Enhanced Data Collection (EDC) During COVID-19 Pandemic **Please submit to daily by 1200 ET**

Directions: Please enter all data for:

- 1) Case counts and traveler test results identified for the previous day
- (i.e., report submitted by 1200 ET today will include information from yesterday [0000 hrs. to 2359 hrs. ET]), and
- 2) Traveler test results received since last submission for the following:
- Symptomatic Case Counts with Viral testing
 - Asymptomatic Case Counts with Viral testing for
 - 0 Identified <u>close contacts</u>
 - o Embarkation day screening
 - **0** During or end of quarantine screening of newly embarking crew
 - **o** Routine screening
 - 0 Disembarkation screening

Completion of this form is required by cruise ships operating or intending to operate in U.S. waters during the period of CDC's Framework for Conditional Sailing Order (CSO). For additional guidance, see <u>Technical Instructions for Mitigation of COVID-19 Among Cruise Ship Crew</u> and <u>COVID-19 Operations Manual for Simulated and Restricted Voyages under the Framework for Conditional Sailing Order | Quarantine | CDC</u>

Important Reminders About COVID-19, Influenza, and Other Respiratory Pathogens

Testing for COVID-19 using viral tests (i.e., Nucleic Acid Amplification [NAAT] or antigen test)

- CDC considers all positive viral test (NAAT or antigen) results as new cases, unless laboratory documentation is provided of a previous SARS-CoV-2 viral test result within the past 90 days and the individual is asymptomatic. Cruise ship operators must have a protocol for evaluating documentation of recovery, including reviewing previous laboratory results. Cruise ship clinicians should diagnose but do **not** need to report any **persistent positive** results via EDC.
- A febrile person in the presence of a more likely diagnosis (e.g., cellulitis, urinary tract infection, tooth abscess) does not represent CLI and should not be reported via EDC.
- If separate respiratory specimens are collected for multiple tests (e.g., COVID-19 viral and influenza rapid antigen test) among symptomatic persons, these specimens should be collected from alternating nostrils of the patient *with the first collected specimen designated for COVID-19 testing*.
- To ensure the integrity of testing, persons with positive NAAT results for COVID-19 must **not** be retested. The original positive result must be reported; subsequent negative results do not negate an initial positive NAAT result and should **not** be reported.
- FOR ASYMPTOMATIC TESTING ONLY (i.e., <u>not</u> testing for symptomatic persons): confirmatory testing for a positive antigen test (i.e., presumptive positives) should take place as soon as possible after the antigen test, and not longer than 48 hours after the initial antigen testing. If more than 48 hours separate the two specimen collections, or if there have been opportunities for new exposures, a NAAT should be considered a separate test not a confirmation of the earlier test.
- Ships that choose to use antigen tests should follow CDC Interim Guidance for Antigen Testing for SARS-CoV-2
- Prior receipt of a COVID-19 vaccine will **not** affect the results of COVID-19 viral tests.

Isolation Practices

- Symptomatic persons with confirmed COVID-19, defined as laboratory confirmation of SARS-CoV-2 by viral test: should be isolated for COVID-19 per CDC guidelines, and
- isolation may be discontinued under conditions outlined at: <u>www.cdc.gov/coronavirus/2019-ncov/hcp/disposition-in-home-patients.html</u>
- Symptomatic persons with CLI that initially test negative via NAAT for COVID-19 *and* no alternative etiology is identified (e.g., influenza, *Legionella*, *Streptococcal* pharyngitis, infectious mononucleosis, *and* respiratory syncytial virus (RSV)):
 - should be isolated for COVID-19 per CDC guidelines, and
 - isolation may be discontinued if a repeat NAAT result—collected at least 24 hours from the initial COVID-19 test—is negative.

Identifying Vaccine Adverse Events for COVID-19 and Influenza

- COVID-19 vaccine side effects can include: *fever*, *chills*, *rigors*, *muscle* or body aches (myalgias), headache, fatigue, vomiting, or *diarrhea*. Please refer to this <u>CDC website appendix</u>.
- COVID-19 vaccine side effects do not include: cough, sore throat, nasal congestion, runny nose (rhinorrhea), new olfactory disorder, new taste disorder, shortness of breath, or difficulty breathing.
- **Inactivated Influenza vaccine side effects** can include: *fever*, *chills*, *fatigue*, *muscle or body aches (myalgias)*. *Please refer to* <u>influenza</u> <u>vaccination side effects</u>.
- Allergic reactions to vaccines (which typically occur immediately post-vaccination) can include: shortness of breath (i.e., anaphylaxis), vomiting, or diarrhea.

Please report any vaccine adverse events (i.e., side effects or allergic reactions) to CDC's Vaccine Adverse Event Reporting System (VAERS).

Influenza Management

- Until further notice, cumulative influenza-like-illness (ILI) reporting via the Maritime Conveyance Cumulative Influenza/Influenza-like Illness (ILI) Form is suspended due to the COVID-19 pandemic.
- If needed, please refer to CDC's website for Guidance for Cruise Ships on Influenza Management.

