

increase uncertainty in the market. The global shift from conventional natural gas toward shale gas, which lacks recoverable quantities of helium, also has the potential to reduce the supply of helium, especially for the United States. While these factors make helium a commodity that bears watching, it is not recommended for inclusion on the 2021 draft list of critical minerals.

There were insufficient data to quantitatively evaluate several commodities that were on the 2018 list of critical minerals: Cesium, rubidium, scandium, and several REEs (europium, gadolinium, terbium, holmium, erbium, thulium, ytterbium, and lutetium). The United States has been completely net import reliant for all these commodities for many years.⁸ No specific global production data were available for these commodities; however, general information suggests that production for each of these commodities is highly concentrated in a few countries. Scandium was produced mainly as a byproduct in China, Kazakhstan, the Philippines, Russia, and Ukraine. Cesium and rubidium had been produced in Australia, Canada, China, Namibia, and Zimbabwe; however, it is thought that all cesium and rubidium mine production outside of China has either ceased in recent years or come under control of Chinese companies. The REEs that were not analyzed because of the lack of data (namely europium, gadolinium, terbium, holmium, erbium, thulium, ytterbium, and lutetium) were all heavy REEs that were produced only or predominantly in China. Based on this qualitative evaluation, none of these commodities are recommended for removal from the list of critical minerals.

Mineral criticality is not static, but changes over time. This analysis represents the most recent available data for non-fuel mineral commodities and the current state of the methodology for evaluation of criticality.
