

The COVID vaccine does its job so they can do theirs.

Your child's COVID vaccine has one job: to teach the body what to look for in case they are infected. After that, it's eliminated from their system within 72 hours. And now that children 6 months to 4 years old can get a COVID vaccine, they can do the job they do best—make us smile.

COVID can affect your child's early development.

The first three years of life are a vital time for the development of a child. Interacting with other kids, like in daycare and at playdates, helps your child build social skills. Having your child get the vaccine makes that safer. Children from six months to 4 years can now get their first dose.

C

There's no greater joy.

We want to see our children thrive. So much of their world has been closed off for so long, but a COVID vaccine can open it up again. Safe and effective vaccines are now available for children six months to four years old, which means more kiddie concerts, more face painting, and more ice cream shop visits.

**You protect them from measles, mumps,
chickenpox, even the boogie man.
And now, COVID.**

Vaccines are available for kids 6 months to 4 years old. Like other vaccines, the COVID vaccine has one job – to kick-start their immune system so it can fight the COVID virus in the future. And like other vaccines, it's in and out of their bodies in about 72 hours.
