

DOCSYS Integration to FAADroneZone

Non-substantive Change

This update will modify the FAADroneZone to connect with DOCSYS (uasdoc.faa.gov) to validate and auto populate manufacturer Remote Identification (RID) Information on the UAS Registration module. The FAA will develop and deploy a data service, that would ingest FAA accepted standard RID drone and broadcast module serial numbers from DOCSYS to the FAADroneZone application. The data service would auto populate the serial number and other device specific information from DOCSYS (uasdoc.faa.gov) to the UAS FAADroneZone Registration applicable fields during the application process versus the current manual process. This service will assist stakeholders by helping them locate and validate their RID serial numbers without having to find and navigate the DOCSYS system which will result in a significant time savings and should help increase overall compliance.
