

Change Request

2019 Field Test of

Proposed Changes to the 2020 Behavioral Risk Factor Surveillance System (BRFSS)

(OMB No. 0920-1061 Exp. Date 3/31/2022)

April 30, 2019

Summary

We request the following: OMB approval of the 2019 field test of new or revised items that are under consideration for use in the 2020 BRFSS.

13c. Screener for the 2019 Field Test

13d. List of Changes in 2019 BRFSS Field Test Questionnaire by Section and Module

Background and Justification

The Behavioral Risk Factor Surveillance System (BRFSS) consists of landline and cell phone interviews in each of the 50 states, Washington DC, and several US territories (“states” or “BRFSS partners”). In addition, personal interviews are conducted in one territory where phone lines are unavailable. The currently approved survey instrument is based on modular design principles, consisting of a standardized core questionnaire administered by all states, and topic-specific optional modules that may be appended to the standardized core, at each state’s discretion. The modular design allows each state to customize the BRFSS questionnaire to address state-specific needs. To ensure that BRFSS content is relevant to the current needs of BRFSS partners, CDC updates selected items in the core questionnaire and/or the optional modules on an annual basis. Information collection needs and priorities for 2020 were discussed by CDC and the states at the annual BRFSS partners meeting held in April 2019. At that time states voted on the items to be adopted in 2020. No changes were made to add questions to the core and two modules were modified.

A field test of proposed changes is needed before the changes are formally incorporated into the CDC-sponsored core questions and optional modules for 2020.

The 2019 field test includes 7 sections of the core, and 2 revised modules.

Sections of the core that will be included in the field test are:

- Health Status
- Healthy Days
- Healthcare Access
- Chronic Health Conditions
- Demographics (partial)
- Tobacco Use
- Alcohol Consumption

Revised modules to be tested include the following topics:
Colorectal Cancer Screening
Adverse Childhood Experiences (ACE)

Attachment 13d provides information on each modification being tested by the field test.

Purpose and Use of Field Test Results

The annual field test has distinct objectives. Field testing is the final means by which changes are made in data collection methods and data collection software is tested. Field tests are used to identify problems with instrument documentation or instructions, problems with conditional logic (e.g., skip patterns), software errors or other implementation and usability issues. Field testing is conducted only with those parts of the questionnaire which have been substantively changed or sections of the extant questionnaire which lead into new or updated questions. In some instances, extant sections of the questionnaire may be field tested if they are topically related to new items on the questionnaire or needed for the flow of data collection. For example, if a new question on disability is added, extant disability questions are included in the field testing to ensure that respondents do not feel that the questions are redundant or overlapping. Field testing is not intended to replace cognitive testing, it is only to check to be sure that questions which have already been thoroughly vetted are appropriately placed on the BRFSS. Sections of the questionnaire which are unchanged and unrelated to new or modified sections of the questionnaire are not field tested, although the some questions from the demographic sections of the core are included in the field test.

Field tests are not designed to produce statistical estimates and field test data are not incorporated into the analytic BRFSS datasets. Results of the field test are used to inform development of the upcoming year's BRFSS questionnaire(s) and the technical assistance and implementation guidance that CDC provides to BRFSS partners.

After results of the 2019 field test have been reviewed by the Division of Population Health and the state BRFSS Coordinators, CDC will send a separate Change Request to OMB outlining plans for the 2019 BRFSS information collection.

Information Collection Methods

Field testing is conducted with a limited number of respondents in a single state that has the capacity to rapidly implement the field test instrument. The 2019 field test will be conducted in the state of Oklahoma by the Oklahoma Department of Health using a state supported telephone calling center in **June-July 2019**. Information collection will begin immediately after receipt of OMB approval.

Field testing is conducted in a manner that mimics the full-scale project protocol, to the degree that is feasible. Both landline and cell phone respondents will be included. The field test will use the same calling protocols as previously approved for the BRFSS. Samples will be drawn in the same manner as previously approved.

Burden Estimate

The 2019 field test will target 300 completions with adults ≥ 18 years of age. The estimated burden per response for a completed field test is 18 minutes, which includes 1 minute for the Field Test Screener (see **Attachment 13c**) and 17 minutes for the 2019 Field Test Questionnaire (see **Attachment 13b**).

In addition, we estimate that 240 respondents will participate in screening, but will not complete the Field Test Questionnaire. This estimate includes individuals who are found to be ineligible, and individuals who decline to participate in the field test. The estimated burden for these respondents is 1 minute per response and the total burden is 4 hours. The total estimated burden for the 2019 field test is 94 hours. Based on an average hourly wage of \$25.54 (as in the main BRFSS), the cost of respondents' time is estimated at \$2,401.

| Type of Respondents | Form Name | No. of Respondents | No. of Responses per Respondent | Avg. Burden per Response (in hr) | Total Burden (in hr) |
|---|---|--------------------|---------------------------------|----------------------------------|----------------------|
| U.S. General Population | Field Test Screener | 240 | 1 | 1/60 | 4 |
| Field Test Respondents (Adults >18 Years) | Field Test Screener and 2019 Field Test Questionnaire | 300 | 1 | 18/60 | 90 |
| | Total | | | | 94 |

The 2019 field test request is based on estimates of 540 unique respondents and 94 burden hours (inclusive of screening and questionnaire administration). These estimates are below the maximum estimates of 1400 unique respondents and 390 hours per field test which were approved in the recent Revision ICR.

Effect of Proposed Changes on Currently Approved Instruments and Attachments

None. Inclusion of any item in the field test does not necessarily indicate that any question or wording change will be included in the final 2020 BRFSS questionnaire or in any optional module. Optional modules which are tested may be available, among other previously tested optional module, for state adoption in 2020. The field test has no impact on the instruments approved for the 2020 BRFSS information collection.
