.

I was just following up with what they're both saying. He was saying he was representing three people he had spoken with today and I would be a fourth running 10 pot trawls in that same area.

OK, great. And are you targeting primarily black sea bass currently?

No lobster, crab.

Lobster, OK. And you fish out to 10 miles?

Yes.

OK, thanks. Yes. So unless we see a lot of questions put into the queue, we can, anyone who's interested in providing a public comment can comment at this time by putting "comment" into the question box.

Yeah. OK. Thomas, you are unmuted, and you may make your comment. I can see that you're unmuted, but we can't hear you.

That may appear.

Yeah, I could just hear you, Thomas. Oh, I'm so sorry wrong Thomas, everyone. Other Thomas', you just need to unmute yourself and make your comment. My apologies.

Hey, everybody, can you hear me? Very Good. Sorry about that. So this is just a comment. I just want to thank you all for inspiring people like myself, a marine science student, and your hard work and love of these whales is really inspiring, and it's been great just to sit in here and the recent Right Whale consortium. And just hear everybody talk about their passion for conservation and these Whales. So thank you.

Thanks for that comment. Any other comments tonight?

Not at this time. Do we have anyone else who would like to make a public comment? Or who has just thought about another question? OK, Brian, I'm coming back to you, Brian, has a question. Brian, you can unmute yourself and ask your question.

Hello, again. Hello, hello.

Coming across loud and clear, Brian.

OK, very good, thank you. I just actually, I wanted to, going to be more of an answer for Mark that had requested before. The COPs, the cops for all the wind farm vessels are allowing construction year round for all the wind farm fields. So there is year round construction going, they are all vessels are supposed to have during the migration, migration times are supposed to have biologists on the vessel's to do correct spotting, um, of migrating right whales and they are supposed to stop construction for as long as the vessels are in as long as the whales, sorry, as long as the whales are in view of the vessels. Um, it's, it's, you know, being involved both in whales, and wind farms it's, it's a pretty lousy hand for the fishermen to have to face year round, Year round: crisis and decisions that we're going to have to make, while these Wind Farm companies do have a hall pass, so when the opportunity does arrive, having the take reduction team hold them to that standard. At the very least, what I would ask you, you know, that they would hold them to the standard of having the proper observers on the boat and following the protocols that are set forth in their construction operation plan. That was about it. So, I guess that's more of a comment than a question.

It's a good comment. And we will take that to the folks we work with that are responsible for helping promote those measures with the wind farm, evaluate the wind farm, and identify those measures. So we'll make sure they're accountable and will pass on as we have in the past that the fishermen fishing in that area want to make sure there's equitable requirements.

Colleen at this time, there are no questions or comments left in the queue.

OK, so we'll go ahead and consider that a wrap of our first remote meeting. I really appreciate those of you that attended today, and, again, this was our first run. So, oh, you're sort of our guinea pigs, are not intentionally did put a lot of prep and really appreciate all the NOAA staff who are on helping maintain the queues and keep the call going, Marisa and Chao for helping present and Kara for helping us navigate GoTo Webinar generally. And, you know, get us through the queue as well. And thanks, Joanne Lorello for helping out with technical support. Thank you everybody and goodnight, and maybe see some of you on future meetings. Thanks.

Colleen I will leave the line open for just a couple more minutes in case anyone is. Furiously writing all of the information on the last slide.

Information Session 2

Massachusetts (Outer Cape and LMA1) and New Hampshire (LMA1), Wednesday, January 13, 2021, 6:30-8:30 pm

So as Colleen mentioned, go ahead and type a question in the questions box. It's helpful for us to sort of lump the questions together by like-topics. If you know your topic or know your slide number, put that in there now.

First up, we have Gib Brogan. I am unmuting you, you may unmute yourself and ask your question.

Hi, Gib Brogan with Oceana. I've got a question you may give

you're, you're very faint. We can't hear you.

Sorry. Hold on. Or is that better?

A little bit.

OK, that's good if it's going to get. I'm, I'm afraid I'll speak up.

In the early in your presentation Colleen, you mentioned that the value of PBR is in flux and will be going down based on more updated stock assessments. Last week in the TRT information session, you mentioned that the agency has conducted an analysis that looks at the effect of a lower PBR on the risk reduction target. I'm just wondering, is there any analysis that's available that can support that? And, if not, then I'm just curious on the effect of a change in PBR on the risk reduction target.

So, thanks, Gib. We haven't made that available because there were so many preliminary data points in that normally before we make something public we wait till a lot of the information is peer reviewed. But to describe it to you, um, the what the main thing that happens when in our target, the way we formulate our target, the main thing that happens when the number of whales goes down is the PBR goes down. And, as you might recall, the way we developed our target was by assigning known US takes to the US, an estimated take level as well as 50% of the unknown. You know, we know it was an entanglement. It was seen in US waters, or, what we know is an entanglement. But, we don't know where the entanglement occurred. We didn't get the gear off it, so, we split up, there, was unattributed, serious injury and mortality is 50%, Canadian 50% US. And so we only assigned, you know, we assigned half of those in the US responsibility. So another thing that's happened in the last five years is that there are no over the most recent five years, there are no known US um, injuries and mortalities. Most of the whales that we've seen haven't had gear on them or we retrieve no gear. And so or we couldn't identify the gear. So as a result, the, the estimated take attributed to the US went down as did the potential biological removal level. So in the end, our estimates are similar, 60 to 80%, depending on the assumptions. We are considering whether or not, even though it's very preliminary, whether or not we can make that available and so, you know, keep looking at the TRT web page if we, if we put that, know that those calculations out there, that's where they'll show up.

And PBR is a formula that anyone can calculate themselves. And so you can sort of look at the new, some of the new numbers coming out. You use nMin, zero point zero four and zero point one times a half and you can calculate the PBR level yourself. And that's sort of the fundamental start of the analysis that was done that we showed at the or that was discussed at the meeting last week. OK, do we have any other questions, just type “question” in the chat. OK, excellent. Marin. I'm coming to you. I have unmuted you. Yep.

I want to say thank you, guys, for the presentation. My question was I was looking at the website, and for the latest entanglement reports. You guys noted a male right whale entanglement off the Georgia Florida line, just in the last couple of weeks, January 2021. So I guess my question is, is that this proposed rule is to achieve a 60% reduction in risk to hit the zero point nine PBR. Why are not all other fisheries included in this proposed ruling south of Rhode Island? And it's not uncommon to have these entanglements. In, you know, Georgia, Virginia, Florida. And I also didn't see that in the north-east region. It seems like it's just Lobster and Gill net. But what about some of the other fisheries that are affected by ALWTRT regulations currently?

I'll try answering that one. So earlier when I identified the efforts for the April 2019 meeting, I indicated that we did. We did focus the scope of that meeting on the north-east Lobster and Jonah Crab Fisheries, because that's where 93% of the buoy lines are fished. Where right whales occur. Um, when we do coast wide, multi, many multi fishery rule, it can take even longer to get a proposed final rule that takes a lot longer to develop that. And so because we were in a hurry we wanted to focus and get, you know, the largest number of potential threats covered in the rule at one time. So that's why we focus on north-east lobster and Jonah crab.

We have notified the team and we are starting to make plans for a Spring 2021 meeting to look at all other lobster fisheries further south and all the other trap/pot and gillnet fisheries as well. So we're in the process of preparing materials to have the team start meeting on that. Um, that entanglement that was observed off of Georgia. I believe it was this week. Um, We don't. that, as I mentioned in the slide, showing Dragon, the picture of Dragon. Where we first see an entanglement is probably best correlated with where we have aerial surveys, or good opportunistic effort, like whale watching or other eyes on the water. It's not where the entanglement occurs. Right whales can drag these drag gear for miles and miles and for months and months. So first sighting, uh, often has nothing to do with the, the location of the entanglement. This is not a brand-new entanglement. This is the first sighting of entanglement. The Whale apparently has reportedly has cyamids on it, which suggests that the abrasions are not new, caused by the entanglement

Thank you. I appreciate the response. It's just one of these overall things where you're putting such a big cost and burden on these two fisheries, when it's a shared responsibility. Because just as you say, you know, a lot of these entanglements haven't been identified by gear. Or by area. But yet, these two fisheries and this region is bearing the brunt right now.

So, you know, if you want to submit that as your comments, when the comment period, or during the public comment period, please do, that we do plan to regulate these other fisheries as well.

Yeah. No, I appreciate that. Thank you.

OK, Mike Walsh. I'm coming' to you. You are unmuted, you can unmute yourself and ask your question.

Yes. My question was I thought I might have heard somebody say that these implementations of the contrivances or gear markings would be pushed out a little further due to the length of these discussions and comment periods. You know? I know plan to start fishing hopefully back on May first, But, you know, Will be Will I need to have my gear ready by May first ready to go for this or will likely be pushed out?

Mike? Are you a Massachusetts fisherman?

I am yes. Marshfield, I'm in the closure.

So, do you fish primarily in State waters?

Yes, I do.

So this the State is on a parallel track to implement rules on well, I shouldn't say parallel, there. They're well ahead of us. So, I don't know what those final rules will look like.
I think that there was recently an indication that that was going to be pushed back a few more weeks before they finalize those things. I do think probably by, I don't know, there's a delay in implementation, that's something you'll have to ask the state regulators.

Thank you.

OK, Kurt, Coming to you. All right. You are unmuted, you can unmute yourself, and I will head over to Slide 41 for you.

We're going to pass. We've figured it out.

Awesome. Thank you. OK, Mary Branch. You ask your question, and I will head over to slides 27 through 30.

Well, I'm just, I'm just been following this for a while. Can you hear me?

Yes.

Yep, OK. And I always get there. I'm just a regular citizen down in Texas and um just very concerned about the right whales, especially. And I noticed that and the answer is probably obvious. And I'm just trying to process all of this. But I noticed. And on those slides, the preferred and non-preferred, um, methods, and the non-preferred seem to have such a significant reduction in right whale, or all whale takes. And I know it's also a very significant increased cost. But to me, biologically, I mean, these whales are going extinct there. I think they're 1. 1 or 2 whales away from becoming critically endangered, or what you call the red, the red zone, where they may never recover. And less than 400 significantly less than 400 of them in known existence. So why wouldn't And maybe you're doing that in the Proposed Rule, but why wouldn't you at least take some non-preferred methods that have that 80% or 83% reduction in occurrence and mix some of those in with the preferred to achieve a better balance. But I don't know. Maybe you're doing that. I just don't know the entire rules. So that was just my question. And I know there's a cost. But wouldn't it be Great if the fishermen and everybody could agree to maybe the first couple of years trying at a higher cost or maybe a reduced catch just and making these changes. Just to see if it makes a difference. Then you'd have some really good data that Yes. This does make a difference. So, that's my question.

I'm not sure I can answer that to your satisfaction, but you can certainly comment. You know, in public comments that you think that our final rule should include measures from our non-preferred alternative. Um, the, the, the large, cost is a part of it. We were also working with a target of 60, well 60 to 80%, but 60% was really what the TRT was going with. There are a lot of uncertainties about where mortalities are coming from and the proportion for instance coming from Canada or other places. And Canada's recent in recent years taken a lot of steps to try and reduce takes. and they've reduced the obvious takes at least. And so we might see. We might see those benefits in changes in what we're seeing in our waters as well. But again, that's a You've got, you raise a valid point and that is a good public comment for you to make if, if you're you want us to look at finalizing something from our non-preferred alternative.

OK, Thank you.

OK? Let's see here. Gib I'm coming back to you. You are unmuted. You can unmute yourself and ask your question.

My question is about the proposed LMA1 restricted area and the Preferred Alternative. And they, too, I think, you call them co proposals. one of them relies on the regional administrator to make a call in the fall. And just wondering, could you describe how that would work? Are we looking at a situation where the regional administrator would have absolute discretion or would the EIS include a series of criteria? And then, my other, the other question on the same thing is, how does the agency propose to collect and process information in near real time to make any determination in season?

So, those details are not in there, in the DEIS currently, things, that, some conversations that were held during the TRT team meetings related to trying to develop more adaptive closures, that or based on evidence, it wouldn't, I don't think it would be something that the regional administrator would wait till October to do it. And I, and as we discuss it with the take reduction team, if we were able to prepare regulations to allow that, it would probably require consultation with the take reduction team. So I would envision something more like in, in July of every year. We would call the team together to look at information such as projections of where copepods are or the last year's aerial survey and other survey efforts to see what whales are doing, and the most recent time series we have available. Right now to get, to get data into models. It's always two years lag. Sometimes more. So we would be looking at the real data, rather than using the model, potentially, unless we develop a more agile model. But those details haven't been worked out, Gib. I do think that anything we would do would require consultation with the team, not the regional administrator entirely by himself. Um, but, as I said, we haven't worked out all those details and they're not currently in the in the DEIS.

OK, thank you. That's very useful. I was trying to reconcile that process with the considered but rejected alternative of using dynamic management and that's also data dependent and happening in, in near real time. So just trying to make sense of that. Thank you.

Just one thing to add to that Gib. When we talked about dynamic management at the TRT meeting, well, we talked about, you know, it's a little easier to open something, to have it, to have it closed. But then, because of information collected in the months leading up to it, or the year before, including the year before it, too, to open it, then it would be to dynamically close it if it's not already a closure in US rulemaking procedures.

OK, Faye Anderson, you are unmuted, and you can ask your question. Faye, are you able to hear me? We can come back to you, if you're having trouble. You can also type your question into the questions box and I can read it for you, but we will come back to you. OK, next up, we have Max. Max, you are unmuted. You can unmute yourself and ask your questions.

Hear me?

Yes.

OK, so, as I'm a New Hampshire commercial lobster pot fisherman, and I'm wondering what why any state, New Hampshire, lobster pot fishermen has to comply with the take reduction plan rules because, obviously, we're not under Federal permit. So, I'd like to ask two quick questions to make sure we're on the same page, and I've not missed something in my wonderment. The first question, I just wanted to confirm that NOAAs never issued the required Marine Mammal Protection Act, Section 101 A 5 E permit to allow the incidental taking of an endangered marine mammal. I.E a right whale and the other whales meaning not even issuing a permit for a single entanglement they can't do under the MMPA. Is that true? That NMFS has not issued that permit and has no intention to which it will.

I won't speak to the intention of the agency, but we have not issued a permit under that.

OK, great, Great. Alright, thank you. Alright. That can just make sure I'm on the same page with you is that the certification of authorization, that's comes with the take Reduction Plan regulations where fishermen are supposed to be immune. From any prosecution for a prohibited taking, which is just an entanglement, not a killing or an injury, does not apply to the right whales and the other endangered whales in the north-east. So is that true also?

I would have to get information on that from our attorneys.

So, it says: It's not really specific to the information in our DEIS and our proposed rule. If you want to keep your questions to those. I'd appreciate that.

No. I am keeping it to that, because the whole point of the rule, TRP rule is who you're going to affect. That's the whole point of the reduction. Who can you affect with these Take Reduction Plan measures? And so, my point is, now, I'll make my point since I know those two issues are, I was right correct on the observation, is that because, New Hampshire fishermen do not have immunity under the MMPA, which are the Which for right whales and specifically, and these other endangered whales we don't get the benefit of the bargain. And the take reduction plan can't possibly apply to us, because that I would be asking you about. And then the other thing is that Because you haven't, NOAA, has not issued, Erika, I'm sure you are interested in this question. And because NOAA was not issued that required permit, which was that issue was cited in the federal lawsuit in Washington, that it can't even issue these take reduction plan requirements. Because you allow entanglements to occur. And if you're allowing entanglements, you're violating the Endangered Species Act. So my I as a fisherman am caught in a rock, and a hard place. If I comply with the Take Reduction Plan regulations. I'm going to be violating this Endangered Species Act, and go to jail for that. And, so, ultimately, what I'm trying to ask here is, is that the real root to safety for a fishermen, so that if I entangle a whale, under take reduction plan that says I will entangle whales. Shouldn't I be getting an incidental take permit under Section 10 of the Endangered Species Act? Now I've tried to do this. I'm still trying, but NOAA resists. they just apparently have never issued that. But the only way I can see protecting myself and my fellow fishermen from when we entangle whales not to go to jail or not to be fined or whatever because we're violating the prohibitions, is to go the Incidental Take Permit route but I don't think that's even going to work. Because since you can't issue intent and incidental take statement, that would allow us,

I'm going to ask you to wrap this up. This sounds a lot more like a comment than a question and? Litigate mitigation on the poll. So, You don't have to do that, I understand. Your question.

Don't cut me off. That's why I'm suing you, you just don't listen to anybody. Just fishermen

Then you, please. Thank you. Thanks, Max. We would love to, not necessarily love to, but we anticipate getting those as comments. And we've recorded your comments today as well.

OK, we have Next, we have a question from Gib on State Management Components. Gib. You can unmute yourself and ask your question.

Yeah, First off, thank you for answering my questions. I've been reading these documents for two weeks and watched these presentations a couple of times. And I appreciate you making this makes sense for me.

Can you make this presentation for us next week Gib?

I think this is my fourth time through, so, yeah. Getting pretty close now. So, my question is that it seems that the plan and the proposed rule rely on two states, Maine and Massachusetts, to take regulatory action in their states. Is there any when or means for the Federal government to compel the states to finish those processes? I'm just wondering what effect, delay or heel dragging in those processes will have on the risk reduction, and the ability to meet the goals?

So, thanks for that question. First, the states are actually a lot more agile than the Feds are, as you know. Um, Massachusetts is working on rulemaking that they may have finalized for state waters. By the end of February or, you know, early this year, Maine has already implemented gear marking measures for all Maine permanent vessels. So, they're way ahead of us on gear marking, state specific gear marking modifications, um, we are likely to mirror states regs, as we identify them, or as they are implemented. So, if they haven't been done by the states yet, but they're in our proposed rule, will be implementing them through our rulemaking, or will be mirroring them if they have already implemented them, so that they are also in our rulemaking. With a couple of exceptions, we won't be implementing measures within Maine exempt waters. Which is much of but not all Maine State waters. And we are. We don't really have an easy ability to implement the, the, the dynamic closure extension that Massachusetts is proposing. So not exactly sure how that will end up being in our measures, but, you know, it will be reflected somewhere in our measures. But. I think, you know, in the case of both those states, they have done things already ahead of us. And, you know, every year, I think, for the past 4 or 5 years, Massachusetts has extended closures when whales have remained in the area. So I think we can have some confidence that they'll continue to do that.

It was the Maine exempt waters that I was most concerned about. And, uh, yeah, just making sure that that element gets finished.

Yeah. I mean, they know. I think Maine is motivated to not have us regulate their exempt waters, and that motivation will ensure that they'll do that as well. Not necessarily sure, but pretty good prediction that they're probably likely to do that. And so far, they have, you know, as I said, they're ahead of us on the state specific gearmarking.

OK, Faye, we're going to come back to you. You're unmuted.

Oh, can you hear me?

Yes. Thank you.

How good. It says, under the Mass State Waters that the under the traps per trawl, there's 1 to 2 traps per trawl. Then you go on to say, no single's on vessels longer than 29 feet permits after 1/1/2020. So, is that saying that you can fish singles if your boat is bigger than that? As long as your permit, you held it before 1/1/20?

So I'll try to answer that. That is a state that was in the state proposal that is not in our proposed rule. So that's not something that would be regulated by the Federal Proposed Rule. It's something that the State of Massachusetts is proposing. So I don't actually know how they would implement that. That might be something that's in the state's rulemaking that will be occurring, you know, early this this year.

OK, And does that also the States ruling that we are closed, the outer cape area in the state waters are also closed through May if there are more than three whales present.

So the state didn't actually propose a trigger for opening. That was an interpretation we made in their actual proposal. They indicated that they would close, extend the mass restricted area in state waters. If whales remain in the area, they do survey the outer cape. And I think in at least one year, in the last four, they did close portions of the outer cape because whales remained in the area. So it would be a continuation of that. Or perhaps we would be, it might be that the default. But what we're proposing is that the default would be closed, that they could open it early if they determine the whales have Left. But, you know, again, as that's likely the State is likely to implement that before our rule is final, and so we would be mirroring or in some way supporting implementation of that in state waters:

OK, Thank you.

Are there any more questions? Colleen, there are, at this time, no more questions in the queue. If people have more questions, we can always come back.

So I think we received some public comments already tonight within the questions session, but if people are interested in Commenting, it's 803, We could probably take comments for 10 to 15 minutes. If you are interested in commenting, please type “comment” in the question box. Let us know. Can we see if there's anyone on the phone that has a question or a comment on a phone only? I don't think we've done that yet tonight.

I don't see anybody who is phone-only, Yeah, OK. But if somebody is having difficulty happening to them, well, I don't know. I guess we wouldn’t know. I don't think there's anybody who's just on, who's just on the phone.

So if anyone has a comment, you can type “comment” in the comment box.

Questions? Comments? Colleen I am seeing none, but we can leave the line open a couple more minutes.

OK, I'd like to, again, thank everybody for joining us tonight, and thanks a lot to lot of take reduction Team members who've joined us, and our regular visitors. You know where to find us. Our information is on, was presented tonight, and contact information, and it's also on the Atlantic Large Whale Take Reduction Plan webpage, which you can see the address here, honestly, if you do a Google search for us, you'll find us that way, as well.

So, one last question on gearmarking. Question: Comment: Marin excuse me, I'm sorry coming to you.

Yeah, that's OK. Hey, Colleen. And I just had a quick question. It might be more of a comment if you can't address it, But I know part of the purpose of this proposed ruling is to increase the gear marking to better identify the areas that need more risk reduction. And at what point do you think that will be achieved. So that you guys can stop assigning the 50% assumption from unknown incidents and entanglement.

I can't answer the question. In probably, I think, 60% of the entanglements over the last five years or so, There has been no gear retrieved. So even if either, in many cases, there's no gear remaining on the whale, but there's signs of acute entanglement-caused injuries. But in some cases, there is gear, But, you know, the Disentanglement team has a lot to worry about, their own lives, the whale’s life. They don't, they're not always able to bring gear in. So really, it's been about 60% of the time we have had no line in hand, which means that the other 40%, it's a pretty small sample size. And it, while, you know, if we find a mark, we can identify the general vicinity of where a take occurred, it doesn't really give us a lot of information about the 60% with no gear and the undocumented mortalities that occur. So you know, when will we have enough information? It's really hard to know. I can't give you a prediction on that.

Yeah, no I'm, a proponent of the increased gear marking I always have been, because I think part of this is, identifying those areas so that we can better direct our resources and the reduction measures for it. So, it's but it's one of the hard things where, there's only three markings on it on your, each state is trying to defend itself. But, um, you know, there's still the US. Canadian issue, that would be, helpful to identify.

Canada does have pretty extensive gear marking now. So that might increase our understanding of when it's coming from Canada. Um, so they, they have increased their gear marking substantially. I think almost all of their, I think all the snow crab vessel the snow crab lines are supposed to be marked and I think that most if not all of their lobster lines are now marked

Yeah. That's good. That's a good step forward, and thank you.

Yeah, that is.

There are no questions or comments in the box.

OK, thanks, everybody, for joining us tonight. We have two more meetings next week, focused, primarily towards Maine. For information sessions. And then join us, as well, in February, If you want to provide comments through these meetings, again, you don't have to come to meetings to provide comments. You can provide comments through the regulations dot gov portal, through midnight, March first. Thanks, everyone, for joining us. Appreciate it! And thanks, NOAA staff for helping me out tonight. I appreciate it goodnight, everybody!

Information Session 3
Southern Maine, Tuesday, January 19, 2021, 6:30-8:30 pm

You know, you kind of made it sound like the gear might move off to better fishing grounds somewhere else. But if you're restricted to the zone that you are able to fish and you shut off the furthest section of that zone, away from shore during a period of the year where that's where people want to be, then it would seem that guys would line right up along that area.

That's a really good question. I would have to check with a modeler, to check with them to see if that's something that he put into the model. I know it's come up in discussion, and I don't know what the final result was. I can try to check on that.

All right. Thank you. I appreciate it because it's just Yeah, I understand that, you know, that other, if you look at relocation from other closures that are currently happening
The curtain effect might not really be a big deal, but this closure would be very different from anything that you guys have done before in that, you know, you can't simply just slide anywhere you want within the area.

Yeah. I really appreciate that comment and if it's not in there now, we'll try to make sure it is for the final.

All right. Thank you very much.

If we can have more information about the relocation that fishermen would like to do in that area. That will also help to estimate the costs for the fuel changes and landing changes. So we would strongly encourage fishermen and friends to provide us comments about those assumptions.

Thank you.

OK, Amy, you are unmuted, and you can unmute yourself and ask your question.

OK, Can you hear me Sorry.

Yes.

OK Um, I'm curious knowing that climate change is leading to a lot of distribution shifts and you know we've seen that in the past 10 years, is this proposed rule going to be able to consider future distribution shifts in thinking about closures If they should be shifted to new areas or um, or expanded or I just wonder if it can accommodate that sort of information that will be coming in, since the preferred alternative seems to rely on that a lot more than the non-preferred alternative.

I'll take a shot at that. I mean, as I said earlier, our ability to close areas is not very agile. But this is, you know, it is one of the most valuable thing that the Mass Restricted Area closure is one of the most valuable things we've done, the team has done. And that that area has gotten increased use since that area was closed by Right Whales, there are more right whales there than there were originally estimated. Um, other areas like the Great South Channel are not getting much right whale use right now, compared to how they used to. And it's one of the reasons we have these larger area-wide permanent measures in weak rope and in Trawling Up to Reduce the Amount of rope. It's because we know that there can be shifts, and so we want to have precautionary measures and risk reduction measures across the whole area, and not just rely on the closed areas. There are multiple reasons, though, for example, for the offshore Maine closed area and one of them is, it's hard for us to predict what whales are going to do. They seem to be continuing to use area as, as you've told us, areas that they've always gone to there, At least visiting those areas. They may not be staying as long, and there may not be as many of them visiting. But, there's, they still seem to still be going back to areas where they were aggregating. And we don't know for sure how they're going to be doing that in the future, but one thing that we do have some predictions about is that that lobster are moving offshore. And that it's a good possibility that effort will move offshore. There is a lot of effort in, in Federal waters offshore of Maine that could continue to move offshore. There is increased capacity in the fleet, although we don't have evidence that they've moved off so far, but 5 or 10 years from now if they didn't move offshore and that area continued to be visited by right whales, That is something that would be much more difficult to regulate at that point and to get ahead. So we did try to at least anticipate fishery potential for fisheries shifts which might be a little more predictable today than anticipating where the whales will shift. But. Again, that's the reason we looked for, area-wide Precautionary Measures. Does that answer your question, Amy?

Yes, it sort of answers my question. I guess the other question I have is, just thinking about, down the road. Um, it seems like this proposed rule is sort of a, it's somewhat static and it's um, I just wonder, is there a way to phase in more broader restrictions? That, uh, we know in the ultimately that maybe if ropeless or fully-formed weak ropes are what might be the best for the whales. And if that can be proven to be effective for fishermen to do their to do their jobs, can it be, is there an opportunity to consider phasing in additional measures in the years ahead? Without going through a whole rulemaking process?

I think it would be difficult for us to act to do the NEPA and other analyzes required before we have some of that information. So I think it is more likely to be something that we would have to do through a rulemaking process. Because under NEPA we have to be able to analyze economic impacts, analyze, affect, you know, as well as we can, analyze the risk reduction. Um, those that requires an ability to describe what those impacts are. You know, phasing something in based on the possibility that we will have feasible ropeless technology that can be broadly used. Where we have surface marking and guessing what the cost of that will be in five years. It's, it's hard to do. It's hard to do it without doing it as a new rule making. We are some of the things that we are doing in this, like, changing all of our closed areas to buoy lineless areas would allow some of that to be implemented quickly, at least in those areas and as an alternative to closures. Hmm. So, I know that's not a very satisfactory answer.

OK, and moving on, Annie. You should be able to unmute yourself and ask your question. Annie, are you with us? Think your audio is off. Try unmuting yourself now.

There we go, OK. So this is Annie with the Maine Lobster Dealers Association in South Portland, Maine. So my question is, Does the model account for vessels outside of the closure that would be crowded and catch less when vessels inside to have to move out into the areas that are already in use?

I think for now, for the economic analysis now, we haven't accounted for the vessels outside. That's a really good comment. We should take a look at that. Also, we hear we need to more data about the vessel fishing around the closed area. So, what we can do now is we can have assumptions of also, like, uh, catch reduction at some rate 5, 5, to 10% of the catch reduction rate for vessels. But at the end, the catch reduction rate as fishermen adapt to that the rate won't be the same for every year. It should be at a decreasing rate, also when the areas close, the lobster within the area could have be like higher quality and they are also spillover effect to that in the long term. I think it will be like, it will reach a point that fishermen can be at the scene,

it just seems as though, Sorry.

Go ahead.

It just seems that your the Economic Impact Study focuses so much on costs of actual adjustments of more focused on gear and changes along those lines rather than actual impact to individual fishermen from the perspective of the change and the impact on their: on their individual harvest and on the impact to the supply chain itself.

Yeah.

Rather than really paying attention to the individual impacts that fishermen are going to feel on the water and the impact that the supply chain is going to have to bear.

For this rulemaking we only consider the impact on the commercial fishery, I don't think we are including the impact to the supply chain, right? Colleen?

I think it I don't think it did. I think that that's a really good comment. And that's something we can work with Burton and others with, particularly if, as part of your comments, you can submit or direct us to some data as well.

Also, for the impact on individual vessels. Because the matter is each vessel, a different area, they have very different situation. So it's hard to estimate but we do have a general number of the economic impacts on the individual vessel OK.

Some of the information in the IEC line model is constrained by the way the permitting works within zones or within state and federal waters and things like that. So some of the data feeding into the model assumptions does have those constraints in it. I don't think that well, I'm not sure that that any model or the economic assessment looked at impacts to the fishermen that were being moved out of the area. Something we need to add to that analysis.

I think one challenge that you're going to run into in doing this is that, you know, you're not going to have the data to estimate the impact because, indeed, there is no data. But it should be considered and added to the error of your estimates and the assumptions that you're making.

Right. That's why we will like to require 100% VTR data in, like, (indecipherable) water, that will help. Because VTR data that they have location information that will help our estimates to be more accurate, we can have, as you said, we can. We can have information about fishermen in different areas. So we can have more like specific estimates.

Thank you.

Thank you.

Thank you. OK, Colleen, I think that we have gotten to the end of the questions so far that have been in the queue. Does anybody have any questions they'd like to get into the queue?

Is there anyone on the phone that would be able to type it into the question box that we can make sure we've heard from?

I'm not seeing any.

Yes. So, next slide is very similar. If I think a lot of what we heard tonight, some excellent questions, and also some good initial comments on things for us, to look at further, analyze, find information, and we're hoping that you will send us, some of you will send us some kind of granular information that we can use to support the analyzes, and maybe qualitative information to improve the DEIS. But if you're ready to actually provide public comments tonight, again, we'll have meetings in February, to take public comment, was a much shorter presentation from us, much more time devoted to accepting comments. But if you are interested in providing comments tonight, you can type comments in the question box now, to get in the queue.
And, similar to what we just did, we can, we will unmute you, and may have to ask you to unmute yourself as well. Um, so, if anyone has any comments, type in "comment" into the question box.

No comments yet. But we do have another question. Alysia, you should be able to unmute yourself and ask your question.

Thank you. So my question relates to what seems to be a situation where you're somewhat relying on state measures to be implemented and enforced in state waters in order to get to the level of risk reduction that you're seeking. I'm wondering why you wouldn't want to just focus on what, you know, you can do in Federal waters and try to get the highest level of risk reduction in Federal waters?

We, under the Marine Mammal Protection Act, we can regulate to the beach. We don't have to confine our measures to federal waters. Um, there are things that states can do with more agility that we can do. For instance, the State of Massachusetts has an ability to keep their state waters closed into May without having to go through the kind of federal protracted rulemaking we go through. So, that state measure is something that they would implement. Um, the state of Maine has asked us to allow them to continue to exempt the exemption area from the federal regulations. But, they have already taken steps to implement measures, for instance, particularly the gear marking measures, which they've already gotten in place well ahead of us, so they, it's clear that they're going to follow through on their measures when we were talking to the take and then additionally, the Atlantic states marine fisheries commission regulates the fishery in the state waters and we support their regulations by following through with consistent measures in Federal waters and they put in place a lot of gear, restrictions, trap reductions, that are, that are still going into place. They're being phased in over time. So there, compared to the 2017 baseline, they've reduced traps and With trawling up measures, there will be reduction in line numbers associated with the trap reduction. The TRT, when we were looking at the effort reduction I mean, the risk reduction measures, the TRT endorsed that concept, accepting ongoing and state risk reduction measures towards our 60% goal and that's why we're doing it that way: they're considering it towards a 60% goal. We're implementing much of it through the federal regs. In some cases we're mirroring what the states are already doing, and in other cases the state will be doing the rulemaking or the Atlantic States Marine Fisheries Commission.

Thank you for clarifying that. one more follow up question. So, how does enforcement of the proposed measure's work? How is that going to happen? Is it going to happen through federal and state enforcement? Coordination going to be going on? How does that work to ensure that the measures that will eventually be adopted or indeed enforced?

Yeah. We think that's a good question. And it's a question with our existing regs as well as any proposed regs. And we do have, particularly in New England, we have great partnerships in our, in between our enforcement agencies. Especially with the state of Maine, the State of Maine doesn't just enforce the state waters. They do go out. I think, at least through 12 miles, further, offshore you, go, the harder it is to enforce. But we do have good partnerships and collaboration with the states. Those are done through their call JEA agreements. We provide some financial support to this.

It looks like we have lost Colleen.

Oh, no. I was hanging on her every word there.

I, we, if, when, if, and when we get her back, I will have her pickup where she left off in talking about the financial part unless Kristy or Kate, would either one of you like to jump in? OK, well, we will pick right back up. When Colleen, OK, yes, we have Christie, who is on the phone. Then, she's going to type it in chat, OK, excellent, we will get that answer to you.

Thank you so much.

No problem. Jack, I see that you have a comment. And I'm going to come right back to you. I had, one more enforcement question I'd like to get to. So Ira. You can go ahead and ask your question.

Can you hear me? All? right?

Yes.

My question is, as they were talking about enforcement, which one of the things I was trying to type both for the question was asked. You say you have partnerships and relationships, which I understand you do. What are the capabilities of those relationships? Anything that I can see, you Maine has some amount of abilities to enforce rules and regulations. But I see that sliding quite well in the other states and especially offshore. Is this something that one segment of the fisheries is going to bear the brunt of enforcement while other parts of the fisheries conduct business as usual?

I'm sorry. I was, I lost my Wi-Fi for a minute. I missed at least half of that question. You repeat that?

Yes. Listening to the enforcement question, it was along the lines of what I was asking you, say you have partnerships and whatever, which I know I realize you do. Uh, and I'm wondering, So, what's the capabilities of those partnerships? I got a good idea of what Maine's Capability is. Don't really have a great idea what Massachusetts, New Hampshire have and especially Area three. Is this something that one area, one state is going to bear the brunt of enforcement while others continue to do business as usual? I mean, if we're going to go through something like this, it seems to me it's got to be fair across the board.

Well, yeah, I agree with you. This requires anticipated enforcement across the board. We do have those joint enforcement agreements with the other New England states not just Maine generally, Maine does patrol a larger area, and in some years, Mane gets more of the funding support to do that. I think New Hampshire and Massachusetts, Rhode Island, they do enforce within state waters. I'm not sure that they have that offshore capability. Some of that offshore effort is covered by our law enforcement in conjunction with the Coast Guard rather than with the States. So, that's another effort going on in Federal Waters. As you said, LMA three, that's the hardest area to enforce. And that is the pilot study that I was talking about using ROVs there. They're developing new technologies to improve enforcement offshore. And again, that offshore enforcement was a problem. It's a problem with our existing measures, Not just the proposed measures. We don't want to make it worse. And an Office of Law enforcement and Coast Guard, they're looking at ways to make it better offshore, um, better than what we've been able to do in recent years. Maine does do a lot more. But Maine also does have a lot more of the effort. So it may be in proportion to the amount of fishing that goes on.

Yeah. Kind of. Aye. I don't know. I could. Without, I understand what you're saying in proportion. If there's areas, there's relatively little to no enforcement, the proportion, there's no, it doesn't. Doesn't match up.

Yeah. Yeah.

And I'm not trying to shove something off on other areas, but, uh, you know, if we're responsible for doing something a certain way, then it can only be as effective as all of us together. Not just certain areas, I agree, among the most aggressive people asking us to get additional enforcement. It's that offshore LMA three fleet, know, they want us out there, improving enforcement, too. So it's more about how hard it is enforce out there. And that's something we do have to improve and that we are working on.

Even with a ROV, they still need the capability to haul the gear.

Right. That's been a big challenge, right? Haul and reset if the gear is legal,

OK, Jack, I'm coming to unmute you. Thank you for your patience. You should be able to unmute yourself.

Yeah, can you hear me?

Yes,

Thank you. I needed my wife's help. So just quick comments tonight. I'll probably have more tomorrow. But. The first thing on the, the closed area, or I don't, I do not fish out there. I'm not sure that I know anybody that does, But I agree with comments earlier that the perimeter of that area will be a wall of traps during that closed season. And, and the one thing that people haven't brought up, that I will bring up is, once that is open, that there will be a gold rush mentality to get into that area. So, unless your timing is perfect, that might, it might not be the greatest thing for Whales. Um, so, other than that, I know. I apologize it Chao is that your first name is Chao how You pronounce it.

Yep, yep.

OK, you've mentioned 20 minutes to put the gear markings in as an estimate or your estimate, it took me, I spent most of the summer doing this year in Maine. And I estimate at least an hour per line.

So, yeah, I'm just telling you, it takes a lot longer than you think For a lot of reasons and it, you know, I don't need to get into here, but its, it's time consuming. That's a minor point, but I just thought I'd bring it up.

Very helpful. Yeah.

The third thing, um, I was just going to, say, give a shout out to Zach. Well, I know pretty well, and I, can't agree with him more about the trawling up. The numbers of traps being possible detriment to whales, I can see them, You know, a pair traps, three traps, they can probably swim free but when you're talking about 15, 25, 45 traps? I don't think they're going to get through that. So I'm not sure why we're even talking about trawling up, and I'll leave it to that here tonight.

Thank you.

Yep.

Kara, any other public comments in the queue?

It does not look like it.

Well, I'd like to thank everyone for joining us tonight. This was really, I think, our best, best night, so far of really great questions and really thoughtful comments. And I really appreciate you participating. I know life is really busy for everyone right now, and I appreciate that you took the time to help us try to implement the documents.

Yeah, Colleen, we have 1, 1, last one.

I take that all back.

Hi. Ira the line is open for you.

Jack just got me thinking about another comment around that cold area because it is in my back door. A lot of guys I know fish that area and there's a lot of guys fishing either side of that area. As you know, in Maine, especially, there's a lot of traditional fishing areas of the fish, traditionally by the same groups, township's areas, what have you, Uh, you'll be creating something there that's going to work. It's going to work against the way life has been for a long time, well forever, as far as people entering and exiting that area. You've also encouraged, uh, talking about encouraging ropeless fishing there. And if you go in there with ropeless fishing the way it is today, it's going to be an absolute nightmare. And it will be you might just as well call it a dumping ground, if you do it. If you use that for an incentive to stop for people to go in and fish, when it's closed, if that actually happens, I'm totally against that area, especially the way it's drawn out. There's, I. Guess I have other thoughts around closed areas, but. First one being that close areas aren't a good thing for us, probably, in the usage of our ocean, the way it is right now. And if we had to go to that, then there's, I think there's other ways to do it.

Thank you.

Thank you.

Appreciate that.

OK, we have 1 last 1, I'm going to put up a slide, and the LMA one proposed area, and, Jonathan, I'm going to unmute you. You are unmuted, I'm going to go put that slide up.

I will also mention that we will be adding this to our fact sheets, so you'll be able to download this in the future.

OK, and there's no question associated. Just wanted to see it. Thank you, Marissa.

So that fact sheet can be found on the Take Reduction Plan website. If you, actually, if you, if you just Google the Atlantic Large Take Reduction Plan Proposed Rule, it'll, it'll take you to the website, I believe, and this fact sheet is one of the documents on there.

Marissa, we will be updating it with this image, is that correct?

We will. I don't know exactly when. I'll have to hear back on that from our comms team.

My guess is within 24 hours, they've been getting information out about, as fast as we can produce, some of them are on tonight, and I appreciate their help.

OK, I think we have one last question. Alicia, back to you.

Thank you and I hope I am not keeping everybody too late this evening. Just the last thing, of course, dynamic closures are something that I'm very interested in and I'm. I know that you're saying that perhaps the NEPA process might be somewhat of a barrier to creating those. I wonder if it might be possible to create a categorical exemption under NEPA, and maybe that's a question for attorneys there, but to allow for a quick creation of a dynamic closure, just an idea.

I don't exactly remember the requirements for categorical exemptions, but I believe that there are generally, uh, related to a lack of on the lack of impacts beyond things that have already been considered and analyzed. Or the lack of impacts altogether. So I not I mean that's something that we can pursue and talk to our NEPA experts and our attorneys about. But I'm not sure it would apply to this type of dynamic closure option. Let's look into that.

Thank you. Thank you for considering it, and thanks again for all the work you're doing. Much appreciate it.

OK, Colleen, I think we're at the bottom of the queue.

OK, again, thanks, everybody, for joining us. This was our best, the most people that joined us and some of the best input that we've gotten. And we really do appreciate it, especially in a busy and fairly dramatic week, potentially, really appreciate it, and perhaps see some of you tomorrow. So goodnight. Goodnight everybody.

Information Session 4
Northern Maine, Wednesday, January 20, 2021, 6:30-8:30 pm

First, 2021, either in writing or through public hearings that we'll be holding in February. After collecting comments, we'll analyze an as needed, update the analysis, and our environmental impact statement. Along with information from public comments, we'll consider any new data that has come in since the DEIS was written, including new stock assessment information, or newly published papers. We'll consider the updated information and complete the final environmental impact statement, and that will be available, followed by a 30 day cooling off period, which is a requirement of the National Environmental Policy Act. So, comments we received and the analyzes will also inform the final rule that will be completed and filed 30 days after the final environmental impact statements published. Note that we anticipate as usual there will be a delayed effective date for modifications to gear configuration and gear marking so that fishermen will be given time to modify their gear. Paralleling this Marine Mammal Protection Act process, there is an ongoing Endangered Species Act, action a Section seven consultation. On a number of federally managed fisheries. Last Friday the agency released a draft biological opinion. The address, the Web address for the information bulletin on that draft biological opinion is listed here. On that webpage you can find the opinion, a conservation framework, and an e-mail address where you can send questions or input. The deadline for providing input is February 19th. Note that there's a court order deadline to complete that Endangered Species Act consultation and to finalize the biological opinion by May 31, 2021. As noted in the draft opinion and in the Conservation framework, the consultation and the resulting biological opinion will be considering the impact of the fisheries as it would be modified by the final rule. Next slide, please. Again, the 60 day public comment period runs through midnight, March first, 2021, we will be holding remote public meetings to provide the opportunity to provide comments. This is our last, information Presentation Meeting. And, in February, we will be holding four public hearings where our presentations will be very brief, and the bulk of the time will be devoted to collecting public comments. You don't have to attend a meeting to provide comments, Written comments are welcome, and can be submitted through WWW dot regulations dot gov, search for the rule and the draft environmental impact statement on that website by using the identification number shown in this slide, and in the proposed rule, and the draft environmental impact statement. When you are at the rule, click on comment, now you submit your comments. The proposed rule, the draft environmental impact statement, the list of public meetings, including the links to get you into the meetings and other resource materials, can be found on the Take Reduction Plan Website, detailed on this slide. Fisheries dot NOAA dot gov backslash ALWTRP, If you have any questions, you can always send me an e-mail at the e-mail address identified here. And as a reminder, attendance at meetings isn't necessary to provide written comments, you send those through regs regulations dot gov. I want to thank the many collaborators and particularly the take reduction team members. There are a few on the phone tonight and particularly the fishermen that participate on the take reduction teams. Meetings are just not a natural environment for them, and they worked really hard with us over the last few years, And a number of meetings, and I'd also like to thank all of you for any comments you provide on this rulemaking effort. Next slide, please. So, we are going to now kick off the question and answer session, we will be taking questions specific to clarifying things in the proposed rule. And in the draft environmental impact statement. Please remember that we will be recording the question session, including information submitted in the question box. And we will start recording, in a few minutes. Type “question” in the question box to convey that you would like to get in line, to ask a question and the slide number, if you remember where, which side that is on. And if you've already done this, you don't have to do that again. You can change your mind at any time by saying “pass”, when you're called on. Or by typing “take me off the question list” to the question box. And as we've mentioned earlier, you, Kara will unmute you, but you may also need to unmute yourself when you, your turn, is up at the queue. And, as always, please be respectful and direct questions to the presenters. And with that, I think we can start taking questions, Kara.

Yes, hi, everyone. I know that there are some people who are having issues typing into the questions box, You can also e-mail me. It's Kara, K A R A, dot S H E R V A N I C K.At NOAA dot gov. I put it into the chat box, and hoping it comes up. So, if you would like to get in the queue, and you are unable to enter that into the questions box, send us an e-mail, or if you know someone else who's on tonight, they can also get you in a queue. Thank you for bearing with our technical difficulties tonight. I promise it worked all the other evenings. Um, so with that, I think we're going to go to our first question. Julie Eatan, I'm going to unmute you. I see you have multiple questions. If you will just ask one question, let our presenters respond and then ask your second question. You are unmuted, you should be able to unmute yourself and ask your first question.

Hi, Thank you very much for taking my question. I would like to know my first question is how many of these entanglements have been found to be involved with Maine Lobster gear? or have ah how many right whales have been seen in Maine waters in the last 10 years? Thank you.

Thanks for that question. I don't have the sightings data from Maine waters at this time. Um, we can see if we can find that for you. We don't have a formal sighting network in Maine and compared to some of the other New England states, there's not as many whale watch operations out of Maine, I do think Zach Kleiber's on here tonight if he asks the question. Later, he can also maybe let us know what he knows about sightings data in Maine. And we don't have any documented right whale entanglements, known to be in Maine gear. If you'll remember what I said earlier, we actually only know the set location of thirteen out of fourteen hundred entanglement incidents that have been investigated by New England Aquarium scientists. We almost never, what that means is we almost never know the location of the original entanglement. What we know generally is the location of first sightings of documented entangled right whales. And as I mentioned earlier, we know that right whales can take gear hundreds of miles, and can be entangled for many months before they're even first sighted That answers your question?

Thank you very much for your answer. Thank you, very much, it does. My second question would be, what diameter of rope would be considered weak rope?

That's another really good question. Unfortunately, it's not. Uh, as, as diameter, there can be very low diameter line that's engineered to be very strong. There can also be large diameter lines that can be engineered to be weak. So, we can't really implement these regulations just by, by requiring a certain diameter of rope. It has to be either engineered to be weak. So rope that's made to be weak and demonstrated to break at 1700 pounds or less Or, or weak insertions need to be intentionally placed within the line every 40 feet to be considered equivalent to weak rope. Um, so weak insertion for instance, the weak sleeves, that the sleeves that are used by some of the Massachusetts fishermen are inserted at every 40 feet. Does that answer your question?

OK, so, to follow, to follow up on that question, I'm an inshore fishermen in Maine. I write about as does my husband. We fished single traps, we are in the exempted area. Ah we do, of course the weak Buoy deal. Um, if you are requiring me to put weak links in my rope, I fish all 5/16 rope because I don't need rope bigger than that. How am I supposed to know or any other fishermen supposed to know what's considered weak rope that would qualify as rope that we can install to make the requirement that you're asking us to do?

So, good question and first of all, we're not in our federal rulemaking. We're not going to be regulating Maine exempt waters. However, Maine is proposing to require a weak rope either weak rope or a weak insertion, 50% down your buoy line in the exemption area. So one weak insertion, 50% down. Again, that can be done with weak rope. And there, there is 5/16 rope That is engineered to be weak. We're going to be, we have started working with gear manufacturers and we're asking them, when they're, when they're creating the rope that's breaks at 1700lb or less. We're asking them to leave in one of the three strands, as an alternating color. So, that would be one way that someone purchasing it, or an enforcement officer looking at it, can tell that it that it was engineered to be a weak breaking rope. But again, in in exempt waters, this rulemaking won't be regulating you on that. the regulation, to include one weak insert would be done by the State of Maine.

OK, thank you very much.

You're welcome.

OK, next we're going to Dustin Delano. I'm coming to unmute you. And I see you have multiple questions. If you'll just ask one, Let the presenters respond and then ask your second one. I can see you're unmuted, but I can't quite hear you yet.

OK, am I all good?

Yes, I can hear you now.

Um, I guess, I'm curious how the number of boats included in the closure were determined to be 45. It seems like it's much higher.

Right, So we got this question last night, too. So first of all, we get the number 40. This number 45 is the number of vessels in a month. This is the highest number of amounts during October to January through the month of January. So there might be there 100 or 150 different vessels fish through the whole restricted period. But from the industrial, industrial economics, research on the VTR data shows in January, that's the most vessel throughout that area, it's 45. So also, we all know the VTR data in Maine federal waters limited, because only 10% of vessels are required to submit VTR, right? So for the next step, we'll double check this number by using multiple years of data, like, 10 years, because I know, or the vessels, they don't do not overlaps throughout the year. So maybe we can use 10, 15 years of data, like, from 2010 to 2000 to 20 20, to see how many vessels actually showed up in that area. We also welcome fishermen to submit comments to us to reveal the actual number in that area. So, does that answer your question?

Yes, I think so. I guess I'm also curious, too, how. Yeah. You know, the economics were figured? that seems like a very, very low number, too. You know, the 100 and something to 300 and something thousand.

Right, because, yeah, only 45 vessel fish there. Oh. This number, the biggest cause for this restricted area. it's, uh, cost of assumption of landing reduction in this area. So first of all, we have to calculate, that's the total landings from the vessel in that area. We use the catch per trap data. We calculate that first. Using VTR data, we can then we estimate estimated the number of traps per vessel. Then we get the total number of catch per month for each vessel In that area, then we assumed 5%, to 10 percent reduction from relocation.

So why would you assume a five to 10% reduction? I mean, I fish all my gear in that area right now, if I was fishing somewhere else, those lobster would be caught up sooner. There was another 45 which is actually, It's definitely more than 45 but if we were all fishing in a different area, you're going to catch the lobsters up sooner. That is if you can even go to a different area, I mean, those spots are all, they're all taken. So, Or you stay up, you know, up, inside longer, and you catch those up, sooner, or, while you're waiting for the area to open you know, or, you might not even be making any money, leaving your trap somewhere else.

So, yeah. You're more than welcome to submit all the comments to our e-mail and we will consider that. So, this, all these analysis we've done here, It's A Draft Economic Environmental Impact Statement. So we're asking for comments here, and to finalize this research and this analysis and to get to the FEIS. And until then you have you have the chance to comment. and after the FEIS you still have the chance to comment, we will incorporate it all the comments into our final analysis. So the assumption here we get is from the previous research including like a dynamic paper and our communication with fishermen. And our lobster biologists I know this is very, very general assumption and it varies from boats to boats and vary from area to area. But, for this analysis, we, so, the, the assumption here, is of 5 to 10 percent. So, if fisherman friends, you have more to say about this number, you can provide your estimation and your, you're like evidence or proof of your estimation, we can incorporate that into our final analysis. Thank you.

OK. Thank you.

Awesome. And, Dustin, you had one question earlier on about the LMA one, the length of the LMA1 closure. Do you still want to ask that one?

I think I saw it answered that in another slide that basically goes into February, and, and I think it's set a soft date. Is that right?

So, the preferred is from October to the end of January and the non-preferred to the end of February.

OK, and in did that have a soft date for opening, or?

I don't think, I mean.

Non preferred, alternative does have a soft open.

OK. All right, thank you.

Thank you. OK, I'm going to go to the phone. Christian Porter, I'm going to come unmute you. You should be able to unmute yourself.

Can you hear me now?

Yes.

Yeah. So, my question was on conservation equivalencies. Zones in the state of Maine, did their own equivalencies to see if they could change the change to be able to suit, you know, each individual zone, are those being considered to be added into this proposed rule?

Hi, Chris. And it's Colleen. Thanks for that question. We actually haven't yet received the list of potential conservation equivalencies. But we anticipate that Maine will be providing them with their comments. And I did sit in on at least one zone meeting, just to listen in on what kinds of things are being discussed. And, everything I heard was within the scope of the proposed rule that we propose, so, You know, we are we do have to get 60% risk reduction. But it looked like they were equivalent, they would get the same amount of risk reduction is what's being proposed, and they are within the scope of what's been proposed, I've heard mostly alternative risk reduction, or alternative trawling up measures, and things like that. So, we can be able to take a lot of those, perhaps all of them, again, I haven't seen the list, But that is something that could be incorporated into the final rule.

