*Case Definition

Check the following that occurred between 24 hours and 28 days after cessation of transfusion:

- Positive direct antiglobulin test (DAT)
- Newly-identified red blood cell alloantibody in recipient serum
- Positive elution test with alloantibody present on the transfused red blood cells
- Inadequate rise of post-transfusion hemoglobin level or rapid fall in hemoglobin back to pre-transfusion levels
- Otherwise unexplained appearance of spherocytes

Check all that apply:

- Incomplete laboratory evidence
- DHTR is suspected, but reported symptoms, test results, and/or available information are not sufficient

***Imputability**

Which best describes the relationship between the transfusion and the reaction?

- No other explanation for symptoms or newly-identified antibody is present.
- An alternate explanation for symptoms or newly-identified antibody is present, but transfusion is the most likely cause.
- Other explanations for symptoms or newly-identified antibody are more likely, but transfusion cannot be ruled out.
- Evidence is clearly in favor of a cause other than the transfusion, but transfusion cannot be excluded.
- There is conclusive evidence beyond reasonable doubt of a cause other than the transfusion.
- The relationship between the adverse reaction and the transfusion is unknown or not stated.

Did the transfusion occur at your facility? YES NO