Reporting Cruise Ship Fatalities or Other Illnesses of Public Health Concern

- Acute gastroenteritis or diarrhea: should be reported to CDC's Vessel Sanitation Program (VSP) via the <u>Maritime Illness Database and</u> <u>Reporting System (MIDRS)</u>. For more information, visit <u>CDC Vessel Sanitation Program (VSP)</u>
- Legionnaires' disease: should be reported to CDC's Respiratory Diseases Branch at <u>travellegionella@cdc.gov</u>. For more information about Legionnaires' disease, visit <u>CDC's Respiratory Diseases Branch (RDB)</u>.
- Fatalities and all other illnesses of public health concern (e.g., TB, varicella, measles, pertussis) should be reported via the Maritime <u>Conveyance Illness or Death Investigation Form</u> to the appropriate <u>CDC Quarantine Station</u>.

Check to acknowledge that you have reviewed these Important Reminders \Box

28	Of the <i>asymptomatic</i> persons tested for COVID-19 using a viral test for routine crew screening or passenger voyage testing, how many tested positive ?		
29	Of the <i>asymptomatic</i> persons tested for COVID-19 using a viral test for routine crew screening or passenger voyage testing, how many tested negative ?		
30	Of the <i>asymptomatic</i> persons tested for COVID-19 using a viral test for routine crew screening or passenger voyage testing, how many were never able to register a positive or negative		
	result (e.g., inconclusive or invalid result)?		
	MBARKATION SCREENING TESTING OF TRAVELERS		
	e report <i>final</i> screening test results only [e.g., if an asymptomatic person is antigen-positive then test		
	antigen-positive result to EDC]). ¹ Ships that choose to use antigen tests should follow CDC <u>Interim</u> - <u>CoV-2</u>	<u>ı Guidance for An</u>	<u>ttigen Testing for</u>
31	How many <i>asymptomatic</i> persons were tested for COVID-19 using a viral test collected within 24 hours before disembarkation ?		
32	Of the <i>asymptomatic</i> persons tested for COVID-19 using a viral test collected within 24 hours before disembarkation , how many tested positive ?		
33	Of the <i>asymptomatic</i> persons tested for COVID-19 using a viral test collected within 24 hours before disembarkation , how many tested negative ?		
34	Of the <i>asymptomatic</i> persons tested for COVID-19 using a viral test collected within 24 hours before disembarkation , how many were never able to register a positive or negative result (e.g., inconclusive or invalid result)?		
35	Were there any additional asymptomatic cases testing positive that were not accounted for by the questions above? Please explain:		
Isolati	on Practices:		
	persons with the following isolated for COVID-19 per CDC guidelines?		
	nfirmed cases of COVID-19 defined as laboratory confirmation of SARS-CoV-2 by viral test, or		
	I with negative test results for another respiratory pathogen (e.g., influenza, <i>Legionella</i> ,		
	<i>eptococcal</i> pharyngitis, infectious mononucleosis, <i>and</i> respiratory syncytial virus (RSV)) <i>prior</i>		
	repeat negative NAAT results (see note below) [¶] ?		

Note:
• For symptomatic persons with confirmed COVID-19, isolation may be discontinued under
conditions outlined at: www.cdc.gov/coronavirus/2019-ncov/hcp/disposition-in-home-patients.html
• For symptomatic persons with CLI that initially test negative via NAAT for COVID-19 and no
alternative etiology is identified, isolation may be discontinued if a repeat NAAT result—collected
at least 24 hours from the initial COVID-19 test—is negative.

* All <u>overnight</u> contractors/visitors/vendors should be identified as crew for all CDC reporting requirements (i.e., day contractor/visitors/vendors can be excluded)

‡ A febrile person in the presence of a more likely diagnosis (e.g., cellulitis, urinary tract infection, tooth abscess) does not represent CLI and should not be reported via EDC.

§ Examples of available NAATs for SARS-CoV-2 include but are not restricted to: reverse transcription polymerase chain reaction (RT-PCR), reverse transcription loop-mediated isothermal amplification (RT-LAMP), transcription-mediated amplification (TMA), nicking enzyme amplification reaction (NEAR), and helicase-dependent amplification (HDA).

| Please refer to CDC's antigen testing guidance.

¹ If an alternate infectious etiology is identified through laboratory testing, routine infection control precautions recommended for the diagnosis should be followed.

[¶]Embarkation day testing applies to all passengers on back-to-back sailings prior to the ship sailing on the next voyage, regardless of vaccination status.

Public reporting burden of this collection of information is estimated to average 20 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB Control Number. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to CDC/ATSDR Reports Clearance Officer, 1600 Clifton Road NE, MS D-74, Atlanta, Georgia 30333; ATTN: PRA 0920-1335.