Great, Thank you.

OK, Jacob Thompson, you are next. You should be able to unmute yourself.

OK, I just had a question about when you when you were talking about the 45 guys and that would have to get relocated. Did you account for the loss of catch for everyone else? That they're going to go and set their traps by not just, I mean, they're not going to catch as much as they want but when they go and set their traps in a different area, it's got to reduce every fisherman around there’s catch to sell. Um, I think that number's kind of low.

Yes, I agree with you. We get the same comment last night. We haven't considered this in our DEIS we will consider it in the final draft. Thank you for your comments.

OK also, just one more thing. In Maine, we have, we have zones, so you can't just take all your traps and go wherever you want and you have to keep 51% in your home zone, is that gone into any of the calculations that you like in Massachusetts, you could take in LMA. You could take all 800 of your traps and you could go right to the Canadian border, but I’m in Vinalhaven. I have to keep 51% of my traps in zone C, which if that area is closed, I could take some into 49 percent in Zone B, but I can't the other 51%, I have to bring back north. I can't just take all 800 trap's into, you know, another area, so I was just curious if that was any thought given?

Right. For the economic analysis, We haven't done that detail, but for the risk reduction, maybe Marisa or Colleen, you have some thoughts on that.

It's more of an economic question, not a risk reduction because I mean, like when the Massachusetts zones close, they can bring , (indecipherable) traps and go set them down in caches or somewhere where it's open. But for a Maine person, we can't just move our traps like they can to relocate as easy.

So for now our assumption is fishermen staying within their own zone then move that closer to shore, that’s all we have now.

OK, That's something you should probably look into.

Thank you.

OK, Next, I'm going to go back to the phone. I'm not sure if you have a question, but Harriot Train. I'm going to come unmute you. Just in case. You're unmuted, you should be able to unmute yourself. If you don't have a question, that's OK, I just want to make sure.

I don't have a question. I just didn't have the option to ask a question

OK, thank you. OK, Gregory Simmins, I'm coming to you, I see you have two questions and please just ask the first one. Let the presenters respond, and then ask your second one, You should be able to unmute yourself.

Can you hear me?

Yes.

It's actually his wife, Amy Simmons, I just signed in under him.

Hello, welcome.

Thank you. I guess I'm wondering who, when we have to do all the gear changes, and there was suggestions that there'll be ropeless gear. Is that going to be something that is going to be paid for, or is that something that's going to have to be covered by lobsterman themselves, and was that factored into everything that they're looking into?

Hi. This is Colleen, I'll take this one, or will give it a try, and the measures that we're proposing and would primarily be costs to fishermen that I'm talking about gearrmarking and the restricted areas moving out of restricted areas there. There is some support was provided by Congress, they re-appropriated funds, and they moved it to provide some support, aye. And some of that is being used really, primarily to work at finding weak insertions that can work so that fishermen don't have to replace their entire lines or, and getting gear specialists to help fishermen modify their gear according to the measures. So, those are funds that went to the States. It might be that Congress will appropriate more funds in past years. They've done things like buy bought back gear, and that that might happen as we move forward with the new Congress. We don't know regarding weak. I mean, regarding ropeless systems, right now, ropeless systems as you indicated or you know, inferred or they're pretty expensive. And the ropeless research that's going on right now in other areas, that is being supported by multiple partners. They are doing things like there's a cache of gear that the Northeast Science Center has out of Woods Hole, and they're lending the ropeless systems. So that people can improve how they're working in or under commercial fishing conditions. They don't have enough gear though to outfit the fishery, they just have some gear you really more for the purpose of accelerating, um, the, the evolution of this gear so that it's more usable by fishermen and honestly they are trying to develop it so that it's less expensive. I do think that even the environmental organizations that are hoping, that large areas can be ropeless fished in the future. They also believe that, if this is ever going to happen, it's going to require a lot of government support. So that's not funding that's currently available. There we are getting a support to from the government so that NMFS can help do the experimentation. But we don't have the kinds of funds that would be needed to transform large portions of the fishery to ropeless gear at this time.

OK. And I guess my second question would be, you know, my husband makes our livelihood pretty much in the months that will be closed down. So, will there be supplementing funding? I know like, Canada gets funding from their government that when they have shutdowns. Is that's something that's being looked at. For these lobstermen that are going to be losing so much money and that, you know, that's where we make our money, that we get to survive on for the year, And without that, you know, it's kind of a scary thought.

Yeah, I mean, at this and, again, NMFS has, we have not gotten that money from Congress, Congress is the one that appropriates funds, it's not something that the agency can do. Um, so, I really, I'm not sure. I mean, I know that the funds that they, that were, we, they were taken from, from one program, and they were put into an effort to send some funds to state to help them with this transition from these new rules, And I don't know if that will happen again. That's not something that our agency can make happen, um,

OK.

You know, in the past, I think the State of Maine, for instance, has been pretty successful at working with their legislators to try and get support for things like that.

All right, Well, thank you.

Welcome.

OK, Eben Wilson. You should, if you're unmuted, you should be able to ask your question.

Yes, Hi, I have two questions. First one is, Zone E Trawling up, we're currently a 600 traps zone we have been. So we're obviously 200 traps less than all the other zones, and I think part of this question may have already been answered. And I think our zone council submitted outside of 20 miles outside of 12 miles, if we go to 20 trap trawls, um, and in this area, I was hoping that maybe that was something that was going to go through because most guys have less than a 40 no smaller than 40 foot boats, that fish outside of 12 down at about 18 to 20 miles. So basically if we had to go to 25, guys would just shift up inside, and whatever, Whatever, vertical line reduction you thought you were going to get. Inside of 12, you would actually increase your vertical line, because guys are being hanging out up inside. So I think that's another thing that I look at, with the restricted area, is that you're going to restrict lines in one area, but you're going to double them in other areas. I don't know how that math works, If you can help me, I'd, I'd appreciate it.

OK, I'll, I'll try answering this one. This is Colleen again. So it sounds like Your Zone has come up with a conservation equivalency. That's within the scope of things that were considered in the rule and then and the draft environmental impact statement and so on, if that's submitted with the state and we analyze that and it has a conservation equivalency. It sounds like the kind of thing we probably could include in the final rule we just haven't received that list yet from the state. As far as your other question goes and Marisa and or Burton who are both on the phone might be able to help me answer this. But your other question was, have we considered? Or how is it that moving the lines into another area reduces the risk? And Marisa sort of described that the assessment is where the lines and right whales co-occur, There is more risk, and if lines our moved to another area where right whales are less likely to occur. Then than that, there's a reduction in the risk. So Marisa or Burton, I don't know if you want to add to that.

So that I can, if there's kind of a second part to my question on one of your slides, where you're talking about co-occurrence, And I'm looking at the Maine proposed restricted area, which is solely in Area one A, If you look at the co-occurrence on a slide, that has both red and blue in that area. Um, it seems to be relatively, there's a higher co-occurrence inside area 1A versus Area three, but it's basically split down the middle. If you look at the pink colored boxes, there's a lot more in that area three. So, why? Why wasn't the area 1 Restricted area split between the Area three and Area one.

Burton, can I ask you to have some input on? This is, I think, had to do with the size of some of the cells in the co-occurrence model, compared to the way it was smoothed in the decision support tool model, perhaps.

Um, concerning the why was closed area only on the LMA one side, we did run scenarios, where we extended it across the border into LMA three. So, we have those scenarios, and that analysis run. We have the results available for that. It's that to the resolution of data that we have, we can't tell that there's a large amount of gear on the LMA three side. So I think that that's why we assess that, but then didn't carry it through to the end. To address the earlier question about relocating gear. And changing trawl lengths, that is actually calculated and accounted for inside the decision support tool. So it assumes that if gear gets moved from one location to the next, that it assumes the local gear configuration. So if you move traps from a 25 trap trawl area to a 15 trap trawl area, then those traps are assumed to be configured in 15 trap trawls and the lines are counted accordingly.

Coming out of the restricted area, guys aren't going to go back to a 15 trap trawl area because they're doing that to get away from those areas. So, you're going to go from 25 traps trawls to 25 trap trawls, because they're only going to move it as far as they need to get out of their restricted area. So, you're essentially doubling the lines outside of your restricted area.

That would be true if they're moving, moving them to a place where people are not fishing. I mean, if they're moved to a location where the local, the local gear configuration is different, and it's assumed that that gear is going to assume that configuration currently. And if that's an incorrect assumption, then we can look at addressing that in the model.

Yeah.

Yep, OK. Yeah. There's just so much fishable, there's only so much fishable bottom that people aren't going to move to where there's actually something to catch. So that means that if you're coming out of the restricted area, you're going to be going to somewhere, which you can just kind of shelter or fish until the restricted area opens. Again, so you're not going to reconfigure your gear offshore. So, you're going to be doubling the lines, vertical lines, and gear density in areas, just outside of that area. It's, that's, that's what's going to happen. It's not an assumption, and that's what will happen, so I, your logic doesn't either. I'm not understanding it correctly or it doesn't make sense. The way that is because no one's going to reconfigure 25 trap trawls offshore.

OK, I think perhaps I was misunderstanding your question. So I think, your concern is the increase in line density, in the areas outside of the closure. Not that They're changing configurations that need to be accounted for.

Exactly.

So in this case, that the if you sort of look at the maps here, you can see that that modeled whale density Is it in these areas there Are whales in areas adjacent to it There are not whales. And so under that circumstance, recognizing the gear it gets moved outside of that area means the gears moved to a location where there may be a high line density as a result, there is presumed to be a low whale presence, which is where the benefit comes from.

OK, so the fact that Area three has a high, high whale or co-occurrence baseline, but has no, has less gear density, means that that's why you didn't split the line. Split the area three, area, one line with. with, with the proposed closure restricted area, because there's just no gear there?

To a certain degree. Yes. And it's really difficult, because we don't have high resolution data on the distribution of gear. It's not reported.

Sure.

So, if we have VTR data, then we can make some assumptions around that. But otherwise, we often just have, you know, you're in this zone outside of 12 miles. We don't know exactly where that gear is, so the only thing we can do is assume it's spread homogeneously over that area, OK, there's a, there's a data limitation there that allows us to do this better.

OK, so, but the co-occurrence data that you have is that acoustic data?

This co-occurrence would be from aerial surveys.

OK, so here's the whale distribution.

Yeah, OK. But when were the last acoustic surveys done, that, you could use for co-occurrence data?

Colleen do you want to step in on acoustic?

I mean the last the last we, right now. Well, Burton, you can let me know if Jason has figured out a way to add acoustic data to the whale data model. But as far as a recent acoustic data for the area, the in the last, um, the last ROV, what do they call those the gliders that go through And are moving through areas, trying to detect whales The last one that I saw that detected a right whale was January in 2019, I think that they, the, there might be another one in that area in the general vicinity in the Gulf of Maine. Now, I haven't been, I haven't been checking the tracks on that. There is also work being done between our Science Center and the state of Maine with acoustics. They're like acoustic traps that are set, but they don't relay the information. They have to be taken out, and the data are uploaded somewhere. And then they're placed back in. And, and the data are analyzed. And I know that they have established those. And someone is actually currently analyzing the data now. So we may have those data soon, but I don't have those right now. Those I believe are from sometime in the last 6 or nine months,

OK? But the plane flights are something that's recent, that's been in the last couple of years?

Right. The way this, they're, they're getting ready to modify how they do their aerial surveys, but the way they've been done in recent years is really been focused on trying to get us good population estimates and to do that, they need to recapture the whale's they need to have. They need to see the whales frequently. So they've been concentrating the flights on where there are abundant whales so they can get the most identifications done in every flight. As a result, the broader surveys they used to do haven't been being done, though, They have sent some surveys into that area. I'm not sure what the sightings have been for that area. I know that they haven't triggered. they haven't had the kind of aggregations that would trigger voluntary vessel speed reductions, in recent months, at least.

Yeah, I guess I was just trying to get at the point of where, where, you know how the co-occurrence data, what the age of it is, and the frequency of those flights. You know, as you say or you know acoustic or whatever you know in that area. I mean, I know the one. I think it was WHOI did the one acoustic glider in 2019. But I think that was the first one that had been done in a decade. You know, I think that's where I kind of step off a little bit on with, you know, looking at a restricted area, is that we're looking at data that's been, you know, we have one baseline for, for 10 years. and we know how much things have changed in the Gulf And so, look at displacing that many fishermen, out of a, you know, in a restricted area during the most profitable months I guess I would like to have a little bit more recent data and would feel more comfortable with that rather than taking a shot in the dark in a way. That's the way it feels to me, at a restricted area. I think that some, I think it's, just don't think it's fair.

And we can, we can record that as a comment. But know, that you're not the only one who's concerned, including some of the scientists on the take reduction team, that we need more data. But we really can't wait till we have all the data to do it. However, the other thing you mentioned that's right is, yeah. The whales have shifted a lot in their distribution since 2010. But although they've shifted a lot, they still seem to be visiting their previous places that they visited, Not as many whales are using in the Gulf of Maine, and in some places, like the Bay of Fundy, they don't visit for a long, they poke their noses in and then they leave out, leave, you know, right away. So that this was an important area at one time and we don't have a lot of recent data to know that it still is, doesn't let us know that they're not still going there. I do think, you know that Maine has been working pretty aggressively to try and get more information. And NMFS has as well, trying to increase the use of acoustic data, because we can't get flights there. But the acoustic data can give us all kind of a longer survey than we can do by setting flights up every day. So, you know, point taken we need more data. I'm yeah, I'm afraid point with the speed with which the population is declining. We can't wait till we have all the answers.

Sure. I mean, I understand that. I think that's one of the frustrating pieces about all of this is the fact that we're doing this, you know, without recent or, you know, there's some good data. There's some bad data. I'm not, I'm not denying the fact that they're, you know, not still in the Gulf of Maine, but I know what I see every day. And every other fishermen, I talked to sees every day and it's not, you know, we're not seeing them, It’s not a reason to not do something but it's also when you're looking at, you know, my bills don't stop every day. So at the end of the day, you know, I want to make sure that what we do actually works for whales and works for us.

All right. Yeah, thanks,

I'm all set, thank you.

Thank you. OK, I'm going to go to Nicholas Morely. Hmm, this lost you in my list. OK, you're unmuted, you should be able to ask your question. I see that you're unmuted, but we can't quite hear you yet.

Can you hear me now?

Yes.

My question is, now, with all the state markings, what if in like, 7 or 8 years or even, like, 2 or 3? What if there's no like entanglements, like from the State of Maine. Is some of this stuff going to be able to change, or?

I'll try this one as well. This is Colleen again. And no, we did mention there aren't that many whales that we're seeing that have gear still on them. So when there's so few incidents, and few have gear on them, not seeing a mark isn't the only data that we would be able to use to know that we can change the measures. But, there are a lot of other things we'll be looking at, You know, the more data we have on, whale distribution, as, as Maine, goes to 100% reporting. The more data we have on whether lines have been reduced from the trawling up, or where the effort actually is, the, possibly, the more we'll be able to, right scale the measures, or modify them. It does take up a couple of years for us to modify measures. And we do need a lot of information to do that. Our, our plan is to be trying to monitor as well as we can, including the whales and the fishery, and bringing that to the take reduction team annually. Uh, you know, while we're trying to figure out whether this is working, whether we need, whether we can move some of the measures in, some places remaining more measures. So that's something where we'll be continuing to look at what the take reduction team, probably through at least annual monitoring meetings. So again, it wouldn't only be the lack of gearmark found it would have to include a lot of other information too.

Thank you.

Andrew Hallinan, you are next. OK, you are unmuted.

OK, my question is, for the LMA one Zone, the Closure Zone, is there any amount of conservation equivalency that Zones in Maine could do to fish that zone?

Marisa, you had looked a little bit at this last night, and, and about 10% of the risk reduction, um, in this 60 something percent. That the decision support tool estimated was from the LMA one closure.

It was 10.8% across the entire north-east.

Right. So, we would have to find, you know, about that level of risk reduction across the region in order to, know, that we wouldn't need the LMA one closure area.

OK. And also, on one of your last slides, you asked for comments about the weak point at the buoy. I, from a fisherman, myself, I don't think it's necessary if you're going to. And if you're going to implement other weak points with the tide boiling and stuff like that, buoys are going to be lost anyway, so you might as well, um, save what gear you can. And also, in the economic factor, I think things that should be considered is if you're going to make fishermen relocate in terms of north and south and not out of their zone, like Jacob Thompson talked about, I think Territory, guys, Cutting each other off should be considered. Trawls with one end when you're fishing 25 trap trawls with one end on them, The amount of gear lost from that should be considered. And also, in Zone E of Maine, the LMA one zone, a lot of guys, I personally don't fish it, but a lot of other guys do. So, I feel like I should talk on their behalf to go.
Their lost income from that. I think that should also be considered, whether it has to be looking at slips or whatnot. I think all that should be considered when you're talking about economic consequences, when you're shutting down zones like that.

Thank you, we were recording those comments. Appreciate that.

That's, that's all I have.

Thank you. We had a question from someone who's unable to speak. The question is. I would like, Here we are. I want to know if there is a fisher-friendly version of the data presented in the DEIS and presentation?

Um hmm. The presentation, to some extent, was created to be accessible. I think from the comments that and questions that we're getting from fishermen, they're understanding it. Pretty dang. Well. There is also a 5 or 6 page summary of the measures in a, you know, an in more accessible format that's on our website that I don't think that has the analyzes summarized. But, it does have the measure summarized. But, but this presentation, one very similar to it, is posted as a slide deck, we can post this one, as well as a slide deck. And it does, I think, present the data in a fairly accessible form.

OK, thank you, see Jack Merrill, coming to you. You should be able to unmute yourself.

Hello.

Hi. Yes. We can hear you.

OK. Thanks. Yeah. Hello, again. I had some things on my mind when this conversation started, but a couple other things have come up in the meantime. So my first comment is, if you want to track whales, use drones, Um, That's all I have to say on that. It's new technology, I guess, but that's the way to do it. Um, and then last night, I pointed out that the parameters of the closed area will be, will become a wall of traps. And after it's open, there'll be a gold mine mentality into the zone. So I think a couple of guys had sort of brought up that point tonight. The parameters of, if any closed areas, are going to be, you know, littered with traps. So what I really wanted to bring up tonight, and I think Christian is, has talked about it a little bit. And other guys have too, equivalency possibilities. And that's one of your questions. Um, and that's extremely important, too, to us in Maine, because you're going to relocate a lot of people anyway. But if you're requiring guys, to fish 8 traps in an area where now they fish three as a way two end lines, versus four traps with one end line. There are some small differences and there are some large differences in those two configurations, it's the same amount of end lines, but two fours, I want to point out, will be further apart then end lines on a trawl of eight. So, I don't know if that's something you've considered. It's also be a little more rope, because in an eight than a two force because you've got to connect the two, so there's more rope in the water as well. Um, so, that's one thing I wanted to bring up. Then I think, I call it the Elephant in the room, both in the State of Maine and in federal waters. Lower Trap limits, Can you consider them as a way to reduce vertical lines?

Colleen here, um, first of all, the, the one buoy on the longer line is something that we can probably consider as a conservation equivalency, as you said. It would, it would result in the same number of end lines, it would probably have reduced economic impact, potentially. If those, um, those sets could be a little farther apart, they'd be less catch loss, potentially. So that's something that we can try and figure out. As you move farther offshore, it might be harder to do. But I'll you know I'll be in contact with the ASMFC, because it would requires changing the lobster rules as well. So I can work with them and figure out how best to do that. Um, so that is something that would be within the Uh, the scope of what we propose, so it would be something that we could include as a conservation equivalency if I could figure that out. The second part about reducing the number of traps. I know the State of Maine did a lot of scoping with that as a possibility. I was also on a lobster/whale working group. I think Burton, you may have participated with us on that as well. Where we, ASMFC, it was for ASMFC and they were looking into whether or not they could propose an amendment that would, um, try for line reduction through trap reductions. And it was pretty complicated and, in part because Maine has a different level of data collected. So, um, you know, understanding how to do that across different states that have different levels of fishing history known for fishermen was really complicated. The whole fishery management regime trying to do is complicated. And in the end, that group was not able to propose an amendment to the ASFMC. So it was considered, and I know, it was considered at the, at the multi-state level, through the Atlantic States Marine fisheries commission and it was considered at the at the state level, through Maine DMR scoping.

Yeah, it's been an ongoing conversation in Maine for about 100 years now. Actually, there's an old video of the Korea Co-op in the 19 thirties that shows fishermen, debating trap limits back then aye. But I think the, you know, the dangers of trawling up, especially for smaller boats, older fishermen. And the displacement of boats from the areas where they would normally fish by these rules that you proposed right now. Um, the dangers far outweigh, you know what giving up, some traps would be, So.

Yeah

And I'm not going to get into it tonight, but I know there are economic benefits to trap reduction as well, and it's worked all around the world. But, yeah. Anyway.

I agree with you quite a bit. And, with herring where it is, right now. There's benefits to be, um, I know if that was proposed as a conservation equivalency, that would be something that would be pretty easy for us to include in the Final Rule. Halving the number of lines by halving the number of traps would be pretty effective.

Yeah, because you know, if I had to reduce my traps, and I think I speak in a general term, You're not going to start. You know, where you fish singles now you're not going to suddenly put pairs. If you have less traps, any. So, anyway. Yeah, I appreciate that. Thank you.

Thank you for your comments, OK.

OK, we are? Going to Kent. Oh. Maybe we've lost Kent. I will come back to Kent. Gregory Simmonds, I am coming. Maybe not Gregory, either. OK, let me, we will come back to this to John Tripp. You should be able to unmute yourself. I can see that you're unmuted, but we can't hear you yet. OK, John, we're going to come back to you. David Tarr. You should be able to unmute yourself

Can you hear me?

Yes.

OK, my question, I guess I have a couple of questions, but primarily that, that restricted area that you're talking about, um, the model that came up with that, I mean, I think it's miraculous that it does just follow the, The area one, and area three lines right along and that, it's fine on one side, not on the other. I'd have a lot more faith in that model if it made a box that somehow crossed those magic lines we have out on the ocean, I'm wondering if it would be possible As you say, there's not much gear outside. Area one, in the area three box, maybe the guys could shift some gear over there, Just have some sort of an exemption for that time so they can fish outside a little further if they want to, to alleviate some of the gear stress from it being moved east, west, or, or north, give them a south option. And I'm also wondering, I don't believe that data, the data you're using, has much to do with aerial surveys, even in the last five years. But I would love to see, or have, Maine Lobstermen Association, or Downeast Lobstermen's Association or the State of Maine have that data that you're using to plug into that model. To, at least give us some faith that, that, that, that isn't, just, uh, a number pulled miraculously out of the air, It just, it just doesn't pass the straight face test, I guess. And then I have a second question after that, you are trying to answer that one?

Oh, sorry. The whale data that were used that were available to us in early 2020 when this is being drafted are from a model created a whale habitat density model, was originally created for the Navy, and it was created down at Duke. And it actually used survey data from a couple of decades so it wasn't just the most recent years. And I believe at the time we were using it was data through 2016 and 2017. That model has been updated in 2010 and on has been broken out. So we are trying to update the decision support tool to include that newer period of time that's more relevant. I think and Burton, could you speak to the availability of the decision support tool for other people to try and use it to model alternatives? I think that there are future plans for making it available, and it's available in a form right now. I think Maine DMR has used in the past, is that right?

Yes, that's correct. So two things there. There's, so what the decision support tool uses is actually output from this whale habitat model. So Duke University is taking the raw whale sightings data and using that to produce a model where projects, where whales are at. And then that then gives us a complete map that we can then connect with gear densities and other things in the decision support tool to look at co-occurrence numbers and such. So there's the data that Duke is using to produce their whale habitat model. Then there's that model results, which are being used in this analysis to look at locations that we would consider that show up as being areas of concern. The output for the Duke model that we're using as an input for the Decision Support Tool has been supplied to Maine DMR and staff of Maine DMR and we've had some back and forth and discussions on what the whale habitat model looks like. And they've done some interesting and clever further analysis on that. That was an earlier version when the newer version came out that was based on only the most recent years. We were we're really looking closely to see if that spatial distribution changed. And what's come with the most recent data is not a suggestion that the spatial distribution of change, but simply that the number of whales in the Gulf of Maine has gone down as a result. It doesn't seem to suggest that they're using a different spatial area portion of Maine. And I've just been able to get a hold of the final version of the updated habitat model, and I will be sending that the state of Maine, um, most anytime. There's a report that goes with the model that at least shows the raw data that went into that, And we can make sure that Maine DMR gets a copy of that as well.

OK, one of the other, I guess I still have two questions they're quick ones though. So, one, is this, all these slides? Are we going to have this accessible somewhere where we can look at this later on and study it, because as they were flashing through and people were talking, it really wasn't a chance to digest it. And I'm just wondering if I can have a hard copy of it, if I want to print it off myself.

Hi, Yes, there is a version available on the website, and I will post that into the chat, that does not have the Maine specific slides in it but we can work to get this version available as well. But I will put what is currently available right now on the chat.

Could you just say what the website is, and I'll just write it down.

Yes, it's fisheries dot NOAA dot gov. backslash ALWTRP, it's on the screen for reference to, and when you go to that website, it should be, at the top, it is current action, and then it says More Information, and it's one of the links listed. The more information.

OK, and the last thing, I didn't see, a slide go by that, that showed a map of what the exemption area was. But, I'd like to be able to pass that along what, where that exemption line is, do you have a map that shows that?

The, the restricted area?

No. No. The exemption line, you're talking about three trap. You know, three traps outside the exemption line I just would like to see where that exemption line is.

You can see it in either one of these maps. It's in red here, and then the next map, though. It'll be all the area in gray. In the next slide so, all the area in gray, you can see that line along there is the exemption line.

So, all of that area could still have pairs and single some, pretty much anything as long as they have the weak link and marked upright.

Yes, there will be no trawling up in those areas.

OK, they've answered my questions, Thank you.

OK, thank you, let's see. John Tripp. Let me, you should be able to unmute yourself. Yup.

Can you hear me?

Yes.

In the last webinar, I believe it was stated that the proposal achieved 64% risk reduction, but the LMA one closure, providing 10.8% risk reduction. Is it possible to achieve the 60% reduction of the closure area where split with area three and possibly stretched if necessary? I know Eban Wilson asked a similar question earlier, but I didn't know if you guys were able to run the numbers to still achieve 60% by, possibly making the area smaller for us, sharing the burden with Area three.

Colleen here, and, um, Burton, add to what I say if I don't provide enough information or Marisa. But when we were developing these areas, we were also following the instruction of getting risk reduction that was equivalent across states and jurisdictions. And so, LMA three proposed, or the Atlantic offshore guys is since don't have a state representative them. They identified one weak end and 45 trap trawls, as well as ongoing, There was ongoing and there's some imminent, trap reductions going on in LMA three, and with that combination LMA3 achieved pretty dang close to the 60% risk reduction. Then, the mass of the Maine LMA one, Measures did not, did not reach 60%. And that was one of the reasons when we were writing those scenarios that included that closure area as an area to protect whales where there is relatively high co-occurrence for the Maine LMA1 area. We ran a number of other scenarios, including ones where it overlapped into three and had other closed areas within or restricted areas within LMA1 Did not include all alternatives. Burton what am I missing, anything? Or Marisa?

No, I think that's correct. You know that the key is that this closure area is what we would have considered last when everything else that had been proposed failed to reach 60%. So, and that was trying to get this minimum number, basically, by jurisdiction.

Does the, we get no credit. For the fact that we actually have enforcement in area one and Maine state waters versus zero enforcement in Area three?

No, I mean that. That would be part of the baseline since it's not much change since 20 17, We, we are, NMFS, NOAA Office of Law Enforcement and the Coast Guard are working on improving the LMA three Enforcement. Um, so, hopefully, it will be improved compared to 20 17 over time, But, right, that wasn't something that we included as risk reduction credit.

While you can know that a lot of the science is based on assumptions, but you can assume that the state of Maine is going to do their job with enforcing the risk reduction measures that we have to take. And the same assumption could be made that there, there's going to be zero enforcement of any risk reduction in Area three. So, considering there's zero enforcement out there now.

Will include to that as a comment, you know, agreed that we do need a lot more risk reduction in area three. That's something that, there are some pilots going on now, but it needs to be wholesale. one thing proposed by the Atlantic States Marine Fisheries Commission that's likely to occur within the next few years is vessel monitoring in federal waters. And if it can't be done and all federal waters right off, if it is, the kind of thing that would probably be started, in an area three, and then when there's more capacity moved into other federal waters. So, that would help, that would help us with enforcement.

Thank you.

Welcome, thank you.

OK, Ira Miller, I'm coming to you. I see you have two accounts, So I'm going to try one, and let's see if this is the correct one. Can you unmute yourself? How about now, oh, I see you're unmuted.

Can you hear me?

Yes.

Uh, lot of the things I've talked about have already been touched upon. Certainly will enforcement, that was something I'd discuss last night. Just start off with that. So basically, Unfortunately, this is going to turn to somewhat of a fight between the sectors because we're all fighting for our existence. That being said, you're depending on the honor system. Basically, New Hampshire, Massachusetts and area three, seems how Maine, has the only enforcement. Or realistically, they're the only ones that can enforce anything out there. So, great big gap right there to begin with. As John just talked about, lengthening the line if it comes to a closed area, I understand why you're saying by co-occurrence model, but it appears to me looking at that co-occurrence model run further the south-west along that line, there's quite a bit of co-occurrence, but you stopped it short of that. It seems to me, that could be narrowed up quite a lot. And it really should be a shared, a shared area. So if it was narrowed up a lot and lengthened. It seems to me that even though it's unpalatable, anyway, that that would make it a little bit better. Jack Merrill brought up the possibility of trap reductions. I'd like to also talk about the possibility although this is uh, very little benefit to it, but you're trying to achieve something that's fair across the board. Uh, you know, winter time closure, possibly in state waters, things like that. It's not that I'm in favor of that stuff, but you're trying to get where it's giving people across the board of a fair chance to get things. I think you need to work those somehow into your calculations. I think people need to understand, if they have, for instance, a trap reduction, or what's what, I don't think that the best way to do it, as I think you, guys, do economic analysis, you should be throwing an economic analysis into that. How much change does it mean if there's a trap reduction, for instance, , 200 traps or something like that? What's it mean across the board for everybody else? What how are they going to have to change the way they fish?
My point being that is, it stands right now. We can all fish, we're all fishing right now. Old, young, everybody, everybody, is still able to make a living. We go to these types of things. You're going to impact some people, and you're going to make it extremely tough on them to make a living in the area that I fish. You move into triples a quarter mile outside the Islands. And I can tell you that I can fish, you'll be fishing triples in about some spots, probably about 6 or 8 fathoms of water, not very doable on hard bottom. So, I'm just wondering, I know this stuff is fast-tracked, but I think in the process as much information as you can on alternate scenarios, because it's pretty hard to make choices when you don't know what the impacts will be. At least you could maybe shine some light on it. I'm all set for now.

Hmm, We've taken that down, particularly as a comment. It would be hard for us to greatly modify the final rule with, with measures that we hadn't considered or didn't include in the analyzes, it's outside the scope of, of what's being considered, it is the kind of thing that we could potentially do through another proposed rule. But, as you indicated, this is somewhat on a fast track, partly based on litigation, greatly, based on the rapid decline in this whale population that's dropped by, oh, buy a quarter in just a couple of years. So we don't have a lot more years to take action. We, we looked at a lot of scenarios. The States did a lot of scoping as well. Some of the things being proposed tonight were not being proposed. By fishermen, when scoping of what's going on, or at least it didn't make it to us. But we'll, know, we'll start, will, as comments, come in when you sent, submit these as comments, and we've taken them as comments tonight as well. We will see where there is room for us to consider it within the analyzes and for the final rule. But some of it's quite outside the scope of what is in the proposed rule. So, if it would, if we changed it to this level, it would have to go out as another proposed rule, and that might be hard to do the time that we have.

When you spoke about, somebody brought this up, I believe, before, last night, And you spoke about proposed changes to the rules, how fast we could change things. Uh, just like to have you speak to that one more time and I'm wondering if there's things that the fishing fleet can do that would help you be more responsive in in making changes to things. if we're implementing this stuff, you know, that reacts to data, as it comes in a more timely way, it allows us to fish the way that we need to fish.

So I think that came up last night when people asked us when we're putting closed area or restricted areas in place if the whales shifted. How quickly can we modify the restricted areas? And I think, I said it usually takes us about two years to do something through a new rulemaking. I mean, this, this rulemaking is an example of that, We, you know, we got proposals from the states early in, late in 20 19, early in 20 20, and now it's early 2021 as we're proposing the rule. We're hoping to have it in place, um, you know, probably by the end of the summer or something like that. Um. Um, so that's almost two years right there. And really, the TRT made their proposal in April 2019. So we're almost up to 2, 2 years from when the TRT proposed their framework measures. I think that a lot of the things that held things up, you know, we did a lot of scoping. The states did a lot of scoping so, between April 2019. And early, 2020, a lot of that was because of the amount of scoping that was done by the states and by NOAA fisheries. And then the other place it got held up was when the rule went into review for because it was considered significant and went into review in the Office of Management and Budget, which is a branch at the White House. And that review period was a lot longer than we anticipated. So, those, Some of those are scoping, doing a lot of scoping is important. But, um, So, you know, it doesn't necessarily need to be nine months long. Maybe that's something that could be shortened next time. It's always hard for us to know how long something is going to be in review inside the Beltway. And that's not something we control. And that's a hard thing for anyone to predict. So it's just not a very agile process.

Right. Is there just a question for you? I know that you're always clambering, Seems like for more information, all Federal vessels were to report, trip reports, maybe even the possibility of electronic monitors if that was implemented in the Federal waters. How, was there any chance that that could implement that could impact that process, speed it up, whatever, To be more responsive to what's actually happening on the water?

I mean, I don't know if it would speed up the rulemaking, but the next rulemaking we do would be much better informed. And I think that it would probably improve, improve the measures and our ability to track the effectiveness of the measures. For instance, right now, we're proposing trawling up, It's hard for us to tell how much trawling up works. Unless we have 100% vessel trip reporting. And we can compare the number of lines being fished today with the number of lines being fished a year after the new measures are in place. So, um, so there are a lot of things that would be improved with that kind of reporting. I don't know that it would ensure we could do rulemaking in less than a couple of years.

Yeah, I mean, that's a benefit. I would hope that might come from that. I do have to do regular reporting. And, you know, it is I'm not sure that it's always finer scale that would that would really make a lot of difference. I mean, there is I think it could be improved, I guess, is what I'm trying to say.

Yeah. I agree. And I think Maine is also doing a lot of really targeted research that would also improve our ability to assess the area's better. For instance, the work that they're doing with the sound traps, to try and get more acoustic data, because there's not a lot of survey data for Maine waters. So yes, the more data we have, a bit, the better the measures would be, the more effective they'll be, and I can't guarantee it will come out faster, but, but it could, Measures that are better and more tailored and better supported often get less held up in review. So, that is the kind of thing that could make it faster.

Understood. Thank you.

Thank you.

OK, Zach, I'm coming to you and second. OK, you're unmuted, you'll be able to ask your question.

OK, thank you, my question has to do with slide 17. And before I ask the question, I just want to say, I'm with Blue Planet strategies out of Bar Harbor, Maine, but I grew up in Eastport in a fishing family. And then I became a whale watch naturalist for 30 years with thousands of trips off the coast of Maine. So I want to say thank you to all the fishermen on this call for all that you have done. And all that you continue to do too: look for solutions and find a way forward. I actually believe that the conservation community has a lot more in common with fishermen than different, including climate change, water quality, maintaining forage fish, um, ship strikes on whales. All those things are common cause for us. My question is with regard to the co-occurrence, if we look at the map for baseline co-occurrence on the left, there's a, there's a large area of red around Jeffrey's Ledge down around the New Hampshire, Maine border. And then also up between Eastport and Grand Manan. Just trying to understand if there were alternatives for closures where other areas are highlighted in red. Um, not that I'm trying to push more closures onto everybody but just trying to understand what, why, weren't alternatives given were considered for closures in those areas or how. How were those considered different? Thank you.

We, we ran a lot of scenarios actually, by we, I mean, Marisa and Burton ran hundreds of scenarios, including I don't know about that That small area off Grand Manan, but I know that I'm fairly certain we ran a few that included Jeffreys Ledge. And I don't remember why in the end those weren't in the preferred. Marisa and Burton, can you remember? I mean, I know this is about a year and a half ago, or a year ago, and hundreds of runs.

It's hard to remember all of the details, and this is something so when you're selecting measures for our preferred alternative, we were primarily using the decision support tool. And so this could have something to do with how we were approaching that and what is in the decision support tool versus what is in our co-occurrance model. So we didn't get these maps until kind of the end of the process, when we are doing our final biological analysis. And I think, when we ran things on the decision support tool, maybe, I don't think they were highlighted as major hotspots as much as the other area. Burton can may remember a little bit more about that. But I don't think, when we ran them through the decision support tool we had the same results as this map is showing. So, it's something that we might want to go back to and look at.

Yeah. I agree with what Marisa said. That one spot near the mouth of the Bay of Fundy did show up. It's sort of overemphasized because the value gets extrapolated out to a larger block in this case. So it showed up as a potential hotspot. But it was an extremely small one that didn't last across multiple months. And so creating a seasonal closure that was of a short time period in a very small area, I think that the people in law enforcement and others said the logistics of implementing something small, over a short period of time, that it had added up to relatively small benefit is not preferred the one over Jeffreys Ledge. I'd have to go back and look. I think that there was also a fairly brief period, maybe only one month or so that it showed up as a hotspot, but we'd have to look at that and see why it was at that and didn't make our final cut.

OK, thank you.

It's important to note that the modeling that we do happens on a monthly basis and we're looking at, sort of, one map out of one month for this.

Thanks. That's right. That's a good point Burton. That was a sample of a month versus the 12 months.

OK, the account of Nicholas Morely, I am coming to unmute you, you should be able to unmute yourself and ask your question.

I just got one more quick question. The state of Maine is proposing like a test, offshore wind turbine field. And it's right smack in the heart of like the closed area, cause like, when you compare the map for the closure and the wind turbines, right, in the exact same spot. So how can they have like, enough data to say it won't change anything like agriculturally. But you guys have enough evidence to shut it down all fishing because there's so many whales in that area, I just don't understand how they can like contradict each other so much.

Yeah. We've had similar questions about this, Off of Rhode Island, where they're struggling with some wind development conflicts as well. And it is really outside the scope of our actions. We are so specific to the take reduction process under the Marine Mammal Protection Act. Often, if our, It's also different federal agency. If they come to us for data, for tools, this is a kind of thing we could offer them. They could run the model as well. But as far as I know, we have not gotten involved in the, my, our team, the people who are here today have not been involved in their assessment and in their data sourcing. I can reach out to the folks that worked for NOAA fisheries that work with the wind energy companies and find out where they're getting their information and whether or not they are interested in using some of the information we have. The basic data, on whale distribution is coming almost all of us are using that Duke model that Burton described because that is currently the best available. But I don't know if that group hasn't yet used that. I can check into that to make sure they are using it.

All right.

OK, Colleen we have just a couple more questions. Jacob Thompson, you are next, you should be able to unmute yourself and ask your question.

Yes. I, I just wanted to know how come you guys didn't really stress that the whale migration pattern has changed as much? And climate change? I mean, everyone talks about it on TV all the time. Obviously, the warmer it gets, the whale's will be going further north, so, how come that wasn't talked about as much?

Yeah. Thanks, Jacob. That, that's a good question. And, um, know, honestly, we had, a slide in, in there, where we showed the trajectory of the population. And when we were presenting that, sort of a longer version. It's in the recorded version that's on our website, even, which is an even longer version of the presentation from tonight. We do point. We do state the problems. The whales are having the reason the population is declining is in, in large part or declining, faster, is in large part. Because since 20 11, they shifted their distribution. As you said, they're spending probably less time in the Gulf of Maine, except in, you know, they're visiting some places fewer of them are, are staying residential in there. There are more of them in Cape Cod Bay, and sometime in the 20 low teens, a bunch of them went to other areas where there are no permanent protective measures in place, particularly the Gulf of Saint Lawrence in 20 17, about 12 of those mortalities that occurred that year, occurred in the Gulf of saint Lawrence because the shippers weren't looking for them. And the fishermen didn't have measures in place. So, those mortalities that shifted distribution, which may also have reduced the whales fitness and did reduce or the calving interval between when the moms were having calves increased, the number of calves being born a year decreased. So, climate change contributed a lot to that shift, that increased the speed with which this population has been declining in the last since 20 10 or 20 11. And I didn't mention tonight because we were trying to give a more targeted presentation of what we're doing versus all the many reasons for the challenge that the population has declined. Doesn't really explain why there's been an increase in entanglement, certainly some of that's Canada, and we do account for that, and how we apportion the undocumented takes. It takes where we don't know where they occur. We assume half of those are occurring in Canada. We don't blame those all on US. Fisheries as may have been done in the past. And you know, the smaller the population gets regardless, what causes it, the more important to them mortalities and serious injuries is. And So it doesn't really reduce our need to continue to reduce the amount of human caused mortality in the population. You're right, we didn't get into it tonight, and it's partly because we we're trying to have a targeted, slightly shorter presentation.

one more question, but she might not be I'll answer but. Was there a reduce this year in the ship strikes because cruise ships aren't going around because of covid 19 or is there? I mean, is there any correlation to that because I've heard different stories about, you know, that a lot of cruise ships, they go to eat bacteria that comes in the shipping lanes or whatever, and they get hit by a lot of cruise ships. Is there any data from a lot from 20 20 that shows no less ship strikes, are: Is it not available yet?

I don't, we don't have that analyzed right now. I don't think we did have two vessels strikes in US waters, both small whales, calves from last year's counts um, and one of those I believe, was a smaller vessel. And the other one, we don't know but so that is actually probably possibly even an increase in US waters to have two in a year. I do think it is the case that there were fewer vessels strikes in Canada this year and I believe the year before as well. Few of them that were documented at least. And I don't know that, that has anything. I mean, there's so much shipping, going through the Gulf Saint. Lawrence is the primary shipping lane into the Great Lakes, and into the side of Canada. So I don't know that that has anything to do with cruise ships. I do remember hearing about that theory. I don't know that I've seen that that theory was proved that whales are changing their distribution because of the waste being dumped off of cruise ships. I'm not sure that that was very convincing to me and to some other, to folks who are scientists and study some of this. Um, so I would say, we don't have any evidence of that. In there, if anything, there's been a slight uptick. Oh. But within the range of vessel strikes in US waters, there was a reduction in Canadian waters, but I don't think anyone would be able to show that had anything to do with cruise ship traffic.

OK, thank you.

OK, Dustin, Delano? It should be able to unmute yourself and ask.

I just have a question on implementation, When do you expect that these rules will be implemented?

So, that's a good question, and I can't, I can't say for sure. I will say that the will be getting, you know, finishing the comment period March first, I suspect, you know, 75% of the comments will come in, Um, March first before midnight. And so, we'll be aggregating those and considering you can, adding to the information that's in our Environmental Impact Statements. And, you know, doing the analysis at all takes a lot of time, as we finalize the rule and finalize environmental impact statements, so probably a couple of months to do that, a couple of months in review. And, you know, we hope to at least have a firm idea before the end of May, at least an internal final draft before the end of May. That can be good, can go into the biological opinion. That needs to be done by the end of May, because of the litigation deadline. And when it is finalized, and when it is published as a final rule, which hopefully would be shortly after May or early in the summer, we would have a delayed effective date for any of those gear modifications. And in the past, those have been anywhere from, you know, four months and up. I think in some years, it was almost a year because of the extent of the gear modifications required. So, you know, we'd probably be looking at a few months delayed actual implementation to give fishermen, an opportunity, you know, some time to make the modifications. So it wouldn't be effective immediately upon publication of the final rule.

OK, thanks.

OK, two more, Julie Eaton, you should be able to unmute yourself and ask your question.

Hi. My question is, I'd like to know if you guys have thought about or what actions you're planning to take, um, to protect the right whales, from ship strikes. The reason I ask this is if you're asking the Maine lobstermen to give up extremely productive bottom, that feed our families by this closure area. It appears to me that ships coming into Maine to offload cargo, will have to transit this closure area. So what you're expecting us to do should also affect the ships coming in. I'd like to hear your comments on this, please. Thank you.

Thanks. And this is Colleen again. So this action that we're taking is under the Marine Mammal Protection Act, take reduction requirements. So, it is very specific as you've noted to commercial fisheries and ship vessel traffic is outside the scope of what this team works on, but the agency under the Endangered Species Act does work on vessel strike measures. And those measures are definitely due for modifications. I believe that probably within the next year will be people will be out scoping on, the analysis that had been done recently for the purpose of determining whether or not the rules that are in place right now, might need to be changed. So when they're doing that, I'll make sure that they include in their outreach that they get to, I think it's Maine, I think it'll be the whole coast, Maine through Florida. And there are measures in place and a number of places, particularly near ports, near some of the larger ports. There are vessel speed restricted areas that are seasonal, it's restricted when right whales are seasonally anticipated to be in the area. But as we've all been discussing over the last few minutes, Right Whales Distribution, have changed a lot. So some of those areas should probably be revisited and considered for modifications. But that is outside the scope of what we are talking about.

Thank you very much, I appreciate it.

Thank you so much. OK, Oh. OK, we have 1 last 1, Colleen. And Eben Wilson, I'm coming to you. You are unmuted, you'll be able to ask your question now.

Yeah. Yes. I just had one last question about enforcement in Area three and the difficulties that Maine and New Hampshire have had. And I believe, Massachusetts, as well, about enforcement in those areas, And it pertains mostly just to police unions and being able to access vessel vessels and, you know, the ability to be able to haul gear out there because they haven't been, and a lot of it pertains to 24-hour payment of wardens, and, and just the ability to be out there.

Thanks for that. I hadn't heard about the police union component of the difficulty enforcing in the offshore. I know NOAA Fisheries provides joint enforcement agreements, so we provide some funding support to enforce, to help with the enforcement of the rules in state waters. And I know Maine extends out well beyond state waters. But I was under the I understood that the offshore enforcement was done by our Office of Law Enforcement, but relying heavily on the US. Coast Guard. And I know that a couple of years ago, they looked into trying to haul gear they looked at like buoy tender is in some of the large vessels because it's they don't have capacity on most of the coast guard cutters and vessels like that to haul gear. And even more importantly, they don't have the skill to reset gear. They're not commercial fishermen, and they're not operating off of commercial fishing boats. So hauling gear, finding out its legal all they can do is take it in and they can probably only take one offshore, set in at a time. So it would also be pretty time consuming. So they have looked into that. They've also looked into the possibility of leasing a fishing vessel and a crew to help them do it. Um but would be pretty expensive. And also, not a lot of fishermen really want to enforce against other fishermen. And then they have considered getting a vessel capable of doing it. You know, they talked, I know with Maine and others about that. The cost of maintaining the vessel between trips, the, you know, the 365 day maintenance. And everything else was pretty prohibitive, I think in the end. And partly for those reasons, they're starting to look instead at, you know, the underwater version of someone suggesting we monitor whales with drones. So they're looking at ROV's to do enforcement work and their preliminary efforts have been pretty positive. They've been able to see, weak insertions on buoy lines, I think they'd been able to count pots on bottom on the trawls on the bottom and things like that. Um. So their hope, I think, is that, as technology advances, they're going to be able to do more of this. And as I indicated, Atlantic States Marine Fisheries Commission has proposed that that NMFS require 100% vessel monitoring on the federal vessels, which I believe will be coming online shortly, 100% trip reporting. That will be coming online in Federal and in Maine Waters will also give us a lot more data and also help us direct enforcement efforts. So there are a lot of things going on to improve enforcement, in LMA three. They're not in place right now in any wholesale way. That's true. And that's been true for a long time that there hasn't been enough enforcement, but I hadn't heard about a police union component to that. I don't know much about that.

OK, yeah, I'm, maybe I'm off base for that, but I think the hard part. for me is the fact that, you know, area One we have, you know, we have Maine Marine Patrol and they've done a decent job at being able to manage all of area one, A and area three has been largely unmanaged to this point and I, the last thing that I want to do is to be able to try to pit one against the other. But the point is, is that there are people that are pushing up against area one, area, three line and, you know, we are we are being assessed at those marks in some way. You know, one side of the line to the other, and it's, it's very difficult. And, you know, we, we need just to see because we're looking at a closure in our area, to you know, to see that the balance fairly and I just, I just want to make sure that it's all being looked at.

I appreciate that. And I don't think it is really pinning a sector against another because among the main people, of the primary people who are coming to us and complaining about the lack of enforcement and enforceability offshore are the LMA three fishermen. So, there, the fishermen out there are also concerned about the lack of enforcement.

I'm sure they are

working on it, but we're not there yet.

I’m sure they are. Thank you.

Thank you.

OK, Colleen. I think we did it. That's it for this evening.

Oh, yeah, I think it's so late that we're probably not going to have a comment session, But, we did really allow comments in with the questions tonight, which is one of the reasons, perhaps. The question session went fairly long. So, I hope that doesn't disappoint everyone. We will be having more public meetings in February, specifically for the purpose of collecting public comment. And also, looking at the slide that's up right now, or going onto our website, You can get information on how to provide us with those comments as written comments. And I really appreciate everyone's input tonight, really, some very sharp questions, some very thoughtful comments and input. And, you know, you're, you're identifying a lot of places where we still have a lot of work to do, and I really appreciate that input. And thanks to all the NOAA folks who have been helping support the webinar tonight. And the TRT folks who are online, appreciate everybody's help and perhaps talk to you all in February. Goodnight everybody.

Public Hearing 1

Rhode Island, Southern Massachusetts and LMA3, Tuesday, February 16, 2021, 6:30-8:30 pm

During our informational sessions, for example, we got some great input that has caused us to revisit some of our economic analyzes, and may help us better understand and compare economic impacts. We hope to get more of that kind of input tonight and throughout our public comment period. Feedback suggesting we analyze the data differently, identifying new data sources, or explaining how the policy would positively or negatively affect your specific situation, will help us improve the final rule and the final environmental impact statement. These types of specifics are a little more useful than a simple Statement of Support, or opposition to a proposed rule and the environmental impact analysis. Also, we realize that NOAA fisheries currently has a number of other documents out for public feedback, including a report evaluating current vessel strike measures and the Biological Opinion that's on the batched fisheries that was mentioned earlier. These actions have separate feedback, processes, and fall outside of the scope of the documents we're discussing tonight, particularly given the size of our audience, we'd like you to please restrict your comments to the documents we're discussing tonight, within the scope of tonight's meeting.

Additionally, throughout the preamble and the rule of the rule and the Draft Environmental Impact Statement (DEIS), there are some places where we called out requests to reviewers specific requests, and I'm giving a handful of examples here. one is we would like comments regarding some of our assumptions on the time, and the associated costs related to the proposed gearmarking on the within the draft environmental impact statement. For the first time our cost estimates assume that fishermen remark their gear every year when they're doing maintenance. Therefore, the estimated cost in our analyzes are higher than previous gearmarking estimates. In addition to assuming annual remarking, we estimated that the gear marking portion of the annual line maintenance takes an additional 20 minutes per rope. And we'd like fishermen's input on how much time it takes them to mark each buoy line. Are we close? are we underestimating any specifics would be welcome. Another issue we asked for comments on Maine proposed to reduce the number of Buoy lines by either trawling up or by allowing a single buoy line on a longer multiple trap trawl. Both approaches would provide equal line reduction, so they are within the scope of the analysis. But in the proposed rule, we only provide the trawling up option. We're asking reviewers, especially fishermen, to comment on whether we should include both options in the final rule. In the past, offshore trawls with multiple traps in a single buoy were allowed as an option within the Take Reduction Plan. But it was rescinded because fishermen indicated they wouldn't use that option because of gear conflict concerns.

The DEIS also analyzes a couple of options related to the weak links that we'd like some input on, and this is specifically talking about the weak link at the buoy or in the Surface system. The weak link already required, We propose some options. A fisherman be allowed to choose the keep the weak link at the buoy or to put them at the base of the Surface system or multiple Surface system lines meet the main buoy rope. We also would like input on whether or not, at Surface System Weak link is required. If there are weak insertions or a weak buoy line below, Some take reduction members suggested that the buoy could actually provide resistance. So if a whale got entangled and broke free due to a lower weak insertion in the buoy line, the resistance of the buoy itself could pull the line away from the whale and possibly help the whale shed the gear. Finally, we're working with New England states to test weak rope and weak insertions, and are continuing to invite ideas for fishermen to help us develop a list of options. Within the proposed regulations and consistent with the way that we currently regulate the weak links at the buoy.

