this form should be discontinued because the timber in usfs land should be allowed to stand for climate help since trees take in carbon and spill out oxygen so that the increasing population of this sworld has oxygen to breather. the continuing tim er industry which is growing every single year in usa assaults by the usfs means there is less and less oxygen produced each year for our citizenry to breathe. the trees perform other necessary work l keeping rivers and streams cools, preventing floods since they store much water in their roots, providing heat when cold wind blow and shade which is much appreciated when the sun hits l00 degrees, so that taking a tree down means much more fossil fuel is used either to cool or heat., the trees are not getting the protection from the USDA, whoichj has absolutely no protection for trees at all. USDA rewards trees as a crop to be maliciously mauled and chopped down despite the homes they provide for wildlife and birds, which is essential for that rapidly extinction population., stop the timber industry cold in the usa public lands. these are public lands. we want them protected fully for our trees, and our animal populations cannot have a life without them standing there. stop the assault on trees by the vicious USDA.it was a mistake to put any forests under the management of the usda, which is uniquely unqualified to be manager of trees.