We will identify the performance specification of the weak inserted rope, so we'll say it needs a break at 1700lbs or less. It needs to be able to be described and duplicated, and it needs to be able to be recognized by enforcement. And we may would probably include the location and the number of inserts. The regional administrator every year can approve weak insertions as they are demonstrated to meet these standards. And that allows this list to be adaptable, to grow as fishermen, learn more and bring us new ideas. At this time there are a few that we'll be adding on the list. There are a number still being tested in Maine and in Massachusetts as well, and we are really welcoming ideas from fishermen. Both Maine and Massachusetts have hired gear specialists that are working with fishermen to gather ideas and test them as and NMFS also has a couple of gear specialists, Rob Martin and John Higgins, who are doing this work as well. So, this work continues, we hope to have a list out well before the final rule.

But also at any time, if you have ideas, please get them to us and we will get them tested. And if they work, we'll be adding them to the list. We're hoping to have variety so that we can meet the conditions across the region. I do have one example here and that's been weak sleeve currently used by some Massachusetts fishermen. That has been proven to break at 1700lbs. And some fishermen have been using this in Massachusetts for the last couple of years. And we're also currently waiting on shipment of weak rope in larger diameters from India actually, that will be testing within the next few weeks. OK, next slide, please.

So, I wanted to quickly go over the next steps. As we are tonight, we're accepting comments on the proposed rule and the draft environmental impact statement, the comment periods ends, March 1 2021. Comments can be accepted either in writing or tonight in these public hearings. After we get the comments, will be analyzing those, and, as needed, we'll be updating the analyzes in our environmental impact statement. And along with that information, we'll be looking at any new data that's come in, since we drafted the environmental impact statement, including new stock assessment information, as well as published papers. All that updated information will be considered to complete the final environmental impact statement. Your comments and the analysis will also inform the Final Rule, the final environmental impact statement. We hope to get that out this summer and a month after that comes out. We'll publish the final rule again, hopefully the summer of 2021. We anticipate that as usual, there'll be delayed effective date for modifications to gear configuration and gear marking requirements so that fishermen will have time to modify the gear. Paralleling this process is an ongoing Endangered Species Act section seven consultation, and a number of federally managed fisheries. This is outside the scope of tonight's meeting. But I'm mentioning it because many of you know the agency released a draft biological opinion, and is accepting feedback on that until February 19th. The address for the information bulletin is listed here on this slide. You can get more information, including the draft Opinion, the conservation framework, and an e-mail address for questions or feedback. We have inserted that e-mail address today in the answers, in the question box. Note that there is a court order deadline to complete ESA consultation and to finalize the biological opinion of May 20, May 31st, 2021. As noted in the draft biological Opinion and the Conservation framework, the consultation and the opinion are likely to consider

the impact of the fisheries as they will be modified in the final rule. So that's the relationship to what we're doing today. The opinion is outside the scope of what we're discussing. But it, but what we're doing will influence the biological opinion. Next slide, please.
So we would now like to begin the public comment portion of our public hearing. If you have not already, please type comment in the question box to get in line. If you change your mind, if or if you wrote comment and you have changed your mind, you can type or say, pass when we call your name in the queue. If you're joining by phone only, there'll be a time set aside to take comments for those unable to see the slides and get in the queue. You must have entered your audio pin in order for us to unmute you to allow you to participate that way. For those of you that want to give your comments in writing, rather than speaking tonight, please see the blue box. On the bottom of this slide. Written comments will be accepted through March 1, 2021, following the directions listed in this text box.

If you've commented already, and you can't find your comment posted on regulations dot gov, please have patience with us. We have gotten over 15,000 comments about 260 or so of those are individual comments. We're not going to post every duplicative comment. We will tally those in that that's important to us. But we're only posting the individual comments. And when we have the full tallying, we'll also post the tally of each of the Dupe's. But as we're going through them to determine whether or not their individual comments, it takes us quite a bit of time. And then after we know they're individual, we are posting them. So I apologize. If you've posted in, you can't see it, You can, you can e-mail me to bring that to my attention, or, or if you're patient, it should get up within a couple of days when receiving them. Again, check the website on the bottom of this slide to get copies of all the documents, to get our recording with, more details, then, tonight's presentation, and to get details on additional public hearings tomorrow. And next week. For commenting tonight, we're going to call on each commenter, and we'll try to let you know who's up next in the queue. Remember that we're recording this public hearing. And, as always, please be respectful and direct comments at us, the presenters. And when you're called them, you'll be unmuted, and then you'll need to unmute yourself for the recording. If you can remember to please state your name before you comment. Tonight, we're limiting comments to three minutes. You'll be muted after three minutes. If you've already provided public comment but wish to give more, you'll be placed at the end of the queue so that everybody tonight has an opportunity to speak. But if we have time at the end, we will circle back to the ones at the end of the queue. With that, I'm going to turn the mic over to Kara, who's going to help us run through the comments.

Hello. Yes. Give me one second. Colleen, we do have a couple questions coming in. So I don't know. I'm going to just intersperse those in through the comments.

Why don't we take questions for about 10 minutes, and then turn it over to comments?

OK. Peter, I'm coming to unmute you. Peter Broder I've unmuted you, you can unmute your question. I know you also have a comment or we're just going to do questions right now and I'll come back to you for comments.

Yeah, I just wanted to make clear that the model that we used at the TRT in 2019 remains the same as the numbers are concerned as far as risk reduction is concerned. Have they changed

Any? Or are we still following up on that? And the proposals that are made today are they based on what that decision was for the risk reduction, according to the model in 19, or has anything changed Colleen?

Thanks, Peter, and I wish I could see you in person. Thanks for all your help as an original team member, I believe.

Yes. Thank you.

Currently an alternate, but one of our originals really appreciate it. So, there happen. So the draft Environmental Impact statement was drafted last year. Last spring using decision support tool, very similar to what was used at the October 2018 meeting. It did go through CIE review, I'm sorry, That was the October 2019 meeting. Sorry, April 2019 meeting, I'm getting my meetings mixed up. It went through CIE review, so it had some updates in late 2019, but it's very similar, and they improved the threat model, and also, well, that was the primary change that came after the CIE review.

Um, so they didn't cause any of the numbers that we achieved, by what we proposed at that meeting, to go down. Like, we did come up with a 60% reduction in our area. Those numbers didn't change from that time going forward?

So we analyze a lot of that in, I think it's chapter five of the environmental impact statement, Marisa, correct me if I'm wrong we, we talked about how we considered what the TRT gave us and analyzed it. And there were other things that we considered, including some of the information that came from the scoping Um, there were things done very simply at that meeting that that didn't entirely pan out when we put, I should let Marisa explain this, but when we put the model together, for instance, when you reduce the risk by changing, how strong the line is, and then reduce the number of lines, You know, it compounds, but it's not as additive as it appeared to be in the April 2019 meeting.

Thank you.

But if we're following a, similar tool with a similar concept for the final environmental impact, statement, will be probably using updated whale data, that we have now, that lets us split the data before and after 2010, And it allows us to use one whale model for the entire region. That was not available prior to drafting the environmental impact statement.

Thank you for your answer.

Thanks Peter.

OK, David, Nettie. Oh, I, you'll have yourself, I just unmuted you.

Oh, thank you. My question was, how was the 1700lb line break threshold determined, does it take into account juvenile whales and whale calves? Thank you.

So, it sounds like you may be familiar with the work that Amy Knowlton and other Scientists did out of the New England Aquarium. Um, where, um, they determine that it somewhere around 1700lbs or less is where they're not seeing serious injuries on right whales. It is not 100% effective. It's a precautionary approach rather than a full avoidance of injury, and that is primarily or that is partly because it isn't as effective on calves and young juveniles. So, in applying risk reduction measure, when we're doing the risk reduction assessment, that there's a weak line does not get 100% risk reduction. As a result. As a result of that fact. That it's not 100%.

So, what other line strengths were looked at?

We didn't propose anything less, since, I mean anything less than 1700 would be allowed. We didn't propose that. Part of that is because 1700 is also line strength that appears, to, reflect the actual forces needed to pull gear to pull the gear for a large portion of the fishery. Particularly if they're not hanging a lot of pots in the water at any one time. So, it was considered to be an operationally feasible line strength for a lot of the fishery and safe to some extent for whales. Some 70% safe for whales.

So it can be less than 1700 is that we are saying? It is permitted to be less. It can't be more than 1700, correct?

Yes.

OK, so sorry. I misunderstood. So, thank you very much.

OK.

I think we have time for one more question for now and John Swap. Forgive my pronunciation, you should be able to unmute yourself and ask your question.

Ok. My question was anything any consideration given after the last meeting to trawling up? I fish by myself in area two and a 25 pot trawl on my boat, is going to be, On a good, flat, calm day, it's going to be burdensome. On a on a rough day with an open stern It's going to be dangerous and it's going to prevent me, also from moving more than one trawl at a time when we moved to stay on the lobster's. So I'm curious as to what we can how we can work around it or what can be done.

Do you fish out of Rhode Island?

Yeah, out of Point Judith.

Yeah. I know. We talked to Scott O, and I and I know he is asking about whether or not we can consider as a conservation equivalency full weak line instead of trawling up. And that's something that. So that's something we can add. So, so I would like to take your question as a comment, because you've provided us with some good detail there and, and I believe we will be getting other comments, requesting that we consider it as a conservation equivalency. Because we've looked at weak insertion and full weak line as an option, I believe that would fall within the scope of the analysis and the proposed rule, And that probably is something that we can consider towards the final rule.

We've been in touch very recently, you know, with Scott O, and he's, he's aware of what would, you know, talking about this. There's a number of men in the fleet now that are I'm the young guy at 67. And, uh, you know, it's going to have a bad impact. People our age having to go to 25 pot trawls.

Oh, well I think that weak line as an equivalent, because I don't think we're talking about a whole lot of vessels out of Rhode Island and Southern New England already had a bad hit, given the lobster fishery there. But, um, I think proposing that as an alternative, if we demonstrate equivalent or better risk reduction and providing us with the kind of details you're discussing, that, the age of the participants, vessel sizes, the lack of deck space to move multiple trawls, that's all good, granular information. That's exactly the kind of information we're hoping to get from the public comments.

Thank you. one more question, if I could, could ask it.

You got the mic.

OK. When you when we talk weak insertions or the whole line being weak, we've used a number 10 braid, that supposedly breaks somewhere 1700, 1650. We've been using it for years. And don't have any problems with it, but what I'm curious about is some places I fish. I am just on the edge at 12 miles outside the 12 miles. And my ends are in 180 feet of water. So I'm, I'm curious as to any thought been given to situations like that, too. I'm not trying to cherry pick my situation, but it, you know, you can be well within 12 miles of land and be hauling pots up from 200 feet if you're fishing in a hole. So, can we throw that into the mix?

I mean, if you have another risk reduction measure for using in deeper waters, it would be great. Let us know in your comments. We do assume that Well, first of all, the line that you're using, that I think some Rhode Island guys are using the top of their gear. Um, that that is one of the. So as I understand it, it's between 5/16 and ⅜ inch It's been tested in Maine, and it does break at 1700 or less fairly predictably and very predictably. And so, but it's not a three strands. And not every fisherman is going to want to use it, but Rhode Islanders seem to like it. If you use that down to the chafing gear at the maybe lowest 25%, then that is what we would consider to be probably reasonable if that's not something that can be done in the holes. I think that that's where trawling up might need to be considered.

OK, thank you.

OK, OK, we were able to come back to some questions. Can you see my screen, OK? Excellent, OK, so we're going to try this. We'll see if it works. There's a timer on the screen and I'm going to try to keep sort of who's up next in giving public comment on the screen and we'll see how this works. Thank you guys for being my guinea pigs. As Colleen said, we're going to be muting you at three minutes. Please keep your comments to the proposed rule. I put into the chat, the e-mails, and the deadlines for the Batched BiOp comments and the vessel speed restriction comments as well. So, Brennan Strong, I know you had a couple comments. I just want to make sure that I'm going to come to you and make sure that you did not want to give public comment this time. You're unmuted, you can unmute yourself. I can see that you're unmuted, but I cannot hear you. We can come back to you. I will keep you on the list. Rachel Thompson. You are unmuted and you should be able to unmute yourself

OK, can y'all hear me?

Yes.

Awesome. Thank you so much. I'll get right to it. My name is Rachel Thompson. Thank you for the opportunity to share comments with you on the proposed new rules for the US American Lobster and Jonah crab fishery to reduce the risk these fisheries pose to North Atlantic right Whales, the world's most endangered large whale species. My first experience with this magnificent species was while I was pursuing my Marine biology degree at the University of Rhode Island. As an undergraduate research assistant, I worked in doctor Robert Kenney's lab at the URI Graduate School of Oceanography, cross referencing, right whale sighting records in the right whale photo identification catalog, managed by the New England Aquarium and the Northern Atlantic Right Whale Consortium, one of the world's most successful collaborative long term studies of an endangered whale species. 10 years later And I now find myself in a position to advocate for the right whale, on behalf of coastal Georgia residents and visitors. Today I'm presenting comments as the Executive Director for the Glynn Environmental Coalition located in Brunswick, Georgia. We're a Georgia coastal advocacy organization whose mission is to ensure a clean environment and healthy economy for citizens of coastal Georgia. We work to navigate complicated task of protecting and preserving our environment and species that call them home while working to not hinder or stunt economic sustainability. The proposed measures are based on outdated information that will not protect right whales in the short term or long term. You stated: your risk reduction goal was between 60 and 80%, but the 64% falls too close to the lowest level of risk reduction and should be aiming for a minimum of at least 70%, If not closer to 80, Stronger protections must be developed to save right whales from extinction. Gear modifications that are proposed are economically burdensome to the industry and have not been proven to be effective in reducing entanglement. The proposed rule relies on the use of ineffective gear and modifications called weak rope to reduce risk, but weak rope has not been thoroughly evaluated and has not been proven to reduce risk. New technologies called ropeless or buoy less, fishing are an opportunity for lobster and crab fishermen to continue operating in areas where right whales are present without further endangering these mammals. NOAA fisheries must continue to test and foster a market for ropeless technologies by creating incentives for fishermen to try them. Measures will not be implemented for at least another year, and the right whale cannot sustain more deaths. While we wait for fishing gear changes on the water, while stronger rules are developed and implemented, NOAA fisheries must use its emergency authority to put vertical buoy line closures in place. I thought we had five minutes today, so I'm just going to stop there. But I thank you for letting me share some of that with you and we will also be submitting written comments for consideration as well. So, thank you so much.

OK, and do keep your place and if we have time at the end, you can finish providing comments

Thank you.

OK, Peter. Lost my place. OK, Peter, you should be able to unmute yourself and give your comment.

OK, fine, thank you. I want to address primarily the trawl up. Many of the lobster boats in the 20 to 30 foot size find themselves working their gear alone. And taking advantage of that 5 to 7 months, loiter wins to follow the lobster as they migrate to deeper water. Many of us have open stern boats that Don't require us to lift the traps off the deck, thank God anymore, to set them in (undecipherable) hauling. Having said this, if we must extend the number of traps we end up spending quite a bit of time at the stern of the boat like Jay referred to a second ago. Stacking the traps, this reduces safety of the operation, especially since there is no one to throw that life ring to us, if we fall off. Some days, the boats are a bit livelier than others. So now, if we are safety minded, and then we stop at 12 miles and let the lobsters go, and so goes 2 to 3 months of profitable fishing because we can't follow them. Even though the federal Permit allows us to continue as we have for years, therefore I am against trawling up above 15 traps from my operation. Of course we could make an exemption for age as Maine and Mass have for certain instances or perhaps by boat size. Whatever is done we must keep a fair degree of efficiency, and most importantly safety in the lobster fishery. A full weak line would be a good asset to go with, as Jay said previously. Also, I wanted to say, I do support the contrivance every time I see Dan’s face when I say contrivance or weaker up and down lines at 1700lbs, I support the code. Color coding change, thank goodness, took a long time to get here. I don't spend that much time because I spray paint, as many people do. And I've been on the phone with a few of the manufacturers of the 1700lb breaking top line that we put on having them put in a silver tracer in the length of the line. So that would help in identification as well. And just as a last little bit, I don't support any closed areas. Thank you for allowing me to speak.

Thanks Peter and boy, did you demonstrate how to hit three minutes. Nice.

Thank you.

Up next is David Dowe. I've unmuted you, you can go ahead and make your comment.

My name is David Dowe. You hear me?

Yes, David. Thanks.

OK. I'm a retired Marine scientists from the fisheries lab in Woods Hole and the grass roots, environmental activists living on Cape Cod. I submitted written comments and both MMPA, Risk Reduction Plan, and the biological opinion. So I was going to mention that the thing that initiated my comments was a Woods Hole Oceanographic institution ocean encounter program in saving North Atlantic Right whales. One of the things I described was the grit, that they have to develop ropeless fishing gear for lobsters. This involves both people in the industry, fishermen, scientists, NGOS, and I would feel that would be a good case study for NMFS support with further grants. Because this grant was provided by SeaWorld and Busch Gardens and there was a private funded endeavor. The first thing I wanted to say about the biological opinion, was that we need to have an adaptive environmental management approach. And they were very vague about what kind of adaptive management they were going to use to develop a conservation frameworks that should be fleshed out. In regard to Atlantic large whale take reduction Teams management plan. We feel that they should conduct a cumulative environmental impact assessment which will allow people to examine the factors influencing the calving rate of female North Atlantic right Whales, and the effect of sublethal stresses from a variety of factors not just ship strikes and entanglements in Lobster pot and Jonah crab gear. This might include climate change, ocean noise, competing human activities, such as naval training, offshore windfarms. And also various things that are associated with the essential fish habitat. Species change, as species and their prey change, their positions in space and time has to be accommodated. Thank you.

Thanks, David. Also nice job getting in under three.

OK. Up next is Matthew. Be unmuted and able to make your comment now.

OK, can you all hear me?

Yes.

Oh, OK, well. Hello everyone. My name is Matt. Um, I've been listening to you guys, And, first of all, I would like to say, I would like to give all of you my blessings on what you guys have been doing. Um? And I was, I was wondering how I can help.

Sir. So joining in, public comment is a good way for us to get input from you tonight Or in writing.

OK, and I'm sorry. This is just, this is my first time doing this, so on. I'm getting used to everything.

That's great.

I definitely, I definitely think that we should, we should do everything that we can to make sure that, um, that these, that these whales don't get caught in, the nets, the fishing nets. I think one of the things that we should do is to, I think we should just keep the nets in one location. So you know, we don't. Where we should keep them away from where the whales are going to be so, that we don't, we shouldn't have to worry about that about, you know, where we should we should just keep the net's, they're like away from them.

Great. Thank you.

You're welcome.

Thank you.

Appreciate it.

OK, Deborah, Ashton? You should be able to unmute yourself. Deborah Ashton, can you hear me? She has written in an extensive comment indicating her mic isn't working.

Oh, perfect. And so she'll go to regs dot gov, but we also will be recording the information in the question box, so we'll be capturing that as well, Deborah, thank you.

Thank you, Colleen. I missed that, and that's OK. Next step, Patrick. I've unmuted you. You should be able to unmute yourself.

Can you hear me?

Yes.

Thanks for this opportunity to comment. And Colleen and Marisa, your introduction of this as usual has been very helpful and informative. My name is Patrick and I'm with the International Fund for Animal Welfare or IFAW and we've been pleased to be working with lobsterman for some years on the challenge of protecting right whales and protecting their livelihoods. Um, and it's not the focus of our work this evening, but a powerful reminder over the weekend with a calf mortality that of the wide variety of threats that these animals face, including, um, vessels, not just Lobster and crab gear. That said, our view, and we've participated closely, as you know, in the TRT process, and in a variety of different efforts aimed at the objectives that NOAA and NMFS share here. Um, our concern is that the proposed rule is not the solution needed to save right whales from extinction. Nor is it a solution that offers comfort, confidence, and continued prospects for our continued livelihood by Lobstermen. And those are reconciling those things is obviously a real challenge. But one that is not going to be achieved by using data that is, is not real time. That is essentially already out of date by the time of the most recent in person, TRT meeting. And is not real-time data. Second, as was already noted by an earlier speaker, going for this sort of lowest rung on the ladder, a 64% risk reduction in the face of continuing right whale mortality from various sources, including entanglement. Which we know as historically in recent years, been the main threat, shooting for 64%, doesn't, um, meaningfully or sufficiently reduce risk and in fact leads arguably to a more uncertain and risky environment both for right whales and for folks making their living on the water in terms of, you know, likely needing to move to more aggressive measures over time. And this is not the time to shoot for the lowest risk reduction target. Third has, as is also, I think, already been mentioned, and acknowledged, in fact.

Hi Patrick, I'm sorry to cut you off, Your three minutes is up. Please remember where you were, and then we'll put your name back at the end. And we can come back to you if there's time at the end.

I hope everyone waits. it'll be worth it.

Thank you. Yeah.

So you were on third. Just remember.

Brian, We are coming to you. You should be able to unmute yourself.

Yes. We are unmuted. We are couple of quick comments. Just first and foremost on the list there. You know, that area I represent in Area 2 we are against the ropeless fishery. Just kind of wanted to get that on the record right off the bat. Um, also comments on the upcoming wind farm projects that are all approximately going to take up 37% of our area two lobster grounds. And it appears that the G and G work that has been going on is coming to a completion inside of area Two. The next step In the process, once finances are established for these wind farms, is got to be the construction variance. And I feel the group should be paying a lot of attention to the extra amount of large vessels in the working environment that they're going to be in. They're supposed to be under stringent laws and rules and have observers on the boats through the last couple of seasons while they're doing their G and G work. And I know they're not supposed to work at night and we know we witnessed them in transiting of our areas. Plenty of nighttime work still continuing. I hope that this does get enforced. I know that, you know, they got handed an exemption against the whales for the, you know, a whale exemption permit, But it should be higher enforced. For a quick comment, back to slide 13. I had not yet heard of the green marks on what would be what you labeled as a Federal, up and down line, or a Federal vertical line, The six inch green mark at the top, that was nothing that I had heard discussed as of yet and wondering how new that was in the presentation. Um, as far as the trawling up in area two and a lot of the fishermen that I do represent and speak for that may not be on here right now are of age and do fish by themselves, a large percentage of our fleet does. And I am quite compassionate to the smaller trawls that they need to fish safely by themselves. But, just wondering if these rules could end up being boat specific, instead of full weak lines, or full weak, Vertical lines, if we could, uh, try to implement boats specific regulations, whereas my larger boat or a full weak vertical line might not work for me. I could possibly handle the larger trawls outside of 12 miles. So wondering, again, you know, if it could be boat specific on the enforcement level. Um, I also heard a request for a quick comment on the vertical lines. It takes at least 20 minutes on land to modify a line with markings. With the additional markings, it might take a little bit longer. I know. I know. You would ask for comment on that, depending on what our ropes come out of my three minutes, depending on what our ropes come out at from new manufacturers. That 20 minutes could be a lot on fully permanent vessel. Roll my name to the end again, one more time, if possible, please. And if there's time, I'll come back and finish my comments. Thank you.

Great, Thank you. Robert Mcclean, I'm coming to you. You should be able to unmute yourself now. Hi, Robert, can you hear me, Robert McClean? We will come back to you. OK, next step, Greg M. OK, I've unmuted you, you should be able to unmute yourself.

Yep. Greg M. Thank you for the opportunity to comment. Like Brian said, I don't believe I've seen the green mark in addition for Federal waters. I'm for the fact that we're parsing out the different colors for the different states. But, you know, we're being asked to do a lot in terms of marking and adding the green mark for Federal waters versus the State waters mark is starting to get probably a little more complicated than it's actually going to be followed. We have to have enforcement for this, And it may make compliance a little more difficult. I'd also like to suggest there's a line, called #10 Neocorp braided ropes that I believe could work instead of some of the weak line that's being suggested or these weak contrivances. So I'd like to put that in there. In terms of the time it takes, to do the markings. It takes it takes a long time the line is seaweeded it up at the end of the year in the spring everything's wet when you're doing this work. So, you have to let the rope dry out before you can start to work with it and do these markings. So, 20 minutes per trawl is, is definitely not out of the question, especially with the additional marking requirements that we have to do. In terms of the trawl lengths, I'm very sympathetic to guys like Peter and J, they fish, a long, long time in this area and safety is a real issue. Fortunately, for Rhode Island, we have moved up to bigger boats and trawled up, whereas Maine has not, but it's still going to be an issue. So finding some sort of equivalency, like, full weak lines for guys that want to take advantage of that is probably preferable. And it may solve a lot of safety issues, operational issues, for guys like that. Also, I was pleased to hear that somebody finally has mentioned, an environmental advocate, has mentioned concern over windfarms. So a lot of this is based on co-occurrence of end lines and right whales, but If you look at the co-occurrence of, Right, whales and wind farms, they actually coincide with a lot of these closed areas. So a lot of this work that we're going to be putting in, may be for nothing in the end, when these wind farms come in and the additional noise and killing their food source all affects them. And their migratory route, If they have to go an additional 500 miles skipping this area because of this massive 1400 square mile wind farm development, they're going to be emaciated, you know, female reproductive issues are going to be exacerbated and things like that. Also, ropeless. I think, has a lot of issues. And we're a long way from away from that. Massachusetts is doing a study right now that's intended to be very comprehensive. And I'm thankful for that. It's going to take into account the opinions and operational factors of fishermen. And I'm looking forward to that before we just get told that we need to jump to that. Thank you for the time.

Whoop, all right good timing. Robert, OK, you're up next again, if you're on up on your computer, on the right hand side,

I see it. I found it. Appreciate it.

Excellent.

And this is a brand new format and that's actually one of the points I wanted to make, Kara if I'm pronouncing your name wrong, which is that this is an issue a number of people, will not get into the weeds like myself here on this. Cannot access due to due to some issues with, you know, it's being commonly available. But I just want to say, I can't get in the weeds too much I knew was proposed rule to be what I can do speak from the heart. Ocean swimmer. Studied past PADI Dive Master. OK, I've already made the first week. We got to make this more available. Particularly, if we aren't interested in comments to just want to listen. It's not about only 100 or so people here to I urge all. Here, to look up the book, Blue Mind, two words, Blue Mind. It's about the cognitive emotional benefits of being near in or underwater by a very smart and seedling accent or marine biologist by the name of Wallace Chain. And he's having a Blue Mind reading club daily now to beginning of April. We have got to get emotion into this conversation and cut out a micro picking up the rules. We have an endangered species here. And where it's a red line. And we're not addressing this really accurately, a film that I just researched online, recently stated by the name of Entangled, an hour and a half film has a Someone protesting a NOAA hearing saying this is ridiculous It's like having the fox guard the hen house. We've got to get real about our connection to the ocean and how much it is intrinsic to our lives. Not just physically. But all those who live off the ocean, it's a global thing. But we've got to be real about how important it is not to let animals die on our watch. And we've got to stop cherry picking this. And it goes on both sides fishermen, NOAA. Division of Marine Fisheries Massachusetts. OK Third. Can we get real about ocean conservation and averting the tragedy of the commons? Creating more MPAs and let's face it marine sanctuaries. Our ocean protected laws had been gutted by the past administration. So we've got to get real on this to quote the Cousteau's, we protect what we love. So we're working backwards. We love what we understand and we understand only what we are taught and strive to learn. So we got to strive to learn how can NOAA how can you, how can the fishermen who are ecologically conscious and understand this teach us about the beauty and the fragility of our oceans. The beauty and the fragility of the right whale family. Thank you very much.

Thank you.

That's it.

OK, Thank you for those comments and, and, Robert, We've tried really hard to make it accessible, but I would be open, if you'd like. I can put my e-mail in the chat to talk to a little bit more about people who don't find this accessible so that we can make it more accessible. And, before I go to the next person, who's, who's able to type into the chatbox, I would like to go to anybody who might be joining us through the phone. Um. Colleen, though, we, they can't unmute themselves if they're joining us through the phone. If you are joining us through the phone and do not have the ability to type in the chat box, please send me an e-mail. My e-mail is Kara K a R A dot. Sure, vanoc, S H, E R V As in Victor, A N I see Kay At NOAA NOAA dot gov, it's K A R A, dot, S H E R, V As in Victor, A N I C K at NOAA dot gov and I will be able to get you in to the queue that way. We will talk more about that Colleen, how to do that next time. Um, OK Quinn, I'm coming to you. You should be able to unmute yourself. Quinn, can you hear me? Quinn Josefine O'Connor. OK, we'll come back to you, Sarah, Austin. You should be able to unmute yourself.

Hi, everyone. Can you hear me?

Yes.

Thank you for this opportunity. My name is Sarah Austin, and I'm attending these meetings in order to show my support for a plan that will expedite the implementation of ropeless fishing gear in order to prevent further deaths to right whales and other marine life, with less than 360 remaining right whales in existence. This discussion is critical, and I'm encouraged to see NOAA addressing it. While alternative solutions exist, such as weaker links and seasonal closures, these implementations are not appropriate for all fisheries and will not prevent entanglements and the death of smaller whales, calves, and turtles. Ropeless fishing has been tested, and it has the potential to reduce and even eliminate entanglements to prevent further marine life death. I would like to see support for more permit programs that will allow ropeless fishing technology to be used more widely in fishing areas. Right whales are on the brink of extinction, but with the right actions, NOAA can intervene while we still have the chance. Thank you for holding this meeting and allowing us to voice our comments.

Thank you. Alright, Quinn, I'm coming back to you. OK, you should be able to unmute yourself, excellent! Hey Quinn we can't hear you. In the Audio section, you just make sure that, if you're on your computer, if you click the little drop-down arrow next to Microphone Array, make sure that's the. Whether you're using your headphones or your computer, you should see several options there.

OK, can you hear me now?

Yes, perfect.

OK, thanks. Sorry about that. So, my name is Quinn O'Connor. I am a senior at Boston College. And for the past year, I've been paying attention to the decline of the North Atlantic right Whale population. So right Whales are in a steep decline, as there's only about 366 remaining in the world. And only one quarter of that number are females that are able to give birth. We know from scientific reports and data that entanglement in fishing gear is the leading cause of death for right whales. In fact, scientists estimate the 85% of right whales bear scars from entanglements, and over half have been entangled more than once in their lifetimes. This past year, I have read about at least three entangled right whales. I can't imagine the stress and pain, each one of them experienced, while trying to swim up, to breathe, or eat, and being unable to do so. I can't imagine being so stressed, unable to travel freely, because I have hundreds of pounds of fishing line and traps wrapped around my body. I can't imagine drowning and suffocating, because I am entangled in fishing rope. I can't imagine this, yet This is the fate that we have set up for right whales. If we don't change our actions fast, we're going to lose the species' forever. We need to change current fishing practices. Ropeless gear can prevent right whale entanglements, while keeping fishermen on the water. Prioritizing safer gear in the water is what will change the fate of the right whales and fishermen for the better, Please implement a ropeless gear permit program. So we can make our oceans and seas safe for fishermen and save North Atlantic right Whales once and for all. Thank you.

Thank you. Paige. You should be able to unmute yourself. I can see that you're unmuted, but I can't hear you. You also might need to check your audio settings and make sure your microphone and speakers match up with that of your device. And well, we will come back to you after the next person. Jenna Stevens. You should be able to unmute yourself. Oh, yes,

Hi. Thank you so much for the opportunity to speak tonight, and thank you all for the work that you do and for taking the time to listen to us all. My name is Jenna Stevens. I'm the environment Florida research and policy center state director. Environment Florida Research and Policy Center is a statewide non-profit dedicated to protecting our air, water, and open spaces. And I'm here tonight on behalf of our membership to urge you to do everything you can to save our critically endangered North Atlantic Right Whales, as others have referenced for the last decade. The number of Right Whales has consistently declined. And today, only about 366 remain in our oceans. From sea to shining sea, the United States possesses an incredible legacy of natural beauty from Ice Capped Mountains, Plains where Bison Roam, and, of course, our oceans, where sea turtles, dolphins, and whales swim, nurse and play. And our laws or reflect our collective value of the beautiful wildlife and wild places that surround us. In particular, the Marine Mammal Protection Act and the Endangered Species Act some of the world's strongest environmental legislative frameworks prioritize actions that prevent extinction and keep our wildlife safe and healthy. We are concerned that, as written, the proposed rule just does not live up to these bedrock environmental laws as it fails to protect right whales from one of the top causes of death, fishing gear entanglements. So I urge you to formulate a stronger final rule, taking into consideration the following factors: that the draft rule is based on outdated, outdated scientific data, as other speakers have referenced. Additionally, that the proposed seasonal habitat closures in the rule will not do enough to prevent right whale entanglement in fishing gear. And then that weak rope, another major tool used in the rule is not a proven effective solution to preventing fatal or seriously damaging entanglement events. We would urge that, NOAA should take emergency action now. The agency should close certain areas to the use of vertical buoy lines immediately. While a stronger package of rules is developed using updated science, We envision that that package would include a plan that closes right whale habitat towards this toward fishing and start to create a path towards the eventual broad scale implementation of ropeless fishing industry. Although the 15 right whale calves born this winter represent some hope for the species. We have already lost two and the number of calves born is still much lower than the number required to prevent the species from extinction. And since most deaths are caused by fishing gear entanglements and vessel strikes, human activity is driving this extinction. Losing the right whales because we failed to act boldly enough would be an unacceptable loss. And so I urge you to uphold our legacy of environmental protection and do everything you can to save the North Atlantic right whales. And thank you again for the time this evening.

Aye, thank you, Jenna. OK. Paige is offline for now. So, she comes back on, Michael Foley. I see that you have both a comment and a question. Let's stick to your comment right now, and then we'll circle back around on questions. You should be able to unmute yourself.

Hello?

Hi. Yep, we can hear you.

OK. Seasonal Migration of Whales, I am a Lobstermen. I have no objection to that. Figuring out when the whales are coming through Area two. And if it's not a profitable time for lobstermen, uh, I don't have any problem with seasonal closures. As long as it's when I think it's going to be. Um, I'd just like to comment that I've been lobstering in Area 2 since 1991. That's almost 31 years, and I've never been entangled with a right whale. I fish 15/16 line and I also would like to know some more about the reduction of lobster gear. We've had a 50% reduction in lobster gear. So there's a lot less lines in the water that they're used to being. Like. The other fellow was saying, Keeping up with it, You know, the information on real to date information on how many lines are actually out there. Let's see. Oh, as far as the trawl lengths. Um, yeah, I understand that some guys are worried about longer trawls. I noticed most of the time outside 12 miles, most of the boats are bigger. So if there's an exemption for the guys with smaller boats to keep it safe for them, That's fine. But I don't object to, the longer trawls either. And I'm just checking my notes. That's about it. Thank you.

Awesome thank you so much. OK, Paige, I see you're back online. Oh, yep, OK. You should be able to unmute yourself.

Can you hear me now?

Yes.

Oh, great. So I'm Paige McLaughlin, I am an art teacher, in Colorado. I live very far from the ocean, but I'm in love with the ocean. And one thing that worries me is that I'm going to die before I even get to see a right whale in the wild. And my husband works in geospatial industry. He has been working on trying to save the Vaquita, which is the endangered porpoise in the Gulf of Mexico. And that porpoise, they believe is now extinct. There was about 20 left in the wild and they've been unable to find them. Now, they have a different problem with fishing because the fishing is illegal, but the Mexican government has never really done anything to stop it. And I don't know anything about the fishing industry or fishing lines. And it concerns me when I hear these comments about the wind farms that could possibly be also endangering the whales. That's I think that's awful. So I'm a proponent of clean energy, but not if it's going to kill the last of our whales. So, I just wanted to go, on record, saying that whatever it takes to save these whales needs to be done, because once they're gone, they're not coming back. And the more species we lose out of our oceans. The more we as humans, lose our humanity. So I don't know how much time I have left, but I think that's about the end of my comment.

Thank you, and thank you for joining us all the way from Colorado. I just muted myself. OK. Rachel, Patrick and Brian, you guys are going to get an opportunity to finish up your comments. So, Rachel, I'm coming to you, if you are still online. Don't think Rachel is still here. Let's go to Patrick. Alright, Patrick, you should be able to unmute yourself, you are on number three.

Yeah, and again, there are only 4. Number 3 had to do with weak rope. Which makes for weak policy, I think. And we ourselves, have been champions of incremental gains toward conservation, including some more care in Massachusetts with the Massachusetts Lobstermen Association on ground line more than a decade ago. So you know, to the extent that there's content conservation contribution in these measures that's to be welcomed, but to continue to cling to vertical lines and sort of wish for the best in terms of juveniles, calves and not go after Solutions that address entanglement itself, um, seems consistent with the sort of low bar in terms of risk reduction. Um, and the blunt instrument of closures being applied rather than some innovative, fresh thinking and bold action in a different direction with respect to that. Finally, number four is ropeless fishing, and as a number of other people with varying degrees of familiarity with the lobster and fishing industry have noted ropeless fishing does seem to hold some promise. I don't say that as an advocate. I say that as a student learning from Lobstermen who are using it, and there's obviously some shifts in the way that fisheries are managed. That's not a small thing, there's, there's, a learning curve upfront for lobstermen, who were engaging in that technology, increasingly, that can be taught by others in an offshore and inshore environment, who've had positive experience with the gear. The rhetoric is very welcome in the proposed rule that there might eventually be a situation down the road in which there is access to closures, otherwise closed areas for lobsterman, that needs to be strengthened. And I think the,

the effort reframed, not going back to the drawing board, but reframed a bit. And the measures in terms of aggressively supporting solutions that offer the opportunity for saving right whales and lobstermen livelihoods. Like, ropeless gear need to be more than a rhetorical flourish in the final rule. We stand ready and we will continue to work with stakeholders across the spectrum and our hard-working government officials. And thanks, again, for the opportunity to comment. This evening. Will, will be submitted comments in writing as well. Thank you.

Thank you. Brian. I'm coming to you, Brian. It's almost like I'm running around the room with a microphone. As I scroll through the list of people, Brian, you should be able to unmute yourself.

Yep. We're all good, we're unmuted. Sorry. Sorry to make you run down to Southern Rhode Island. Um, just, unfortunately, some of that's going to come across more of the question, then that actually a comment. The implementation dates, and when they got, when they go in. I'm not sure if we're going to try and specifically stay on permit renewal times for implementation dates, or if we were going to go with seasons, you know, with a calendar year of January first, February first. You know, we're a slower season for the fishermen, just wasn't sure about that. And with a conservation equivalency with the: with the weak 1700 pound vertical line all the way to the first trap. Um, I know we've done some line work. Where maybe we extend, you extend the endline off the first trap, so you can have a stronger rope to get your gear up off the bottom And begin hauling your trawl. But a 1700lb vertical line, right, to the ground line. Would that not be required at this point in time then to have weak links installed in it? Could it maintain just the, the buoy weak link that we're currently using? So, kind of comment kind of question. And again, you know, the fishermen I hear a lot of comments. You know, there's, there's not a single lobsterman that leaves port in the entire north-east region. Certainly not in Southern New England, also that we're having the discussions with tonight Area three, southern Massachusetts area 2 Rhode Island. None of us leave the dock with the intentions of a whale entanglement or trying to kill a whale. You just kind of want that on the public record currently. Right now we are the low hanging fruit, that can get targeted and managed very easily. The ship strikes Need much more attention than they are given. I know they're well-funded group, and have very good policy setters, and good representation for speakers. But it's just as important that the ship strikes get taken into factoration, along with the wind farm work. Again, like I mentioned earlier. So that was about it. That was my list. Kind of scrambled. I had a couple of different articles in there, or numbers, in there written, but that sums it up for my comments. I appreciate you coming back. Thank you.

Thank you, Brian. If I could, answer, just two of those questions. We can't tell you, Well, our DEIS we wrote last spring and it ended up getting caught a really long time inside the beltway in a review process that we don't control. And so not having control, I can't tell you when our final rule will be published, we'll do our best to get it done this summer and published this summer. And depending on when it's published, there will be a multi month time period that will allow fishermen time to pull and reconfigure their gear, remark their gear. If it can coincide with wintertime or our normal maintenance time, we will probably consider that. But again, it depends on when it is actually finalized, so I can't really tell you when. My expectation is that it would be certainly, well, hopefully by at least early, gear configuration changes early in the new year. Um, something like a closure. We would want to give, you know, a month's notice for that to give people time to get their gear out of the water, but to modify gear takes longer. We know that it takes sometimes buying new gear that that needs to get out on the shelves and things like that. So we're going to have to consider all that when we determine what the delay is an implementation. That depends on our final date. So I can't really tell you that. As far as weak and weak line, if you're using a fully weak line like that, braided rope that is used by some Rhode Island fishermen, now, down to your chafing line at about 75%. You wouldn't need a weak line and weak insertions need either weak line or weak insertions. And to be considered a fully weak line you need you need weak insertions at something like 40 to 60 foot intervals on your buoy line. OK, so I think the next commenter.

OK, awesome. Lise, I'm coming to you, You should be able to unmute yourself. Lise, if you can hear me, you are up next, You'll need to unmute yourself.

Oh, there we go!

Awesome.

Sorry about that. I don't know much about lobstering and in the deep sea fishing. But the closest I got to fishing was my father, who was a trout fishermen and my partner who was a trout fish fishermen of probably over 40 years. But my father, who was a biology teacher in Dearborn, Michigan, he did help save the Jordan Valley. Jordan River Valley, watershed, in his retirement. So, I know things are possible and that's why I'm on this call. I got a last-minute text today, which I appreciate was totally unexpected but I'm so glad I sat in tonight and it was very edifying and I'm glad to participate for whatever it's worth. I'm not a scientist and I'm not very well versed. I just know about the right Whale situation. So I'll just be brief and I'll say this; I agree with and applaud all the efforts by NOAA and various groups to create awareness of the right whale extinction crisis and the horrible existence they live due to human fishing gear, ship strikes and infrastructure such as wind farms. I support sustainable solutions that keep the species from extinction. That also includes fishing and livelihoods, but the Whale's must be emphasized. And this is because, in the end, our society will be defined not only by what we create, but by what we refuse to destroy. And that was spoken by John Sahil, the late President and CEO of the Nature Conservancy in 19 99 through 2000. Thank you for letting me comment. I hope this has a positive effect on the situation.

Thank you. John.

Colleen, you mentioned earlier, and I wasn't able to latch onto it, but I want to comment that comment and comment on it, that when we start using weak rope, which we already are, when it becomes in the final rule, there will be a specific color scheme to that. Is it something that we can get approved? Um, you know, tracers in it so that when were boarded by enforcement officers of the Coast Guard at sea, we have a tangible thing to hand to them saying, Here we are in compliance. So, I feel really strongly about that being part of this situation now.

So, we are trying to determine, working with enforcement as well, how enforcement can recognize a weak rope or a three braided ropes. We're talking to the gear manufacturers, you know, three strand rope, about putting an alternating color in to show that it was intentionally created to break at 1700lbs or less. Um, you're using a weak rope that I know that our gear guys can recognize that specific rope. It's kind of unique in the fishery that the one that the Rhode Island fishermen are using. We have not brought, We haven't taken that one, to enforcement. Peter suggested putting a silver trace or gray tracer to indicate that it's Rhode Island line, and I think that's a great idea if the gear manufacturers able to do that. That's something that should be in the proposed rule, because that's not the gear marking that we have in place. But we would prefer in our well, we would prefer a gear mark that goes throughout the line. So top 75% marked with a gray tracer would be a good recommend, Another good cut. You know, it doesn't reduce risk, but it gives us more detailed information than the gear marking that we're currently requiring.

Well, it's just a situation where the kid, that's, I say kid young Coast Guard person that's on your boat may have come from you know, growing corn. In the middle of the country, you know his family's farm and has no idea about Rope. Um, so if it's, if it's tangible, you know there's an orange and green whatever color is decided upon, but that we can have the manufacturers put into that. Weak rope to signify it, signify that it's weak, you know, it would make things a lot easier for everybody involved.

Yeah and I will tell you we have a gear specialist that has gotten a call at four in the morning from Coast Guard Board and boarding a boat and asking a question about Lobster Gear. Um, so, when they don't know, they do reach out to our gear specialists and us but this will also be accompanied by outreach that includes enforcement, you know, at the at the docks when we're doing the outreach.

Thank you.

Thank you.

OK, at this time, I just want to let anybody who's on the phone who might not be able to chat into the chat box my e-mail. if you want to get in line to ask a question or give a public comment, please send me an e-mail. My e-mail is K A R A, dot, S, H, E R, V as in Victor, A N I C K at NOAA dot gov. Colleen, at this time, we don't have anybody else wants to give public comment. We do have two questions. We can take those now. They were from earlier on, so Robert Randle: are you still on? Hey Robert! If you can hear me, you should be able to unmute yourself.

Thank you very much Kara. Um I'm also in Brunswick Georgia, as well as Rachel Thompson, founding member of the Glen Environmental Coalition down here and I have a question for you though that's related to the fact that we're where the right whales do their calving and right in the middle of their calving grounds down here we have the Kingsbay Trident nuclear submarine base. I'm wondering if you know if anyone has done any research on the inter-relationship between sonar, contamination, and entanglement. Do we know whether or not the ability of the whales to see fishing vessels or possible entanglement threats is impacted in any way?
By their Exposure to Sonar. Does the entanglement increase or decrease after Navy, use of sonar in training exercises or in wargames? Do you know if anybody is looking at this?

So I'm not the best person to answer this question partly because I'm not in the south-east. I know that there has been work done on the impacts of naval operations on marine mammals. I think it is more often concentrated on toothed whale. Well, first of all, they're not. They're generally restricted from doing their operations. When, you know When right whales are around. And I don't know that they do any right there at that base, but I'm not familiar with that base and what they're doing right now. However, the Naval operations have impacted a number of toothed whales and some of the deep diving toothed whales. And those whales do more echo locating in order to eat and to find their way around. The baleen whales do less echolocating, they still need to keep their ears in good shape to survive. So I'm not saying they wouldn't be hurt by some of those ships testing and other naval operations. But, um, right now, usually that then the Navy would be required to consult on those under the Endangered Species Act, and they, I believe, would be dissuaded from doing anything like that in the breeding area when the right whales are down there and I can check with my colleagues in the south-east to make sure that's true Or to verify that, that's how they're still doing it.

Thank you, Colleen.

Thank you, Robert. OK, last step for this evening, it's a question from Michael. I actually think you potentially asked this question in your comment, and it might have been answered, but I just want to come to you to make sure.

Yeah. I was just wondering, what time of year the right whales are coming through Area two.

Area two is a tough one, that's a relatively new area for them, we have had. So, we have a program called dynamic management area. We do voluntary speed reduction requests when we know, when, we have seen whales or detected them acoustically in an area. And in Area two, over the last few years, there is very commonly within area two speed reduction request out Right whales, seem to be using that area of many months. It's a little bit different. Each year. They're shifting around It appears to be available Copepods are spilling out of the Bay. Um know, they're there in the same months that that the proposed area closure there. Also there in other months during in the year. And you know that the discussion of Right Whale migration, it's not like gray whales that go north and south on the California coast. It's more like if they need to breed, they go down to Georgia and Florida where there's lot less food. So, the so, the cows are there, they have their calves there and they're accompanied by a few maybe future moms and a few males, but if they don't need to go down there, they can stay where the food is and they're going to be where the food is as much to do the ecosystem changes and climate change, including a shift to Canada. But one of the areas in US waters where there is still food is that area in LMA2 south of the islands. And it is not, not necessarily year round, every year, not necessarily every month, every year, but much of the year. There were right whales in that area.

Thank you.

OK, Colleen, I think unless anybody has any last-minute questions that they would like to give, we are just about out. I'll take this opportunity to remind folks that at regulations dot gov, using the docket number, which is highlighted on the screen, it's NOAA dash NMFS dash 2020 dash 0031. You can search by the docket number, and that's how you can provide written public comment.

If there aren't any questions, I'd just like to thank everyone for joining us tonight, and for your comments tonight, or any written comments that you send, as well. I entirely agree. This is not the most accessible way for everybody. I wish we could also meet in person, I think in the future, we might do a combination of online, and in person when we're all allowed to be in person together. We have tried, as Kara pointed out, or mentioned earlier, we have tried to be as accessible as possible. There is a lot of material on our website, including information on how you can engage. There is, again, a lengthy recorded overview of the documents. And the documents themselves can be found there. There's also a seven, or eight page summary of what would be in the proposed rule, so please do take a look at that. And, I appreciate everyone's participation tonight. Thanks, everybody.

Thank you. Thank you, everyone for joining.

Public Hearing 2

Massachusetts (Outer Cape and LMA1) and New Hampshire (LMA1), Wednesday, February 17, 2021, 6:30-8:30 pm

If you want to provide comments tonight, as Kara's already said, please type "comment" into the questions box. And if you change your mind at any time, you can say pass when we call your name, or you can write pass into the queue. If you're joining by phone only, we will ask you to e-mail Kara Shervanick so she can unmute your phone and allow you to participate, and Kara will provide you with her e-mail address shortly. For those of you that want to give your comments in writing, rather than speaking tonight, please see the blue box at the bottom of the slide. Written comments will be accepted through March first. Following the directions listed in this text box, we've already received nearly 15,000 comments, including primarily comments generated through environmental organization campaigns that are somewhat duplicative, but also including at least 260 individual comments. If you've commented and can't find your comments posted yet, please have patience, we'll tally duplicates but we're only posting one of each of the duplicate e-mails. And it takes us some time to go through all the mailings to identify which ones are individual comments and to post those. So we are sometimes a day or two behind. Again, check our website, the address given at the bottom of the slide, to get copies of all the documents. To get details on additional public hearing opportunities next week, and to get another opportunity to see these directions for how to provide public comments. To comment tonight, we're going to call on each Commenter, based on your indication of the comment box that you're interested in commenting. And we'll try to let you know who's up next in the queue. Remember, we are recording this public hearing, and, as always, please be respectful, direct comments at us the presenters. When you're called on, you'll be unmuted, and then you'll need to unmute yourself so that we can hear you. For the recording if you can remember to please state your name before your comment, comments will be limited to three minutes. You'll be muted after three minutes. And if there's time at the end, we will be able to go down the queue and give people a second opportunity to complete their comments. If you've already provided comments, but have an entirely another comment you want to add, you can also be placed at the end of the queue. That way, we can give as many individuals an opportunity to speak tonight as possible, with that, I'm going to turn the mic over to Kara to help us run through the comments.

Hello. Yes, so give me one second and I'll put the comment slide up. But on deck we have Eric Anderson, Christa Early, and Glenn Carol, so be prepared. OK, awesome, as Colleen said, we're going to be limiting comments tonight to three minutes. I'll try to keep an updated list of who's coming up to just give you an idea. Here on the screen, we're going to intersperse some questions in-between the comments. I know some of you have both questions and comments. We're going to start with comments, and then we can come back to you and take your questions. So, up first, we have Eric Anderson. When I unmute you, you may also have to unmute yourself. And Erik Anderson might play a little bit of phone chicken because I see you've joined from several devices. So I'm going to start with one of them. You're unmuted, you should be able to.

Yes, I think I am I unmuted

Yes, you are. I can hear you

Thank you very much and thank you for this opportunity. I'd, I've also submitted, you know, I've submitted some questions and I'm not sure which way to start here, some of them are clarity issues, clarity issues with regards to how the proposed rules of written are written.

Ok why don't we start with those. Let's start with your clarifying questions.

Yeah, I, it was, it was any insertions, there is a insertion opportunity for a three foot, um, two loop two tuck insertion. It is, it probably has the probability of being very popular in New Hampshire. But there, we understand, when we question, why is written as being a length of three feet, is it 3, 4 is a three foot loop, or is it A, is it three feet from the second tuck? um, it's kind of a technical thing. And I just do want to say that it was a surprise to us. I represent the New Hampshire Commercial fishermen's Association. We have a lot of fishermen in a trip switching over now. It was. It was unknown to us. The potential implementation of these regulations will going to be all the way out to 2022 they started to complain like guys that are switching over the gear now without a lot of clarity. And what they can use for insertions are don't know if there is, if they're making these, these corrections in compliance with the Final Rule. So it's, it's caused a little bit disruption in the fact that people are trying to and to enter this process and comply, but they have very they have, There's some confusion in the direction that they're proceeding to know if it's the right direction or not. There's a lot there is some ambiguity in the way the rules are written.

So, Eric, if I could take a shot at answering that, and thanks for joining us tonight. Um, I think there is some confusing to some confusion because Massachusetts is implementing state regulations on a much faster timeline. There'll be finalized soon and that might be sweeping some New Hampshire fishermen along with them. But we do not yet have a final list of approved weak insertions. And the what our regulations is going to do is it's going to, um, identify the specifications that have to be met, not necessarily the list of approved regulation or approved insertions or, as Bob Glenn likes to call them Contrivances. So, you know, one insertion example that we know is working and would be acceptable is the sleeve that's used by some of the South Shore lobster fisherman that they that they invented. And the line that I described that some of the Rhode Island boats are using. I am not sure if the I know that we had some knots early on. In Maine DMR's testing that looked good and more popular, we're not certain I don't have the list of knots that have passed the 10 test, um, average breaking strength, Yet, we're still working on developing that list. So I actually think that it might be best to tell the New Hampshire fisherman that they're probably not going to need to do this right away, although, we would love weak insertions to be in place earlier if that's possible. But I am concerned that they might be using insertions, that aren't going to be on the final list. We're not sure yet. When we do have a list, we'll be preparing a lot of outreach, documentation, including videos, we hope, as well as illustrations So that each insertion that's approved will have some clear documentation of what is meant and that will help both enforcement and help fishermen when they're modifying their gear.

Yeah, that's appreciated, but I had to modify the at least, a newsletter or a news broadcast, to say, to these people that are very anxiously trying to participate, say, stop, and that's kind of a tough thing to do. It's always more often that it's hard to engage people. You have people I'm trying to engage right now, and it's almost wise to tell them to stop.

Wait, since you have, since you have them engaged. I mean, in a way, their field testing before they have to, we would love to hear about how it's going if they've already done it. And we also would love to make sure that we've tested the configuration that they're using. So I can have our gear specialists get in touch with you. So we can get an example of what's currently popular in New Hampshire, and we can work with Maine DMR to get that tested and see if we can get that added to the approved list.

Could I add while it is Fresh in my mind? The 0 to 3, 3 miles. The insertion is 1. 3 to 12 is 2. 12 and beyond is one. Why is it? What is the rationale? And in reducing the insertions from 12 to 12 to greater than only one insertion seems like there would be more, but especially since two insertions at 3 to 12.

That's an excellent question. And the more insertions and the lower they go on the line. The more protective they are to whales and the closer they come to being assessed as a weak rope. So the more conservation benefit is credited to them in the decision support tool. The configurations that were proposed initially, I think, that was in Maine DMR's proposal and it was based on. Actually, measured forces on line's at various depths and with various sized trawls and it. And so it includes, you know, those depths and number of insertions that they felt was most likely to be operationally feasible without parting more lines than fishermen were, felt safe, parting so due to reduced gear loss for safety reasons. That was proposed by the State of Maine. We did consider it in the decision support tool and with all the other measures that are in there for the region, we determined that we were getting at least a 60% risk reduction target. But as you're pointing out more insertions and insertions that go deeper would get a greater conservation benefit.

Thank you. I do have a couple more comments, but I've taken up. I'll go to the end of the queue again. So, let somebody else take a shot. Thank you.

Thank you for those questions, Eric. Next up, we have Christa Early

Can you guys hear me?

Yes, Christa, we can hear you.

Perfect, OK. So my name is Krista Early, and I'm an advocate with environment North Carolina. We're a state based non-profit dedicated to protecting our air, water, and open spaces. I'm testifying today because North Carolina has a special relationship with one of the impacted species, critically endangered North Atlantic right whales. Each year, expectant mothers migrate south to their calving ground, which extends from the coast of Cape Fear North Carolina to Southern Florida. This winter, we celebrated, as our scientists have spotted right whale calves off our coast. But we've also grieved as two of the calves have been found washed ashore on our beaches in North Carolina. For a species whose protection has continuously declined over the last decade to less than 370 whales. These deaths are especially heartbreaking. from our North Carolina Beaches and Ocean where these right whales swim to our mountains and plains we’re blessed with an incredible legacy of natural beauty. Our legal framework featuring cornerstone, Environmental laws like the Marine Mammal Protection Act and the Endangered Species Act prioritize actions that prevent extinct extinction and keep our wildlife safe and healthy. As written the proposed rule violates these bed rock environmental laws as it fails to protect right whales from one of their top causes of death, fishing, gear entanglement. I urge you to formulate a much stronger final rule keeping in mind the following consideration. The draft rule is based on an outdated population data. We need to use the most date most recent data available. Additionally, the proposed seasonal habitat closures and the rule will not do enough to prevent right whale entanglement in fishing gear. The proposed closures to vertical lines are too small and too short in duration. The third point is weak rope. Another major tool used in the rule is not a proven, effective solution to preventing fatal or seriously damaging entanglement events. NOAA was petitioned twice, once by the conservation law firm, Foundation, and others, and one by the Pew Charitable Organization for Emergency Action in recent months to create closures. As the proposal recommended, NOAA should take emergency action now. The agency should close certain areas to the use a vertical buoy lines immediately, while a better package of rules is developed for are using updated science. We envision that this package would include a plan that closes certain right whale habitat toward fishing and starts to create a path for the eventual broad scale implementation of ropeless fishing industry. Today, I urge you to uphold our legacy of environmental protection and do everything you can to save our North Atlantic right whales.

Thank you, Krista. Glenn Carroll, you are up next.

Can you hear me?

Yes, Thank you.

My name is Glenn Carroll. I'm coordinator of Nuclear Watch South, and we're an environmental group in Georgia. And I'm appreciative of the scope of the EIS and to that, I would say, what a tall order, NOAA has such a big habitat, and such a dire situation. As you know, we lost one of our precious calves this week in Florida, um, to the scope. It is baffling how you describe very, um, well, how dangerous noise is to these creatures, and yet then decide that it has no impact. Um, and I'm frankly, I'm not positive how that intersects with the fishing gear as much as I think of how it intersects with the ship strikes, which are more the hazard in our region. I thank you for posting the link to that rule. Thank you very much. I want to share with you, we didn't know that the whales had habitat in Georgia until NOAA had already permitted the US Navy to build a massive submarine site and when a baby whale showed up on an island, there was a study and we found out for the first time in the mid-eighties. Right whales were visiting Georgia. We did not know that. It became our state mammal, Georgia's State Marine Mammal, is the North Atlantic right whale. And to my knowledge, NOAA has never analyzed the impacts of the U S Navy activities on the Whale. We, have not had hearing in Georgia since the original EIS in 19 79, which led to the permit for the king's base submarine base. So I'm here to appeal that we do be on NOAA's mind as important, habitat concerned citizens. And for hearings, I thank you for doing the strongest measures you can. We've already made deep changes in our attitude toward the whales, and now it's the time to do that before it's too late. Thank you.

Thank you. OK, Max R, were e coming to you. Yeah.

Hi, can you hear me?

Yes.

All right. Hi, my name is Max, and I'm a senior at Saint Anselm College in New Hampshire, two years ago. While attending a Right Whale event at the Massachusetts State House, I learned of the devastating reality that the North Atlantic right whale population faces. Right whales are in a steep decline, as there are only about 366 remaining in the world. Additionally, only one quarter of that number are females that are able to give birth. Since I started following this situation in 20 19. The numbers have not only plummeted. But there has also been very little progress towards solving entanglements, the leading cause of death for right whales. It seems that every few months there is a report of a new Entangled whale off our coast. Just last month, there was a severely entangled right whale found off the coast of Georgia with blue fishing line trailing behind it. The photos are horrifically gruesome to see. And this poor whale has probably been trailing this gear around wrapped around its tail for months on end. When do we say enough is enough? Right now, there is more at stake here than just the safety of the whale's. We also need to consider the men and women who make their living on the water. The facts suggest the facts all suggest that the widespread implementation of ropeless fishing gear is a necessary step in preventing a huge amount of needless right whale deaths while also ensuring the safety of the fishing industry. The transition to ropeless gear is less of a matter of if. But a matter of when, if our government does not properly lead and aid in the transition, to ropeless fishing gear in 20 21, fishermen may ultimately be pushed out of pushed out by further closure of New England waters. And right whales may continue to die off a tradition, a transition to ropeless and a federal funding program is needed now. We don't have time to waste. Thank you.

Thank you. All right, at this time, if there's anybody who is joining us by phone and has entered their audio pin, but cannot see this screen, or does not have a chat box, I'm going to say my e-mail. If you will just send me an e-mail, then I can find you and unmute you. My e-mail address is K a R A, dot, S, H, E R, V as in Victor, a N I C, K. At NOAA dot gov, K, A R A, dot, S, H, E R, V As in Victor, a N I C, K at NOAA dot gov and I'll also put that in the chat in case you know someone who's joined by phone but isn't able to use the questions box. Sheridan, I'm coming to you next. I've unmuted you, you should be able to unmute yourself. Sheridan, O'Connor, can you hear me? OK, no fear, we're going to come back to you. Colleen, we're going to take a couple questions now. Stuart Jones coming to you now. You should be able to unmute yourself Stuart Jones, and ask your question.

Yeah. Can you hear me OK?

Yes.

Yeah, I was just curious if there was any talk of the increase in the reduction by doing a buyback program, like you did with the Groundfish know a federal permit or a lobster license buyback to reduce the end lines. You Obviously, know, like in the state of Maine we have 800 trap limit so every endline out of water would probably add to their reduction and hopefully in the long term would increase that.

So that's a great question. Um, we did meet with the Atlantic States Marine Fisheries Commission they had a group that was whale. A whale/lobster working group that discussed a number of possible ways to reduce the number of end lines through fishery management options. And I'm not positive that this specific one came up. But that's the kind of thing that we would consider doing if we had the funding to support that. It didn't get into rulemaking in the end. It didn't have a lot of support, and it was very complicated. Particularly in Maine, it's difficult because past buyback programs like in the ground fish fishery are based on fishing histories. And because of the size of the fishery in Maine, the reporting has been at about 10% of the fishing fishermen, fishing of the participating fishermen. Not 100%. So, we don't have as accurate histories in Maine as we have in some of the other states, where they have 100% reporting, particularly Massachusetts, where they have a detailed reporting. So, at this time, that's not that's something that's being done. I do think that and maybe Chao could have input. I think the Social Science branch at this north-east Science Center is looking at potential economic futures or social science choices that could lead towards less rope and buyback might be one of the things that they're considering. That's an ongoing study, so it's, you know, it's a year or so from being produced, I think. Chao I'm not sure if you're familiar with that work.

Well, thank you. Sheridan O'Conner. I'm going to come back um, Sheridan O'Connor if you can hear me. Oh yes I can see that you're unmuted. Can you hear me? We're not able to hear you. You might try to find your audio settings and make sure that your microphone is, is either your computer, if you're using your computer, or if it's your headphones if you're using your headphones. Well, we're closer were closer, Sheridan. I'll come back to you next, OK. All right. Brian Sharp, I'm coming to you. I see you have a question and a comment. So you. Just let me know which you are going to start with. You should be able to unmute yourself.

There we go, thank you Kara. I can start with the clarifying question first, if that's OK. In the economic analysis, for when considering the costs and gear conversion you mentioned in the presentation is going to be about $2 million, Does that? I apologize if I looked through and I could not find this in the document, but it may be there, Does that take into account the replacement savings of cure current gear that's increasing the end of its life span? The kind of depreciation cost?

We do, we, all the costs now are extra-long, so it does not include, like the normal use of the gear, if they need their gear annually right, or the ropes So we, we also do distribute the cost. So, our assumed, like life span of some ropes are like six years. We have, like, cost added to each year. The extra cost to they're like normal use of the ropes and other gear.

To clarify, are you mean that each in each year, you assume one sixth of the line is being replaced with new line?

Yes.

Brian, does that answer your question?

Yeah, thank you.

OK. Awesome. Are you ready to give you a comment now?

Yeah, absolutely.

OK. Awesome.

Good evening. My name is Brian Sharp, I direct the Marine Mammal Rescue and Research team for the International Fund for Animal Welfare. Like to begin by thanking Colleen, and the NOAA team for holding these meetings and allowing me the opportunity. And all of us to provide comment tonight. one of my responsibilities at all is to be their representative on the Take reduction team, and then reviewing the proposed rule. There are three areas that I'd like to briefly address number, one, the risk reduction goal itself. When the team met back in April 2019 in Providence, it was believed that 60% would be the best that we can hope for, and that that would be enough since said April meeting there have been 13, known right whale deaths and likely others proving this situation is even worse that we really realized, at the time, with the hindsight of almost two years of additional data and continued decline of the population, this risk reduction goal, 64%. That really does need to be increased to 80%. To ensure that the deaths and serious injuries do not push the species past an irrecoverable tipping point. The second is a 1700lb breaking strength of weak ropes should only be viewed as an interim step, not the Solution. Weak ropes do not remove the vertical lines from the water column and therefore, does not reduce the risk of the entanglement itself. We know that weak ropes will not protect calves or juveniles from lethal entanglements. Of all. You know, the study that was done showed sub adults and adults. It also does not protect adult whales with chronic entanglements from the long-term health impacts of those entanglements. And then, finally, the transition to ropeless; we urge the agency to increase the incentives and assistance to fishers transition to ropeless fishing. While we recognize that progress has occurred with the inclusion of ropeless in some areas of the plan, more needs to be done and fishers need to have a streamlined permitting process that allows them to thrive on ensuring the survival of the species. So again I want to thank you for the opportunity to comment, and we'll be providing more comprehensive written comments. Thank you.

Thank you. Sheridan, we're going to come back to you OK. Let's try again. I think we're close. All right, I've unmuted you. You unmuted you. OK, you're unmuted. Can you hear me? We're not able to hear you at this time. I see that you, why don't you try in your audio, the audio bar, click phone Call, then use the numbers. It gives you to dial in, making sure to enter your audio pin, then we'll come back to you. OK, let's see who's next on my list, Elizabeth Clemmie. You're unmuted.

OK, I'm all set?

Yes.

OK, so basically, I will be submitting comments that are a lot more detailed on the specifics and the science, if you want to call it that. But my basic comment tonight is, I've just been involved as a lay person, and a concerned citizen, my entire adult life. I'm 61 years old. Um, and it's the same rhetoric that's been going on for 20 years. I get the plight of the lobstermen and the fisherman but we have whale's that are not going to be here, potentially in five years, they can't come back. That's the, that's the prediction. We have technology that does amazing things all over the world, out of space, on the ocean floor, why we cannot subsidized government. But with the government, with our tax dollars, cannot subsidize these fishermen, so they can afford to use ropeless gear. Immediately, this has been talked about in the ropeless gear has been talked about for 20 years. It just seems like it's just a lot of rhetoric, It keeps going on and on and nothing happens and the whale's keep dying and we just have less and less of them. And we keep having hearings and we keep meeting. And we keep talking about how we're going to save them. And we're not so I I've read through a lot of this. I'll be more detailed in my, in my comments when I write in, but my we're just not doing the job. And these meetings aren't helping and nothing's getting accomplished except we're losing whales. So it's all very disappointing to me. Um, it's all very frustrating and for a lot of other people. And I don't think the fishermen need to suffer I think we can subsidize I think the government can subsidize and create and subsidize what they need to get started to stop being a problem for the whales. You also have ship strikes. I think we can do a much better job at monitoring where whales are and so that so they can avoid ship strikes. And I guess that's pretty much my comment.

Awesome, Thank you so much. OK Sheridan, I have a really good feeling about this.

Can you hear me?

Yes!

OK, great. Hi, my name is Sheridan O'Connor and I'm currently a vet student at Virginia Tech. I attended BC for undergrad Boston College, where I was lucky enough to spend time by the water, visit the New England Aquarium, and where I really solidified my dream of becoming a veterinarian. I've learned about different animal species, but my favorite are the different Whale species that inhabit our oceans and seas. We studied many over the course of vet school so far. But the one near and dear to my heart, definitely the North Atlantic right whale, because it desperately needs our help. Right whales are critically endangered. And soon could reach the point of no return from extinction. Scientists estimate that in five years, right whales could be functionally extinct, which means they could die off in our near future if we do not act fast and take swift conservation measures now. I have poured over the data from venerable scientists, marine biologists, and veterinarians. That show 86.1% of right whales have been entangled, at least one, and more than half of them entangled twice. Some right whales had been entangled in fishing lines as many as eight times over the course of their lives. We cannot keep letting this happen. We cannot fail right whales and have them continually become entangled in fishing gear, new technology, to prevent entanglement, ropeless gear, or pop up gear to prevent right whale entanglement, while still allowing fishermen to continue to harvest. There do not need to be closures up and down the Eastern seaboard. If we start to implement ropeless gear now, this gear is safe, it works. And it can help save both fishermen and whales. As a vet student, a biologist and as a human who cares about how our actions today have great consequences in the future. I'm asking you to please create a ropeless gear permit program now so we can get gear in the water before. it's too late. We owe it to the North Atlantic. Right Whales to do all we can. And this is the strongest start. Thank you.

Thank you.

OK, next is Nina. It should be unmuted.

Yes. Thank you very much for this opportunity to make a comment on this very important issue. I appreciate all of the information that has been developed thus far this evening regarding the North Atlantic, right whale. I represent the coastal black women's ocean memory and conservation Collective in the state of Georgia. As you all have so eloquently stated that Georgia, as one of the southeastern states, where these North Atlantic, these beautiful creatures calve each year. I also represent the faith community. This is a part of a larger question about the, biodiversity of life, but the vitality of this species. That is on the brink of extinction is deeply troublesome to us all. I believe one of your persons on the call attendees on the call this evening mentioned the King's Bay Naval Base in which the, whales have calved in this area for many decades now. I had the opportunity earlier today to read your DEIS and some parts of it was a very troubling regarding large whales, that anthropogenic noise can impact whales both physiologically and behaviorally. Physiologically, noise causes a stress response in the North Atlantic, right whale, over an extended period of time, physiological stress can impact marine mammal health by altering metabolism and energy stores. Decreasing immunity and impacting reproduction, noise can also impact behavior, including initiation of avoidance behavior in large whales, changing communication patterns that can reduce mating opportunities, and interrupting feeding behavior. The physiological impact of these behavioral changes is unclear but could impact nutritional health and reproductive success. Small populations with limited home ranges, may be more vulnerable to the physiological impact of noise. Given this information, impacts of noise on large whales is likely to be low, negative, to negative. I find this conclusion and this, this very small paragraph to just be incomprehensible and I just don't understand it. However, given that the Naval base is here, we know that the testing, the submarine testing that is done here on the Coast it does impact the whales. And I just implore you all to make a better decision in terms of the vitality and regeneration of the North Atlantic right whales. Thank you.

Thank you. OK. We'll take a question at this time, Marin. Marin, you should be able to ask your question now.

Yep. So those are the question, my husband's lobsterman. So in terms of the insertion points for the different, you know, three miles, and then what does it, I don't have in front of me that slide, six, and then out to 12, you have it ideally, with 50% in state waters although that will be different for Massachusetts, and then 25%, 50%, And then 35% outside, 12 miles. But I just wondered how strict the enforcement was, and I want to say that I am supportive of those measures, but in terms of picking up, you know, 6 to 8 trawls, and moving them from one spot to another. And you've got all that rope on deck. And you've got two blue lines per trawl, and now you're trying to measure out you know, 600 feet for the 25% mark. That 50% mark, and then even deeper for that 35% mark. I'm just curious what enforcement will look for that, because you don't want to make it too burdensome on these guys, but that's a lot of rope. And you've got 160 traps on board, and you're trying to offload them And you don't actually know where you're going to go. Know, you get out there, and you look at all the effort, so you can pick your spot. Um, so you know they have to It sounds easier than it is, but they're going to take out the sleeves or the weak rope points and then they have you know navigate back to that that marker. So how strict will enforcement be for these guys to give them a little leeway on that stuff?

So We don't have our enforcement plan completed yet, but I am if it's not operationally feasible, it's not going to be effective. This was developed partly because the feeling was that as fishermen move back and forth they could connect lengtheners using weak insertion points. I mean, we're not going to be measuring to feet or to inches, certainly. And maybe not to specific feet but I do think that we're going to want it to be defensively at those places. Right now, there's a pilot study being done by our enforcement program. And While piloting, they've already made some cases using ROV's to do underwater enforcement rather than hauling gear, and I suspect that that's one of the ways they're going to try and enforce this aspect as well. Um so you know I'll work with the gear specialists that we have and have them work with fishermen to figure out how to make this as easy to implement as possible and include that direction in our outreach materials. But, you know it's us, the measures are being assessed with those insertion points and if that gets eroded it's going to erode the effectiveness of the measure's further. So, um, you know, we need to be as close as possible and, you know, Marin we'd love comments from you, your husband, other fishermen, on how they could try to do it. I do think that there are some places like we have heard from a couple of fishermen from Rhode Island that want to use weak rope because they don't want to have to worry about measurements. And they just want to use weak rope throughout or weak rope in their top half or third of their line. So, which would be easier for everyone to not have to put an insertions. But insertions allow fishermen to fish without replacing their entire blue line. So, there's some savings in that as well. Um, one of the reasons I think that 10 fathoms insertions were suggested as an option at some of our scoping meetings was that it's a fairly common lengthener apparently in some segments of the fishery. So, the states every 60 foot insertion requirement is similar to that. And, you know, we do have some fishermen without weak insertions being required. They're already fishing with them now, at every 40 foot. In Massachusetts, well just a handful, or maybe just two. But, um, no, they're able to do it moving back and forth. So, I think it's doable. Love your input and your comments on, you know, help us guide you, on how to do it, in a way that's operationally feasible.

Yeah, Can I, can I ask a follow up to that? So if he puts in just more weak insertion points to kind of cover himself, will you know they say anything to the 25% and 50%. if he's got maybe three within the top, 50% you know, and then he uses that as because he may use different toppers with different add ons because he tends to fish deeper. So if he has, sorry toddler.

That's a comment we like.

He's actually got a baby shark costume on right now.

If I wasn't seen it, so if you, but if he is able to put in more, weak insertion points, then that may help cover him. Or you know, instead of the 25 and 50% Or is that 25 a magic number? If he's got something? Above and below it and then as 50%, you know, if there's some flexibility, there might be easier for him to move gear. Just because not like you said not that not everybody has the add ons at 60 feet. I know he does not, but I know a lot of other guys do.

So the lowest point is important because whales are using the entire water column. And so if a whale intersects the rope below the weak insertion, there is no risk reduction as far as we would know. So the lowest point is probably going to be important. But I think you bring up a good point and when we finalize the rule, I think we would say, you know, at least, one at 25%, but it can be more and more is, is more is more risk reduction. Um. So it could, we can try and figure out how to write that to allow for more than one above but we still would probably stick with the lowest insertion as a requirement.

Yeah, no, I agree with it. Like I said, I'm in favor of this and just, know, especially this time of year they're out there, he’s only fishing, maybe 2 or 3 days a week picking weather and is moving gear like crazy to, you know, chase what he can for the price. Yeah, that's 200 Traps on board and maxes out 'because he's only got two days to fish And all of a sudden is dealing with trying to re rig buoy lines with all that, You know, thousands of feet on board, so. It's just finding that balance of how to make this best work with whatever flexibility you can offer them. I guess. This is the point which sounds like you guys are doing so I appreciate that.

Yeah. And if you send written comments with specifics, you know, with input from him and other fishermen, on specifics on how to how to write it that way, that's exactly the kind of input we're looking for.

OK, I appreciate that. Thank you Colleen

Thank you.

So, thank you. OK, Eric Anderson, coming back to you to give, I believe you asked questions in the beginning, but did not have the opportunity to give your public comment. So, if you would like to, let me find the right one, if you'd like to give your public comment now. Oh, Yep. Can't Hear you.

Can you hear me?

Yes.

Thank you. A couple of things. You, you asked for comments on the weak link. Whether it's still appropriate or not. It's hard to it's hard to speak for the whole community, but at least they've been in practice for such a long time that it's not a new, it's not, it's not a new requirement. So, and we think that it has, it has it has a benefit in a multitude of ways. So, we probably want us to stay, say that, to keep them included, again, I represent the New Hampshire Commercial Fisheries Association and trying to, we're trying to get this, this thing resolved. There is one provision in there for the state waters in New Hampshire might be small, but it's still an important thing, five trap trawls were required to reduce down to one buoy line. Um, normally they had two. If anything is to be considered to reach and reduce it down to four traps, one buoy line. Um, These guys have used to buoy Lines, eliminating one, creates a lot of confusion operationally in knowing where the gear is and because two buoy lines always marked the both ends of the gear, if they have to go to one, we would like to see shorter trawls, um, be reduced to shorter trawls four trap trawls vs. five, it's a small matter, but it's a big matter for some of these fishermen here. Um, I know you are able to respond to the variety of comments that have, um, uh, promoted ropeless fishing gear. And they seem to come from, with no offense. The comments are legitimate, but they come from an aspect of the commenters that don't have a lot of experience in the fishery. Ropeless gear is just not as easily implemented. As saying some words, it has some very, it's expensive. It has some operational difficulties that would upset the fishery, and cause more damage, or more, more of a chaotic condition as the fishery tries to promulgate itself. Um, that needs to be overcome. There is some technical aspects of it that have been accomplished but there's some operational aspects of it that have a long way to go before it can have some feasibility. And I think that has to be expressed from the industry or people that work with the gear. You just can't say this, a just have ropeless fishing gear in. It has the ability to solve some things. It has the ability to create tremendous problems in other aspects that have been discussed within the TRT. So I just want to get that that point for us. Anything else? Thank you very much for this time.

Thank you. Does anybody, I don't have any e-mails. Does anybody have any more public comment they would like to give? They're saying questions. Does anybody know any good jokes while we wait?

Kara did you get any e-mails for people on phones?

I did, I did not. Let me just double-check though. No. Nothing in my inbox.

So it looks like we can probably wrap this up tonight.

Just a couple of things. One second.

One more scan? While we're scanning, I'd like to thank the take reduction team members that are on the phone tonight, including some of our original team members. I think there's about 15 team members and alternates on and, um, a, this has been a really, it's the most busy and most active of all the take reduction teams. They work really hard and it's a really hard job trying to come to consensus across such a large group of stakeholders. So I really appreciate their participation and their joining on the call tonight, as well. So maybe everyone's going to be sending their comments in writing, which would be great.

Colleen, I do have one comment somebody made. I will let them speak. Rain, You're unmuted, you can make your comment now.

Can you hear me?

Yes.

Yes.

Hello. I was just, you know, I've been following along with all of the webinars that you have had and you've put out and it's been going on for months. This has been going on and there hasn't been any real significant change. And I listened to the fishermen and they're trying but I feel like their Interests would be better served if the whole industry was shut down until they could figure out a way they could agree to get back out on the water in a safe fashion. I live on Nantucket, we're picking up fishing gear along. Every beach along every massive tangles of them. There has to be a better way.

Thanks, Rain.

OK, Colleen we have one more in the queue. OK, Jim, you should be able to unmute yourself. Hey, Jim, can you hear me?

Is that better now?

Yes, I can hear you.

I lost that screen for a moment. Yeah, I've got two comments I'd like to make. And some are relative to the last 2 that you had on. I've been a commercial fisherman for 32 years. And the last 25, I've served as either a representative or an advocate for the fishing industry. Including terms on a New England Fishery Management Council, I would like to caution you. And the people who are trying to help the right whales. That is not as easy as what it may seem. one of the questions had to do with enforcement. Enforcement at sea is basically relative to what's written on the paper. You have a lot of young coastguard men. Trying to enforce these regulations with probably not much of an understanding of what it takes to write these regulations so that they're enforceable and fair and workable. You want these to work for the whale but you need them to work for the fishermen as well. So the people that think that you can shut down a fishery, consider shutting down your own occupation while you fix a problem. It's not that easy. Let me say that I've never been a lobstermen, I've always been a commercial mobile gear guy. And there are several problems that come in with the mobile gear and the fixed gear. And that's being able to identify where that gear is. So, we don't have gear mishaps where we tow up their gear, tear up the gear, and we're both at a loss. At some point, you need to identify where this gear is being fished. Ropeless gear will not make that possible for the mobile fleet. There's been discussions about how one lobsterman can identify another one's area. I have yet to hear someone say, How does the mobile gear or, even someone with a trawl gear, touch trawl gear, Gillnets, In other words, identify these areas if they're not part of that program. When, when you have the unidentified areas or lost gear, and they’re towed up by a mobile gear fishermen. I'm not sure if this rule still applies, but I believe it does. If I was to take up someone's mobile gear with ropeless gear at a tremendous cost, I can't even return it to him. I have to throw it back overboard and leave it where I found it. There's a lot more to this than what meets the eye. So while we're trying to save the whale, we do not want to lose the fishermen and I thank you.

Thank you. OK, we have 1 last 1, I believe, and I check my e-mail while we're on the last one, Joel, Erickson. Joel, you're unmuted.

Hello. Can you hear me?

Yes.

Great. Thank you. I'm pretty new to this whole situation with the right whales. And I was listening to the meeting last night, and tonight. And I'm wondering if any consideration has been given to trying some method. Somehow, letting the right whales themselves know of the presence of ropes in the water column. Where they're visually or probably more acoustically with some sort of pinger or something attached to the line to just basically say, hey, danger. There's a something in the water that you can't see, but you can swim into and get entangled with and stay away and swim around us. Um, you know. It seems that there's sort of an assumption that the right whales may not be as intelligent as, as they may be and we really don't know. Um, and I'm wondering if there's been any research or any thought given to that, you know, allowing them to sort of see the lines or know about the lines. Similar, for instance, to signs on a freeway or a highway that alerts drivers to you know, upcoming invisible danger. Um, so that they don't because those lines are pretty thin, you know. They can't see them and they just swim into them. So if there's some way that we could communicate to them, hey danger, stay away, swim around us. Because the lines to them, the lines just must appear randomly and sort of Ah. Yeah. They're in their normal course of Migration. And, you know, if, if we could somehow shift the burden and rely upon their intelligence, maybe we could shift the burden away from the humans and the fishermen, um, to allow them to know of the danger and avoid it. Thank you. This has been really great, really, educational. And I really appreciate all the effort that's gone into this. Thank you.

OK, and I can actually take a shot at answering your question a little bit. New England Aquarium has done some studies that indicate that, right whales may be able to see red line, at least near the surface column and that's one of the reasons some fishermen in Massachusetts try using a red line. We don't really have enough information to know, for sure. And we don't know how far down in the water column, color would be visible to the right whales. Sound does not work with baleen whales. We do use pingers on gillnets, to alert Harbor Porpoise, that the nets are there, it makes the nets visible to the porpoise, or alert them that there's something there, But sound doesn't work as well on baleen whales we have trouble using sound, even trying to herd whales When they're up in dangerous locations, the baleen whales themselves, they react unpredictably to sound if at all, a feeding right whale probably wouldn't react at all. And, I mean, you have heard some people talk about a calf, that was struck, um, recently off of Florida, right whales are not on, you know, periodically, hit by vessels. And the vessels are making noise and the whales, if they're reacting to the noise, might be coming up under the vessel. They're not reacting in a way that lets them avoid being hit. We have seen a couple of videos of right whales encountering line, not necessarily getting entangled. Recently, a crab pot, a right whale, in the South, came along a crab pot and it almost circled there, their eyes, you know, not looking frontwards like ours they're sort of looking to the side and down which is where their food would be. And it sort of circled that pot or that line, as if it was trying to figure out what the heck did I just bump into. And that kind of behavior, if it actually gets entangled, and then starts thrashing, is probably what would create what creates these complicated entanglements. So at this point, from what we do know and have observed, they're not able to detect and avoid, on their own.

Thank you.

OK, Colleen, I, There's nothing left in my e-mail. We have one more person with someone who has commented previously, that had another comment, And I think that's probably the last one. Let's see. Hi Rain,

Hi, Thank you for letting me speak again, and thank you for all the hard work that you're doing and, to the fishing community. I'm not cold and heartless. You know, and I don't remember the gentleman's name. That said like, if my industry was in trouble and being regulated like this, how would I react? But my response to that is, like, any other industry that was causing so much harm would have been shut down long ago. You know, like, we know the migratory paths of the right whale, we know where they are. But yet, we're still killing them. Like, it's just, it's unacceptable. Like, we just have to do more. And I know the fishing community are really ingenuitive people. Like, if we leave it up to them, to maybe figure out a way they can get back safely out onto the water, we might have new technologies that, none of the scientists could have come up with. You know? Because, we're not fishermen, and I think it should be shut down, shut down until they can come back out safely. What, 366 whales left? We don't have time to do this anymore. Thank you. That's all I have to say.

OK, let me just check on my list of things Colleen you're on mute.

I was just saying I don't see anyone in the queue at this point.

Erik Anderson has one more comment.

OK, and I would like to say please remember direct your comments to us and not at each other. I'd appreciate that. That was one of our operating protocols. And I let that slip a couple of times. So, um. Eric?

Eric I might need to come unmute you, hold on one second. OK, you're unmuted.

Yes I am? All right. Thank you. I think I've thoroughly worn out my welcome and, you know, with comments, but thank you for the final opportunity. I just want to say that, you know, this has been a as far as a TRT, it's been a long, long journey to try and come up with some solutions here, and I think there is a prospect of them. This, this plan has to have a chance to work, and in a way that works for both um, interests here. But I know whether the complete knowledge of everybody that's listening in is, unless our Canadian counterparts, come to the table with the same sincerity as we have this, we're going to have some problems. It upsets this community or our domestic fishing community to see that they're putting in such a variety of effort are sincere effort to try and, you know, take this issue on and in come to resolution with it. When we see that there's probably been a lack of response from the Canadian, um, government to take it on as seriously as we have. There is just far, far more, the majority of the mortality and serious injury that has recently taking place in use. It's caused the device or the downfall of that part of the right whale population is taking place in Canada. And until that is also addressed, anything that we do here is not is it is not for not, it will always help. But if it's not equally taken under consideration, we're not going to have the progress that people expect out of this. And, um, that just has to be recognized. These whales don't understand domestic boundaries or international boundaries, and, um, would just hope that the Canadian government could come to the table with equal sincerity on this issue, or there's going to be a lot more frustration. Thank you.

Thank you.

OK, Joel, uh nope, Yes, Joel Cohan. So I've unmuted. You yell. You'll have to unmute yourself.

Yes. Oh,

OK.

OK, hi. I'm Joe Cohen. I'm from Florida, I'm a wildlife photographer. And my comment is basically I get to watch the moms come down and give birth with their calves and I get to take pictures of them. And I really can't stand to watch any more come down with scarring all over them. The majority of the Whale's I've seen over the last three years all have scarring all over them. It's from the ropes and gear being entangled around them. It's really hard to stomach it. And so, yeah. I want I want something to change, I don't want to hurt the fishermen. I understand that it's a livelihood. It's uh, it's a tough thing. I do believe ropeless, I've gotten into this a lot recently. The last year I spent the summer and the fall, trialing ropeless gear with commercial fishermen and a few different states that so much. I just I want to want to get involved with this and ropeless gear does work for sure. It. It has potential to solve many issues. Of course, it's not an absolute perfect system yet. It's not completely done, but it certainly has great potential and the trials, I did it. It absolutely works. And, and from my perspective, there's even a chance that there's a financial part of this that the fisheries side has or the fishers side hasn't realized and that is that you may not lose as much gear. There's a possibility where you won't lose as much gear where people won't mess with your gear as much. Um, so, I know there's a lot of concern about ropeless and all that, but I do believe it's, it's very close and, and should be very, strongly considered. So, also, as far as some of the other concerns, the Canadian thing, you know, we have to lead by doing the right thing. We can't worry about other, You know, if we do the right thing, other people will follow other countries and follow, So. Yeah, that's, that's most of my comment. It's, I can't stomach watching. Another whale come down here with scarring. And knowing that 86% of the population has been entangled, and 50% of that has been entangled more than more than once. And that the female population is 85 or less and that they're not reproducing at the same rates they used to because they're not as healthy. So, there's all these things. It's just, it's so, it's very hard and maybe I'm over my three minutes, but anyway, yeah, thank you. And that's my comment.

You could not see the timer that was going, but you left 3 seconds on the table. So, nice job staying under three minutes.

OK, Pete, Peter. You should be able to unmute yourself, Peter, and make your comment. Well, Peter, OK, I see you're unmuted, but I can't hear you.

Hi is this all right now?

Yes. I can hear you now.

It is part question. Having listened to this, I'm a member of the Marine mammals on Nantucket Island. And my question is this more of a I'm just wondering how much will be available. I mean I have an opinion a feeling that there shouldn't be anything available to the fishermen and we should really get into the tech of this ropeless technology. We don't have any more time with the whales, that's moved. But we also don't have any I don't think we're you guys have a lot of responsibility. We can't leave the fishermen hanging either and I think that's the bigger fear. So you definitely have to, you know, work that out. But bottom line is that we don't need any more of this entanglement. And I think that the ropeless will work. There are situations. The fishermen will report and what will happen is after they report, they're going to want to make some changes, and we have to make sure that our subsidy will change with them so they can improve the ropeless, so it's not a negative thing anymore. It becomes much larger, positive. So, and I think generally, the group our group out here, agrees with this. But there are other officers that may want to talk, and they would add to that. And thank you for what you do. Thank you for if you all lived for five years through the government. Thanks for still being here at the end. And have a good night.

Thank you for that comment, Peter. OK, up next we have Tessa. Tessa Brown. Tessa, you, I've unmuted you. You can just unmute yourself.

I just had a question sort of, for other people listening, or because I'm more of a stakeholder in this, about what sort of development you guys have, or data you have with the ropeless fishing so far at the point were at. Because so many people are asking questions and want that to come into play so much sooner. Where we're sort of not even at that point, and have other regulations that have already been put forth. But just sort of what hurdles and status the ropeless fishing data is at this point?

I'll, I'll try this one Tessa, so we don't have our ropeless gear specialists on with us today, as far as I know. But we have NOAA, First of all, we don't appropriate funds. So I can't develop subsidies by myself or through rulemaking. That's done by Congress. Congress has appropriated over a million dollars a year, the last two years for us to engage in ropeless research. And there's also been a lot of private funds and NGO's developing funds, some of whom are on the phone with us now or listening in now. And this is a partnership between NOAA, fishermen, I would say fishermen are more or less lead and many of these projects. I believe there are about 14 fishermen participating right now in New England. And I know there is another project going on in the south-east their offshore, their near shore there, inshore their fishing in various habitats. NOAA has developed gear cache or a gear library and can lend gear out to fishermen. There are a number of organizations that are developing this equipment, which is most commonly, it's remotely uh, the fisherman goes to where their gear is. And they remotely release the buoy. So it comes to the surface and then they can pull up the gear. The buoy doesn't persist. The buoy line doesn't persist in the water column. It is retrieved with an acoustic retrieval system. They are also working on an ability to mark. For vessels, at the surface mark, where the gear is, down below the space, to Jim Candles point, that a really big problem is gear conflict if mobile If other mariners, mobile gear users and others don't know, the gear is down there, it can cause a lot of problems including safety concerns when there's a gear conflict. Recently, the people doing research at NOAA and others are reaching out to the mobile gear fleet to get them involved in the research to improve the ability to detect the gear from the surface. So that work is being done. It's advanced a lot in the last couple of years and particularly over the last year, as fishermen have been more engaged in doing it, it is still a requirement that they get an exempted fishing permit. And we're working on making that easier by doing the environmental assessment work for them, if they follow certain conditions under their permit, they won't have to go through the whole NEPA compliance and ESA compliance. Those would be conditions that would prevent, um, prevent risk from the efforts that they're that they're taking. So, it is progressing very quickly, it is, it has attracted a lot of public and private funding, you know, Congress, the, the, the Congressional representatives, particularly in New England, particularly Massachusetts, have been very supportive of this. And they have funded some gear research. There's now some social science research being done. And the State of Massachusetts has just initiated a study where they'll be working with fishermen to consider attitudes and all of all kinds of social science and other information to determine how to make ropeless more operationally feasible and more acceptable across the industry. So, it's, it's developing, um, there are still problems. There are, there, there are still problems under certain fishing conditions. So it's, I would say it's not fully baked. Operationally yet, but, um, it is something that's progressing and it's progressing fairly quickly, with the input of fishermen. This is not something that can be done without fishermen participating.

No, I agree, and I think it's sort of important to have, like, you're saying, the Mobile Gear, people involved. Because I know it's, like, has a direct impact on lobsterman, and people that are going to have to consider taking this on, but it's really the whole entire fishery. And people that are involved that it's going to affect just as much, that might not have, right now, any clue of what's going on, or how it might impact them. But I think it would be important to get more stakeholders involved in what's actually going on and how the implementation would actually take place.

Thanks for the question.

Thank you, Tessa. OK, Colleen, I don't have any e-mails. There's nobody left in the questions or comment queue. So, I think, um, for folks who are still with us, I put up on the slide, the instructions for providing written comment. As Colleen mentioned, you know, we sort of specific details on how we can make this rule better, We'd love to get that in written comment as well. All of your comments that you've given tonight have been captured, and thank you for attending.

Yes, thank you very much, everybody, for attending. We have two more public hearings next week. There was one question about whether or not this webinar will be available. I don't think we'll be posting this entire audio webinar. We are recording this primarily to make sure we get all the public comments. But there is a longer presentation on our website at the address shown here at Fisheries dot NOAA dot gov backslash ALW TRP, where you can also find the documents and these directions for commenting as well. Thanks very much, everybody. Have a good night.

Sorry. I was just trying to put the link in the chat, and it started playing.

Goodnight all.

Public Hearing 3
Southern Maine, Tuesday, February 23, 2021, 6:30-8:30 pm

As Kara has already said, If you're interested in providing public comments tonight, please, type “comment” into the question box to get in the queue. Um. We will call your name in somewhat in order. If you change your mind and no longer want to comment, you can type “Pass”, or you can say Pass when we call your name in the queue. If, if you're joining by phone only, Kara will be letting you know how you can also provide comments. We'll call on each commenter, will try to let you know who's up next in the queue. And please remember, we are recording this public hearing. As always, We'd like you to be respectful and direct your comments at us, the presenters, and not at each other. When you're called on, you'll be unmuted, and then you'll need to unmute yourself. Comments will be limited to three minutes. You'll be muted after three minutes because of the large crowd. If you've already provided comment but want to give another comment, or if we had to cut you off, we will place you at the end of the queue, and if there's time, at the end of the night, you might get enough at another opportunity to provide your comments. If you do not want to come back at the end tonight, or if we can't get to, because of the number of people here tonight, please do submit your comments in writing. We do want all your comments. And at this point, I'm going to, shortly, I'm going to turn the mic over to Kara to help us run through the comment queue. I understand Commissioner Kelleher is with us tonight, and he would like to thank you all for attending and open public comment session with comments of his own Kara?

Yes, hi. Commissioner Kelliher I am going to unmute you. Give me one second. I've unmuted you. You should be able to unmute yourself.

Great. Thank you. Can you hear me?

Yes.

Great. Thank you. For the record. my name is Patrick Kelliher, I’m the Commissioner to the Maine department Marine resources. And I'm here tonight also speaking on behalf of Governor Mills directly related to our deep concerns in the direction we seem to be going with protection of North Atlantic Right whales. The lobster Fishery is the most single. The most valuable single species fishery in the country. In Maine it comprises one point five billion in economic activity and touches thousands and thousands of families. While we understand and even support some additional levels of protection being put in place for north Atlantic right whales, it seems the agency is moving in the direction of species protection with no care about collateral damage. I know we're here to focus on the proposal, but I do have to say that the BiOp itself has the potential to drastically change the Maine Lobster fishery and worse, has the potential to see it close. I just also want to just raise the fact for the record. It's a very troubling that the biological opinion hinges on the Canadian Government. For the National Marine Fisheries Service to move forward with implementation. Excuse me. The national marine fisheries service needs to move forward the implementation of the marine mammal protection fishing court rules and finally puts a meaningful pressure on Canada to implement measures that are comparable to the significant measures already put in place by the United States. The focus more specifically on the rule as it pertains to conservation equivalency to trawling up Keystone, part of the Department's proposal in conservation equivalencies, And it seems to have been somewhat ignored by the service. one area in particular was that a trawl with two end lines is equivalent to a trawl with half the traps and one endline. Again, this type of flexibility is paramount. And we need that type of flexibility in order for the safety. It's interesting that the agency is cited fishermen safety and gear conflict for a reason for not implementing this type of equivalency, ironically, it's the reason that it is needed. Specifically to the closed area, I'd like the first point out, the fact that your decision support tool indicates the only one closure, if, if to be implemented, will become the most important conservation area to right whales along the coast. But it doesn't say, however, is the support supporting that it supports the findings. When DMR mapped out the right whale, detections against the boundaries of the closure. Always 70%, 73% of the detections were outside the area. I can see I've got 10 seconds left Colleen, and I don't know if I'm going to get some leeway from the state perspective here on that timeframe, um, the agency continues to feel Excuse me, Maine DMR would also like to reiterate, as we did, during the hearing, some of the phased closures, gear will just move outside of the boundary and you need it really need to take a look at that about the kind of the collateral damage It could be. It could be more harmful to the right whales, not to mention gear conflicts. Um, the state is really willing to work with the agency on a trigger mechanism as it pertains to the closed areas. We have some ideas and thoughts on that, and we will make sure that we address those directly if you are looking for comments. The preferred alternatives, for the sake of expediency will state that there are areas that you have accepted to the Maine plan when we submitted over a year ago. We do appreciate that. We'd like to speak directly to the issue, of weak point. So, you know, we support the configurations. We will be submitting and believe that the agency must strongly consider weak points. They're very practical, given the diverse conditions along the coast. Weak points are a common thread throughout the zone specific conservation equivalencies that we will be submitting as part of our written proposals. And again, I want to stress that a one size fits all does not, does not work along on the coast of Maine. Quickly, I want to thank you for the issue, the recognition of the gear marking work we've done. It's troubling though that the economic impact from the DEIS did not include any the cost associated with that we've done directly and in anticipation of the rule. So we would ask for that to be corrected. Also, I would, I implore you to take the time to listen to the industry about implementation days. That is a critical factor here and we need to make sure that anything that is done is done with the idea of the operation of the industry in mind. And changing mid-stream will be very difficult. Specifically, I'd want to comment about Ropeless. Based on the proposed rule, and especially the BiOp the agency is attempting to move the US lobster fishery in the direction of ropeless. Maine DMR intends to continue working with, NOAA on the development of this technology, but we all need to work within the operational realities, and acknowledge that this technology is years away from use at any meaningful scale. Need to deal with these real challenges before the technology can be reliable tool to protect whales. Gear laid down on the bottom, without end lines, must still be, quote, seen by mobile gear fleet. And others within the fixed gear fleet and ropeless gear must also be able to be retrieved, inspected, and reset by law enforcement agencies who enforce the lobster regulations. Let's not drive this issue of ropeless just to try to deal with the right whale issue when we also have to clearly manage sustainably the lobster resource. In closing I just want to reiterate a one size fits all managing approach will not work in Maine. it's difficult for Maine fishermen to see themselves as part of the problem when we have not seen any entangled right whales for more than a decade. It's time for the agency to finally recognize Maine's risk to right Whales is very low compared to other areas. The agency knows this yet, based on your proposed rule, compared to the BiOp, the economic harm, is far and away, greater domain, than in any other jurisdiction. Well, thank you very much, Colleen and staff, for the time this evening, we will be submitting, written, detailed comments, prior to the deadline. Thank you to the indulgence on the extra time.

Thank you Commissioner Kelliher. At this time, we're going to move on to comments from the public. If we have time at the end, we will get to questions but that's only if time allows depending on how many people are in the queue. So I see that people do have questions and we are getting them in the questions box. Just know that we may not get to them. OK, up next is Bill Mcqueeney. I've unmuted you, Bill, so you'll just need to unmute yourself.

Can you hear me, Kara?

Yes. I can.

Thank you. My name is Bill Mcqueeney and I live in Brooksville, Maine. I have been a volunteer, right whale scientists for more than 20 years. For the past 16 years, I have directed a school club called the Calvineers that studies the North Atlantic, right Whale. Each calvineer has submitted a comment letter to you. Tonight, I speak for another group I am part of. And it's called Mainers Guarding Right Whales. Mainers Guarding Right Whales Is Formed. Was formed by a group of concerned Maine citizens wishing to ensure the recovery of the critically endangered right whale. Mainers Guarding right whales supports both short term and long term initiatives to reduce the impact of the Maine lobster industry on the recovery of the North Atlantic right Whale. In the short term, we support the implementation of weak insertions throughout the entire vertical lines. We also support time area closures that reduce the risk of entanglements, substantially. Therefore, we support Alternative three of the proposed rule with a 50% reduction of vertical lines in Federal waters. And the three closures, Georges basin, LMA one, and Massachusetts south to the islands where a year round closure, makes sense. Finally, we support weak rope insertions, be included, every 40 feet in all end lines, in all areas Maine fishermen used, which is the way they were designed, tested and currently are being used. 1 or two weak insertions in an end line will not reduce the risk of serious entanglement. In the long term, Mainers Guarding right whales supports the reduction of gear in the water both through sustainable effort reduction and ultimately the complete conversion of the industry to Ropeless fishing. We also support the Maine Lobster fishery regaining its Maine Stewardship Council certification by adopting the innovations just noted. The Maine fishing industry have proved themselves to be incredibly resourceful and had tremendous success as stewards of the lobster resource. Over the last 10 years, 682 whale entanglements were documented on the East Coast in US waters that includes at least 25 serious or lethal and entanglements of right whales. A recent study has concluded that, for every documented right whale death, there are almost three more deaths not documented. Most likely, they are actually 2 or 3 times more right whales killed each year in the United States waters than we know. We believe this is both a moral and humane issue that the fishing industry needs to take responsibility for and work to change. Some fishermen are already working to change and help solve the problem. Mainers Guarding right whales, looks forward to the day where, fishermen could fish without harming right whales And the right whales can thrive in their natural environment. We believe both scenarios are necessary and possible.

Thank you. Next, Cindy. OK, Cindy, it looks like you're unmuted.

Hi. My name is Cindy Dawn. I am the wife and mother of three fishermen and a daughter that has a retail lobster business. We will be terribly impacted along with all the other men, women, and children in the industry. And future fishermen, my grandsons are planning on growing up as lobstermen as well. Is there any concern for human casualty you are creating? Is this small number of whales' more important than humans? The Maine lobstermen have always been conservation-minded dating back to the late 18 hundreds. We have repeatedly been told to and complied with, painting ropes, which requires months to do and then they asked us to do it again and again, changing colors and how many spots they want painted. It has been very difficult, watching my sons and husbands bring all their gear in to comply with these requests over and over. They also changed ropes, biodegradable bends, put in weak links over and over You have asked them to modify their gear and they did it. Are you taking into consideration the loss of income when you pull all of our gear out of the water for repeatedly for God knows how long it takes. These men do not catch whales. Why are you after them? So intensely with all that has gone on in the past couple of years. I have watched many, many fishermen's whose families depend on them to become depressed and unable to handle all that you throw at them. It brings me to tears just talking about it. What is wrong with a society that cares more about a pod of whales that are doomed to extinction due to inbreeding then a whole band of fishermen that are struggling and have no way to feed their families. These men and women, all and all of the big companies, wholesale companies, boat builders, trap builders, and many, many other companies depend, dependent on the industry are hurting both financially and emotionally. I think it is time for you to consider the loss of humans rather than whales. I am sorry, but the children in the State of Maine deserve your consideration of them. Their fathers are ready to jump off a bridge and who will care for their families. I am sick and tired of the very men and women who go out in the cold and risk their lives every day to never be considered in this formula. These men and women are hard-working Americans that deserve the right to lobster in peace. This industry has coexisted with Nature Forever. Leave them alone. They are participating in the most sustainable fishery in the world. They have historically fished these waters. The American Indians have had their fishing industry protected as should these men and women. It is time to stop this nonsense and think about human casualties and in closing, I just want to bring up that the ropeless fishing is never going to work. How are they going to know where everybody's gear or they don't tell each other where they're fishing. That's a very private thing in their industry And weak links you're going to end up with more rope in the water tangling up whales than you ever thought of. Thank you for your time and consideration.

Thank you for your comment. Up next is Sarah Stewart.

Hi.

Hi. Um. I feel very much for people who are having to change their lives because they are fishermen or related to fishing in this industry. And I can really appreciate how hard that is. Both personally and well in a bunch of ways. But I also do want to speak up for I have a place in Maine. I'm also in Massachusetts. And I love whales as do a whole group of people who I go watching doing Whale watching with. And really, I'm holding the perspective of that. Whales are incredibly precious to our planet, and that human beings do have the extraordinary capacity as a group to grow and change. And I'm a therapist by profession, so I know how difficult it is for individuals to have to grow and change. But in fact, we can shift into doing different things if we have to. And the extinction of these incredible mammals who can't actually speak up for themselves would be forever and an enormous human loss like the many other extinctions that we cause. Unless we change our ways. So I want to support all being done for the right whales as much as possible. And, um, and I actually would support whatever is most going to protect them and trust that human beings will find a way to sort this out over time. Because we are intrepid and are able to do that. And that's all I have to say. Thank you.

Thank you. Up next we have Maya. Made this joke the other night, but it's not imagine that I'm running around a crowded auditorium with a microphone. That's, that's me finding you guys in the attendees list, So it might take me a second, so just bear with me. Maya, you should be able to unmute yourself.

Can you hear me?

Yes.

OK, great. My name is Maya and I'm an Oceans Intern with Environment America. We are a nationwide network of state based non-profits dedicated to protecting our air, water, and open spaces. We have a chapter in Maine called Environment Maine. I'm testing, I'm testifying at today's hearing, because I like many environment America members love our oceans and wants to do everything we can to keep our ocean wildlife safe, and healthy. When I was a child, one of my most memorable experiences was going on a SCUBA diving trip in the ocean. Only a small distance from off shore. The amount of life was astounding, filled with sea stars, and colorful small fish, The bountiful life held underneath the surface is one of my favorite aspects about the ocean. And this memory always comes to mind and people ask why I care so much about protecting the life, the ocean holds. North Atlantic right Whales, which swim right off the Maine Coast are one of these animals that call our oceans home. Tragically, this species only numbers at less than 360 whales. If we don't create strong policies to protect them, this species could vanish from our ocean forever. We want to create a healthy future for our oceans, where future generations can continue to wonder at all the treasures our oceans hold. as I did when I was little. We have to start by standing up for our most vulnerable species, like the North Atlantic right Whales, as written in the proposed rule fail fails to give right whales the protections they need, as it doesn't do enough to prevent one of their top causes of death. I urge you to formulate a much stronger rule, keeping in mind the following considerations. one, the draft rule is based on outdated population data. To best protect the species, you must use the best available science, and this means using updated population counts. Two, additionally, the proposed seasonal habitat closures in the rule will not do enough to prevent right, right whale entanglement in fishing gear. The proposed closures to vertical buoy lines are too small and too short and durations. Three, weak rope, another major tool used in the rule is not a proven effective solution to preventing fatal or seriously damaging entanglement events. Organizations, including Pew and the Conservation Law Foundation, have recently petitioned NOAA to take emergency action. And we at Environment America echo those words. The agency should close certain areas to the use of vertical buoy lines immediately until a better set of rules is proposed using the best available science. We think this set of rules should include larger and longer plan closures for right whale habitats that prohibit commercial fishing. We also would like to see this rule take concrete steps towards creating a pathway for the eventual widespread adoption of ropeless fishing gear. I urge you to do everything you can to save our right whales. We can't let the species disappear on our watch. Thank you.

Thank you. What's next is. Brennan strong, Brennan, you should be able to unmute yourself.

Yeah. Can you hear me?

Yes.

Hey, thank you, everyone, For your time and consideration tonight. My name is Brennan Strong, Lobstermen Entrepreneur and Nature lover from Yarmouth, Maine. Can we please have a serious discussion about pausing the new vertical line, process, immediately, in light of Maine, Department of Marine Resources, comments? On the biological opinion, the Department of Marine Resources Comments prove beyond a doubt that the biological opinion is both inaccurate and incomplete. In the meantime, NOAA and NMFS need to do a study specifically on the decline in ocean going vessels in 20 20, due to covid 19 and the positive effect that had on the population of the North Atlantic right whale. The CDC issued a no sail order for cruise ships in 20 20. Almost all Maine lobsterman, however, deployed a normal number of traps. Two right whales died in 20 20, neither from entanglement. How can I willingly sacrifice my operation to accept deadly regulation changes, when there's no proof that the regulation changes will help right whales? NOAA own suggestions in their Vessel Speed report plus other evidence backed vessel regulation, suggestions should be fast, tracked immediately to protect whales from vessel strikes. The North Atlantic right Whale deserves 100% compliance on vessels, speed, and route regulations. NOAA has the power to demand 100% compliance. Current compliance is far below that. We cannot have a legitimate discussion about new risk reduction regulations for fishermen, when it has been proven by the Department of Marine Resources in their comments that the risk assessment calculations are flawed. How can you propose a closed area without giving State and area specific gear marking a few years to create legitimate data? Any closed areas at all will cause extreme financial stress as well as gear conflicts for fishermen. What is the latest data on whale's being able to see? Potentially red or orange end lines. Has that been studied? I watch healthy whales, porpoises and seals navigate dense vertical lines every day with ease. They are very intelligent creatures. What is the optimum line scope to avoid entanglements? What is the most whale safe way to use a tide buoy? It sounds like you are unsure if buoy breakaways even work. How can this be when we have been using them for years with positive results? Why are some of these more common sense solutions being skipped over in pursuit of ropeless gear that will never work? Ropeless gear would be a disaster for everyone. The cost alone would put me and most others out of business, as well as it being unenforceable for marine patrol. Why are there no offers from our government to pay for whale safe endlines and buoys? We truly want the whales and all sea life to prosper. And I mean that, but we also need our coastal communities to prosper too. Thank you.

Thank you. Brennan.

Next up we have, Erica, Fuller. Erica?

Thanks, Kara. Can you hear me?

Yes.

Thank you, I'm Erica Fuller and I represent the Conservation Law Foundation. I also serve as an alternate on the take reduction team. Starting in 20 17, scientists unanimously agreed that right whales are dying at unsustainable rates and that immediate action to address entanglements and ship strikes is necessary in both the US and Canada. For several reasons, CLF cannot support this proposal, or the deeply flawed framework that presumes to take another 10 years to comply with the Marine Mammal Protection Act. It is destined for failure and it needs to be redone. First, the risk reduction target of 60% needs to be revised. It is based on outdated population estimates, outdated mortality estimates, and then outdated PBR zero point nine. Using NMFS's own data and methodology in the DEIS, new population estimates, the current PBR and estimated annual deaths in this gear including undocumented deaths. Risk must be reduced by more than 80%, given that no alternatives in the DEIS achieve such reductions, additional and more protective alternatives need to be identified. Second, the rule relies far too heavily on weak rope and weak insertions. Weak rope does not prevent entanglements. It does not reduce sublethal impacts. It does not protect the most vulnerable animals, and it is not a viable option in the offshore fishery. It is unfair to ask fishermen to invest in gear modifications now that they will later be told, we're never enough to save the species. Third it's not clear that the seasonal closures proposal would result in the risk reduction predicted. Some segments of the industry will be unable to remove their gear and will ultimately redirect this effort somewhere else. The proposed rule does not appear to analyze this redirected effort or the associated risks. Fourth, the efficacy of any new rule requires a well-established monitoring and enforcement plan which this proposal currently lacks. As part of this rule, NMFS should require 100% harvester reporting. And vessel tracking systems on all federally permitted boats. NMFS should also significantly increase its aerial survey effort in order to better understand, right whale, location and behavior. We appreciate that this rule incentivizes ropeless fishing, but acknowledge the need for additional input from industry before this technology is commercially operational. We urge NMFS to prioritize this transition and seek additional funding from Congress immediately. In the meantime, for those areas that pose the highest risk outside of the closures, NMFS should require a single vertical buoy line on all trawls, CLF, urges the agency to revise this proposal. Implement the emergency measures requested in our MMPA petition submitted with partners on December second, 2020. Expedite the rulemaking requested in our vessels strike petition submitted on August 6, 2020, and aggressively engage in open and transparent process with Canada to ensure that appropriate risk reduction measures are implemented bilaterally. Thank you.

Thank you. Eben? You should be able to unmute yourself.

Yeah. Hello, This is Eben I'm a Monk fishermen, Ground fishermen and Lobstermen out of Kennebunkport and Portland, Maine. Um, I guess I am opposed to running ropeless buoys and whatnot. I feel like the whales have been safe from us for many of years, and I've been able to fish around them with Gillnets, as well as lobster traps and not had any issues ever. Never have I ever had a whale entanglement And that I feel like that $15,000 a buoy is kind of ridiculous and absolutely unacceptable to expect small boat fishermen to be able to afford. At 1 buoy for $15,000 like a lot of guys, they're string of gear cost, them than 60,000 So four buoys, a lot of guys run, triples, doubles, singles fish up inside. I don't really see where that would work out all too well unless the government was to pay for it and I don't see how the government could ever cough up that kind of money, and a lot of the buoys are really, really heavy. I am actually working with a group of people to try to, I was working on an EFP to get into closed areas, to fish monkfish gear. And it was, that is $15,000 a buoy. I don't see how the Maine lobstermen can afford that. And it'll drive all the small boats out. I am now 1 of 12 ground fishermen left because of what national marine fisheries has done with the PTMS program. That was an absolute failure. It drove all the small boats out of the fishery and is now 12 small boat gillnetters left in the north-east. That is a very small number, it is very sad it came to that. All it is a big boat fishery now. Uh I. Don't want to see that happen to lobstering, and price guys right out of it, end up like deadliest catch where those 15 boats own all the quota and all big boats. It should be for a young people that want to work hard and make a buck. They should have the opportunity to be able to do it and having really expensive gear will price, all of the young people out of it. It is absolutely unacceptable. That's all I have to say. Thank you very much.

Thank you. Madison Lynch, coming to you next, You should be able to unmute yourself.

Hi, can you hear me?

Yes.

OK, great, yeah. So my name is Maddie, and I'm a college student from Dartmouth. And over the past few years, I've spent a lot of time studying right whales and all the different threats facing the population. So if things continue the way they're going, right whales will become extinct. NOAA's own scientists recognize that right whales are dying at a rate that's very concerning and attempts to blame, to ship this blame to Canada. It does nothing to help the whales. Really, the fact is that their entire migration path is cluttered with millions of vertical lines and that does include the Gulf of Maine. So I understand that Maine lobstermen and have been working to modify their gear over the past few years in an effort to save the whales. But we need to keep moving forward. There are solutions that can benefit both right whales and the fishing industry. And most importantly, ropeless fishing gear is that option. So NOAA scientists have been studying ropeless gear for over 20 years. And we need to act now to move ropeless gear forward. The proposed rule change, needs to fast track permits for ropeless gear and also provide a funding mechanism so that this technology can be widely accessible to fishermen. Thank you.

Thank you, Gib Brogan coming to you next. Just Sang the ABC song in my head to get to the Gs. You're unmuted, you can make your comment.

I'm unmuted there. There I am. Good Evening. My name's Gib Brogan. I'm a campaign manager at Oceana. Oceana is the largest international conservation organization solely focused on protecting the world's oceans. With one point two million members around the world and over 340,000 members in the US Atlantic seaboard, We appreciate the opportunity to comment on the risk reduction rule that's proposed by the agency. The rule as currently proposed is inadequate for the job. First off, it aims at a target. That is outdated. The 60 to 80% reduction is based on outdated information, and needs to be updated with current estimates and current information and then revised based on that target. The tools that are proposed are also inadequate. Time area management is a good first step, but needs to be expanded to include both seasonal closures in known aggregation areas and the authority of the fishery service to react with dynamic management to respond to unexpected aggregations of right whales. The primary weakness of this proposal is the reliance on weak rope. Weak rope, as discussed in the EIS, relies on two scientific papers, both of them are theoretical. And both of them are focused on adult right whales. The weak rope. If in fact it does work as proposed, will only protect adults, provides very little protection for juveniles and calves, and doesn't reduce takes under the ESA, will only reduce, in theory, reduce the lethality of the takes. Finally, the range of alternatives that are included in the EIS is incomplete and inappropriately rejects a number of proposals and ideas that were put forth during stakeholder scoping process. The agency should revise the EIS and properly analyze and consider those alternatives. Going forward, what should the agency do here? The agency needs to significantly improve the document and strengthen the conservation measures that are included in this to provide a clear path to protection of right whales from this known risk. If the agency doesn't approve or improve the proposed rule at this time to offer this protection, we suggest that the agency revoke this rule and go back to the drawing board and put interim rules in place that will offer immediate protection. Not in that 10 year timeframe. But this summer, right whales don't have time to wait. Oceana, Thanks you, for the opportunity to comment, will be submitting written comments before the deadline. Thanks very much.

Thank you. Matt, Gilly, you are up. Next. You are unmuted. You should be able to unmute yourself.

Hello. My name's Matt Gilly, Lobster Boat Captain up in Harpswell Maine, and I just wanted to start off and reiterate what Brennan said Earlier, he hit a lot of major points that I was going to hit, so I'm going to try not to repeat anything. Um, I think one thing that I've heard so far is both parties, whether we're fisherman or on the environmental, the environmental side. We all agree on one thing, and that is that the data is flawed, in what direction that remains to be seen. But, when you have two groups, that, both are telling you the data is flawed. It might be time to look and say maybe the data is wrong, or even your own data says that if we remove all end lines out of the water, the population of whales is still going to plummet. So I guess, why are we taking these efforts? It's not going to help, even if we removed everything. I was at a NOAA meeting early or late last week, where it was said that NOAA has difficulty enforcing vessel speed. Because of the transit between state and federal waters and everything like that. I find it ironic that they have a difficult time enforcing vessel speed because of where the vessel may be, but they can seem to enforce regulations on us. Ah. Who's going to tell my family when I don't come home that the reason I didn't come home is to save a whale that nobody's ever seen? There's been no risk assessment done on the risk that the fishermen are taking it. It's all about a whale that none of us have ever seen by. No means do. We want to injure this whale when we would love to see it flourish. But this is a whale that nobody, I know has ever seen. And I'm going to end with, I guess, a rhetorical question. Is there anything that any of us fishermen could say that would change anyone's mind or is this just merely a process that is being done because that’s the legal way it has to be done? I’ve gone through this before. It's rare that anything happens. I feel like I'm wasting my breath. Thank you.

Thank you, Matt. Next step is CT Harry.

Can you hear me Kara?

Yes, I can.

Great, thank you. Um, my name is CT Harry. I represent the International Fund for Animal Welfare. I'm a Marine campaigner. I'd like to start off by thanking Colleen and the NOAA team for, for holding these meetings and allowing me the opportunity to provide comments tonight on an extremely complex problem. But, one that I feel has an answer, I'm an alternative member to take Reduction Team. with IFAW and reviewing this proposed rule. I think there's three areas that I'd like to briefly address. We've heard it tonight, The risk reduction goal. back in April of 2019, it was believed that approximately 60% would be the best that we could hope for. That would be enough for risk reduction. Well there has been 13 deaths since that time period and the situation is even worse than we realize. With the hindsight of almost two years of additional data and continued decline of the population, of the population, that risk reduction needs to be increased to 80% to ensure that the deaths and serious injuries do not push the species, past, an Irrecoverable tipping point. Second regarding, uh, 1700lb breaking strength, breaking strength line. Weak rope. Weak ropes, are an interim solution. And they're an interim step at best. Weak ropes do not do not remove the vertical lines from the water column and therefore do not reduce the risk of entanglement. We know that weak ropes will not protect calves or juveniles from lethal entanglements. It does not protect adults with chronic entanglements, from the long term health impacts. The burden of proof shouldn't be a dead carcass. It should also be the sub lethal effects of entanglement. And if weak ropes are used, the entanglement threat is still there. And finally, regarding ropeless, we urge the agency to increase incentives. And assistance to fisherman to transition to this technology, moving forward. We recognize that this process has occurred with the inclusion of ropeless in some areas and particularly some of the closed areas. But more needs to be done particularly over for a streamlined permitting process that allows fishermen to use 21st century technology to harness their innovation. And for them to be part of this solution of removing the of the removing, the vertical line threat and saving the species. This is the solution. This is a solution that can keep fishermen on the water and keep right whales alive. My colleagues at IFAW and our partners, including leaders in the fishing community, are resolved that the right whale cannot go extinct on our watch. State and federal officials and regulators should reflect that same resolve. I think more reflection and attention is needed to improve this proposed rule. We Welcome. We would be submitting further comment in written form later on, and thank you again for chance to speak.

Thank you CT. Star Scott. I've unmuted you. You'll also need to unmute yourself.

Thank you. Can you hear me?

Yes.

Great. Thanks so much for this opportunity to speak with you today, and thanks for having this hearing. I just wanted to say that fewer. So I work at a I'm a scientist and wildlife biologist, and I work at an R one research institution. I'm in Georgia. Fewer than 375 right whales currently exist on the entire planet. And since 2017, at least 46 right whales have died because of boat strikes and entanglement in fishing rope. So most right whales migrate over a thousand miles each year, traveling from their feeding grounds off of Canada and New England to the warm shallow coastal waters of South Carolina, Georgia, and Florida's coast. So right whales first give birth at an average, age of about 9 or 10, and they have a gestation period of almost a whole year. And what this means is it impacts to right whale populations take a long time to recover from. We have to be very mindful when we're, when we're determining what to do here. So I know, according to NOAA the proposed changes are going to reduce, right whales encounters with fishing rope in gear by 60%. I wanted to request that NOAA recalculate the risk reduction with up to date data, and publish a rule that achieves a minimum of 80% risk reduction. So I want to support what's going to most protect right whales, knowing that humans are resilient and will adapt. So right whales have a right to live. I have a deep compassion for the fishermen and lobstermen and the families impacted by these efforts. I do feel that we need to find solutions, which will work for both whales and people. The fishermen and the lobstermen don't own the right whales. They don't own the oceans and they don't get to make decisions for an entire future, for the future of an entire species. So scientists should be making these decisions. And I would humbly request that you don't show favor to industry or state agencies, such as not even having to adhere to communication standards and time limits of this very hearing. Preference should be given to right whales. They don't have social safety nets, people do. They don't have voices, but we do, and the loss of a species, the loss of biodiversity not only impacts those of us who love whales. It impacts the entire planet by creating an ecosystem imbalance, and would also contribute to climate change which impacts communities all over the planet, especially marginalized and minority communities. So according to an analysis by the International Monetary Fund, whales provide the critical ecosystem service sequestering carbon in the ocean, and this service is estimated to be worth millions of dollars per whale. I know a lot goes into this. I just want to thank all of you for your time, and consideration, and Thank you very much.

Thank you. Dustin Delano. You should be able to unmute yourself.

All right, thanks. Good evening, my name is Dustin. Lobster fisherman from Friendship ME. First of all, I'm commenting to urge you to accept the conservation equivalencies provided to you by the Maine Department of Marine Resources. It would give each zone the flexibility to comply with the percentage of risk reduction in their own abilities. Second, I'm urging knots being available source for weak rope links rather than sleeves and whatnot. Third, national marine fisheries has drastically underestimated the amount of fishermen actively fishing in the LMA one closure. I do not support closures in the Gulf of Maine. There a slippery slope. And as we can see from Massachusetts, they get larger, and they stay closed for longer. Fourth, fishermen need an appropriate timeline for gear reconfiguration. I urge you to implement the new regulation between seasons or the downtime in fishing. fifth, I want to emphasize that environmentalists' know nothing about fishing. They know nothing about our lives, about our communities and what we strive to take care of every day. They do not have the right to tell us how to fish and they do not have the right to think that they are better people than us. Fourth, the future for all Lobsterman is at stake. Maine Lobstermen have created themselves one of the most sustainable fisheries in the world. We have coexisted with marine mammals for decades and the health of the ocean ecosystem is one of the most important things to us all. Maine lobstermen are real people.

As some commenters have inaccurately stated we can't just do something different. Our entire life savings are tied up in this industry along with the blood, sweat, and tears associated. There is no way all Maine lobstermen can accomplish having a ropeless fishery which would appear to be the 10 year goal. 90% of us will have to find something else to do. If that's the case, who will buy our mortgaged boats, our homes our wharves our trucks? who will help us feed our families and help send kids to college, will there be a buyout for fishermen if the livelihoods are destroyed by their own government? Before government interference based off bias, inaccurate information and false right whale counts, fishermen wouldn't need help but if our government is going to destroy us. We're at least owed a way out if we can't survive. Thank you.

Thank you. Renee, Renee. You should be able to unmute yourself.

Thank you. Just because these mammals do not look like us, just because they do not need opposable thumbs just because they have evolved to live seamlessly and harmoniously in their environments such that they don't need buildings for shelter or infrastructure for transportation. Does not mean that they are not otherwise just like us. They have complex and immense feelings, love, fear, compassion, sadness, the sense of loss of a loved one. With this in mind, I want to appeal to your sense of right and wrong. Your morals and ethics. if these proposed measures would not be enough for humans, they are not enough for whales. If doing too little would feel wrong to you. In the case of saving humans, it should feel wrong to you in this case of right whales. So, please do what is right.

Thank you. Next, we have William Clayton. Hello, William you are unmuted can you hear me? I can see you are unmuted.

OK, can you hear me now?

Yes, I can.

So I just swapped to a Chromebook I'm getting used to it. My name is, Will Clayton I'm a sternmen for my father-in-law on a family owned island called Green Island here in Maine. I'd like to start saying with the Onset of covid and the reduction in shipping traffic. And near complete stoppage of cruise lines, it has proved undoubtedly what the precipitating factor in right whale deaths are. And that's ship strikes. Can you please explain to all Maine fishermen and families how you continually push the theory of entanglement deaths while not having the gusto to rail against shipping and the cruise lines? I referenced RW, SAS, which is NOAA's own, personally, developed right Whale sighting advisory system. And I always look at that constantly to see where the migratory patterns develop. In fact, I keep it on my cell phone at all times to show people. And year after year, you can clearly see once again through NOAAs own application, that the right whales do not come close to the coast of Maine. How on Earth you continue to push lobster line entanglement when the real cause is as blatant as the propeller marks on a whales back. We are sick, think of, continually bending over backwards to incorporate time consuming and costly, quote unquote upgrades to the gear. Now we can fully understand why the real cause is not being addressed. It's big money. It's politics. We get it. You referenced it today when you said just how many thousands of comments came in from conservation groups and a few from fishermen. We get that it's an uphill battle for your agencies to fight them, But someone needs to step up and they need to do so now, If you continue down the same path and bleed us all dry, and lobster fishing is gone, you will still have ship strikes being the cause of right whale deaths. Will everybody fight them at that point? And I got to say, in closing, I find it ironic that every single previous commenter tonight, that was part of a conservation, didn't mention cruise lines, shipping, nor did they mention Whale watch agencies. I find it extremely ironic that there's a love affair with an entity which is whale watching that actually takes money from patrons and goes out multiple times a day on multiple vessel's owned by multiple companies to find and harass whales. When Lobsterman do everything they can to stay away from them, including the right whales, which we don't ever see anyway. So, where are the hearts of the conservation agencies, when are they going to rail against shipping, cruise lines, and whale watch agencies, thank you, everybody for your time tonight.

Thank you Jarod Bray, you're up next I've unmuted you, you can go ahead and unmute yourself.

Can you hear me?

Yes.

OK, I'll try to make this short and sweet. So really what it needs to come down to is, we really need to start tracking the whale's. I know people have brought it up plenty of times, but it's really frustrating that I think we can all get on that page. You know, lobstermen, scientists, environmentalists, I think we just need real data. Not educated guesses, it's I mean, we just put a rover on Mars. Why can't we tag a whale? I just, I don't know why we haven't gotten to that point yet. Getting off that, I was curious to why we ended up with a October to January Closure. That impacts a rough guess would be 75 to 80% of, you know, our lobster season out in that area. Realistically, a spring closure would be a lot easier on us. And I would assume that whales migrating, coming and going, that would pose the same risk? I'm not really sure. But that would that would really help out the fishermen, if there was a closure, if we could move it into the spring fishery, I believe. Also, I'd like to say that if ropeless was implemented, I don't believe there would be any change in whale deaths at all. Because realistically, we're not a big enough threat that's been said a lot of times. And I know, I know scientists and environmentalists really don't want to believe that. And I don't know how to make them see that. That's the truth, but it's, you know, it's hard for them. In other states, You know, reading the report isn't really the same thing as being on the boat, and seeing it with your own eyes. They're just aren't right whales around in our area, I'm I fished in that closed area. for 5 to 10 years. I've literally never seen a right whale. So, you know, lack of understanding, shouldn't lead to policy making is, you know, it's just very frustrating on our end. But the other part is, the whale population has increased in the last 20 years, if I'm not mistaken. And our fishery has stayed the same. So it just, it doesn't seem to make sense to all the blame should fall on to us, or really any of the blame actually. But thank you for allowing me to make a comment, Have a good night.

Thank you Jarod. Douglas Mcclennan? Oh, yes you were just unmuted. There you go.

Can you hear me?

Yes I can.

My name is Douglas, I'm commercial fisherman from Spruce Head Maine. I'd just like to go on the record as agreeing about everything that Pat said. And a lot of everything else the fisherman said against this modification for us. And I would even go on to say, I agree with most of the environmental groups that have spoken tonight that the data is outdated. It's just not good data that we're getting regulated by, not going to spend a lot of time here I didn't prepare a speech, like a lot of these people did. I just was listening to all the opposition to the fisherman, and I figured I ought to just get my word and say something. So, basically, what Pat said and what Dustin said. What Will said, What Jarod said is how I feel, you'll find that if you could question, lobstermen on the coast of Maine We all pretty much have the same outlook on this. We never see these whales. You could get rid of us. The whales are still going to be killed by ship strikes. Their own model that they use is flawed. It even shows if you took every endline out of the water, the whales are still going to decline. So I don't think we're at a problem. I guess that's all I got to say. Thank you for letting me speak.

Thank you. Zach Klyver, you are. Next. You just unmuted, you just muted yourself again. I can see you're unmuted, Zach, but I can't hear you if you're speaking.

You hear me now?

Yes, I can.

OK, thank you. I'm Zach with Blue Planet Strategies. I grew up in a Maine fishing family in East Port and fell in love with the ocean and became a whale watch Naturalist, and did that for 30 years from Bar Harbor. I've been on over 3000 trips, in the Gulf of Maine, I saw on those trips dozens of times. Right whales on one trip in August. We saw seven right whales on a trip. I've also helped in leading winter surveys for Right Whales in 2010, 11. We did a number of them out off the Coast of Maine. And Jordan Basin. And we saw a 35 right whales on one trip. I've also over my career encountered dozens of whales, entangled, humpback, finback, and minke. And I've spent many necropsies and seen whales those whale species entangled in Maine lobster gear. And those were the most of those entanglements I just mentioned were: Maine gear. Um, I want to say that on page 10 of the DEIS The numbers of known entanglements during the time period between 2010 and 2018 in the waters between Canada and the US are given. And over that nine year period. The document points out There's 267 minke whale entanglements 264 Humpbacks 89 right whales and 62 finbacks For a total of 682 entanglements. That's an average of 75 whales per year, and it points to the crisis situation that we're in and that we've been in for a long time. So I do not support any of the trawling up provisions in this DEIS Because they add more traps in weight to each endline. And I believe they make them more lethal. I hope the agency will conduct additional analysis of the risks to pose to whales from adding more weight to the trawls. I do support Alternative three, um, to reduce endlines by 50% per month. For 15 years, there's been a serious discussion among fishermen and I have a lot of really great lobster fisherman friends that I value. Some of my best friends are lobster fisherman and I've heard the discussions about Trap reductions and about entry into the fishery. There are numerous studies that show that reducing effort will not equal necessarily or poor proportional reduction in catch. The research that Carl Wilson conducted showed around Monhegan in the closed area that when you went from 800 traps to 600, 600 caught almost as much as the 800. And there's been research done in Nova Scotia, the Myerson/Moore paper that showed that with 300 traps the fishermen had very high catch rates. That trap reduction will also dramatically reduce costs, and fuel, bait, wear and tear on the boats and gear. Additional conservation risk is still needed, so I support Alternative three provisions for closures and weak rope with these caveats. I support the three Area closures and the one.

So, sorry to interrupt you. Your three minutes is up but we can put you at the end of the list and if there's time, we can circle back to you.

OK, Thank you.

Thank you so much for your comment. Gina, I'm coming to you. Next. You should be able to unmute yourself.

I think I just did that. Can you hear me?

Yes. We can.

Hi. Hi. Good evening. Thank you for giving me a moment to support some of the comments that we've already heard. My name is Gina, Gary. I've already submitted written comments to the website. However, I did want to weigh in this evening specifically, um, and note, many of the comments made by the fishermen here in Maine, I reside in Portland, Maine. I'm the State Director for Animal Wellness Action, and I'd like to support the comments made by my friend and colleague, Zach Klyver, who just spoke before me. Also, the, the emphasis placed on updating data by Erica Fuller at Conservation Law, Gib from Oceana, as mister Scott from IFAW And to all of the fishermen, I will I just want you to know, I was pulling up traps at the age of 11 with my brother in Massachusetts Bay. So, I do understand the need to maintain their fisheries and healthy fisheries. So I want to reference my comments of the August ninth, 2019 scoping hearing that you held in South Portland, Maine, in which I commented on. As one of our scientists did this evening from Georgia, the importance of the whales presence, all of the whales, all species of whales to the Gulf of Maine, to the health of their fisheries in the long term health of their families in the fishing industry here in the great state of Maine. And I know that all of the fishermen want to make sure that these animals are looked after, but Zach is, right. The truth is 83% of the right whale population show, entanglement scars and that's been documented. So that's not a false approach. We do at animal wellness action support a revision to your rulemaking effort to increase what we find the level of reduction of risk, to from 60 to 80%. We do support further research. And we do support in terms of the use of weak rope. But we do support. We do not support the trawling up of additional traps as a danger to the fishermen. And we do support, um, bilateral work from the Congress and appropriate funding vehicles for these fishermen. And their families to make whatever changes they need to make to come into compliance with protecting. Um, all of the whales in the Gulf of Maine, all of whom are currently listed by Maine statute as endangered species here in their own state. So, with that, I will say thank you for the time to speak with you this evening. I do really want to also add that, as Canada has done, could we consider funding a funding vehicle for observation of whale migration and population patterns in the Gulf of Maine? And bring that up to speed with what Canada has already been doing. Thank you.

Thank you, Caroline Coburn, you're next, you should be able to unmute yourself.

Hi, my name is Caroline. I grew up in Portland, Maine, and I'm currently a senior at Boston College. Some of my favorite memories of home include sitting by the water and visiting the lobster shack. I've even had the pleasure of learning how to lobster on a commercial fishing boat. I'm studying to become an elementary school teacher, and worry that my students will not have the chance to ever know the majesty of the North Atlantic, right whale. North Atlantic right whales are one of the most endangered species on the planet. And if we don't act fast, they could be extinct in my lifetime. What's worse is that the young children I want to teach may only ever see a right whale in a history book because they could be extinct fast. That disturbs me, how can we let a beautiful species die off when we know that there are stronger solutions out there to save them, the modifications in your plan don't do enough to help save young right whales and calves. The new generation of whales desperately needed to bring the population away from the brink of extinction. Weak rope and links are not a long term solution, but ropeless gear is. Ropeless gear devices have been created specifically to prevent marine life entanglements for mammals like the North Atlantic Right Whale. ropeless gear is real. And it works. Period. Fishermen are using it on the West Coast, in South Africa and in the UK and Australia. Why can't we be doing the same thing over here? Ropeless gear will help us save the livelihood of the men and women in our coastal communities that harvest lobster while also ensuring right whales can remain safe and most importantly alive. NOAA, please implement, implement ropeless gear in your plan to save right whales. Thank you.

Thank you, Hayden. Hayden Brewer. You are unmuted, you should be able to make your comment.

My name is Hayden Brewer, Can you? Can everyone hear me?

Yes, we can hear you.

Um, one thing that I'm going to comment on that I have not heard so far. I came in a little late, so I don't know if it's been talked about. My question is we are focusing on Lobstermen, but there is something that is going to very in the near future, going into Maines waters, and that is the wind turbines that are going to be out at sea, and unlike the breakaway lines that we already have on our lobster traps, I'm also a 9th generation Lobstermen for the record, um, unlike the Breakaway lines that they have. I don't believe that lines on the wind turbines are going to have breakaway lines, because then, that wind turbine is going to go away or the power line that brings the power back to the mainland is going to go away and that renders it useless. So while Lobstermen are being looked at and I hope the cruise ships will be looked at after all that my other lobsterman friends have pointed out. I think that the wind turbine should be looked at as well, because they are going to be lines heavily placed in the water. And that's what I have to say.

Thank you so much, David. Not going to pronounce your last name, I have a hard one to that if it makes you feel any better.

Don't try. It took my classes until third grade were able to. I want to point out that my background is my 53rd year, lobstering. Prior to that, I was in pre-med. I did four years on my doctorate, Marine bacteriology, and taught chemistry for 13 years. So, my background is scientific but this is my 53rd year lobstering. And I raised a family of three daughters doing it. What I've seen and don't think that I'm not a part to it, Tree hugging, granola, eater, I love nature. I love the water. I sympathize with everybody that's spoken tonight. But what we have to look at here is data. What I see and reading and reading the publication that you put out, NOAA put out, it's quite evident that there is no empirical data that supports what we're asking fisherman to do. And until we get that empirical data, we're not going to have any direction. We're not going to, we're not going to know where we're going. So I strongly urge to regroup, get some data on where these whales are, what they're doing, don't impose, rules and regulations on fishermen that are not going to be impacted by the whale's presence. Only subject these areas where the whales are known to be, but it's obvious that we don't know where they all are and when they're going to be there. So you have to go back, regroup, and then come up with another program. Breakaways not the answer. Well, we're not going to get into it. But anyhow, you need your data. And it's very important that you put it all together and then we come up with a brand-new program. So I sympathize with everyone, all sides. So, thank you for your time and we'll go from there.

Thank you. Chris Smith. I'm coming to you. I'm not sure if you have a comment, but I just want to make sure.

Yeah, can you hear me?

Yes, I can hear you.

OK, thank you, so my name is Chris Smith, I'm a 30 year old 30 year Lobsterman from Monhegan Island. And I would really urge NOAA to listen to the comments by Commissioner Kelliher with Maine DMR There is no one size fits all solution. Um, I'll also echo what David just said, the data is flawed here. Folks. It's very, very flawed it uses data from, you know, a decade ago. And I really would hope that some credence would be given to the fact that we've had very few entanglements this year. And it's been said, many times tonight, that the lack of cruise ships in the Gulf of Maine this year have a big part in that. And I really would hope that that gets looked at closely. And I would also encourage NOAA to really step up surveillance of where the right whales are that seems to be also flawed. So I know there's others that want to talk, so I'll sign off, And I thank you for your time tonight.

Thank you, Chris. Jack. You should be able to unmute yourself.

Yeah, can you hear me?

Yes.

Alright, so, I'm a 19 year old lobstermen out of Yarmouth Maine. I would just like to comment that this these, when you're making these trawl regulations, you have to come into account a lot of people. My age who come into this industry We don't can't afford a 40, 45 foot boat, you know, even a 35 foot boat. I was just fishing out of a 22 foot Eastern. And I was, and I had to fish inshore, which was good out of that size boat, but if I were to upgrade to something like 25 or 35, but that wouldn't be big enough for me to fish. Fish off by you know 3-6 mile, so there has to be a way for, for lobstermen like me to be able to get into this industry. Now, I'm lucky enough that I was able to make enough money beforehand to get in, get into this and get a bigger boat. But a lot of people are not, a lot of people, are going into this. They don't have they don't have a financial backing that I do. They don't have when they try to go into this. They don't they just can't afford that big boat And as a result they are forced to only the fish in the summer and it's hard to make money if you only fish in the summer. So you got to keep that in account as well for the financial costs for the younger fishermen, for the rules. Thank you.

Thank you so much. OK Troy plumber. You're unmuted.

There we go, I think I'm unmuted now, I'm a lobstermen, from Boothbay Harbor just going to run through a quick list. A few things here. Where a right whale isn't there zero risk imposing restrictions where a whale isn't makes no sense it has no benefit to a whale, And only affects fishermen. Canada's been flying flights, spot whales. It seems like to me, the tagging whales are spotting whales is the best way to both protect whales. Allow our fishery to continue. It's been awhile. But I seem to remember in a meeting a long time ago, that 90% or more of the rope taken off the Entangled Whales has been large rope 6-7/16 or larger. You don't know where Maine fishermen fish. You don't know how we fish. We haven't been doing 100% reporting. And that's probably hurt us in the long run. A lot of this is just guesses. I've heard the population in this meeting at the beginning, NMFS was talking about around 400 whales. Some of the eco groups are saying around 365 whales. It seems like a lot of this data. It just seems to be incomplete, and there's just not enough data out there. We sit there and watch the PR from the media Against Us. They show a picture of an entangled whale and we're looking at it, it's like inch thick rope. with these Massive Polly balls, nothing that you know, Maine near shore fishermen use. And we know that, the public doesn't, I'm not sure these eco groups do, I'm not sure NMFS does because there's no concrete data on how Maine fishermen, fish and where they fish. The population of these right whales was somewhere around 250 you know years ago. Some around 2000 and it rebounded all the way up to 500 whales. While our industry was moving right along with a lot less restrictions than we have now. Apparently, there's a lot of other fact factors affecting these whales. I'm not sure if a whale gets bumped on the head by a ship's, more likely, or not to swim into a rope and get entangled. And in the end, the NMFS and the agency has no accountability. If you're wrong, this round and the whales keep going down, you can say, Well, we didn't do enough, and you can do more. We have everything to lose. And in the Eco groups, non-profits, and the federal government, you have nothing to lose, you know, just keep regulating, see what happens, keep, keep finding out. We're sitting here, paying the cost, means very beginning of this meeting, and I think it'd be interesting to talk about it more, the idea that our 600lb Breakaways on our buoys may actually be hindering the Whale's ability to snap the rope if they are entangled in it, because there's less drag against it. That was pretty interesting, we've been buying these 600lb links now for years, and we're just throwing out there casually to know, maybe that wasn't right, know, if it wasn't right, are we going to get our money back and all the 600lb links and all the buoys we've lost because of the 600lb links. Of course, not. It's just incomplete data, incomplete idea of the picture. And really whales need to be tracked or spotted because it's completely pointless to regulate somewhere where there isn't a right whale because there's not going to help the right whale. It makes no sense at all. So that's about all I got to say tonight.

Thank you for your comment, OK, Chris MacIntyre. You're next. You are unmuted, you should be able to unmute yourself.

Hey, can you hear me?

Yes.

Hi, my name's Chris MacIntyre, federally and State permitted Lobstermen from Harpswell Maine, I'd like to comment tonight against the use of the LMA one closure mainly do, because of the lack of data around the usage of the area. I know that, you know, what's helpful to you guys is, you know, specific data around, you know, from fishermen who do use the area I do not. So I can't provide you with that. But what's obvious to me and it should be obvious to you, is that the financial cost of that proposed closure is laughable. It's. And, NOAA should wait until, you know, there's better data about usage of the area by lobsterman and by whales, before considering such a closure. Um, and when it comes to ropeless fishing being allowed within the closed area, I mean, you're, you're proposing something that's against the law. You know fishing, fixed gear, without end lines is illegal. It's illegal for very good reasons. You're proposing something and without answering any of the questions around how would mobile gear fleet be able to fish around the fixed gear? How would other fixed gear fishermen be able to fish around the fixed gear? How would NOAA, Coast Guard, the State of Maine anybody be able to enforce any of the regulations around the lobster fishery if they can't find or haul the gear to check for compliance? The, the big push towards ropeless fishing makes absolutely no sense because NOAA's own model used in the biological opinion shows that even if you take all the fixed gear rope fisheries out of the water, the right whale population is still going to decline. So there's no doubt that you know the question. What can we do to save right Whales is an important question. But the answer of destroying the lobster fishery to do it it's just completely backwards, you know, why do we need to go to all ropeless fishing? If even if we go to all ropeless fishing, the whales are still going to decline, it shows the models. If run with us not taking any more risk reduction currently shows only a difference of five breeding females over the next 50 years. So I mean, that proves that we do not interact with these whales in a way that will determine whether the species survives or doesn't survive. I'd also like to comment that NOAA should take the conservation equivalencies that will be provided by the Maine DMR into consideration in order for individuals' areas of the coast of Maine to be able to comply with the risk reduction targets. Thank you very much.

Thank you. Joshua. Just got to get to the J's. I know, Josh, that you are back online. You should be able to unmute yourself.

Can you hear me?

Yes, I can.

My name is Josh I fish out of Spruce Head. I'd just like to start off by saying that none of us fisherman are interested in harming any whales and we, we have complied with everything that's been thrown our way. We, I mean, there's, there's a lot of questions with, with what's going on.

And. and one of the big issues like Jarod had Explained is about tracking whales. Um, like he said, if we can land a rover on Mars, we should be able to track the whale's. That's something that I realize that some of the conservationists have said. It's been very difficult to do that because the trackers won't stick in the whales. Um, that's, I mean, we can, we can track everything else, it just seems impossible that we couldn't track the whales. Also, in regards to Zac Klyver speaking, and he has seen all these right whales and seeing them entangled, and he knows it was Maine fishing gear. Last year was the first year that Maine specifically had their own marking system. So, if that was other than last year, how would it be known that it was Maine fishing gear? Um, the number of documented deaths for vs. births and undocumented, that goes hand in hand. They don't know how many actually died, but you don't know how many actually, have been born. There's just so many questions. And as everybody has stated, that the data is flawed. There needs to be more research done before anything can effectively be done. Um, there's just too many questions. And especially for Maine where, I mean, nobody that I have heard of has ever seen a Right Whale. It's going to affect far too many people For, as other people have said, something that that's never existed. Never, never been, Never been an issue before that we've seen. Also, as far as the shipping industry, if we're going to have all these regulations put on us, how I realize that they are a huge part of import export or cruise ships. It just doesn't seem fair that that something that size is not going to be affected. Like, we are, we, we may be something smaller, but we are big, big part of the north-east. And it's just, it's tragic that that they're above all the other regulations that we're going to deal with. I think that's all I've got for tonight. Thank you very much.

Thank you. John Tripp.

Can you hear me?

Yes.

Thank you, my name is John Tripp. I'm a fisherman in the Mid Coast. Um, I would just like to speak against the LMA one closure. I do not believe that establishing a closure based on assumptions of congregations in the future is an acceptable management tool.
I feel like it'll cause a gold rush mentality. You guys seem to think that only 45 guys might fish over there out there right now but If you put in a closure, I think you need to worry about when it reopens having 90 guys in there and just the fact that you'll have gear stacked up outside of the closure waiting to get in. Um, and I'm also worried that what may start as a three month closure could turn into a dynamic closure, dynamic area management didn't work in the past and I don't think without tracking the whale's and, uh, tracking the boat's and it will work in the future. Another big fear is that it could turn into a permanent closure. I believe management should be based on facts and hard evidence. I agree with what Jared said, whales need to be tagged and tracked. And that information needs to be available to The fishermen on a live basis. We need to know where they are. Um, I have no issue in doing things that will actually help save a species, my issue comes with guess and check management. I urge you to listen to the fishing organizations, in particular, the MLA, which I am a board member of. The MLAs worked tirelessly on this and I believe they have the best input. I echo Dustin and Jared’s comments they hit the nail on the head, same with Troy. And I would I would also urge you to consider the conservation equivalencies from the Maine DMR. Thank you.

Thank you. Ryder, we're coming to you. Next. You're unmuted.

OK. My name is Ryder Noyse, and not this really matters much, But I actually went to the University of Maine and I minored in environmental studies. So you know, I do understand where everyone's coming from as far as, you know, saving the right whales and can strongly say that every fisherman agrees with that. We're not out here in the middle of the ocean trying to endanger these whales or hurt them or anything of that precedent. That being said, we rarely come into contact with these whales to begin with. And it's really difficult for me as a fisherman to support these rules, regulations being put in place that are designed to save whales, I understand, However, they're not designed to save fishermen. I guess what I'm getting at is if we're doing you know 20 trap and 30 trap trawls, even the trawl increase, that's a danger to every person on the boat. You're adding more rope. You're adding more traps. You're putting guys in situations that they don't need to be in necessarily and at what cost? The other one I wanted to mention was as far as an area being closed, I'd like to know how DMR would even be able to enforce the fishing, as has been stated before. Um, it doesn't really seem to me like that's something that's even possible for them to maintain. It was also stated, I believe that there would also just be a wall around that closed area. Um, the other one that also was mentioned earlier and I'm going to mention that again is the windmills, there's windmills being put out. That's the whole goal coming out here There's, you know, the efficiency Maine That's just going to create issues. If you're worried about 600lb breakaway, imagine three inch chain, also agreeing with David from earlier, we need more accurate data. We need to find what the direct correlation is to the right whales deaths. There's plenty of graphs and plots out there that are available. And it shouldn't be that difficult to find the correlation coefficient or Value R Seems to me that there is no direct correlation from lobster fishery to right whale deaths. And it does seem like it more not just, but more so leans towards ship strikes. Um, we all do care about the ocean, and all the creatures that inhabit it. We treat the ocean as if it were our home, mainly because it is. We treat it with respect, we take care of it, and we maintain. So anyways, that's all I've got. Thank you very much.

Thank you. Ira Miller?

Hello! Can you hear me?

Yes. I can.

I'd just like to start by saying that fishermen were the stewards of this ocean for 100s years long before it was cool. They were the environmentalists out there. That doesn't mean all, most fishermen. Uh, we all have impacts. I don't think that the impacts are anywhere near understood on this species. There's a lot of knee jerk science going on has been brought up. I like David's comments to that. I think, really the crux of the problem. You don't have good data. We're be persecuted by that because we can be, Uh, this wouldn't fly. I don't think in a lot of situations, it's only, because we don't have something to refute it. Our job is going out on the ocean, making a living. We're not lawyers, we're not, paper writers were not academia. So were taking time out of our day to try and fight a battle that's way out of our league. Um. I Like Commissioner Kelliher's comments, I think they were to the point I think a lot of the fishermen, Troy Plumber was definitely to the point where a lot of others I think tagging needs to happen or tracking. You Know, there's ways to prosecute this fishery. I've been fishing out all over the Gulf of Maine for over 50 years. And I can tell you right now, that ropeless fishing, no matter what these people speaking to it think, they don't live in our world. They don't understand. They're making comments, being very uneducated. They don't understand what it takes to accomplish that in our area of the world. Yes. It goes on in some other areas of the world, West Coast of Australia or something like that, where there's a minimum number of fishermen. If they think that that's going to take place in our area without having a massive impact, they'd be wrong, they are way off base. I think enforcement is going to be a problem. You have area closures that don't make sense. Uh, I think that Jarod's point transiting animals back and forth through there a Spring closure, if you got to, have a closure, which I don't support at all, doesn't make sense. I think that, you know, the gear marking estimate times was way under done. You know, the cost involved to the fishermen. I think a lot of these people, a lot of these environmental groups instead of working with us to try and make things better, all they've done is try and pit us against each other. And, uh, they haven't made a situation that we could actually work together on a solution. Haven't come to the industry that I've ever seen and I've been pretty involved. come to the industry offering much in the way of solutions. Anyway. Thank you for allowing me to comment. Have a good night.

Thank you, Ira.

Judith Howard. I'm not sure if you have a comment, but I just wanted to double check. You should be able to unmute yourself. Judith Howard, Not sure if you can hear me.

I can hear you. I didn't really have a comment. I wrote you a bunch of questions, but, um, so I guess my one comment listening as a, as an open minded listeners, how different the data are interpreted and I think our job as scientists, is to find out what the true data are. That's what worries me right now.

Thank you OK, Cindy Donnell Coming back to you, you're unmuted.

I find it interesting that the conservationist that have spoken tonight are going back to years previous for the whale entanglements, previous to all the trap modifications that have been made over the past 10 years. And the past 10 years have been very successful. And the fishermen are not getting any credit for the whales that have not been entangled in the past 10 years in the Gulf of Maine because of their gear modifications, perhaps, who knows what it was. But it's been very successful that we haven't entangled any and that Canada has entangled whales, and they are not doing even what we're doing. And nobody does anything about that. And we're asked to do more. And they are the ones catching the whales, it makes no sense. And Then, you know. They talked about that whale down South, that was killed the baby whale that was a ship strike. I mean, it had nothing to do with gear. And I just don't understand why they've not caught up with us in the Northeastern United States. And Canada has started a program of following the whales, why aren't we doing that? There they are talking about if the whales come into a certain area, closing it, we don't even talk about that. Now, we're just going to close an area, just a random area that the whales may not even be and it makes absolutely no sense. My husband has been a fisherman for over 45 years. And my sons are both fishermen and none of them and none of the fishermen in York, have ever seen a right whale. So they're out there every day. They're out there today. I mean, you conservationists aren't out in the water and the guy that said that he saw the entanglements. He was going back, years ago, Before, we had the gear modifications and the teacher that talked about the kids, you know, not being able to see the whales, the right whales someday. Well, it's darn good possibility with the number of whales that are left that they probably aren't going to be here, reality is they're not going to be here and they're going to be talking about them like they talk about dinosaurs. I mean, it's sad, but we get along without dinosaurs. We talk about them all the time. And Troy, I like what Troy said, is correct about Canada, you know, they're, they're doing some things right and they're doing some things wrong and maybe we ought to take the things that they are doing that are right and track the whales. that's all I have to say.

Thank you, Cindy. Zach, I'm coming to you to give you time to finish up your comment.

OK, thank you Kara. Yes, I will say a few follow up comments. To the question about risk. Whether right whales are in Maine waters we, we collected all right, whale sightings and we have over 100 from whale watching trips in the 30 year period. And the majority of those sightings I think 85 to 90% or more are in 300 feet of water or more. So, out 15 to 20 miles offshore. That's what we found. So that's where co-occurrence is. I sit in on the take reduction team when I had a chance to speak, last meeting two years ago. And I think that's where we get our greatest conservation effort. Um, also, I wanted to say that we looked at the sighting data from Mount Desert Rock, the Lighthouse tower data, there was a long term watch by Allied whale researchers counting whales from Mount Desert Rock, which, I think most of you know, is 25 miles off the coast of Maine. And in a 18 year period between 1976-92 there were 59 days when right whales were seen. So if we add that all together, that's a 50 year set of sighting data. Right Whales are in Maine waters and I'm not surprised that a lot of fishermen haven't seen them. If you're working, I've worked on boats, your head down. But right Whales dive, they spent 10 or 20 minutes underwater, they come up with good distance away. They're not, they're not the easiest, whale to see. Um, but fishermen have reported them to us. Many times. We had a trip on July fifth, 1991 that I remember vividly, where a couple of fishing boats off of Jones port reported five right whales when we got there. It was five right whales. I do want to say that I support the EFP proposal for ropeless and allowing testing and I and I heard the comments tonight and I'm really surprised that so many are full of fear and concern about ropeless. No. No. None of us that are working in this area to develop it, want to put a technology on your boat that doesn't work, that's not, That isn't subsidized and supported by Federal funding. We aren't, we don't want you to pay for all of it, the transition. We want it, it has to work on every level. But just like the comment was made about the rover going to Mars, we use technology to solve human problems Here. We have an opportunity to have a win-win solution. The fishermen could be the heroes of the whales. And we're trying to develop it, so, So just come with me, or let me come with you, and you can see, and I hope that you'll keep an open mind. Thank you.

Thank you, we have two last commenters, and just a reminder, please direct your comments at the presenters at us. Eben. Eben do you have another comment, Or was the entry into new to the questions?

I do have another comment. Ah.

It's quite hard to hear.

This is about the windmills and a lot of the scientists are in favor of the windmills I do want it be known that 5 thousand whales have been killed, for the green energy. Because of the windmills are wiping out the sonar, these scientists all for it, they will shut us down. They will successfully kill the last right whales. What is happening over 220 decibels loud and the brain can only tolerate 150 before it kills us. So the whale Doesn't know, left right up from down and end up beaching. So this energy that All these centers are all about that are so for saving the planet. In which you're going to have these floating mills off of Maine with floating, cable, it is inches thick, it's going to be hanging in between each windmill, that is absolutely 100% against everything that they want to save the whales. A great big cable drooping in between miles becomes a wall that whales will not cross from the sounds. Also, the clanging of the chains and multiple, 7 to 12 anchors of huge Chain. Nowhere whale safe. So I want it to be known. They'd be the death of the whales by being clean energy, that is 6x more expensive. Or else, it's saying clean energy. That'll do OK.

Thank you. OK, and last up Douglas, you should be able to unmute. You are unmuted.

Yeah I just wanted to point out that what everybody has said earlier from the fishing side of this of what Zach was just saying all the data that he gave us is 30 years old. He just said, he saw all these right Whales around Mount Desert, we all know Mount Desert is a hotspot for whales. He's given 30 year old data. Every scientific thing I read now, is about how the Gulf of Maine is warming faster than any ocean on the planet. With that said, the copepods, the right whales Feed on just do not come in the Gulf of Maine, anymore. So I just wanted to point out the kind of data that were living with on this side, is from people Like him saying, all this stuff about all these right whales being seen is 30 year old information. That's all I had to say. Thank you.

Thank you. Colleen?

Yeah, I'd like to thank everyone for coming tonight. It's nearly nine o'clock. Thanks for all of you. Quite a few of you who stuck with us all night. Um, this is a public hearing session. We really were interested in getting public comments, And that's what we prioritized tonight. But if you have questions that can also be turned into comments, please include those in comments that you can submit in writing in our in our final documents. In our final rule, we will be responding to comments, and a lot of those questions would be answered there, or well, and or incorporated into the final documents. So, thanks, everyone, for your interest tonight. I'd like to thank Commissioner Kelliher for joining us and for his comments tonight. As well as I saw a number of take reduction team members and alternates on thank you as well and everyone else. And I really appreciate the number of fishermen who spoke up tonight. We were concerned that our remote meeting would make it harder for us to provide access for you. And your active participation is really appreciated. So, thank you, everybody. Goodnight.

Public Hearing 4

Northern Maine, Wednesday, February 24, 2021, 6:30-8:30 pm

The of the meeting. If you have not already, but want to provide comments tonight, please go ahead and type “comment” into the questions box. We've already got quite a queue going. If you change your mind, you can type or say, Pass when we call your name in the queue. We'll call on each commenter and we'll try to let you know who's up next in the queue by showing the next few names. Remember, we are recording this public hearing. As always, we ask you to please be respectful, and please direct your comments to us, the presenters, and not to each other. When you're called on, you will be unmuted, and then you'll need to unmute yourself for the recording tonight. Please state your name before your comment. Comments will be limited to three minutes, given the size of our audience tonight. You will be muted after three minutes if you've already provided comments. But wish to give another one tonight. So if you've come up, we called your name. You provided comments, you don't finish, or you wish to give another comment, you'll be placed at the end of the queue to give everyone an opportunity to speak. If there is still time at the end of the night, you may get that other opportunity to complete comments. If not, please provide your additional comments to us in writing. This is a public hearing. We want to maximize the opportunity for you to provide comments. If we wrap comments up very early tonight, we may have time to answer clarifying questions. If we don't, you can please send in questions as comments. As written comments, we are required to respond to comments, and the answers will be in the documents in the preamble to the rule. In a minute, I'm going to turn the mic over to Kara to help us run through the comment queue, But I'd like to welcome and thank the many state representatives and staff from Senators King and Collins offices tonight that we've seen in the queue tonight. I'd like to thank as well, a special thanks to Representative Golden, who's on tonight as well for joining us. Commissioner Kelliher is also with us. And we're going to start out introducing allowing him to introduce representative Golden and inviting Representative Golden to make some remarks tonight. So with that, I'm going to turn the mic over to Kara to unmute as needed.

Yes, Commissioner Kelleher, you should be able to unmute yourself and Congressman Golden, I'm going to unmute you, as well, So you'll be able to unmute yourself when the time comes.

OK, thank you Kara, and thank you, Colleen, and your staff, for, again, hosting another meeting. As you said, it's too bad, I think we probably would have filled the Civic Center tonight. So, but I am very pleased to see the number of participants. I want to thank all the staff that are here from all of the Congressional offices, Collins, King and Congresswoman Pingree's office. And I'm very pleased to now introduce Congressmen, Jared Golden. Jarod has been very active in these discussions. And we appreciate him taking the time this evening to address the agency. So, Congressman, the floor is yours.

Thank you, You hear me all right?

Yeah.

Very well.

Thank you for that. I appreciate it very much And I also want to thank everyone who joined tonight as well as all the folks that are presenting and everyone at NOAA I do appreciate the opportunity. I did want to start by acknowledging to the folks on the line tonight that the delegation has sent a letter just today to the President, to the President, the United States, to President Biden asking him to pay attention to what's going on here, as we did with the last administration. And I think that the delegation is United, continuing to push to represent the lobster community in Maine, But I'm not going to read the letter I'll spare you all that. But I did think it was worth repeating a couple of key points, which I know you're all familiar with. I know the folks at NOAA recognize the importance of this fishery to the state of Maine and to the country really financially. It's incredibly important to these communities. It's everything. I also wanted to point out, I know, you know, as well how hard they have strived through many years now to work with you on risk reduction related to right whales. Quickly, I'll go through it. Implementing weak links in 97, gear marking in 2002. Sinking ground lines in 2009 reduced vertical lines in 2014. Working with you most recently on trying to come up with a plan working with Maine DMR and NOAA on further potential rope reductions. I think that this community has bent over backwards. But at the same time, I think they have some really valid questions of NOAA about the evidence that is out there that they are, in fact, part of the problem because they very strongly and passionately believe that they are not and the data seems to back that up. It seems very problematic from their perspective, from my perspective and from the entire congressional delegations. As NOAA has pointed out, out of 10, right whale entanglements in US Lobster Gear from 1997 through 2017, 8 occurred before 2009. I'm sure we can tie that to the move to go to sinking ground Lines. Made a big difference. In addition, the other two involve gear from another state successfully removed, neither of which cause serious injury or mortality to a whale. It has been since 2002 since there was a right whale serious injury or mortality attributed to the Gulf of Maine or Georges Bank Lobster fishery. One of the points we made to the president was that this fishing community, these families. And really the state I think, deserves an understanding of how what they're being asked to do in regards to further regulations is going to have any positive impact upon the whales whatsoever. If NOAA had data showing that this fishery was at fault for serious injury and mortality, you surely would have presented it in court. Uh, you know, We have, we have a common set of data here to look at, in regards to what's happening, to right whales in the Gulf of Maine, you know, I guess what I would ask tonight is, do you have documentation? Do you have some kind of set of best practices? What evidence are you, are you using to inform the regulations that you've proposed, and how can you show us the kind of agency, you know, best practices for how this is going to make a difference? If any? one thing we pointed out was that the draft, BiOps projections said even if all 10 federal fisheries that you covered were completely shut down, the North Atlantic right Whale population would still decline at the same rate as it would under the 98% risk reduction is currently pending finalization. I think this raises big questions about whether or not this is really going to have the desired effect. And the outcome for the right whales but it is going to come at a very high cost for these fishing communities. So now I think it's important that they have the opportunity to provide feedback and be heard but also I think they need to hear an explanation about what impact this is going to have. On the right whale population. I'm sure you're going to hear a lot of testimony tonight about how hard of an impact it's going to have on them and on their ability to make a living, very concerning, and I'm sure you don't want to move forward with regulations that the data wouldn't back up. I know that's not why you do your jobs. I know that certainly you can point to laws like the Endangered Species Act but would you move forward with these regulations, absent lawsuits, and in some ways, it looks given the lack of data that there's a problem that's being solved here, it looks like this is regulation of the fishery by non-governmental organizations through a strategy of lawsuits. Oh, And it's just that is not the spirit of the law as far as, as far as I can see it. You know, this fishery wants to be helpful. They want to make a difference. But they don't want to be regulated out of work, especially when they suspect they're going to sit back and see that it won't actually have any positive outcome for this whale population. We continue to see the focus of the problem up and up in Canada, as you've heard repeatedly, I guess with that I would turn it back over to you so that the community can weigh in on and I'm sure that they've got a lot to say and plenty for you to learn, but I suspect you've heard a lot of it are already. So we're looking for a proactive and productive working relationship as we have here and hopefully the best outcome for these lobster communities, as well as for the whales.

Thank you very much.

Yeah, thank you, Congressman. And I appreciate, again, and appreciate your support and the support of Senator Collins, Senator King, Senator Pingree on this important matter. I'll go right into my comments, and knowing the knowing the large crowd, I will try to keep them brief and try to also help focus some comments from the industry here tonight. And for the record, my name is Patrick Kelliher, I'm the Commissioner at the Maine Department of Marine Resources. I'd like to highlight a few of the comments from the Department. First around conservation equivalencies, Trawling up. A key part of DMR's proposal is trawl length equivalencies, whereby a trawl with two end lines is equivalent to a trawl, with half the traps, and only one endline. This type of flexibility is paramount. A one size fits all approach in the State of Maine will not work. Our coast is too large, and it has too much geographic and oceanographic diversity to make it work. DMR will also be recommending the inclusion of conservation equivalency proposals that have been developed by our zone councils. Throughout 2020, the Zone councils worked with the department to develop conservation equivalencies that would work better for their individual zones. The proposed closed area, the Agency Decision Support tool indicates the LMA one closure if it was to be implemented, would become the most important conservation area to right whales along the coast. There is very little data supporting this finding when DMR mapped out the right whale detections from the Acoustical gliders mentioned in the DEIS against the boundaries of the closure, 73% of the detections were outside of that area. If the agency continues to feel that that area must be defined and in some way used for management in the protection of right whales, we strongly urge you to consider a trigger approach. With the trigger approach, the agency must also avoid creating a scenario where actions by a fisherman licensed outside of Maine would trigger a closure that would only impact Maine fishermen. Implementation date. And again, I would ask you to take the time to listen closely to the industry members as it pertains to the implementation date. We think a reasonable timeline based on the operational reality of the fishery will be needed. Ropeless fishing. Based on the proposed rule, and especially the biological opinion, the agency is attempting to move the US lobster fishery, in the direction of ropeless fishing. Maine DMR will continue to work with NOAA on the development of this technology. But we must need to work within the operational realities and acknowledge that technology is years away from this use at a meaningful scale. Gear laid out on the bottom, without end lines, must still be, quote seen, by mobile gear, fleets, and others within the fixed gear fleet. Ropeless gear must also be retrieved, inspected and reset by law enforcement agencies to enforce lobster regulations, not just whales rules. Again in your race to protect right whales we must also manage sustainably manage the lobster fishery. Our next comments are directed to the industry itself. I would ask the industry tonight please focus your comments on some key areas that's very important for the for the National Marine Fisheries Service folks to hear these comments. They are looking for feedback on whether you support trawl length equivalencies, like the ones who included in Maine's proposals and the zone. And the zone conservation equivalency proposals that were created by the industry. They also need to know the LMA one closure, how it would impact you, particularly the economic impacts, and where you would move your gear. And please also comment on the time it takes to mark your gear, as well as how long it takes to implement these measures and the best time of year to do it. It's very important that they hear from you tonight on those matters. In closing, I would like to highlight the Maine lobster fishery is the most valuable single species in the country. In Maine it comprises over one point five billion dollars in economic activity. And touches thousands and thousands of families. In the background of this proposed rule is a draft biological opinion. That could very well be very devastating to this fishery and to the people who depend on it. We look forward to trying to work with this agency and navigate through this very difficult time. Thank you for your time. And as stated yesterday, the department will be submitting very detailed comments on the proposed rule. Thank you very much.

Thanks. Commissioner Kelliher.

Thank you. OK, so now, as you can see on the screen, and people who have been put in the queue so far, there are there are more, but as we go through the queue, I'll add them on. At the end, the timer on the screen is three minutes. We ask that you keep your comments to three minutes. I will let you know when you're over time. And as Colleen mentioned, we may be able to come back to you at the end, but there are quite a few people in the queue tonight. So, as I call on you, I will unmute you, and you will also need to unmute yourself. So to start us off for tonight is Micheala. Yes. You are unmuted. Michaela, I can see that you're unmuted, but I can't hear you. You'll need to make sure your audio settings OK. We can come back to you. Oh, thanks. Thank you. OK, next up, we have Shayne Mcfarland. Shayne, you should be able to unmute yourself. OK, Jim, O'Connell coming to you. OK, Jim, you should be able to unmute yourself.

One second. Hang on.

I can hear you.

OK. I'm looking for my name. There it is, Hi. Can you hear me?

Yes. I can hear you.

My question. So how did you get 411 that's the amount of whales that you think are out there, minus the 47 of the ones who had died. In that period of time, and 14, a serious injury decided to call dead. So that comes. That means about 366 whales, is what you're saying, is out there. But how did you get the number 411 to start with? And why does F, the one that looks like a mountain, that, that shows the 411, Why does that graph go down, suddenly, in 2010, at the peak of a baby boom, from 481 to 411. That means, while the whale's, we're actually increasing, you guys were killing off 27 per year on paper. That is the whole crux of this. I'm afraid the whole thing is based on a terrible graph. Error. We're not going into extinction. We that. only for three years, did we lose a population And that was 2017, 18, and 19. The rest of the time we're gaining, and apparently, according to the math, we should be, we should be looking at 702 whales, not 366. So it seems like you're rationalizing a whole bunch of ways of cutting down on the population, and none of it is needed. We would, we should go to status quo. We're on the, we're in the beginning of a baby boom right now. The were came out of the boom from 2010. The females are ready to give birth now. And they're starting to go for quite a while. Because 200 whales of sudden pop up, around 2000 to 2010, I mean, in 2010, there was 20 whales. Then the follow, 2011 was another 20. Meanwhile, you, guys, just subtract 27 whales per year on paper. It's just doesn't make any sense. There's so much more to look at here. Like the whales. The Whale's that there was seven unknown whales found in Canada, in the Gulf of saint Lawrence, there was 33 deaths, That's 21%, we don't know out there. For forever, we haven't been able to count all the whales. And they're not marked and not registered. And they weren't in so bad shape, you couldn't identify him. These were kind of fresh whales, just see killed by a ship. And that was their guidance, whole fruit and critical, is the explosion in saint Lawrence. Approach per year, tips per year? That it's been fixed. We're on the way up. We're into the second baby. Boom. It's going to be a boom. Boom. Didn't mean I'm exponential, it seems. So that's where I'd say just leave everything don’t make these lobstermen paint all these ropes, that's a heck of a job. They don't even know how to paint. Probably can't hold the paintbrush. I'm sorry. I'm getting carried away. There's so much more, uh, that we don't know about these whales. Why haven't we seen these 10%? Where are they hanging out? I would suggest that you, next time you see an unknown Whale, to actually put a tag on and track a couple of them. Just a couple of me not going to harm the whole thing. And satellite for, do, are they going, why haven't you gotten them.

Hi Jim Thank you so much for your comment.

OK, thank you for listening.

Thank you. Hey, John Emerson. You are unmuted.

OK, Thank you. I have a very short comment. And it is as follows, I don't have confidence in the low number of right whales being used as the premise for adopting more strict measures such as more traps on a line, more weak links, closures. And perhaps most troubling of all to me, adopting ropeless fishing. I do think more work needs to be going into identifying the number of whales and having that be accurate. And in addition to that, the collisions with the ships from what I can tell, are doing way more damage to the whales than ropes from, especially from Maine fishermen. So, that's my comment. Thank you.

Thank you. Bill McWeeney, coming to you, you're unmuted.

You hear me, Kara?

Yes, I can, Bill.

OK, my name is Bill McWeeney I live and work on the Blue Hill Peninsula. Contrary to what some people think entanglements have continued to happen in US Waters. three, right whale entanglements have been found in US. Waters Just since October. As usual, no gear was retrieved, nor were any of the whales disentangled. two are presumed dead, and one is probably dying. As I speak, 86% of right whales have been entangled, and 60% have been entangled more than once. There have been more than 1500 documented entanglements of right whales and only 16 of them have been traced back to the source. That means 99% of entanglement will not be traced back to the point of origin. It is not so easy to find a smoking gun, like King Fisher in 2004 that actually had Maine gear on him. By the way, Kingfishers Flipper was wrapped with rope so bad, his flipper turned white. That was just, before, he was last seen in 20 15. He suffered for over a decade with that entanglement. With 87% of the pot trap gear on the East Coast of the United States, it is extremely likely that Maine Lobster gear is responsible for many of the 1500 entanglements of unknown origin. Some people, miss interpreted the 1700lb breaking strength research. I heard people saying last night that weak ropes will not help young and juvenile right whales. That these weak ropes will entangle those whales. This is a direct contradiction to the research that was done showing that no young or juvenile right whales were caught in ropes with a breaking strength of less than 1700lb. That is why the Recommendation for weak ropes is 1700lb and those ropes let young whales get free. There's been a lot of talk about ropeless fishing. This current rule does not rely on ropeless fishing to reduce risk. That is something for the future. If fishermen think they're going to be forced to use ropeless in the near future. They are not. The current rule uses weak ropes and line number reductions. And closures to lower risk. Finally, I agree that fishermen should not have to trawl up any more than they are doing. It is dangerous, fishermen and regulators should look closely at the research done showing the trap reduction will not hurt the bottom line when fishing and the Gulf of Maine lobsters. There are three peer reviewed papers showing that less traps in a given area will catch just about as many lobsters as the full complement of traps. Thank you.

Thank you, Bill. OK, Jason, Joyce, coming to you. You should be able to unmute yourself Jason.

OK, Yeah, just came off can you hear me fine?

Yes I can.

Yep. OK, Jason Joyce Lobster fishermen of Swans Island Um, my family goes back here over 200 years fishing in this area. Um, I appreciate what Jared Golden said. I appreciate the well thought comments that the Congressional delegation has put forth. I appreciate Commissioner Kelleher’s comments on some of the things I'll try to hit on. I made a note here, obviously, at first, they said, Not to just have a gripe session. I don't want anybody to say, Would you like to have some cheese with that wine? But in my opinion, ropeless will not work. The technology is not there, so I don't even, really want to talk about it because that will put us completely out of business. I don't feel like there's enough data to support this plan or the closures. If the data supported the closures in zones C, D, and E, then the proposed windfarm by the Governor should not be allowed to be introduced near that area. Because if it was, it would likely change the whale's migration pattern. The negative effects of this plan on Maine’s economy and my Island's economy will be catastrophic. We have 370 year round residents. If, as I look at, not just this year’s plan, but the extended plan for 10 years, what the reductions are going to be, it will make us into a seasonal community and my family has been here since 1806. It doesn't make any sense. We are small boat fishery as well. So the trawling up is difficult. If we have to do it, we will, I, I do support Zone B's Request. To be able to split the trawls so they can have one end line. Lot of the boats are smaller where they've traditionally fish. If they have to go in with two lines, it's very difficult. And some guys fish by themselves. This is going to be very difficult on them because they're going to have to come up with some crew. We don't have that many people on the island. So, I'd have to dig up somebody. one thing I'd like to mention, I'm good friends with the fellow down in Chatham Masters name is Billy Chaparralus, he worked tagging great whites when they first showed up 6, eight years ago down in Massachusetts. And he was telling me when they watch the tagging of those great whites, they end up down off of that. I think it's south of Carolina’s maybe off of the Florida coast where the right whale birthing areas and his theory is a great whites are down there for cheap meal. And I've never heard that studied to check if that's where maybe some of these low birth rates come from, but I think that's a possibility. He's a fisherman. And he has worked on a lot of these projects, and he studies it. And that is his theory for the low birth rate, low birthing success because the great whites are down there having a snack. Other than that, I appreciate the time to speak out and again, I agree with that the Commissioners comments as well as Jared Golden and our Congressional delegation. Thank you.

Thank you, Jason. Gina, you are next. OK, Gina, you should be able to unmute yourself.

Can you hear me?

Yes, I can.

Hi, good evening. My name is Gina Gary. Thank you very much to for the opportunity to speak with you this evening. I wanted to add some comments to what I had to say last night. I'm in Portland, Maine. I am the Maine State Director for Animal Wellness action. And although I have spent my entire life on the New England Coast and understand the delicate balance of healthy fisheries and environmental obstacles in particular, those related to driving the potential extinction of a keystone species such as the North Atlantic right Whale. I'm going to leave specific comment on the gear, and the recommendations surrounding gear to the experts and the fishermen that you have on the line tonight. But I will say that we believe at animal wellness action and the Center for Humane Economy that resolving the fisherman's dilemma and the lobstering industry's dilemma in terms of their wish to also protect the marine mammals in their waters and saving the North Atlantic right whale. That those propositions are not mutually exclusive. But we do have no time to waste with less than 85 breeding females, and in excess of 80% of the population documented with scars and injuries from entanglement from fishing gear. So, more needs to be done, and while the rule proposal is a good first step, it does not go far enough. I will say that what we support, Well, sorry. What we do not support is the trawling up proposal, as has been mentioned, as it increases the risk of lethal threat to whales and increases the risk to the fishermen. We do request and support longer and larger feeding habitat closures through the northeastern fisheries, especially in the Gulf of Maine. And we do support an increase to the proposed risk reduction measures from 60% to 80% given the updated numbers on the population counts. We'd also like to add that Commerce needs to create financial incentives around this proposal for fisheries to offset the anytime off the water to our local fishermen and any reduce catches that evolve from being off the water to their practices. And also to cover the cost of any gear changes. And we also recommend further that this proposal consider creating a funding mechanism for a state-of-the-art tracking monitoring system. As Canada has done using drones with live feeds, accessible to the fishermen, 24/7 on the location of feeding whale pods and to substantiate the necessity of the closures that are proposed in summary with so few animals left in our waters. We need to get this right the first time, and I appreciate your consideration. And we at Animal Wellness action and the Center for Humane Economy, hope you will amend your rule to consider the request. Thank you.

Thank you, Gina. Hey Jack, Merrill. Coming to you. OK, Jack, you should be able to unmute yourself. Yep you're unmuted.

I'm on?

Yes, I can hear you.

I've got a degree in Marine biology, and I've done oceanographic work, but I chose, Instead a 45 year old year career as a Lobstermen. After spending the last month researching the scientific data, there's clearly a disconnect between what it says and what NMFS is proposing, even a further disconnect between what the data and what environmental corporations are alleging. The fact is that no, right whale death or serious injury event has been attributed to Maine lobster gear ever. The fact is, there is only one documented entanglement in Maine gear in the last 20 years. And that whale was disentangled 9 years ago. I sent NMFS 20 reasons I found fault with the bio opinion. And here's a few of those. It assumes mortality and serious injury of unknown origin occurs equally in the US and Canadian waters while acknowledging that the overwhelming number of entanglements and ships strikes have been happening in Canadian waters in recent years. It assumes no future reduction in mortality and significant injury from ship strikes or entanglements in Canadian waters, despite the most recent evidence to the contrary. It acknowledges that entanglement rates have been markedly less since 2010, but fails to recognize the importance of the significant gear reconfiguration. It fails to evaluate the importance of the most significant threats, disease, toxins, pollutants, and the overriding factor of global warming. It fails to evaluate pollutions effects on feed health, birth rate, and survival. The absorption of plastic by all levels of sea life, for example. It acknowledges, but fails to calculate the drop in surveillance and the parallel relationship to less whales seen and counted. It fails to recognize the importance of co-occurrence information, which shows a change in right whale travel patterns, taking them to the outer boundaries of Maine's possible, lobster efforts. It gives very little recognition to scarring caused by ship strikes, natural scarring caused by the attack from other marine animals or their own attempts to rid themselves of predator sea lice. It fails to acknowledge that while attempting to calculate minimum population numbers and incorporating the unusual losses from 2015 through 2018, the right whale population has increased over the last 40 years by 56% when most other animal species have significantly declined. It fails to consider that since serious known entanglements in US Lobster Gear remain Minimal, or Non-existent, Other factors must be the primary causes of population threats. And three final comments: Trawling up is dangerous for both Whales and humans. Random seasonal closed areas, is a bad scenario for both whales and humans. Conditions, right whales are now facing are changing rapidly. We're looking at a no analog future predicting right whale populations one year ahead is hard enough, but making 10 to 50 year projections impossible. Everyone seems to be ignoring 2020, was on all accounts a good year for right whales. Thank you.

Thank you. OK, Karen. All right. OK, Karen. You're unmuted.

Hi. Thank you for this opportunity. I've attended all three of the previous sessions on right whales. I'm an ordinary citizen living in Florida. And I'm an advocate for the environment and all creatures living in it. While, I'm not unsympathetic with the plight of the people whose incomes depend on fishing, lobstering, crabbing, shipping and cruising. I'd like to send out a reminder that there are alternatives as unpleasant as they might seem for some. If jobs are impacted, or even end, there are other options. In contrast, if right whales are killed off, or if their numbers dwindled to the point of no return. That's it. It's over. There are no second chances. Whales are an important part of the ecosystem that we all depend on for life. Scientific data shows that they even affect climate, without whales, all life would be negatively impacted. There are complaints that data is old and more research is needed. But no more research is needed to demonstrate that right whales are in extreme danger of extinction, and that there is a dire emergency. Now, According to the Marine Mammal Commission, which is part of the US government, there used to be a minimum of 10,000 right whales. Some who work at sea say that whales aren't where they work, they never see them. Well, maybe they never see them because they're almost all dead. So as the situation of the right whale is urgent, I urge that every measure possible will be taken to save the species and prevent the suffering of whales who are victims of human activity, fishing, crabbing, lobstering, shipping, and cruising. Thank you.

Thank you. OK, Russel, Wray. OK, you should be unmuted.

Yep. Can you hear me?

Yes, Russel I can hear you.

Good evening, I’m Russel Wray and I'm providing comments for Citizens Opposing Active Sonar Threats or COAST. The proposed rule states alternative 2 was selected as the preferred alternative quote. With extensive input from fishing industry stakeholders who will be directly affected by the measures unquote. COAST acknowledges fishermen in their communities will be affected. Firmly believes that state and federal government must financially assist them in making any required changes. This statement and the proposed rule on the whole implies others will not be affected, which is far from the truth, especially seen as some measures proposed, most likely will not prevent right whales To be injured and killed at rates exceeding your PBR. Thus moving a species closer to extinction. This negatively affects the ecological community in which the right whale plays a vital role like the whales themselves, these community members are also stakeholders. The draft EIS did not properly consider ecological impacts. In addition, a great many people care about the well-being of our oceans, whales, in particular, for some they are a source of awe and wonder and mystery. I'm one of those people having been totally fascinated by whales and dolphins as a young kid. To this day as a professional artist, their beauty inspires much of my work. So while we may not be directly affected economically, we are stakeholders all the same who are directly impacted by the inadequacy of the proposed protections. News of the whales' impending extinction has caused people across the globe to show sadness, anxiety, depression, and anger. Given the fact we are already facing multiple environmental disasters. Looming extinction of this iconic animal further drains people's hopes for the future, no doubt hitting young people, particularly hard. NMFS gave these widespread, direct effects. Little consideration and No, real wait. A few lines included in Draft EIS were lip service and nothing more, this heavy bias on the part of NMFS decision makers in favor of those economic interests. It's not fair or justified. Any final rule must consider and give due weight, All impacted stakeholders not just those affected economically, the protective measures must be made effective in the real world, not just on paper. Thank you.

Thank you. OK, Katherine Deuel

Can you hear me?

Yes, I can.

OK, Great. This is Katherine Deuel with the Pew Charitable Trusts. Pew agrees with others that the proposed rule is fatally flawed and needs to be significantly revised. The data and analysis used to develop the risk reduction target is based on an outdated understanding of both documented and undocumented deaths and serious injuries. NOAA has also failed to apportion PBR for right whales between US and Canada and between entanglement and ship strikes, even though there is ample scientific basis for doing so. If this were done, it would clearly show that NOAA needs to bring the level of mortality and serious injury in this fishery to effectively zero. Unfortunately, the situation for right whales has only gotten worse during the three years it has taken NOAA to develop these proposed rules. NOAA should take immediate action and implement several temporary closures to vertical lines, while working to revise and propose a new set of alternatives. We'll have more details in our written comment, but I wanted to make a few more key points tonight. First, I want to emphasize that public comment from all stakeholders, similar to what Russell just mentioned, should be considered, including those who sign onto group letters that are submitted into the online portal. Many Americans across the country have weighed in on this issue already because they don't want whale species to go extinct. And they care deeply about the status of an endangered whale. Even if most of them will never get to see a right whale in person, please ensure all comments are counted no matter how they are submitted. Next, on ropeless Gear Pew's glad to see that NOAA has proposed allowing ropeless fishing in areas that would be closed to vertical lines. But NOAA can and should do more to advance ropeless gear beyond these areas and work to solve the legitimate economic technical and logistical issues with ropeless that are being raised by the fishing industry. These issues are not impossible to solve. People are working towards solutions already, and the issues can be overcome within the next year or two if all stakeholders work together and keep an open mind.

NOAA should keep ropeless moving forward, by demonstrating leadership and tackling challenges and providing funding opportunities. Finally, it has been mentioned by different stakeholders. And I agree that NOAA should more fully explore the concept of dynamic management. Closing some areas to vertical lines when right whales are spotted, and then re-opening if there are no additional sightings. NOAA has not recently analyzed or explored dynamic management and should consider that there have been advances in technology since this system was last used in the US 15 years ago. And NOAA can look to similar programs in Canada. Just last week, Canada announced their plans for 2021 to once again, use real-time detections to close areas. to vertical lines when right whales are present and then re-open them if no whales are detected again. The US should follow suit. The decline of the right whale population requires all options to be on the table. And unfortunately, this proposed rule only offers a narrow set of measures that will not do enough to reduce risk of entanglement in US waters. Thank you for the opportunity to comment tonight.

Thank you. Michaela Morris, You should be able to unmute yourself.

Great. Are you able to hear me?

Yes. I can hear you.

Great. Thank you Also, like everyone else, has said for the opportunity to speak tonight, my name is Michaela Morris and I'm an Oceans associate with Environment America Research and Policy Center. We are a nationwide non-profit that works to protect clean air, water, and open spaces. We are fortunate in the United States, and that the United States has a rich natural legacy. oceans, where whales dolphins, and sea turtles thrive, forests where families hike together like I grew up doing I'm from New Hampshire. And mountain ranges that stretch into the distance, right whales are a part of this natural legacy of natural beauty. And in sharing that future generations are able to experience the beauty of our wildlife and wild places, starts with standing up for our most vulnerable species like these whales. A framework of strong environmental protection laws, like the National Environmental Policy Act, Marine Mammal Protection Act, and the Endangered Species Act, codify this set of values. It is in this spirit today that I testify tonight with grave concern for the future of our north Atlantic right whale. Scientists estimate that we can lose less than one right whale per year, but since 20 17, we have had over 30 documented, right whales deaths most caused by human activity. And as we all know, Entanglement in Fishing gear accounts for at least eight of these deaths, and has caused at least 13 more serious injury. At Environment America, we believe that the current draft of the risk reduction rule to modify the Atlantic large whale take reduction plan, as proposed by the agency, does not uphold the American legacy of environmental protection and will not do enough to protect right whales from one of their top threats. I will submit more comments through the portal, officially from our organization, but I would like say a couple of key points. First, I encourage the agency to formulate a much stronger rule, taking into account the input of all stakeholders, like Katherine and Russel, just mentioned. I'll also say that we need more and longer habitat closures. To truly save the species, we need to dramatically reduce the amount of vertical lines in the water. And the proposed closures are too short in duration and not large enough to protect these whales. Looking in the long term, we also believe that ropeless fishing gear is the best path forward. We know the best way to prevent entanglement is by removing vertical lines from the water and in the long term. This means ropeless fishing gear and forging a path for the widespread adoption of such technology. NOAA Fisheries must continue efforts to test, and foster a market for ropeless technologies. Um, NOAA was petitioned. Actually, I'm not going to. Finally, we encourage the agency to rewrite the rule according to updated right whale population data. The risk reduction measures in place aimed at achieving a significant sufficient level of risk reduction to prevent seriously damaging and fatal fishing equipment, entanglement so that the population, can avoid extinction are based upon an outdated right whale population estimate. Today, I urge you ultimately to uphold our legacy of environmental protection and do everything you can to save the North Atlantic right whales. Thank you.

Thank you. Robert Simmons, I'm coming to you next. I'm not sure which one to unmute, so, you should be able to, unmute yourself. Robert, Simmons, you should be able to unmute yourself, if you can hear me. Oh, I'm so sorry. Yes, you did. I apologize. Yes, thank you. Thank you for that reminder. OK, Christian Porter, I'm coming to you next. Sorry The list is so long. Imagine me running around the auditorium, bringing you a mic OK, I'm in the K's now, Kristin Porter. There you are, OK, you're unmuted.

Can you hear me?

Yes, I can.

OK, thank you. My name is Kristin Porter and I'm president of the Maine Lobstermen's Association. I'm here tonight just to give a few comments from the association, but we will be submitting lengthy written testimony. So I'm going to be here too long. But I just wanted to say that this plan has to be based on sound science, lobstermen want to do our share, but we can't prevent whales from dying in Canada. Just a few facts from National Marine Fisheries Service data. From 2016 to 2019, 39% of the right, right whales serious, injury and death, we're in Canadian fishing gear, and that was 0% from US fishing gear. And because there was so much prevalent gear, there was, there was a, a person testifying earlier said that 90% of the gear was unknown, that rate went down to 61%, because there was so much Canadian gear on from that time period. So, and 10 of the deaths are in Canada in 2019. So, but yet the US fishery is supposed to take 50% of the unknowns. Which means that we are, we're at 60% risk reduction. And that just doesn't pass the straight face test. And MLA has been saying that since day one of this process. And we continue to say that, um, your data shows that right whales are rare in Maine, and it seems it seems pointless. For us to be doing all of this with no sound data, there are thousands of families and dozens of communities that are being affected by this. Please consider the cost of these regulations compared to the little real benefit it has to the right whales. And I also want to comment on a couple of things as a fisherman, that I do support the trawl up equivalencies. If you think about if you have a 20 trap trawl rate requirement. And so that would be two lines for 20 traps, But if you, if somebody wanted to fish 15 traps with a single end, they wouldn't be able to do that. And that would be a lot less lines in the water. So just. And so just so it could be a chance to have less lines in the water by those equivalencies. And also, I support the conservation equivalencies because Maine is such a big state and the zones are so different. that as long as they meet, that the threshold for the, for the 60% or whatever percent that we have to use. I support those. So thank you.

Thank you. OK, Brian Tripp, you are up. next. You should be able to unmute yourself. I can see that you're unmuted, but I can't hear you yet. If you have headphones in, then just make sure on your audio settings that then your microphone and speaker settings match whatever device you're using. We're going to, we're going to go to Jacob, and then we'll come back to you. So, you'll be up next. OK, Jacob Thompson, coming to you next. OK, Jacob, you should be able to unmute yourself.

Yes. Can you hear me now?

Yes. I can hear you.

OK. I just had a few things. We've heard from a lot of people that are paid employees of non-profits. And you have to realize that a lot of the fishermen aren't comfortable commenting on these forums. So that kind of goes by that but also you guys have a whale sighting app on the i-phone iPad. And I don't see where in January there have been any whales in that area one closure that you guys are talking about. And it also seems pretty convenient that it follows the Area three line. When, I mean, obviously, whales don't know where these arbitrary lines that you guys draw on the water are. And all these people that don't know anything about fishing are talking about this ropeless, ropeless fishing, I would like to see them have to do their jobs with no internet, That would be comparable of us doing our jobs with No rope in the water. Maybe that would get them thinking about how hard, uh, of a job that would be, too, for us to do. Also, Since we started doing all of our things that you've mandated. We've gone from 200 to less than 300 whales to over 500 whales before climate change in feed sources. And God knows what changed to make all the whales die in the last 4 or 5 years. And the last thing I'll speak on is I am in favor of the conservation equivalencies. Some boats in Maine are 30 feet, some boats are 50 feet. You can't have a one size fits all rule. And with the area one closure, I think there if it has to go through. there should be some kind of a mechanism. But we shouldn't be lumped in with the all area one fishermen, because down in Massachusetts, obviously they've had a closed area for years. So they obviously have a problem. So it shouldn't be if so many whales are entangled in area one that we get closed out, it should be just in the zone around where they are, which I know will be hard since you don't fly any planes or know where any of the whales really are. Then, the last thing was about the how we didn't get any credit on how much money we spent for the gear marking because that was the big, big time suck for me last year, that probably cost me a lot of money that you guys didn't include. And I know my three minutes is up, so thank you.

Thank. You, Jacob. Thank you so much for your comment. OK, Brian, I'm going to come back to you. Oh, OK, we're going to come back to Brian. After that, he looks like he’s fixing audio, OK? Max Strahan I'm coming to you next. OK, Max, you should be able to unmute yourself.

All right. Can you hear me?

Yes, I can.

All right, so my name is Richard Maximus Strahan, I’m with Whale Safe USA. And I'm the whale guy. I started I am the responsible for most of this stuff going on. I'm a scientist and also a commercial fisherman in New Hampshire and Massachusetts, a green fisherman. The problem here started when Congress handed the right whales and all endangered marine wildlife over to NOAA. NOAA is corrupt and has had corruption and fraud since day one, because all NOAA wants to do is support the small, insignificant, commercial fishing community in New England in the north-east. We have 350 million Americans want right whales to survive, but it has this forum today shows. We only have a handful. A teeny percentage of people who actually want to kill the right whales off so that they can make their cheap profit of destroying ocean wildlife.

Instead of having real jobs, they make things like farmers do, instead of just ripping off the ocean for all its biomass? All of this is actually illegal that NOAA’s brigade is spent most of its time trying to evade the Endangered species act enforcement, and it's done that till this day. The Atlantic large whale take reduction plan, as it's now operate is completely illegal. NOAA can't make that negligible impact determination required under the Act. And it's formed this Atlantic Take Reduction Team of commercial fisherman in their support WINGO or get your supporting whale interested NGO's, despite the fact that they can't allow a single take of any northern right whale or any other endangered whale in mass in the New England area. And despite that, they're going forward with this plan. And they ignore the number one alternative they should have put in the plan, which is to ban all vertical buoy, ropes. But because they're controlled by the commercial fishing industry, they ignore this obvious thing that would stop the killing the whales. They claim the right whales are going extinct even if they stop fishing because they don't want to recognize after decades of driving the whale population down, just like the codfish. The right whales are so few in number. They can't bounce back if they wanted to. And that's the problem. Right whales are gone. They're extinctions inevitable, and it's caused by NOAA And now as a green fishermen, the problem is we need to fire all these lobster pot fisherman and open up the fisheries to green fishermen who can't even get a permit now and go fishing. And that's what is going to be decided in the Federal courts in Washington and in Massachusetts and Maine, because state federal judges or rule states have to get incidental take permits under the ESA that Marine Protection Act Regulations do not work, are invalid and illegal. And I personally well not obey these regulations because they're in violation of the Endangered Species Act and killing whales. CLF and other WNGOs have only backed up now, NOAA and prevented the protection of these whales, and if there's one agent in the world that's responsible for their extinction would be the Conservation Law Foundation, which told the federal judge after re-ordered.

Hey, Brian, have you oh no Don't worry. We're going to keep you on the list and come back to when your audio is connected again. OK, Richard Howeland. I am coming to you, Richard.

I'm going to just jump in, while Kara’s looking.

Yeah, yeah, I'm right here. Can you hear me?

Yes, OK, hold on one second, Richard, and I'll come back.

Sorry Richard, we won’t start the timer until I’m done. Colleen again. I want to remind everyone, Max was directing most of those comments at us, and so we did let him finish. But we, yes, we do ask that people be respectful and do please direct comments at us, and we will limit folks to three minutes. If we had heard foul language or any kind of threats or anything like that, We certainly would have cut him off. So, thank you for the chats in the question boxes.

Great. Can you hear me?

Yes, I can hear you.

OK great, I'm Richard Howland and I'm a lobster fisherman from Little Cranberry Island. I guess, I'd like to offer the previous speaker an opportunity to come on the boat with me. and actually see the operation I'm running and see the modifications I've made to protect whales. You know, We really I think we probably have more in common than then we Don't, but he sounded pretty negative. That's too bad for him, but I've heard a lot of people on this call thanking the politicians and the government officials. I want to thank the lobster fisherman for being on here. We're actually the ones that have something to lose, the politicians, the scientists. And the government officials are still going to have a job after this is over. I really understand this process pretty well. I've been involved in the industry for a number of years. I've always been willing to compromise, but I'm actually starting to question, is this really about saving the whales. Or is this about the environmental groups that are pushing a radical agenda to have something to hold up to their donors so they can say, look, we put lobstermen out of business, could be saving whales, please donate money. When the honest truth is, after you guys have cut us back by 98% by the year 2030, similar to what representative Golden said, ships are going to continue to strike whales and kill them. And all you're going to have left is it decimated coastal economy on the coast of Maine, a coast of full of hard-working, honest guys. That just want to earn a living, have never hurt whales in the first place. Please think about that. What is this all about, and what will this actually accomplish? Thank you.

Thank you. OK, we're going to go to Barry. All right, Barry, you're unmuted.

Hi Barry had to step away, so this is Gretchen Catlin his wife, I'm speaking on his behalf.

OK When he gets back we can put him back on the list as well, but.

OK thank you. So Barry has been a lobstermen since he was eight years old, he's never seen a North Atlantic, right Whale in the Gulf of Maine, he was also in the merchant Marines for over eight years and has been in every ocean except the Antarctic. during that time. He'd only seen right whales on the East Coast of Florida. While he was on a 700 foot break bulk shifts doing 19 knots, and the vessel never slowed down, through that pod of whales in the wintering grounds. So that's a concern that we have is regarding the ships. And the negative impact they're having on the whales, down, off the coast of Florida. The amount of shipping traffic in the Gulf of Maine has been reduced. But we encourage further reduction, of the nautical speeds for the shipping vessels to help protect the whales. Thirdly the economic impact of closing Area one would not only put Barry out of business, but it would put several other lobstermen out of business without sound data to support these measures. So we encourage further research to be conducted before we implement, further changes that will negatively impact all of the lobsterman, not only in Maine, but Massachusetts, New Hampshire, as well. Thank you.

Thank you. OK, Darren Turner, Brian. I will come back to you, we are so close. Darren Turner, you're next. I'm not sure which account. You should be able to unmute.

Hi can you hear me?

Yes. I can hear you.

OK I’m a fishermen, Maine fishermen, lobster fisherman, and other fisheries. I've had 25 years on the water. I love all ocean life. Um, but while I'm fishing, I've never seen a right whale or an Entangled Whale of any species. With that said, I'm focusing on science here. The ocean is really big. And it's really big for fine-tuned science, that we're trying to achieve. With all due respect, very intelligent people doing the best they can with, with what resources they have but, science is repeatable and peer reviewed, and it just seems like there's a lot of holes in it. I just ask that, we put data before agenda, and if we don't have the data, that's solid, and we really are going down the wrong road. Um, moving forward with questionable data, it ruins the National Marine Fisheries Service’s credibility, that's just the road that we're all heading down. With that said, I just disagree with the whole proposal based on the premise of the, of the of the holes in the data. So, but specifically, the 1700lb breakaway will cause me to lose extensive amounts of gear, I fish, weigh up in the Bay of Fundy. And the tides are enormous, and we have tangles in. Anytime there's a storm that blows through, and we get a big sea, we have our gear our trawls tangled together. And, I am telling you it is heavy when you try to pick them up and untangle them, and the breakaways are going to cause us to lose a large amount of gear and there's going to be huge costs, not just the gear lost. Um, and if you lose a couple of trawls right during the run, we have like 5, 6 week season where we make most of our money if you lose trawls you're losing a huge amount of your income percentage, so the costs will be enormous, not to mention, It's going to leave a mess on bottom. So, that's all I have to say. Thank you.

Thank you. OK, Brian, I think we're there. Brian, you should be able to unmute yourself. I can see that you're unmuted, but we can't hear you yet. OK, we'll come back to you, I promise. We will not give up tonight, OK, Matt Gilley, you're next.

OK, Can you hear me?

Yes.

Alright. I spoke last night and I'm a lobstermen I'll try to keep it short. I'm not very good speaker. I spent most of my time on a boat not most my time, speaking to different groups, like a lot of the people that have spoken before me. one thing I will comment on is I think the whole way that this has been done with the Zoom meetings is unfair to fishermen. We have an industry we're averaging 58 years old. A lot of these guys don't understand how to use the technology that has come out within the last year or two. We've just started using since the pandemic began. And we have environmentalist who this is. Their whole job is to go to Zoom meetings and make presentations and stuff like that. As lobstermen our job is to lobster. We don't understand how a lot of this works and we're doing, the best we can to make an effort to make our voice heard. Following that up, the few points I do have is I want to reiterate something I heard last night last year is a prime example that we're not the problem. There was no reduction in effort or by the lobstering community in Maine, and the only thing that's stopped happening during the pandemic with cruise ship, the amount of right whales that were hit last year, and killed were two, none were entangled, so that right there shows that we're not the problem. It is the shipping industry 56% of deaths NOAA themselves has contributed to the shipping industry. So, even if you take all of our line out of the water, the population is still going to decline. Last year, I was at one of these meetings, and a ship came into Portsmouth. With a whale draped over its bow. We're not the problem. Furthermore, ropeless fishing, It isn't feasible financially, safety-wise or anything.

Let's say we sent out a string and my crew get snagged in the rope in the string goes over. What do I do to haul him back, I can grab the rope now and throw it in the hull, and get my crew back but if its ropeless what buoy do I grab to pull my crew back? You're asking me to put my life. My crews life, Anybody else, life at risk for a whale that we've never seen? Let's just call this what this is. And this is just a way to get us out the way so they can put the windfarms out there. You have to follow the money. The money is coming from the environmentalists groups, funneling into a wind farm. And they can't put their wind farm in If our gear is there. This is a direct way to get us out of the way. So they can put windmills in. And windmills have been shown to cause whale deaths between the electrical signal that they omit and the sound from them spinning, they screw up their sonar and the whales beach themselves. We are not the problem, and Max Strahan can go back to the street. I'll end it on that.

OK, Tyler, well, Brian, let's come back to you real quick. OK, Brian. You should be able to unmute yourself. Brian If you wouldn't mind calling our Help desk number. I've put the number in a private chat to you. We should be able to figure this out for you. OK, Tyler Bemis and coming to you next. OK, Tyler, you should be able to unmute yourself.

Can you hear me?

Yes.

Alright, I'd like to thank everybody on this meeting for letting me speak. I'd like to start off by saying I agree with Commissioner Kelliher and Jared Golden and I thank them for speaking as well. I'm a lobstermen from Matinicus Maine and I fish in Area one as well as inside the three Mile line. And I disagree with just having a one size fit all plan just because, where we fish, the majority of boats are under 35 feet and you can't, not going to be able to fish trawls and stuff with these small boats. And another thing with putting more traps on one line with, uh, with weaker rope is you're going to have more gear, parted, you're going to have more snarl ups with the gear that's in there because guys aren't used to setting that many traps in an area. On one line. So with a weaker rope, you're going to have risk of parting with your hands in there. It can rip you overboard, you know you lose limbs, rip you overboard, cause a lot of damage and I just don't agree with that at all. Also, with that, you're going to have a lot more ghost gear. You're going to have a lot more rope in the water column. And, you're going to have seabed pollution from the ghost gear rope, et cetera, which isn't good for anything. And then with more rope, when you fishback ghost gear, you're more likely to part and lose more, which is just a revolving door. And it's the same deal with that, add, more traps, to a trawl line. You know, and with that, it's increases the size of the boat that you're going to need. And a lot of guys, then, they can't make that financial burden. So, it's pretty much just going to force them out of area one, which I don't think is fair at all. And then the zone closure For area one that you guys are talking about from October till January, I don't think that very just either, just because that's during their southern migration. And that's when the whales are the strongest. I think that if there was to be an Area one closure it should be during the spring migration when the calves are the weakest. That way they'll have a free path to get up there which I don't think that there should be a closure without some satellite surveillance or flyovers, which there are none in Maine right now. If they were flyovers and stuff and you to pinpoint where they were close down that one area and then you could leave the rest of the area one open, until they're no longer there. But we don't do any of that. Instead, we're just going to blanket everything over and just say, Yeah, you guys are screwed, and, uh, we're going to just close you down which is, which is crazy, because from October until January is our most profitable time of the year. Thank you. That's all I got.

Thank you. Julie Rabinowitz you are next you should be yep, you're unmuted, can you hear me?

Yes. Good evening. Julie Rabinowitz with Maine people before politics I live in Falmouth, Maine. And we echo the comments made tonight that the prior forms made by Maine's lobster industry, have had a tremendous positive effect in the rebound of the right whale population up to the 2017 mortality event. However, the data surrounding the recent decline in the right whale population does not support these new regulations to the lobster fishery in the Gulf of Maine. We continue to see mortality is tied to ship strikes. Many in Canadian waters, which these regulations do not prevent 2020’s decline in shipping due to the Pandemic correlated with a sharp decline in ship Strike, right whale deaths in the North Atlantic. A study published in June 2019 into Journal Diseases of Aquatic organisms, reviewed all 70 right whale deaths from 2003 to 2018. Entanglement was identified as the cause of death in 22 cases, of which 14 involved Canadian snow crab fishing gear. one involved US gear and the remainder were unidentified since the period of that study. Here are the facts. The 2019 deaths in Canadian waters were either ship strikes or undetermined. The single 20 19 death in US. Waters was an entanglement off the coast of New York. that whale snake eyes had been seen gear free in the Gulf of saint Lawrence on July 16th, just a few weeks earlier than the entanglement when he was seen entangled in the Gulf of saint Lawrence on August six. Excuse me. The deaths in 20 20 were in the Mid and South Atlantic. Both calves, one killed by a vessel strike, and the other was determined to have died during or shortly after birth. The sole death this year is a calf from a ship strike off the coast of Florida. We should save these whales, however, the regulations under discussion tonight would not have saved a single one of them and long after the rules are in effect. Right whales will continue to die in Canadian waters and by ship strikes. Reducing risk on a computer model is not the same as saving whales. Regulating Maine’s lobstermen do not stop deaths by ship strikes in Canadian Waters, Studies also indicate ocean noise. such as that from ships or energy generation could be a significant source of whales stress possibly causing both increased ship strikes and fewer calves. Maine’s lobster fishery is unfairly bearing the brunt of the risk reduction yet NOAA continues to grant right whales Incidental take authorizations for offshore wind turbine development, which pose a significant risk to right whales and other marine mammals, because of the interference with the sonar and may be it may also be affecting the birth birth rates. Before implementing regulations. We ask NOAA to further investigate the dangers posed right whales and other endangered marine mammals by the incidental take authorizations and the development of wind energy in the region under discussion. Thank you.

Thank you. OK, we have Rebecca Johns, next, I’ve unmuted you. You should be able to unmute yourself.

Thank you. Can you hear me?

Yes, I can.

Thanks. So I guess I'm one of the few people on the call who has seen a right whale, which is, which is one of my obviously many, many, many years ago, I came here from the UK. Must be 23 years ago, I drove down to the Sagamore Bridge because a friend called me and said a right whale was coming through the canal, went down and watched a right whale swim through the canal and under more underneath the second one bridge got a photograph of it. But clearly, I'm one of a really small percentage of people on the planet. With that, I'm a marine biologist, originally by training. Had a different career since, and I now live and work on the coast. And in Maine there is a, and I, I haven't got prepared. I'm not reading a prepared statement. I've been listening to what has happened tonight. Big believer in multi stakeholder groups. And there is huge expertise in the take reduction team. And you've done amazing work over many decades now. But it's really clear that the work of the team has been completely overtaken by the speed of the decline in the population. And we can talk about 20 whales up, 20, whales down in the population. Data. But we're talking about a small, a small potential percentage, and a really, really small population. We're talking in a way, we're looking at a classic running to catch up in the situation facing our proposals on science. But the nature of a good science is that results of peer reviewed publications. We just can't keep up with the speed of the situation that we're dealing with were nickel and diming the population estimates. Uh, and we really need to be, if we're going to work with this narrow a margin for the survival of a species, we absolutely have to be working with the latest population estimates, and it doesn't seem to me that we are. on top of that. In terms of last year's numbers, the latest numbers were just not, our margin is not big enough to be making the plans that we're making. With the estimates that we have, So, I would really, really encourage the team to work with absolutely the latest. If we're going on the latest data, if we're going to work with such small margins of error in terms of survival of the species, the, the second piece is about the ropeless gear. My, my neighbors are lobstermen, wonderful, wonderful people that I live and work alongside. But it's clear, if you, if you talk to my neighbors, and, to, the kids in the elementary schools, along the coast here, that the only sustainable, long-term future for the marine environment is ropeless gear if we want to everything to survive. And we need a pathway to that. And it's not that we need everybody to switch overnight. But we need an ability to have some piloting and some granting and financing programs and none of that can happen without permitting scale. Thank you very much for your time.

Thank you, Rebecca. Virginia, Olson, you are up next.

Hi, thank you. I wanted to thank Commissioner Kelliher, and Senator Golden. I agree with them completely. Um, a few things I wanted to point out: I think that it is vital that NOAA looks at Maine’s conservation equivalency on our zone proposals. That's what our trawl lines are very important to our zones. The Closure and LMA one. I think that it is very important that to have any sort of closure that NOAA has got to be able to show some sort of data that has is showing that we have whales in some sort of seasonal aggression across multiple years in LMA one in Zone C, D, and E, for this Closure to be an effect because we don't have whales there. And having a closure on LMA one would hurt us considerably, ropeless fishing. It's not ready. It would not be good to put ropeless fishing in any capacity in LMA one for a seasonal closure, or in a future. Looking at a fishery at 98% risk reduction to a ropeless fishery. I think that is a very scary future for Maine. And we need better science. If we're looking to save whales, we can go on a satellite and look at my eight foot skiff on the dock, but we cannot tell where a whale is, the size of my house. I think that it's not feasible. We need to be able to tell where the whales are, to be able to save whales. If that's where we're going, then let's let Max be a hero again, maybe he can fix that for us. And I think that's all I have right now. Thank you for the time.

Thank you. OK, Jan. I'm coming to you, lots of Js on here tonight, OK Jan, you should be able to unmute yourself.

Yes, hello. So first of all, I'd just like to say how much I respect, lobsterman and their lifestyle. I just have a comment, and kind of a question: The density of lobster traps in some offshore areas are so dense. It's hard to negotiate a boat through the maze. No less the skill a whale would have to master to do so. So I'm, I'm just wondering if NMS has considered limiting the amount of gear in given areas And maintaining wide unhindered corridors for whale-safe travel. That's my question. Thank you so much, everybody. Goodnight.

Thank you. OK, next we have John. OK, John.

Do you hear me OK?

Yes. I can hear you.

Great. Thank you. Thank you very much. My name is John Drouin and I'm a lobster fishermen, Cutler Maine. I've been lobster fishing for 42 years. Cutler is in the mouth of the Bay of Fundy and we'll bring that up in a minute here. I have a couple comments and questions about your data. And then I'll have a couple comments about your proposed rules. Looking at your marine mammals Stock assessment, which was written dated April of 2020. You folks state that there are 270 whales that were in 1990. And there were 481 in 2011. And currently, your estimates are that there's 428.

And yet, this is out of your report. And yet at the beginning of the presentation, Colleen states that there are below 400 whales. I've seen other people report, since these webinars are taking place, numbers of like 366, It baffles me the inaccurate data that you're basing people's livelihoods on and communities in. Anyways, it also continues on in your report that's in from 1990 to 2017 447 calves were born into the population all while you're claiming a decline. To me that shows that we existed with the whales and a lot while they were rebounding. What happened in 2011 is The Gulf of Maine warmed, the food sources had shifted again, I fish in the mouth of the Bay of Fundy and I've never seen a right whale even though that's where the Right whales summer for decades. They don't come through the Grand Manan channel. They go around the other way. Um, what took place in 2017? Oh, back to 2011. So climate change, and the food source shifted. So now, whales are stressed, they have no feed. And that's what, in my opinion, attributed to the low birth rates. In 2017, what took place up in the Gulf of saint Lawrence? Oh, that's right. Whale showed up there now because they found feed So they're now feeding. And in the last year, the birth rates have gone back up, um, doesn't seem to me that the problem with things were with the Maine fishery. According to your proposed plan. I support no closures anywhere in the Gulf of Maine, along the Maine coast. The trawling Up scenario that Maine has provided for you. We feel will work for most. It doesn't work for everybody, but nothing does. If we're trying to work and trying to help, to save something that, again, we're not the problem of, we will do our part . Give time for the gear markings to work. We've only implemented them last year, this is the second year. As with any regulation, you need to give time to work. The weak links, again in the Bay of Fundy. They do not work. And I also fish in the gray zone, which is disputed Waters with Canada. I would be put out of business sooner than the BiOp is suggesting because Canadians will sit on top of us and we have no way of retrieving our gear. Thank you.

Thank you. OK, let me go. Michael Myers. You should be able to unmute yourself now, Michael.

Hello?

Hi.

I'm Michael Myers. I've been lobstering out of Tenants Harbor and the surrounding area as a kid my whole life. Ah, this whole right whale thing is, it's really got a bunch of us in, shaken us up. I’ve been fishing my whole life, I've. I've traveled pretty much every inch of the, oh, this ocean on the East Coast between Georges Bank to Massachusetts. And I mean, I've never seen a right whale, I've been lobstering my whole life as a child, my grandfather was a lobstermen. we're, we've been we've always advocated for wildlife, we're, you know, we're not, we're not this. We’re not a whale fleet out there trying to rid the ocean of these creatures, because we think they're there just as beautiful, domestic, as anyone does. And we've gone through great lengths. I think we've proven it with our efforts to just, you know, to, to keep up with you, guys. And not only keep up with you, but do stuff on our own to, to implement, you know, on our own. You know, our own regulations. And in order to keep the resource alive that's what it's all about. We want to keep it alive for everybody, not just for us. And we want to keep whales alive. We want to keep the ocean alive. And that's what we're there for. We were not there, too So, I don't approve of the traps and I don't approve of the closures. Um, I think, it all needs to go to the data and the Science. And I think if this is what you guys are implementing on us, this is a big hit. I mean, we've took hit after hit after hit. This is, I mean, this is, this is really food out of our mouths, our families mouths, not only our families, I mean it, trickles all the way all the way down the line. Car salesman's, auto insurance. I mean, it's not just us, its everybody I mean, we're all going to pay for it if this is, if this is the way life is really going to be. So I think we've done enough, I think, but if we can't back this up with science, then I think this is a raw deal, And I don't think we're think we're getting this **** end of it. I don't really have much more to say. And I hope, I hope everybody can see it through. You know, if you can prove the science that we're killing whales, I think, you know. We will. we will gladly go out of our way to change anything we can. But I don't think the science will prove that it's the Maine fisherman. Or any fishermen harm at that mount so that I will leave my time. Thank you.

Hi. Thank you. OK, Julie Eaton. Julie you should be able to unmute yourself.

Can you hear me?

Yes, I can hear you.

Can you hear me?

Yes.

Oh, yeah. Hi, my name is Julie. I'm a Maine lobstermen I've been fishing for 37 years. And I have over 10,000 hours commercially diving underwater. I've never seen a right whale. As a matter of fact, I've never seen any kind of whale. Maine lobstermen want to protect all marine mammals. We don't just fish, because it's what we do to feed our families. But rather, it's who we are. It's our calling. Most fishermen, in Maine live in small coastal communities or islands with no other job opportunities. We don't have a Wal-Mart, a McDonalds, or even traffic lights. Communities, our schools, and our way of life will die without the support of the Maine Lobstering industry. We've worked hard to protect our ocean and our fishery. We have a sustainable fishery. Maine should never be lumped in together with states that have actual whale issues. The copepods, which are the preferred food source for the right whales, is no longer in Maine water due to climate change, right whales do not come to Maine on vacation. Please address the issue where it exists. Blaming Maine lobstermen for the decline in right whales is comparable to blaming Mexico for the polar bear decline. They just don't have them and neither do we. NOAA has stated. It doesn't fly over Maine looking for whales. Why is that? Because there are no right whales are not here. We welcome NOAA to start flying over our waters, please. We'd like to have some proof. If you intend on closing an area, give us documentation that that area actually is a problem. We're willing to do whatever we can to save these animals. They are amazing majestic creatures. But if they're not in our waters, we can't do that. I want to thank Jared Golden and our commissioner and I entire federal delegation for going to bat for us. I think that if you're going to close an area. Why isn't it in area three? Why does it have to be all in Maine when Maine isn't a problem? I guess I guess I have to say I'm very concerned about the safety of our fishermen, ah, Who already take huge risks, fishing offshore and uh, I'm very concerned about increased trawl lengths and at what cost, if the whales aren't here, It's not going to save anybody but could really cost our fishermen, their lives and their lives that has to be of value too. Thank you.

Thank you. OK Hannah. You should be able to unmute yourself, Hannah.

OK, Can you hear me now?

Yes. I can hear you.

OK, great. Thank you. My name is Hannah McGowan. I am a Native Mainer. I'm not a fisherman. I have done some work, documenting the lives and work of our fishermen here in the state. I'm a photographer. I wanted to speak mainly about two things and it feels like we're looking to implement a lot of really massive changes here based on incomplete data that ultimately is pointing to entanglement happening elsewhere. Um, now, my first big point here, as we're talking about all of this stuff, really casual casually, We keep saying implementing measures and just throwing all this, really great environmentalist, talk around, but like, let's talk, like we're real people who aren't just paid by environmental agencies. I want to urge every single one of you listening tonight, to consider that the actual implementation will be done by real people, like Real Mainers who every day, get up before the Sun comes up, and they risk their lives to feed their families. And ultimately, they feed all of us. You know surf and turf doesn't happen without these guys. These guys feed us, giving over, the human element of all of that is a huge error. We need to not villainize our fishermen. They are some of our best conservationists And they care so much about our oceans and our marine life being on the water as not just a job. I mean, the time I've spent with, all of these fishermen, its who they are. It's the blood their blood. It's their heritage, it's everything about who they are, and, skipping over that, in my opinion, a massive error. Then, regarding trawling up, how do we really expect our fishermen to trawl up? I've been on mostly small boats, and it would be extremely dangerous. Also, you need to think about our older fisherman. Our older population, I mean, I spent time at Virginia Max Oliver down in Spruce Head All and Miss Virginia as 100 years old, and her son. Is elderly as well, sorry Max! They could not safely trawl up. They absolutely could not do that. They not only do not have the deckhands to be able to handle that but their boat is small. I know several other fishermen who will also have small boats, and that would be really dangerous. This is something that we need to not forget about. We shouldn't be imposing costly and under researched regulations on these guys, their jobs are dangerous enough as it is. And, you know, if you think about what I'm saying here and you think, Oh she's just waxing poetic about fishing because she's a Mainer and she’s a photographer and blah, blah blah. Call up a lobstermen and go Out for a haul for a day. It's grueling. And we really need to respect that when we start making them bear the brunt of all of these changes. Um, yeah, I just really want you guys to think about the human element of that these guys care about our oceans and We need to care about them, too. Thank you.

Thank you. OK, Brian, let's give it a go. You should be able to unmute yourself. Oh, I'm sorry, I muted you. OK, try again.

Am I really unmuted now?

Yes!

Haha, that's crazy. All right,

Thank you for hanging in there with us.

Yeah, well, thank you. Alright, I'm not I'm not paid to speak to anybody. Pretty much keep to myself like most fisherman. I go to work. And I come home and I live in a small world and I'm an old fashioned type person. So bear with me. My name is Brian Tripp I’m a lobstermen and I live in Sedgwick Maine, I fish offshore area one year round and I've done that for the past three years. Before that I fished inshore for nine years I've got a 38 foot boat. It's a pretty, pretty small 38 foot boat, actually the way it's rigged. I employ a single stern man, and our, our boat, I say ours, because he's just as much a part of the operation as I am, our boat earns a modest income, and that provides for 4 adults and 8 children all under the age of 12. Maine’s fishing fleet is, is diverse. And I think that needs to be taken into account, and I appreciate Commissioner Keliliher bringing that up because that's what makes Maine special. We're all different and there's a place here for everybody. I went to Prince Edward Island with Maine Lobstermen’s Association. I saw how they operate. It's just a cookie cutter fishery. They're all the same size boats. They only have enough berths for the number of permits. There's no room for anybody to be any different. Everything's 45 feet long, 15 feet wide. And it's got to fit in in a certain box. What makes Maine special is is my wife fishes a 20 foot boat. She fishes 180 traps, not that that matters to anybody.

But that's what fits her. I've got an eight year old and an 11 year old. They both fish out of a flat bottom skiff and, and they certainly aren't going to trawl up and neither is my wife, but, but I fish 10 trap trawls right now. I don't fish anchors because it's just Matt and I and we're not going to lug 75lb anchors down to the stern. It's just not how we're going to work. We fish a single end line, and we do that, basically, just voluntarily, It works best for us, because there's less rope on the platform in this. We can turn and set them back quicker, and we can get home to our families quicker. We fish. Like I said, 10 trap trawls single ends we haul 440 a day. We leave at Whatever, four, 4:15 every morning. When we get back. It's usually after 5 or 6 o'clock, if things don't go well. So, I just think it's important to take into account who we are, real people, and what we actually go through, and what we do. I think single endline equivalency is important trawl equivalencies. I think gearmarking it's way more time consuming than you give it credit for because I have to change that, endline out that takes a lot longer throughout the day. And closed areas create a gear curtain, which is way more dangerous for whales that we obviously don't want to harm. Thank you, I know my time's up, and I appreciate you guys all waiting, working with me to be able to hear what I had to say.

Thank you, Brian. That was really helpful and, and anything like that, if you'd like to type that into the chat, if you have anything else to say, type it in the chat, we can come back to you or submit it as a written comment. That was really helpful. OK, next we have Dwight. Dwight?

Can you hear me?

Yes.

Very good. Thank you, guys for having this meeting tonight. And all the fishermen that have come on tonight to share their thoughts and questions and comments. Not so much of a fan of the environmentalists that have come on with their some derogatory. I could care less about that. It's not their industry that's at jeopardy. My first comment and question would be what other industry has had a 60 to 80% reduction and made out, OK? oh, you said, Colleen, that we had to be resilient to change, 80% of anything in a reduction is quite a change. And you'd have to be nothing but resilient in order to change and adapt to that. So I'd be curious to know if, if, maybe you could even answer it, if there's time left. What other industry has had that type of reduction? Even 60% reduction and not had a monumental effect on really their way of living. Everyone on, probably this meeting tonight is established with a financial burden based on an income that they've generated. Even myself, I make X amount a year. I base my bills off that you dropped that reduction to 60 to 80%, that's less income. Now, someone said that if you take the, everyone fishes 600 traps, well, yes, you're going to be close to the same amount of pounds per year. Maybe you'll have more pounds per trap. But that does not mean that the price is going to be there for us. So that, I mean, you guys say, OK, let's reduce that but you don't control the price. Actually matter of fact and I'm sure you all know this is that there's big businesses buying up waterfront properties that are selling these lobsters premium brands. one of them that's another factor fishermen have to fight with is the price of a lobster. pretty soon that's going to be controlled and dictated just like this type of the end of the industry is. My other comment and question is, we talked about the gear marking up and down the state of the coast and in Canada, what's to say? And who's to say that those other states don't throw some purple tracer on their rope down the line up in Canada? There's nothing saying that. And I'm sure that they're not going to comply with that, They're going to throw every color on that rope. But it seems to me, if I was them, I would too. It looked like Maine did it and Massachusetts as well. I mean, what's And you guys can say, well, that's the job of Maine Marine Patrol. And I think that you're exactly right, but I got to be honest, the turnaround on Maine Marine Patrol is incredible. And, I think it's because of the low pay and the what, not that has to do with it. And I know my time's running short, but please don't shut me off. Um, I've always been feeling like this has been an argument going on for several years. Why is it that we still don't have a solution to the problem? but we just keep chipping away at this block? It seems as though all the money that these environmental groups and NOAA and whoever else has had, invested in this time and energy would have had the solution that would have compromised this whole problem so that we wouldn't even be having this meeting. And the last thing I have to say is if and when as our good buddy Max said, the whales are going to die, does that mean our fishery can go back to what it was before? Or is it going to just be reduced and restricted again even more even if the whales aren't there? So I'm just, those are my comments. And those are my questions is what other industry has had that reduction. And survived? that the whales aren't the only ones that are going to, fishermen are the stewards of the sea. We love all that. We're out there, because we love the ocean and everything that's in it. And I am a resilient person. I'm Young. I can go through some change. I, I feel like there's already Been. It's going to happen.

Thank you, Dwight OK, Krista Tripp.

Hi. Can you hear me?

Yes, I can hear you.

Hi, my name is Krista Tripp. I am a Lobster woman. Out of Maine. I am third generation. Um, and I, um, finally, just got my Lobstering captain's license, just five years ago. I was on the waiting list for 12 years, and I grew up fishing. I grew up going fishing with my dad. My uncle, my brother, I've been on several different boats. And I have never, in my life ever seen a whale offshore and definitely not inside fishing. Where I fish is within the three mile line. And there is just, it is, is just baffling to me that we are all having to do these gear modifications. I could understand the offshore fishery you know Area one having to do some of these regulations with weak links and their ropes. But for me, who have just gotten into the fishery, all of my ropes are old ropes that I fish. I have all of my grandfather's gear and I have traps that break all the time when I'm hauling my gear because I've tried to keep costs down in order to be able to get into this fishery. So for me, to put weak links in already old gear is going to be extremely cost. It's costly to me, because I'm going to have to buy all new rope. And last year, in just doing the gear marking, I mean, it took me a month to go through all of the gear that I already had. This is going to take me months, and it is going to cost me tens of thousands of dollars and is, I'm going to make nothing this year, and I mean, I can't even fathom the thought of trawling up. I'm going to have to hire another crewmember it's going to be extremely dangerous for, for me to put more traps on my very small boat. And I just, I am just completely baffled that this is happening right now. My dad was on the Atlantic Take Reduction Team when it first started to come out years ago, because we care so much about the ocean, the marine creatures, the whales and we have done everything in our power. And since we've put gear model modified our gear since then, years ago, I mean, I think the last whale death in Maine was seven years ago. And I mean, we haven't even heard of an entanglement in our area for, for, for many years. So I don't know why Maine is being bundled up with Canada and with the ship strikes that have killed the whales. Because we're definitely not the ones to blame. And you guys are going to be just cutting a lifeline to Maine's economy, our fishery, um, my time is up so I'll end it there. Thank you for letting me speak.

Thank you Krista. OK, Blake,

I'm going to jump in while we're waiting. Thank you, Krista saying the three minutes, and sorry, that we sometimes have to cut people off on a breath, but it is late, and there are still at least three more people who are interested in speaking tonight. Thank you.

OK, Blake, You are not connected to audio. So, if you are using your computer, you'll get, you're going to want to, under audio settings, either choose computer or off, or use phone for audio. If you're on your phone, you're going to want to connect to your audio, and won't be able to unmute you, if you are not connected to audio, so I'll keep you on the oh, OK. Excellent. Can you hear me Blake? I believe that you have not entered your audio pin.

NOAA?

Excellent! Yes Blake, I can hear you.

Hello There.

Yes.

My name's Blake Alley. I'm 37 years old. I fish out of Steuben. So in Washington County, the poorest, most uneducated county in our great state of Maine. I just wanted to say a couple of things and I'll answer your, actual questions at the end of it here but I mean it's pretty obvious everybody. I'm not going to keep going over what's already been said but it's pretty obvious that there's a line in the sand here, there's two sides being taken and both saying facts saying what we think is right up X or whatever. one of us has to be right. one of us has to be wrong. So if all the data, a lack of data, no news is good news kind of thing. There's zero whale deaths. How can who is the one collecting the data? How are they coming up with these numbers? Who's supposed to be the? The actual one. Who's like the official data? I mean I would almost think it would be like the National Oceanic Atmospheric Administration. I mean, you guys should have this data. I mean, you guys are the ones paid hundreds of millions, Probably billions. I don't even know what your budget is, to find all this stuff out. And here we are, where we border another country. We're putting these regulations in, Canada, Doesn't have to do the same things we do, They're going to have a whole nother set of rules, They're not all packaged together. I mean, this is complete insanity. And I'm glad that everybody's getting involved in everything, but at the end of the day, this is a total manipulation of the Endangered Species Act. People are worried about dangerous trawls endangering species. I call it completely dangerous at one man with little man syndrome, can completely control a group of people? I mean, it doesn't even, How can you manipulate the law and you favor that way? That's what these Congressmen should be looking at. And everybody else, we can, obviously, it's going to be economic. We know what's going to happen at all bad things that are going to come with it. But isn't that insane that one man can, basically, with zero data, no facts whatsoever, completely wipe out an industry? It doesn't make any sense. It's a complete failure of our laws and our government to let it happen. I mean, where does it end? So, I don't know, I wasn't going to say anything, but my buddy, Max just has a way to motivate people. Everybody's awful mad at him, but I feel bad for the poor bugger. Somebody really needs to give them a hug. I don't like you got enough money you get. But anyway, so, and to actually comment real quick on things that you wanted to actually comment, I disagree with every regulation, the trawling up, everybody should be able to fish just as we're fishing, its' not a problem, we cannot find a solution. When there is no problem, there cannot be a reduction to zero, we can artificially inseminate Whales and get negative numbers. It doesn't work that way. Were at zero, we can't get any less. So I can't speak for Canada, I can't speak for Area 3. The state of Maine, that's where we're at. Thanks everybody for listening. Please write your opinions. Write where you can.

Thank you OK, Joel Cohen, I'm coming to you. OK, Joel, you should be able to unmute.

OK, hi, can you hear me?

Yes.

OK, thank you for letting me speak. Yeah, my name is Joel Cohen And I am in Florida. I have no, like chips in this game. I'm not a commercial fisherman, I'm not a government official. I'm not an environmental person. As far as with a group, I'm a wildlife photographer. Now, I was the automotive parts distributor for the majority of my life, so I kind of have a unique perspective on this. And the last speaker, I agree, we have two sides that, that, there's not much budging going on. So I want to give my perspective real quick. I'm not paid by anyone, I'm a volunteer to go out. I do, I do have a lot of experience. Because I watch the moms come down here to Florida in my backyard. I've lived on the beach for 34 years or five years and 34 years. I'm on the B, I'm not a commercial fishermen, but I fish and I surf, and I'm on the beaches and I've seen plenty of right whales. Because they all come down here. The reproductive mothers come down here to give birth, and because I'm a photographer, I like to take pictures of them and I've volunteered with groups to go out and, and, uh, help monitor them. I'm not a scientist, but I take pictures. I look at the whales, and I see these white marks down their body or all around their tail and I asked the people, what does this? Those are scars, OK, That's interesting. I also see a lot of Manatees in Florida and almost eight out of ten Manatees have propeller scars down their back. And when I see a right whale, it's I see both propeller scars and entanglement scars. And it does bother me very much to say that the entanglement issue is not happening or that. It's mostly boat strikes is just patently false. I mean, I see it with my own eyes through my own pictures. I can see the scars on these whales. Real fast story of my last seven days. I did get to see the calf that was run over by a vessel. We I also saw the pictures of the mom that was also hit by that same vessel. And then a few days later, I was on a boat with researchers as a photographer volunteer, using my own time, my own money, my own gear, because I love being out on the ocean just like you guys, the fishers. And I watched a whale named Cottontail, who's 11 year old male, 11 year old, boy whale. It was down here in Florida now. Who just swam past my house and we went out on a boat and I got to get close to cottontail and see how horrible how horrible condition. His body is in. Extremely emaciated that there's a rope wrapped around it, is through his jaw, wrapped around his head, and seems to be hanging straight down with something very heavy. Pulling down them and I just, I can't stomach to see that anymore. Real fast, please don't cut me off I have one more comment Real quick comment. On the entanglement deaths versus ship strike death's, ship strike death is many times more obvious, Especially when they wash up with the ship when the ship come in or when they just wash up next morning just like this calf did. Entanglements are much more difficult to see them, because they get entangled as they. They swim. They get entangled, and they slowly die. Like, is what's happening to cottontail right now that, whale to me, has days left? So anyway, I applaud the measure to allow fishers to get a exempted permit to try ropeless and to get fishing with it. I got to fish with it all last summer with commercial,

I'm so sorry Joel Thank you so much for your comments. Thank you. Well, if you can put your name back in the queue we can we can come back to you. But thank you so much. OK, Genevieve! Yeah. OK Genevieve. You should be able to unmute yourself.

Thank you. I'm Representative Genevieve McDonald, Lobstermen out of Stonington Maine and a member of the Maine House of Representatives. As fishermen we take great pride in our heritage and our relationship with the sea. Few people are fortunate to have an intimate connection with the changes of the seasons, the weather, and the tides. We're stewards of the sea and depend on a vibrant and thriving marine ecosystem for our success. The current regulatory argument over North Atlantic right whale protections is not between lobstermen and whales. The question is how to move forward with regulations that will best protect the struggling species and the fishery. Reducing vertical lines in areas of the Gulf of Maine where North Atlantic right whales are visiting less frequently. And for shorter durations, due to the shift of their primary platonic food source, is not an effective solution To protect the right whales. We need by-national policy. And research collaborations focused on learning the North Atlantic Right Whales Adaptive Migration patterns, based on oceanographic conditions that best support their primary prey. Reducing the potential of a right whale being entangled based on where they were instead of where they are, will not save any whales, but will inflict grave damage on the Maine lobster fishery and the coastal communities that depend on it. Instead of dedicating resources to crafting effective regulations that would help protect right whales. The National Oceanic and Atmospheric Administration is demanding arbitrary restrictions that will benefit neither right whales nor Maine Lobstermen. These regulations would check a box in Washington DC. and temporarily appease the special interest groups who neither understand nor care about what lobster means to the people of Maine. It's hard to draw a direct line between these developing rules and actual remedy or relief for right whales. There's time for us to demand peer reviewed science, dedicated resources and effective, rather than arbitrary regulations. The value of the people who contribute to one of Maine's most iconic industries. And I will be submitting written comments, as well. Thank you.

Thank you Representative McDonald. OK, Gabe Shadis, you are next. Ok Gabe?

Yes, hello.

Hi.

Hi, just a quick analogy, kind of from the perspective of what most of the fishermen in Maine here, view this as. So you're on a Boeing 747 max, It is doomed to crash. So, what's the solution? The solution is to lower the speed limit on the turnpike. Um, really, there are so many entities involved in this. And it looks like this is the weakest member. And the easiest really with the least defense to defend itself against what really appears to be an effort to, you know knock this fishery down a peg. You've got the Department of Defense, doing sonar testing. You've got the shipping industry. And I know people are arguing about ship strikes versus entanglements whatnot. It's all bad. Whales in Maine, If there are whale's passing through the Gulf of Maine, certainly in the last decade, they've seem to fare pretty well. In this day of, like, everybody's got their own set of facts, it's a, it's a pretty hard thing to defend. Um, you know, and you've got, you've got powers to be with the money making the choices. Um, anyway, it's not just the Maine Lobster and it's not just the coastal communities. It's the state of Maine. It's New England as a whole. Um, this is going to have impact far, far, reaching. I guess that's about all I have to say. Thank you for listening.

Thank you, Gabe. OK, Corey. You should be able to unmute yourself.

You're asking an awful lot, can you hear me?

Yes, I can.

OK, actually, my name's Matt Samuels I'm using Corey’s iPad. I’m a fishermen, out of Rockport Maine. And couple of things I just wanted to throw in everybody has pretty much answered everything: Um, I think a young lady put an important point out earlier, and the whole human element of this. Fishing really isn't what we do. It's really who we are. And that's really different from most other jobs. Whoever was saying that earlier, there are scientists, they go home. They get to go do what they do. We go home, We go to sleep. We dream about fishing, we think about fishing. it's in our blood. It is what we do. My daughters has been on my boat since they were toddlers and fish. Now they're fishing, commercially on their own, it's a big deal. The next would be it's really important. if we haven't learned anything over the last few years, facts matter. We talk about it all the time. And this is a great example of that. All the facts that we have, all the data that we have, shows that the whales are not being impacted by our fishing gear. And I guess I'm really kind of stunned as to why as soon as we say that there's just a silence. Um, that should really end the discussion. We should then be doing whatever it takes to be able to prove where the whales are, what they're doing, where they're eating. And, you know, maybe we should be putting the same amount of effort to regulate shipping, the cruise ships, the wind power industry. It seems kind of silly to be putting the most draconian measures, the group least, responsible for the whale interaction. Uh, hopefully, that's it. I'm going to mute myself again. Thanks a lot, bye.

Thank you. Let's take Jennifer Johnson. OK, Jennifer, You should be able to unmute yourself.

Awesome. Can you hear me?

Yes. I can hear you.

Awesome. Hi. My name is Jennifer. I'm a trained anthropologist with a background in, Environmental Science. I teach high school history right here in Maine, as well as climate policy, and on top of that, I'm also a photographer working with fishermen off the coast of Maine. I'm typically considered the hippie teacher, the granola crunching, sort of environmentalist, but, um, I really take issue with the proposed regulation for a few reasons. I've been using this as a case study in my environmental policy class, and I've had to pause because, I have students with unanswered questions, and the biggest one has been, Why is this being based off data that doesn't seem to support the policy? And I have had to stop talking about crafting policy and switch gears to talk more about lobbyists and politics. It's really difficult to help my students understand the way this is happening when I myself am baffled. I guess that's my first point. My second issue is that I worry about the future for these students, a worry about the lack of jobs for young people in Maine as of right now, and how our young people are leaving the state already. It would seem we continue to narrow down options for the future of our state. I don't need to restate the data issue, everyone else has spoken to, but I need to speak for the coming generations of young people in Maine. Our economy based on tourism is already suffering seriously. And when you rip out the fishing industry, the whole thing, Crumbles. And I could explain the chain of jobs and economics that's been off this industry, but we already know. And lastly, I just want to say that good, solid Policy is based on excellent data, as well as an analysis of environment economy, and the human element. It would seem as though this policy is either not based on those things, or it's not doing a good job of presenting whatever data does exist. I would ask that if you have crafted this regulation, that you can stand behind, that you present it in a way that is more easily digestible, and to the point and explanatory, I suggest that if this regulation is inevitable, it's accompanied by funding for fishermen to be able to pivot more easily while continuing to support Maine, economy. And I will be writing this all out, and thank you for your time.

Thank you. OK, Lee Watkinson, you are next. Lee.

Kara, thanks, Appreciate your hard work tonight and shout out to Brian Tripp for holding on. and that was the hour and a half of, uh, good for him. I wouldn't have done it, but I've listened to some of the data And I've looked at NOAA’s website and compiled some figures. And some of the stats kind of, uh, I don't know, they alarm me, I guess, because when you look at what went on, when I was a, I was a senior in high school, in 98. And my father encouraged me to go to college, because he was worried about the initial right whale rules, and to see that we've grown the population by almost 50% since then. Um, since I've come back home to fish for last, you know, 20 years on my own as a captain, and probably since the age of five, it's a little, it's a little hard to take for me just to say that we're the problem where we've actually grown that population that much. I mean, if you compare every other whale that's in the Gulf of Maine, that are living in the same environmental conditions that that the right whales are in, I mean, the Humpbacks have grown from the Endangered Species List to over 35,000. The pilot whales have grown 71%, up to almost 40,000 whales. And the blue whales, you know, they're at 308 in 1995 to 402 that gives you 31%. So the right whales are actually doing better than the blue whales. And you know, it's hard for me to sit here. And you know, I've listened to the environmentalists, and I get it were the first persons on the scene when there's an Entangled Whale which it does happen. I don't deny that. But we're the ones that take care of the ocean. Um, the Stock Assessment Data on NOAA webpage alone, I don’t get how we dropped from 408 to 366, So quick, I guess the 2019 one was 422. But we just had a birth in the Canary Islands, which is off Europe. two years ago we had a whale, a male whale documented there. So that is the population migrating back to Europe is the loss of whales that you guys aren't documenting because of that?. I mean, it just, it causes alarm for me. I went to college for education in math mathematics, because you can't lie about math and the numbers that you guys are presenting. Just kind of worry me, I mean, how, how are the whales shifting back to Europe. And how do we have births going over there from North Atlantic, Right whales. And you're, you're, you're saying that the population here is shifting that you've subtracted 90 whales. I just don't get the math. I think the current fishery that we're doing now, it's where we're working together to grow. I mean, any species that you're growing by 50% over 30 years isn't a negative thing. Are there ways that we could tweak it? Yes. But we should get a pat on the back that we're trying. I just want to say that, thanks.

Thank you, Lee. OK, Michael Stone, next. You should be able to unmute yourself.

Hear me?

Yes.

All right, first. First, I would like to thank you for the chance to speak tonight. I'd also like to thank Jared Golden, Commissioner Kelliher, for their support and comments tonight. My name is Michael Stone. I'm a commercial lobster license holder and a student at Maine Maritime Academy. Lobstering is my passion. But I went to school because policies like this make the industry uncertain. I'm sorry if I repeat some, I've been doing my homework, and listening to this webinar. In my short time, in the merchant marine industry, I've heard of more whale deaths from ship strikes than from fishermen. A training ship, which only sails for three months a year, if that, has killed more whales than anyone I know in the lobstering industry. My second question is I want to ask why we the small business owners who are fighting with each other most of the time, are subjects, to spend our money on speculative, speculative, tactics, why can't the costs that we will be subjected to in this policy will be put into research specimens? Would this not be the most logical approach? Thank you for your time.

Thank you, OK? Zach Klyver You're up Next?

Can you hear me?

Yes Zach I can hear you.

OK. Thank you for the opportunity to speak. I believe fishermen are marine mammals. They spend half their life on the ocean. Conservation and fishermen have common cause in protecting the oceans. We have way more in common with fishermen and I grew up in a fishing family. So I consider myself in love with fishermen and with the with protecting the oceans. I want to thank all my great fishermen friends that are on this call tonight and say I look forward to working with you. I believe this isn't fishermen versus whales or a win lose situation. There is a win-win option and fishermen are going to solve this. Last night I presented 160 right whale sightings of between 1 to 7 whales from Whale Watch tours and from sighting data at Mount Desert Rock since 19 76 up to the present. I was on 30 or 40 of those tours that saw right whales off the coast of Maine. The vast majority of those sightings are offshore in 300 feet of water or more and 15 to

25 miles offshore. Now, that's important. That's where the co-occurrence is happening primarily. And secondly, this also points to the fact that we have 50 years of right whales showing up off the coast of Maine. Even this past year in 2020, 2 were photographed from whale watching tours from Bar Harbor at a very limited season. And right whales were also photographed, off of Eastport, and Frenchboro, and there was a report from Skutik that was very detailed. There are absolutely right whales in Maine Waters, they've been here for a long time. And they will continue to come through here. This is their habitat. For that reason, I presently support trap reductions offshore to reduce risk. I believe less traps can catch more lobster or a lot of lobster and reduce fuel bait and boat wear. For now, I think that's our best alternative to reduce risk. I support increased surveys, acoustic, boats and planes that I hope NOAA will invest more, and I hope the State of Maine will invest more in that. I support evolving the fishery to overcome all entanglements of whales not just right whales. I have personally seen dozens of whales entangled in Maine lobster gear. That's why I'm but I'm involved in developing ropeless fishing gear to allow fishermen and whales to both win in the long run. We can do it. We can do it in the next 10, 20, 30 years. Whatever it is, we can do it. We do know that from the DEIS there, there's 700 entanglements reported in nine years in that document: 89 of those were right whales. That's from Canada, to Florida. That's 75 whales per year. That's a crisis. These are the animals that are entangled, 75 a year. They're scared. They're in pain. And we can't say that we don't have culpability. The lobster and crab industry is 93% of line

Hey Zach I'm so sorry. Your three minutes is up.

OK, thank you very much.

Thank you, Zach. OK?

Hey guys can you hear me alright? Thanks for giving me a chance to speak. My name is Julie Albert.

It just sounds very faint.

I just wanted to put out some clarifying remarks that a lot of people have reported. As far as differences in the populations sizes that are out there and people are referencing or whales just drop off paper and aren't accounted for anymore. I want to make sure people understand that sometime models change from year to year. But helps us with what he size of the population is. The north Atlantic right whale Consortium puts out a report card with multiple numbers in it from best case scenarios to worst case scenarios. Its available to everybody on Consortium website. I highly suggest everybody that thinks the data is flawed, or inconsistent, or does not exist, to go look at those reports. For those people who say they've been on the water a lot and don't see whales, and I don't mean for this comment to sound snarky, but I'm guessing you're not on the water 24/7 so I'm just wondering how many of you considered that maybe the whales go by when you're not out there or at night when you can't see. A right whale was discovered off of Georgia in December trailing a trap and entanglements do happen and for those animals that we never see again, never rescue, and never recover gear from, there is no way to prove what kind of gear it is. So even though we can't prove how much Maine gear specifically is on the whales, there's also no way to prove it's not Maine gear. So I want to make sure people understand that as well. If anyone has questions I want to refer you to the right whale report cards on the Right Whale Consortium website that are put out annually. That's where the information is.

Thank you, Julie. I think you're done. You sound it. OK, so, we have three last comments, People who, um, just need a little bit more time and want to wrap up. You'll be given 90 seconds Oh, Oh, boy. You'll be given nanana seconds just singing to us. Oh, oh. Oh, oh. Excellent. The night is young, OK, Ooh! Michael Myers. I'm coming back to you. Oh, boy. Oh, boy. OK, Michael.

Mike stepped away for a minute, but my name is Noah Mank and I'm from Midcoast Maine, Saint George. I've had the pleasure of fishing on many boats over the years in the Mid Coast region as long as from as well as from here to Portsmouth, New Bedford. Um. And I've seen a lot of whales I'm not going to say I'm, I'm not a Scientist of whales by any means. But I'm pretty well versed in in what whales are which the Humpbacks, finbacks and stuff like that. And I've never specifically seen a right whale. To answer the lady before, I don't know that the whales they could be there when I'm not there. But I spend just about 24/7 on the water, and I know quite a few other people who do, and I've never heard them talk about right whales either. So. Ah. It's a sensitive subject for everyone, no doubt. It's the question I really have about the regulations and the proposals is that, uh, those are all fine for operations that are up and running. And stuff like that. But I, you know, I just had my second daughter, I delivered her in my house, in the town in which I have grown up in, and I fish in, and I sterned in for 15 plus years. I'm also just getting my Maine state license for myself to go out. How does someone, like my daughters or anyone's children, for that matter, how does the future expect to have a chance to thrive? Not every one of them is going to be born with a captain for a father or mother, and I was always under the impression part of the beauty and the tradition of this business in this lifestyle was to hand it down to someone else, to hand it to another generation. That's part of the beauty of growing up in Maine is that that's what we do here. Even if you're not a fisherman. You know, people are third generation farmers. Um, so, I think you would, honestly, if these things are to go through, for me to just actually weigh in on it, I think you would actually be destroying a way of life. And it would be really unfortunate. So, I don't support closures. I don't support any of it. Thank you.

Thank you, Did you say your name was Noelle?

Noah N O, AH, Like the guy who built the boat.

Awesome, thank you so much, Noah. OK Dwight, you'll be able to unmute yourself.

I'm all set here. It's late. Thank you.

OK Thank you Dwight. OK Joel give me one second.

OK. Can you hear me?

Yes.

Yeah. My name's Joel Cohen and I mentioned before Wildlife photographer from Florida photograph the whales, at least, eight out of ten of the whales I've seen each year are show entanglement scars. But anyway, I wanted to comment on the regulation about allowing ropeless with the exempted fishing permits. So if that passes, I applaud that very much. I know other states didn't really include that. So I think that's great. I think it's a great opportunity for the fishers to get their hands on this stuff and get it. See that it really does work. I spent last year last summer and the fall with commercial fishers in Florida, Georgia, North Carolina, on the water with them active fishing side-by-side. We use six different manufacturers, gear, and different alterations of there of each one. It absolutely works. I don't agree with the claims of it being once it's adapted, I don't believe it's going to be making it less safe. There's definitely concerns and things to work out, like the overboard concern. But that's, uh, that that can be easily solved in the technology. So anyway, the ropeless gear I believe, has been pushed on the fishermen and there's been articles written that give it an incorrect assessment in everyone's eyes. I am really hope that some guys that are really doing is the Maine fishers can use this stuff and play with it and see that it's not, as some of those Articles, claim it does work and I also argue that there's a financial case for fishermen because there's a very good chance you'll lose less gear.
And my time is up.

Your time is up. Yes. Thank you.

No one wants to hear from you.

Oh. So, sorry. Please keep yourselves muted unless I've called on you. OK, Jack Merrill Coming to you next. OK, Jack.

OK, thanks. Yes. So I wanted to respond to Julie's comment about not being not knowing where the entanglements come from. You can definitely tell where they come from, by the rope that's taken, off of them. And I had the opportunity years ago to be at a meeting with TRT meeting. And we had a pile of rope on the floor, hotel in Massachusetts. It was a huge pile of rope, it was taken off whales that were entangled, not right whales, necessarily, but whales. We were asked if any of it looked like our gear where we fished, and I was, did not anticipate that opportunity. But I was pleasantly surprised that absolutely none of it even remotely resembled Maine gear. It was much larger, and I don't know where it came from, I can't say, but it was much larger than anything we fish. So you can identify that. I also want to urge NOAA and environmental groups, or anybody else that concerned, to seriously consider the use of drones for surveillance. Canada just invested in a drone. They have, it's unbelievable, the technology they have. I'm pretty sure we can track right whales with drones. Um, so, and my final comment is, to you guys, please pay attention to the data, because it's not the Gulf of Maine, that's the problem. Thank you.

Thank you. OK, we have two last comments, Sam Rosen, you should be able to unmute yourself? Sam, let me send you a unmute request. OK? OK, Brian. OK, Brian, you should be able to unmute yourself.

Yeah, I am. Can you hear me?

Yes, I can hear you.

It's was so good The first time I couldn't help but come back. The ropeless thing it's easy to say that that would work great when you aren't a fisherman in the Gulf of Maine. We have so much gear and so much tide. And the bottom is jagged. It's not like Florida. Those people that believe that this is a solution they need to come and see for themselves. We are not stupid. Maine fishermen know what works. We have had to adapt for hundreds of years and we simply do what works. It's a financial thing. It's how to keep it. I have $80,000 in lobster traps. If you think I'm going to throw $80,000 overboard without a way to get it back, you're crazy. That's all I have to say.

Thank you, Brian. OK, OK, Sam, I'll come back to you. Really quickly give me one second. try one more time. Ok Sam you're unmuted.

Can you hear me?

Yes, I can hear you,

Yeah. I just wanted to say, I'm a lobstermen in Maine, fish offshore. Lot of things I could talk about. But I just wanted to specifically address the ropeless fishing. I've actually fished in Australia, New Zealand at high school and in New South Wales, and I've seen ropeless in action. And I can say the technology is not to a point where we could use it. It's not even close. There are a number of reasons why I say that. First, they're fishing single traps or pairs and they're only fishing about 50 to 200 traps and their price per kilos, like 100 to upwards of that per kilo. So, there it's a lot more valuable fishery. And there, we would have to contend with lines of gear. I mean, trawls that are actually covering more area than just a single point. So, the gear conflict between our gear and then, mobile, gear, like, like, Drags and whatnot. They'd have to be able to see our gear and avoid it. And in order to see it, or, sorry, in order to avoid it, they'd be able to see it long in advance. I mean, upwards of probably a mile or something like that if they're towing or dragging in deep water. And I don't, I don't really know what technology, where the technology is at right now, but I know it's quite a ways from being able to avoid our gear a mile in advance, so, that’s all I have to say.

Thank you, everyone, for your participation this evening.

I just quickly wanted to show you guys, again, maybe what slide can you see?

We can see the written comments slide.

You can see that, comments, Excellent.

That's right.

OK, so just a reminder, and if you guys have any comments after this evening, you can go to regulations dot gov, It will be a blue page like this. You'll be able to search by the docket number, which is NOAA Dash NMFS dash 2020 dash 0031. It'll come up with a list of documents. Under the Proposed Rule, you should see a comment button, and if you click

Comment, you'll be able to type or attach any written comments that you might have. So if you have any anything else you'd like to tell us after this evening, you can submit written comments. Everything that you have typed to us and said to us tonight was recorded as a comment, as well. Colleen I think that's it.

Yeah, people are leaving quickly, but I'd like to thank the last 150 hanging around, that that's a marathon meeting over three hours. I'd like to thank all the NOAA staff that helped and Marissa, great job tonight presenting. And I'd really like to shout out Kara today and our other calls. Today was like, you know, like running, like, landing planes. She was looking at so many screens at once. So thanks, Kara. You made it pretty smooth and I appreciate the help. And thanks everyone, especially all the TRT members that were on and all the fishermen and others that commented tonight really appreciate it. Hopefully next time we'll see you in person.

Thank you all. And I will just leave this slide up as people and in case they would like to write anything down. Have a great evening.

Total matches 70-100%: 22,933

Right whales are intelligent, sentient beings that have a right to an ocean not overrun with lethal hazards of ship hulls and propeller blades ready to kill any whale unfortunate enough to collide with them. These intelligent, sentient animals have inhabited the Atlantic for vastly longer than humans have exercised their covetous jurisdiction over it.There is no amount of cost avoidance or convenience for the shipping and groundfish industries that can justify the gross violation of the rights of whales to existence, to not suffer torturous deaths at human hands, or justify industry's reappropriation of their oceans. The North Atlantic Right Whales are out of time and out of space in their struggle to stay biologically and demographically ahead of the human assault upon their bodies and their homes. These precious animals desperately need expansive, robust, legally enforceable shields against fishing rope ensnarement, reckless shipping vessel strikes, and the acoustic warfare of seismic oil exploration. The striking and killing of whales with ships and fishing gear, even if ostensibly accidental, is a cruel and heinous fate to which to subject our fellow mammals. NOAA must enforce their right to exist through, regardless of self-serving industry complaints with no moral merit. The North Atlantic right whale is critically endangered and needs immediate help to recover. It is NOAA Fisheries legal responsibility under the Endangered Species Act and the Marine Mammal Protection Act to protect this species from injury and death in U.S. waters. The greatest threat to right whales in U.S. waters is entanglement in commercial fishing gear. NOAA Fisheries estimates that entanglement risk from lobster and crab fisheries needs to be reduced by 60% to 80%. The calculations in the Draft Environmental Impact Statement showing how NOAA Fisheries proposes to achieve that risk reduction rely on an old stock assessment using 2016 population estimates, whereas the most recent population estimates indicate that the North Atlantic right whale has further declined to about 366 animals. So there is no question that a risk reduction target of at least 80%which accounts for unseen whale mortalitiesis required. The alternative measures that NOAA Fisheries released would achieve only 60-69% risk reduction. Further, these risk reduction measures rely on an ineffective gear modification called weak rope that has not proved to reduce serious injury and death in whales. It is not worth the economic burden on the industry to change to this rope if there is no proven conservation benefit. In addition, the closures outlined in the proposed rule are too small and too short in duration. Specifically, the closure south of Nantucket and Marthas Vineyard should be year-round, because right whales have been present nearly every month of the year in that area for the past several years. NOAA Fisheries proposed rule simply does not do enough to save the right whale from extinction. On the most optimistic timeline, the measures included in the final rule to reduce risk to whales would not be in effect on the water until 2022 or later. While this rule is revised, finalized, and implemented, NOAA Fisheries must immediately implement emergency action designating a year-round closure south of Marthas Vineyard and Nantucket and in three areas in the Gulf of Maine that would be closed seasonally to vertical buoy lines in the American lobster and Jonah crab fisheries. Targeted vertical buoy line closures where right whales interact with this heavy, lethal fishing gear are the fastest and most effective management tools to prevent unlawful deaths and extinction of the North Atlantic right whale. Closures in offshore areas would also minimize the impact on fishermen, because the majority of lobster fishing occurs closer to shore. North Atlantic right whales can recover if NOAA Fisheries takes swift, effective action to protect them from the vertical buoy lines that entangle and kill them. The proposed rule must be revised, and the final rule must meet the level of risk reduction required by the most recent scientific information. In the meantime, NOAA Fisheries must immediately implement closures to lobster and crab fishing with vertical buoy lines in the areas where right whales concentrate, and help prevent the extinction of this iconic animal.

National Oceanic and Atmospheric Administration (NOAA), The National Marine Fisheries Services proposed rule to address North Atlantic right whale entanglements in fishing gear does not go far enough to save this species from extinction. With only about 360 individuals remaining, the right whale is one of the world's most critically endangered whales. The species has suffered a 25% population loss in less than a decade. Fishing gear entanglements are the leading cause of skyrocketing rates of right whale deaths and serious injuries and are also preventing them from reproducing, pushing calving rates to historic lows. National Marine Fisheries Service officials have acknowledged for years that the right whale's situation is dire and that more needs to be done. More right whales are being harmed and killed by fishing gear entanglements while we wait for action. The proposed rule must do more to protect right whales by expanding the proposed closures and fast-tracking the transition to requiring "ropeless" fishing gear. The Fisheries Service has the statutory authority to enact emergency regulations to close important right whale habitat to fishing with static vertical buoy lines. Please use that power to save this species from extinction. The Democratic Party platform should support: Animal Rights, Defending the Affordable Care Act, Ending Citizens United, Ending Marijuana Prohibition, Giving Greater Visibility to Pro-Life Democrats, Gun Control, Net Neutrality, Raising the Minimum Wage to $15 an Hour, Responding to the Scientific Consensus on Global Warming, and a Sustainable Energy Policy. North Atlantic right whales are dying solely due to human activities. Without bold action, I fear these whales may go extinct in my lifetime. The National Marine Fisheries Service has the opportunity to make the necessary changes to save this species. I am glad to see steps are being outlined to promote the protection and survival of right whales but, unfortunately, the proposed steps are based on outdated science. I urge NMFS to redraft these regulations using the most up-to-date population estimates of North Atlantic right whales in order to develop an accurate risk reduction plan. I also urge NMFS to aim to reduce risk to right whales by at least 80 percent, as recommended by the US Marine Mammal Commission, rather than the less effective risk reduction outlined in the current proposal. In the interim, NMFS should immediately implement temporary emergency regulations to protect right whales. I strongly encourage NMFS to further invest in developing ropeless technology as quickly and responsibly as possible, while establishing a plan to assist commercial trap fisheries in a transition to whale-safe gear. This rule relies too heavily on a costly and inadequate transition to weaker rope, which has not been proven to protect younger whales and does not reduce the long-term health effects of chronic entanglements on whales. In October 2020, it was estimated that fewer than 360 right wales remain. Although right wales received protection from whaling in 1935, the population has struggled to recover since then. They face growing modern-day threats from fishing gear entanglements, vessel strikes, habitat loss, and pollution. Thus, the need for NMFS to redraft, strengthen, and improve the Atlantic Large Whale Take Reduction Plan is critical to the whales' survival and recovery. Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that NMFS will prioritize right whale protections.

Total matches 70-100%: 7,822

Please accept these comments on the proposed modifications to the Atlantic Large Whale Take Reduction Plan as published in the Federal Register. As NOAA has recognized, entanglement in outmoded fishing gear is the leading cause of death for North Atlantic right whales. 85% of right whales have become entangled at least once as they navigate through more than one million buoy ropes attached to fishing gear on the East Coast of the United States. Where there is rope, there is real and imminent risk to right whales. Time is running out. According to NOAA’s most recent estimate, fewer than 370 right whales remain. The proposed rule modifications do not represent a serious, science and technology-based effort to save this species from extinction. If NOAA is going to change the rules protecting right whales, the new rules should reflect the most recent population estimate produced by the Agency’s own scientist, not data consider obsolete by NOAA itself. Proposals to reduce entanglement risks to right whales must promote and accelerate the permitting process for ropeless fishing gear. This 21st century technology, pioneered by New England lobstermen, reduces entanglement risk to right whales while maintaining fishermen's access to otherwise closed areas. The NOAA-preferred option of reduced breaking strength or weak rope is a short-term policy option that offers no protection to right whale calves or juveniles from potentially lethal entanglements. We cannot state strongly enough our outrage that these magnficient mammals are being killed as collateral for profiteering greed, and treating the deaths with a shrug of the shoulder. We urge you to strengthen the proposed rule changes to ensure they are based on the best available science and technology and to accelerate the adoption of ropeless fishing, a win-win solution for endangered whales, fishermen and coastal economies. Otherwise, the use of any ropes, nets, or any other type of fishing gear that "may" entangle any species should be completely banned with fines and incarceration upon conviction to be large enough to create compliance incentives. Thank you.

My name is Mara Lyn Leverett, and I am a resident of New York, but was born in Georgia, where my family has lived for generations. I was born the same year that the Endangered Species Act passed and the year after the Marine Mammal Protection act was passed. The right whale is my home state's Marine mammal. and right whales' calfing area are off the coast of Georgia where I spent every summer. I appreciate that the National Oceanic and Atmospheric Administration (NOAA) has given the public an opportunity to comment on the new regulations regarding the lobster and crab fisheries. I encourage the agency to take every step possible to protect the North Atlantic right whales and enact stricter regulations than what are currently proposed, especially after reading about the death of the right whale known as Cottontail's death by entanglement off the coast of South Carolina today. With fewer than 375 North Atlantic right whales in the Atlantic, NOAA must act quickly to implement emergency closures to restrict the use of vertical buoys in high-risk areas while the agency finalizes the proposed regulations. The North Atlantic right whale population is at a tipping point, and without emergency action, they will suffer irreversible harm before new regulations can even be implemented. NOAA must rely on the best and most up-to-date data available to determine the final regulations and aim for a minimum of an 80% risk reduction. The unusual mortality events that have resulted in 46 known deaths since 2017 must be considered in NOAA's calculated risk reduction, but NOAA must also account for unknown deaths, which the latest science shows is significant. The weak rope equipment suggested as an alternative in the proposed rule has not been proven to effectively reduce harm to right whales. In fact, many fishermen have stated that they will use more rope if the weak rope requirement is implemented, overall increasing the likelihood of entanglements. Ropeless gear should be encouraged and as technology is improved, required, instead of weak rope. Finally, the rules should extend the duration of closures in high-risk areas where historical observation documents that right whales are present year-round. Thank you for your consideration of these comments.

This rule relies too heavily on a costly and inadequate transition to weaker rope, which has not been proven to protect younger whales and does not reduce the long-term health effects of chronic entanglements on whales. It is cruel and inhumane and against God's wishes for us to be so gluttonous & selfish re: life that He created. We humans take and take and destroy and destroy and take until there is no more - every living thing deserves to live, and to live well . We humans have trawlers that scoop up everything in their nets' path - WE don't require that much seafood, but the seafood and waters do. Zoos are bad enough in that the only way many kinds of life are able to still live from extinction. Tell me, where could whales live if not in the oceans. Only about 2 aquariums are large enough for 2-3 whales, and even then, it's as bad for the whales as it is for goldfish in a bowl. They deserve better!!! Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that NMFS will prioritize right whale protections.

More right whales are being harmed and killed by fishing gear entanglements while we wait for action. The proposed rule must do more to protect right whales by expanding the proposed closures and fast-tracking the transition to requiring "ropeless" fishing gear. The Fisheries Service has the statutory authority to enact emergency regulations to close important right whale habitat to fishing with static vertical buoy lines. Please use that power to save this species from extinction. In closing I'd like to share my poem on what's happening to right whales, in hopes that it will lead to this necessary measure to protect them. RIGHT WHALE Bound up in plastic floats and ropes, it washes ashore, unrecognizable, an enormous garbage heap feathery baleen ripped and bedraggled beside its body, hardened wounds on its skin like craters edges, moon rocks. Its sightless eyes accuse us. Can I avenge this mauled being which can live a hundred years, span a thousand miles? I recognize my kindred. By mourning. By framing it for others to see. Form Letter H

Total matches 70-100%: 40

Thank you. I am writing to comment on the proposed modifications to the Atlantic Large Whale Take Reduction Plan as published in the Federal Register. As NOAA knows, entanglement in outmoded fishing gear is the leading cause of death for North Atlantic right whales, and fewer than 400 of these whales remain in the world. Fortunately, there is a perfect fix for this, to save this species! Ropeless gear technology. Ropeless gear is the long-term solution to reduce entanglements of right whales and other marine life, while keeping fishermen working and on the water. And these rules could be put in place now. Nearly the entire existing population of right whales, 85%, have become entangled at least once as they navigate through more than one million buoy ropes attached to fishing gear on the East Coast of the United States. Ridiculous and wasteful! We know, our best marine research scientists know, that where there is rope, there is real and imminent risk to right whales. And time is running out. According to NOAA’s own most recent estimate, fewer than 370 right whales remain. Please save this species from extinction. If NOAA is going to change the rules protecting right whales, the new rules should reflect the most recent population estimate produced by the Agency’s own scientist, not data consider obsolete by NOAA itself. Proposals to reduce entanglement risks to right whales must promote and accelerate the permitting process for ropeless fishing gear. This 21st century technology -- pioneered by New England lobstermen, no less (and they should know what is feasible, what will work for fishing AND whales) -- reduces entanglement risk to right whales while maintaining fishermen’s access to otherwise closed areas. The NOAA-preferred option of reduced breaking strength or weak rope is a short-term policy option that offers no protection to right whale calves or juveniles from potentially lethal entanglements. In closing, my family and I urge you: Strengthen the proposed rule changes to ensure they are based on the best available science and technology and to accelerate the adoption of ropeless fishing, a win-win solution for endangered whales, fishermen and coastal economies. Thank you for making this fortuitous and effective solution happen now. Fishermen and scientists know what to do, and so do federal regulators. Let's make it happen now.

Form Letter I

Total matches 70-100%: 32

Dear NOAA Fisheries: I am writing in reference to Docket No. 201221-0351 - the rulemaking process to protect critically endangered North Atlantic right whales. The North Atlantic right whale is Georgia’s state marine mammal. Our coast is one of the few known calving grounds and each winter, calving North Atlantic right whales make their annual journey from New England and the Canadian Maritimes to give birth and rear young here. Since 1981, when they were first spotted along our coast, each calving season has been met with anticipation by right whale supporters. Successful reproduction is a challenge for the North Atlantic right whale. Female right whales reach reproductive maturity at around 10 years of age. Historically, the species can give birth to only one calf every three to five years, yet trauma from entanglement has increased this interval to nearly 10 years. With an estimated population of fewer than 100 breeding females, every birth is a cause for celebration and, unless action is taken by your agency, this species will be lost forever. The National Marine Fisheries Service (NMFS) released new data on October 26, 2020 indicating that the population estimates, and mortality and serious injury rates are worse than previously thought. Given the low population numbers (including fewer than 94 breeding females remaining), it is essential that we work together to protect every North Atlantic right whale in order to avoid extinction for this endangered species. Based on the expert opinions of scientists, trusted non-governmental organizations and conservation groups, I don’t believe NOAA Fisheries’ proposal to reduce the serious injury and mortality of right whales can move the lobster and crab fisheries into compliance with the Marine Mammal Protection Act (MMPA) and the Endangered Species Act (ESA). NOAA Fisheries’ proposed measures aim to achieve only 60-69% risk reduction, but they must recalculate the potential biological removal (PBR) level using updated data and publish a final rule that achieves a minimum of an 80% risk reduction. We have a biological, legal, and moral responsibility to curtail human-caused deaths of this species. The U.S. federal government is required to protect these animals in our waters, under the MMPA and the ESA. Please strengthen the proposed North Atlantic right whale take reduction plan and consider emergency action. Thanks for your consideration and efforts to preserve this symbol of our state, our ecosystem and biological diversity. Sincerely,

Form Letter J

Total matches 70-100%: 31

The North Atlantic right whale is critically endangered and needs immediate help to recover. As we already know, NOAA Fisheries legal responsibility is to protect this species from injury and death in U.S. waters. The greatest threat to right whales in U.S. waters is entanglement in commercial fishing gear. NOAA Fisheries estimates that entanglement risk from lobster and crab fisheries needs to be reduced by 60% to 80%. The calculations in the Draft Environmental Impact Statement showing how NOAA Fisheries proposes to achieve that risk reduction rely on an old stock assessment using 2016 population estimates, whereas the most recent population estimates indicate that the North Atlantic right whale has further declined to about 366 animals. So there is no question that a risk reduction target of at least 80%which accounts for unseen whale mortalitiesis required. The alternative measures that NOAA Fisheries released would achieve only 60-69% risk reduction. Further, these risk reduction measures rely on an ineffective gear modification called weak rope that has not proved to reduce serious injury and death in whales. It is not worth the economic burden on the industry to change to this rope if there is no proven conservation benefit. In addition, the closures outlined in the proposed rule are too small and too short in duration. Specifically, the closure south of Nantucket and Marthas Vineyard should be year-round, because right whales have been present nearly every month of the year in that area for the past several years. NOAA Fisheries proposed rule simply does not do enough to save the right whale from extinction. On the most optimistic timeline, the measures included in the final rule to reduce risk to whales would not be in effect on the water until 2022 or later. While this rule is revised, finalized, and implemented, NOAA Fisheries must immediately implement emergency action designating a year-round closure south of Marthas Vineyard and Nantucket and in three areas in the Gulf of Maine that would be closed seasonally to vertical buoy lines in the American lobster and Jonah crab fisheries. Targeted vertical buoy line closures where right whales interact with this heavy, lethal fishing gear are the fastest and most effective management tools to prevent unlawful deaths and extinction of the North Atlantic right whale. Closures in offshore areas would also minimize the impact on fishermen, because the majority of lobster fishing occurs closer to shore. North Atlantic right whales can recover if NOAA Fisheries takes swift, effective action to protect them from the vertical buoy lines that entangle and kill them. The proposed rule must be revised, and the final rule must meet the level of risk reduction required by the most recent scientific information. None of this is intended to curtail the fishing industry. Rather, overall environmental and economic futures depend on a renewed sense of cooperation between humanity and nature. Small adjustments based on positivity can create ripples and ultimately tides of positivity ... just as negativity has been so contagious along the way to the crossroads in history reached here.

National Oceanic and Atmospheric Administration (NOAA), The current National Marine Fisheries Services proposed rule to address North Atlantic right whale entanglements in fishing gear does not go far enough to save this species from extinction. There are only about 360 individuals remaining. The right whale is one of the world's most critically endangered whales. The species has had a 25% population loss in less than ten years. Fishing net/gear entanglements are the leading cause of increasing rates of right whale deaths and serious injuries. This type of fishing equipment and use are also preventing right whales from reproducing, causing calving rates to spiral to historic lows. Thankfully, National Marine Fisheries Service officials have acknowledged for years that the right whale's situation is dire and that more needs to be done. And, more must be done now. Unfortunately, more right whales are being harmed and killed by fishing gear entanglements as we wait for needed action. The recently proposed rule must do more to protect the lives of and reproduction of right whales by expanding the proposed closures and fast-tracking the transition to requiring "ropeless" fishing gear. The Fisheries Service has the statutory authority to enact emergency regulations to close important right whale habitat to fishing with static vertical buoy lines. Please use that power, now, to save this species from extinction. Thank you. Judy Lukasiewicz jsteel@cruzio.com 701 Happy Valley Rd. Santa Cruz, California 95065

Form Letter L

Total matches 70-100%: 17

I write to you as a taxpayer who cares deeply about the extinction crisis and believes that it must be treated as the emergency that it is. I am writing to comment on the proposed modifications to the Atlantic Large Whale Take Reduction Plan as published in the Federal Register - a plan that is clearly inadequate. As NOAA has recognized, entanglement in outmoded fishing gear is the leading cause of death for North Atlantic right whales. 85% of right whales have become entangled at least once as they navigate through more than one million buoy ropes attached to fishing gear on the East Coast of the United States. Where there is rope, there is real and imminent risk to right whales. This situation never should have been allowed to happen in the first place and it has to be remedied fast. We are talking about extinction of a endangered species. This is an emergency. According to NOAA’s most recent estimate, fewer than 370 right whales remain. The proposed rule modifications do not represent a serious, science and technology-based effort to save this species from extinction. Whatever the intention, they look like a plan to kick addressing this lethal fishing gear down the road, at which point it will be too late. NOAA should deal with this issue realistically now. Its new rules should reflect the most recent population estimate produced by the Agency’s own scientist, not data considered obsolete by NOAA itself. Proposals to reduce entanglement risks to right whales must promote and accelerate the permitting process for ropeless fishing gear. This 21st century technology, pioneered by New England lobstermen, reduces entanglement risk to right whales while maintaining fishermen's access to otherwise closed areas. The NOAA-preferred option of reduced breaking strength or weak rope is a short-term policy option that offers no protection to right whale calves or juveniles from potentially lethal entanglements. It is a diversion from what will actually work best. If right whales are to survive, we cannot afford to lose any right whale calves. I urge you to strengthen the proposed rule changes to ensure they are based on the best available science and technology and to accelerate the adoption of ropeless fishing, a win-win solution for endangered whales, fishermen and coastal economies. Again, we are in an extinction crisis. Right whales are a species at extreme risk. It is incumbent upon NOAA to take action immediately and to do it in a way that will actually work. Thank you.

National Oceanic and Atmospheric Administration (NOAA), The National Marine Fisheries Services proposed rule to address North Atlantic right whale entanglements in fishing gear does not go far enough to save this species from extinction. With only about 360 individuals remaining, the right whale is one of the world's most critically endangered whales. The species has suffered a 25% population loss in less than a decade. Fishing gear entanglements are the leading cause of skyrocketing rates of right whale deaths and serious injuries and are also preventing them from reproducing, pushing calving rates to historic lows. National Marine Fisheries Service officials have acknowledged for years that the right whale's situation is dire and that more needs to be done. More right whales are being harmed and killed by fishing gear entanglements while we wait for action. The proposed rule must do more to protect right whales by expanding the proposed closures and fast-tracking the transition to requiring "ropeless" fishing gear. The Fisheries Service has the statutory authority to enact emergency regulations to close important right whale habitat to fishing with static vertical buoy lines. Please use that power to save this species from extinction. The whales are also disturbed by all the darn ships. There should be a place they could be safe. Here where I live, people take out whale watching ships. It's like they have no idea that the whales did not come out to be seen but they are trying to eat. Every time these fools do that it makes me unhappy. We're losing our orcas because of people/dam interface and your losing the right whales because of fishermen whining about making a living and being unwilling to change their behavior. I hope you can save the poor damn whales, they don't deserve the way they are being treated. Most of the living things left don't de

Dear NOAA Fisheries, My name is Daryn Clevesy and I currently reside in Portsmouth, NH. I have grown up in NH my entire life and have always been drawn to nature, both the mountains and the sea. My love for nature only grew as I did, leading me to earn a Bachelor's degree in Environmental Conservation and Sustainability from the University of New Hampshire. Today I am lucky to be working at the Seacoast Science Center (SSC) located inside the beautiful Odiorne Point State Park where I work everyday to educate the public about our World's Ocean importance, and what we can do to help protect the oceans themselves, as well as the many species that depend on it. Thats why Im writing to you today about our North Atlantic right whales. Im asking you to do everything you can to save this critically endangered species from extinction. While your proposed rule is a step in the right direction, it does not go far enough. I urge NOAA Fisheries to consider the following in formulating the final draft of the rule: Weak rope will not do enough: modifications to fishing gear, called weak rope, are intended to reduce risk of entanglement. But weak rope has not been thoroughly evaluated and has not been proven to reduce risk. We need more, and longer, habitat closures: to truly save the species, we need to dramatically reduce the amount of vertical lines in the water, for a longer period of time. The proposed closures are not long enough or large enough to protect these whales. Ropeless fishing gear is the best path forward: NOAA Fisheries must continue efforts to test and foster a market for ropeless technologies by creating incentives for fishermen to try them. Right whales are majestic, social creatures that are a critical part of the ecosystem. We are their greatest threat, and only hope We have to act now to save them. Please do everything you can to prevent their extinction. Sincerely, Daryn Clevesy

Dear NOAA Fisheries: We are writing in reference to Docket No. 201221-0351 - the rulemaking process to protect critically endangered North Atlantic right whales. The North Atlantic right whale is Georgia's state marine mammal. Our coast is one of the few known calving grounds and each winter, calving North Atlantic right whales make their annual journey from New England and the Canadian Maritimes to give birth and rear young here. Since 1981, when they were first spotted along our coast, each calving season has been met with anticipation by right whale supporters. Successful reproduction is a challenge for the North Atlantic right whale. Female right whales reach reproductive maturity at around 10 years of age. Historically, the species can give birth to only one calf every three to five years, yet trauma from entanglement has increased this interval to nearly 10 years. With an estimated population of fewer than 100 breeding females, every birth is a cause for celebration and, unless action is taken by your agency, this species will be lost forever. The National Marine Fisheries Service (NMFS) released new data on October 26, 2020 indicating that the population estimates, and mortality and serious injury rates are worse than previously thought. Given the low population numbers (including fewer than 94 breeding females remaining), it is essential that we work together to protect every North Atlantic right whale in order to avoid extinction for this endangered species. Based on the expert opinions of scientists, trusted non-governmental organizations and conservation groups, we don't believe NOAA Fisheries' proposal to reduce the serious injury and mortality of right whales can move the lobster and crab fisheries into compliance with the Marine Mammal Protection Act (MMPA) and the Endangered Species Act (ESA). NOAA Fisheries' proposed measures aim to achieve only 60-69% risk reduction, but they must recalculate the potential biological removal (PBR) level using updated data and publish a final rule that achieves a minimum of an 80% risk reduction. PARK CANNON REPRESENTATIVE DISTRICT 58 931 MONROE DRIVE SUITE 102, NUMBER 460 ATLANTA, GA 30308 PARK.CANNON@HOUSE.GA.GOV House of Representatives COVERDELL LEGISLATIVE OFFICE BUILDING, ROOM 512 ATLANTA, GEORGIA 30334 (404) 656-7859 (O) (404)656-5605 (FAX) STANDING COMMITTEES: ETHICS CODE REVISION HUMAN RELATIONS & AGING INSURANCE SMALL BUSINESS DEVELOPMENT CREATIVE ARTS & ENTERTAINMENT WORKING GROUP We have a biological, legal, and moral responsibility to curtail human-caused deaths of this species. The U.S. federal government is required to protect these animals in our waters, under the MMPA and the ESA. Dear NOAA Fisheries: As a non-profit environmental law center, Midwest Environmental Advocates works to defend public rights, protect natural resources, and ensure transparency and accountability in government. That is why today we write with concern for the North Atlantic right whale. Right whales, which exist in Atlantic coastal waters off the eastern United States and Canada, are critically endangered with fewer than 360 left on Earth. Since 2017, 47 known right whale deaths have been documented – including the tragic death of a newborn calf in St. Augustine this month. Sadly, right whales are not dying of natural causes – they are hit by moving vessels or entangled in commercial fishing lines that connect lobster and crab traps on the seafloor to buoys at the water's surface. The greatest threat to right whales in U.S. waters is entanglement in commercial fishing gear. Once entangled in vertical buoy lines, whales may drown or drag and swim with attached gear for long distances, ultimately resulting in fatigue, compromised feeding ability, or severe injuries that lead to reduced reproductive success and long, protracted deaths. Scientists estimate that 85% of right whales have been entangled at least once, and over 50% of right whales have been entangled multiple times. We believe there is a biological, legal, and moral responsibility to end these human-caused deaths and keep the right whale from extinction. In fact, the U.S. federal government is required to protect these animals in our waters, under the Marine Mammal Protection Act (MMPA) and the Endangered Species Act (ESA). While we appreciate the agency's work on new rules for the U.S. American lobster and Jonah crab fishery, to reduce the risk this fishery poses to endangered North Atlantic right whales, the rule must be reworked and strengthened to save right whales from extinction. As it is proposed, the rule 1) uses outdated data to calculate risk reduction to whales, 2) proposes fishing technology which has not been proven to help, Regarding: Docket No. 201221-0351 – The Taking of Marine Mammals Incidental to Commercial Fishing Operations Page 2 of 3 and 3) does not go far enough in its recommendation for closures. NOAA Fisheries estimates that entanglement risk from lobster and crab fisheries needs to be reduced by 60% to 80% for the right whale to survive extinction. Unfortunately, the calculations in the Draft Environmental Impact Statement showing how you achieve that risk reduction relies on 2016 population estimates of 412 whales, whereas the most recent population estimates indicate that the North Atlantic right whale has declined to about 366 animals. So there is no question that a risk reduction target of at least 80% which accounts for all whale mortalities is required. The latest preliminary data suggests the average annual right whale mortality is approximately 24 whales per year – meaning the risk of entanglement needs to be reduced to near zero for the population to survive The proposed rule relies on the use of ineffective gear modifications, called "weak rope" (or "weak inserts") to reduce risk, but weak rope has not been thoroughly evaluated or shown to reduce risk. Though intended to help entangled whales break free, this new style of rope does not prevent entanglements, has not been proven to sufficiently reduce serious injury and death in whales, and is especially risky for younger, smaller right whales. In addition, many fishermen say that if forced to use weak rope, they will add rope to their buoy lines for hauling traps, thus potentially increasing the risk of entanglement. It is not worth the economic burden on the industry to change to this rope if there is no proven conservation benefit. Closures and "ropeless" technologies are a step in the right direction but the rule doesn't go far enough in either regard. The proposed closures to vertical buoy lines are too small, and too short in duration. The closure south of Nantucket and Martha's Vineyard, in the most conservative alternative (3a) may be an appropriate size but is far too short in time at February through April. This should be a year-round closure as right whales have been seen almost every month of the year here for the last several years. Closures should be based on the best available science which includes recent and historical sightings, acoustic data, and prey data. As proposed by the rule, new and existing closures will allow for the use of ropeless fishing with special permits. NOAA Fisheries must continue the effort to test and foster a market for ropeless technologies by creating incentives for fishermen to try them. The technologies are a promising practice that can prevent extinction of the right whale and meet the needs of the fishing industry and its employees. Overall, the use of ropeless technologies in new and existing closed areas is a good idea. Because measures will not be implemented for at least another year, and the right whale cannot sustain more deaths while we wait for stronger rules to to be developed, NOAA Fisheries must use its emergency authority to put vertical buoy line closures in place in areas where large numbers of right whales and harmful fishing gear co-exist in Southern New England and offshore in the Gulf of Maine. Regarding: Docket No. 201221-0351 – The Taking of Marine Mammals Incidental to Commercial Fishing Operations Page 3 of 3 The North Atlantic right whale is critically endangered, dangerously close to the tipping point for extinction, but their population can rebound if we lower human-caused deaths. If we don't act now, it would mark the first human-caused extinction of a large whale. This would be tragic for right whales and detrimental to the ocean ecosystem, to the lobster and crab fisheries, and to people who care about the health of our oceans and marine wildlife. Sincerely,

Your plan is inadequate. You can do better that this. North Atlantic right whales can recover if NOAA Fisheries takes swift, effective action to protect them from the vertical buoy lines that entangle and kill them. The proposed rule must be revised, and the final rule must meet the level of risk reduction required by the most recent scientific information. In the meantime, NOAA Fisheries must immediately implement closures to lobster and crab fishing with vertical buoy lines in the areas where right whales concentrate, and help prevent the extinction of this iconic animal.

North Atlantic right whales are dying solely due to human activities. Without bold action, I fear these whales may go extinct in my lifetime. The National Marine Fisheries Service has the opportunity to make the necessary changes to save this species. I am glad to see steps are being outlined to promote the protection and survival of right whales but, unfortunately, the proposed steps are based on outdated science. I urge NMFS to redraft these regulations using the most up-to-date population estimates of North Atlantic right whales in order to develop an accurate risk reduction plan. I also urge NMFS to aim to reduce risk to right whales by at least 80 percent, as recommended by the US Marine Mammal Commission, rather than the less effective risk reduction outlined in the current proposal. In the interim, NMFS should immediately implement temporary emergency regulations to protect right whales. I strongly encourage NMFS to further invest in developing ropeless technology as quickly and responsibly as possible, while establishing a plan to assist commercial trap fisheries in a transition to whale-safe gear. This rule relies too heavily on a costly and inadequate transition to weaker rope, which has not been proven to protect younger whales and does not reduce the long-term health effects of chronic entanglements on whales. I strongly support full protection for the critically endangered North Atlantic right whales, which are cherished gentle giants who traverse the busy waters of the US East Coast. Many of these docile creatures wear the painful evidence of fishing gear entanglements and ship strikes which is a reminder of the dangers they face. Eighty-five percent of North Atlantic right whales bear scars from being entangled in gear at least once in their lives, while over half bear scars from being entangled at least twice. Right whales nearly went extinct due to commercial whaling but were able to slowly recover after whaling on them ceased. Now, they are once again in serious jeopardy of extinction due to human actions. I thank the NMFS for consideration of my letter and strongly urge the NMFS to please institute emergency protective measures and regulations to ensure the survival of the critically endangered North American right whale species. Please prioritize the enforcement of these protective measures. Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that NMFS will prioritize right whale protections.

It is NOAA Fisheries legal responsibility under the Endangered Species Act and the Marine Mammal Protection Act to protect the North Atlantic right whate from injury and death in U.S. waters. The greatest threat to right whales in U.S. waters is entanglement in commercial fishing gear. The most recent population estimates indicate that the North Atlantic right whale has further declined from the 2016 population estimates to about 366 animals. So there is no question that a risk reduction target of at least 80%which accounts for unseen whale mortalitiesis required. The alternative measures that NOAA Fisheries released would achieve only 60-69% risk reduction. The ineffective gear modification called weak rope has not proved to reduce serious injury and death in whales. It is not worth the economic burden on the industry to change to this rope if there is no proven conservation benefit. NOAA Fisheries must immediately implement emergency action designating a year-round closure south of Marthas Vineyard and Nantucket and in three areas in the Gulf of Maine that would be closed seasonally to vertical buoy lines in the American lobster and Jonah crab fisheries. Targeted vertical buoy line closures where right whales interact with this heavy, lethal fishing gear are the fastest and most effective management tools to prevent unlawful deaths and extinction of the North Atlantic right whale. Closures in offshore areas would also minimize the impact on fishermen, because the majority of lobster fishing occurs closer to shore. North Atlantic right whales can recover if NOAA Fisheries takes swift, effective action to protect them from the vertical buoy lines that entangle and kill them. The proposed rule must be revised, and the final rule must meet the level of risk reduction required by the most recent scientific information. In the meantime, NOAA Fisheries must immediately implement closures to lobster and crab fishing with vertical buoy lines in the areas where right whales concentrate, and help prevent the extinction of this iconic animal.

As per the following statement from the Turtle Island Restoration Network: "Lobster and crab are caught with vertical buoy lines in areas where right whales concentrate. Because vertical lines run from the trap up to the surface buoy, traps and pots can entangle marine animals including endangered North Atlantic right whales, humpback whales, fin whales, and grey whales. The effects of entanglement can range from no permanent injury to serious injury and death. If the traps are weighted down, entangled whales, dolphins, and sea turtles can drown if they cannot reach the surface to breathe. NOAA Fisheries estimates that entanglement risk from lobster and crab fisheries needs to be reduced by 60% to 80%. The calculations in the Draft Environmental Impact Statement showing how NOAA Fisheries proposes to achieve that risk reduction rely on an old stock assessment using 2016 population estimates, whereas the most recent population estimates indicate that the North Atlantic right whale has further declined to about 366 animals. So there is no question that a risk reduction target of at least 80%which accounts for unseen whale mortalitiesis required. The alternative measures that NOAA Fisheries released would achieve only 60-69% risk reduction. North Atlantic right whales can recover if NOAA Fisheries takes swift, effective action to protect them from the vertical buoy lines that entangle and kill them. The proposed rule must be revised, and the final rule must meet the level of risk reduction required by the most recent scientific information." I support any revisions that will help in the recovery of the North Atlantic Right Whales. Our world is losing way too may species that keep it in balance and we absolutely must take bold steps in protecting wildlife and marine species.

I am commenting on the proposed modifications to the Atlantic Large Whale Take Reduction Plan as published in the Federal Register. As NOAA is aware, the leading cause of death for North Atlantic right whales is getting entangled in old fishing gear. The vast majority of right whales (85%) have become entangled in gear at least once as they attempt to swim through over a million buoy ropes attached to fishing gear on the U.S. East Coast. These ropes are real risk to right whales. As a result, the right whales are practically extinct. According to NOAA’s most recent estimate, fewer than 370 right whales remain. The proposed rule modifications won't solve the problem and are not science and technology-based. If NOAA is going to change the rules protecting right whales, those rules should based on the most recent population estimate produced by the Agency's own scientists, not obsolete data. Proposals to reduce entanglement risks to right whales must promote and speed-up the permitting process for ropeless fishing gear. This latest technology, pioneered by New England lobstermen, reduces entanglement risk to right whales while maintaining fishermen's access to otherwise closed areas. The NOAA-preferred option of reduced breaking strength or weak rope can still kill young right whales that get tangled. I urge you to strengthen the proposed rule changes based on the latest science, and to accelerate the use of ropeless fishing - a win-win for endangered whales, fishermen and coastal economies. Thank you

Form Letter ZE

I wish to comment on the proposed modifications to the Atlantic Large Whale Take Reduction Plan shown in the Federal Register. As NOAA has recognized, entanglement in outmoded fishing gear is the leading cause of death for North Atlantic right whales. Where there is rope, there is real and imminent risk to right whales. Leveraging ropeless fishing texhnology is the best way forward. Time is running out. According to NOAA's most recent estimate, fewer than 370 right whales remain. The proposed rule modifications do not represent a serious, science and technology-based effort to save this species from extinction. If NOAA is going to change the rules protecting right whales, the new rules should reflect the most recent population estimate produced by the Agency's own scientist, not data consider obsolete by NOAA itself. Proposals to reduce entanglement risks to right whales must promote and accelerate the permitting process for ropeless fishing gear. This 21st century technology, pioneered by New England lobstermen, reduces entanglement risk to right whales while maintaining fishermen's access to otherwise closed areas. The NOAA-preferred option of reduced breaking strength or weak rope is a short-term policy option that offers no protection to right whale calves or juveniles from potentially lethal entanglements. Please strengthen the proposed rule changes to ensure they are based on the best available science and technology and to accelerate the adoption of ropeless fishing, a win-win solution for endangered whales, fishermen and coastal economies. Thank you.

North Atlantic right whales are dying solely due to human activities. Without bold action, I fear these whales may go extinct in my lifetime. The National Marine Fisheries Service has the opportunity to make the necessary changes to save this species. I am glad to see steps are being outlined to promote the protection and survival of right whales but, unfortunately, the proposed steps are based on outdated science. I urge NMFS to redraft these regulations using the most up-to-date population estimates of North Atlantic right whales in order to develop an accurate risk reduction plan. I also urge NMFS to aim to reduce risk to right whales by at least 80 percent, as recommended by the US Marine Mammal Commission, rather than the less effective risk reduction outlined in the current proposal. In the interim, NMFS should immediately implement temporary emergency regulations to protect right whales. I strongly encourage NMFS to further invest in developing ropeless technology as quickly and responsibly as possible, while establishing a plan to assist commercial trap fisheries in a transition to whale-safe gear. This rule relies too heavily on a costly and inadequate transition to weaker rope, which has not been proven to protect younger whales and does not reduce the long-term health effects of chronic entanglements on whales. I can absolutely appreciate the time and effort that would have to be put into a transition to ropeless technology and an updated risk reduction plan, but the reality is that we, as human beings with a significant impact on the environment, have a moral responsibility to protect wild animal life. I sincerely and wholeheartedly plead that we take these small steps towards taking a greater responsibility for our place in the world around us. I love animals, but loving animals is not my job or my passion in life. I personally believe that humans have emerged as one of the most intelligent and impactful species through the natural process of evolution, and there's no reason why we can't take pride in that position. I say this to be clear that I speak from a position of concern but not a position of bias. Ultimately, any position of power comes with responsibility, and taking care of animal species that share the world with us is simply right, especially when such simple measures would go such a long way. Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that NMFS will prioritize right whale protections.

The Georgia Conservancy is pleased to provide comments for the rulemaking related to the NMFS Large Whale Take Reduction Plan Regulations ("proposed rule"). The members of our organization, along with residents across the state of Georgia, have a strong interest in the North Atlantic right whale (Eubalaena glacialis) ("right whale"), which spends part of each year off of our shores. Founded in 1967, the Georgia Conservancy is one of Georgia's oldest nonprofit conservation organizations. Working to protect our coast for more than 50 years, the Georgia Conservancy is a statewide conservation organization whose goal is to develop practical solutions for protecting Georgia's environment. We establish policy decisions under a vision statement that seeks to cultivate a Georgia where people and the environment thrive. In the 1980's, Georgia Conservancy staff played a role in discovering the thenunknown calving grounds off our shore. Since that time, this iconic animal has played a role in the organization's conservation outreach and advocacy. Right whales are critically endangered, but their population can rebound if we lower human-caused deaths using updated science and fishing technologies. Currently, conservation of the right whale is of principal concern now that the species' apparent recovery seems to have stalled. The National Marine Fisheries Service (NMFS) has proposed rules to amend the regulations to reduce serious injury to North Atlantic right whales in the northeast commercial lobster and crab trap/pot fisheries. The most recent stock assessments during the regulation development have shown that the species is declining more rapidly than initially anticipated. The numerous right whale deaths since 2017 have rendered the measures in the proposed rule to be "too little, too late." However, Georgia Conservancy supports updated regulations that build off of three primary elements of the proposed rules (closures, gear, and technology). COASTAL OFFICE 428 Bull Street, Suite 210 Savannah, GA 31401 tel 912.447.5910 fax 912.447.0704 coastal@gaconservancyorg georgiaconservancy.org. PRESIDENT Katherine Moore* BOARD CHAIR Mark S. Berry, Douglasville* BOARD OF TRUSTEES Felicia Adkins, Canton Brent Beatty, Atlanta Hardie Davis Jr., Hephzibah Richard S. Downey, Atlanta Patrice T. Francis, Atlanta* Stephen Green, Savannah Virginia Harman, Cave Spring* Peter Hartman, Atlanta Holden Hayes, Savannah Byron Kirkpatrick, Atlanta* Mike LaFerle, Marietta Leslie D. Mattingly, St, Simons* Tim McKinley, Atlanta Chris Miller, LaGrange Robert Morris, Tybee Island PJ Newcomb, Decatur Amanda Brown Olmstead, Atlanta Russ Pennington, Brookhaven* Steven E. Arnold, Atlanta Braye Boardman, Augusta Joel Cowan, Peachtree City Ann Q. Curry, Atlanta C. Edward Dobbs, Atlanta Amir Farokhi, Atlanta Elliott Levitas, Atlanta J. Lacey Lewis, Atlanta Hank Linginfelter, St. Simons Clay C. Long, Atlanta Joe Montgomery, Rome Marci Collier Overstreet, Atlanta Laura Turner Seydel, Atlanta Ron Shipman, Macon Jim Timmons, Atlanta *Executive Committee Member These updates should reflect recent developments that could shift the recovery trajectory, namely. • Expanded and improved fishery monitoring to account for interactions between fishing gear and right whales • Additional measures provided for fisheries that must close due to the presence of whales and • Interim emergency management measures including vertical line reductions, seasonal closures, and ropeless fishing areas We realize that these proposed regulations create significant economic impacts on fishermen and their communities. Though the restrictions will impact fisheries, we anticipate that they will create areas off of Georgia's shores that can be used for right whale protection. Opportunities, which build on and support NOAA regulatory changes: Investing in longer-term adaptations (technology and fishery practices) that take effective action over the years will once more place the right whale on a trajectory to becoming a truly viable population. Hopefully, this combination will encourage a future where local fisheries prosper while protecting our stock of whales from entanglement. We want to emphasize that these measures will minimize conflicts across the range (northern and in southeastern waters too): Equipment adaptation and incentives across the range: "Ropeless (or buoyless) fishing" adaptations carry the promise to improve fishing and protect whales. These systems allow fishers to continue operating in areas where right whales are present without further endangering these marine mammals. We advocate for NOAA Fisheries to continue to test and foster a market for ropeless technologies by creating incentives for their use. Additional funding and scientific inquiry: Improvements in stock assessment and support for science related to right whale conservation are very much needed. We hope for additional funding from legislation such as the proposed "Scientific Assistance for Very Endangered North Atlantic Right Whales Act of 2019" (S.2453), also known as the SAVE Right Whales Act. This bill seeks to establish "a grant program to promote collaboration between states, nongovernmental organizations, and members of the fishing and shipping industries to reduce human impacts on right whales and promote the recovery of the population." Another bill, titled the Right Whale Protection Act, goes a long way to furthering much needed NOAA research, stock assessments, and gear adaptation. The bipartisan Senate bill, which former Senator Johnny Isakson of Georgia co-signed, was introduced in September 2019 and would authorize up to $5 million annually from 2019 - 2029 to projects that promote or contribute to the wild population's sustainability and recovery. The SAVE Right Whales Act also encourages North Atlantic right whale recovery efforts between the United States and Canadian governments. We see a perilous need for a spirit of cooperative action that furthers right whale conservation. To that end, we would like to see agency support for speeding up the adaptation of new technologies and added funding that will lead to a reduction in human/right whale conflicts. The Georgia Conservancy has been involved with North Atlantic right whale conservation issues for nearly 40 years. Stewardship of our iconic state marine mammal is a legacy for the Georgia Conservancy and thus provides a policy lens through which we view our advocacy, research, and outreach. Specifically, the proposed rulemaking is directed to New England fisheries; however, notable changes in Southeastern US fisheries may be made to reduce rope entanglements as well. By way of example, the Georgia Conservancy seeks to support the early, promising work being done in Georgia to adapt ropeless gear in the black sea bass fishery. With less than 400 right whales left and deaths occurring at a rate that far exceeds the sustainable level, there is an imperative to approve strong regulatory changes and to do more across the entire migration range-north and southeast. Further protective measures will need to be implemented across the whole range, from the Southeastern shores to New England and Canadian waters. As they stand now, the proposed regulations do not meet the threshold of strength needed to support this critical species. If there is no significant revision to the Proposed Risk Reduction Rule by NMFS, the Georgia Conservancy recommends that it be withdrawn and updated and emergency measures put in place. We look for an informed and comprehensive implementation of these measures.

Dear NOAA Fisheries, My name is Deb Wills, and I am from Oakland, CA. I have fundamental concerns about the decline in biodiversity. While no longer pursued for its oil, meat and bones, North Atlantic right whales continue to be the victim of ship strikes and entanglement in fishing gear, which can result in protracted, painful deaths.This whale population is declining so quickly that they may be functionally extinct by 2040, in not before, if more isn't done to protect them. Thats why Im writing to you today about our North Atlantic right whales. Im asking you to do everything you can to save this critically endangered species. While your proposed rule changes are a step in the right direction, it does not go far enough. I urge NOAA Fisheries to consider the following in formulating the final draft of the rule: 1. Weak rope will not do enough: modifications to fishing gear, called weak rope, are intended to reduce risk of entanglement. But weak rope has not been thoroughly evaluated and has not been proven to reduce risk. 2. We need more, and longer, habitat closures: to truly save the species, we need to dramatically reduce the amount of vertical lines in the water. Additionally the proposed closures are too short in duration and not large enough to protect these whales, so some areas need to be enlarged, and some areas need to be protectef ro longer periods of time, possibly year-round in some cases. 3. Ropeless fishing gear is the best path forward: NOAA Fisheries must continue efforts to test and foster a market for ropeless technologies by creating incentives for fishermen to try them. Right whales are majestic, maternal creatures that live in our own local oceans. Its up to us to save them. Please do everything you can to prevent their extinction.

The North Atlantic right whale is critically endangered and needs immediate help to recover. It is NOAA Fisheries legal responsibility under the Endangered Species Act and the Marine Mammal Protection Act to protect this species from injury and death in U.S. waters. The greatest threat to right whales in U.S. waters is entanglement in commercial fishing gear. NOAA Fisheries estimates that entanglement risk from lobster and crab fisheries needs to be reduced by 60% to 80%. The calculations in the Draft Environmental Impact Statement showing how NOAA Fisheries proposes to achieve that risk reduction rely on an old stock assessment using 2016 population estimates, whereas the most recent population estimates indicate that the North Atlantic right whale has further declined to about 366 animals. So there is no question that a risk reduction target of at least 80%which accounts for unseen whale mortalitiesis required. The alternative measures that NOAA Fisheries released would achieve only 60-69% risk reduction. North Atlantic right whales can recover if NOAA Fisheries takes swift, effective action to protect them from the vertical buoy lines that entangle and kill them. The proposed rule must be revised, and the final rule must meet the level of risk reduction required by the most recent scientific information. In the meantime, NOAA Fisheries must immediately implement closures to lobster and crab fishing with vertical buoy lines in the areas where right whales concentrate, and help prevent the extinction of this iconic animal.

National Oceanic and Atmospheric Administration (NOAA), The National Marine Fisheries Services proposed rule to address North Atlantic right whale entanglements in fishing gear is inadequate to save this species from extinction. With only about 360 individuals remaining, the right whale is one of the world's most critically endangered whales. The right whale population has declined 25% in less than a decade. The leading cause of skyrocketing rates of right whale deaths and serious injuries is fishing gear entanglements, which are also preventing reproduction, pushing calving rates to historic lows. More right whales are being harmed and killed by fishing gear entanglements every day. The proposed rule must do more to protect right whales by expanding the proposed closures and fast-tracking the transition to requiring "ropeless" fishing gear. The Fisheries Service has the statutory authority to enact emergency regulations to close important right whale habitat to fishing with static vertical buoy lines. Please use that power to save this species from extinction. Thank you for considering my perspective. Patricia Harlow harlowpp@gmail.com 624 Erlen Road Plymouth Meeting, Pennsylvania 19462

I am writing to comment on the proposed modifications to the Atlantic Large Whale Take Reduction Plan as published in the Federal Register. As NOAA has recognized, entanglement in outmoded fishing gear is the leading cause of death for North Atlantic right whales. 85% of right whales have become entangled at least once as they navigate through more than one million buoy ropes attached to fishing gear on the East Coast of the United States. Where there is rope, there is real and imminent risk to right whales. Proposals to reduce entanglement risks to right whales must promote and accelerate the permitting process for ropeless fishing gear. This 21st century technology, pioneered by New England lobstermen, reduces entanglement risk to right whales while maintaining fishermen's access to otherwise closed areas. The NOAA-preferred option of reduced breaking strength or weak rope is a short-term policy option that offers no protection to right whale calves or juveniles from potentially lethal entanglements. I urge you to strengthen the proposed rule changes to ensure they are based on the best available science and technology and to accelerate the adoption of ropeless fishing, a win-win solution for endangered whales, fishermen and coastal economies. Thank you.

North Atlantic right whales are on the brink of extinction. Current population studies estimate that there are fewer than 366 living whales, with only 82 reproductively active females. Entanglement in commercial fishing gear is the leading cause of serious injury and death for this iconic species. The law requires NOAA Fisheries to make new rules to protect endangered North Atlantic right whales in U.S. waters. After years of delay, the agency finally released a proposed rule to reduce entanglement risk, but its risk reduction measures are based on outdated science and do not go far enough to save right whales from extinction. Also, on the most optimistic timeline, measures included in the final rule to reduce risk to whales would not be in effect on the water until 2022 or later, and the right whale population cannot sustain more deaths in the interim. NOAA Fisheries officials must take emergency action and create immediate fishing closures in areas where right whales are most prevalent while the agency develops stronger protections for the long term.

CENTER FOR A SUSTAINABLE COAST 221 Mallery Street, Suite B Saint Simons Island, Georgia 31522 Voice: 912.506.5088 REVISED Draft We share the concerns of millions who are witnessing the alarming decline of marine mammals pushing them to the brink of extinction, including the Right Whale. The population of these magnificent animals has plummeted, making them extremely vulnerable to further risks, including offshore fishing that is the cause for most fatalities, in combination with ship-strikes. According to marine scientists, since 2017, 45 right-whale deaths have been documented, and many more are suspected. Because injuries and deaths are often caused by entanglement with vertical buoy lines, rules governing related offshore fisheries activities are extremely important. We are advised that some 85% of right whales have been entangled at least once, and an alarming 50% or more have been entangled repeatedly. As currently drafted, marine biologists advise that unacceptable risks would be propagated despite efforts intended to reduce hazards to right whales and other marine mammals. The proposed requirements are based on obsolete information, leaving right whales needlessly vulnerable to further fatalities and suffering. Moreover, in the interim period of at least a year prior to these new measures being implemented, the right whale population remains dangerously exposed to continued destruction. Due to the dire predicament of near extinction and such unacceptable hazards, we strongly urge NOAA Fisheries to adopt added protection of the right whale, using the agency's lawful emergency authority to impose restrictions suspending the use of vertical buoy lines in zones where large numbers of right whales are known to have been entangled. Fisheries experts advise that new technologies, called rope-free (or buoy-free) fishing are an opportunity for lobster and crab fishermen to continue operating in areas where right whales are present without further endangering these marine mammals. To develop these alternatives, NOAA Fisheries must continue efforts to test and foster a market for rope-free technologies, including the creation of incentives for fishermen to try them. Accordingly, rope-free testing in closure areas should be authorized under carefully monitored and evaluated conditions, using "exempted" fishing permits. We have a biological, legal, and moral responsibility to end these cruel and avoidable human-caused deaths. Under the Marine Mammal Protection Act (MMPA) and the Endangered Species Act (ESA), the U.S. federal government is required to protect these animals in our nation's waters. We implore you to take our comments to heart by adopting the most protective approach possible to prevent extinction of the right whale.

I am writing to comment on the proposed modifications to the Atlantic Large Whale Take Reduction Plan as published in the Federal Register. As NOAA has recognized, entanglement in outmoded fishing gear is the leading cause of death for North Atlantic right whales. 85% of right whales have become entangled at least once as they navigate through more than one million buoy ropes attached to fishing gear on the East Coast of the United States. Where there is rope, there is real and imminent risk to right whales. Time is running out. According to NOAA's most recent estimate, fewer than 370 right whales remain. The proposed rule modifications do not represent a serious, science and technology-based effort to save this species from extinction. If NOAA is going to change the rules protecting right whales, the new rules should reflect the most recent population estimate produced by the Agency's own scientist, not data consider obsolete by NOAA itself. Proposals to reduce entanglement risks to right whales must promote and accelerate the permitting process for ropeless fishing gear. This 21st century technology, pioneered by New England lobstermen, reduces entanglement risk to right whales while maintaining fishermen's access to otherwise closed areas. The NOAA-preferred option of reduced breaking strength or weak rope is a short-term policy option that offers no protection to right whale calves or juveniles from potentially lethal entanglements. I urge you to strengthen the proposed rule changes to ensure they are based on the best available science and technology and to accelerate the adoption of ropeless fishing, a win-win solution for endangered whales, fishermen and coastal economies. I have been advocating this same issue for these creatures for 40 years. Enough talk and review just take action. I am exhausted by the tedious continuation of debate that goes no where. We are loosing this battle. The North Atlantic Right Whales are loosing this battle and we keep meeting, discussing, debating to no avail. We have equipment roaming planets beyond countless miles from this planet and yet somehow we can't get fishermen the equipment they need to maintain their livelihood while keeping whales from entanglement or monitor whales right here on this planet to keep them safe from ship strikes. Just how incompetent are we. or more accurately just how much don't we care? Get this done-rope less gear totally subsidized by government for immediate implementation and increase monitoring to avoid ship strikes immediately. We are out of time. The North Atlantic Right Whale is out of time. How ironic #3920-Cottontail has just died after months and months of suffering with entangled line. Thank you. Elizabeth Clemmey 175 Essex Street Mansfield Ma 02048

Please protect the whales!

Form Letter ZR

Total matches 70-100%: 3

Time is running out to save the right whales. NOAA's own scientists estimate only 366 remain. We must act now to save them from extinction. The main threat to the survival of this species is entanglement in fishing gear up and down the East coast, and recent proposed rule changes are supposed to reduce this threat. Some of these rule changes might help, but they do not do enough to save right whales from extinction. And whales are not the only ones threatened. NOAA's proposals close more areas to fishing but fail to provide support and fast-track permitting for rope-less fishing gear, a win-win solution that reduces entanglement while fishermen continue to make a living. Ropeless gear technology is the only long-term solution to reduce entanglements while keeping fishermen on the water. NOAA should include a fast-track permitting process to ensure ropeless is legal. Let's get as much rope out of the water as we can and give the North Atlantic right whale a fighting chance. Thank you for your consideration.

Form Letter ZS

Total matches 70-100%: 3

North Atlantic right whales are among the most endangered animals on the planetand without strong, evidence-based protections, the species will continue to decline. And so my family and I urge the NIAA to create immediate fishing closures in areas where right whales are most prevalent, while the agency develops stronger protections in the long term.

Total matches 70-100%: 3

NOAA Fisheries 1315 East-West Highway Silver Spring, MD 20910 RE: Docket No. 201221-0351 - the rulemaking process to protect critically endangered North Atlantic right whales. Dear NOAA Fisheries: Successful reproduction is a challenge for the North Atlantic right whale. Female right whales reach reproductive maturity at around 10 years of age. Historically, the species can give birth to only one calf every three to five years, yet trauma from entanglement has increased this interval to nearly 10 years. With an estimated population of fewer than 100 breeding females, every birth is a cause for celebration and, unless action is taken by your agency, this species will be lost forever. The National Marine Fisheries Service (NMFS) released new data on October 26, 2020 indicating that the population estimates, and mortality and serious injury rates are worse than previously thought. Given the low population numbers (including fewer than 94 breeding females remaining), it is essential that we work together to protect every North Atlantic right whale in order to avoid extinction for this endangered species. Based on the expert opinions of scientists, trusted non-governmental organizations and conservation groups, I don't believe NOAA Fisheries' proposal to reduce the serious injury and mortality of right whales can move the lobster and crab fisheries into compliance with the Marine Mammal Protection Act (MMPA) and the Endangered Species Act (ESA). NOAA Fisheries' proposed measures aim to achieve only 60-69% risk reduction, but they must recalculate the potential biological removal (PBR) level using updated data and publish a final rule that achieves a minimum of an 80% risk reduction. We have a biological, legal, and moral responsibility to curtail human-caused deaths of this species. The U.S. federal government is required to protect these animals in our waters, under the MMPA and the ESA. Please strengthen the proposed North Atlantic right whale take reduction plan and consider emergency action. Thanks for your consideration and efforts to preserve our ecosystem and biological diversity for future generations. Sincerely, Representative Rachel Hunt North Carolina House District 103 Rachel.Hunt@ncleg.gov

My name is Brennan Strong and I have already shared a lot of my thoughts with you and others regarding the new BiOp and regulations for right whales. I wanted to share a few more genuine suggestions while you are still accepting comments. Instead of more U.S. fishing industry regulation, we all need a lot more research. The only new

U.S. trap/pot regulation I support is increased gear marking with state and area specific colors and that all gear buoys everywhere have at least the same marking requirements as Maine (license number unique to that fisherman/gear owner). Beyond this, anymore regulation is not backed by enough credible research to justify immediate implementation. I can say this with absolute certainty for Maine, I can not speak specifically for other states. I heard the testimony of a Man at a recent public hearing, who was at an ALWTRT meeting and saw a pile of fishing gear pulled off a whale and immediately could tell none of it was from Maine. Please re - direct all effort to increased research and whale disentanglement efforts. We need whale disentanglement teams that are as fearless and tenacious as they are intelligent, willing to do whatever it takes whenever needed to disentangle whales safely. I applaud those who have led the way with these brave rescues. You have my contact so I would happy to be trained on how to help, as well as many others I know. We should be conducting a world-class study on what specific gear configurations and locations are causing entanglements, and during what times of the year. We need both public and private, state and federal, U.S. and Canadian scientists, engineers, ocean goers, and fishermen for an all hands on deck effort to get to the bottom of this serious issue. As well as the gear studies, we need to do much better with tracking right whales. I appreciate and congratulate the work that has been done so far, but it is time to build on our successes, and turn away from the scary path we appear to be going down. If you do not make serious and timely changes to your plans, I will go out of business in 10 years or less. The job I've loved and pursued for over half of my 22 years on earth will be illegal to do practically, safely, or efficiently. I will have to sell my boat and gear which will be rendered worthless, and try to fit in somewhere in the world that I don't belong. As far as vessel strikes go, the U.S. and Canada need immediate world-class research and regulations to reach 0 vessel strike injuries/deaths. Again utilizing both public and private, state and federal, U.S. and Canadian scientists, engineers, ocean goers, and fishermen. This research needs to include a specific study on how the complete shutdown of cruise ships and reduction in freight ships in 2020 positively effected the right whale population. Remembering that during this time the U.S trap/pot fishery still deployed almost 100% of our gear. Personally, I actually doubled gear and production from 2019 to 2020. Most vessel speed and route information can be easily tracked with AIS, so 100% enforcement and compliance is very realistic. Frankly the fact that we don't yet have 100% enforcement and compliance for the current vessel speed/route rule is a failure. I see 10 knots is the number, but that is twice the speed of a right whale. Our dynamic management areas need to be accurate, enforced, and continually updated and moved if necessary to provide the best whale protections possible. Ship noise interferes with right whale communication. I truly care deeply about the whales , all sea life, our way of life, and coastal communities, I hope and pray everyone else involved in this process does too. If there is any way I can be of help in making things work for everyone, please don't hesitate to contact me.

The North Atlantic right whale is critically endangered and needs immediate help to recover. It is NOAA Fisheries legal responsibility under the Endangered Species Act and the Marine Mammal Protection Act to protect this species from injury and death in U.S. waters. The greatest threat to right whales in U.S. waters is entanglement in commercial fishing gear. NOAA Fisheries estimates that entanglement risk from lobster and crab fisheries needs to be reduced by 60% to 80%. The calculations in the Draft Environmental Impact Statement showing how NOAA Fisheries proposes to achieve that risk reduction rely on an old stock assessment using 2016 population estimates, whereas the most recent population estimates indicate that the North Atlantic right whale has further declined to about 366 animals. So there is no question that a risk reduction target of at least 80%which accounts for unseen whale mortalitiesis required. The alternative measures that NOAA Fisheries released would achieve only 60-69% risk reduction. Further, these risk reduction measures rely on an ineffective gear modification called weak rope that has not proved to reduce serious injury and death in whales. It is not worth the economic burden on the industry to change to this rope if there is no proven conservation benefit. In addition, the closures outlined in the proposed rule are too small and too short in duration. Specifically, the closure south of Nantucket and Marthas Vineyard should be year-round, because right whales have been present nearly every month of the year in that area for the past several years. NOAA Fisheries proposed rule simply does not do enough to save the right whale from extinction. OVERWHELMINGLY, the American people want to PROTECT THE ENVIRONMENT and PROTECT ENDANGERED SPECIES such as the right whale. I IMPLORE YOU TO TAKE IMMEDIATE STRONG ACTIONS to protect the right whale. NOAA Fisheries must take IMMEDIATE EMERGENCY ACTION to PERMANENTLY CLOSE the areas south of Marthas Vineyard and Nantucket and in three areas in the Gulf of Maine. Fisheries for lobster and Jonah crab hurt right whales with their lines, etc. NOAA Fisheries must immediately implement closures to lobster and crab fishing with vertical buoy lines in the areas where right whales concentrate, and help prevent the extinction of this iconic animal.

I support limiting the number of buoys, it would help reduce the chances of whales becoming entangled, the ocean should not be an obstacle course for whales and other marine life to swim through.

Everyone wants to save the right whales. INCLUDING the Lobster man. We have done everything possible at this point to coexist modifying our gear, even though we are NOT the problem! All of these so called “entanglements” have been proven they are not American lobster gear. One thing that CAN NOT happen is ROPELESS fishing! Ropeless is not real and will not work! Ropeless technology will never be able to combat with the north Atlantic Ocean and the elements along with impossible avoidance of gear conflict not being able to mark our gear from the surface! We have more safe regulations now then ever INCLUDING closures when the whales are even in our waters! The lobsterman have eliminated every factor of harming these whales possible. Ropeless needs to be forgotten, it’s not needed with the precautions we have now taken and is a impractical fantasy that would miserably fail and ruin the lobstering industry.

I am writing to comment on the proposed modifications to the Atlantic Large Whale Take Reduction Plan as published in the Federal Register. And to simply say that I urge you to strengthen the proposed rule changes to ensure they are based on the best available science and technology and to accelerate the adoption of ropeless fishing gear, a win-win solution for endangered whales, fishermen and coastal economies. Thank you.
